In instances where NYCDPR felt that the installation of demarcation material was not necessary, test pits were excavated to four feet below grade, spaced 50 feet apart, to determine if there was more than four feet of clean shaping layer material installed over MSW. If it was determined via test pits that there was

more than four feet of clean shaping layer material present, demarcation material was not installed. The reasoning assumed a one foot thick cover layer installation and considered the March 9, 2011 NYSDEC/NYSDOH correspondence determining that demarcation layer was not required if the combined fill thickness above MSW was five feet or greater. The March 9, 2011 correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

All areas with less than four feet of shaping layer material present that required the installation of demarcation layer material are identified on Figure SP-200 entitled "Demarcation Layer Plan". The limits of demarcation layer material, as represented on Figure SP-200, were located by the IEM using handheld GPS units at the time of installation, prior to cover layer material installation. Areas associated with the cart paths are also identified on Figure SP-200.

### 4.4.3 Cover Layer Material

Cover layer material was installed at the Site in accordance with the Permit. Special Condition 15(d) of the 2005 Permit required the following:

"The final placement (including topsoil), location, thickness, and detailed chemical limits of the final cover layers on the Site, including the community park and waterfront park, are subject to the specifications, directions and requirements determined by the NYS Department of Health (NYSDOH) to be applicable. It is the responsibility of the Permitees to obtain a written determination from NYSDOH.
The Permitees must provide the Department with a copy of NYSDOH's determination. No cover layer material may be placed on the Site, until the Department acknowledges receipt of NYSDOH's determination."

As required by Special Condition 15(d) of the 2005 Permit noted above, NYCDPR obtained such written determination from NYSDOH in a letter dated, August 2, 2006 included as Appendix C.3 of the 2013 Engineering Report (Appendix 20).

The NYSDEC's active recreational determination from July 28, 2009, required that NYCDPR install two feet of cover layer material and a demarcation layer throughout the Community Park. Soil probes confirmed extremely consistent and appropriate thickness of cover material throughout the Community Park and Golf Course.

For the Golf Course, the upper portion of the landfill was capped using Permit specified criteria for sand and/or topsoil material formally referred to as cover layer material. A sand material was used for the majority of the golf course cover layer with topsoil being used primarily in tree planting pits and other landscaped areas. The IEM observed capping activities associated with the cover layer material including, inspecting cover material at each source site and at the Site per the conditions set forth in the Permit and supporting reference documents. After installation of the shaping layer material and demarcation layer (as required), the cover layer material was installed. The IEM confirmed the depth of cover layer material placed on the Site in accordance with the Permit at the time of installation.

A minimum of one foot of cover layer material was placed over top of the shaping layer material consistent with the passive recreational determination at the Golf Course. Cover layer material was installed by means of either transporting stockpiled material that was previously inspected and approved by the IEM or by directly dumping the material in the work areas as it was imported to the Site. The material was then spread by bulldozers and specialty golf course shaping equipment. The IEM confirmed the depth of the cover layer material placed on the Golf Course area utilizing a graduated rod as the material was being installed.

Confirmation of the minimum of one foot of cover layer material installation on the Golf Course is included on Figure SP-200 entitled "Cover Layer Material Plan". This plan identifies the DOR report numbers and corresponding dates for when the IEM witnessed and measured a minimum of one foot of cover layer material being installed on the Golf Course. The cover layer material depth checks were completed by the IEM using a graduated rod to confirm that the final placement consisted of a minimum of one foot of cover layer material soil. Individual DORs documenting the IEM's observations are included in Appendix 5.

In addition to the IEM checking and confirming the minimum one foot thickness of cover layer material immediately upon installation, post-construction soil probes were completed in March 2015, and dug by hand to confirm the depth of cover layer material throughout the Golf Course. Prior to March 2015, once the site construction concluded and the vegetation was established throughout the Golf Course, an aerial survey (including topography) was performed by LAWS in Spring/Summer 2014 and provided to NYCDPR and subsequently to the IEM in December 2014. In addition, NYCDPR performed a Golf Course wide ground topographic field survey.

The IEM was provided with electronic AutoCAD files of both surveys that captured the final topography of the cover layer material surface. The IEM performed a cut/fill analysis using Civil 3D software by comparing each cover layer material survey to the previously generated shaping layer material surveyed surface (also field surveyed by NYCDPR). Based on a review of the cut/fill analysis results and subsequent discussions with the NYSDEC and NYCDPR, it was agreed by all parties that both survey results were inconclusive, and could not accurately reflect the thickness of the cover layer material on the Site. Since the 12-inch minimum cover layer material thickness could not be verified via survey, NYCDPR then moved forward with field investigations using handheld soil probing equipment in order to perform comprehensive Golf Course wide physical confirmation depth checks.

The IEM was on-site and witnessed all soil probes, and documented all soil probe locations and depth results using handheld GPS equipment. The soil probing work was completed by NYCDPR staff. Soil probe fieldwork commenced on March 11, 2015 and was completed on March 27, 2015. Soil probes were initially completed on a 50-foot grid but were increased to a 100-foot grid on March 19, 2015 based on the satisfactory initial field results and approval by the NYSDEC in an email dated March 18, 2015 (see Appendix 19 for the March 18, 2015 email).

Refer to Figure SP-003 entitled "Cover Layer Material Soil Probe Investigation Results" which illustrates the results of the soil probing investigation. The final results of the soil probing investigation were reviewed on-site with NYSDEC staff, and the NYSDEC required that NYCDPR correct an area in the vicinity of the Hole 14 Green, which resulted in cover soil layer thicknesses of 3 inches and 6 inches. NYSDEC staff stated that this area would require reconstruction in order to satisfy the intent of the 12-inch cover layer material thickness as required by the Permit. NYSDEC staff concluded that the remaining soil probe results sufficiently addressed the intent of the 12-inch cover layer material thickness Permit requirement, and the remaining Golf Course area did not require any further reconstruction or evaluation of the cover layer material.

As per the IEM's Daily Observation Reports, the IEM witnessed the subsequent field delineation the of the area deemed to be of insufficient cover layer material thickness (i.e. the area adjacent to Hole 14 that resulted in cover layer material depths of 3 inches and 6 inches via soil probe results) during the week of April 20, 2015. This was performed by using the soil probe equipment to accurately delineate the limits of the area having a cover layer material thickness of less than 12 inches, and resulted in an area of approximately 6 feet by 12 feet.

On May 4, 2015, the IEM observed the Trump Organization construction crew over-excavate the previously delineated areas that had less than 12 inches of required cover material, adjacent to Hole 14 Green. The area was over-excavated approximately 24 inches below grade, and 24 inches of Cover Material was backfilled and graded over the excavated area. The excavated area was GPS mapped using a hand held Trimble device. Excavated surplus shaping material was transported to a shaping stockpile adjacent to Pond P2.

Similar to the Golf Course, the 24 inch minimum cover layer/shaping layer materials thickness could not be verified via survey. NYCDPR moved forward with field investigations using soil probes in order to perform physical confirmation depth checks. The IEM was on-site and witnessed all soil probes, and documented all soil probe locations and depth results using handheld GPS equipment. The soil probing work was completed by a NYCDPR subcontractor. Soil probe fieldwork commenced on May 18, 2015 and was completed on May 22, 2015. Soil probes were completed on a 50-foot grid. Refer to Figure SP-004, entitled "Community Park Cover/Shaping Layer Material Soil Probe Investigation Results", which illustrates the results of the soil probing investigation.

#### 4.4.4 Greens and Tees Mix, Bunker Sand

Consistent with Section 2.1.2 "Cover Layer Fill Specifications" included in Volume #2 of the 2005 Engineering Report, environmental testing was not required, consistent with cover layer material requirements for the green and tees mix or bunker sand, and therefore was not completed for these materials.

On June 8, 2012, the NYSDEC confirmed that the sand material used for the tees, greens, and bunkers should not be counted towards the Permit stated allowable cover soil maximum. A copy of the June 8,

2012 correspondence is included in Appendix 19. NYCDPR's consultants estimated the required sand material volumes as follows: Tees and Greens (24,705 cubic yards), Driving Range Tee (3,025 cubic yards), and bunkers (6,076 cubic yards). Since these values were estimated, calculated by NYCDPR's consultants, it shall be noted that actual installed volumes may have fluctuated from the volumes identified above. This information is based on an email from Joe Voss to Faisal Choudhury on June 13, 2012.

Special Condition 15 of the 2005 Permit did require that the tees and greens mix imported to the site to be tested as per material testing requirements to meet the project technical specifications. Fertilizer and soil amendments could be applied on the tees and greens mix after spreading to construction specifications and finally grassed, as per the specifications provided by the agronomist.

#### 4.4.5 Topsoil

Topsoil was used on the Site, in lieu of sand, specifically in tree planting pits and other landscape areas. Any topsoil that was imported and used on the Site was approved and met all of the cover layer material Permit requirements including the specification included in Exhibit C of the 2005 Engineering Report.

## 4.5 Meetings

On a bi-weekly basis during construction of the Community Park and the Golf Course, progress meetings occurred in the NYCDPR field office trailer on the Site. Various representatives from NYCDPR, Trump, LAWS, KSE, TRC, the IEM, and appointed representatives attended the meetings to discuss construction progress, current issues, and scheduling.

Available meeting minutes from construction progress meetings are attached as Appendix 9.

## 4.6 As-Built Survey, Record Drawings, Deviations from Approved Design Plans

This section deals specifically with as built drawings, final record drawings and deviations that occurred during construction. It is further broken down into work performed in the Community Park, the Golf Course, the Waterfront Park, deviations to NYSDEC Permit as it pertained to fill importation quantities, modifications to the landfill gas vent trench and additions to the golf course made by the concessionaire.

#### 4.6.1 Community Park

The Community Park project consists of the following features and was designed by Thomas Balsley Associates:

- A softball field and smaller peewee/T-ball field with new drainage
- Two basketball courts
- New formalized park entrances
- Play areas for tots to pre-teens
- Seating areas and lawn for non-programmed activities
- A path and trail system that winds throughout the park
- A detention pond which collectives drainage from the eastern part of the golf course
- Foot bridges
- Shade structure

- Timber deck overlook
- Herbaceous plant materials
- Temporary below grade utilities to service a standard DPR Comfort Station (constructed under a separate contract),
- Below grade infrastructure to service Community Park lighting and fountains,
- Modifications to the Landfill Gas Vent Trench system
- New perimeter fence.
- New Comfort Station. (The comfort station construction is still in progress and expected to be completed in the Fall of 2015)

Deviations to the Community Park project consist of the following:

- The reconfiguration of the location of the perimeter fence on the south and west sides of the Community Park reducing the area of the site[1].
- One missing Vertical Landfill Gas vent just south of the most southerly entrance to the park.
- The relocation of a drain inlet in the softball field[2].
- The utilities servicing the Comfort Station are constructed as of December 10, 2015,[3] which represents the date in which the sanitary sewer connection was completed.

It is noted that below grade features were not examined during a NYCDPR field inspection conducted during July 2014. Community Park as-built information and documentation are included in Appendix 16 and includes a November 18, 2011 letter from LAWS indicating that the Community Park construction was completed as designed (exclusive of the comfort station) as well as three as-built drawings associated with the pond liner construction dated July 14, 2010 as prepared and certified by LAWS (Appendix 16).

### 4.6.2 Golf Course

The Ferry Point Park Golf Course project consisted of the following:

- A Maintenance Building with an active sub-slab depressurization system.
- A comfort station with as active sub-slab depressurization system, which includes a snack bar.
- A unenclosed rain shelter
- An 18 hole links style golf course
- A practice area
- Fill and topsoil importation
- A site drainage system and retention ponds
- A new irrigation pond and irrigation system
- All the necessary plumbing, electrical, gas, environmental monitoring and control devices for the golf course, maintenance facility and comfort station
- Roadway and parking area construction, paving, striping and drainage in compliance with the DEC permit
- Perimeter fencing and appropriate landscape screenings.

[1] See App. 4; Community Park Contract Drawings; Thomas Balsley Associates Constr. Dwg L1.3 & L1.6 dated 03/06/09, revised 09/30/09.

[2] See App. 4; Community Park Contract Drawings; Thomas Balsley Associates Constr. Sketch dated 2/11/09

[3] See App. 4; Community Park Contract Drawings; Thomas Balsley Associates Constr. Comfort Station Dwg P-2 dated 1/26/09

Deviations to the Golf Course consist of the following:

- The active venting system around the Irrigation Pond was converted into a passive system. Fiberglass manholes were changed to concrete manholes and additional piping added around the entire pond. Six (6) vertical passive vents were added, one at each box location and installed October 2014, following NYSDEC discussion. On May 22, 2015 the NYSDEC approved the removal of vertical passive vent #5 thereby leaving five (5) vertical passive vents in operation.
- Modifications to the grading plan did occur as well as minor modifications to drainage and are documented in "Ferry Point Site" visit notes produced by "Nicklaus" from 2010 through 2013 and as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- Retention ponds were lined as per NYSDEC requirements as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The golf cart path surface material was changed to asphalt and additional drainage was added as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The Clubhouse Parking Lot paved footprint was increase/installed as per NYSDEC Consent Order # R2-20100521-172. The Clubhouse Parking Lot was completed in May 2014 as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The irrigation pond pipe penetrations were revised as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The Turf Nursery was revised as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The active venting system inside of the Comfort Station was modified as per Integral Engineering, Inc. design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015). System is functioning, and requires the installation of sensor components of the vapor detection system. Contractor procurement for the installation of the sensor components is in its final stage of approval. Implementation is anticipated by Spring 2016 and the final signed and stamped as-built drawing will be submitted to NYSDEC following prompt inspection of the installation.

### 4.6.3 Waterfront Park

Construction has not begun in the area designated "Waterfront Park".

### 4.6.4 Additions to the Golf – Concessionaire

The concessionaire running the Golf Course is the Trump Organization. Since in their possession (NYCDPR Use Inspections were held for various parts of the project from September 2012 through March 2014) the following additions/deviations have occurred (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015, revised 4/23/2015, 6/25/2015 & 7/13/2015):

- The construction of a Golf Cart Barn (currently under construction)

- The construction of a sign (currently under construction) and curb line realignment
- The construction of a temporary clubhouse including temporary utility services (trailers placed upon the asphalt parking lot)
- The construction of a "starter" kiosk including utility services as well as minor golf cart path widening around it.
- The construction of a clock.
- The construction of a weather vane/station.
- Minor irrigation changes.
- Additional planting along the perimeter fence line. Removal of the aluminum fence along the Waterfront Park and the Golf Course and the installation of a fiber optic sonar alert system in its place (installation of the fiber optic sonar alert system occurred from July 25, 2015 to August 19, 2015 and was witnessed by the IEM).

# 5 Environmental Monitoring

## 5.1 SWPPP

On November 20, 2003, NYCDPR received an Acknowledgement of Notice of Intent for coverage under SPDES General Permit for Stormwater Discharges from Construction Activity (General Permit No. GP-02-01), permit identification number NYR10D547, which transitioned SPDES General Permit coverage previously held under GP-93-06. On May 12, 2009, NYCDPR received an Acknowledgement of Notice of Intent for coverage under SPDES General Permit GP-0-8-001; permit identification number NYR10R112, which was maintained throughout construction completion. A copy of the SPDES General Permit Acknowledgement and Notice of Intent are included in Appendix 1.

In compliance with NYSDEC guidelines for State Pollution Discharge Elimination System (SPDES) General Permit (GP-0-8-001) and General Condition 9 of the 2014 Permit, a Storm Water Pollution Prevention Plan (SWPPP) was implemented during the course of construction at the Site. All work was completed in compliance with the final SWPPP, dated December 22, 2009.

In addition to intermittent IEM SWPPP inspections, NYCDPR representatives also performed SWPPP inspections. NYCDPR performed bi-weekly inspections and associated Site Assessment Reports (filed at the FPP document repository) to ensure compliance with Permit requirements. SWPPP inspections were carried out through the spring of 2014. The SPDES permit will remain effective until completion of ongoing construction including the Golf Course Clubhouse.
Every possible action was taken to avoid non-compliance, such as turbid water leaving the Site. The following is a list of permanent features that were installed at the Site, beyond the SWPPP requirements:

- French drain at the eastern, western, and northern perimeters of the Site to control surface flow of stormwater;
- All ponds were lined, to prevent stormwater infiltration into the solid waste layer; and
- A new trash rack and rock outlet dam at the 60-inch Whitestone sewer outfall draining to the East River.

## 5.2 Landfill and Off-Site Gas Monitoring

The entire Ferry Point Site is equipped with a Landfill Gas (LFG) Management system to cover both on and off site monitoring. The systems purpose is to allow use of the site in its intended purpose as a golf course without having the occupants on the site and users of the golf course being exposed to harmful conditions that would be the direct result of the existence of the landfill. The Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, New York May/August/Oct 2013, referenced the summary of prior LFG efforts. These included preparation of a model for surface methane emissions using data collected during 2009 and 2010. Data for these studies also included a health impact analysis that is summarized in this final Certification Report and is attached with the 2013 Supplemental Engineering Report as an Appendix 20.

The generation rates for LFG were estimated as far back as 1999 using EPA Guidance documents and the results indicated the LFG rates for Ferry Point were consistent with municipal solid waste landfill rates for a facility of this era and overall age. The analysis in 2010 also evaluated hazardous air pollutants (HAPs) in areas of the course as well as community park. In 2011, NYSDEC concluded that there was not an ambient air impact from gas vent emissions and that there was no health impact in the park. This was a major component that allowed the discontinuation of monitoring the passive vents installed in 12 locations throughout the park. Monitoring of the passive vents is included as Appendix E.3 in the Supplemental Engineering Report (Appendix 20).

The following were included as components of the Ferry Point Park Landfill Gas Control System:

1. Irrigation Lake Venting System-Passive
2. Water Quality Ponds Venting System-Passive
3. Sub-Slab Depressurization Systems
    a. Maintenance Facility-Active
    b. Comfort Station in Golf Course-Active
    c. Comfort Station Community Park-Active
4. LFG Venting for subsurface utilities entering enclosed spaces-Passive
5. Perimeter Vent Trench-Passive
6. Perimeter Vent Trench/East-Passive
7. Golf Course 25 In-ground vents-Passive

The Ecology & Environment 2011 Landfill Gas Management Report describes in detail the landfill gas generation rates, composition, migration pathways and methods for diffusion (Appendix 20). It also discusses both the horizontal and vertical migration of LFG across the landfill. Figure 3-1 in the LFG Report (MSW Fill Progression Map, March 11, 2015) shows the historical fill progression that occurred over the landfill lifespan between 1951 to 1959 and how significant areas of open water was filled in over the life of the landfill .

As far back as 1999, Landfill Gas generation rates were noted to be low and in the range of .00004 cubic feet per minute per square foot or about 2cfm per acre of surface area. These generation rates provided discussion and recommendation for installation of an active system beneath planned structures. A 1999 Report referenced in the Ferry Point East Landfill Gas Management Plan did not recommend installation of active venting systems in open spaces with the exception of specific turf grass areas. The 1999 Report also included numerous LFG Control Systems including; interceptor and venting systems, impermeable liner systems for irrigation ponds, soil plugs and conduit seals for underground utilities that enter buildings (Appendix 20).

The main facility LFG management structure was the perimeter vent trench installed in 2001. The specific purpose was to prevent offsite migration of landfill gas. This was designed, and installed with oversight by TRC. The entire trench was installed along the eastern site boundary and allowed a gas barrier to be present between the site and the neighboring residential homes. Construction included extending the trench from the water's edge at Emerson Avenue along Balcom Avenue and the site boundary, approximately 1050 ft. past the intersection of Schley and Buttrick Avenues.

Monitoring of the venting trench began using a number of wells that were installed along the trench. In 2001 monitoring performed after the trench was installed indicated there was an off-site source of methane. This was identified by AKRF and further evaluation along the venting trench indicated there were additional off-site LFG readings. Test pits were identified to have MSW beyond the site and this was one potential source of the elevated readings. The second was the historic filling in the northeastern portion of the site on a former tidal or marsh wetland. No methane was reported in ambient air at that time and the source of methane was concluded by AKRF to have originated from an off-site source.

The initial facility LFG system was proposed to be installed as an active system. Following the 2009 landfill permit modification submittal, the conceptual passive LFG system was updated to include all areas not covered by enclosed structures. In summary, the passive LFG system meets a number of historic reports including the 1999 EAS (AKRF), 2002 referenced in the Landfill Gas Management Plan (Appendix 20) and Volume #2 Application for Modification to the Solid Waste Permit Engineering Report, June 30, 2005, Appendix 20) and was approved under the 2005 NYSDEC Part 360 permit (Appendix 1). In the 2009 DEC Part 360 Permit Modification Request (November 25, 2009, Appendix 20), an active system was recommended. Supplemental Site investigations and extraction testing was performed by TRC Engineers in the period between 2009 and 2010. This information was reviewed by Walsh Environmental Scientists and Engineers in 2010 (Ferry Point Landfill Gas Report, November 2010, Appendix 20). The resulting analysis and evaluation concluded that the Site was able to be operated safely with a passive venting system which was consistent with the 2005 Permit.

The July 2000 NYSDEC Part 360 Permit (Appendix 1) and February 2002 Part 360 Permit Modification (Appendix 1) approved by NYSDEC included numerous conditions related to material importation and capping. The permit was also specific in requiring the installation of a series of perimeter-based landfill gas monitoring wells. Twenty-one (21) perimeter monitoring wells were initially recommended and a final total of 25 were installed at intervals of approximately 250-300 ft. around the perimeter (PZ-01 to PZ-25),

(SH-21 Groundwater Monitoring Well Construction; November 8, 2011. The perimeter for purposes of these wells would be the edge of the golf course portion of the landfill and the adjacent residential neighborhood. An additional 56 monitoring points were required to be installed as the main component of the off-site monitoring network. The off-site wells were referenced in the modified 360 permit. The combined perimeter and off-site wells comprise the full gas monitoring system for the golf course fill area.

Modifications to the overall Landfill Gas Collection systems were based on and included the following:

- In 1986, a passive venting system was reportedly installed with outflow venting. In 2002, there was a plan presented by TRC to perform test pits in order to identify this system and more specifically, to identify the outflow vent location and to determine if connective piping was functioning. The system was never located and has not been able to be incorporated into any LFG system.
- 2005 Engineering Report Vol. 1 (June 30, 2005, Appendix 20) included several LFG components and systems that were aimed to maintain a similar program to the 1999 proposed EAS. This included active systems for all enclosed buildings and sealed penetrations for utility connections. All perimeter and off-site monitoring wells would be monitored bi-weekly for both methane and oxygen. Monitoring showed several points off-site with elevated levels indicating a source that was also located beyond the site. Groundwater was monitored on a monthly basis to evaluate water level in concert with the LFG trench elevation. Irrigation Lake and ponds were recommended to have gas-venting layers and liners installed at their base to allow for collection and discharge of gas collected from beneath them. Specific instances of impermeable barrier installation could be noted where turf health was necessary to be maintained. Most specifically, the 2005 Report did not recommend LFG venting systems in open space areas (Appendix 20).
- A 2009 Extraction Pilot test was conducted to better understand generation rates for on-site LFG. The interpretation of the results of this test prompted a proposal for a low-flow active LFG system that covered the overall golf course. The reason referenced in the Supplemental Engineering Report for the Solid Waste Facility Permit Application, October 13, Appendix 20) was that methane levels in the subsurface was not expected to be able to be made safe by the opening of the golf course. The irrigation pond system was also included in the plan to be connected to the landfill venting system. One caution in this report was the potential for pulling large volumes of ambient atmospheric air into the subsurface which could cause fires and explosions. The system included some forty control zones of extraction wells, green and tee collection piping all connected to vent flares with in-line fans. This system was never instituted.

Modifications to the gas monitoring system included the design and installation of a landfill gas (LFG) vent trench along much of the eastern park boundary. This trench extends from the water's edge at the foot of Emerson Avenue, along the entire length of the site boundary of Balcom Avenue and along Schley Avenue. The trench continues approximately 1050 linear feet to the west past the intersection of Schley and Buttrick Avenues. The trench totals just over 1 mile in length (5350 feet) and construction began in May 2001 and was completed by the end of December 2001. This trench does not cover the entire upland

perimeter. The remaining portion was covered with an existing trench along Miles Avenue. This was planned to remain following the golf course development and provided an effective cutoff for off-site migration in that direction. The final construction included the trench and drainage.

The LFG passive vent trench was designed to intercept landfill gases (primarily methane) originating and leaving the site. The limits of the municipal solid waste extend beyond the park boundaries and the LFG passive trench was not designed to facilitate collection of or negate the impact of gas generated from that material. The trench presents a sound engineering control that will intercept gas migrating through preferential pathways and other routes of least resistance that intersect it. The LFG trench acts to briefly capture LFG moving out of the park and then allows it to vent to the atmosphere. The trench is designed to have a very high relative permeability with increased porosity in comparison to the landfill waste material. As gas enters the trench is can easily and rapidly mix with ambient air in the pore space and then rise out where it can be discharge to the atmosphere. One of the key components of the trench is that the bottom remains into the water table. As long as the bottom of the trench is submerged in the shallow water table, LFGs at the Park cannot migrate beneath and beyond the trench.

The 25 perimeter monitoring wells (also referred to during the construction as piezometers) were located immediately adjacent to the LFG passive vent trench and along the site perimeter adjacent to Miles Avenue. The specific purpose was to provide consistent data comparing the trench bottom and top of the water table to identify locations where the water table may have dropped below the trench, thus indicating the ability for the trench to intercept and capture all LFG along its entire length.

The LFG passive vent trench was constructed of a geotextile wrapped stone envelope that extends from .5 ft. below the ground surface down to a depth of approximately 3 ft. below the surface of the water table. The upper .5 ft. of the trench has a loose covering of wood chips to allow LFG that has entered the trench to exit and discharge to the atmosphere. There were areas where the final depth of the trench only reached to 1 ft. below the water table. These locations were caused by an unstable sidewall after the groundwater table was reached. The trench was also constructed with horizontal perforated 4 to 6 inch polyethylene tubing placed beneath the wood chips near the top of the stone backfill. The horizontal tubing was installed to allow connection to vertical risers in the event the trench surface is covered at some point in the future with an impervious surface.

LFG monitoring has been performed in accordance with Special Condition 30 from the modified Solid Waste Permit (Response Action Plan, December 10, 2002, Appendix 19). This included monthly monitoring during construction in order to determine if water levels were maintained above the bottom of the trench. Specific protocols were required to be performed in the event groundwater was determined to be below the bottom of the trench.
The following Action Plan items were incorporated for low groundwater levels:

1. Evaluate methane concentrations in nearby perimeter methane monitoring wells and semi-permanent monitoring points. If methane concentrations measured are below site-

specific action levels (25% LEL), the normal frequency methane monitoring will continue and the groundwater level measurements will increase to bi-weekly.

2. When groundwater levels increase to fall back into the envelope of the recovery trench, measurements will return to monthly.
3. If groundwater remains below the trench bottom for one additional bi-weekly monitoring event but nearby well methane levels remain below the action level, groundwater monitoring will continue until such time as routine monitoring can be reinstated.
4. When groundwater is measured below the trench and methane levels are at or above the action level, both groundwater and methane measurements will continue at bi-weekly frequency.
5. If both groundwater and methane remain below the trench bottom and above the action level (respectively) for a second consecutive week, a recommendation for further action will be made to NYSDEC.

During the 2014 Solid Waste Facility issuance several references to continuing monitoring and the documents that would be covered under were made (DEC No. 2-6006-00014/00013 (2-6006-0014/00016 Permit Issuance – Solid Waste Management Facility (Tidal Wetlands), May 21, 2004, Appendix 1). The Ferry Point Park East Post Construction Custodial Care Plan is specifically called out as the governing set of protocols for this. Monthly LFG vent trench monitoring is to be performed during the duration of the permit (October 2013, Appendix 20). Additionally under Special Condition 25 there is continued monthly inspection required for the gas venting trench integrity as well as mulch cover. All repairs are required to be made within two weeks and therefore prior to the next inspection. The mulch cover is required to be replaced each spring. Trench maintenance is also described in the Supplemental Engineering Report, Volume 3, Appendix F (Appendix 20).

Landfill methane monitoring has shown from collection of data within the site to be above general action levels of 25%LEL as well as LEL from within the MSW layer. The resulting measurements between 2008 and 2009 supported the hypothesis that methane was generally present throughout the entire MSW layer rather than just from individual locations. Measurements from the shaping layer above the MSW indicated that concentrations decline rapidly once out of the fill layer. These measurements appear to present a better picture of the landfill gas presence and production because the extraction test performed in 2009 referenced a 2003 Journal of Air &Waste Management with fatal flaws for infiltration of atmospheric air into the landfill. In addition, the 2009 extraction test did not reportedly follow the EPA testing methods and would then incorrectly estimate the presence and production of methane. Testing reportedly used differential pressure at surrounding test wells. EPA specified determining radius of influence based on absolute pressures under static and active extraction conditions. EPA measures ambient air intrusion by percent volume of nitrogen and the testing identified ambient air intrusion by percent oxygen. The conclusions that were reached at that time indicated that atmospheric intrusion noted during the testing would have caused the LFG extraction rate to be significantly higher than actual LFG generation rates within the area of the pilot test. If the entire LFG generation rates were then based on pilot test results, the resulting estimate would be potentially far over the actual LFG generation. Historic data from monitoring indicated that LFG generation rates had sharply declined since the initial

2000 measurements began. The reduction was referenced largely as readings from over 100% LEL to non-detect. While there were a few exceptions, this overall reduction was credited to, among other things, the perimeter venting trench and overall LFG decline. One specific area in the vicinity of MW-0 found to continue to present elevated readings was believed to be impacted from an off-site source.

The Ferry Point Landfill Gas Report (November 2010, Appendix 20) was a summary of various testing across the landfill including flux chamber testing that was used to determine the surface emission rates from the overall landfill. The resulting emission rates were important in making the determinations for receptors and potential impacts of methane and hazardous air pollutants. During this review of testing data and as it was presented in several reports, no methane was detected in field measurements from any of the sample locations. This lack of detectable methane was attributed to rapid attenuation of methane as it passed from the MSW into the shaping material and out into the atmosphere. Hazardous air pollutants in the form of certain VOCs were detected in flux box sampling but all below the reported standards or at levels similar to those identified as background.

Testing within the Community Park was also conducted and methane was also not detected in flux box testing indicating it is not emitted at the ground surface at concentrations that are measureable. This meets NYCRR Part 360 criteria. Measurements from within the top 2 ft. of the shaping material were below 25% of the LEL which also falls within the NYCRR Part 360 requirements for on and off-site structures. Perimeter methane was below Part 360 criteria with the exception of the vicinity of MW-0 along Buttrick Avenue where methane was above 100% LEL. This particular area was beyond the site and consisted of early tidal marsh and pre-1945 MSW filling that is believed to be the contributing source of methane. All measurements from the Community Park vents were below ambient concentrations and well below NYSDEC standards indicating no impact above public exposure thresholds in the vicinity of the vents (Ferry Point Landfill Gas Management Plan, October 2011, Appendix 20).

Modelling of the emissions over several efforts conducted between 1999 to 2010 showed that methane levels were very low and in locations where methane was identified, levels were expected to continue to diminish over time. In order to provide adequate ventilation for enclosed spaces and especially where there is a source of ignition (electrical connections or machinery), mitigation methods would be implemented including Sub Slab depressurization systems (SSDS) at each building. This was further described as conservative as methane concentrations exceeded LEL within the MSW layer back during 2008/2009 in TRC testing of the subsurface. Also during this same monitoring period, methane was not present within the shaping material above the NYCRR Part 360 limit of 25% LEL in any location of proposed buildings. Passive venting of the MSW was recommended as a precautionary measure where no buildings were planned and active venting below or within building footprints.

The Golf Course portion of the Site also includes a sizable irrigation lake and water quality ponds. The purpose for these water bodies covers two positive issues. The first is to help control and limit precipitation and infiltration through the cover material and into the solid waste and the second is to help collect water for controlled release and irrigation. Golf course ponds are typically used for storage and

irrigation regardless of the overall construction. The ponds and lake were each designed to be lined in order to contain as much runoff as possible making it available for irrigation. A gas transmission layer was constructed beneath the irrigation lake. This was connected to perforated piping installed around the lake. The 2009 Part 360 Permit Modification Request included Contract drawings showing this piping as a passive venting system surrounding the lake (Appendix 20).

Water quality ponds were proposed to be lined up to the permanent water level capacity with low permeability low density polyethylene (LDPE) liners with the incorporation of a passive venting system. Ponds where MSW was encountered within the excavation would be lined for the entire volume.

The smaller ponds have also been designed and constructed with a gas transmission layer to promote passive venting. This layer consists of permeable gravel and perforated collection piping extending beneath the ponds and exiting from vent stacks that extend above the breathing zone. The drawings and specifications for the water quality pond liners and passive venting systems were included in the Supplemental Engineering Report Appendices (Appendix 20).

The Community Park portion of Ferry Point Park is located along the northeastern side of the site. This includes walking paths, open space and a single comfort station structure. The LFG components of the Community Park portion consist of 12 LFG vents and an active sub-slab depressurization system beneath the comfort station. Sampling and monitoring of the vents has shown that since at least 2011 there has been no measurable flow in the vents and detectable methane in 3 of the 12 vents. Ranges of methane were between 7.5% to 100% LEL as referenced in the 2011 Ferry Point Landfill Gas Management Plan (Appendix 20).

Twenty-five stand-alone vertical passive vents were installed across the golf course and twelve passive vents were installed in the Community Park. The total area not covered by buildings and water features is approximately 190 acres and the ratio of vents per acre is one per five acres. A greater ratio was applied to the community park which has twelve passive vents in open spaces. All landfill and community park vents operate based on changes to water level, atmospheric pressure and also production of landfill gas. Gas can move through the fill material to a point where it is able to be removed through a vent. Additional smaller gas volumes can move upward into the shaping material to be passed along the surface interface. Based on readings, these concentrations are both low and rapidly diffused indicating the overall volume is much lower.

Following the revision of the active venting proposal for the entire Site, the enclosed buildings and structures were left with the earlier requirement for active venting systems. This was required due to the explosive and accumulating nature of methane and other oxygen displacing gases that exist in landfill conditions as well as being precautionary to prevent the potential of accumulation of explosive gases in these locations. In order to protect occupants and visitors of enclosed structures from accumulation of LFG, active venting of the sub-slab area was recommended. The active sub-slab systems prevent accumulation of gas by actively removing it to the atmosphere and increase the flow of air beneath the buildings. This creates a change in pressure from beneath the slab and the inside of the building which

prevents LFG from entering the building in its more concentrated form. Once LFG leaves the confined space from beneath the landfill and mixes with ambient air, the concentrations are rapidly diminished to levels that are not detectable above background.

The three enclosed buildings (maintenance and two comfort stations) located on the Golf Course and Community Park were required to have SSDS incorporated into the slab design and foundation plan.

Two initial buildings within the golf course (maintenance and comfort station) and one in the community park (comfort station) were recommended to be outfitted with active sub slab venting systems. The maintenance building and comfort station in the golf course and comfort station in the Community Park were each proposed and were outfitted with an active SSDS. The designs were initially submitted in the 2009 DEC Part 360 Permit Modification Request (Appendix 20). Operation and maintenance of the systems (once active) is provided in the Operations, Monitoring and Maintenance Plan and in the Post Construction Custodial Care Plan. Systems will have monitoring, notification controls and remote capabilities in order to allow monitoring of conditions.

Sub slab systems for the three existing structures on site function in a similar fashion by reducing the air pressure beneath the foundation and inducing a slight negative pressure. The negative pressure prevents upward migration, accumulation and infiltration of LFG into the aboveground space. Systems can incorporate varying designs in order to accommodate structural requirements, utilities and layout of the overall building.

The maintenance building and community park systems consist of more typical sub slab systems with perforated piping placed in the backfill material above the municipal solid waste but beneath the foundation slab. Piping is connected to a vacuum blower that exhausts the sub slab gas from a high single point into the atmosphere. The comfort station within the golf course uses a similar manner of equipment with the major difference being the foundation design was modified to include the creation of isolated vaults sandwiched between the lower mat slab and upper floor. No access can be made into those vault spaces and they are filled with low density foam. Vent piping was installed into the sealed vaults and the vapor extraction system effectively creates a higher vacuum (negative pressure) in this vault space than would typically be seen below an open foundation. The piping penetrated the floor in the main portion of the building and was extended into the attic where the blower was mounted. Exhaust was vented through the top of the roof in a dedicated stack. The system was installed in March 2015 and put in operation prior to opening the golf course on April 1, 2015. The comfort system details are also described in the deviations section of this report.

The Maintenance building was constructed with a pile supported slab that covers the entire footprint of the building. The system was constructed as shown on drawings X-001.00 through X-006.00 (Contract drawings for: Construction of a Maintenance Building, A Comfort Station, and One Rain Shelter Within the Ferry Point Golf Course – Contract No. X1256-209M, November 11, 2011, Appendix 4). Prior to pouring the slab, the existing ground surface was prepared with geo-textile fabric, a minimum 12 in. layer of aggregate that is gas permeable to allow flow from all areas beneath the slab into the collection piping,

rigid insulation all covered by an impermeable barrier such as liquid boot or other equivalent. Liquid boot and all barriers used are compatible with the known and identified volatile organics identified at the site. Liquid boot was applied to provide a 60 mil thickness. A special capping material was also placed above the liquid boot to protect it from perforations when the rebar reinforcing rods were set in place. Six inch dia. PVC piping was installed beneath the center of the Maintenance Building floor and this was connected to a vertical riser that would exhaust through the roof. The blower was located as the piping exited the slab into the building and exhaust extended up through the roof. The system was combined with combustible gas meters located in each of the occupied spaces of the building that monitor the atmosphere in each area and are connected to a central alarm. Sub slab monitoring points were also installed along the length of one side of the building to allow for sampling. Each point was installed through the slab into the permeable aggregate and the penetration through the slab was sealed. This system was operational prior to the opening of the golf course as the building was being occupied prior to opening of the golf course.

The system in the comfort station at the Community Park was installed in a similar fashion with a smaller footprint building. This system was a single length piping system installed beneath the foundation using the same construction layering as the maintenance building. The blower and equipment has been completed and the system not yet initiated as that area is not currently open. The system is expected to become active in the very near future.

The comfort station within the golf course was also outfitted with an active system but the slab design for this building was modified so as not to require pile supports. This foundation design included a vapor barrier placed on the prepared subgrade. No MSW was exposed and the fill beneath the building was consistent with shaping material consisting of sand and gravel. A mat slab that was 1.5 ft. thick was poured over the vapor barrier and then 4 ft. vertical walls were formed on the slab to cover the perimeter as well as divide the slab into 4 roughly equal sections. The inner sections of the slab were then filled with solid foam up to just below the top of the walls. Six inch PVC piping similar to that used in the maintenance building sub slab was used and extended to the outer two segments. A vertical riser penetrated the floor inside of the building and was extended up into the attic space where the blower was located. The blower exhaust was directed out of the roof through a vent. The system was designed to create and maintain a lower pressure vacuum on the entire four-chamber sub slab area in order to prevent any sub slab gas from accumulating within that space. Pressure testing of the entire area showed that negative pressure was able to be generated and maintained between the mat slab and floor of the comfort station. This system was installed and began operating prior to opening of the golf course and occupation of the building.

Additional controls installed within the buildings included soil/bentonite collars around utilities servicing the buildings. Foundation penetrations were sealed with these engineering methods to prevent infiltration both into the void spaces and up through foundation slabs where utilities are installed. Additionally, soil/bentonite collars were installed in utility corridors where permeable pipe bedding was used in order to prevent LFG from migrating laterally. All conduit and utility penetrations into floor slabs

were also closed with soil/bentonite seals to prevent those corridors from acting as preferential pathways for LFG migration up into occupied spaces.

The Community Park Comfort Station was constructed in an area of MSW at shallow depths below grade and within the foundation envelope. The foundation was designed to incorporate piles for slab support. All utility trenches that were excavated to the building were installed in either shaping material or if MSW was encountered, it was over excavated and the trench backfilled with granular fill to allow all utilities to be place on bedding that did not contain MSW. During excavation, short duration and dewatering was occasionally necessary. Any water removed during dewatering was pumped a short distance away into existing trenches or other locations.

Off-Site monitoring for methane has been conducted back to the early 2000s. Probing was the primary early monitoring and assessment method. Probes were historically located on Schley, Buttrick, Balcom, Miles and Emerson Avenues. Since 2002, concentrations of methane have been lower than the LEL and this has been used to present the lack of significant source of methane at these off-site sources. In 2002, the Methane Monitoring Study (AKRF) identified the presence of buried MSW beyond the site boundaries. In addition to MSW, soils were logged and identified as fine organic deposits representative of the historic marsh deposits.

OM&M incorporates criteria from NYCRR Part 360-2.17(f) including the following:

- Concentrations of explosive gases must not exceed 25% of the LEL in on-site and off-site structures.
- Concentrations of explosive gases must not exceed LEL at the property boundary.

These requirements are being used to guide mandated additional monitoring under Special Conditions and to govern the construction of all future buildings. Several Special Conditions were included within the 2005 Part 360 Permit (Appendix 1) and are incorporated into regular OM&M and will continue moving forward until they are recommended for elimination as part of the permit.

Special Condition 26 includes the monthly monitoring and inspection of gas venting trenches to evaluate the mulch cover material. This will occur each spring following the winter months.

Special Condition 30 includes the monthly groundwater gauging in the perimeter piezometers in order to evaluate the depth to groundwater with respect to the bottom of the gas venting trench. This measurement will continue through the construction process and that period will be considered complete upon the approval of this Construction Certification Report. The monitoring specifies that id groundwater is measured below the bottom of the trench, DPR will implement Special Conditions monitoring. This is further described below in 5.2.2.

Special Conditions 31 includes specific notification and frequency monitoring if groundwater is identified below the bottom of the trench or if LEL of LFG is noted in adjacent monitoring probes.

Special Conditions 32 and 24 include the bi-weekly monitoring of specific perimeter gas wells and on-site monitoring wells. Results of the monitoring will direct more frequent sampling or monitoring and when monitoring may return to the regular schedule.

Special Condition 37 includes bi-weekly monitoring of the off-site gas monitoring network and the results of this monitoring will direct more frequent monitoring or testing.
Additional parameters were added in 2011 by NYSDEC to include hydrogen sulfide, VOCs and carbon monoxide, all were to be reported in parts per million (PPM) and temperature/pressure.

Work that will continue following construction is included in the Post Construction Custodial Care Plan (Appendix 20). That document covers the efforts beyond this report in order to effectively monitor and report on post construction conditions under the Part 360 Permit.
Monitoring during the entire construction period has been performed in accordance with the Landfill Gas Monitoring Plan and the approval of this Report will serve to conclude all construction monitoring.

The most recent and final documentation submitted under this construction effort is the Ferry Point Park Golf Course Irrigation Pond Vent Boxes Monitoring Final Report submitted in May 3, 2015 (Appendix 20). This Report summarized monitoring data and piping/vent/vale configurations around the irrigation pond at the golf course. The overall purpose for the preparation of the Report was to present information to NYSDEC prior to this Closure Certification Report in order to gain approval to close and remove one vent from the golf course area at vent box #5.

The Report describes and presents the configuration of the piping surrounding the irrigation pond and that the removal of this single vent would not have a detrimental effect on the overall LFG system. The entire lop surrounding the pond collects LFG under the conditions that have been evaluated and calculated over the landfill and that appears to be less than one cubic foot per minute. Based on measurements from specific vent box locations within the overall loop, the LEL readings concentrations indicate two possible theories; that methane may be coming from possibly one area and then slowly migrating or spreading to one or two other vent box areas or it may be concentrated in one area and is also being generated at much lower levels from one or two other areas.

In either case, the volume and rate of methane being generated is similar to much of the remainder of the landfill and while this area has actual vent pipes, the remainder of the landfill is direct vented to the atmosphere through the shaping layer. Removal of the single vent at Vent Box 5 will not impact the collection of methane within the underground passive piping but will only eliminate one outlet location. The valve placement at each box allows for multiple vents to be open or combinations of vents to be either open or closed. In addition, sections of the piping around the irrigation pond can be isolated. There is no specific plan other than to remove the single vent from the overall system and this would not impact the passive systems ability to remove methane from the subsurface.

Landfill and off-site gas monitoring was completed as required by the Permit Special Condition X during construction. The IEM accompanied American Environmental Solutions (AES) during landfill gas

monitoring activities at on-site and off-site locations during the course of construction. Monitoring results were transmitted to the NYSDEC by AES after monitoring was completed and monitoring reports were included in the bi-weekly FMRs for the corresponding periods. Landfill gas monitoring results are attached as Appendix C in each the FMRs which are included as Appendix 6. In addition, refer to Appendix 15 for the spreadsheet compilation of all LFG monitoring results to date in tabular and graphic format.

### 5.2.1 Bi-Weekly

Methane gas monitoring of the entire site was conducted on a bi-weekly basis. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR (Appendix 6). In addition, refer to Appendix 15 for the spreadsheet compilation of all LFG monitoring results to date in tabular and graphic format.

A review of the historic field data associated with the perimeter LFG vent trench monitoring program from 2001 to present was conducted to evaluate LFG trends at the Site relative to the perimeter passive LFG control (Ferry Point Park East Post Construction Custodial Care Plan, October 2013, Appendix 20) and showed the following:

- After the installation of the vent trench in 2001, methane levels in the vicinity of the LFG vent trench tended to decrease significantly within a year in most LFG monitoring wells;

- Methane levels remained relatively low and below regulatory limits from 2002 through 2004, except for a few wells that sporadically exceeded the regulatory limit;

- In 2005, the measured methane levels tended to increase, likely due to the installation of more reliable monitoring points (new monitoring points and repaired wells); and

- Results from 2008-2011 generally indicate relatively consistent levels of methane, with certain limited sporadic increases above regulatory limits.

Methane levels increased for several on-site perimeter wells, on-site interior wells and off-site semi-permanent wells located during the construction period between 2010 and 2014, especially for the wells located in the northeast portion and south portions of Ferry Point Park; however, the levels were significantly lower than the beginning of the monitoring program, and the levels decreased to zero by 2015 with the exception of two on-site perimeter wells (MW-14 and MW-15) located in the southern portion of the golf course, three on-site interior monitoring wells (MW-0, MW-4 and MW-19), and three off-site semi-permanent wells located on Buttrick Avenue (10, 12R and 14R). The last recorded monitoring event on April 10, 2015 (Special Conditions Landfill Gas Monitoring Report, April 13, 2015, Appendix 7) reported the following methane concentrations (% by volume) exceeding the site specific action level in eight locations:

- MW-0 - 4.5%

- MW-4R - 50.2%
- MW-19 - 83.8%
- MW-15 - 6.7%
- MW-14 - 33.4%
- Well 14R (Buttrick Avenue) - 1.6%
- Well 12R (Buttrick Avenue) - 28.6%
- Well 10 (Buttrick Avenue) - 10.1%

### 5.2.2 Special Conditions

In accordance with Special Conditions #34 and #37c of the November 18, 2005, Permit Modification (Appendix 1), if any individual monitoring point has a bi-weekly reading that equaled or exceeded 100% LEL, or three consecutive bi-weekly readings that were greater than 25% LEL, methane monitoring of these points was conducted on a weekly basis. Monitoring returned to the bi-weekly monitoring schedule once three consecutive readings were each less than the 25% LEL action level. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR. In addition, refer to Appendix 15 for the spreadsheet compilation of all LFG monitoring results to date in tabular and graphic format.

## 5.3 Piezometer Monitoring

On a monthly basis, groundwater elevation measurements were taken and recorded in all piezometer locations along the site perimeter vent trench in accordance with Special Condition 28 of the 2014 Permit. Measurements were manually taken using a portable water level meter. The IEM observed piezometer monitoring in the field and groundwater data was submitted to the NYSDEC. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR. Piezometer monitoring results were incorporated into the landfill gas monitoring reports attached as Appendix C in each bi-weekly FMR, which are included as Appendix 6.

## 5.4 Settlement Plate Monitoring

Short term settlement was performed with plates installed throughout the landfill in order to evaluate settlement and compaction during the fill placement and grading. The majority of the short term plates were installed following the importation of significant amounts of fill material when the areas had been brought near to or at final grade. The 2014 NYSDEC Permit Modification (2-6006-00014/00013) Special Condition #6 required short term settlement monitoring to meet those requirements incorporated in the January 2005 Settlement Evaluation and Long Term Monitoring Plan. Short term monitoring was performed in accordance with the early 2005 Plan and as construction progressed and as per Special Condition #6. Short term settlement plates were either removed or monitoring discontinued when long term monitoring plates were installed in accordance with the revised Permit. Long term settlement plates were installed throughout the landfill in areas shown on the Figure titled Ferry Point Golf Course Settlement Plate Locations 4/11/2012 by KS Engineers, P.C. The locations of the long term plates were identified to be in the same specific vicinity of the short term plates.

The overall Program for monitoring settlement began in 2002 with the construction of 7 instrumented test fills and installation of 6 settlement plates that were located across the site. Test fills varied between 10 to 18 ft. in thickness and the specific locations were placed where future settlement would be most critical (e.g. future green areas and where significant thicknesses of fill were necessary). The majority of the settlement plates were located in the eastern portion of the site at a time when most of the fill had been imported in order to begin monitoring on-going settlement for areas that had been filled for a period of 9 months or longer. Initial settlement monitoring was conducted for a period of over 2 years and monitoring results were transmitted to NYSDEC on a bi-weekly frequency.

Settlement recorded following June 2003 was recorded but noted to have been significantly influenced by the importation if fill and the loading that this had on the areas adjacent to the test fills. Initial settlement was noted to have a range between 3 and 23 inches with the greatest variation in the western section. This was believed to be the result of a significant compressible clay layer near the surface. The recorded measurements were compared by Langan to the estimated values that had been calculated and they were found to be comparative. One positive aspect of this initial measurement and comparison showed the site to be in an optimal character for surcharge as a result of placement of larger fill loads for shorter periods of time in order to maximize the settlement as early as possible and minimize post construction settlement that is a critical issue for the sensitive surface of a golf course.

The resulting settlement analysis provided a recommendation for fill placement and long term predicted settlement. This information and comparison to settlement data is critical in monitoring the underground utilities for maintenance and repair. Piping settlement would result in lower carrying capacity and therefore storm lines were designed to be oversized with welded ends to prevent separation. Sanitary lines were also designed with the additional anticipated settlement incorporated into their long term maintenance. Increased slope, HDPE piping and flexible joints were recommended where piping would pass through areas of different fill thicknesses and therefore a differential in overall settlement would be expected to occur. Recommendations for flexible connections capable of withstanding rotation and extension were made for sewer lines exiting structures.

Settlement over the golf course surface was presented following the initial evaluation and recommendations for anticipated settlement were determined to be within the initially anticipated settlement and possibly sooner for areas where more substantial thicknesses of material were placed. Additional influences on long term settlement will be thickness and depth to the compressible clay layer. The variation in settlement was estimated to be between 3 to 15 inches over a 30 year period. Non-uniform settlement is also anticipated over the life of the golf course due primarily to the variable thickness of imported material and could equal up to 6 inches. Slope stability is not anticipated to be adversely impacted as a result of the long term settlement anticipated at the site.

Areas where significant amounts of fill were identified to be placed, such as the area between the irrigation pond and Hole #1 was required to be placed in a more controlled manner in order to allow the pore pressure to be evenly reduced. This method would prevent slope failures caused by buildup of pore

pressure. Placement of fill was specified to be in 2 ft. lifts per week which would allow for dissipation of pore water in the clay layer.

Special Condition #7 of the revised 2014 NYSDEC Permit specified long term settlement requirements and that they would continue to conform to those established in the earlier permit. Locations of the replacement long term settlement plates shown on the 2012 Figure were referenced and approved as part of the 2014 Permit Modification.

Long term settlement monitoring will be performed at the initially 8 recommended settlement monitoring plates located throughout the golf course for a period of 30 years following completion of construction.

The plates are located in variable subsurface conditions but in general have been placed where the greatest concentrations of fill material have been placed in connection with the thickest compressible soil layers. The locations were also chosen to be adjacent to underground utilities such as water and sewer mains and/or adjacent to green areas where differential settlement is most critical.

The date being used as the construction completion is April 1, 2015. This was described in the March 30, 2015 executed letter between NYSDEC and NYCDPR which referenced the Substantial Completion of Construction Certification allowing the golf course to open on April 1, 2015. The letter states that NYSDEC and NYCDPR agree that the April 1, 2015 opening of the golf course constitutes completion of the filling operation on the Site and construction of the earthwork portion of the Project as contemplated under the NYSDEC Permit (No. 2-6006-00014/00013 and 2-6006-00014/00016). As a result of this completion date, monitoring will continue until April 1, 2045 or until a point that NYSDEC authorizes monitoring to cease if it is prior to April 1, 2045.

Long term settlement will be documented as it is referenced in the Post Construction Custodial Care Plan (October 2013). This includes providing NYSDEC with an annual inspection report certified by a licensed NYS professional engineer. The monitoring will document the following information during the timeframes referenced:

1. Beginning within 60 days of the approval of this Engineering Certification Report and continuing for a period of 5 years, the quarterly monitoring results will be summarized and submitted on an annual basis.
2. Immediately following the initial 5 year period and continuing for an additional 5 years (10 years from the date of Engineering Certification Report approval) monitoring will continue on a reduced bi-annual basis and the results will be summarized annually.
3. Immediately following the year 10 bi-annual report summaries, monitoring will be performed and reported on a reduced annual basis. This annual monitoring and reporting will continue for the duration of the 30 year period or for 20 years.
4. Following the initial 5 year quarterly monitoring period, NYCDPR may petition NYSDEC for a decrease in the monitoring frequency or for cessation of monitoring altogether. In the event that NYSDEC approves terminating the monitoring for any monitoring plates, NYCDPR will evaluate the settlement plates for either abandonment or removal. This evaluation will be performed within

the first year following approval of monitoring cessation. The abandonment or removal documentation will be signed and certified by a NYS licensed professional engineer and provided to NYSDEC within the concurrent post closure reporting period after the completion of the work.

Special Conditions 6 and 7 of the 2014 Permit and the recommendations provided in the Settlement Evaluation and Long-Term Monitoring Plan dated January 26, 2005, prepared by Langan Engineering and Environmental Services, Inc. set forth settlement monitoring requirements related to the placement of fill material across the Site. A copy of the Settlement Evaluation and Long Term Monitoring Plan is included in Appendix 20. Settlement plate monitoring was performed on-site in accordance with the Permit. Settlement monitoring reports are attached as Appendix D in each of the FMRs, which are included as Appendix 6. Monitoring was conducted on-site as follows. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR.

### 5.4.1 Short Term

The short-term settlement monitoring program began in December 2002 with the bi-weekly monitoring of seven test fills and six settlement plates located throughout the Site. Test fills consisted of an engineered soil fill ranging from 10 to 18 feet deep, generally located on-site in areas where significant thicknesses of fill were required. Settlement plates consisted of a subsurface plate beneath a casing and a flush-mount monitoring access port, similar to a monitoring well. Settlement plates that were part of the short-term settlement monitoring program were generally located in areas of the Site already at or close to final grade. The Settlement Evaluation and Long-Term Monitoring Plan recommended the following adjustments be made to the monitoring program during construction:

- Test fills that obstructed construction activities should be replaced with a settlement plate to be monitored near the location of the test fill.

- Settlement plates that needed to be moved for construction purposes should be relocated to the same general area and monitored until long-term monitoring points were installed.

Monitoring at short-term monitoring points was discontinued as required due to interference with ongoing construction. In an email correspondence dated May 1, 2012, included in Appendix H of the 2013 Engineering Report (Appendix 20), the NYSDEC informed NYCDPR that these short-term monitoring locations did not need to be replaced as long as construction at the Site progressed. As construction was concluded in each area of the Site, long-term monitoring plates were to be installed as described below. Short-term settlement monitoring continued to be performed bi-weekly at the Site until October 14, 2013. The design of the long term settlement monitoring points is presented in a January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. and outlined in a May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by New York State Department of Environmental Conservation. These documents outline the long term settlement plate monitoring locations, detail and required monitoring intervals. Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. As previously stated, the monitoring and reporting schedule will be

modified as the post construction period extends into the future. This has been included in the Post Construction Custodial Care Plan (October 2013).

The following summarizes the efforts with respect to conformance to project design documents:

The approved May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by NYSDEC refers to Appendix H of an October 15, 2013 *Supplemental Engineering Report* for a long term monitoring location plan. Appendix H of the permit which is included as Appendix 20 here, references and includes the April 11, 2012 *Ferry Point Golf Course Settlement Plate Locations* plan prepared by KS Engineers, P.C.

The February 20, 2014 *Ferry Point Golf Course as Built Drawing* prepared by Contractors Line & Grade South, LLC shows the as-built locations of the long term settlement monitoring plates in conformance with the above referenced April 11, 2012 KS Engineers plan. An additional monitoring point between golf course Hole 6 and Hole 7 was added and approved in the May 1, 2012 *Re: Settlement Plates Email* prepared by NYSDEC.

A January 26, 2005 Settlement Evaluation and Long-Term Monitoring Plan prepared by Langan Engineering and Environmental Services, Inc. states that:

> *"These settlement points will be utilized to determine future settlements during the golf course operation. They should be installed once filling operations are completed to within 1 foot of final grades or in other words, during placement of soil cover materials. After their installation, monitoring of the settlement points should be performed once every other month until the construction is complete. Subsequent monitoring should be performed once every 3 months during the first year of golf park operation and once every 6 months for the second year."*

The description above is a deviation from the Post Construction Custodial Care Plan where quarterly monitoring and annual summary reporting will be performed for an initial period of 5 years followed by an opportunity to evaluate and proposed changes. The frequency would without any additional recommendation be reduced to semi-annually following 5 years. This reference accepts a switch to semi-annual monitoring and annual reporting following the first year. This is the only approved change in the settlement monitoring plan outside of the approved 2013 document.

The data from the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran indicate that settlement plate monitoring was conducted every two weeks in conformance with the minimum requirements of the above referenced monitoring plan.

Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. Results of the monitoring are available in the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran.

The November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran do not document any non-conformance issues regarding the construction of the long-term settlement monitoring locations. A settlement monitoring plate detail is provided in the January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. does not identify any deviations from the location plan and all long term settlement plates installed were specifically located as replacements for short term plates installed earlier during construction

### 5.4.2 Long Term

The design of the long term settlement monitoring points is presented in a January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. and outlined in a May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by New York State Department of Environmental Conservation. These documents outline the long term settlement plate monitoring locations, detail and required monitoring intervals. Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. As previously stated, the monitoring and reporting schedule will be modified as the post construction period extends into the future. This has been included in the Post Construction Custodial Care Plan (October 2013).

The following summarizes the efforts with respect to conformance to project design documents:

The approved h, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by NYSDEC refers to Appendix H of an October 15, 2013 *Supplemental Engineering Report* for a long term monitoring location plan. Appendix H of the permit which is included as Appendix 20 here, references and includes the April 11, 2012 *Ferry Point Golf Course Settlement Plate Locations* plan prepared by KS Engineers, P.C

The February 20, 2014 *Ferry Point Golf Course as Built Drawing* prepared by Contractors Line & Grade South, LLC shows the as-built locations of the long term settlement monitoring plates in conformance with the above referenced April 11, 2012 KS Engineers plan. An additional monitoring point between golf course Hole 6 and Hole 7 was added and approved in the May 1, 2012 *Re: Settlement Plates Email* prepared by NYSDEC.

A January 26, 2005 Settlement Evaluation and Long-Term Monitoring Plan prepared by Langan Engineering and Environmental Services, Inc. states that:

> *"These settlement points will be utilized to determine future settlements during the golf course operation. They should be installed once filling operations are completed to within 1 foot of final grades or in other words, during placement of soil cover materials. After their installation, monitoring of the settlement points should be performed once every other month until the construction is complete. Subsequent monitoring should be performed once every 3 months during the first year of golf park operation and once every 6 months for the second year."*

The description above is a deviation from the Post Construction Custodial Care Plan where quarterly monitoring and annual summary reporting will be performed for an initial period of 5 years followed by an opportunity to evaluate and proposed changes. The frequency would without any additional recommendation be reduced to semi-annually following 5 years. This reference accepts a switch to semi-annual monitoring and annual reporting following the first year. This is the only approved change in the settlement monitoring plan outside of the approved 2013 document.

The data from the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran indicate that settlement plate monitoring was conducted every two weeks in conformance with the minimum requirements of the above referenced monitoring plan.

Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. Results of the monitoring are available in the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran.

The November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran do not document any non-conformance issues regarding the construction of the long-term settlement monitoring locations. A settlement monitoring plate detail is provided in the January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. does not identify any deviations from the location plan and all long term settlement plates installed were specifically located as replacements for short term plates installed earlier during construction

The long term settlement monitoring was performed at the locations shown on the revised Settlement Plate Location Plan and a sketch that includes an additional monitoring point between golf course Hole 6 and Hole 7 included in Appendix H of the Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, NY dated May 31, 2012 (Revised August 31, 2012, October 15, 2013) as described in Appendix I of that report. These locations were approved by NYSDEC in an email dated May 1, 2012. The long-term settlement monitoring points were installed as construction was completed in each area of the Site. Upon installation, the long-term settlement plates were monitored in accordance with the criteria set forth in Special Condition 7 of the Permit.

As a component of this Report section the following list of documents were used:

- A January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc.;
- A May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by New York State Department of Environmental Conservation;
- A April 11, 2012 *Ferry Point Golf Course Settlement Plate Locations* plan prepared by KS Engineers, P.C.;
- A November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran;
- A undated *additional settlement plate sketch;*
- A February 20, 2014 *Ferry Point Golf Course as Built Drawing* prepared by Contractors Line & Grade

South, LLC; and,

- A May 1, 2012 *Re: Settlement Plates Email* prepared by NYSDEC.

The long term settlement monitoring was performed at the locations shown on the revised Settlement Plate Location Plan and a sketch that includes an additional monitoring point between golf course Hole 6 and Hole 7 included in Appendix H of the 2013 Engineering Report and as described in Appendix I of that report. These locations were approved by NYSDEC in an email dated May 1, 2012, which is included in Appendix H of the 2013 Engineering Report (Appendix 20). The long-term settlement monitoring points were installed as construction was completed in each area of the Site. Upon installation, the long-term settlement plates were monitored in accordance with the criteria set forth in Special Condition 7 of the 2014 Permit.

## 5.5 Groundwater Monitoring

The overall setting of the Ferry Point Park Site with respect to the groundwater regime can be described as an area covering approximately 220 acres bounded along the waters of the East River to the south, Saint Raymond's Cemetery to the north, Balcom and Emerson Avenues to the east and the Bronx-Whitestone Bridge and ramp to the west. The entire site was a former operating municipal solid waste landfill that ended accepting fill material in the 1960's. The overall landfill footprint extended beyond the boundary of the Ferry point Park Site. The period of operation predated the existence of current Solid Waste Facility design and construction requirements and therefore, no groundwater assessment or survey was performed for the construction or during operations of the landfill.

A review of aerial photography was conducted at the time this report was being prepared. The photographs are available on the New York City public website and include those showing the overall site and surrounding area from a period beginning in 1924 and up until 2012. The earliest photo of 1924 shows nearly the entire footprint of the Ferry point Park Site was formerly open water, existing as a large bay of the East River. A review of the 1951 aerial photograph of the same scale shows the northwest portion of the landfill site was filled with what appears to be very light colored fill material. The photo shows filling operations to be expanding from the northwest corner outward and based upon the extreme contrast in color of existing land and fill material to be sand material possibly sourced from in-water dredge operations. This practice was performed in many other areas of the City at this time when harbor deepening and widening took place from 1940 onward. There were no photos between 1951 and 1996 and so there was no further photographic record in this collection to show the progression of landfilling. This period of filling (pre-1951) predated the DSNY recordkeeping and existence and there would not be any expected record of the placement of this fill in Sanitation Department documents. The existence of these photos is important to present the hydrogeologic origin of site groundwater for comparison to that of other groundwater. This history places the entire Site at the base of a larger drainage basin and in direct connection with the East River system of salt and brackish waters. Using this as the basis for the hydrogeologic model, shallow groundwater at the Site would now be considered to be part of the upland groundwater table as a result of the filling and extension of the shoreline into the river. Groundwater

within the fill material could be expected to be tidally influenced but the inland limit of this influence would be dictated by the fill material, its composition and compaction.

As part of the Volume #1 Application for Modification to the Solid Waste Management Facility Permit for Construction of the Ferry Point Park Recreation Facility Engineering Report (June 30, 2005; Appendix 20), a specific groundwater impact assessment was presented. This was based on a qualitative assemblage of data and information from other related studies but not specifically from a focused groundwater evaluation.
A May 31, 2005 letter on the Influence of Fill Placement on Groundwater prepared by Langan Engineering assessed the impact of fill material on the groundwater (found in Appendix VII of Volume #1 Application for Modification to the Solid Waste Management for Construction of Ferry Point Park Recreation Facility Engineering Report, June 30, 2005, Appendix 20). This was based upon information and conditions gathered during geotechnical evaluations and site history knowledge. The findings presented at that time indicated the development of the Ferry Point Park Site as a golf course would not further impact or change groundwater flow patterns or conditions and would therefore not further impact the East River beyond the existing conditions.

Much of the description presented in the Langan assessment focused on the site development and the addition of engineering controls that would become part of the site. These included: paved path and parking areas, significant stormwater collection systems, site grading to control flow, control devices and systems as well as importation and capping of the entire site with a varied but significant layer of clean cover materials that would all have a positive impact and reduce the amount of surface water filtering through the landfill and into the groundwater. The overall completed site development in the 2005 Engineering Report included a total of 26 acres of impervious area and collection of stormwater in detention facilities (Appendix 20).

A total of 26 piezometers were installed to monitor shallow groundwater along and immediately adjacent to the Landfill Gas passive trench. These piezometers, while used for depth to groundwater measurements are not incorporated into the groundwater evaluation as they were specifically used to assist in the design and monitoring of the LFG vent trench. The principal purpose for the piezometers and their association with the LFG trench was to monitor the level of groundwater to determine if groundwater levels went below the LFG passive recovery trench. Groundwater elevation measurements collected from the piezometer locations along the site perimeter vent trench (Special Condition 28) are addressed in section 5.3 (Piezometer Monitoring) of this report. Section 5.5 addresses the baseline groundwater monitoring requirements established in 2010.

The NYSDEC Permit issued on November 18, 2005 for the construction of the 222 acre golf course did not include a specific requirement for a groundwater monitoring plan outside of the singular focus of monitoring groundwater elevation for landfill gas control in the trenches (Appendix 1). In 2010, NYSDEC requested additional information regarding groundwater conditions and if any new, relevant information was available to verify the conclusions of the geotechnical portion of the 2005 Engineering Report (June

30, 2005, Appendix 20). As no information was available, recommendations were made in 2011 by NYSDEC for the installation of a monitoring well network.

A Technical Memorandum was prepared by Ecology & Environment Engineering, P.C. (E&E) outlining the field procedures for establishing reference point groundwater characterization methods including the installation, development, sampling, well gauging and slug testing of 11 new monitoring wells at the Site (Technical Memorandum re: Field Sampling Procedures for Ferry Point Site – Reference Groundwater Characterization, September 19, 2011, Appendix 20). At the time of monitoring well installation (February 2012), construction activities were well underway and estimated to be 80% complete. The baseline characterization was expected to capture the potential measurable impacts to groundwater. Future monitoring is expected to capture the impacts representing a more complete construction condition

The well installation program included consistent and standard well installation and construction methods, well development, baseline sampling, water level survey and aquifer testing. A figure showing the well construction details and installation elevations and locations is presented as S-H21 dated 11/8/2011. Well construction methods included the installation of shallow 2 inch diameter PVC wells with 10 ft. of slotted screen penetrating into the upper surface of the water table and standard construction finishing. All of the wells were developed and monitored using consistent criteria (turbidity, pH, conductivity and temperature), Table 1 and 2, respectively, Fieldwork Summary Report (as part of Groundwater Characterization) (May 31, 2012; Appendix 20). Each of the newly installed wells was then sampled to establish the initial baseline conditions and each was surveyed to determine groundwater level and flow direction conditions. Basic site hydrogeological information was also characterized during this effort, including direction of flow, groundwater elevation gradients, and flow velocity. Based on the initial measurements, flow direction was found to be relatively consistent in that groundwater flow was in the south-southeasterly direction toward the East River (Figure 1, Fieldwork Summary Report, May 31, 2012, Appendix 20). There was one important item noted from the initial conditions assessment and this was the lack of measureable tidal influence on any of the monitoring wells.

One soil sample was collected from each borehole from the shaping material zone with an additional quality assurance sample collected from MW-02. The soils were sampled for synthetic precipitate leaching procedure (SPLP) semi-volatile organic compounds (SVOCs), PCB/pesticides, metals, and cyanide. Seven metals and one SVOC (phenol) were detected in the 13 samples sent to the laboratory
SPLP analysis. For comparison purposes, these results are shown along with the NYSDEC Technical and Operational Guidance Standard 1.1.1, for Class GA groundwater. Four metals, and one SVOC (phenol) were detected with concentrations higher than the comparison standard (Table 6, Fieldwork Summary Report, May 31, 2012, Appendix 20).

Slug testing was performed on each of the wells to evaluate hydraulic conductivity and while this is not a critical measurement for wells installed within landfill material, it is useful in evaluating the consistency of all wells in the system. The results of the slug testing presented a fairly uniform range of hydraulic conductivities within the landfill material.

The results of the baseline groundwater analysis showed that with the exception of metals, the analytical results were in line with a landfill of this type and age. All metal detections were higher than the NYSDEC Class GA groundwater standard, which was used for comparison purposes. It is noted that these samples had high turbidities (e.g., greater than 1000 NTU) and this likely impacted the metals test results. Phenolics and ammonia leachate parameters were also detected higher than the comparison standard (Table 7, Fieldwork Summary Report, May 31, 2012, Appendix 20). As a result, NYSDEC requested that both filtered and unfiltered samples be collected. If the results were consistent, subsequent events would be completed using filtered samples only for the inorganic parameters (May 8, 2012 Ferry Point Groundwater Characterization Conference Call, May 9, 2012, Appendix 20). Filtered and unfiltered groundwater samples were collected during subsequent events.

NYSDEC also provided DPR with requirements for future groundwater monitoring (e.g., Post Construction Monitoring) in their FPP Groundwater Characterization Monitoring Objective on May 8, 2012 (Appendix 20). The objective included the following requirements: reference point/background characterization in three quarterly rounds of sampling for all parameters listed in 6 NYCRR Subpart 360-2.11 baseline parameters. Following completion of the characterization sampling, baseline sampling would continue on a biannual basis after the initial three quarterly rounds until the FPP landfill end use (golf course) is operational. Table 5-X below summarizes the reference point/background characterization events.

Table 5-1. Summary of Reference Point/Background Characterization Events

| Sampling Frequency | Wells Sampled | Status |
|---|---|---|
| Quarterly 1 | GMW-1 – GWM-11 | Completed February 2012 |
| Quarterly 2 | GMW-1 – GWM-11 | Completed May 2012 |
| Quarterly 3 | GMW-1 – GWM-11 | Completed August 2012 |
| Bi-Annual | GMW-1 -GMW-11 | Completed March 2013 |
| Bi-Annual | GMW-1, GMW-2, GMW-3, GMW-4, GMW-5, GMW-6, GMW-7, GMW-8, and GMW-10 | Completed March 2014 |
| Bi-Annual | GMW-2, GMW-3, GMW-4, GMW-5, GMW-6, GMW-7 and GMW-8 | June 20, 2014 |
| | GMW-1, GMW-7, GMW-10, and GMW-11 | July 31, 2014 |

The three quarterly sample events were completed without modification. The Bi-Annual events were modified following the March 2013 event due to construction of the golf course which limited access to the Site. The modifications include the following:

- No September 2013 Bi-Annual sample event.
- No sample was collected from GMW-9 (well was dry) and GMW-11 (access) during the March 2014 sample event.
- The second biannual sample event for 2014 was split into two events completed in June and July. GMW-9 was not sampled. Groundwater samples were collected from the site on July 22, 2014; however the samples were not analyzed due to compliance issues with the Standard Operating Procedures.

Table 5-1 presents the overall groundwater and analysis date for monitoring wells GMW-1 through GMW-11 covering the period between February 2012 through July 2014 and are consistent with the baseline sample events: metals, phenolics and ammonia compounds, isolated and sporadic VOCs (except for chlorobenzene detected in well GMW-01 and GMW-06 during multiple events) and SVOCs (primarily PAHs) were detected above the NYSDEC Technical and Operational Guidance Class GA Groundwater Criteria. The Class GA Groundwater Criteria were used for screening purposes as groundwater is not used for potable resources. The results of the filtered (dissolved) metals samples are significantly lower than the non-filtered metals samples and in most cases exceedances of non-filtered samples are non-detect or below the Class GA Groundwater Criteria in the filtered samples.

In accordance with the Post Construction Custodial Care Plan (Appendix 20), groundwater monitoring will be performed at all 11 permanent monitoring wells throughout the golf course. Approval of this Closure Certification Report signifies the commencement of operations at the golf course beginning the period of post construction monitoring. Sampling will be performed on an annual basis with collection and analysis of groundwater for those constituents listed in 6 NYCRR Part 360-2.11 routine parameters. This sampling information and data will be summarized and included with the overall annual facility monitoring and inspection report. Monitoring and reporting will begin 60 days following the approval of this closure report and will continue for a period of three years.

Following the completion of the initial 3 year post-operations monitoring, DPR may submit documentation to NYSDEC to request a reduction in sampling or complete cessation of sampling. The initial 3 year period will form the data set to be used in the event a reduction or change in monitoring is requested. The goal of the monitoring will be to provide data showing if the park adversely impacts water quality with respect to leachate quality or quantity and to compare the 2013 permit performance criteria to existing and current conditions.

Should a request for modification or cessation be approved, monitoring wells will be assessed for abandonment or removal within a 1 year period following the ending point of monitoring. Closure documentation will be provided by a New York Professional Engineer during the same annual reporting period.

Upon commencement of operation of the golf course, the frequency of groundwater monitoring changes to annual with samples being analyzed for all constituents listed in 6 NYCRR Subpart Part 360-

2.11 routine parameters and parameters of concern identified during the reference point characterization period. The golf course began operation in April 2015 and post construction monitoring will be initiated in September 2015. Post construction groundwater monitoring is discussed in detail in Section 5.7.4.

Design documents for the groundwater monitoring wells are included in Appendix G.2 of the 2013 Engineering Report (Appendix 20). An initial sampling event was completed in February 2012 and included the testing activities described below.

Groundwater monitoring results are attached in Appendix 15.

## 5.6 Deed Restriction

Special Condition 32 of the 2014 Permit requires that the Permittee executes and files a NYSDEC approved deed restriction, which shall run with the land in perpetuity, and shall recite and require compliance with the Part 360 Permit's provisions as regards to the custodial care requirements described in Appendix I of the 2013 Engineering Report (Appendix 20).

NYCDPR is in the process of reviewing the language in Attachment A transmitted with the 2014 Permit, and will use this language as the model for the deed restriction. NYCDPR will contact the NYSDEC in the event NYCDPR has any proposed additions, deletions, and/or revisions to the general text of Attachment A.

## 5.7 Post Construction Monitoring

Post construction monitoring of the Golf Course, Community Park, and Waterfront Park is the responsibility of NYCDPR and will be completed as required by the Permit. Post closure monitoring will be completed in accordance with the plans set forth in Ferry Point Park East Post Construction Custodial Care Plan dated October 2013 included as Appendix I of the 2013 Engineering Report (Appendix 20).

The following table includes each monitoring component, the frequency, and the duration of monitoring dependent upon the cessation of activity:

| Component | Frequency | Duration |
|---|---|---|
| Final Cover System | Quarterly | 5 years |
| LFG System | Quarterly | 5 years |
| Infrastructure | Bi-Annually<br>Annually | 10 years<br>15 years |
| Groundwater Monitoring | Annually | 3 years* |
| Long Term Settlement Plates | Quarterly | 5 years* |
| Parking Lot Asphalt Cover (April & October) | Bi-Annually<br>Annually | 5 years*<br>20 years* |

*Denotes Dependent on Cessation of Activity

NYCDPR will not be performing post-construction monitoring for the Waterfront Park portion of the Site until construction is complete and approved, and will restrict public access until such time.

NYCDPR is in the process of engaging a full service environmental firm to conduct the post construction monitoring requirements and will complete the post construction monitoring required to comply with the Permit in accordance with the Post Construction Custodial Care Plan and as follows.

### 5.7.1 Golf Course Operations

The Site will be operated as part of the New York City Department of Parks and Recreation system. The Community Park and the Waterfront Park will be operated and maintained by the NYCDPR Borough of the Bronx Operations and Maintenance division or an appointed representative. NYCDPR has entered into a contract with a golf course concessionaire, Trump Ferry Point LLC to implement post construction care necessary to maintain the Golf Course for operational purposes. Golf Course maintenance and operations exclude those requirements specific to post construction monitoring and maintenance of existing environmental conditions and infrastructure as installed by NYCDPR and specifically defined in this report as being landfill gas systems, groundwater monitoring, and long-term settlement plates.

### 5.7.2 Landfill Gas Monitoring

NYCDPR will implement post construction monitoring necessary to fulfill the requirements of the Post Construction Custodial Care Plan for landfill gas monitoring. The landfill gas monitoring program includes monitoring for on-site and off-site landfill gas wells, piezometers, passive vent trench, passive vents, sub-slab depressurization systems, and Irrigation Lake venting system. Any necessary repairs or maintenance required as a result of inspection and monitoring activities will be the responsibility of NYCDPR or an appointed representative.

The Site's landfill gas management system will be inspected and monitored in accordance with the Operations, Monitoring, & Maintenance ("OM&M") actions presented in Section 6 of the Landfill Gas Management Plan ("LFGMP") located in Appendix F.1 of the 2013 Engineering Report (Appendix 20).

Monitoring and inspection will commence concurrently within 60 days of the approval of this construction certification report unless otherwise noted within the OM&M plan. Adjustments to monitoring frequencies will be requested of NYSDEC upon meeting the performance criteria thresholds identified in Section 6.3.4.2 of the LFGMP. NYCDPR will submit a request with supporting documentation to NYSDEC 30 days prior to the desired date of the proposed change in monitoring. NYCDPR will not change monitoring frequencies until the request has been approved.

### 5.7.3 Long Term Settlement Monitoring

NYCDPR will implement post construction monitoring necessary to fulfill the requirements of the Post Construction Custodial Care Plan for nine settlement monitoring plates on the Golf Course.

Monitoring will commence concurrently within 60 days of the approval of this construction certification report for a period of three years. Based on the results of the initial five years of monitoring, NYCDPR may

petition for decreased monitoring or a cessation in monitoring frequencies. NYCDPR will not change monitoring frequencies until the request has been approved.

### 5.7.4 Groundwater Characterization Monitoring

NYCDPR will implement post construction monitoring to fulfill the requirements of the Ferry Point Park East Post Construction Custodial Care Plan (October 2013). Groundwater monitoring will be performed at the eleven well locations located within the golf course.

Upon commencement of operation of the golf course (April 2015), groundwater sampling will take place annually with samples being analyzed for constituents listed in 6 NYCRR Subpart Part 360-2.11 routine parameters. The results of the groundwater sampling will be presented in a groundwater monitoring report and a summary will be submitted to NYSDEC as a part of the annual monitoring and inspection report. Monitoring and inspection will commence concurrently within 60 days of the approval of the construction certification report for a period of three years with the goal of demonstrating whether operation of the park adversely impacts on water quality with respect to leachate quality or quantity, and whether operation of the park meets the performance criteria established in the Permit.

Post Closure monitoring is anticipated to be conducted on the following schedule:

| Sampling Frequency | Requirement | Wells Sampled | Status |
|---|---|---|---|
| Annual - Year 1 | Post-Construction Monitoring | GMW-1 – GWM-11 | Anticipated September 2015 |
| Annual - Year 2 | Post-Construction Monitoring | GMW-1 – GWM-11 | Anticipated September 2016 |
| Annual Year 3 | Post-Construction Monitoring | GMW-1 – GWM-11 | Anticipated September 2017 |

Upon completion of 3 years of post-operation annual routine groundwater sampling, DPR may submit documentation to NYSDEC in furtherance of a request to reduce or cease groundwater sampling at the Ferry Point Park golf course (Ferry Point Park East Post Construction Custodial Care Plan, October 2013). The Groundwater monitoring and sampling program will cease either at the three year completion or ten years from the date of the initial groundwater sampling event. When the request for cessation is accepted, the groundwater monitoring wells will be evaluated for either abandonment or removal within the first year of the cessation of monitoring. The abandonment or removal documentation, signed and

certified by a licensed NYS Engineer will be provided to DEC within the concurrent post closure reporting period after the completion of the work.

Monitoring and inspection will commence concurrently within 60 days of the approval of this construction certification report for a period of three years. Upon completion of three years of post-operation annual routine groundwater sampling NYCDPR may submit documentation to the NYSDEC in furtherance of a request to reduce or cease groundwater sampling at the golf course. NYCDPR agrees to perform operational groundwater sampling, data analysis and reporting for a minimum of three years after construction, with the goal of demonstrating whether operation of the park adversely impacts water quality with respect to leachate quality or quantity, and whether operation of the park meets the performance criteria established in the Permit. NYCDPR will not change monitoring frequencies until the request has been approved.

### 5.7.5 Final Cover System

The integrity of the final cover system will be inspected routinely by NYCDPR, or their duly appointed representative, to fulfill the requirements of the Post Construction Custodial Care Plan. Inspections and maintenance will be completed in association with the Maintenance Guidelines for Trump Golf Links at Ferry Point Park included in Appendix I of the 2013 Engineering Report (Appendix 20).

Monitoring and inspection will commence within 60 days of the submittal of this construction certification report and then undertaken annually within 30 days of the submittal of the initial report. NYCDPR agrees to a rolling five-year plan, whereby NYCDPR may petition to modify or terminate the final cover inspection requirements by demonstrating that the integrity of the final cover system has been maintained in accordance with performance criteria established in the Permit.

### 5.7.6 Parking Lot Asphalt Cover (Consent Order)

During 2010, fill material from a JFK Airport source site was brought on-site and placed in seven different stockpiles. The material was believed to be in conformance with permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. On January 10, 2011, NYCDPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to this fill material, which was used to construct the base of the clubhouse and maintenance facility parking lots.

Specific requirements within the Consent Order as they pertain to post construction operations are as follows:

From Consent Order No R2-20100521-172: “Attachment “A” Proposed Handling of Ferry Point Park Soil Stockpile, Item 6, Once the asphalt top course is installed, the asphalt surfaces of the clubhouse and maintenance facility parking lots will be inspected during April and October every year by a licensed professional engineer (“engineer”) who is registered to practice in New York State. Within thirty days (30) days of such inspections, the engineer will submit to the Department a stamped and certified written detail report, including photo documentation, regarding the condition of the asphalt surfaces and their

adequacy, including photo documentation, regarding the condition of the asphalt surfaces and their adequacy to effectively function as covers. A description of any needed repairs will be included in the engineer's report.

Item 7, any repairs deemed necessary by the engineer must be completed by New York City Department of Parks and Recreation ("NYC Parks") within fifteen (15) days of the notification by the Department to NYCDPR to begin such repairs. A certification, including supporting written and photo documentation must be submitted by NYC Parks within fifteen (15) days after completion of repairs."

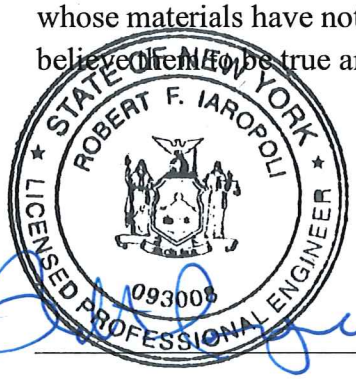
# 6 Summary

Construction activity at the Site began in July 2000 and concluded in July 2014 with physical completion of the Golf Course. Although the Golf Course construction is complete, some incidental work continues to occur at the Site associated with specific improvements necessary for golf course operations by the golf course concessionaire. Construction activity included clearing and grubbing, excavation, grading, importation of fill material, construction of the Community Park and Golf Course and associated appurtenances, installation of site utilities and infrastructure, installation of plantings, and installation of asphalt parking lot. A representative of the NYCDPR was present during all construction activities. To the best of our knowledge, a representative of the IEM was present during all earth moving and soil importation activities. For this project, fill importation followed the Permit requirements and resulted in a large scale earthwork fill conducted in general accordance with NYSDEC requirements as documented in the daily, bi-weekly, and quarterly reports and as summarized herein.

# 7 Certification

Certification Statement

I, Robert Iaropoli, PE, LS, an employee of the New York City Department of Parks and Recreation, exercising independent judgment and discretion do hereby certify that this Final Construction Certification Report was prepared under my direction and supervision. This Final Construction Certification Report was prepared in accordance with the NYSDEC requirements in 6 NYCRR Part 360, the current Part 360 Permit and approved Part 360 Permit Modification documents. The information contained herein is based upon: 1) Work which I have personally inspected both during and after construction from November 2012 to date; 2) Information provided to me by those directly employed by or under contract with the New York City Parks and Recreation and the New York City Department of Design and Construction as construction project managers;3) Design Consultants; 4) Contractors responsible for construction pursuant to their contracts except as indicated; and 5) third parties, such as manufactures, suppliers, etc., whose materials have not been personally verified by me for accuracy and/or adequacy but believe them to be true and accurate[4].



Robert Iaropoli, PE, LS

## EXECUTIVE SUMMARY

Maser Consulting P.A. (Maser Consulting), on behalf of The Trump Organization, has prepared this Certification Report for the construction of the permanent Clubhouse at the Trump Ferry Point Golf Links located at 500 Hutchinson River Parkway, Bronx, New York. This report has been prepared pursuant to 6 NYCRR Part 360 of the New York State Solid Waste Management Program and the 2013 Ferry Point Park East Post Construction Custodial Care Plan. This report also includes a summary of a supplemental project to install a new gas main as part of the Clubhouse Construction project.

Acting as the Independent Environmental Monitor (IEM), Maser Consulting witnessed, recorded and confirmed construction of the new Trump Links Clubhouse, including the installation of support pilings, importation of suitable materials used for cover; the application, installation and testing of the Liquid Boot® Vapor Barrier System and the associated Sub-slab Depressurization System (SSDS); and the installation, calibration and testing of the interior Methane Detection System. For each construction and testing component, Maser Consulting confirms compliance with the Permits, plans and specifications of the project. Minor deviations to the plans and specifications are noted in this report and in the As-Built documents contained herein. Minor deviations to the specifications were the result of two main issues: the need to relocate system components to avoid conflicts and interferences with utilities and appurtenances; and the substitution of the materials of construction that were equivalent or superior to the original specifications.

The IEM also monitored, tested and confirmed that soil materials imported for the new Clubhouse construction were derived from pre-approved sources. The IEM conducted periodic surveillance of trucks being loaded at the approved facilities and transported to the Construction Site. For material imports, the IEM visually evaluated loads and scanned loads with direct reading instruments for signs of contamination. Only those loads meeting project permit and specifications standards were permitted to be unloaded at the site.

At times when imported soil materials had to be stockpiled on-site, the IEM took steps to ensure that a controlled staging area was secured. The staging area was established in the parking lot to the west of the new Clubhouse site. The IEM also took steps to ensure that the stockpile was properly covered to prevent erosion by wind and water, and that catch basins in the parking lot were properly protected to ensure that sediments would not enter the storm water system. Weekly erosion control inspections were conducted by the IEM in accordance with NYSDEC's Construction Site Management Program. The IEM immediately communicated deficiencies in the erosion control features to the General Contractor (JCS) such that immediate mitigative action could be taken.

Maser Consulting also acted as the IEM for a supplemental project associated with the new Clubhouse construction. The supplemental project consisted of the installation of an approximately 5,500-foot long, 6-inch diameter gas pipeline installation. The new gas supply line was deemed necessary to provide heating, ventilation, air conditioning and other utility service to the new Clubhouse. The gas pipeline was connected to a Consolidated Edison main located north of the clubhouse along Schley Avenue. The pipeline route generally traverses the western property line before turning east toward the new clubhouse in the vicinity of the Clubhouse parking lot. As IEM for this supplemental project, Maser Consulting witnessed, recorded and confirmed that the gas pipeline installation was conducted in accordance and incompliance with the project permits, plans and specifications.

Similar to the Clubhouse construction project, cover material importation was required for the gas main installation project. The IEM took appropriate measures to ensure that the source material was inspected and tested. Soil quality analytical results have been included within this report. Analyzed permit parameters were found to be acceptable. The IEM also visually assessed and field screened each load to ensure that the quality of the material met project permit requirements and project plans and specifications.

Appendix D – Letter from NYSDEC to Trump Golf Links at Ferry Point re: "Ferry Point Park SSDS/Foundation Drawings – Trump Golf Links Clubhouse" dated June 22, 2017
Appendix E – Maser Consulting P.A. Letter of Transmittal to NYSDEC (via The Trump Organization) re: "Construction Certification – SSDS" dated June 7, 2018
Appendix F – Letter from NYSDEC to NYCDPR re: "Ferry Point Park Golf Course Permanent Clubhouse SSDS Construction Certification Report" dated July 2, 2018
Appendix G – Maser Consulting P.A. letter to NYSDEC re: "Ferry Point Park Golf Course Permanent Clubhouse SSDS Construction Certification" dated July 11, 2018
Appendix H – NYSDEC Construction Duration Inspections performed by Maser Consulting P.A.
Appendix I – DORs for New Clubhouse Construction
Appendix J – Hampton-Clarke Project No. 7092827 Report dated October 30, 2017
Appendix K – Manifests for Imported Fill from New York Recycling
Appendix L – Manifests for Imported Fill from Ranco Sand & Stone
Appendix M – Minutes of Weekly Construction Progress Meetings
Appendix N – Hampton-Clarke Project No. 8081617 Report dated September 14, 2018
Appendix O – Drawings titled "Methane Monitoring System Ceiling Plan (As Built)" prepared by EAI dated February 11, 2019 & "Vapor Remediation Floor Plan (As Built Monitoring Pt Layout as of 8/1/18)" prepared by French & Parrello with annotations by EAI dated August 1, 2018
Appendix P – CETCO/Minerals Technologies Letter to EAI Inc. re: "Liquid Boot Spraying Temp" dated November 9, 2017 & EAI Inc. letter to Maser Consulting P.A. re: "Vapor Remediation System Installation, Ferry Point Clubhouse, Ferry Point Park, Bronx, NY" dated October 18, 2019
Appendix Q – Drawings titled "Ferry Point Clubhouse, 500 Hutchinson Parkway, Bronx, NY" showing new gas line prepared by Victor Famulari Architect P.C. dated July 25, 2018
Appendix R – DORs for Installation of New 6-Inch Gas Line to Clubhouse

# I. INTRODUCTION

## A. Purpose

This Final Construction Certification Report for the Trump Ferry Point Golf Links clubhouse is submitted to the New York State Department of Environmental Conservation (NYSDEC) and the New York City Department of Parks & Recreation (NYCDPR) upon completion of the construction of a new clubhouse at Ferry Point Park East. Built on top of a former municipal landfill, the major elements of the Clubhouse construction project consisted of the installation of over 200 steel support pilings driven through the former landfill material and into competent rock at an average depth of 75 below grade. During the support piling installation, Maser Consulting (acting as the IEM) measured the ambient air quality for signs of methane gas release from the subsurface. When detected on rare occasions, immediate measures were taken to mitigate methane from the work and breathing zones with the use of engineering controls including physical barriers and the use of industrial explosion-proof fans to ventilate the work zones.

Following the installation of the support pilings, Maser Consulting observed the installation of two added protective elements – a Liquid Boot® Vapor Barrier System and a corresponding SSDS. Both systems were designed to mitigate the intrusion of methane and other landfill gases into the new Clubhouse.

As a means to assess the effectiveness of the Vapor Barrier and the SSDS, a Methane Detection System was installed inside the new Clubhouse. The methane detection system consists of a network of in-floor methane sampling ports as well as a series of methane detectors located throughout the main banquet and reception areas as well as in the smaller offices, the kitchen and other employee and publicly-accessible areas.

This report certifies that the construction of the Liquid Boot® vapor barrier system and the SSDS for the new clubhouse have been completed in accordance with the 6 NYCRR Part 360 Solid Waste Management Permit for Ferry Point Park (copy provided as **Appendix A**). This report further certifies that Methane Detection system was also installed, tested and calibrated in compliance with the project permits, plans and specifications.

## B. Report Organization

This report has been generated to provide a written post-construction certification report to comply with the requirements of the above-referenced Part 360 Permit. The narrative and supporting information provided in this report have been organized such that any individual, especially those not familiar with the new clubhouse construction, can gain a concise understanding of the history of improvements at the Site (a former solid waste management facility, i.e. landfill).

The report has been organized into the following sections:

- Section I which briefly describes the purpose and scope of the project, provides details pertaining to the Site background including a Site description, key agencies involved, and permitting history

- Section II describes the Part 360 Permits and modifications, Permit reference documents, nonconformance issues, operational upsets, emergencies, and unusual circumstances, and reporting completed associated with the new clubhouse

- Section III details the fill importation Quality Assurance / Quality Control (QA/QC) program, specifically source site reviews for cover layer material, on-site fill importation inspection, trucking manifests, rejected trucks and materials, fill tracking, and total carcinogenic semi-volatile organic compound (SVOC) tracking

- Section IV provides details related to construction activities on-site including construction of the new clubhouse, environmental controls such as landfill gas monitoring, municipal solid waste handling, earthwork and fill placement, demarcation layer, construction progress meetings, and deviations from the approved design plans and/or Permit requirements with as-built surveys

- Section V details the environmental monitoring completed during the Project including Stormwater Pollution Prevention Plan (SWPPP) erosion control inspections.

- Section VI provides a summary of the report

- Section VII provides report certification

## C. Background Information

### a. Project Scope

Ferry Point Park in the Bronx (the "Site") is a former landfill covering 222 acres that is bounded by the Bronx-Whitestone Bridge and Hutchinson River Parkway to the west; Balcom, Miles, and Emerson Avenues to the east; Schley Avenue and St. Raymond's Cemetery to the north; and the East River to the south. The project was originally managed under Ferry Point Partners, LLC and was taken over solely by the City of New York Department of Parks and Recreation in October 2007.

The original project scope included the construction of three main elements including a golf course, a community park, and a waterfront park over the 222-acre Site as follows:

- An 18-hole golf course with practice facility, driving range, clubhouse, maintenance facility, irrigation lake, stormwater retention ponds, and a parking lot (192.5 acres);
- A passive recreation waterfront park with walkways and a comfort station (19.5 acres); and
- A community park with baseball fields, basketball court, walkways, comfort station, and landscaped stormwater retention area (10 acres)

A new element of the project was initiated in 2017 with the construction of a permanent clubhouse in the southern corner of the Site. The project began in July 2017 and was completed in August 2018.

A supplemental component of the Clubhouse project was deemed necessary when the existing 2-inch gas service line to the facility was determined to not be capable of providing the volume of gas necessary to support the heating, ventilation and air conditioning units as well as other facility utilities such as the kitchen and other amenities. Construction of the Gas Main Installation began in late August 2018 and was substantially completed by November 2018.

## b. Project Site[1]

The origins of the site date back to the early 1900s. At that time, an available 1900 map of the Bronx showed the western edge of the site which now contains the expressway and Whitestone Bridge was a long narrow peninsula extending out to the same area that the northern landing of the Whitestone Bridge now extends. Immediately east of this peninsula was a large open bay which is the area that the Ferry Point Golf Course is now located. Northeast of the bay and well inland was the Baxter Creek that drained into the bay. The eastern landfall of this embayment area is a larger peninsula that contains roadways and a residential development. The road patterns do not resemble the roadways that currently exist in that area and appear to have been changed.

A 1938 aerial photo showing the construction of the Whitestone Bridge shows the Bay, mooring, residential area and land to the west to be virtually the same as shown in the 1900 map. The significant change is in the widening of the western peninsula where the expressway was being constructed leading to the bridge ramps. The widening was not significant at this time but a rectangular area in the extreme northwest corner of what is now the site appears to be filled and graded – possibly to support construction staging area for the bridge/expressway. Areas of filling can be readily identified in the photograph by the contrasting lighter color typically indicative of sandy dredge sand placement. Other areas along the shoreline can be seen as containing a lighter-colored band of fill material and this includes much of the new Ferry Point Park located west of the Whitestone Bridge. Much of the park area was filled and graded by 1938. Bulkheads were constructed with linear components to present a smooth shoreline but one that does not appear to contain a beach where water diminishes in depth to 0. Photos of the eastern area of the bay where mooring and docks can be seen showing large vessels moored against the shore. This would indicate the water had significant depth all of the way to the center of the bay.

Aerial photographs from the 1950s show a drastic change in the area currently referred to as the site. Large expansion of the filling that was evident in 1938-39 up in the northeast corner can be clearly seen. The filling extends well into the bay and it appears that a connective bridge

[1] *Reference: "Ferry Point Park Golf Course & Community Park, Bronx New York, Final Construction Certification Report, NYSDEC Permit #2-6006-00014 / 00013 (SW)" prepared by the City of New York Department of Parks and Recreation dated October 19, 2015 – a.k.a. the 2015 Final Construction Certification Report*

was constructed from the eastern shore to the fill area. It is difficult to discern if this is a usable structure for crossing or if it had some other purpose. The filling operation appears from the photo to consist of the same light-colored material that was placed in the Ferry Point Park and from photos showing a large number of barges in the water filled with material of the same light color. There is specific documentation that presents the specific origin and consistency of the material. but from the prior aerials showing filling and this large expansion, it appears to be of a similar origin which would be dredge sand. In the 1951 aerial, no specific municipal solid waste dumping and disposal can be seen; however, records indicate the landfill operated during this approximate time period. It is therefore assumed that municipal solid waste was disposed shortly after the photo was taken. The landfilling shown in the aerial may have been the initial construction of the upper portion of the landfill with the tidal gate or bridge closing in the upper bay area. Additional aerials of the landfilling were not identified and more recent aerials document the completion of filling as well as the more recent golf course construction.

What can be discerned from this compilation of photos is that the landfill could be located in an area that may have been open water as well as some area that was previously reclaimed land with dredge material.

The Site operated as a landfill from before 1951 to the 1960s. The landfill reportedly accepted municipal solid waste during its operating period and was closed and covered in the mid-1960s, with additional closure operations conducted more recently in the 1980s. Prior Site use was determined from historic aerial photographs from 1938 thru 1991. The aerial photographs span the entire operational period of the prior landfill, from its initial operations to the present, and provides substantial information about the Site's development.

### c. Key Agencies

The following were the key agencies associated with the project providing oversight, administration, design, construction, and monitoring services. The following is not intended to be an exhaustive list of involved entities related to the Project:

Primary Regulatory Agency:
New York State Department of Environmental Conservation Region 2 ("NYSDEC")

Project Permittee:
City of New York Department of Parks & Recreation ("NYCDPR")

Primary Design, Engineering, Construction, and Monitoring Consultants:
Hart Howerton Planning, Architecture and Landscape Architecture, P.C. ("Hart Howerton")
French & Parrello Associates ("FPA")

Independent Environmental Monitor ("IEM"):
Maser Consulting P.A. ("Maser Consulting")
Woodard & Curran ("W&C")

General Contractor:
Golf Course Clubhouse: JCS Construction Group, Inc. ("JCS")

Subcontractor for the SSDS and Liquid Boot® Vapor Barrier Installation:
EAI, Inc. ("EAI")

Golf Course Concessionaire/Operator:
The Trump Organization ("Trump")

See **Appendix B** for a list of project participants.

### d. Independent Environmental Monitor

The requirement for an IEM on this project was associated with an increased level of monitoring exceeding normal review and oversight practices of the NYSDEC in order to protect public health and the environment. The increased level of review and oversight for this Project was mainly associated with the effort required for evaluation of fill material sources, source site testing and inspection, importation of the fill material, environmental monitoring required at the clubhouse construction site, and later along the gas main installation route. IEM services were also necessary during the installation of over 200 support piles through the former waste pile located beneath the new Clubhouse.

In accordance with Special Condition 24 of the 2014 Permit (**Appendix A**), NYCDPR was responsible to retain an IEM, accountable to NYSDEC, to provide environmental oversight of activities authorized under the Permit including but not limited to the quantification, importation and placement of fill, and the monitoring of the clubhouse construction site. Particular activities performed by the IEM for this Project included the following:

- Report deviations from or non-compliance with permitted activities to NYSDEC;
- Evaluate and inspect fill sources;
- Evaluate, monitor and mitigate methane intrusions during the installation of steel support pilings for the new clubhouse foundation;
- Witness source site investigation, sampling, and compare lab test results to Permit requirements;
- Visual and Photoionization Detector (PID) inspection of imported fill materials to the Site;
- Monitor offloading of trucks and reject unacceptable materials from being dumped on the Site and used for construction;
- Monitor environmental sampling on the Site (i.e. landfill gas);
- Monitor fill operations on the Site, particularly the installation of minimum thickness of shaping layer and cover layer materials as well as demarcation layer installation;
- Complete and submit Daily Observation Reports to NYCDPR;
- Complete weekly Erosion Control Reports; and
- Attend weekly Construction Progress Report meetings

The selection, continued retention, discharge, or replacement of the IEM was subject to the approval of NYSDEC at its sole discretion.

### e. Project and Part 360 Permitting History

The following represents an overview of project and permitting history outlining key events:

On May 21, 2014 NYSDEC issued Permit No. 2-6006-00014 / 000013 for a Solid Waste Management Facility for the Ferry Point Park Golf Course; this permit establishes an IEM. A copy of this permit is provided in **Appendix A**.

On June 12, 2017 the Ferry Point Park SSDS Plan prepared by FPA for the proposed permanent clubhouse was submitted to NYSDEC. A copy of this submittal is provided in **Appendix C**.

On June 22, 2017 NYSDEC issued a letter to The Trump Organization approving the Ferry Point Park SSDS Plan. A copy of this letter is provided in **Appendix D**.

On June 7, 2018 Maser Consulting (through The Trump Organization) submitted a Construction Certification for the SSDS to NYSDEC to allow for the temporary, one-day opening of the new clubhouse on June 11, 2018. A copy of this submittal is provided in **Appendix E**.

On July 2, 2018 NYSDEC issued a review letter with comments on the June 7, 2018 Maser Consulting Construction Certification for the SSDS. A copy of this letter is provided in **Appendix F**.

On July 11, 2018 Maser Consulting provided a letter response to NYSDEC's July 2, 2018 review letter. A copy of this letter response is provided in **Appendix G**.

### f. Construction Drawings

Construction drawings for the SSDS are included in **Appendix C**.

## II. PART 360 PERMIT

### A. Part 360 Permits and Modifications

The following permit was issued for this Project:

NYSDEC Permit No. 2-6006-00014 / 000013 (Solid Waste Management Facility – Ferry Point Park Golf Course, Bronx NY) issued on May 21, 2014 (copy provided in **Appendix A**).

### B. Reference Documents

Refer to the 2015 Final Construction Certification Report for a list of Permit reference documents. These documents support the original Permit and/or provide basis for subsequent permits renewals and modifications.

### C. Non-Conformance Issues

In accordance with Special Condition 24 of the 2014 Permit, the IEM reported on Permit-related non-conformance issues during the duration of construction of the permanent clubhouse and on the gas main installation project. Non-conforming issues identified during the construction of the new facility were immediately addressed and remedied so that activities were in conformance with applicable plans, specifications and permits.

### D. Operational Upsets, Emergencies, and Unusual Circumstances

No evidence of security breaches, unauthorized entries, injuries, fires, theft, vandalism etc. were observed during construction of the permanent clubhouse. The only post-construction upset was related to damage caused to the outdoor lighting system from wildlife borrowing and chewing. Corrective measures were undertaken with normal and routine maintenance actions by The Trump Organization maintenance staff.

### E. Reporting

The IEM was responsible for daily and weekly reporting to the NYCDPR regarding the status of the work. The IEM participated in weekly on-site construction meetings and submitted weekly Erosion Control Reports during the construction period. Daily Observation Reports ("DOR") were also submitted to the NYCDPR for review and comment.

The IEM reported to the NYCDPR on a generally daily basis on the following information: weather conditions, fill materials imported to the site, detailed notes of construction activities, and non-conformance issues related to the Permit conditions. Non-conformance issues were immediately addressed by the contractors under the supervision of the IEM. The IEM also reported weekly to the NYCDPR on the construction status and pertinent observations regarding the erosion control measures around the construction site and at the imported soil stockpile area.

DORs are provided in **Appendix I** beginning on July 19, 2017 through February 5, 2019.

### F. Authorized Fill Volumes

Imported fill material was derived from two pre-approved sources, one for cover material associated with the new Clubhouse and one for cover material used in the installation of the new 6-inch gas main.

New York Recycling located at 475 Exterior Road, Bronx, NY was the source of the material used for the new Clubhouse. A table in **Appendix K** indicates the volumes of material imported from this facility. This material met the soil quality standards set forth in the Permit requirements. During the course of the importation process, the material was re-sampled in order to reconfirm its quality. Analytical testing data can be reviewed in **Appendix J**. A total of 1,062 cubic yards of material was imported from this source site between November 2017 and March 2018.

Ranco Sand and Gravel located at 151 South Street, Manorville, New York was the source site for materials imported for the gas main installation project. A site source inspection was conducted in advance of the imports and analytical testing was performed to establish that imported material would meet all Permit conditions and requirements. A table in **Appendix L** provides a summary of the imports from Ranco Sand & Gravel. A of total 690 cubic yards of material was imported between September and October 2018.

# III. FILL IMPORTATION QA/QC PROGRAM

## A. Background

Fill material importation for construction of the permanent clubhouse commenced on November 27, 2017 and the last day for fill import was March 12, 2018. The fill importation QA/QC program implemented for the Project based on the Permit and associated reference documents was adhered to. The fill importation consisted of two main components: source site reviews and on-site inspections. A source site review was conducted by the IEM prior to fill material being imported to the Site and additional visual and PID inspections were completed by the IEM upon the material entering the Site at the IEM inspection area and again once the material was dumped at the work or stockpile location on the Site.

## B. Source Site Reviews

Prior to cover layer material being imported to the Site, each potential source was thoroughly evaluated by the IEM. An environmental review was performed for proposed source sites in accordance with Special Condition 24 of the 2014 Permit. The source site review process criteria were specified in the Report on Fill Management, Operations and Maintenance, prepared by TRC on May 16, 2000, and revised June 30, 2005 (Volume #2 of the 2005 Engineering Report). The source site review process was modified over time as compared to the original process outlined in the various engineering reports and permit modification requests. The process generally consisted of the following main components:

- NYCDPR would notify the IEM of a new potential source site. NYCDPR would provide the IEM with the site name and location as well as any available historical site information and soil environmental analytical results that existed for the potential source site.

- Once NYCDPR confirmed that their desire to move forward with pursuing the potential source site, NYCDPR authorized the IEM to retrieve available site information. NYCDPR then completed an initial review of the existing site information, generated a sampling plan, and provided the results of the initial review and sampling plan to the IEM. NYCDPR then authorized the IEM to conduct a desktop review of the existing site information, available soil environmental analytical results, and NYCDPR's sampling plan. The IEM provided NYCDPR with comments related to their review and their sampling plan in consultation with NYSDEC. Once a final sampling plan was agreed upon, the source site investigation was initiated and executed per the NYCDPR sampling plan with IEM oversight. For source sites with in-situ material, test pits

were typically completed with additional soil samples inspected, collected, and analyzed in accordance with the Permit requirements. Once the sampling was completed, the IEM reviewed sample results and the IEM generated a memorandum summarizing the review process and provided recommendations and requirements necessary for NYCDPR to address in order to continue pursuing the potential source site. The recommendations typically included conditions associated with overseeing the excavation, loading, and importing of the source site material to the Site in accordance with the Permit. The IEM submitted the memo of recommendations to NYSDEC for review and comment prior to issuing the final memorandum to NYCDPR. NYSDEC would provide final comments and approval of the source site with any additional required conditions.

- If NYCDPR determined that the potential source site was worth pursuing considering site-specific conditions, schedules, etc., they coordinated with the source site operator and IEM on importation schedule and requirements. The IEM provided oversight to confirm that the loading, hauling, and overall import of the approved material was completed in accordance with the memorandum of recommendations, NYSDEC conditions, and the Permit.

- The IEM provided oversight during export from the approved source sites on an as needed basis and provided oversight at each source site during additional sampling activities if the source site was exporting more than the minimum sampling frequency outlined in the Permit (i.e. 10,000 cubic yards for shaping layer material and 2,000 cubic yards for cover layer material).

If at any time during the review process there were reasons for concern identified by the IEM resulting in the potential source site being classified as a "complex" source site, NYSDEC became the primary reviewer and made final recommendations related to additional site investigation requirements or approval/rejection of the potential source site with support from the IEM. A complex source site was defined by the presence of an abundance of or particular Recognized Environmental Concerns ("RECs") and NYSDEC made decisions related to approval and/or associated conditions for further evaluation or import of the fill material.

For both source sites used in this Construction Project, no complex source site determinations were made.

Details of source site review and site testing activities are included in the report text and specific DORs. Source site review supporting information and testing data is included in the 2015 Final Construction Certification Report.

### C. Cover Layer Material

Materials accepted for use as cover layer on the Site were sampled prior to acceptance and after each additional 2,000 cubic yards. As per the 2005 Permit modification, the parameters for cover layer material included the complete analyte list of TAGM 4046 for total VOCs, total SVOCs, total pesticides and herbicides, total PCBs, total metals, sulfur, and asbestos.

Based on source site reviews and site testing activities, the cover layer material imported to the Site met the following chemical limits:

| Analyte | Shaping Layer |
|---|---|
| **RCRA Metals (mg/kg = ppm)** | |
| Arsenic | 28 |
| Barium | 2,000 |
| Cadmium | 20 |
| Chromium | 1,000 |
| Copper | 1,000 |
| Lead | 400 |
| Mercury | 0.57 |
| Selenium | 11 |
| Silver | 100 |
| **TCLP Metals (mg/l)** | |
| Arsenic | 5.0 |
| Barium | 100.0 |
| Cadmium | 1.0 |
| Chromium | 5.0 |
| Lead | 5.0 |
| Mercury | 0.2 |
| Selenium | 1.0 |
| Silver | 5.0 |
| **Volitile Organic Compounds (mg/kg)** | |
| Acetone | 0.2 |
| Benzene | 0.06 |
| Benzoic Acid | 2.7 |
| 2-Butanone (i.e. MEK) | 0.3 |
| Carbon Disulfide | 2.7 |
| Carbon Tetrachloride | 0.6 |
| Chlorobenzene | 1.7 |
| Chloroethane | 1.9 |
| Chloroform | 0.3 |

| 2,4,5-T | N/A |
| Total PCBs | 10 |
| Total Pesticides | 10 |
| **Other** | |
| Asbestos | 0.50% |
| Total Sulfur | 0.50% |

N/A = Not Available
SB = Site Background
* = Total SVOCs must be less that 500ppm. Total carcinogenic SVOCs must be less than 3 ppm if any one of the cSVOCs** exceeds TAGM.
** = cSVOC list includes: Benzo(a)pyrene, Dibenzo(a,h)anthracene, Benzo(a)anthracene, Benzo(b)fluoranthene, Indeno(1,2,3-cd)pyrene, Benzo(k)fluoranthene, and Chrysene.
*** = Some forms of Cyanide are complex and very stable while other forms are pH dependent and hence are very unstable. Site-specific form(s) of Cyanide should be taken into consideration when establishing soil cleanup objective
**** = Background levels for lead vary widely. Average levels in undeveloped, rural areas may range from 4-61 ppm. Average background levels in metropolitan or suburban areas or near highways are much higher and typically range from 200-500 ppm.
MDL = Method Detection Limit

### a. New York Recycling

Details of the New York Recycling (475 Exterior Street, Bronx NY) source site review and site testing for this cover layer material source site are included in the DORs. Analytical sampling and testing was completed at the site in September 2017. A site inspection was performed concurrently with the sampling event.

Approximately 1,062 cubic yards of cover layer material were imported to the Site from this source site for construction of the permanent clubhouse between November 2017 and March 2018. The majority of the material was used to raise the grade elevation in the immediate vicinity of the Clubhouse foundation and the landscape beds surrounding same.

### b. Ranco Sand & Stone

The source site review for Ranco Sand & Stone (151 South Street, Manorville NY) consisted of an August 25, 2018 site visit to collect samples of this cover layer material for laboratory analysis; results are included in **Appendix N**. Results indicated that analyzed parameters met the permit standards.

Approximately 690 cubic yards of cover layer material were imported to the Site from this source site for cover material related to the gas main installation project.

## D. On-Site Fill Importation Inspections

### c. Process

As required under Special Condition 24 of the 2014 Permit, fill importation was inspected at the Site by the IEM. Fill material volume (truck volume) was measured and recorded for each delivery of fill material as it arrived on-site by NYCDPR's appointed representative. The fill material was then inspected by the IEM at the entrance to the Site. At this time, the fill material was visually inspected and field screened for signs of contamination. The visual inspection included observations of the material, disturbing the material with a shovel, and close-up observations of the material retrieved by shovel while still in the truck or trailer. Field screening of the fill material was executed using a PID. If the fill material failed to meet the Permit requirements for reasons such as a PID reading above ambient air, the presence of asphalt, concrete or brick components, or some other unauthorized debris, the load was rejected immediately prior to dumping. If the material was rejected, the truck was not allowed to dump on-site and was directed to exit the site immediately.

During the material imports for the Clubhouse and the gas main installation project, the IEM found no reason to reject the imported loads. Loads met the visual and field screening tests and were subsequently accepted.

If the fill material passed the initial inspection at the IEM observation area, either it was allowed to dump directly at a work location for immediate use as cover layer material or it was transported to, and dumped at, a stockpile location. At the dump location, the IEM screened the fill material visually and with a PID for a second time prior to spreading if dumped at an active work location. If the fill material did not meet the permit requirements at the dump location, it was immediately rejected, loaded back onto the same truck, and transported off-site. During the material imports for the Clubhouse and the gas main installation project, the IEM found no reason to reject the imported loads. Loads met the visual and field screening tests and were subsequently accepted.

#### d. Trucking Manifests

Trucking manifests were utilized for imported cover layer materials. A three-part manifest form was completed to track each load of material from origination at the source site to destination at the Site. The manifest contained information including but not limited to a manifest number, the source site name and address, the truck driver's name, truck and trailer license plate numbers, volume of material, as well as the time of departure from the source site and arrival time at the Site. Copies of fill import manifests are provided in **Appendix K**.

#### e. Rejected Trucks & Materials

Materials imported to the Site met the IEM's importation inspections, and none were rejected.

### E. Fill Tracking

Testing per 2,000 cubic yards for cover layer material is included in Special Condition 14 of the 2014 Permit).

Cover layer material volumes were tracked based upon the calculated volumes within each truck. This provided for the most accurate and consistent approach to monitoring the volume of imported fill materials. Prior to receipt of the calculated volumes, the IEM tracked estimated volumes as trucks dumped on the Site.

The total volume of cover layer material imported to the Site for construction of the permanent clubhouse was 1,530 cubic yards (truck volume) or 0.39 percent of the authorized amount under the Permit.

### F. Total Carcinogenic Semi-Volatile Organic Compound Tracking

As identified in Special Condition 14 of the 2014 Permit, the NYSDEC Acting Regional Director letter dated October 25, 2006 authorized the import of shaping material with a total carcinogenic SVOC (tcSVOC) level of up to 10 parts per million (ppm), which would not otherwise be acceptable, provided the tcSVOC weighted average of all imported material is equal to or less than 3 ppm at the end of each quarter. The tcSVOC weighted average is defined as the sum of the products of the material volume and the material tcSVOC, for each material source, divided by the total volume of the material imported. The weighted average was calculated over the course of construction and the final weighted average for shaping layer and cover layer materials imported to the Site was 0.70 ppm, less than the 3 ppm maximum. The total carcinogenic SVOC weighted average table and computations are included in the 2015 Final Construction Certification Report for materials imported to the Site after November 18, 2005.

SVOCs were sampled for New York Recycling on September 28, 2017. The tcSVOC level did not exceed 10 ppm. A copy of the laboratory report is provided in **Appendix J**.

SVOCs were sampled for Ranco Sand & Stone on August 25, 2018. The tcSVOC level did not exceed 10 ppm. A copy of the laboratory report is provided in **Appendix N**.

# IV. PERMANENT CLUBHOUSE CONSTRUCTION

## A. General

From July 2017-September 2018, Trump Golf Links at Ferry Point constructed a permanent clubhouse facility. The 14,100 square foot one-story building is located in the far southern section of the Site (immediately west of the 18th fairway) and includes locker rooms, showers, a bar room, a kitchen and associated facilities, ballrooms, administrative offices and a golf pro shop. The Trump Organization contracted with JCS Construction, Inc. to build this facility on piles, as it was formerly a landfill.

## B. Environmental Controls / Construction

### a. Landfill Gas Monitoring

Steel beams were driven to intermediate depths of approximately 40 feet, welded to another steel beam of the same length, driven to completion depths of approximately 75 feet, then cut to grade. Prior to welding/cutting, the piles were checked at the inlet (i.e. ground surface elevation) with a four-gas MiniRAE Meter. The meter alarm was triggered if concentrations of carbon monoxide, hydrogen sulfide, oxygen and methane (as Lower Explosive Limit) were above OSHA exposure limits; the alarm was not triggered for the vast majority of field activities, and on the few occasions when triggered, soil was placed over the inlet until the meter alarm was not triggered prior to welding/cutting activities. As an added measure of protection, when the meter alarm activated, explosion-proof industrial ventilation fans were activated to vent the work area and disperse gases emanating from the subsurface.

### b. Imported Soils Monitoring

Fifty-nine (59) loads of soil (approximately 1,062 cubic yards) were imported from New York Recycling, a donor source located at 475 Exterior Street in the Bronx; and 27 loads of soil (approximately 690 cubic yards) were imported from Ranco Sand & Stone, a donor source located at 151 South Street in Manorville NY. Air monitoring performed during the course of the workday revealed no detections above background on the PID. Visual observation and PID monitoring of each load of soil from New York Recycling and from Ranco Sand & Stone showed no evidence of VOCs or visual signs of debris within the material.

### C. Municipal Solid Waste

A Royal Carting commercial municipal solid waste (MSW) six-yard container was available on Site during the duration of clubhouse construction activities. MSW was not encountered or generated during digging, earth-moving or excavation activities associated with the new clubhouse or the gas main installation activities.

### D. Earthwork / Fill Placement

Earthwork and fill placement for this Project were performed in accordance with the Permit.

#### a. Cover Layer Material

Cover layer material was installed at the Site in accordance with the 2014 Permit (**Appendix A**).

Imported soil from New York Recycling and from Ranco Sand & Stone was backfilled and graded around the perimeter of the concrete sub-structure. The soil from New York Recycling was characterized as brown fine-coarse sand with occasional crushed stone roughly 1-1.5 inches in diameter. Materials imported from Ranco Sand & Gravel was characterized as clean, well-rounded white to gray medium sands.

#### b. Topsoil

Topsoil was used on the Site (in lieu of sand) specifically in tree planting pits and other landscape areas. Topsoil was imported from commercially available sources (i.e. Home Depot) and used on the Site as approved. This material met the cover layer material Permit requirements including the specification included in the 2014 Permit.

### E. Meetings

On a weekly basis during construction of the permanent clubhouse, progress meetings were held in the JCS field office trailer or in the temporary clubhouse on site. Various representatives from NYCDPR, the Trump Organization, JCS and the IEM (Maser Consulting) attended the meetings to discuss construction progress, current issues and scheduling.

Available meeting minutes from construction progress meetings are provided in **Appendix M**.

### F. SSDS / Liquid Boot® Installation

From November 2-7, 2017 the SSDS was installed. Lateral collection piping was laid, and the SSDS pits were excavated and connected to the lateral collection piping. The IEM provided oversight, including taking measurements of the as-built SSDS component installed locations for use in this report.

Stone cover was then poured over the SSDS prior to Liquid Boot® installation.

From November 8-15, 2017 the stone cover was lined (base fabric), sprayed with Liquid Boot®, and allowed to cure. Smoke testing was then performed, with leaks identified and resprayed. Coupon samples were measured to ensure that the cured thickness met the design requirement. Once smoke testing, coupon measurements and leak repairs were complete, a cover fabric was placed over the floor footprint prior to pouring the slab.

On two separate occasions after the initial spraying, curing and smoke testing of the vapor barrier, repairs had to be made to the barrier layer. IEM observations of damage to the cover fabric provided the impetus for additional spraying and testing. The first event took place in January/February of 2018 when weather conditions and mild temperatures prevailed. A final smoke test and barrier layer repair took place before the concrete floor was poured and once the Clubhouse was being enclosed. During both re-spray events, defects were located, repaired and re-tested for integrity. Like the previous smoke tests, the final smoke test indicated no signs of vapor barrier leaks, tears or defects.

On one occasion, Liquid Boot® was sprayed at temperatures below the recommended 45 degrees F. However, it was determined by experienced applicators and inspectors—based on site specific conditions—that the curing of the spray was acceptable. See documentation from CETCO/Minerals Technologies (the Liquid Boot® manufacturer) dated November 9, 2017 (**Appendix P**).

A letter of completion provided by EAI is provided in **Appendix P**.

### G. Six-Inch Gas Main Construction

In July 2018, the existing 2-inch gas service line was determined by FPA engineers to be insufficient to support the demands of the new Clubhouse facility. A new 6-inch gas main was required to meet the demand. Installed between August and October 2018, the new main provides sufficient volumes of natural gas to support the new Clubhouse facility and its amenities.

The new gas line was connected to a Con Ed main located on Schley Drive, north of the golf course. The new pipeline runs along the western perimeter of the site along fairways #6, #7 and #8. The line doglegs to the west side of the maintenance area and generally follows the service cart path along the west side of the property. The line turns to the east toward the new Clubhouse in the general vicinity of the parking lot.

The service connection to the Clubhouse is located in a vault approximately 50 feet west of the Clubhouse, near the driveway entrance.

Architect drawings for this gas main are provided in **Appendix Q**. DORs are provided in **Appendix R** beginning on August 24, 2018 through October 22, 2018.

### H. Record Drawings & Deviations from Approved Design Plans

The permanent clubhouse project consisted of the following features and was designed by Hart Howerton and FPA:

- Golf pro shop
- Women's and men's locker rooms
- Dining room
- Bar/grill
- Kitchen
- Terraces
- Offices
- Vestibule and porch
- SSDS/Vapor Barrier

Deviations to the permanent clubhouse construction project were as follows:

- Drawing No. FO-500.00 "Vapor Remediation Underslab Plan" – lateral piping to SSDS pits DP-2B & DP-2C built approximately 2 feet offset from design due to piping conflicts
- Drawing No. FO-501.00 "Vapor Remediation Floor Plan" – riser piping for fan units SF-1 & SF built within walls to conceal system and prevent unauthorized access; gas sensors in Hall 124, Vestibule 101 & Electrical 113 ceilings built approximately 3-5 feet from design due to piping conflicts; monitoring point MP-1 built approximately 9 feet from design due to piping conflicts; monitoring point MP-8 built approximately 50 feet from design due to piping conflicts; monitoring point MP-9 built approximately 14 feet from design due to piping conflicts; monitoring point MP-10 built approximately 14 feet from design due to piping conflicts; monitoring point MP-2 was installed at the location shown in the Plan, however, it appears to have been tiled-over and is no longer accessible as a sampling point
- Drawing No. FO-502.00 "Vapor Remediation Attic & Mezzanine Plan" – fan unit SF-1 built approximately 10 feet to the left of design due to piping conflicts
- Drawing No. FO-504.00 "Vapor Remediation Details" – detail 1B built using hollow (instead of solid) concrete blocks; 'Methane Gas Sensor Detail (option 1)' & 'Methane Gas Sensor Detail (option 2)' added for sensor plenum boxes
- Drawing No. SD201 "Methane Monitoring System Ceiling Plan (As Built)" – methane gas sensor S16 built approximately 5 feet from design due to piping conflicts; methane gas sensor S19 built approximately 4.5 feet from design due to piping conflicts; methane gas sensor S28 built approximately 5 feet from design due to piping conflicts

Copies of the drawings issued for construction are provided in **Appendix C**. Copies of the drawings showing deviations from design are provided in **Appendices E and O**.

## V. ENVIRONMENTAL MONITORING

### A. Stormwater Pollution Prevention Plan (SWPPP)

The IEM performed weekly erosion control inspections to ensure compliance with Permit requirements. Erosion control inspections were carried out through the duration of permanent clubhouse construction. The SPDES permit remained effective until completion of ongoing construction including the permanent clubhouse. Copies of erosion control inspection reports are provided in **Appendix H**.

### B. Landfill Gas Monitoring

NYCDPR will implement post-construction monitoring necessary to fulfill the requirements of the Post-Construction Custodial Care Plan for landfill gas monitoring per the 2015 Final Construction Certification Report.

## VI. SUMMARY

Construction of a permanent clubhouse in the southern corner of the Site began in July 2017 and was substantially completed in October 2018. Activities included clearing and grubbing, excavation, installation of support pilings, grading, importation of fill material, construction of the permanent clubhouse with a protective vapor barrier system and associated SSDS and associated appurtenances, installation, testing and calibration of an interior methane detection system, installation of utilities and infrastructure, installation of plantings, and installation of a new gas main. A representative of the IEM was present during construction activities. For this project, fill importation and SSDS/Vapor Barrier construction followed the Permit and NYSDEC requirements as documented in the DORs as summarized herein.

## VII. CERTIFICATION

Certification Statement

I, Donald Bowman, an employee of Maser Consulting P.A. and a Registered Professional Engineer licensed by the State of New York, exercising independent judgment and discretion do hereby certify that this Subslab Depressurization System (SSDS) for the Trump Golf Links at Ferry Point Clubhouse was constructed under my direction and supervision. The information contained herein is based upon: (1) work which I have personally inspected both during and after construction from July 2017 to date; (2) information provided to me by those directly employed by Maser Consulting P.A.; (3) Design Consultants; and (4) contractors responsible for construction pursuant to their contracts except as indicated[2].

I certify that, from July 2017 to date, Maser Consulting representatives observed the installation of the critical elements of the SSDS for the Trump Golf Links at Ferry Point Clubhouse, with the following deviations from design:

- Drawing No. FO-500.00 "Vapor Remediation Underslab Plan" – lateral piping to SSDS pits DP-2B & DP-2C built approximately 2 feet offset from design due to piping conflicts
- Drawing No. FO-501.00 "Vapor Remediation Floor Plan" – riser piping for fan units SF-1 & SF built within walls to conceal system and prevent unauthorized access; gas sensors in Hall 124, Vestibule 101 & Electrical 113 ceilings built approximately 3-5 feet from design due to piping conflicts; monitoring point MP-1 built approximately 9 feet from design due to piping conflicts; monitoring point MP-8 built approximately 50 feet from design due to piping conflicts; monitoring point MP-9 built approximately 14 feet from design due to piping conflicts; monitoring point MP-10 built approximately 14 feet from design due to piping conflicts; monitoring point MP-2 was installed at the location shown in the Plan, however it appears to have been tiled-over and is no longer accessible as a sampling point
- Drawing No. FO-502.00 "Vapor Remediation Attic & Mezzanine Plan" – fan unit SF-1 built approximately 10 feet to the left of design due to piping conflicts
- Drawing No. FO-504.00 "Vapor Remediation Details" – detail 1B built using hollow (instead of solid) concrete blocks; 'Methane Gas Sensor Detail (option 1)' & 'Methane Gas Sensor Detail (option 2)' added for sensor plenum boxes

[2] Certification means a statement of professional opinion based upon investigation, analysis, knowledge and belief that is stated to be true and accurate. 6 NYCRR Part 360-1.2(b)24.

- Drawing No. SD201 "Methane Monitoring System Ceiling Plan (As Built)" – methane gas sensor S16 built approximately 5 feet from design due to piping conflicts; methane gas sensor S19 built approximately 4.5 feet from design due to piping conflicts; methane gas sensor S28 built approximately 5 feet from design due to piping conflicts

Donald Bowman, P.E.

# 1 Introduction

## 1.1 Purpose

This Final Construction Certification Report for the Ferry Point Park Golf Course is submitted to the New York State Department of Environmental Conservation upon completion of the construction of Ferry Point Park East, a solid waste management facility, which includes the resultant information prepared in accordance with 6NYCRR Part 360 of the New York State Solid Waste Management Program.

This report is to certify that the construction of Ferry Point Park East has been completed in accordance with the 6NYCRR Part 360 and the Ferry Point Park Part 360 permits. Therefore, this report will present in great detail each specific approved component of the project – what was approved, what was actually constructed initially (with pictures), the changes that were made, and the final status and design as of the date of this report (with pictures).

## 1.2 Report Organization

This report has been generated to provide a written post-construction certification report to comply with the requirements of the Project's Part 360 Permits. The narrative and supporting information provided in this report have been organized such that any individual, especially those not familiar with the project, can gain a concise understanding of the history of improvements at the Site. As such, the report has been organized into the following sections:

- This report begins with this introductory chapter (Section 1) which briefly describes the purpose and scope of the project, provides details pertaining to the Site background including a Site description, key agencies involved, and Project and permitting history.

- Section 2 describes the Part 360 Permits and modifications, Permit reference documents, non-conformance issues, operational upsets, emergencies, and unusual circumstances, and reporting completed associated with the Project.

- Section 3 details the fill importation QA/QC program, specifically source site reviews for shaping layer and cover layer material, on-site fill importation inspection, trucking manifests, rejected trucks and materials, fill tracking, and total carcinogenic semi-volatile organic compound tracking.

- Section 4 provides details related to construction activities on-site including construction of the Community Park and the Golf Course, status of the Waterfront Park, environmental controls such as landfill gas wells, groundwater wells, liners, gas venting systems, vent trench, landfill cap, municipal solid waste handling, earthwork and fill placement, demarcation layer, miscellaneous golf course materials such as greens and tees mix, construction progress meetings, and deviations from the approved design plans and/or Permit requirements with as-built surveys.

- Section 5 details the environmental monitoring completed during the Project including Stormwater Pollution Prevention Plan (SWPPP), landfill gas, piezometer, settlement plate, and groundwater monitoring as well as information related to the deed restriction and post construction monitoring requirements at the Site.

- Section 6 provides a summary of the report.

- Report certification is provided in Section 7.

## 1.3 Background Information

### 1.3.1 Project Scope

Ferry Point Park in the Bronx (the "Site") is a former landfill covering 222 acres that is bounded by the Bronx-Whitestone Bridge and Hutchinson River Parkway to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south (See Figure 1-1 Ferry Point Park Project Area Map). The project was originally managed under Ferry Point Partners, LLC and was taken over solely by the City of New York Department of Parks and Recreation in October 2007.

The original project scope (the "Project") included the construction of three main elements including a golf course, a community park, and a waterfront park over the 222-acre Site (see Figure 2-1 Ferry Point Park Site Layout) as follows:

1. An 18-hole golf course with practice facility, driving range, clubhouse, maintenance facility, irrigation lake, stormwater retention ponds, and a parking lot (192.5 acres);
2. A passive recreation waterfront park with walkways and a comfort station (19.5 acres); and
3. A community park with baseball fields, basketball court, walkways, comfort station, and landscaped stormwater retention area (10 acres).

### 1.3.2 Project Site

The origins of the site for purposes of presenting a description of the site and surrounding area for this report extend back to the early 1900's. At that time an available 1900 map of the Bronx (Figure 2-2) showed the western edge of the site which now contains the expressway and Whitestone Bridge was a long narrow peninsula extending out to the same area that the northern landing of the Whitestone Bridge now extends to. Immediately east of this peninsula was a large open bay which is the area that the Ferry Point Golf Course is located within. Further to the northeast of this bay and well inland and beyond the current golf course was the Baxter Creek that drained into the bay. The eastern landfall of this embayment area is a larger peninsula that contains roadways and what appears to be residential development. The road patterns do not resemble the roadways that currently exist in that area and appear to have been changed.

A 1938 aerial photo (Figure 2-3) showing the construction of the Whitestone Bridge shows the Bay, mooring, residential area and land to the west to be virtually the same as shown in the 1900 map (Fig. 2-2). The significant change is in the widening of the western peninsula where the expressway was being constructed leading to the bridge ramps. The widening was not significant at this time but a rectangular area in the extreme northwest corner of what is now the site does appear to be filled and graded possible for bridge and expressway construction staging or support. Areas of filling can be readily identified by the contrasting lighter color typically indicative of sandy dredge sand placement. Other areas along the shoreline can be seen as containing a lighter colored band of fill material and this includes much of the new Ferry Point Park located west of the Whitestone Bridge. Much of the park area was filled, graded and completed by 1938. Bulkheads were constructed with linear components to present a smooth shoreline but one that does not appear to contain a beach where water diminishes in depth to 0. Photos of the eastern area of the bay where mooring and docks can be seen showing large vessels moored against the shore. This would indicate the water has significant depth all of the way to the center of the bay.

Aerial photographs from the 1950's (Figure 2-4) show a drastic change in the area currently referred to as the site. Large expansion of the filling that was evident in 1938-39 up in the northeast corner can be clearly seen. The filling extends well into the bay and it appears that a connective bridge was constructed from the eastern shore to the fill area. It is difficult to discern if this is a usable structure for crossing or if it had some other purpose. The filling operation appears from the photo to consist of the same light colored material that was placed in the Ferry point Park and from photos showing a large number of barges in the water filled with material of the same light color. There is no specific logs and documentation that presents the specific origin and consistency of the material but from the prior aerials showing filling and this large expansion, it appears to be of a similar origin which would be dredge sand. In the 1951 aerial, no specific municipal solid waste dumping and disposal can be seen but the records indicate the landfill operated from this approximate time period. So it can be assumed that municipal solid waste was dumped within the site area very soon after that. The filling shown in the aerial may very well have been the initial construction of the upper portion of the landfill with the tidal gate or bridge closing in the upper bay area. Additional aerials of the landfilling were not identified and more recent aerials document the completion of filling as well as the more recent golf course construction.
What can be discerned from this compilation of photos is that the landfill was located on area that may have been completely filled open water as well as some area that was previously reclaimed land with dredge material.

The Site operated as a landfill from before 1951 to the 1960's. The landfill reportedly accepted municipal solid waste during its operating period and was closed and covered in the mid-1960's, with additional closure operations conducted more recently in the 1980's. Prior Site use was determined from historic aerial photographs from 1951 thru 1991. The aerial photographs span practically the entire operational period of the prior landfill, from its initial operations to the present, and provides substantial information about the Site's development.

### 1.3.3 Key Agencies

The following were the key agencies associated with the project providing oversight, administration, design, construction, and monitoring services. The following is not intended to be an exhaustive list of involved entities related to the Project. A more extensive list of project participants is included in Appendix 18.

Primary Regulatory Agency:
New York State Department of Environmental Conservation Region 2 ("NYSDEC")

Project Permittee (Prior to October 2007):
Ferry Point Partners, LLC ("FPP")
City of New York Department of Parks and Recreation ("NYCDPR")

Project Permittee (Post October 2007):
City of New York Department of Parks and Recreation ("NYCDPR")

Primary Design, Engineering, Construction, and Monitoring Consultants:
Sanford Golf Design ("Sanford")
Nicklaus Design ("Nicklaus")
TRC Companies, Inc. ("TRC")
Langan Engineering & Environmental Services, Inc. ("Langan")
Ecology and Environment, Inc. ("E&E")
KS Engineers PC ("KSE")
Wesler Cohen Associates ("WCA")
The Pignato Group ("TPG")
Thomas Balsley Associates ("TBA")
Green Bases, Inc. ("GBI")

Independent Environmental Monitor ("IEM"):
ARCADIS/Geraghty & Miller (July 2000 – December 2000)
Gannett Fleming (December 2000 – October 24, 2010)
Woodard & Curran ("WC") (October 25, 2010 – Project Completion)

General Contractor:
Golf Course and Community Park: LAWS Construction Corp. ("LAWS")
Community Park Comfort Station: TJM Construction Corp. / Long Island Concrete, Inc.
Golf Course Maintenance Building, Rain Shelter, Comfort Station: Triton Structural Concrete, Inc.
Golf Course Cover Layer Material Importation: MFM Contracting Corp.

Golf Course Concessionaire/Operator:
The Trump Organization ("Trump")

### 1.3.4 Independent Environmental Monitor

The requirement for an Independent Environmental Monitor ("IEM") on this project was associated with an increased level of monitoring exceeding normal review and oversight practices of the NYSDEC in order to protect public health and the environment. The increased level of review and oversight for this Project was mainly associated with the extensive effort required for evaluation of fill material sources, source site testing and inspection, importation of the fill material, extensive earthwork, and environmental monitoring required at the 222-acre Site.

In accordance with Special Condition 24 of the 2014 Permit, NYCDPR was responsible to retain an IEM, accountable to the NYSDEC, to provide environmental oversight of all activities authorized under the Permit including but not limited to the quantification, importation and placement of fill, and the monitoring of the Site. Particular activities performed by the IEM for this Project included the following:

- Report deviations from or non-compliance with permitted activities to the NYSDEC;
- Evaluate and inspect fill sources;
- Witness source site investigation, sampling, and compare lab test results to Permit requirements;
- Visual and Photo-Ionization Detector (PID) inspection of imported fill materials to the Site;
- Monitor offloading of all trucks and reject unacceptable materials from being dumped on the Site and used for construction;
- Monitor environmental sampling on the Site (i.e. landfill gas, piezometer, groundwater, settlement, etc.);
- Monitor all aspects of fill operations on the Site, particularly the installation of minimum thickness of shaping layer and cover layer materials as well as demarcation layer installation; and
- Complete and submit to the NYSDEC Daily Observation Reports, bi-weekly Fill Management Reports, and Quarterly Reports related to Project activities.

The selection, continued retention, discharge, or replacement of the IEM was subject to the approval of the NYSDEC, at its sole discretion.

### 1.3.5 Project and Part 360 Permitting History

The following represents an overview of project and permitting history outlining key events associated with the Project. For more detailed and additional supporting information, reference the updated Permit Modification application package titled "Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East", dated May 31, 2012 and subsequently revised on August 31, 2012, June 20, 2013, and October 15, 2013 ("2013 Engineering Report") included in Appendix 20.

In May 1997, a Request for Proposals was released for the development of the Site. In May of 1998 Ferry Point Partners, LLC ("FPP") was selected as the developer and in the late May 2000, the City of New York Department of Parks and Recreation ("NYCDPR") initially entered into a license agreement with FPP to develop, construct, and operate the new recreation facility. The facility included a Jack Nicklaus signature golf course, a community park, a waterfront park, and related facilities (the "Project"). At that time, all required reviews for the Project were completed under the City Environmental Quality Review (CEQR),

State Environmental Quality Review Act (SEQRA), and New York City's Uniform Land Use Review Procedure (ULURP).

On July 17, 2000, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-00014-00011) (the "2000 Permit") jointly to NYCDPR and FPP (the "Permittee"), for a non-specific "facility" under Part 360-1.9(b) at the Site (see Appendix 1 for a copy of the permit). This permit allowed the Permittee to import and place fill necessary to construct the Project. This permit allowed for 1,000,000 cubic yards of fill material (in-place volume) to be imported and placed on the Site. The Permittee prepared an Engineering Report, dated April 11, 2000 and a Report on Fill Management Operations & Maintenance, dated May 16, 2000 as part of the permit application.

After the receipt of the original Part 360 Permit in July 2000, FPP entered into a contract with LAWS Construction Company, Inc. (the "Contractor") to construct the golf course, parks and other features of the Project, and to identify, secure and import the off-site fill material to be used to meet the design elevations of the grading plans referenced in the 2000 Permit.

Initially ARCADIS/Geraghty & Miller, Inc. was retained as the IEM. ARCADIS/Geraghty & Miller, Inc. was retained as the IEM for a period from July 2000 to December 2000 and was replaced as the IEM by Gannett Fleming Engineers and Architects, P.C. in December 2000.

FPP began importing fill to the Site in August 2000 and continued, with some interruptions, until January 2002 when fill deliveries were halted pending the modification of the 2000 Permit.

On January 10, 2001, the NYSDEC issued a letter addressing quality control protocol for potential sources of material from sites that previously experienced backfilling with soil, but not with waste materials, for the use in the shaping layer.

On May 21, 2001, the NYSDEC issued a Fill Procurement Protocol letter addressing acceptance of uncontaminated, unprocessed construction and demolition debris ("C&D") from registered C&D processing facilities.

On May 24, 2001, the NYSDEC issued a Fill Procurement Protocol letter addressing paragraph b in the May 21, 2001 letter and clarifying the definition of processed material.

From May to December 2001, based on the results of the Site perimeter methane gas monitoring, the NYSDEC required the construction of a landfill gas passive vent trench along most stretches of the Site perimeter from the water's edge near the foot of Emerson Avenue, along the entire length of the Site boundary with Balcom Avenue, and along Schley Avenue and continuing approximately 1,050 feet to the west past the intersection of Schley Avenue and Buttrick Avenue. In total, approximately 5,350 feet of passive vent trench was constructed (see Section B.3.a of Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx,

NY, Engineering Report, dated June 30, 2005 (revised) for additional information). Additional discussion related to the vent trench construction is included in Sections 4.2.4 and 4.6 of this report.

In February 2002, the Permittee requested a modification to the 2000 Permit to increase the volume of in-place fill to approximately 1,550,000 cubic yards and changes in design features. The Permittee prepared a Supplement to the Engineering Report, dated February 11, 2002 and a Response to Request for the Additional Information, dated July 2, 2002 as part of the permit modification.

On October 18, 2002, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-0014-00013) (the "2002 Permit") to allow the Permittee to place 1,522,300 cubic yards of in-place fill on the Site (see Appendix 1 for a copy of the permit modification). Prior to October 18, 2002, 446,500 cubic yards of shaping material had been imported to the Site.

After the NYSDEC issued the 2002 Permit in October 2002, FPP resumed importing fill to the Site. The importation of fill to the Site was performed in accordance with the 2000 Permit, the 2002 Permit, the 2000 Fill Report and the Fill Procurement Protocol per the NYSDEC letters dated January 10, 2002, May 21, 2001 and May 24, 2001.

On December 10, 2002, NYCDPR submitted the Response Action Plan ("RAP") as required by Special Condition 31 of the 2002 Permit. A copy of the RAP is included in Appendix 19.

On March 10, 2003, NYCDPR submitted a proposal to the NYSDEC to repair and replace methane monitoring system components. A copy of the proposal is included in Appendix 19.

In response to NYCDPR's March 10, 2003 request to repair and replace methane monitoring system components, the NYSDEC approved replacement of 34, 25-foot spaced, semi-permanent monitoring wells with eighteen, 50-foot spaced, monitoring wells along Miles and Emerson Avenues, in accordance with Special Condition #37 of the 2002 Permit, on March 17, 2003. Installation of the replacement monitoring wells was completed in May 2003.

On November 18, 2003, the NYSDEC approved the Work Plan for the Final Consent Order, Case No. R2-20030724-187, dated November 18, 2003. This provided for the placement on Site of the solid waste material excavated during the construction of the gas venting trench, the size reduction of concrete on Site, and the processing and composting of existing wood on Site. The solid waste material was moved and placed in January 2004 and the processing and composting of the wood was completed in the spring of 2004. A copy of the approval is included in Appendix 19.

On January 12, 2004, the NYSDEC transmitted a copy of the executed Order on Consent No. R2-20030724-187 to NYCDPR. A copy of the fully executed consent order is included in Appendix 19.

On November 1, 2004, the NYSDEC approved the revised truck compaction factor of 42.4% based on the October 10, 2003 30% aerial topographic survey as was required per the 2002 Permit.

On December 7, 2004, the NYSDEC approved the revised truck compaction factor of 41% based on the July 17, 2004 60% aerial topographic survey as was required per the 2002 Permit.

In May 2005, the Permittee requested a modification to the permit to increase the volume of in-place fill to approximately 2,370,000 cubic yards among other items in order to reshape the Golf Course related to a revised design by the golf course architect. The Permittee prepared Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associated dated June 30, 2005 (revised) and Volume #2, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associated dated June 30, 2005 (collectively known as the "2005 Engineering Report"). A copy of the 2005 Engineering Report is included in Appendix 20.

On August 2, 2005, NYCDPR responded to NYSDEC comments on the previously submitted June 30, 2005 Permit Modification and Engineering Report. A copy of the comment response is included in Appendix 19.

On November 18, 2005, the NYSDEC issued the modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013) to place a total of 2,543,729 cubic yards of in-place fill on the Site (see Appendix 1 for a copy of the permit modification). This action was followed by a December 27, 2005, revision (No. 2-6006-00014/00013) that amended the total in-place fill volume to 2,370,000 cubic yards (the "2005 Permit").

On April 4, 2006, NYCDPR submitted a request for a determination related to cover layer material chemical criteria to the NYSDOH. On August 2, 2006, the NYSDOH provided written determination related to fill material chemical criteria required under Permit Special Condition 15(d) of the 2005 Permit. The submission and response are included in Appendix 19.

On October 25, 2006, the NYSDEC authorized the importation of shaping layer material from otherwise allowable sites with a total carcinogenic SVOC level in exceedance of the site limit, but 10 ppm or lower provided that a weighted average equal to or less than 3 ppm would be achieved by the end of each quarter of each year. A copy of the correspondence is included in Appendix C.1 of the 2013 Engineering Report (Appendix 20).

On October 26, 2007, the NYCDPR terminated the license agreement with Ferry Point Partners, LLC and took over site development activities. Ferry Point Partners, LLC was no longer involved with the Project or a Permittee.

On February 29, 2008, FPP submitted an application to the NYSDEC to transfer the Part 360 Permit solely to NYCDPR.

On July 25, 2008, a permit renewal application package to the 2005 Permit was submitted by NYCDPR. This submittal requested a modification of the 2005 Permit to allow the use of dredge and processed dredge material (PDM) as fill and the barge delivery of such fill material to the Site.

On August 12, 2008, the NYSDEC notified NYCDPR and FPP that the Part 360 Permit had been transferred to NYCDPR.

On October 24, 2008, the NYSDEC issued a Notice of Incomplete Application and comments to the July 25, 2008 submittal.

On December 2, 2008, the NYSDEC issued a letter to advise NYCDPR that the 2005 Part 360 Permit (with the corresponding November 30, 2008, expiration date) remained in full force and effect until NYSDEC approved the permit renewal application, as per Section 401(2) of the State Administrative Procedure Act (SAPA). See Appendix A of the 2013 Engineering Report (Appendix 20) for a copy of the SAPA letter.

On December 26, 2008, a response to NYSDEC's comments of October 24, 2008 was submitted by NYCDPR with a supplemental permit application package to the 2005 Permit.

On April 8, 2009, the NYSDEC issued comments to the December 26, 2008, permit application submittal. A copy of the comment letter is included in Appendix 19.

On April 9, 2009, the NYCDPR withdrew its request for a permit modification to allow the use of Processed Dredged Material ("PDM") as fill.

On April 30, 2009, the NYSDEC directed NYCDPR to not accept or place on the Site any cover layer materials with arsenic concentrations greater than 16 ppm or lead concentrations greater than 400 ppm. A copy of the correspondence is included in Appendix C.2 of the 2013 Engineering Report (Appendix 20).

On July 9, 2009, NYCDPR submitted proposed cover layer material chemical criteria to NYSDEC for review and approval. A copy of the correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

On July 28, 2009, the NYSDEC notified NYCDPR that cover material is divided between two classifications: Active (suitable for use in Active or Passive Recreation areas), and Passive (suitable for use in Passive Recreation areas only). NYSDEC provided a table to NYCDPR listing modified heavy metal chemical limits for the cover layer at the Site. A copy of the correspondence is included in Appendix C.2 of the 2013 Engineering Report (Appendix 20).

On September 18, 2009, NYCDPR submitted rationale for a revised shaping layer correction factor based on the latest survey and fill imports volumes at that time. A December 11, 2012 letter evaluating the September 18, 2009 submittal was also submitted to the NYSDEC. The submissions are included in Appendix 19.

On September 25, 2009, the NYSDEC revised and clarified the chromium chemical limits for the cover layer previously presented in the July 28, 2009 correspondence. A copy of the correspondence is included in Appendix C.2 of the 2013 Engineering Report (Appendix 20).

On November 25, 2009, a response to NYSDEC's comments of April 8, 2009, was submitted by NYCDPR with a second supplemental permit application package to the 2005 Permit. This submittal withdrew the request to allow the use of dredge material and PDM as fill and the barge delivery of such fill material to the Site. This submittal also proposed a design modification for a Site-wide active landfill gas control system. The 2005 Permit included passive venting systems for the Site, with active systems proposed only in enclosed structures. The November 25, 2009 permit renewal application is included in Appendix 20.

On June 25, 2010, the NYSDEC issued a Notice of Incomplete Application and comments on the November 25, 2009, permit application submittal. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On August 6, 2010, the NYSDEC issued additional comments on the November 25, 2009, permit application submittal. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On September 29, 2010, a response to NYSDEC's comments of June 25 and August 6, 2010, was submitted by NYCDPR with a third supplemental permit application package for the 2005 Permit. This submittal withdrew the proposed design modification of a Site-wide active landfill gas control system and proposed a system consistent with the 2005 Permit. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On October 7, 2010, a supplemental response to NYSDEC's comments of June 25 and August 6, 2010, was submitted by NYCDPR to accompany the September 29, 2010, permit renewal application submittal. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On October 25, 2010, Woodard & Curran replaced Gannett Fleming, assuming the duties of the IEM for the Project.

On December 17, 2010, NYCDPR submitted supplemental information to the NYSDEC related to the Landfill Gas Report originally submitted to the NYSDEC on November 16, 2010 to address requests from the NYSDEC from a December 2, 2010 meeting. The November 2010 Landfill Gas Report and the December 17, 2010 supplemental information are included in Appendix E of the 2013 Engineering Report (Appendix 20).

On January 3, 2011, the NYSDEC issued a letter directing NYCDPR to collect and provide additional landfill gas data to better elucidate the subsurface conditions at a frequency described in the 2005 Permit. The letter requested that NYCDPR expand the landfill gas monitoring to include concentrations of hydrogen

sulfide, volatile organic compounds, and carbon monoxide, well temperature, and well pressure. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On January 10, 2011, NYCDPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to fill material imported to the Site that violated the Permit. During 2010, fill material was brought on-site and placed in seven different stockpiles. The material was believed to be in conformance with Permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. Under the terms of the consent order, the material was allowed to remain on-site under controlled conditions. The material was used to construct the base of the clubhouse and maintenance facility parking lots. Additional details are included in the Order on Consent, which is included in as Appendix I of the 2013 Engineering Report (Appendix 20).

On January 12, 2011, NYSDEC issued a response to NYCDPR's Request for Explanation of NYSDEC Request for Expansion of Ferry Point Park Landfill Gas Monitoring Parameters. Additional parameters included collecting data for hydrogen sulfide, volatile organic compounds and carbon monoxide, well temperature and well pressure. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On February 16, 2011, NYCDPR submitted test pit analytical data to NYSDEC for review related to demarcation layer installation requirements. A copy of the correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

On March 9, 2011, the NYSDEC issued a response to NYCDPR's February 16, 2011 correspondence requiring demarcation layer to be installed on the Site only in areas where there was less than five feet of shaping and cover layer materials. A copy of the correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

On May 13, 2011, NYCDPR issued a memorandum to the NYSDEC presenting the results of a site-wide water balance based on a cover layer material permeability of 14 inches per hour, which indicated that there would be a reduction in the infiltration rate over the entire Site. A copy of the correspondence, which includes additional details on the topic, is included in Appendix D.1 of the 2013 Engineering Report (Appendix 20).

On May 26, 2011, NYCDPR requested confirmation from the NYSDEC that the use of USEPA Analytical Method 625/8270 was an acceptable alternative method for the analysis of dioxin and furan constituents. The NYSDEC provided verbal confirmation that this was an acceptable method to be used. A copy of the correspondence is included in Appendix C.5 of the 2013 Engineering Report (Appendix 20).

NYCDPR issued a June 2011 report to the NYSDEC regarding sampling and analysis of landfill gas vents at the Community Park. A copy of the report, which includes further details of this sampling and analysis, is included in Appendix E.3 of the 2013 Engineering Report (Appendix 20). On July 1, 2011, the NYSDEC concluded that there were no ambient air impacts due to the landfill gas emissions from the twelve vents

located in the Community Park and that no further monitoring was necessary beyond routine maintenance.

On August 10, 2011, NYCDPR issued a subsequent water balance memorandum indicating that a higher cover layer material permeability of 30 inches per hour would also result in a lower volume of water infiltrating through the surface of the Site after completion of construction. Section 4.2.1 includes the description relating to the site permeability modifications. Additional details related to the water balance are included in Appendix D.2 of the 2013 Engineering Report (Appendix 20).

On September 19, 2011, NYCDPR prepared technical memorandum Field Sampling Procedures for Ferry Point Site related to groundwater characterization. The memorandum is included in Appendix G of the 2013 Engineering Report (Appendix 20).

On October 18, 2011, NYCDPR submitted a technical drainage review memorandum to the NYSDEC for review regarding the final cover material and site wide water balance. A copy of the correspondence is included in Appendix D.5 of the 2013 Engineering Report (Appendix 20).

On October 21, 2011, the NYSDEC provided a response to NYCDPR's October 18, 2001 technical drainage review memorandum including a conditional approval allowing cover layer material to have a percolation rate of up to 30 inches per hour. The condition was that NYCDPR was required to submit for approval an amendment to the Stormwater Pollution Prevention Plan (SWPPP) including plans and computations that reflect the partial lining of stormwater basins. A copy of the correspondence is included in Appendix D.5 of the 2013 Engineering Report (Appendix 20).

On November 16, 2011, NYCDPR provided NYSDEC with a technical memorandum addressing the conditions included in the October 21, 2011 conditional approval for the cover layer material percolation rate. A copy of the correspondence is included in Appendix D.6 of the 2013 Engineering Report (Appendix 20).

On December 2, 2011, the NYSDEC provided an approval for NYCDPR's SWPPP amendment via email. A copy of the correspondence is included in Appendix D.6 of the 2013 Engineering Report (Appendix 20).

On January 26, 2012, the NYSDEC clarified that the average percolation rate from all samples collected within one cover layer material stockpile could be used as the representative percolation rate of that stockpile due to the mixing that occurred during loading, unloading, transport, stockpiling, and spreading of the material. A copy of the correspondence is included in Appendix 19.

On March 28, 2012, NYCDPR submitted to the NYSDEC initial groundwater monitoring data from the installation of 11 new monitoring wells installed and sampled in February 2012. NYCDPR requested additional direction from the NYSDEC concerning procedures for future sampling events.

On May 1, 2012, the NYSDEC acknowledged that settlement plate monitoring at several points has been discontinued due to interference with ongoing construction, and informed NYCDPR that the short-term monitoring locations did not need to be replaced as long as construction at the Site progressed and the long-term plates were installed as construction was completed. A copy of the correspondence is included in Appendix H of the 2013 Engineering Report (Appendix 20).

On May 8, 2012, a conference call was held between NYCDPR and the NYSDEC to discuss the initial groundwater monitoring data submitted on March 28, 2012 and to discuss guidance for future groundwater monitoring. The NYSDEC provided NYCDPR with requirements for future groundwater monitoring in their May 8, 2012 Ferry Point Park Groundwater Characterization/Monitoring Objective. Meeting minutes are included in Appendix G of the 2013 Engineering Report (Appendix 20).

On May 24, 2012, the NYSDEC verified via email that there were no outstanding enforcement actions for the Site. A copy of the correspondence is included in Appendix B of the 2013 Engineering Report (Appendix 20).

In May 2012, the Permittee requested a modification to the Permit presenting studies, modeling, investigations, and design work that were performed to resolve outstanding comments that were received by the Permittee after the April 8, 2009 Notice of Incomplete Application and the November 25, 2009 permit application to the NYSDEC. NYCDPR submitted the initial version of the Supplemental Engineering Report dated May 31, 2012.

On June 8, 2012, the NYSDEC confirmed that the sand material used for the tees, greens, and sand traps (bunkers) should not be counted towards the Permit stated allowable cover soil maximum of 250,000 cubic yards. Based on information provided to the IEM by NYCDPR, NYCDPR's consultants have estimated the required sand material volumes as follows: Tees and Greens (24,705 cubic yards), Driving Range Tee (3,025 cubic yards), and bunkers (6,076 cubic yards). Since these values were estimated and calculated by NYCDPR's consultants, it shall be noted that actual installed volumes may fluctuate from the volumes identified above. Information is from an email from Joe Voss to Faisal Choudhury on June 13, 2012. A copy of the correspondence is included in Appendix 19.

On January 23, 2013, NYCDPR submitted the rationale for increasing the amount of cover layer material that could be imported to the Site under the Permit. A copy of the correspondence is included in Appendix 19.

On February 1, 2013, The NYSDEC issued an amendment to the 2005 Permit (last modified October 17, 2012) authorizing the Permittee to import a total of 2,514,000 cubic yards of in-place fill totaling approximately 2,120,000 cubic yards of shaping layer material and approximately 394,000 cubic yards of cover layer material. A copy of the amendment is included in Appendix 1.

On April 26, 2013, the NYSDEC notified NYCDPR that the compaction factor for cover layer material was revised to 18%, approving NYCDPR's revised April 8, 2013 submittal. A copy of the approval letter and submittal are included in Appendix 19.

On October 15, 2013, NYCDPR submitted the final version of the "2013 Engineering Report", entitled Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, NY dated May 31, 2012 (Revised August 31, 2012, October 15, 2013) to address concerns raised by the NYSDEC since the Notice of Incomplete Application of November 25, 2009 to modify the 2005 Permit. The 2013 Engineering Report is attached in Appendix 20.

On April, 17, 2014, the NYSDEC confirmed via email that a minor exceedance of the cover layer in-place volume as included in the Permit is acceptable considering no additional shaping material will need to be imported and that the exceedance could be addressed via as-built drawings and in the final construction certification report. A copy of the email is included in Appendix 19.

On May 21, 2014, the NYSDEC issued the modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013 (SW)) and Tidal Wetlands Permit (No. 2-6006-00014/00016 (TW)) (the "2014 Permit"). See Appendix 1 for a copy of the permit.

On October 29, 2014, the NYSDEC issued an amendment to Special Condition 24 of the 2014 Permit stating that during fill delivery and earthwork, NYCDPR should submit quarterly reports to the NYSDEC summarizing all Site activities set forth in the Permit. Each report should provide details of all rejected fill material, quantify the amount of material imported to the Site using truck volumes, and the results of all on-site monitoring for that period. All fill tracking, earthwork activities, landfill gas monitoring, and associated reporting requirements typically contained within each Fill Management Report would be addressed by Quarterly Reports moving forward and Fill Management Reports would no longer be issued. FMRs were no longer being issued due to a significant reduction in fill importation and earthwork activities at the Site. A copy of the letter is included in Appendix 1.

For a detailed history of site operations and activities prior to June 30, 2005, see Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associated dated June 30, 2005 (revised) which is attached in Appendix 20.

### 1.3.6 Construction Drawings

The project included a substantial number of different construction drawings associated with the Project. Construction drawings are included in Appendix 4.

# 2 Part 360 Permit

## 2.1 Part 360 Permits and Modifications

The following is a list of the permits and modifications issued for this Project:

On July 17, 2000, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-00014-00011) (the "2000 Permit").

On October 18, 2002, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-0014-00013) (the "2002 Permit").

On November 18, 2005, the NYSDEC issued a modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013), followed by a December 27, 2005 revision (the "2005 Permit").

On May 21, 2014, the NYSDEC issued a modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013 (SW)) and a Tidal Wetlands Permit (No. 2-6006-00014/00016 (TW)) (the "2014 Permit").

Note that a separate SPDES General Permit for Stormwater Discharges from Construction Activity (GP-08-001) was obtained for the Project and the Acknowledgement of Notice of Intent is dated May 12, 2009 (Permit Identification No. NYR10R112).

Copies of the aforementioned permits and modifications are included in Appendix 1.

## 2.2 Reference Documents

Refer to Appendix 2 for a list of Permit reference documents. These documents support the original Permit and/or provide basis for subsequent permits renewals and modifications.

## 2.3 Non-Conformance Issues

In accordance with Special Condition 24, the IEM reported on Permit related non-conformance issues during the duration of construction at the Site. A complete list of all non-conformance issues observed and corrective actions taken during the Project is included in Appendix 3.

## 2.4 Operational Upsets, Emergencies, and Unusual Circumstances

### 2.4.1 Security breaches, Unauthorized Entries, Injuries, Fires, Theft, Vandalism, etc.

The following information was gathered from TRC, NYCDPR's design and construction consultant:

In July/August of 2013, a CBS film crew received authorization from the Agency to scout and film areas within the Ferry Point Golf Course proper. There were no known issues with those activities.

TRC did not have specific detailed reports for thefts or vandalism that occurred on the Site. To the best of their knowledge, there were two incidents of vandalism to contractor equipment (broken glass

windows and spray painted vehicles), and a few incidents when the perimeter fence was damaged (bent/scratched vertical bars). Landfill gas vent caps were damaged, but there was no evidence of vandalism; the vent caps may have been damaged by lawn mowers or other equipment running over them.

There were no known major fires or injuries during the construction time period.

The only unusual event was the discovery of the body of a construction worker who had fallen from the Throggs Neck Bridge and washed up at the Waterfront Park. For several days there was police presence and other related activity. However, that event was not related to the work at the golf course nor did it delay or adversely affect the progress of the project.

As reported by the IEM:

On the evening of August 18, 2011, the Site was broken into by unknown persons. LAWS equipment storage containers were forced open and various tools and copper piping was stolen. The trespassers appeared to have entered the Site at the back entrance to the golf course along Balcom Avenue. The fence was observed cut open in that area.

Upon arrival at the Site on August 26, 2011, IEM staff observed that the IEM trailer had been broken into by unidentified persons. On-site security and LAWS representatives were notified as well as the local police (by LAWS). Two digital cameras were stolen from the IEM trailer.

On June 25, 2012, the IEM witnessed a trailer of imported fill material slide off its frame during dumping activities. No injuries were reported.

On October 31 and November 1, 2012, IEM staff performed on-site inspections to assess damage caused by Hurricane Sandy. IEM staff observed many areas around the Site where restoration work needs to be performed on the vent trench, silt fence repair, site security fence repair, and garbage/debris removal. The southern site boundary was observed to have significant damage and washout. The entire south end of the Site was open without protection and it was filled with debris from the storm.

On October 25, 2012, the IEM witnessed both a truck and a trailer roll over onto their side during dumping activities. No injuries were reported.

Various Permit non-conformance issues were observed related to unsatisfactory security at the Site beginning with non-conformance issue 12 on October 1, 2003 where security fence and other controls were not properly maintained on-site allowing for unauthorized entry to the Site. Site security, control, and unauthorized access were the subject of non-conformance issues 15, 72, 90, 93, 97, 98, 122, and 127. Ultimately, all of these non-conformance issues were resolved and closed out during construction on an ongoing/as-needed basis.

There was a presence of coyotes at the Site as tracked and studied as part of the Gotham Coyote Project. The work was conducted under NYCDPR permits and information was released to NYCDPR for informational purposes. Coyotes were initially monitored by game camera in Ferry Point Park beginning in January 2012 through 2013. Coyote monitoring did not occur at the Site in 2014.

## 2.5 Reporting

The IEM was responsible for reporting to the NYSDEC related to Permit activities and compliance for the Project in accordance with Special Condition 24 of the 2014 Permit. The IEM prepared and submitted to the NYSDEC Daily Observation Reports ("DOR"), bi-weekly Fill Management Reports ("FMR"), and Quarterly Reports ("QR"). These reports are attached as appendices to this report and available at the NYCDPR Bronx Borough Headquarters (Ranaqua) document repository and are part of the public record. The address of the repository is 1 Bronx River Parkway, Bronx, NY 10462, telephone: (718) 430-1800.

### 2.5.1 Daily Observation Reports (DOR)

The IEM reported to the NYSDEC on a daily basis on the following information: weather conditions, municipal solid waste material removal from the site, fill materials imported to the site, detailed notes of construction activities, and non-conformance issues related to the Permit conditions.

DORs are attached in Appendix 5 beginning on October 25, 2010. Daily site activity observations for the time period prior to October 25, 2010 are summarized in the IEM's Fill Management Reports.

### 2.5.2 Fill Management Reports (FMR)

The IEM prepared Fill Management Reports (FMRs) that were submitted to the NYSDEC on a bi-weekly basis. Generally, the FMRs contained the following information and data: a project summary including an overview of site activities, Permit non-conformance issues, fill source site review activities and associated data, site testing activities, filling and shaping activities, and environmental monitoring. FMRs contained figures identifying imported material dump locations and any active filling, grading, and shaping areas associated with the landfill cap.

FMRs were discontinued on October 31, 2014 with FMR 346. FMRs were discontinued because the importation of shaping layer and cover layer materials and earthwork activities were significantly reduced in scope and scale on the Site. In a Permit amendment issued to NYCDPR on October 29, 2014, the NYSDEC stated that all fill tracking, earthwork activities, landfill gas monitoring, and associated reporting requirements would be addressed by Quarterly Reports thereafter.

FMRs 1 through 346 are attached in Appendix 6.

### 2.5.3 Quarterly Reports

The IEM prepared Quarterly Reports (QRs) that were submitted to the NYSDEC on a quarterly basis. Generally, the QRs contained summarized and aggregated information included in FMRs over each quarterly reporting period.

QRs beginning with the 4th Quarter of 2002 through the 1st Quarter of 2015 (with the exception of the 1st Quarter of 2011) are attached in Appendix 7. Observations for site activities for the 1st Quarter of 2011 are included in FMRs 247 through 253.

## 2.6 Authorized Fill Volumes

On July 17, 2000, the NYSDEC issued 2000 Permit jointly to NYCDPR and FPP to allow for a total of 1,000,000 cubic yards of fill to be imported and placed on the Site including approximately 750,000 cubic yards of in-place shaping layer material and 250,000 cubic yards of in-place cover layer material.

On October 18, 2002, the NYSDEC issued the 2002 Permit to allow a total of 1,522,300 cubic yards of fill (in-place) to be imported and placed on the Site. The fill material was to consist of approximately 1,272,300 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The 2002 Permit also stated that, "approximately 415,000 cubic yards of fill was deposited on the Site prior to the effective date of the Permit and the projection for in-place fill material to complete the project was 1,107,300 cubic yards, consisting of approximately 857,300 cubic yards (in-place volume) of select exempt construction debris for the shaping layer and approximately 250,000 cubic yards (in-place volume) of uncontaminated soil for the cover layer.

In 2003, the golf course architect determined that the tournament quality and signature status of the course could be significantly improved by making the facility a "links" style golf course. The changes to the Project as compared to the work authorized under the 2002 Permit included:

- Increasing the support mounding between golf holes and grading the course in a links style.
- Re-routing of holes 11, 12 and 13 to reverse their direction in order to improve player circulation and playing time.
- Moving Hole 9 to the west of the golf driving range in order to improve the safety zone of the driving range and remove the need for high netting.
- Realigning the centerlines of holes: 10, 16, 17, and 18 to improve the strategic layout and visual experience of the golf course.
- Lowering the elevations of tees 4 and 6. This eliminated the retaining wall proposed at the northeast corner of the Site.
- Adding a golf training area at the north end of the driving range. This required shifting the centerline of Hole 8 slightly north and increasing the support mounding around this area to buffer the adjacent holes.
- Increasing the mounding adjacent to the TBTA toll plaza in order to block noise and adjacent traffic from view.
- Shifting the Site roadway along the east side of the bridge to accommodate a TBTA easement that extends 25 feet east of the bridge. This required changes to the parking lot at the clubhouse and the location of detention/water quality basin and Waterfront Park.
- Eliminating the Boathouse Grill restaurant in the Waterfront Park. A restaurant would be located within the banquet facility. Parking spaces for the banquet facility were increased to

accommodate the restaurant. A restaurant may be constructed within the Waterfront Park in a future phase, based on economic demands.

- Modifying the parking lot for the Waterfront Park. The 120 parking spaces for the Waterfront Park will be located near the Whitestone Bridge approach structure.

These proposed changes to the Project increased the total needed in-place fill volume for the project to 2,370,000 cubic yards to shape the golf course in a links style.

The quantification of the imported fill material was continuously tracked by both truck volume and periodic topographic surveys of in-place volumes. Initially it was assumed that truck volume would be reduced by 25% when compacted into place, but a new correction factor was to be calculated. On November 1, 2004, the NYSDEC approved a revised truck correction factor of 42.4%, which was based upon an October 10, 2003 30% aerial topographic survey, and on December 7, 2004, the NYSDEC approved a revised truck correction factor of 41%, which was based upon a July 17, 2004 60% aerial topographic survey. These recalculations were performed by dividing the actual in-place volume by the total cubic yards of truck volume delivered to the Site as of the date of the survey, as required by the 2002 Permit.

TRC prepared the 2005 Engineering Report, which comprised of Volume #1, Volume #2, and a 26 sheet drawing set entitled, "Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2". The 2005 Engineering Report is included in Appendix 20 and represented the following scope of work:

- An 18 hole golf course with practice area;
- Maintenance Area in the northwest corner of the Site;
- Clubhouse parking lot in the southwest portion of the Site;
- Banquet Facility in the southwest portion of the Site (along Emerson Avenue);
- Community Park;
- Waterfront Park with parking lot; and
- Drawing G-3 and G-4 of "Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2", showed the deviations in grading between the plans approved on October 18, 2002 with the proposed plan.

On November 18, 2005, the NYSDEC issued the 2005 Permit authorizing the importation of a total of 2,370,000 cubic yards of in-place fill material to the Site. The fill material was to consist of approximately 2,120,000 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The correction factor was 41% at that time and could be further modified.

On January 22, 2009, in accordance with Special Condition 10 of the 2005 Permit, TRC submitted a revised truck reduction factor of 40.3%. On September 18, 2009 TRC submitted a truck reduction factor of 43.3% based on a May 10 2009 aerial topographic survey. On February 11, 2010, the NYSDEC approved a truck reduction factor of 41.7% as submitted by the IEM on December 11, 2009 (included in Appendix 19).

The Golf Course layout that NYCDPR moved forward with was modified from what was shown in the 2005 Engineering Report as revised by the 2013 Engineering Report. One major change was the complete removal of the Banquet Facility in the southeast part of the Site. There were also changes in the placement, alignment, and grading of some holes on the Golf Course.

On February 1, 2013, the NYSDEC granted a permit modification to increase the limit of cover material from 250,000 to 394,000 cubic yards with the stipulation that NYCDPR revisit the correction factor for cover layer material. It was determined that the correction factor for the granular cover material (sand) was 18%. This revised the truck volume to 480,488 cubic yards. The correction factor for cover layer material was approved per an April 26, 2013 letter from NYSDEC to NYCDPR as included in Appendix 19.

On May 21, 2014, the NYSDEC issued the 2014 Permit to NYCDPR to allow the import of a total of 2,514,000 cubic yards of in-place fill material including 2,120,000 cubic yards of in-place shaping layer material and 394,000 cubic yards of in-place cover layer material.

# 3 Fill Importation QA/QC Program

Fill material importation commenced on August 2, 2000 and the last day for fill import was May 5, 2015. The fill importation QA/QC program implemented for the Project based on the Permit and associated reference documents was adhered to. The fill importation consisted of two main components including source site reviews and on-site inspections. A source site review was conducted by the IEM prior to any fill material being imported to the Site and additional visual and photo-ionization detector (PID) inspections were completed by the IEM upon the material entering the Site at the IEM inspection platform and again once the material was dumped at the work or stockpile location on the Site.

## 3.1 Source Site Reviews

Prior to any shaping layer or cover layer material being imported to the Site, each potential source was thoroughly evaluated by the IEM. An environmental review was performed for all proposed source sites in accordance with Special Condition 24 of the 2014 Permit. The source site review process criteria was specified in the Report on Fill Management, Operations and Maintenance, prepared by TRC on May 16, 2000, and revised June 30, 2005 (Volume #2 of the 2005 Engineering Report). The source site review process was modified over time as compared to the original process outlined in the various engineering reports and permit modification requests. The process generally consisted of the following main components:

1. NYCDPR would notify the IEM of a new potential source site. NYCDPR would provide the IEM with the site name and location as well as any available historical site information and soil environmental analytical results that existed for the potential source site.

2. Once NYCDPR confirmed that they wanted to move forward with pursuing the potential source site, NYCDPR authorized the IEM to retrieve any available site information from Environmental Data Resources, Inc. (EDR) which included environmental and historical land use records for the source site property under evaluation including Sanborn maps, city directories, topographic maps, and aerial photographs. NYCDPR then completed an initial review of the existing site information,

generated a sampling plan, and provided the results of the initial review and sampling plan to the IEM. NYCDPR then authorized the IEM to conduct a desktop review of the existing site information (i.e. EDR), any available soil environmental analytical results, and NYCDPR's sampling plan. The IEM provided NYCDPR with comments related to their review and their sampling plan in consultation with the NYSDEC. Once a final sampling plan was agreed upon, the source site investigation was initiated and executed per the NYCDPR sampling plan with IEM oversight. For source sites with in situ material, test pits were typically completed with additional soil samples inspected, collected, and analyzed in accordance with the Permit requirements. Once all the sampling was completed, the IEM reviewed sample results and the IEM generated a memorandum summarizing the review process and provided recommendations and requirements necessary for NYCDPR to address in order to continue pursuing the potential source site. The recommendations typically included conditions associated with overseeing the excavation, loading, and import of the source site material to the Site in accordance with the Permit. The IEM submitted the memo of recommendations to the NYSDEC for review and comment prior to issuing the final memorandum to NYCDPR. The NYSDEC would provide final comments and approval of the source site with any additional required conditions.

3. If NYCDPR determined that the potential source site was worth pursuing considering site-specific conditions, schedules, etc., they coordinated with the source site operator and IEM on importation schedule and requirements. The IEM provided oversight to confirm that the loading, hauling, and overall import of the approved material was completed in accordance with the memorandum of recommendations, NYSDEC conditions, and the Permit.

4. The IEM provided oversight during export from the approved source sites on an as needed basis and provided oversight at each source site during additional sampling activities if the source site was exporting more than the minimum sampling frequency outlined in the Permit (i.e. 10,000 cubic yards for shaping layer material and 2,000 cubic yards for cover layer material).

If at any time during the review process there were reasons for concern identified by the IEM resulting in the potential source site being classified as a "complex" source site, the NYSDEC became the primary reviewer and made final recommendations related to additional site investigation requirements or approval/rejection of the potential source site with support from the IEM. A complex source site was defined by the presence of an abundance of or particular Recognized Environmental Concerns ("RECs") and the NYSDEC made any decisions related to approval and/or associated conditions for further evaluation or import of the fill material.

A flow chart detailing the source site review process is included as Appendix 21.

Details of source site review and site testing activities are included in the report text and tables of each bi-weekly Fill Management Report issued by the IEM. Source site review supporting information and testing data is included in Appendix 8.

The following is a listing of source site reviews completed by the IEM since October 25, 2010. Since October 25, 2010, Woodard & Curran's first day as the IEM, 42 potential source sites were formally identified as potential fill source options by NYCDPR. Of the 42 potential source sites identified since October 25, 2010, 39 were advanced to at least a preliminary review stage. Potential source sites did not advance to a full source site review for various reasons such as changes in schedule, insufficient material, financial infeasibility, red flags identified with past uses of the source site, etc. Details of each source site review and site testing activities completed by the IEM, prior to any importation to the Site, are included in Sections 3.1.1 and 3.1.2 below.

A total of 15 of the potential source sites evaluated after October 25, 2010 and through project completion resulted in material being imported to the Site during that same time period. It is noted that all of the source site reviews included in Sections 3.1.1 and 3.1.2, are associated with the Golf Course and all cover layer material exposed at the surface within the golf course was imported from the cover layer material source sites included in Section 3.1.2 below. Refer to FMRs 1 through 241 for details related to source site reviews and site testing prior to October 25, 2010, which are included in Appendix 6.

For a list of source sites that imported material to the Site between November 18, 2005 and October 25, 2010, see the table included in Appendix 12. Refer to FMRs in Appendix 6 for source sites and estimated fill material imported to the Site prior to November 18, 2005.

The following were potential source sites that were identified by NYCDPR since October 25, 2010 where a review was not initiated:

1. 10 Byron Place (Larchmont, NY)
2. College Point
3. PS-331 (Tremont Avenue, Bronx, NY)

The following were potential shaping layer source sites that were identified by NYCDPR since October 25, 2010 with some level of source site review being completed. Source sites that resulted in a complete review and the importation of shaping layer material to the Site after October 25, 2010 are identified with bold text.

1. **PS-310 (942 62nd Street, Brooklyn, NY)**
2. PSAC
3. Barclays Arena (620 Atlantic Avenue, Brooklyn, NY)
4. JFK Jet Blue/Delta Runway (Jamaica, NY)
5. Columbia University
6. Long Island Jewish Center (270-05 76th Avenue, New Hyde Park, NY)
7. Highbridge Terrace (220 West 167th Street/Sedgewick Avenue, Bronx, NY)
8. Astoria (27-07 23rd Avenue, Queens, NY)
9. **Eastside Access (Queens Street and Jackson Avenue, Queens, NY)**

10. **Kew Gardens (Van Wyck Expressway between Grand Central Avenue and 86th Avenue, Queens, NY)**
11. PS-285 (1065 Martin Luther King Boulevard, Bronx, NY)
12. Flushing Hotel (133-63 Roosevelt Avenue/39-20 Prince Street, Queens, NY)
13. **2nd Avenue (2nd Avenue and 94th Street, New York, NY)**
14. 2nd Avenue (2nd Avenue and 72nd Street, New York, NY)
15. Alexander Hamilton Bridge (Bronx, NY)
16. **Throgg's Neck/Target/USPS (815 Hutchinson River Parkway, Bronx, NY)**
17. **PS-287 (110-10 Northern Boulevard, Queens, NY)**
18. City Point Brooklyn (1 Dekalb Avenue, Brooklyn, NY)
19. 400 Park Avenue South (New York, NY)
20. **Union Street (43-31 Union Street, Flushing, NY)**
21. **Mount Vernon Recycling Corp. (113 Edison Avenue, Mount Vernon, NY)**
22. 228th Street (Rosedale, NY)
23. Evergreen Recycling/Tully Environmental (Willets Point Boulevard, Corona, NY)
24. Waterpointe-Whitestone
25. Don Carlo Environmental/Brooklyn (1247 38th Street, Brooklyn, NY)
26. Castle Hill Recycling (1000 Zerega Avenue, Bronx, NY)
27. Springfield Gardens
28. Calvert Vaux (Brooklyn, NY)
29. 160 Myrtle Avenue (Brooklyn, NY)
30. 215 E. 68th Street (New York, NY)
31. **DEP Valhalla (10 Walker Road, Valhalla, NY)**
32. **Tilcon (Bronx) (980 East 149th Street, Bronx, NY)**
33. **NY Recycling (475 Exterior Street, Bronx, NY)**
34. Little Bay (Queens, NY)

The following were potential cover layer source sites that were identified by NYCDPR after October 25, 2010 with some level of source site review being completed. Source sites that resulted in complete reviews and the importation of cover layer material to the Site after October 25, 2010 are identified with bold text.

1. **Bloomingburg (C.M. & Sons Trucking Site, 680 Bloomingburg Road, Bloomingburg, NY)**
2. **Ranco Sand (115 South Street, Manorville, NY)**
3. **East Coast Mines (Lewis Road near Route 104, East Quogue, NY)**
4. Amboy Aggregates (415 Main Street, South Amboy, NJ)
5. **Long Island Compost/Great Gardens (445 Horseblock Road, Yaphank, NY)**

### 3.1.1 Shaping Layer Material

Materials accepted for use as shaping layer on the Site were sampled prior to acceptance and after the import of each additional 10,000 cubic yards as required by Special Condition 14 of the 2014 Permit. For recycling facilities, sampling was conducted after each additional 5,000 cubic yards. As per the November

18, 2005, Permit Modification, each soil sample was analyzed for TCLP VOCs and metals as well as total VOCs, SVOCs, priority pollutant metals, pesticides, PCBs, sulfur, and asbestos.

Fill material imported to the Site and used for the shaping layer was analyzed for the following parameters, per Special Condition 14 of the 2014 Permit. A description of which can be found below as included in Section 4.2.1.1 of the 2013 Engineering Report.

Based on source site reviews and site testing activities, the shaping layer material imported to the Site met the following chemical limits:

Total carcinogenic SVOC levels less than 10 ppm from individual fill material sources, provided that a weighted average of equal or less than 3 ppm for the entire Project. The following are the list of carcinogenic SVOCs that are subject to this 10 ppm limit: Benzo(a)pyrene, Dibenzo(a,h) anthracene, Benzo(a)anthracene, Benzo(b)fluoranthene, Indeno(1,2,3-cd)pyrene, Benzo(k)fluoranthene, and Chrysene.

Total SVOCs less than 500 ppm.

Metals:

- Arsenic less than 28 ppm;
- Barium less than 2,000 ppm;
- Cadmium less than 20 ppm;
- Chromium less than 1,000 ppm;
- Copper less than 1,000 ppm;
- Lead less than 400 ppm;
- Mercury less than 0.57 ppm;
- Selenium less than 11 ppm;
- Silver less than 100 ppm

Asbestos for all layers 0.5% or less
Total sulfur for all layers 0.5% or less
Total PCBs less than 10 ppm
Total Pesticides less than 10 ppm
VOCs (all individual analytes less than TAGM 4046)

In a letter dated October 25, 2006 (included in Appendix C.1 of the 2013 Engineering Report), the NYSDEC provided a clarification adding that a carcinogenic SVOC limit of 10 ppm or lower is allowable from individual fill material sources, provided that a weighted average of equal or less than 3 ppm is achieved by the end of the Permit.

NYCDPR followed the NYSDEC's directives since receipt of each one associated with the importation of shaping layer material to the Site.

Details of the source site reviews and site testing for each potential shaping layer material source site are as follows:

#### 3.1.1.1 PS-310 (942 62nd Street, Brooklyn, NY)

Source site testing analytical results for the PS-310 site were provided to the IEM by NYCDPR in a submittal dated October 6, 2010, and reviewed by the IEM for potential shaping layer material, based on the site visit performed by Gannett Fleming (the previous IEM) on September 21, 2010, and as recommended in their memo dated September 28, 2010. Samples were collected and tested by Analytical Chemists and issued via lab reports dated October 1, 2010. Analytical results were collected from five test pits from both the fill and natural formation soil layers. An exceedance of lead relative to the Site Permit shaping layer material chemical limits was noted in the fill layer within test pit #3. This information was factored into the final memo of recommendations issued by the IEM dated October 26, 2010 regarding the approved locations and depths of shaping layer material from the source site.

The IEM was on-site on November 10, 2010 to visually inspect and confirm that all fill and petroleum impacted fill from Areas of Concern 1 and 2 were removed. The IEM was also on-site on November 12, 2010 to observe the sampling of three additional sample locations of natural formation soil. The IEM submitted a detailed email to the NYSDEC and NYCDPR summarizing the November 12, 2010 site visit. Shaping material analytical results were reviewed for the PS-310 source site for three samples collected on November 12, 2010. All parameters met Permit criteria for import to the Site.

Approximately 5,308.48 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.2 PSAC

Initial site and fill material information was provided to the IEM between October 25 and November 5, 2010 by Gannett Fleming (the previous IEM). No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.3 Barclays Arena (620 Atlantic Avenue, Brooklyn, NY)

Initial site and material information was provided to the IEM by Gannett Fleming (the previous IEM) between October 18 and November 5, 2010. An initial site visit was completed by the IEM to initially inspect site conditions and materials at the source site. The IEM issued a memo of recommendations for the source site on November 16, 2010 based on materials available at that time. Materials were not reviewed further or imported to the Site at that time.

New material became available at this source site and additional data was provided for IEM review between December 18 and December 31, 2010. The review of this additional data and associated information was initiated. The sampling plan from mid-November 2010 was resubmitted to NYCDPR for the new materials being evaluated at Barclays Arena between January 1 and January 14, 2011 as the

original plan still applied to the additional/revised materials being made available. NYCDPR subsequently notified the IEM that the site source manager did not consider the Site as a viable option at that time.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.4 JFK Jet Blue/Delta Runway (Jamaica, NY)

On December 3, 2010, NYCDPR forwarded the IEM initial lab data for this potential source site associated with a Jet Blue/Delta runway at JFK Airport. On December 6, 2010, the IEM visited the potential source site to inspect the material totaling an estimated 7,000 cubic yards. The IEM witnessed evidence of asphalt and slag in the fill material and notified NYCDPR and the NYSDEC that the material was not a viable option for import to the Site. (See section 3.2.3)

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.5 Columbia University

Initial site and material information was provided to the IEM by Gannett Fleming (the previous IEM) between October 25 and November 5, 2010.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.6 Long Island Jewish Center (270-05 76th Avenue, New Hyde Park, NY)

The IEM conducted an initial site visit on November 5, 2010. An email containing the summary of site visit activities and summary of recommendations was provided. The IEM issued a formal memo of recommendations on November 11, 2010.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.7 Highbridge Terrace (220 West 167th Street/Sedgewick Avenue, Bronx, NY)

On January 10, 2011, a formal fill source site review was initiated for the Highbridge Terrace source site. Sanborn Maps, historical topography maps, historical aerial photos, and the EDR and NYSDEC Spill Databases were reviewed. Approximately 5,900 cubic yards of potential fill material was reportedly available. Initial analytical data was provided however, the IEM was informed by NYCDPR that this potential source site was no longer a viable option at the time and further review did not occur.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.8 Astoria (27-07 23rd Avenue, Queens, NY)

A formal fill source site review was conducted for the Astoria source site February 3, 2011 and consisted of the review of historical information and existing source site sampling data and EDR information. The existing sample data was reviewed and some sample results did not meet the Site Permit limits for shaping material. Preliminarily, the site contractor estimated approximately 2,000 cubic yards of potentially approvable material. The initial review was completed and NYCDPR reported that this source site was no longer a viable option and no further action was expected.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.9 Eastside Access (Queens Street and Jackson Avenue, Queens, NY)

A coordination call was held with the IEM, NYCDPR, and the source site contractor on February 8, 2011. The IEM witnessed initial source site sampling as requested by NYCDPR at the Eastside Access source site on February 9, 2011. A total of seven grab sample collections were observed and one discrete VOC sample collection was observed. The existing stockpile was estimated to measure approximately 2,000-4,000 cubic yards based on an approximation of stockpile dimensions by the IEM.

The IEM received a submittal of information from NYCDPR between February 12 and February 25, 2011. The IEM reviewed the material and found the site to be noncompliant with the Site Permit as material could not be segregated and stockpiled at the source site. Per NYSDEC directive, NYCDPR would be coordinating directly with the NYSDEC for further site review. The site was reviewed by the NYSDEC and a site-specific analytical parameter list (for Metals) was approved by the NYSDEC between March 12 and March 25, 2011.

Between March 26 and April 8, 2011, the IEM was notified by the NYSDEC and NYCDPR that this source site had been approved to export fill materials to the Site by the NYSDEC. The IEM discussed the conditions of the approval with the NYSDEC and began witnessing sample collection of the East Side Access crushed stone material and review of lab reports.

The IEM conducted monitoring of shaping layer material sampling and loading at the East Side Access source site for materials exported to the Site. Sampling at this source site generally occurred the day before materials were expected to ship to the Site. Samples were being analyzed for metals, laboratory results were compared to the Site Permit requirements, and no exceedances of shaping material limits were identified.

Between April 2011 and December 2011, the IEM continued monitoring for this source site. The IEM witnessed sample collection of East Side Access crushed stone material every 10,000 cubic yards, reviewed lab reports, and periodically monitored loading of trucks with shaping layer materials for export to the Site as materials were shipped to the Site.

The IEM reviewed the lab results related to the IEM witnessed source site sampling conducted on December 12, 2011 for proposed shaping material at the East Side Access source site and found the sampled material to be unacceptable for import to the Site based on the fact that the detected value for Arsenic was 48.7 ppm. The permit allowable maximum concentration for Arsenic is 28 ppm. The sampled material was determined to be unacceptable for import to the Site as shaping layer material per the Permit.

NYCDPR requested that the material sampled on December 12, 2011 be removed from consideration for import to the Site and requested that a sample be collected for the next available material at the East Side Access source site. The IEM reviewed the lab results dated December 14, 2011 related to the IEM witnessed sampling conducted on December 13, 2011 for the proposed shaping material and found them to be acceptable based on the fact that the RCRA metals results fell below the Permit shaping layer material allowable maximum concentrations and the Permit USEPA referenced testing method was used. It was determined that approved shaping material to be imported to the Site could only originate from the stockpiles witnessed during the December 13, 2011 sampling event. Material previously sampled on December 12, 2011 was not imported to the Site.

NYCDPR and their associated representatives hypothesized that the unacceptable sample results for arsenic may be a result of a change in the rock removal process, which included drilling, blasting, and crushing to generate the shaping layer material. On December 16, 2011, the NYSDEC stated that if the mining technique did not change (i.e. drilling as opposed to blasting) the sampling frequency could remain unchanged on the basis of the number of successful past results. However, in the event of another failure, the sampling frequency would become one sample per 2,000 cubic yards. The IEM proceeded with observing one sample per 2,000 cubic yards based on a change in mining operations as per discussions with the source site operator.

On February 7, 2012, the NYSDEC stated that based on the number of successful test results for the East Side Access material since the December 12, 2011 failure due to high arsenic content, the NYSDEC approved NYCDPR's request for future testing of East Side Access material at a reduced frequency of one sample per 10,000 cubic yards.

On December 18, 2012, Analytical Chemists collected samples from stockpiled East Side Access Source Site shaping material at the Site that had elevated PID readings when scanned during the on-site inspection process upon import and after dumping. The six segregated loads of East Side Access shaping layer material passed the Site Permit criteria for shaping layer material based on sampling conducted at the Site. Sampling consisted of collected samples witnessed by the IEM on December 18, 2012. Therefore, the material remained on-site and was used as shaping layer material.

Approximately 191,293.87 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.10 Kew Gardens (Van Wyck Expressway between Grand Central Avenue and 86th Avenue, Queens, NY)

Initial site and material information was provided to Woodard & Curran by Gannett Fleming (the previous IEM) between October 25 and November 5, 2010.

A formal fill source site review was initiated for the Kew Gardens between November 6 and November 19, 2010 consisting of compiling and reviewing historical maps, photos, EDRs, and spills database and available information from the source site contractor.

A formal fill source site review was continued for the Kew Gardens source site between November 20 and December 3, 2010 and consisted of the review of Sanborn maps, topographic maps, aerial photographs, NYSDEC spills and remediation database, and the City Directory. A Phase II Environmental Site Assessment (ESA) and associated analytical data was reviewed and sample results did not exceed the Permit limits for shaping layer material. Preliminarily, the source site contractor estimated approximately 10,000 to 15,000 cubic yards of potentially approvable material was available.

On February 11, 2011, the IEM issued a memo of recommendations and sampling plan for the Kew Gardens source site.

The IEM conducted fill material source site sampling oversight at the Kew Gardens site on February 17, 2011. Six areas (1, 2, 3, 4, 5, and 9) were assessed by IEM desktop review and a sampling plan was submitted to, and approved by the NYSDEC for potential cover material evaluation. Representatives from the laboratory, NYCDPR, IEM, and the source site operator met prior to the initiation of sampling activities. The source site operator stated that the full extents of Areas 4, 5, and 9 would not be accessible for visual screening and analytical sample collection and soils in Area 9 were being actively loaded for off-site use. NYCDPR requested that source material evaluation proceed for accessible material. Composite grab and discrete VOC soil samples were collected for laboratory composite and analysis from Areas 1, 2, 5, and 9. Area 4 was not accessible for evaluation. Asphalt and other materials non-compliant with the Site Permit were observed on various soil horizons in Area 3, and as such, no samples were collected as the material was no longer considered for import to the Site.

On February 25, 2011, NYCDPR submitted draft analytical data from the Kew Gardens site for IEM review. At the request of NYCDPR, the IEM performed an initial review of the draft analytical data for cover material, understanding that no final determination can be made until the complete and final data package has been submitted, reviewed by the IEM, and approved by the NYSDEC. The initial IEM review identified cadmium in composite samples from Areas 1, 2, 5, and 9 at concentrations that exceed the Site Permit requirements for cover material. NYCDPR was informed and subsequently requested the material be evaluated for shaping layer material. No exceedances of the Site Permit requirements were identified in the draft data submittal. Additional draft data from the Kew Gardens source site was submitted on March 8, 2011. No exceedances of the Site Permit requirements were identified in that draft data submittal.

Final laboratory data was submitted to the IEM for review on March 18, 2011. Laboratory results were compared to the Site Permit requirements and no exceedances of shaping layer material limits were identified. Metals concentrations in the samples did exceed cover layer material limits. Fill material from

the Kew Gardens source site was approved by the NYSDEC for importation to the Site for use as shaping layer material on March 24, 2011.

Per NYCDPR request, the IEM submitted the Kew Gardens EDR files to NYCDPR on July 1, 2011.

Beginning on August 5, 2011, NYCDPR indicated to the IEM that they had renewed interest in considering shaping layer material from Area 17 at the Kew Gardens source site. The IEM provided a list of concerns and items to address in the sampling plan associated with the attempt to obtain approval for this shaping layer material. On August 11, 2011, NYCDPR indicated that the Kew Gardens review was on hold.

On September 19, 2011, IEM representatives were on-site at Area 17 of the Kew Gardens Source Site to perform a visual, physical, and PID inspection of the existing soil via a total of seven test pits excavated from ground surface to approximately 12 feet to 16 feet below the existing ground surface. The first four test pits were excavated to approximately terminal depth. The last three test pits were terminated prior to reaching terminal depth due to instability of the sidewalls as a result of the presence of dry sand material. The test pits were completed consecutively moving from south to north. The area consisted of approximately 10,000 cubic yards of proposed shaping layer material as identified by NYCDPR and the source site contractor. In addition, the IEM witnessed the collection of grab samples for chemical analysis by NYCDPR's laboratory and logged the test pit locations using handheld GPS equipment.

IEM staff observed an initial layer of organics, which contained a slight odor attributable to decomposition and yielded PID results of 0.1 to 0.5 ppm. This material was not approved for use at the Site and this was communicated directly to NYCDPR and the site contractor. The IEM indicated that any potential approval of shaping layer material from Area 17 would require the full removal of the organic layer prior to any loading and shipping of potentially approval soils to the Site, which would need to be confirmed by the IEM.

The soil below the initial organic layer (beginning approximately 0.5'-1.5' below grade) consisted of brown, silt with some sand and a trace of clay. Cobbles and boulders were also evident throughout the soil profile. No soil staining or odors were observed, and the material encountered below the organic layer was generally consistent in composition. The soil shifted to more of a sand and cobble composition as the test pits progressed towards the north. No asphalt or any other debris was observed in the soil, and the PID scans did not yield any detections.

IEM staff observed the collection of a grab samples at approximately two-foot intervals in each of the seven test pits completed at the Kew Gardens Source Site on September 19, 2011. It was estimated by NYCDPR and the site contractor that approximately 10,000 cubic yards were available from Area 17 of the source site. In addition to the required discrete sampling of VOCs/TCLP VOCs, the lab was instructed by NYCDPR to run three composite samples for the remaining analyses. The composite samples consisted of the grabs from each depth interval. The first two test pits completed represented composite sample #1, the second two test pits represented composite sample #2, and the last three test pits represented composite sample #3.

The IEM completed a preliminary review of shaping layer material originally sampled on September 19, 2011 proposed for import to the Site from Area 17. The IEM required a revised lab report from Analytical Chemists which contained the TCLP VOA and Metals results as well as the dioxin/furan scan using SW 8270. All other lab data was complete and did not exceed any of the Site Permit criteria. Prior to final

approval to import this material to the Site, NYCDPR was required to obtain the NYSDEC's approval to use the alternative dioxin/furan analysis.

NYCDPR received NYSDEC approval to use Method 8270 for analysis of dioxins/furans at this source site on January 3, 2012. The IEM completed a final review of shaping layer material (originally sampled on September 19, 2011) proposed for import to the Site from Area 17 on January 4, 2012. The review of available lab data identified that sampled material does not exceed any of the Site Permit criteria. On January 5, 2012, the IEM inspected the source site and visually confirmed the removal of the top 0.5 feet to 1.5 feet of soil which consisted of an initial layer of organics that were previously considered unacceptable for import to the Site. It was determined that the available shaping layer materials from Area 17 totaling approximately 500 cubic yards of the original estimated 10,000 cubic yards were approved for export to the Site.

The source site operator provided the IEM with a proposed excavation plan on December 5, 2012 for additional materials available at the source site. On December 8, 2012, the IEM notified NYCDPR that the previous desktop review (i.e. EDR, etc.) performed for this source site was still applicable for the latest area proposed for excavation. The IEM was on-site at the Kew Gardens source site on December 14, 2012 to witness test pits and environmental sampling for additional shaping layer materials being considered for import to the Site.

On January 3, 2013, the IEM provided a memo of recommendations to the NYSDEC regarding an additional estimated 7,500 cubic yards of shaping layer material being considered for import to the Site that was sampled on December 14, 2012. On January 4, 2013, the NYSDEC approved the importation of this material to the Site subject to the following conditions. The outer limits and depths of all areas of excavation should be clearly delineated in the field and confirmed by the IEM in the field prior to any excavation, loading, or trucking of approved soils. The approval only applied to the material samples and inspected on December 14, 2012, consisting of what appeared to be native material, free of debris and any traces of organics. The limits beyond test pit #8 consisted of observed unauthorized C&D material mixed into the soil (i.e. metal and glass, etc.), and were not approved for import to the Site. The IEM periodically inspected the excavation and hauling activities at the Kew Gardens Phase II site to perform visual and physical screening of the proposed shaping layer material. Inspection frequency was at the discretion of the IEM and the NYSDEC. The exportation of all material to the Site was conducted in accordance with the current Permit requirements (i.e. trucking manifests, etc.).

On June 5, 2013, the IEM issued a third memo of recommendations dated June 5, 2013 for the Kew Gardens source site. The IEM notified NYCDPR that the latest round of shaping layer material (approximately 5,000 CY) was acceptable for import to the Site due to the fact that the material met the Site Permit requirements. The approval applied to the material sampled and inspected on May 22, 2013, consisting of what appeared to be native material, free of debris and any traces of organics, and as delineated horizontally and vertically on the provided test pit plan. The top portion of unauthorized soil (i.e. RCA, geotextile, organic) was stripped and removed off-site to the depths and locations listed on the provided test pit plan, and this condition was witnessed by the IEM prior to importation to the Site. The importation of all material to the Site was conducted in accordance with the Permit requirements (i.e. trucking manifests, etc.).

Approximately 11,988.51 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.11 PS-285 (1065 Martin Luther King Boulevard, Bronx, NY)

On March 10 and 11, 2011 the IEM was provided with fill source site documentation for the PS-285 source site. The IEM initiated review of the source site materials provided per request of NYCDPR. Site visits to the PS-285 source site by the IEM were completed on March 14, 2011 to observe test pits and on March 25, 2011 to discuss the approval process and submittal requirements. NYCDPR requested the IEM purchase an EDR Report for the site on March 25, 2011.

The IEM witnessed additional test pits and sampling on March 29, 2011. At the time of sampling, certain portions of the source site were not accessible for sampling. Samples were collected from four test pits and composited into two samples. Lab results were provided on March 30, 2011, but were deemed incomplete by the IEM. A revised report was submitted to the IEM addressing the missing parameters, but it did not address the non-compliant dioxin/furan USEPA Test method used to generate the lab report. Final laboratory data was submitted to the IEM for review on April 5, 2011. Laboratory results were compared to the Site Permit requirements and no exceedances of shaping material limits were identified. Additional review by the IEM and the NYSDEC was required to determine if the source site was approved for material importation to the Site. The IEM completed the review of NYCDPR's EDR and desktop review, and issued a memo to the NYSDEC detailing the IEM's review results on April 5, 2011. The NYSDEC provided their review comments on April 7, 2011.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.12 Flushing Hotel (133-63 Roosevelt Avenue/39-20 Prince Street, Queens, NY)

NYCDPR requested that the IEM order and provide the EDR materials to NYCDPR for their review and submission to the IEM. The draft initial submittal was provided to the IEM over the course of several days (April 5, 6, and 7, 2011). The IEM's review commenced during this timeframe.

The IEM witnessed test pits and sampling at the Flushing Hotel source site on April 8, 2011. Final laboratory data was submitted to the IEM for review on April 19, 2011. Laboratory results were compared to the Site Permit requirements and no exceedances of shaping layer material limits were identified. Additional review by the IEM and the NYSDEC was required to determine if the source site was approved for material importation to the Site.

The IEM conducted a review of NYCDPR's EDR review, as well as a full review of the EDR, and submitted Phase I and Phase II ESA reports. The IEM reviewed the lab results provided on April 19, 2011. The IEM prepared a review document dated April 20, 2011 titled "Flushing Hotel Source Site - Desktop Submittal Review" and submitted it to NYSDEC and NYCDPR. The NYSDEC provided a response on April 21, 2011.

NYCDPR provided the IEM with supplemental historical lab data and two (2) separate Phase II reports on April 26, 2011. The IEM provided additional review comments based on the aforementioned documents to NYCDPR via conference call and email on April 29, 2011. NYCDPR provided a draft submittal response package dated May 5, 2011.

NYCDPR provided the IEM with a final submittal dated May 13, 2011 in response to IEM comments. The IEM reviewed the final submittal and transmitted that submittal to the NYSDEC for review and comment on May 18, 2011. Due to the fact that this was a complex site, final comments regarding acceptance for import to the Site was to be provided by the NYSDEC.

Conditional approval for the export of shaping material from rows 4, 5, and 6 was provided from the NYSDEC on May 27, 2011. The IEM witnessed the first day of test pits on June 3, 2011 as requested by NYCDPR. Five test pits were excavated at the source site to the maximum depth reachable by the heavy equipment available. The IEM witnessed a second day of test pits on June 6, 2011 as requested by NYCDPR. Three additional test pits were excavated to the maximum depth reachable by the heavy equipment available. NYCDPR submitted a revised site review proposal for importing shaping layer material from this source site on June 15, 2011.

A total of eight (8) test pits were excavated at the Flushing Hotel source site on June 3 and June 6, 2011. One composite sample and one discrete VOC sample was collected from each test pit. Lab results were submitted to the IEM on June 10, 2011. The IEM provided preliminary review and comments to NYCDPR regarding the source site review proposal on June 17, 2011.

The IEM submitted the memo of recommendations to the NYSDEC on June 20, 2011. The IEM visited the site on June 21, 2011 to confirm conditions within the memo of recommendations were met or could be achieved. The IEM reported conclusions to the NYSDEC via email on June 21, 2011. The observed site conditions did not allow for the source site to be approved due to the presence of asphalt, objectionable material, and stockpiles that did not allow for the confirmation of soil elevations. The NYSDEC also indicated that as of June 21, 2011, a formal submittal from NYCDPR to NYSDEC had not occurred to date. The IEM's site observations from June 21, 2011, were emailed to NYCDPR on June 23, 2011. NYCDPR submitted a revised site proposal on June 27, 2011. On June 28, 2011, the IEM indicated that items included in NYCDPR's submittal were non-complaint with the current Site Permit requirements, and therefore required approval from the NYSDEC.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.13 2nd Avenue (2nd Avenue and 94th Street, New York, NY)

The IEM witnessed fill material sampling for this potential source site on May 12 (two samples) and May 16, 2011 (one sample) regarding acceptance of crushed rock from NYCMTA's 2nd Avenue Subway construction project at 94th Street in Manhattan. Samples were analyzed for the nine RCRA metals and all passed the Site Permit requirements relative to the nine RCRA metals. One sample on May 12 was collected from material directly out of the hopper after it was deposited into a truck and the other sample was taken from a stockpile. The May 16 sample was also taken from material that came directly out of the hopper and deposited directly into a truck. The NYSDEC performed all associated reviews for this

source site similar to the East Side Access source site due to the nature of the material that was being generated from subway tunnel construction.

The NYSDEC provided approval for this source site to export shaping layer material to the Site. Shaping layer material sampling began on May 26, 2011 and occurred on a continual basis after each consecutive 2,000 cubic yards of material was imported to the Site.

Approximately 86,667.95 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.14 2nd Avenue (2nd Avenue and 72nd Street, New York, NY)

NYSDEC staff reviewed NYCDPR's submittal dated October 28, 2011 regarding acceptance of crushed rock from NYCMTA's 2nd Avenue Subway construction project at 72nd Street in Manhattan which was proposed for import to the Site. NYCDPR's proposal was acceptable to the NYSDEC provided that a composite sample of this material was tested for the proposed analytical parameters and the sample results were obtained (and approved) prior to loading material for export to the Site.

The IEM reviewed the lab results related to the IEM witnessed source site sampling conducted on December 5, 2011 for the proposed shaping layer material at the source site. The IEM identified that the sampled material was unacceptable for import to the Site based on the fact that the detected value for Arsenic was 38.4 ppm. The permit allowable maximum concentration for Arsenic is 28 ppm. The sampled material was determined to be unacceptable for import to the Site as shaping layer material per the Permit. It was determined that no material may be imported from the 2nd Avenue at 72nd Street source site to the Site. The IEM also witnessed that the physical composition of the sampled material was not that of pure stone dust as witnessed previously at the 2nd Avenue ($94^{th}$ Street) and East Side Access source sites. This material had stones as large as 12 inches to 24 inches in size. The IEM was advised that the hopper at the 2nd Avenue at 72nd Street source site used a screen that contained openings that were 24 inches by 20 inches.

On December 5, 2011, NYCDPR requested that the IEM witness one additional sample from the 2nd Avenue at 72nd Street source site. On December 6, 2011 in response to NYCDPR's request to perform one additional sample, the NYSDEC stated that if re-sampling produced acceptable results, a more stringent sampling frequency would be required for this source (i.e. one sample per 2,000 cubic yards instead of one sample per 10,000 cubic yards). NYCDPR advised the IEM that they were not pursuing material from this source site any further because it did not meet the specified physical properties for the golf course construction.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.15 Alexander Hamilton Bridge (Bronx, NY)

NYCDPR notified the IEM on February 8, 2012 that NYCDPR was interested in the opportunity to obtain potential shaping layer materials from the Alexander Hamilton Bridge source site (originally sampled July

7, 2009) which had been reviewed and approved in the past by the previous IEM. The IEM requested, obtained, and reviewed the previous files for the source site including previous approvals and corresponding lab data. On February 10, 2012, the IEM requested and received the proposed location for the recently considered shaping layer material.

The IEM visited the Alexander Hamilton Bridge source site on February 22, 2012. The IEM visually inspected a stockpile of approximately 3,000 to 5,000 cubic yards of potential shaping layer material from the previously approved source site (as per IEM records from 2009). Upon a visual inspection, it was determined that the material did not meet the Site Permit requirements due to the presence of unauthorized C&D material including asphalt and metal, as well as other miscellaneous debris. Site observations were photo documented. The IEM notified NYCDPR of its observations and NYCDPR determined that they did not want to pursue this source site any further at that time.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.16 Throgg's Neck/Target/USPS (815 Hutchinson River Parkway, Bronx, NY)

On February 28, 2012, NYCDPR requested that the IEM begin the source site review for the Throgg's Neck/Target/USPS source site. The source site was an existing USPS building that was proposed to be redeveloped with a new Target retail building. The anticipated volume of material being considered as potential shaping layer material was reported to be approximately 20,000 cubic yards per information forwarded to the IEM by NYCDPR. The IEM ordered the EDR and provided the EDR information to NYCDPR. The IEM reviewed the Phase I ESA and the Phase II ESA. The IEM completed a review of the EDR on March 9, 2012. NYCDPR provided the IEM with an EDR review memo on March 27, 2012. The IEM provided NYCDPR with some initial comments and NYCDPR submitted a revised EDR review memo on April 2, 2012.

NYCDPR provided the IEM with a proposed sample location plan with proposed depths for source site sampling on April 19, 2012. The IEM provided comments on a revised sampling plan identifying the location and quantity of test pits on April 20, 2012.

The IEM witnessed three of ten proposed test pits and the associated source site sampling at the source site on April 25, 2012. The remaining test pits were completed and witnessed by the IEM on May 11 and May 14, 2012.

The IEM reviewed the lab data (originally dated May 15 and May 24, 2012 and revised May 30, 2012) and no exceedances of shaping layer material limits were identified. The IEM prepared a memo of recommendations and submitted it to the NYSDEC on May 30, 2012. The NYSDEC reviewed the IEM's May 30, 2012 memo of recommendations for the source site. On May 31, 2012, the NYSDEC approved importation of shaping material from this source site to the Site, provided that all recommendations in the memo of recommendations were implemented. The source site commenced trucking shaping layer material to the Site.

The IEM conducted an inspection of the source site on November 6, 2012. The purpose of the inspection was to determine if site conditions warranted allowing the source site to resume importation of shaping layer material to the Site, in light of the nine truck rejections (due to presence of asphalt) that occurred on October 23, 2012 (resulting in ceasing of importation that same day). Based on the IEM inspection and observations, it was determined that importation may resume to the Site. Observations included surface asphalt had been stripped from within the approved limits of excavation between former TP-6 and TP-8, stockpiles of excavated soil from areas outside the approved excavation limits (i.e. cut along Weiner Place) were located outside the approved excavation limits, and no stockpiles of asphalt material or other poor housekeeping practices were observed within the current area in preparation for export to the Site. NYCDPR was notified that all importation must comply with all previous conditions outlined in the source site approval memo of recommendations (i.e. top +/-3 feet of fill was not approved for importation to the Site; this layer was clearly identifiable due to its color and consistency relative to the native approved material).

The IEM was on-site at the source site on February 6, 2013 to complete a source site inspection associated with a request to resume import to the Site. The site was approved to resume importation of shaping layer material on February 6, 2013 based on the IEM's inspection, which confirmed that the material originated from IEM inspected/approved areas, and the fact that the material is the native approved soil, and there are no signs of asphalt or historical fill on-site in the vicinity of the work area. The area inspected was consistent with the approved areas included in the original NYSDEC approval and IEM memo of recommendations.

Approximately 27,262.77 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.17 PS-287 (110-10 Northern Boulevard, Queens, NY)

On March 2, 2012, NYCDPR requested that the IEM begin the source site review for the PS-287 source site. The source site was a former parking facility that was being redeveloped into a new school. The anticipated volume of material being considered as potential shaping layer material was reported to be approximately 7,000 to 9,000 cubic yards per information forwarded to the IEM by NYCDPR. The source site operator expected to remove the top two feet of asphalt and historical fill, as well as a one-foot buffer. The potential shaping layer material that was being considered was what was claimed to be native soils from a depth of approximately 3 feet to 15 feet below grade. NYCDPR and the site operator wanted to proceed with sampling prior to review of the EDR. A sampling plan was provided to the IEM for review. The IEM completed a review of submitted documents including the Phase I ESA, Phase II ESA, and the proposed sampling plan and issued a review memorandum with comments on March 7, 2012. The site operator submitted a revised sampling plan for review by the IEM on March 8, 2012.

The IEM received NYCDPR's initial review of the EDR on March 14, 2012. The IEM completed a review of the EDR and forwarded a copy to NYCDPR on March 16, 2012. On March 16, 2012, the IEM requested that NYCDPR submit a revised EDR review memo incorporating the identified Recognized Environmental Concerns ("RECs") and other site conditions that were not included in the original review memo.

On March 22, 2012, the IEM received sample results for shaping layer source site sampling that occurred on March 15, 2012. The IEM completed an initial review of the sample data and although there were no exceedances relative to the Site Permit limits for the parameters that were analyzed in the lab reports, there were multiple parameters missing from the lab report.

The IEM received a revised lab report for the PS-287 source site on March 28, 2012. The IEM reviewed the revised lab report for the previously missing lab data and confirmed that the tested soil met the Site Permit criteria for shaping layer material. The IEM issued a memo of recommendations for this source site to the NYSDEC on March 28, 2012. The IEM visited the source site on March 30, 2012 and confirmed that all asphalt, historic fill, and areas not being considered for import to the Site were previously removed from the source site to the appropriate depth including the one-foot buffer below the fill layer. The NYSDEC approved the PS-287 source site for shaping layer material and NYCDPR was notified of the approval on April 2, 2012.

Approximately 6,754.8 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.18 City Point Brooklyn (1 DeKalb Avenue, Brooklyn, NY)

The IEM issued a desktop review summary for the City Point Brooklyn source site to the NYSDEC on July 27, 2012. The review included information acquired or provided to the IEM including EDR files, Phase II report, and boring information. The material being considered was approximately 22,000 cubic yards of native material proposed to be used as shaping layer material.

The NYSDEC approved the City Point Brooklyn source site for further investigation (i.e. physical and visual inspection via test pits and sampling) on August 13, 2012 since all environmental samples for the source site were made available to the IEM for review.

The IEM was on-site at the source site on August 31, 2012 to witness site investigation and sampling activities for 8,000 cubic yards of potential shaping layer material.

On September 11, 2012, the IEM received sample results for source site sampling that occurred on August 31, 2012. On September 20, 2012, the IEM issued a Site Investigation Memorandum (dated September 19, 2012) to the NYSDEC for review for the source site related to IEM witnessed activities that occurred at the source site on August 31, 2012.

On September 25, 2012, the NYSDEC notified the IEM that the City Point source site was conditionally approved pending implementation of the recommendations included in the IEM's September 19, 2012 Site Investigation Memorandum and satisfactory responses to NYSDEC questions.

On October 10, 2012, the IEM notified NYCDPR that the City Point Brooklyn source site was approved by the NYSDEC considering implementation of the recommendations included in the IEM's September 19,

2012 Site Investigation Memorandum. The IEM needed to complete a final inspection of the proposed material prior to importation to the Site.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.19 400 Park Avenue South (New York, NY)

The IEM received initial documents associated with this source site beginning on July 3, 2012. The IEM performed an initial review of the submitted documents. The IEM requested a proposed sampling plan on July 11, 2012.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.20 Union Street (43-31 Union Street, Flushing, NY)

On May 15, 2012, NYCDPR submitted a request to the NYSDEC to import shaping layer material from the Union Street source site. On June 11, 2012, the NYSDEC provided NYCDPR with email approval to import up to 30,000 cubic yards of shaping layer material from the Union Street source site based on environmental testing results submitted to the NYSDEC that was not witnessed by the IEM. On June 14, 2012, NYCDPR notified the IEM that they would begin importing, no earlier than June 18, 2012, an estimated 5,000 to 10,000 cubic yards of shaping layer material from this source site to the Site. The material originated from 30 to 55 feet below grade.

Approximately 1,675.69 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.21 Mount Vernon Recycling Corp. (113 Edison Avenue, Mount Vernon, NY)

On November 27, 2012, the IEM notified NYCDPR that the topsoil on-site that originated from the Mount Vernon Recycling Corp. facility was approved as shaping layer material based on previous NYSDEC approval allowing material to be used as shaping material, and the fact that the material passed all Site Permit criteria per IEM witnessed sample collection and a review of the associated analytical reports. The IEM witnessed sampling on October 11 and November 12, 2012. The approval was pending a receipt of all truck tickets/manifests, and confirmation of the volume of on-site soil. The Site Permit requires that this material be covered with a minimum 1-foot thick layer of approved cover soil.

Approximately 3,920.0 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.22 228$^{th}$ Street (Rosedale, NY)

The IEM completed a review of initial lab data dated December 28, 2012 for the 228th Street source site. Of the 12 lab reports that were reviewed, none of the sampled soil exceeded Site Permit levels for the shaping layer parameters that were analyzed in the reports. A significant number of parameters (including some VOCs, SVOCs, pesticides, and metals) were not analyzed and NYCDPR was notified of the review

findings on January 22, 2013. Sample collection for the submitted lab reports was not witnessed by the IEM.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.23 Evergreen Recycling/Tully Environmental (Willets Point Boulevard, Corona, NY)

On January 28, 2013, the IEM notified NYCDPR that an initial review of the lab data provided for the Evergreen Recycling source site (operated by Tully Environmental) was completed. Sampling was not witnessed by the IEM. There were no exceedances relative to the Site Permit criteria for shaping layer material, however there were a significant number of parameters that were not analyzed. The IEM received a Registration Form for a Waste Management Facility (DEC Registration # 41W93) for the source site. The IEM performed a visual inspection of stockpiled material at the source site material on January 30, 2013 and identified asphalt fragments in the source site material. The stockpiled material was not acceptable for import to the Site based on the presence of asphalt.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.24 Waterpointe-Whitestone

On February 1, 2013, the IEM notified NYCDPR that an initial review of the lab data provided for the Waterpointe-Whitestone source site was completed. Sampling was not witnessed by the IEM. There were no exceedances relative to the Site Permit criteria for shaping layer material, however there were a significant number of parameters that were not analyzed.

On March 27, 2013, the NYSDEC informed NYCDPR that shaping layer material from the Waterpointe-Whitestone source site could be imported to the Site if the material meets the required Permit limits and that the NYSDEC review would continue once involved staff was available to complete the review. On April 3, 2013, the IEM forwarded the NYSDEC correspondence regarding previous NYSDEC work plan acceptance for the proposed source site, which was for work occurring as part of a separate project under NYSDEC review.

On April 3, 2013, the NYSDEC confirmed that the Waterpointe-Whitestone source site was not approved as a potential source for shaping layer material.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.25 Don Carlo Environmental/Brooklyn (1247 38th Street, Brooklyn, NY)

On February 1, 2013, the IEM notified NYCDPR that an initial review of the lab data provided for the Don Carlo Environmental/Brooklyn source site was completed. Sampling was not witnessed by the IEM. The results in the submitted report exceeded the levels in the Site Permit for shaping layer material for the

VOC's ethylbenzene (6.9 ppm vs. 5.5 ppm), toluene (2.1 ppm vs. 1.5 ppm), and xylenes (57 ppm vs. 1.2 ppm). There were a significant number of parameters that were not analyzed.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.26 Castle Hill Recycling (1000 Zerega Avenue, Bronx, NY)

On February 11, 2013, NYCDPR provided the IEM with a permit for Castle Hill Recycling (DEC Registration #03-W-94) that was being considered as a potential shaping layer material source site. The IEM was notified that the source site was creating a 2,000 cubic yard stockpile for sampling. Castle Hill Recycling was a NYSDEC registered solid waste management facility.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.27 Springfield Gardens

On February 21, 2013, the IEM completed an initial review of a soil analysis summary documentation (no lab reports) for approximately 2,500 cubic yards of potential shaping layer material at the Springfield Gardens source site as provided by NYCDPR. The IEM did not witness sample collection. The IEM notified NYCDPR that there were several parameters exceeding the Site Permit criteria and multiple required parameters were not analyzed.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.28 Calvert Vaux (Brooklyn, NY)

On February 20, 2013, NYCDPR provided the IEM and NYSDEC with lab data for the Calvert Vaux source site for approximately 500 cubic yards of shaping layer material. On February 22, 2013, the IEM was notified by the NYSDEC that the NYSDEC would be handling the review of this source site.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.29 160 Myrtle Avenue (Brooklyn, NY)

On February 20, 2013, NYCDPR forwarded the IEM initial sample data information for a potential shaping layer material source site located at 160 Myrtle Avenue, Brooklyn, NY. The potential shaping layer materials totaled approximately 40,000 cubic yards. On February 21, 2013, the IEM notified NYCDPR that the initial review of the soil analysis summary documentation (no lab reports) was completed for the information provided to the IEM. The reviewed material had exceedances for lead and mercury relative to the Site Permit criteria.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.30 215 E. 68th Street (New York, NY)

On March 7, 2013, NYCDPR requested that the IEM review initial lab data for approximately 3,000 to 4,000 cubic yards of potential shaping material at 215 E. 68th Street, New York, NY. On March 8, 2013, the IEM notified NYCDPR that there were exceedances for Mercury and total cSVOC's for multiple samples and multiple VOC, SVOC, Pesticide, and TCLP VOC parameters were missing in all samples.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.31 DEP Valhalla (10 Walker Road, Valhalla, NY)

On February 25, 2013, the IEM initiated review of potential shaping material at the DEP Valhalla source site (Catskill and Delaware Water Treatment Facility). On March 1, 2013, the IEM notified the NYSDEC that a review of the initial lab results and site background information was completed. The initial review indicated that there were no exceedances relative to shaping layer material criteria for the hardcopy data, some sample parameters were missing, and there were no records indicating unacceptable background conditions. The IEM notified the NYSDEC that there was a discrepancy in the hardcopy and electronic data and clarification was requested from NYCDPR/NYCDEP. On March 5, 2013, the IEM completed a visual and physical inspection of the potential shaping layer material at the source site. On March 6, 2013, the IEM notified NYCDPR and the NYSDEC that the potential shaping layer material passed all visual and physical inspection requirements and the material passed the Site Permit criteria for shaping layer material (hardcopy data) although not all parameters were tested. In addition, the data provided electronically on CD contained information demonstrating that previous soil investigations identified soil containing elevated levels of lead and mercury that did not pass the Site Permit criteria for shaping layer material. It was communicated to the IEM verbally that the NYCDEP has been handling all impacted soil separate from the stockpiled material that was inspected, and that all impacted soil has been disposed of off-site and tracked accordingly.

On March 13, 2013, the IEM received requested documentation from the source site owner/operator regarding conditions of the existing soil stockpile and removal of contaminated materials at the DEP Valhalla source site. On March 14, 2013, the IEM notified NYCDPR that the IEM must be notified prior to importation of shaping layer material from the DEP Valhalla source site in order to witness initial loading of trucks at the source site.

Approximately 6,631.2 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.32 Tilcon (Bronx) (980 East 149th Street, Bronx, NY)

On April 1, 2013, the IEM received initial lab data and a NYSDEC Registration Form for a Solid Waste Management Facility (NYSDEC Registration #03W39R) for the Tilcon (Bronx) source site. On April 1, 2013, the NYSDEC confirmed that the Tilcon (Bronx) source site had a valid Registration Form for a Solid Waste Management Facility. On April 2, 2013, the IEM notified NYCDPR that a review of the initial lab data was completed and noted that sampled parameters did not exceed Site Permit criteria for shaping layer

material (samples WCA-1 to WCA-6), however the following parameters were not analyzed: TCLP Metals missing for sample WCA-3, WCA-5, and WCA-6, VOC: 1,2,4-trichlorobenzene, methyl ethyl ketone, and tetrachloroethylene in all samples, SVOC: 4-chloro-3-methylphenol, 2-chlorophenol, 4-methylphenol, and naphthalene in all samples, and Pesticides: 2,4 D, dibenzo-p-dioxins, endrin ketone, gamma-bhc, gamma-chlordane, mitotane (2,4 DDD), and parathion. On April 3, 2013, the IEM witnessed sampling of approximately 4,000 cubic yards of the proposed shaping material at the Tilcon (Bronx) source site.

On April 9, 2013, the IEM notified NYCDPR that the Tilcon (Bronx) shaping layer material, totaling approximately 4,000 cubic yards, witnessed by the IEM on April 3, 2013, was acceptable for import to the Site due to the fact that environmental results met the Site Permit requirements. The IEM conducted a visual inspection of material, and the IEM confirmed that the material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.).

Approximately 3,041.8 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.33 NY Recycling (475 Exterior Street, Bronx, NY)

On April 23, 2013, NYCDPR requested that the IEM initiate review of a potential shaping layer material source site named New York Recycling. On April 24, 2013, the IEM verified that the facility's NYSDEC registration was valid and that the submitted analytical results did not reveal any exceedances relative to the Site shaping layer material Permit requirements; however, several parameters were missing including TCLP metals, TCLP VOCs, and four pesticide parameters. NYCDPR was notified that in order to proceed with this potential source site, the IEM will need to complete a site visit to the facility for visual and physical inspection of the material, and witness collection of samples for chemical testing. In addition, NYCDPR would be required to collect a sample of the fines for submittal to the NYSDEC for review. On April 25, 2013, NYCDPR requested that the IEM take a grab sample of the material fines and provide that sample to the NYSDEC as required. On April 30, 2013, the IEM performed a visual, physical, and PID inspection of the material and collected a sample of fines using a No. 35 sieve. The sample was delivered to the NYSDEC on April 30, 2013.

On Friday, May 24, 2013, the IEM notified NYCDPR that Stockpile #1 of NY Recycling shaping layer material (approximately 8,000 CY) was acceptable for import to the Site due to the fact that the source site qualified as a valid NYSDEC registered C&D processing facility, the IEM conducted a visual/physical inspection of the stockpile on April 30, 2013, the IEM confirmed that the stockpiled material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.), all PID readings measured 0 ppm, and the environmental results were acceptable per the Site Permit requirements for IEM witnessed sampling completed on May 21, 2013. In addition, a sample of fines was collected by the IEM and submitted to NYSDEC for visual review, and subsequent approval. Approved shaping material to be trucked to the Site could only originate from the stockpile witnessed during the May 21, 2013 sampling event.

On June 19, 2013, the IEM notified NYCDPR that Stockpile #2 of NY Recycling shaping layer material (approximately 10,000 cubic yards) as witnessed by the IEM on June 11, 2013, was acceptable for import

to the Site. The IEM conducted a visual/physical inspection of stockpile #2 on June 11, 2013, and the IEM confirmed that the stockpiled material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.). The site qualified as a valid NYSDEC registered C&D processing facility and the test results were acceptable per the Site Permit requirements. Approved shaping material to be trucked to the Site could only originate from the stockpile witnessed during the June 11, 2013 sampling event.

On July 16, 2013, the IEM notified NYCDPR that the latest stockpile of shaping layer material (approximately 5,000 cubic yards) from the NY Recycling source site was acceptable for import to the Site. The submitted lab report met all Permit chemical requirements for sample collection witnessed by the IEM on July 11, 2013 and met Permit visual and physical criteria as per inspection by the IEM.

On August 1, 2013, the IEM notified NYCDPR that the latest stockpile of shaping layer material (approximately 5,000 cubic yards) from the NY Recycling source site was acceptable for import to the Site. The submitted lab report met all Permit chemical requirements for sample collection witnessed by the IEM on July 29, 2013 and met Permit visual and physical criteria as per inspection by the IEM.

On October 24, 2013, the IEM notified NYCDPR that the latest 5,000 cubic yard stockpile of NY Recycling shaping layer material as represented by the submitted TAGM lab report and per samples witnessed by the IEM on October 11, 2013, was acceptable for import to the Site. The approval was based on the fact that the source site qualified as a valid NYSDEC registered C&D processing facility and the IEM conducted a visual/physical inspection of the stockpile on October 11, 2013. The IEM confirmed that the stockpiled material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.), and all PID readings registered in at 0 ppm. The test results were acceptable per the Site Permit requirements. Approved shaping material to be trucked to the Site could only originate from the stockpile witnessed during the October 11, 2013 sampling event.

Approximately 26,688.05 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.34 Little Bay (Queens, NY)

On October 16, 2013, the IEM notified NYCDPR of the findings associated with a preliminary review of available data for the Little Bay source site. The IEM reviewed lab data for Stockpiles 1 through 9 (S-1 through S-9). The lab report did not capture all of the parameters required for testing by the Site Permit, and was missing the full TCLP VOC and TCLP Metals analyses, as well as several SVOC, VOC, Pesticide/Herbicide, and PCB parameters. Based on the data presented, at a minimum, the following stockpiles did not pass the Site Permit criteria as shaping layer material: S-1 exceeded for copper, lead, mercury, and total PCBs; S-4 exceeded for mercury; S-5 exceeded for lead and mercury; and S-9 exceeded for mercury and total PCBs.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

### 3.1.2 Cover Layer Material

Materials accepted for use as cover layer on the Site were sampled prior to acceptance and after each additional 2,000 cubic yards. As per the 2005 Permit modification, the parameters for cover layer material included the complete analyte list of TAGM 4046 for total VOCs, total SVOCs, total pesticides and herbicides, total PCBs, total metals, sulfur, and asbestos.

Fill material imported to the Site and used for the cover layer was subject to the following requirements, per Special Condition 14 of the 2014 Permit and Section 4.2.1.2 of the 2013 Engineering Report. A table of the cover layer material chemical acceptance criteria listed below is included in Appendix C.2 of the 2013 Engineering Report.

In order for topsoil material to be used on the Site for the cover layer, it was sampled prior to acceptance and after the importation of each additional 2,000 cubic yards (in truck volumes). Each soil sample was analyzed for the entire analyte list in the NYSDEC Technical and Administrative Guidance Memorandum (TAGM) 4046, total volatile organic compounds (VOCs), total semi-volatile organic compounds (SVOCs), pesticides and herbicides, polychlorinated biphenyls (PCBs), and metals (including Resource Conservation and Recovery Act (RCRA) metals).

Based on source site reviews and site testing activities, the cover layer material imported to the Site met the following chemical limits:

TAGM 4046 Table 1 – Volatile Organic Compounds (VOCs)

TAGM 4046 Table 2 – Semi-Volatile Organic Compounds (SVOCs)

TAGM 4046 Table 3 – Pesticides/Herbicides and Polychlorinated Biphenyls (PCBs)

TAGM 4046 Table 4 – Metals

Total Asbestos 0.5% or less

Total Sulfur 0.5% or less

The following additional criteria were directed in NYSDEC correspondence:

April 30, 2009 – Directed NYCDPR not to accept or place on the Site any cover layer materials with arsenic concentrations greater than 16 ppm or lead concentrations greater than 400 ppm.

July 28, 2009 – Provided a table to NYCDPR listing modified heavy metal chemical limits for the cover layer at the Site.

September 25, 2009 – Revised and clarified the chromium chemical limits for the cover layer previously presented in the July 28, 2009 letter.

NYCDPR followed the NYSDEC's directives since receipt of each one associated with the importation of cover layer material to the Site.

Details of the source site reviews and site testing for each potential cover layer material source site are as follows.

#### 3.1.2.1 Bloomingburg (C.M. & Sons Trucking Site, 680 Bloomingburg Road, Bloomingburg, NY)

NYCDPR requested that the IEM witness fill material sampling for this potential source site on May 9, 2011. The Site is a sand and gravel supply yard. Material was separated into sand and gravel of various sizes and stockpiled. The source site had been importing sand and gravel material from a nearby real estate development under construction. Material being considered for the Site included two stockpiles (SP-1 and SP-2) of a brown, medium to coarse sand. Both stockpiles were from material generated on-site. Each stockpile was approximately 25,000 cubic yards. Prior to sample collection the piles were screened in various locations using a calibrated PID. No detections of VOCs were observed. The material was inspected using a 3/4-inch screen. No prohibited materials were observed in the screened material. The IEM witnessed a total of six samples collected from two separate stockpiles. Per the AES sampling plan, three samples were collected from each stockpile. Each sample consisted of 20 grabs (depths ranging from the surface to three feet into the pile) which were composited. One discrete grab per sample was collected specifically for VOC analysis without being composited.

NYCDPR provided the IEM authorization to commence review of this source site on May 24, 2011. NYCDPR requested this source site review be put on hold on May 27, 2011. It was requested by NYCDPR that the IEM witness sampling for physical parameters on June 1, 2011. NYCDPR provided authorization to the IEM to order the EDR on NYCDPR's behalf on June 8, 2011.

On June 24, 2011, the IEM emailed the final source site review updates to NYCDPR which identified that Sample #2 for SP-1 failed to meet the cover layer material Permit requirements due to an Antimony exceedance. NYCDPR requested that the source site review be put on hold on June 24, 2011. On June 30, 2011, NYCDPR requested that the IEM resume the source site review. The IEM notified NYCDPR that the review was completed on June 24, 2011 and forwarded the original June 24, 2011 review findings/comments to NYCDPR. On July 1, 2011, NYCDPR requested that the IEM provide the EDR files to NYCDPR which were ordered for the site in June. The IEM resubmitted the EDR files to NYCDPR.

On July 8, 2011, NYCDPR submitted a preliminary review of the EDR to the IEM via email. The IEM provided comments to NYCDPR via email. On July 11, 2011, NYCDPR submitted a preliminary site review submittal via email and the IEM provided comments to NYCDPR via email. On July 12, 2011, NYCDPR submitted the site review submittal to the NYSDEC and the IEM via email. On July 12, 2011, the NYSDEC requested that the IEM provide preliminary comments of NYCDPR's submittal and the IEM provided comments to the

NYSDEC via email. On July 15, 2011, the NYSDEC provided comments to the IEM and a request for clarification on NYCDPR's submittal.

The IEM provided NYCDPR a review status update with respect to this source site via phone and email on July 20, 2011. The update contained action items required for NYCDPR to advance the review process. The IEM provided the NYSDEC with an update on the status of NYCDPR submittals for this source site on July 22, 2011 via email. NYCDPR provided the cover layer material permeability testing results to the IEM on July 22, 2011. The IEM consulted with the NYSDEC beginning on July 22, 2011 regarding the permeability results and the IEM notified NYCDPR on July 28, 2011 that the cover soil permeability rate of 1.51 X 10-2 cm/s (21.4 in/hr.) did not meet the NYSDEC maximum allowable permeability of 1 x 10-2 cm/s (14.7 in/hr.). The IEM also requested clarification on NYCDPR's intent on handling the SP-1 Antimony exceedance as identified in lab reports.

NYCDPR requested the analytical lab data from the IEM on August 8, 2011 and indicated that they would be submitting a final proposal to the NYSDEC regarding the request to import cover material from the Bloomingburg source site by addressing outstanding metals and permeability requirements. The IEM forwarded requested lab data to NYCDPR via email on August 8, 2011.

IEM staff visited the Bloomingburg source site to inspect the cover layer material on October 6, 2011 and the existing material appeared to be the same material that the IEM inspected originally in May 2011 with the exception that SP-1 had been removed off-site and was no longer available. The results of the site visit were consistent with what the IEM was told by the site operator earlier on October 6, 2011. The IEM confirmed that the GPS coordinates of the stockpile (SP-2) were consistent with the original location, the soil appeared to be the same color and consistency, and the stockpile had vegetation growing on it, indicative that it had been untouched for an extended period. The IEM witnessed the loading of one truck on October 6, 2011 headed to the Site, which was carrying approximately 26 cubic yards of cover layer material. IEM staff was on-site at Bloomingburg on October 7, 2011 to witness the initial rounds of cover layer material loading.

In general, the NYSDEC allowed up to 16,000 cubic yards of approved cover material (from all cover material source sites) to be stockpiled in the rough of holes 4 and 5 (8,000 cubic yards per hole) prior to satisfying the conditions associated with spreading the cover material on the Site. These conditions included meeting permeability and shaping layer thickness requirements. On October 21, 2011, the NYSDEC provided NYCDPR with a conditional approval to allow NYCDPR to import cover layer material with a permeability of up to 30 inches per hour pending NYCDPR submitting for approval of an amendment to the Stormwater Pollution Prevention Plan (SWPPP). With this permeability approval, NYCDPR was notified that they could spread cover material on-site at their own risk pending shaping layer thickness compliance which occurred at a later time.

Approximately 4,768.0 cubic yards of cover layer material were imported to the Site from this source site.

#### 3.1.2.2 Ranco Sand (115 South Street, Manorville, NY) [LAWS]

On December 2, 2011, the IEM was directed by NYCDPR to order the EDR for the Ranco Sand source site located in Manorville, NY. The IEM visited the Ranco Sand source site on December 8, 2011 to inspect a stockpile of approximately 10,000 to 12,000 cubic yards of proposed cover soil. The soil was inspected and visually appeared to be 100% sand, free of any debris. The material appeared to be native as it was mined from a NYSDEC permitted facility, extending approximately 100 feet below original grade. The stockpile of sand that was inspected was mined from below the water table.

The IEM witnessed the collection of six composite soil samples and six discrete VOC samples, as well as a physical sample to be analyzed for permeability. The IEM logged the location of the perimeter of the stockpile via GPS. The source site owner and NYCDPR were made aware that the stockpile must remain untouched in order for the material to be considered for approval.

NYCDPR/LAWS submitted a copy of a previous NYSDEC mining permit containing the source site's previous permit number (1-4722-00218/00001). LAWS was informed by the source site representative that the source site is operating under a NYSDEC authorized permit extension.

The EDR was ordered on December 9, 2011. The IEM performed a review of the EDR and provided observations and a list of RECs to the NYSDEC. The IEM received the lab data (from the December 8, 2011 sample event) from LAWS on December 19, 2011. The IEM completed review of the lab data on December 19, 2011 and found that the material met the Site Permit criteria for cover layer soil. The IEM reviewed the NYCDPR submittal associated with the EDR for the source site. Based on review of the NYCDPR EDR review memo, site visits, inspections, and data review, the IEM did not have any objections associated with proceeding with this source site. Prior to receiving approval for importation of this cover material to the Site, the NYSDEC needed to receive and review the permeability testing data.

On January 4, 2012, the IEM forwarded the NYSDEC the permeability data for review. On January 9, 2012, the NYSDEC identified that this source site was conditionally approved as a source for cover material based on samples meeting the approved permeability specification at a frequency of one sample per five hundred cubic yards for the initial 2,000 cubic yards (analysis for permeability only). Thereafter, sampling for permeability would be performed at a frequency of one sample per 2,000 cubic yards if the permeability results for the initial 2,000 cubic yards were satisfactory. This conditional approval was based upon information provided by NYCDPR in its January 5, 2012 email and the IEM's January 4, 2012 email to the NYSDEC. Additional permeability sampling witnessed by the IEM was required since only one IEM witnessed sample has occurred (i.e. January 2, 2012). The IEM witnessed permeability testing at the source site on January 10, 2012.

NYCDPR transmitted additional percolation testing results to the NYSDEC on January 26, 2012. The results were for IEM witnessed sampling completed on January 10, 2012 and January 23, 2012. On January 26, 2012, the NYSDEC provided NYCDPR with approval to use the average of twenty permeability test results as representative of the 12,000 cubic yards of stockpiled cover layer material at the source site. This

approval was based on the fact that loading, transporting, stockpiling, and spreading of the material would result in thorough mixing. The initial 12,000 cubic yards were approved for import to the Site.

On February 1, 2012, IEM staff was on-site to observe loading and transportation of cover layer materials from the approved stockpile and completion of trucking manifests. On February 7, 2012, IEM staff notified NYCDPR and NYSDEC that the IEM had reviewed the environmental sample data for the second round of environmental sampling completed on January 30, 2012 for cover soil (i.e. eight composite samples from an approximately 15,000 cubic yard stockpile). Per the results in the lab report transmitted to the IEM, the IEM verified that the material complied with the Site permit criteria for cover layer material. On February 9, 2012, the IEM reviewed the infiltration rate test results for the second stockpile of cover layer material, and all of the sample results met the Site Permit criteria (i.e. less than 29.4 in/hr.). Based on a review of the submitted environmental data and the infiltration testing data, the second stockpile (up to 16,000 cubic yards) was approved for import to the Site since it met all of the Site Permit criteria.

The IEM was on-site at the Ranco Sand source site on February 22, 2012 to witness sampling of a new stockpile of potential cover layer material (stockpile #3). The IEM witnessed the collection of five samples from the stockpile consisting of approximately 10,000 cubic yards of potential cover layer material.

The IEM reviewed the environmental sampling results from the February 22, 2012 sampling event for this source site and found that the sample results fell below the Site Permit limits. The IEM reviewed the percolation test results and found that the percolation rates for stockpile #3 exceeded the established threshold of 29.4 inches/hour. The IEM required a proposal from NYCDPR on an acceptable approach to remedy the percolation rate exceedance.

On March 15, 2012, the NYSDEC notified the IEM that the environmental testing (TAGM) frequency for this source site had been reduced from one sample per 2,000 cubic yards to one sample per 10,000 cubic yards of cover layer material. The percolation testing frequency remained unchanged at one sample per 2,000 cubic yards.

On March 15, 2012, the NYSDEC found NYCDPR's proposed truck loading and mixing protocol acceptable to address elevated percolation rates for the stockpile #3 materials. On March 19, 2012, the IEM informed NYCDPR that stockpile #3 at the Ranco Sand source site had been approved for import as cover layer material based upon the acceptable environmental testing results and the percolation results in conjunction with the required mixing and truck loading protocol. The IEM witnessed the appropriate truck loading protocol of the first round of trucks at the source site on March 16, 2012. Trucks were loaded in an alternating pattern from both stockpile #2 and stockpile #3.

The IEM witnessed source site sampling at this source site on March 30, 2012. The IEM received a lab report on April 5, 2012 containing infiltration testing data for ten samples collected from stockpile #4. The IEM reviewed the infiltration testing data and confirmed that the results met the permeability requirement for cover soil.

The IEM received the environmental (TAGM) lab report on April 6, 2012 for the samples collected for stockpile #4 on March 30, 2012. On April 9, 2012, the IEM confirmed that sample results for stockpile #4 did not exceed any of the Permit criteria for cover material and the material was acceptable for import to the Site.

The IEM received the environmental (TAGM) lab report on May 9, 2012 for the samples collected for stockpile #5 on April 30, 2012. On May 10, 2012, the IEM confirmed that sample results for stockpile #5 did not exceed any of the Permit criteria for cover material and the material was acceptable for import to the Site. The IEM reviewed the infiltration testing data on May 17, 2012 and confirmed that the results met the permeability requirement for cover soil.

The IEM approved Ranco stockpile #5 on May 17, 2012, as the environmental testing results did not exceed any of the Permit criteria for cover layer material. The 20,000 cubic stockpile from Ranco that was tested and witnessed by the IEM met the Site Permit criteria and was acceptable for import to the Site. Infiltration testing was also approved by the IEM. The NYSDEC lowered the frequency of infiltration testing to one infiltration sample per 10,000 cubic yards for this source site on May 11, 2012. Through May 17, 2012, this source site was approved to export 78,000 cubic yards of cover material to the Site.

The IEM was on-site at this source site on June 8, 2012 to witness the collection of samples from stockpile #6. Two samples were collected for environmental and infiltration analysis for the approximate 20,000 cubic yard stockpile. The IEM received infiltration testing data on June 14, 2012. Infiltration test results were reviewed and approved on June 19, 2012. The IEM received environmental testing lab results on June 18, 2012. The environmental testing lab results were reviewed and approved on June 19, 2012. Stockpile #6 (20,000 CY) did not exceed any of the Site Permit criteria for cover layer material and infiltration requirements and was therefore acceptable for import to the Site.

The IEM was on-site at this source site on July 17, 2012 to witness sampling of stockpile #7 consisting of 10,000 cubic yards of cover layer material. On July 26, 2012, the IEM notified NYCDPR and LAWS that the material from stockpile #7 was acceptable for import to the Site based on the fact that the submitted environmental and infiltration lab reports met the Site Permit requirements.

The IEM reviewed the infiltration and environmental lab reports for stockpile #8 of cover layer material (10,000 cubic yards) sampled on August 14, 2012. The IEM notified NYCDPR on August 22, 2012 that the material was approved for import to the Site as both infiltration and environmental results were acceptable per the Site permit requirements.

On September 17, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #9 of cover layer material sampled at this source site on September 7, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

On October 1, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #10 of cover layer material sampled at this source site on September 21, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

On November 7, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #11 of cover layer material sampled at this source site on October 17, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

On December 10, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #12 of cover layer material sampled at this source site on November 16, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

IEM staff was on-site February 1, 2013 at this source site to perform the visual inspection and witness sampling of the cover soil for environmental and infiltration testing associated with stockpile #13 (10,000 cubic yards). The IEM witnessed collection of one environmental sample and one infiltration sample.

On February 19, 2013, the IEM notified NYCDPR that the latest round of cover layer material for this source site was acceptable for import to the Site based on the fact that both the environmental and infiltration results met the Site Permit requirements. The results were for sampling witnessed by the IEM on February 1, 2013 for stockpile #13.

The IEM witnessed sample collection for stockpiles #14 and #15 totaling 20,000 cubic yards worth of proposed cover layer material at this source site on March 19, 2013. Based on review of submitted lab results, the proposed cover layer material was approved for import to the Site as both infiltration and environmental results were acceptable per the Site Permit requirements.

On June 3, 2013, the IEM notified NYCDPR that the latest round of cover layer material for stockpiles #16 and #17 totaling approximately 20,000 cubic yards were acceptable for import to the Site as both infiltration and environmental results met the Site Permit requirements. Submitted infiltration and environmental lab reports were for sampling witnessed by the IEM on May 22, 2013.

On August 5, 2013, the IEM notified NYCDPR that the latest round of cover layer material for stockpile #18 (approximately 10,000 cubic yards) was acceptable for import to the Site. The submitted infiltration and environmental lab reports for sampling witnessed by the IEM on July 26, 2013 met the Site Permit requirements.

On August 29, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #19 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on August 21, 2013.

On September 13, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #20 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on September 6, 2013.

On October 3, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #21 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on September 25, 2013.

On October 28, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #22 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on October 16, 2013.

On November 8, 2013, the IEM notified NYCDPR that the latest cover layer material stockpile #23 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on October 25, 2013.

On November 18, 2013, the IEM notified NYCDPR that the latest cover layer material stockpile #24 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on November 8, 2013.

On March 14, 2014, the IEM notified LAWS and NYCDPR that the cover layer material stockpile #24, originally sampled and witnessed on November 8, 2013 was acceptable for importation. On March 14, 2014, the IEM completed a site visit and performed a visual inspection of the existing stockpile on-site.

#### 3.1.2.2.1 Ranco Sand (115 South Street, Manorville, NY) [MFM]

On July 10, 2012, the IEM received lab results for a 10,000 cubic yard stockpile of cover layer material sampled at the Ranco Sand source site on July 2, 2012 for MFM. On July 11, 2012, the IEM confirmed that the environmental lab testing results did not exceed any of the Site Permit criteria for cover layer material environmental analyses however the stockpile could not be approved for import as infiltration test results were not reviewed and approved.

The NYSDEC approved the infiltration test results on August 21, 2012 for stockpiled cover layer material (10,000 cubic yards) sampled on July 2, 2012. Based on the NYSDEC approval of the infiltration results, the IEM notified NYCDPR on August 22, 2012 that the stockpiled material was approved for import to the Site as both infiltration and environmental results were acceptable per the Site Permit requirements.

#### 3.1.2.2.2 Ranco Sand (115 South Street, Manorville, NY) [Triton]

On June 6, 2013, the IEM notified NYCDPR that the revised environmental lab report for a 5,000 cubic yard stockpile met the Site Permit requirements for IEM witnessed sampling completed on May 31, 2013. On June 7, 2013, the IEM notified NYCDPR that the infiltration testing results did not meet the Site Permit requirements.

On June 24, 2013, the IEM notified NYCDPR that the additional infiltration tests analyzed for a 5,000 cubic yard stockpile did not meet the Site Permit requirements for IEM witnessed sampling completed on May 31, 2013 and it was not approved for import to the Site. On June 24, 2013, NYCDPR notified the IEM that this material would not be sampled any further.

Approximately 271,801.2 cubic yards of cover layer material were imported to the Site from this source site based on approved materials noted above in Sections 3.1.2.2 and 3.1.2.2.1.

#### 3.1.2.3 East Coast Mines (Lewis Road near Route 104, East Quogue, NY)

Between August 10 and August 12, 2011, NYCDPR and the IEM coordinated a site visit to the East Coast Mines source site (DEC Facility ID: 1-4736-00539), and discussed review requirements. The EDR was ordered by the IEM on August 12, 2011, and the initial EDR files were forwarded to NYCDPR.

The IEM visited the source site on August 17, 2011 to inspect two stockpiles each consisting of approximately 2,000 cubic yards of soil. The soil was inspected and visually appeared to be sand, free of any debris. The material appeared to be native as it was mined from roughly 80-100 feet below original grade. The stockpiles were inspected with a PID, which yielded no detections. The IEM witnessed the collection of a composite and discrete VOC sample from each stockpile, as well as a physical sample to be analyzed for permeability.

The IEM visited the site again on September 29, 2011 to inspect a separate stockpile of proposed cover layer material of approximately 2,000 cubic yards of soil. The soil was inspected and visually appeared to be sand and free of any debris. The material appeared to be native as it was mined from roughly 80-100 feet below original grade. The IEM witnessed the collection of a composite and discrete VOC sample from the stockpile, as well as a physical sample to be analyzed for permeability. The IEM logged the location of the perimeter of the stockpile via GPS. The source site owner and NYCDPR were aware that the stockpiles must remain untouched in order for them to be considered for approval. NYCDPR performed a review of the EDR. The IEM performed a review of NYCDPR's review submittal, as well as a review of the EDR. No RECs were identified. NYCDPR submitted the facility's NYSDEC mining permit to the IEM.

On October 11, 2011, the NYSDEC identified that they had reviewed the initial analytical data for the East Coast Mines source site and authorized the importation of two stockpiles of cover material totaling approximately 3,500 cubic yards. This approval was associated with cover material that was sampled on August 17, 2011. This material was approved for only stockpiling on-site, and had not been approved for spreading on-site. Cover material was stockpiled in the rough of holes 4 and 5 pending NYSDEC approval for spreading. The NYSDEC had not reviewed the September 29, 2011 analytical data resulting in a

maximum allowable import volume from this source site of 3,500 cubic yards. In general, the NYSDEC allowed up to 16,000 cubic yards of approved cover material (from all cover material source sites) to be stockpiled in the rough of holes 4 and 5 (8,000 cubic yards per hole) prior to satisfying the conditions associated with spreading the cover material on-site. These conditions included meeting permeability and shaping layer thickness requirements. On October 21, 2011, the NYSDEC provided NYCDPR with a conditional approval to allow NYCDPR to import cover layer material with a permeability of up to 30 inches per hour pending NYCDPR submitting for approval of an amendment to the Stormwater Pollution Prevention Plan (SWPPP). With this permeability approval, NYCDPR was notified that they could spread cover material on-site at their own risk pending shaping layer thickness compliance.

On April 18, 2012, NYCDPR requested that the IEM witness source site sampling for two 2,000 cubic yard stockpiles at this source site.

The IEM witnessed source site sampling at this source site on April 23, 2012. Four samples were collected for environmental testing and four samples were collected for agronomic testing. The IEM reviewed the environmental and infiltration testing data and confirmed that the environmental results met the Site Permit requirements for cover layer material and three of four stockpiles met the NYSDEC permeability requirements. The stockpile SP2 infiltration rate exceeded the Permit limit. Material from SP2 was not acceptable for import to the Site.

The East Coast Mines stockpiled material sampled on April 23, 2012 was formally approved by the NYSDEC on May 15, 2012. Although the environmental results passed the Site Permit criteria, one of the four stockpiles (each stockpile was 2,000 cubic yards) did not meet the Site Permit infiltration criteria. However, the NYSDEC, after a review of a NYCDPR submittal request, granted approval of the four stockpiles by allowing averaging of the four stockpile infiltration results; the average of the four stockpiles met the Site Permit criteria.

The IEM forwarded the Site environmental testing criteria per the Permit for cover layer material to the lab on July 2, 2012. On July 4, 2012, the IEM notified NYCDPR, the lab, and the source site contact of parameters that had to be re-analyzed or re-reported to coincide with the required Permit limits for potential cover layer material sampled on June 22, 2012. On July 5, 2012, the IEM reviewed the revised lab report for material sampled on June 22, 2012 and determined that the material (6,000 cubic yards) was acceptable for import to the Site. On July 10, 2012, the IEM received a lab report associated with a 10,000 cubic yard stockpile sampled on July 2, 2012. On July 10, 2012, the material was found to be acceptable for import to the Site based upon review of the submitted lab report and NYSDEC review and approval of the infiltration testing results. The NYSDEC approved the infiltration results based on the condition that the stockpiled materials were mixed at the source site prior to import to the Site.

The NYSDEC notified NYCDPR on July 18, 2012 that the proposed 1:3 ratio of mixing for cover layer material stockpiles #1, #3, and #6 at East Coast Mines source site was acceptable and subject to verification by the IEM. The IEM notified NYCDPR and the source site operator on July 18, 2012 that the submitted lab report was missing the analysis of dibenzofuran. NYCDPR and the source site operator

submitted revised lab reports on July 18, 2012. The IEM notified NYCDPR and the source site operator that the two separate stockpiles of material (8,000 cubic yards each) sampled at the East Coast Mines source site on July 11, 2012 were conditionally acceptable for import based upon proper mixing of the stockpiles. The IEM was on-site at the East Coast Mines source site to witness sampling of a new 10,000 cubic yard stockpile and the mixing of the cover soil stockpiles on July 23, 2012. The IEM notified NYCDPR and the source site operator that the sampled materials were acceptable for import to the Site on July 24, 2012.

The IEM was on-site at the East Coast Mines source site on July 31, 2012 to witness mixing of cover layer material stockpiles. On August 6, 2012, the IEM notified NYCDPR that the cover layer materials sampled on July 23, 2012 at the East Coast Mines source site, totaling 14,000 cubic yards, were acceptable for import to the Site based on review of submitted environmental and infiltration lab reports.

On August 20, 2012, the IEM notified NYCDPR that the 8,000 cubic yard stockpile of cover layer material sampled on July 31, 2012 was approved for import to the Site. The approval was based on the submitted environmental results meeting the Site Permit requirements, approval from the NYSDEC to mix and average the infiltration test results, and the mixing of the stockpiled material at the source site which was witnessed by the IEM on August 14, 2012.

On August 30, 2012, the IEM notified NYCDPR that the 12,000 cubic yards of cover layer material sampled on August 14, 2012 was approved for import to the Site. The approval was based on the submitted environmental results meeting the Site Permit requirements, approval from the NYSDEC to mix and average the infiltration test results (August 23, 2012 email), and the mixing of the stockpiled material at the source site which was witnessed by the IEM on September 4, 2012.

On September 12, 2012, the IEM notified NYCDPR that a portion of the 14,000 cubic yards of cover layer material sampled on September 4, 2012 was approved for import to the Site. Stockpile SW consisting of 6,000 cubic yards of cover layer material was approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile DSS consisting of 8,000 cubic yards had acceptable environmental results meeting the Site Permit requirements but was not approved due to infiltration results not meeting the Permit requirements. On September 14, 2012, the IEM notified NYCDPR that Stockpile DSS consisting of 8,000 cubic yards of cover layer material was approved for import to the Site since the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of September 14, 2012.

On September 20, 2012, the IEM notified NYCDPR that a portion of the 14,000 cubic yards of cover layer material sampled on September 14, 2012 was approved for import to the Site. Stockpile FFS consisting of 6,000 cubic yards of cover layer material was approved was based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile NW consisting of 8,000 cubic yards had acceptable environmental results meeting the Site Permit requirements but was not approved due to infiltration results not meeting the Permit requirements. On September 21, 2012, the IEM notified NYCDPR that Stockpile NW consisting of 8,000 cubic yards of cover layer material was

approved for import to the Site since the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of September 21, 2012.

On September 28, 2012, the IEM notified NYCDPR that a portion of the 12,000 cubic yards of cover layer material sampled on September 21, 2012 was approved for import to the Site. Stockpile SW consisting of 2,000 cubic yards of cover layer material was approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile DSS consisting of 10,000 cubic yards had acceptable environmental results meeting the Site Permit requirements but was not approved due to infiltration results not meeting the Permit requirements. On October 2, 2012, the IEM notified NYCDPR that Stockpile DSS consisting of 10,000 cubic yards of cover layer material was approved for import to the Site since the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of October 2, 2012.

On October 8, 2012, the IEM notified NYCDPR that all of the 16,000 cubic yards of cover layer material sampled on October 2, 2012 was approved for import to the Site. Stockpile SW consisting of 6,000 cubic yards of cover layer material was approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile NW consisting of 10,000 cubic yards which had acceptable environmental results meeting the Site Permit requirements was approved based on the fact that the average of the infiltration test results met the Permit requirements and the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of October 9, 2012.

On October 18, 2012, the IEM notified NYCDPR that all of the 16,000 cubic yards of cover layer material sampled on October 9, 2012 was approved for import to the Site. The stockpiled cover layer material was approved was based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results.

On November 7, 2012, the IEM notified NYCDPR that all of the 16,000 cubic yards of cover layer material sampled on October 24, 2012 was approved for import to the Site. Stockpile SW consisting of 6,000 cubic yards of cover layer material and Stockpile NW consisting of 10,000 cubic yards of cover layer material were approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results.

On May 8, 2013, the IEM inspected previously tested and approved cover layer material (sampled October 24, 2012) at the source site and notified NYCDPR that import may resume for the previously approved material.

On July 25, 2013, the IEM notified NYCDPR that the latest round of East Coast Mines cover layer material (approximately 8,000 cubic yards) was acceptable for import to the Site. The submitted infiltration and environmental lab reports for sampling witnessed by the IEM on July 19, 2013 met the Site Permit requirements.

Approximately 167,007.05 cubic yards of cover layer material were imported to the Site from this source site.

#### 3.1.2.4 Amboy Aggregates (415 Main Street, South Amboy, NJ)

The IEM reviewed the infiltration and environmental lab reports for cover layer material (2,000 cubic yards) sampled on August 27, 2012. The IEM notified NYCDPR on September 6, 2012 that the environmental results were acceptable per the Site Permit requirements, however the infiltration results did not pass the Permit requirements for cover layer material. The IEM's involvement on this source site was limited to witnessing the collection of the soil samples for testing and a review of the lab results.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.2.5 Long Island Compost/Great Gardens (445 Horseblock Road, Yaphank, NY)

On November 16, 2012, the IEM notified NYCDPR and LAWS that the Long Island Compost/Great Gardens source site (DEC Permit Number: 1-4722-03647/00001) was conditionally approved to allow for the import of topsoil to be used as cover layer material pending IEM visual inspection and witnessing the collection of soil samples of the proposed material at the source site.

On December 7, 2012, the IEM notified NYCDPR that the 2,000 cubic yard stockpile of cover layer material sampled at this source site on November 30, 2012 was acceptable for import to the Site as both environmental lab results and visual inspection met the Site Permit requirements. The NYSDEC waived infiltration testing requirements for this material as long as the material was used solely in tree pits.

The IEM witnessed sample collection for a 2,000 cubic yard stockpile of proposed cover layer material at this source site on March 20, 2013. On March 28, 2013, the IEM notified NYCDPR and LAWS that the submitted sample results did not pass the Site Permit criteria due to the fact that Benzo(a)pyrene exceeded the permit limit of .061 mg/kg in sample 49369 with a value of .097 mg/kg and Chromium exceeded the permit limit of 19.4 mg/kg in sample 49369 with a value of 22.9 mg/kg. The material was not approved for import to the Site as cover layer material at that time.

On April 9, 2013, the IEM notified NYCDPR and LAWS that the submitted sample results for a 2,000 cubic yard stockpile of proposed cover layer material at this source site (sampled on March 20, 2013) did not pass the Site Permit criteria due to the fact that Benzo(a)pyrene exceeded the permit limit of .061 mg/kg in sample 49369 with a value of .097 mg/kg. The revised lab report dated April 8, 2013 addressed concerns with the analysis of trivalent and hexavalent chromium (the previous lab report had only analyzed total chromium). On April 10, 2013, the NYSDEC notified NYCDPR that after further review of the revised lab results, the 2,000 cubic yards of material was acceptable for import to the Site.

On April 29, 2013, the IEM notified NYCDPR and LAWS that the submitted sample results for a 2,000 cubic yard stockpile of proposed cover layer material at this source site (sampled on April 19, 2013) did not pass the Site Permit criteria due to the fact that Benzo(a)pyrene exceeded the permit limit of 0.061 mg/kg with

a value of 0.140 mg/kg and Dibenzo(a,h)anthracene exceeded the permit limit of 0.014 mg/kg with a value of 0.020 mg/kg. On May 1, 2013, NYCDPR requested approval to use the material as backfill for the tree pits only. On May 1, 2013, the NYSDEC notified NYCDPR that the 2,000 cubic yards of material was acceptable for import to the Site.

On May 14, 2013, the IEM notified NYCDPR and Triton that the submitted environmental and infiltration sample results for 2,000 cubic yards of proposed cover layer material at this source site (witnessed by the IEM and sampled on April 30, 2013) was acceptable for import to the Site as both environmental and infiltration results met the Site Permit requirements.

On October 28, 2013, the IEM notified NYCDPR that that a review was completed for a 2,000 cubic yard stockpile of proposed cover layer material from this source site. The proposed material was visually inspected and sampling was witnessed by the IEM on October 16, 2013. Although the material passed the IEM's physical/visual inspections and did not yield any PID detections, the sampled material did not comply with Site Permit criteria for the following parameters: Benzo(a)pyrene exceeded the permit limit of 0.061 mg/kg in sample GBF65277 with a value of 0.150 mg/kg; Dibenzo(a,h)anthracene exceeded the permit limit of 0.014 mg/kg in sample GBF65277with a value of 0.024 mg/kg; and Dieldrin exceeded the permit limit of 0.044 mg/kg in sample GBF65277 with a value of 0.100 mg/kg. On October 29, 2013, NYCDPR submitted additional documentation to the NYSDEC for evaluation. Based on review of submitted information, the NYSDEC notified NYCDPR on October 29, 2013 that this material may be imported to Site and used solely for backfilling the parking lot curb planters and shall not be used as capping material.

On March 11, 2014, the IEM notified LAWS and NYCDPR that the 2,000 cubic yard stockpile of cover layer material originally sampled and witnessed on October 16, 2013 was acceptable for importation. On March 11, 2014, the IEM completed a site visit and performed a visual inspection of the existing stockpile at the source site.

Approximately 8,434.85 cubic yards of cover layer material were imported to the Site from this source site.

## 3.2 On-Site Fill Importation Inspections

### 3.2.1 Process

As required under Special Condition 24 of the 2014 Permit, all fill importation was inspected at the Site by the IEM. Fill material volume (truck volume) was measured and recorded for each delivery of fill material as it arrived on-site by NYCDPR's appointed representative. The fill material was then inspected by the IEM at the observation platform near the entrance to the Site. At this time, the fill material was visually and chemically inspected. The visual inspection included observations of the material, disturbing the material with a shovel, and close-up observations of the material retrieved by shovel while still in the truck or trailer. Chemical inspection of the fill material was executed using a calibrated PID. If the fill material failed to meet the Permit requirements for reasons such as a PID reading above ambient air, the presence of asphalt or some other unauthorized debris, etc., the load was rejected immediately prior to

dumping. If the material was rejected, the truck was not allowed to dump on-site and was directed to exit the site immediately.

If the fill material passed the initial inspection at the IEM observation platform, either it was allowed to dump directly at a work location for immediate use as shaping layer material or cover layer material or it was transported to, and dumped at, a stockpile location. At the dump location, the IEM screened the fill material visually and with a PID for a second time prior to spreading if dumped at an active work location. If the fill material did not meet the permit requirements at the dump location, it was immediately rejected, loaded back onto the same truck, and transported off-site.

After the second round of inspection and after the material was dumped on-site and accepted for use, the IEM recorded dump and stockpile locations utilizing handheld GPS units. The data was uploaded to a web-based GIS system intermittently throughout the process in order to provide real-time data to authorize users including the NYSDEC and NYCDPR and to generate figures used to track the dump locations in the biweekly FMRs. The web-based GIS database was maintained by the IEM. Figure 2, included in each FMR beginning with FMR 246, identifies where fill materials were being used and dumped on the Site during construction activities.

A flow chart detailing the on-site fill importation inspection process is included as Appendix 21.

### 3.2.2 Trucking Manifests

Trucking manifests were utilized for all imported shaping layer and cover layer materials. A 5-ply manifest form was completed for each load of material to track each load of material from origination at the source site to destination at the Site. The manifest contained information including but not limited to a manifest number, the source site name and address, the truck driver's name, truck and trailer license plate numbers, as well as the time of departure from the source site and arrival time at the Site. See fill import manifests included in Appendix 13.

Note that manifests for material approved for importation prior to November 2008 cannot be retrieved and are not included in Appendix 13. The manifest information was stored in a NYCDPR document repository that was damaged by flooding and the files have been lost. However, the FMRs for the time period prior to 2008 comment on the nature of this work.

### 3.2.3 Rejected Trucks & Materials (JFK Consent Order Material & Misc. Debris)

Generally, materials were either rejected upon initial inspection at the IEM observation platform or rejected upon dumping at the work area or stockpile location. The most common reasons for rejection were the presence of asphalt or other unauthorized debris mixed with the material or elevated PID readings.

Details for all rejected trucks were included in each bi-weekly Fill Management Report (FMR). Trucking manifests associated with rejected truckloads were marked with the word "REJECTED" by the IEM. Trucking manifests for rejected trucks are included as Appendix 13.

During 2010, fill material from one particular source at JFK Airport was brought on-site and placed in seven different stockpiles ultimately being used as fill material beneath the clubhouse and maintenance building parking lots. The material was believed to be in conformance with permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. On January 10, 2011, NYCDPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to this fill material. The Consent Order is included as Appendix I, of the 2013 Engineering Report included in Appendix 20.

## 3.3 Fill Tracking

Special Condition 9 of the 2014 Permit required quantification of all imported fill material. Fill importation was continuously tracked by the IEM. To account for the difference in truck volume and in-place volume, the IEM applied a 41.7% correction factor for shaping layer material and an 18% correction factor for cover layer material as set forth in the Permit. Additional details and methodology related to calculation of the shaping layer correction factor is included in a December 11, 2009 letter included in Appendix 19.

The cover layer material correction factor was separated from the shaping layer correction factor and revised in accordance with a NYCDPR submittal dated April 1, 2013 and revised April 8, 2013. The methodology for calculating the cover layer material correction factor is included in the revised April 8, 2013 submittal, which is included in Appendix 19.

As shaping layer and cover layer fill materials were imported to the Site, the IEM tracked volumes for each source site with respect to authorized volume based on approved sample analysis results for each source at the required sampling frequency (i.e. per 10,000 cubic yards for shaping layer material and per 2,000 cubic yards for cover layer material as included in Special Condition 14 of the 2014 Permit). The volume of imported material was tracked real-time as the IEM uploaded source, truck, and fill material volume information as each load of material was dumped on the Site. The fill tracking process, as part of the overall environmental monitoring and database management web-GIS system developed by the IEM and utilized beginning on October 25, 2010, was awarded a New York Chapter American Council of Engineering Companies (ACEC) Platinum Award in April of 2013. The web-GIS system allowed the IEM to upload and store data related to each load of fill material entering the Site, map its location, and allow real-time access to the data and mapping for NYCDPR, NYSDEC, the Contractor, and the general public.

At various times throughout fill importation activities, source site, shaping layer, or cover layer material totals were modified for various reasons. Additional details related to corrections and modifications can be found in Section 4 of corresponding Fill Management Reports, notably FMRs 213, 266, 277, 290, and 305.

Effective with FMR 290 and retroactive to October 25, 2010 (i.e. Woodard & Curran's first day as the IEM on-site at the Site), shaping layer and cover layer material volumes were tracked based upon the calculated volumes within each truck, as calculated by TRC and provided to the IEM (i.e. Tables 4-2 and 4-3 of each FMR). This provided for the most accurate and consistent approach to monitoring the volume

of imported fill materials. Prior to receipt of the calculated volumes from TRC, the IEM tracked estimated volumes as trucks dumped on the Site.

The Fill Delivery Summary Table included in Appendix 11 contains information related to the total amount of shaping layer and cover layer materials imported to the Site. The total volume of shaping layer material imported to the Site since October 18, 2002 was 2,681,338.15 cubic yards (truck volume) or approximately 93.4% of the authorized amount under the Permit. The total volume of cover layer material imported to the Site since October 18, 2002 was 480,959.49 cubic yards (truck volume) or 100.1% of the authorized amount under the Permit.

On April, 17, 2014, the NYSDEC confirmed via email that a minor exceedance of the cover layer in-place volume as included in the Permit is acceptable considering no additional shaping material will need to be imported and that the exceedance could be addressed via as-built drawings and in the final construction certification report. A copy of the email is included in Appendix 19.

The Bronx-Whitestone Bridge bound the “Site” to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond’s Cemetery to the north, and the East River to the south. The project was originally managed under Ferry Point Partners, LLC (FPP).
On July 17, 2000 the New York State Department of Environmental Conservation (NYSDEC) issued Part 360, Solid Waste Management Permit No. 2-6006-00014-000110 jointly to the New York City Department of Parks and Recreation (NYCDPR) and FPP to allow a total of 1,000,000 cubic yards of fill to be imported and placed on the Site. Importation began in August 2000.

On October 18, 2002 the NYSDEC issued Part 360, Solid Waste Management Permit No. 2-6006-00014-000113 (2002 Permit) to allow a total of 1,522,300 cubic yards of fill to be imported and placed on the Site. The fill material was to consist of approximately 1,272,300 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The 2002 Permit also stated that, “approximately 415,000 cubic yards of fill was deposited on the Site prior to the effective date of the permit and the projection for in-place fill material to complete the project was 1,107,300 cubic yards, consisting of approximately 857,300 cubic yards (in-place volume) of select exempt construction debris for the shaping layer and approximately 250,000 cubic yards (in-place volume) of uncontaminated soil for the cover layer.

In 2003, it was determined that the tournament quality and signature status of the course could be significantly improved by making the facility a "links" style course. The changes from the 2002 Permit include:

- Increasing the support mounding between golf holes and grading the course in a links style.
- Re-routing of holes 11, 12 and 13 to reverse their direction in order to improve player circulation and playing time.
- Moving Hole 9 to the west of the golf driving range in order to improve

the safety zone of the driving range and remove the need for high netting.

- Realigning the centerlines of holes: 10, 16, 17 and 18 to improve the strategic layout and visual experience of the golf course.
- Lowering the elevations of tee 4 and 6. This will eliminate the retaining wall proposed at the northeast comer of the Site.
- Adding a golf training area at the north end of the driving range. This required shifting the centerline of Hole 8 slightly north and increasing the support mounding around this area to buffer the adjacent holes.
- Increasing the mounding adjacent to the TBTA toll plaza in order to block noise and adjacent traffic from view.
- Shifting the Site roadway along the east side of the bridge to accommodate a TBTA easement that extends 25 feet east of the bridge. This required changes to the parking lot at the clubhouse and the location of detention/water quality basin, and waterfront park.
- Eliminating the Boathouse Grill restaurant in the Waterfront Park. A restaurant will now be located within the banquet facility. Parking spaces for the banquet facility were increased to accommodate the restaurant. A restaurant may be constructed within the waterfront park in a future phase, based on economic demands.
- Modifying the parking lot for the Waterfront Park. The 120 parking' spaces for the Waterfront Park will be located near the Whitestone Bridge approach structure.

These proposed changes to the golf course would have increased the total in-place fill volume for the project to 2,370,000 cubic yards to shape the course in a links style.

The quantification of the imported fill material was to be continuously tracked by both truck volume and periodic topographic surveys of in-place volumes. Initially it was assumed that truck volume would be reduced by 25% when compacted into place, but a new correction factor was to be calculated. On November 1, 2004, the NYSDEC approved a revised truck reduction factor of 42.4%, which was based upon an October 10, 2003 30% aerial topographic survey, and On December 7, 2004, the NYSDEC approved a revised truck reduction factor of 41%, which was based upon a July 17, 2004 60% aerial topographic survey. These recalculations were performed by dividing the actual in-place volume by the total cubic yards of truck volume delivered to the site as of the date of the survey as per the “2002 Permit

TRC Raymond Keyes Associates, A Division of TRC Engineers, Inc. prepared an, “Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY – Engineering Report; Dated May 31, 2005; Revised June 30, 2005” which comprised of Volume #1, Volume #2 and a twenty six (26) sheet drawing set entitled, “Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2” (2005 Report) . The 2005 Report represented the following scope of work:

- An eighteen (18) hole golf course with practice area.
- Maintenance Area in the northwest corner of the Site.
- Clubhouse Parking Lot in the southwest portion of the Site.
- Banquet Facility in the southwest portion of the site (along Emerson Avenue)
- Community Park
- Waterfront Park with parking lot.
- Drawing G-3 and G-4 of "Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2", showed the deviations in grading between the plans approved on 10/18/02 with the proposed plan.

On November 18, 2005 the NYSDEC issued Part 360, Solid Waste Management Permit No. 2-6006-00014-000113 ("2005 Permit") authorizing the importation of a total of 2,370,000 cubic yards of in-place fill material to the Site. The fill material was to consist of approximately 2,120,000 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The truck reduction factor was 41% and could be further modified.

In 2007, TRC Engineers, Inc. ("TRC") was awarded a one (1) year contract to provide "Civil, Environmental and Construction Services for Compliance with DEC permit Related to the Construction of a Golf Course at Ferry Point Park". The order to work date for that contract was October 25, 2007. The scheduled completion date was October 23, 2008. The contract was extended an additional year to October 24, 2009. On October 26, 2009, "TRC" issued a "Year 2 End Project Summary" and estimated that approximately 202,000 total cubic yards of material was imported to the Site by October 22, 2007.

On October 26, 2007, the NYCDPR and FPP terminated the license agreement to develop, construct and operate the Project at the site and on February 29, 2008 FPP submitted an application to transfer the "2005 Permit" solely to the NYCDPR. On August 12, 2008, the NYSDEC notified the NYCDPR and FPP that the "2005 Permit" had been transferred to the NYCDPR.

The order to work date for construction of the Community Park was August 11, 2008. Fill importation continued as witnessed by the Independent Environmental Monitor (Gannett Fleming). On September 30, 2009, Thomas Balsley Associates, NYCDPR design consultant issued a revised drawing changing the limit of the Community Park. The new Site was reduced in size by moving the fence line in the south further north and by moving the fence along the proposed golf course closer to Balcom Avenue.

On January 22, 2009, in accordance with Special Condition #10 of the "2005 Permit", TRC Engineers, Inc. (TRC) submitted a revised truck reduction factor of 40.3%. On February 11, 2010, NYSDEC approved a truck reduction factor of 41.7%.

The order to work date for construction of the Ferry Point Golf Course was October 23, 2009. The golf course layout that the NYCDPR bid was modified from that which shown in the 2005 Report. One major

change was the total removal of the Banquet Facility in the southeast part of the Site. There were also changes in the placement, alignment and grading of some holes.

On February 1, 2013, the NYSDEC granted a permit modification to increase the limit of cover material to 394,000 cubic yards with the stipulation that the Agency revisit the compaction factor. It was determined that the compaction factor for the granular cover material (sand) would be 18%. This would revise the "trucked in" quantity to 480,488 cubic yards. The compaction factor for cover layer material approved per April 26, 2013 letter from NYSDEC to DPR.

On May 21, 2014, the NYSDEC issued Part 360, Solid Waste Management Permit No. 2-6006-00014-00013 (SW) & 2-6006-00014-00013 (TW) to the NYCDPR to allow a total of 2,514,000 cubic yards of material in-place volume (2,120,000 cubic yards in-place shaping material/394,000 cubic yards in-place cover material).

## 3.4 Total Carcinogenic Semi-Volatile Organic Compound Tracking

As identified in Special Condition 14 of the 2014 Permit, the NYSDEC Acting Regional Director letter dated October 25, 2006, authorized the import of shaping material with a total carcinogenic SVOC (tcSVOC) level of up to ten parts per million (ppm), which would not otherwise be acceptable, provided the tcSVOC weighted average of all imported material is equal to or less than 3 ppm at the end of each quarter. The tcSVOC weighted average is defined as the sum of the products of the material volume and the material tcSVOC, for each material source, divided by the total volume of the material imported. The weighted average was calculated over the course of construction and the final weighted average for shaping layer and cover layer materials imported to the Site was 0.70 ppm, less than the 3 ppm maximum. The total carcinogenic SVOC weighted average table and computations are included in Appendix 12 for materials imported to the Site after November 18, 2005.

SVOCs were not sampled for at the East Side Access and 2nd Avenue (94th Street) source sites due to the source being undisturbed, virgin rock material generated from subway tunnel boring. NYSDEC email correspondence dated April 15, 2011 stated that the IEM should apply one-half of the method detection limit (MDL) from the latest lab report sampled at that time for materials originating from those two source sites.

# 4 Construction

## 4.1 General Construction

### 4.1.1 Community Park

Construction of the Community Park consisted with capping the 11 acre site, installing baseball fields, a basketball court, walkways, a comfort station, and a landscaped stormwater retention area. Construction started on August 11, 2008. As of December 31, 2011, the stormwater retention pond, passive landfill gas (LFG) vents, and recreation facilities were considered complete. The Order to Work date for the comfort

station was March 19, 2014. The original scheduled completion date was September 15, 2014. The anticipated completion date is currently the Fall of 2015.

### 4.1.2 Golf Course

Generally, construction for the Golf Course was completed from the northeast to the southwest. The sequence of construction started by grading, rough shaping and compacting each hole, installing major drainage lines and inlet drains, installing irrigation lines and fine shaping the holes, installing branch drainage lines, constructing the greens and tees, installing demarcation material, grading cover material, fine grading cover material, and final stabilization by hydro-seeding. Each hole was constructed individually and then turned over to Trump, who is contracted with NYCDPR to maintain and operate the grounds and golf course, for care and maintenance during the grown-in period and prior to course operations.

LAWS completed construction work, including punch list items associated with their construction contract, and demobilized from the site in July 2014. Trump has and continues to perform various earth disturbance related work on the Site, in addition to standard maintenance of the Site. All permit related activity, including earthwork, general construction, and fill deliveries have been coordinated with the IEM, and the IEM has witnessed the work activity and documented inspection observations in the Daily Observation Reports. Specifically, IEM oversight related to Trump's on-site activity includes, but is not limited to, the replacement and relocation of trees, construction of a clock tower and associated subsurface concrete footing, excavation of trenches and installation of utilities to support various on-site facilities including the temporary clubhouse, installation of a cart barn, re-grading of an existing shaping and cover layer earthen berm and subsequent installation of concrete block letters at the surface, and installation of asphalt. For a detailed description of Trump's work activities requiring IEM oversight subject to the Permit conditions, refer to the Daily Observation Reports located in Appendix 5 beginning on June 19, 2014.

### 4.1.3 Waterfront Park

Special Condition 37 of the 2014 Permit requires that NYCDPR submit a revised design for the Waterfront Park and provides NYCDPR the flexibility to remove the Waterfront Park from the NYSDEC Part 360 Permit and permit the project under a separate NYSDEC tidal wetlands permit. The Waterfront Park is currently in the process of being conceptually scaled back in magnitude due to the impacts of Hurricanes Irene and Sandy, and design plans are being value engineered and developed. NYCDPR intends to submit plans to the NYSDEC upon completion of an approved design, and handling the construction via a separate NYSDEC tidal wetlands permit. Any SEQR related documents will be updated accordingly. The final end use of the Waterfront Park is anticipated to be publically accessible and consists of a passive recreational feature. NYCDPR will not be performing post-construction monitoring in this area of the Site until construction is completed and approved, and will restrict public access until such time.

## 4.2 Environmental Controls/Construction

### 4.2.1 Wells (Landfill gas, groundwater and water balance analysis)

NYSDEC requested NYCDPR on August 6, 2010 to demonstrate that soil being used for final cover material (not specifically the uppermost layer) would have a sufficiently low coefficient of permeability and percentage of organic material to minimize infiltration of water into the lower layer of fill material. These comments were submitted as additional comments to the November 25, 2009 permit application submittal.

NYCDPR performed a site-wide water balance evaluation to predict post-construction infiltration rates. EPA's Hydrologic Evaluation of Landfill Performance (HELP) model was used for this evaluation. The results were presented to NYSDEC on May 13, 2011 as well as incorporated in Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East, Bronx New York October 15, 2013. The model used criteria including a typical one-foot thick soil landfill cover with the proposed soil cover material as designed for the facility. The model also accounted for impermeable areas of the site, irrigation of the golf course, drainage system stormwater capture and the lining of ponds.

The soil cover permeability of 14 inches per hour was used for the overall site model. Using this infiltration rate the overall volume of water penetrating the site would be lowered by approximately 9,700 gallons per day. A subsequent water balance analysis was submitted to NYSDEC on August 10, 2011 presenting infiltration rates with a soil permeability of 30 inches per hour that also lowered the overall volume of water infiltrating the site following completion of construction. Discussion and request for confirmation that the site drainage was adequate for a 30 inch per hour permeability took place and the final maximum permeability of 30 inches per hour was approved by NYSDEC for cover material. Cover material imported to the site was tested subsequent to this approval to insure it was able to meet the goal for material permeability. More specifically, testing was combined from individual stockpiles and sources and the average from those was used to determine acceptability of material. Individual variability in sample results was expected because loading, unloading, stockpiling and spreading over the site was recognized as providing a homogeneous layer over the site. Samples were collected at a frequency of one per 2,000 cubic yards moving forward from January 26, 2012 until importation of material was completed.

Additional impacts on water balance came from lined irrigation and retention ponds. There is one large irrigation pond located on the course and several small retention ponds located throughout the open course. The irrigation pond's purpose is to collect storm runoff during storm events and stor it to be utilized for irrigation of the upper cover layer during non-storm periods. The grading and drainage for the stormwater collection and retention were provided in the November 25, 2009 permit application. NYSDEC requested that infiltration beyond the upper layer of cover material be minimized to the maximum extent possible on August 6, 2010 and this included lining each of the five on-site retention ponds to limit infiltration as much as could be done.

The subsequent changes to cover permeability and the lining of irrigation and retention ponds required a review of the Stormwater Pollution Prevention Plan (SWPPP) in order to confirm the additional flow would

not exceed the design criteria for the storm system. The engineering review conducted at that time (October 18, 2011) confirmed the stormwater system design was adequate to carry this flow.

NYSDEC granted a conditional approval for the Ferry Point Site to accept a 30 in. percolation rate per hour cover material on October 21, 2011. The conditional approval was based on a request for DPR to "submit for approval an amendment to the Stormwater Pollution Prevention Plan (SWPPP) dated November 13, 2009, with plans and computations that reflect the partial lining of the stormwater basins." DPR provided this in a technical memorandum to NYSDEC on November 16, 2011. The memorandum presented a formal submittal of the pond liner design to NYSDEC and included excerpts of calculations from the November 13, 2009, SWPPP. An approval was provided by NYSDEC on December 2, 2011.

Municipal solid waste (MSW) filling operations ceased at the Site in the 1960s, prior to the implementation of the comprehensive environmental regulations now in place, and a formal groundwater sampling program was not required at that time. Information on groundwater quality at a former landfill site such as Ferry Point Park East can be used to help evaluate existing groundwater conditions. For the 2005 Permit application, the Site's history was reviewed and a geotechnical investigation was performed to evaluate the potential for adverse impacts on the Site's groundwater due to the placement of fill during construction of the golf course and parks.

A summary provided in the 2005 Engineering Report concluded "that the placement of fill would not have an adverse impact on pre-development groundwater conditions at the site and that the proposed golf course construction would not result in an increased flow of contamination into the river through groundwater flow." (TRC 2005a).

In their comments of June 25, 2010, NYSDEC asked DPR whether any new information was available regarding groundwater conditions at the Site, and if any new, relevant information was available, to verify the conclusions of the geotechnical portion of the 2005 Engineering Report (TRC 2005a).
Following several discussions with DPR, and because no prior sampling had been required, NYSDEC requested that DPR undertake a groundwater sampling program and develop a reference point for background water quality conditions at the Site.

To comply with this request, DPR prepared written field procedures for new well installations, well development, and groundwater sampling (see Appendix G.1).
The field procedures were submitted to, and approved by, NYSDEC prior to the start of the work effort. Prior to installation, the locations of the monitoring wells were approved by NYSDEC during a meeting held with DPR on September 22, 2011.

Landfill gas monitoring over the entire Site has incorporated various different types and configurations of monitoring points. These include perimeter and interior wells and vents that have been monitored over time on a regular frequency. Monitoring has been recorded and reported according to Special Conditions Monitoring as referenced in the March 2014 permit and results dictate continued additional monitoring when that has been necessary. This monitoring continues under the Post Closure Monitoring

requirements and in accordance with the Landfill Gas Management Plan. A total of thirty seven passive vents were installed throughout the Golf Course and Community Park on an average spacing of approximately one vent for every five acres. These vents are considered passive and allow the natural venting of subsurface gases to take place without any additional vacuum or fans. Additional active vapor removal does take place at each of the constructed buildings on the site. This includes the comfort station and maintenance shed on the Golf Course and comfort station at the Community Park. Active systems operate at both of these locations on a continual basis and vent the subsurface area beneath the associated slabs to the atmosphere. There are no structures planned for or constructed on the Waterfront Park parcel at this time.

Passive gas vents are installed throughout the golf course and are included along the perimeter within the venting trenches, within the overall golf course as individual stand-alone vents and in combined systems of interconnected piping to carry landfill gas from beneath irrigation ponds.
Landfill gas monitoring includes perimeter probes located along an approximate 250 linear ft. interval on the north, east and southern site boundaries; off-site monitoring points along Buttrick, Balcom, Schley, Miles and Emerson Avenues; a passive vent trench installed along the eastern and northern perimeters of the course with piezometers installed along the vent trench to allow for monitoring of the groundwater levels associated with the vent trenches; individual passive vents within the golf course and community park space; a passive vent system of interconnected piping serving the irrigation pond; and sub-slab depressurization systems beneath the enclosed buildings located within the golf course and community park.

In February 2012, eleven new groundwater monitoring wells were installed across the Site to obtain information on current groundwater conditions. Design documents for the groundwater monitoring wells are included in Appendix G.2 of the 2013 Engineering Report, included in Appendix 20. An initial sampling event was completed in February 2012 and included the testing activities described below.

■ Groundwater Elevation Measurements: Water depths were measured at the 11 groundwater monitoring wells. Two measurements were taken from each well within one hour each of high and low tides, starting at the shoreline and moving inland.
■ Elutriate Testing: One soil core sample per well was collected during well installation in order to perform elutriate analysis. Samples were selected from shaping material zones based on visual observation of the soil cores.
■ Groundwater Testing: Groundwater samples were collected at each of the 11 wells and shipped for laboratory analysis in accordance with the required testing as referenced in the 2002 permit.
■ Hydraulic Conductivity Testing: In situ slug testing for hydraulic conductivity was completed at each of the 11 groundwater monitoring wells.

The initial groundwater monitoring data from February 2012 was submitted to NYSDEC by email on March 28, 2012. This data is included in the report for the initial groundwater monitoring event (see Appendix G.5 of the 2013 Engineering Report, included in Appendix 20). At that time, DPR requested direction from

NYSDEC concerning procedures for future sampling events. That is, should future sample collection be modified due to the high turbidity.
(>1,000 nephelometric turbidity units [NTUs]) observed in the initial samples. A call was held with NYSDEC on May 8, 2012, to discuss the initial data and provide guidance on future monitoring (see Appendix G.3 of the 2013 Engineering Report, included in Appendix 20 for call minutes.) Also during this call, NYSDEC directed DPR to perform inorganic analyses on both filtered and unfiltered samples collected during the next sampling event. If the next round of results is found to be in expected ranges, then future sampling events will utilize only filtered samples for inorganic analyses.

NYSDEC provided DPR with requirements for future groundwater monitoring in their FPP Groundwater Characterization/Monitoring Objective, on May 8, 2012 (see Appendix G.4 of the 2013 Engineering Report, included in Appendix 20). DPR implemented the groundwater monitoring program in accordance with the schedule and monitoring parameters requested by NYSDEC.

The schedule included two additional quarterly sampling events, followed by approximately three semi-annual events (through completion of construction) and three post-construction annual sampling events. After the third annual sampling event, DPR may request to reduce the sampling frequency or cease the groundwater sampling program at the Site. Table 4-1 provides a schedule of the monitoring events that will be performed to complete this program and the parameters that will be analyzed for during each event.

Post-construction groundwater monitoring and groundwater monitoring well maintenance requirements are incorporated into the Post-Construction Custodial Care Plan for the Site (see Appendix I).

### 4.2.2 Liners

A single irrigation pond has been constructed at the Site. The purpose of this pond is to collect and store stormwater runoff and reuse it later for irrigation and maintenance of the golf course vegetative cover. This pond is fully lined to maximize the retention of irrigation water. The irrigation pond design documents were included in the November 25, 2009, permit application package. In addition, there are five smaller water quality ponds designed to provide active stormwater retention and limit the off-site migration of sediment. The geometry and grading (engineering design) of these ponds were also provided in the November 25, 2009, permit application package. DPR considered various methods to meet NYSDEC's request of August 6, 2010, to minimize the infiltration of water through "the lower layers of material to the maximum extent possible." Based on this consideration, DPR is implementing a recommendation contained in the November 16, 2010, memorandum (see Appendix D.1 of the 2013 Engineering Report, included in Appendix 20) to line the five on-site water quality ponds to limit water exfiltration. The pond system has been included in the overall water budget evaluation that was submitted and approved by NYSDEC in addition to the permeability of the upper imported fill material.

Supplemental drawings and specifications for the lining of these ponds are provided in Appendix D.4 of the 2013 Engineering Report, included in Appendix 20. The pond liner designs are consistent with the

previously approved geometry and grading (engineering design) presented in the November 25, 2009, permit application package.

### 4.2.3 Gas Venting

#### 4.2.3.1 Active

According to the 2009 permit the site wide active landfill gas control system consistent with the proposed with the 2005 permit was withdrawn as a design modification. Active systems were installed at buildings and initially proposed for the irrigation lake.

Based on the Final Engineering report, due to the explosive nature, LFG is not allowed to accumulate within any enclosed structure at the site. Therefore active sub-slab depressurization systems (SSDS) have been installed at each of the enclosed buildings at the site. These systems have continuous explosive gas monitoring components of the design. The irrigation lake was not made active and continues as a passive system as per the September 2009 permit modification application.

The SSDS engineering drawings for the golf course facilities (maintenance building and comfort station) are provided in Appendix F.3 of the 2013 Engineering Report, included as Appendix 20. The Community Park comfort station design was provided in the November 25, 2009, permit application. The Waterfront Park comfort station has not been designed. Maintenance of the SSDS and their monitoring equipment will be performed in accordance with the operations, monitoring, and maintenance (OM&M) program for the Site's Landfill Gas management system (see Section 4.4.4). The design of any additional structures at the Site will be completed in accordance with New York City Department of Buildings requirements. The need for LFG mitigation systems for any future Site structures will be evaluated as part of their design.

#### 4.2.3.2 Passive

The LFG management system as redesigned for the Site (since the November 25, 2009, permit application submittal) is an update of prior conceptual passive LFG designs and includes a passive system for the venting of LFG in all areas not covered by enclosed facilities. The primary goals for the design of the Site's LFG management system are to provide safe operating conditions and protect human health.

The proposed passive system is consistent with the plans presented in the 1999 EAS (AKRF 1999), the 2002 Technical Environmental Assessment (AKRF 2002), and the 2005 Engineering Reports (TRC 2005a, b) and was approved under the 2005 Part 360 Permit. It deviates from the 2009 permit renewal application prepared by TRC Engineers (TRC), which recommended an active system. An active system uses blowers or fans to extract gas through vents from the landfills subsurface, whereas a passive system uses vents without blowers or fans. Supplemental Site investigations and extraction testing performed by TRC Engineers at the Site in 2009 and 2010 were reviewed by Walsh Environmental Scientists and Engineers, LLC (Walsh) in 2010. Emissions modeling was also performed by EEEPC in 2010, as discussed in Section 4.4.1. Based on these evaluations and modeling of Site conditions, a Landfill Gas Management Plan (LFGMP) was prepared (see Appendix F.1 of the 2013 Engineering Report, included in Appendix 20). The plan concluded that a passive venting system is sufficient to achieve safe operating conditions for users and workers of the golf course and parks. A description and details of the Site's LFG management system

are presented in the LFGMP. The LFG management system as currently designed is consistent with the proposed venting system described in the 2005 Permit.

### 4.2.4 Vent Trench

The landfill gas perimeter trench was the primary gas-management structure installed in or about 2001. The Trench was initially proposed in the 1999 conceptual LFG control system. The purpose of the vent trench was to capture and prevent the off-site migration of LFG. The 2002 AKRF Report included installation details and certified drawings of the trench and its details.

The LFG trench was constructed along the eastern and a portion of the northern perimeter and was completed in 2001. The trench begins at the water's edge at the foot of Emerson Avenue, continues along the length of the Balcom Avenue Site boundary and continues approximately 1050 ft. in a westerly direction past the intersection of Schley and Buttrick Avenues.

The LFG passive trench is essentially a stone-filled /geotextile-wrapped envelope that begins three feet below the groundwater surface and extends upward to just below the ground surface. The upper 6 inches of the trench is dressed and finished with a layer of wood chips that allow LFG entering the trench to vent to the atmosphere. During the construction there were some areas where stability of the fill material at the water table was noted to be an issue and in these areas the trench was extended to a depth of one foot below the groundwater surface. In addition to the gravel filling of the trench to allow for a porous medium allowing LFG to move upward and escape, a continuous 4 to 6 inch diameter perforated PVC pipe was buried in the upper portion of the stone backfill. Vertical passive vents are connected to this horizontal piping to allow for future modifications should the top of the trench need a cap installed above it. The trench will collect and disperse any and all LFG that comes into it but it was primarily designed to remove methane from passing beyond the site boundary. The vent trench was specifically installed below the elevation of measured groundwater in order to maintain a constant layer of saturation within the lower part of the trench. This groundwater layer would prevent landfill gas from migrating beneath the trench and off of the site. Passive vents were also installed within the trench to allow a rapid ascent of LFG out of the trench and into the atmosphere. Concentrations of LFG that could be an issue within the trench would immediately be diffused in the atmosphere and reduced to a concentration that is not a concern.

Following the installation of the trench, methane concentrations were noted to have declined significantly, demonstrating the effectiveness in controlling LFG in the area.

Landfill gas migration is influenced by a number of factors including barometric pressure, diffusion gradients, composition and distribution of subsurface soil and fill material and groundwater. As landfill gas builds up and accumulates, it moves outward from the points or areas /zones where it is generated, spreading into other areas. Landfill gas migrating vertically will reach the surface and diffuse when it mixes with ambient atmospheric air. The other main concern for migration from the landfill was horizontal migration from the landfill to areas off-site. This horizontal migration can be controlled and to a significant extent can be eliminated through the use of LFG trenches. The LFG trench configuration can prevent accumulated gas from passing beyond the site because it creates an area allowing for diffusion and mixing of LFG with ambient air. The overall trench is constructed and filled with material of a higher

permeability than the surrounding soil or fill and typically offers a more direct connection to the open atmosphere. The base of the trench is extended into the water table which performs two functions that both increase the opportunity for LFG to be removed and thus prevent it from migrating offsite. The first offers a more open contact of the shallow groundwater surface to ambient air allowing dissolved concentrations to be volatilized out of the water column into the air and the second prevents LFG that exits from the landfill soil from travelling beneath the trench out beyond the site.

Approximately 5,350 feet of LFG passive vent trench was constructed along the site boundary between May 2001 and December 2001.

Routine inspections of the LFG passive vent trench included the following observations, depth of wood chip layer over geotextile, excessive fine grained materials, vegetation, erosion along the vent trench and any other condition that may have a potential to compromise the ability of the LFG passive vent trench to intercept and transmit LFG to the atmosphere. Refer to the non-conformance table. Monitoring includes routine bi-weekly observations and inspection of the following specific components of the trench:

- Observation of the covering wood chips to insure they extend to and are level with the ground surface and are free of excessive fine grained materials that would restrict the flow of LFG from the trench once it is intercepted.
- Observation of the vertical hard piping risers to insure they do not show signs of cracking bends or breaks;
- Observation of the vertical riser piping to insure they remain vertical and anchored as they were installed;
- Observation of the vertical vents and openings to insure they remain open.

Continued monitoring of the trench is described in Special Conditions 30 of the modified Permit with NYSDEC. This includes monitoring of groundwater levels in the adjacent monitoring wells. If the groundwater is noted below the bottom of the trench, the following actions are initiated:

1. Evaluate the methane concentrations in nearby perimeter methane monitoring wells and semi-permanent monitoring points. If the methane concentrations measured that day are below the site-specific action level of 25% LEL, continue the normal (bi-weekly) methane monitoring frequency and increase the groundwater level measurements at the location of concern to bi-weekly.
2. If the groundwater level measured at the initial bi-weekly monitoring event is above the base of the vent trench, then defer back to the routine monthly piezometer monitoring frequency.
3. If the groundwater level remains below the trench bottom for the first additional bi-weekly monitoring event, but nearby perimeter methane monitoring wells and semi-permanent monitoring points are below the site-specific methane action level of 25% LEL, continue groundwater level and methane monitoring at a bi-weekly frequency until such time as the

groundwater level is above the base of the trench. Then defer back to the routine monthly piezometer monitoring frequency.

4. If the groundwater level remains below trench bottom for the first additional bi-weekly monitoring event, and nearby perimeter methane monitoring wells and semi-permanent monitoring points are at or above the site-specific methane action level of 25% LEL, then continue monitoring the groundwater levels and methane concentrations for the second bi-weekly event.
5. If the groundwater level remains at or below the trench bottom for the second bi-weekly monitoring event, and the nearby perimeter monitoring wells and semi-permanent monitoring points remain at or above the site-specific methane action level of 25% LEL, further recommendations will be made to NYSDEC.

### 4.2.5 Landfill Cap

In accordance with provisions of the Permit dated May 21, 2014 the landfill was capped with minimum of one foot of shaping layer material over the landfill and one foot of cover layer material over top of the shaping layer material. In areas where there was less than 4 feet of shaping material over the waste layer, a layer of demarcation material was installed. See Section 4.4 for additional information related to the landfill cap construction.

The permit authorized importation of 2,514,000 cubic yards of material to the Site for overall capping of the waste material. This consisted of approximately 2,120,000 cubic yards of select exempt construction and demolition (C&D) debris for the shaping layer, and approximately 394,000 cubic yards of cover material. Specific restrictions were incorporated into the material and those restrictions were maintained and are described under the importation section of this Report. Final surface components of the cap including; greens, contour, heights and top soil) were incorporated into the site under the Nicklaus Design Technical Specification of the June 30, 2005 Engineering Report. This included:

- Greens-Mix imported to the site and tested as per the material testing requirements. Fertilizer and soil amendments applied on the greens after spreading to construction specifications and then grassed as per the specifications.
- Topsoil-Imported to be consistent with native topsoil, and free of rock and debris greater than three quarters of an inch as per Exhibit C of the Engineering Report. Soil amendments, fertilizer applications and seed were added to tee, fairway and rough areas as per Exhibit C of the June 30, 2005 Engineering Report.

### 4.2.6 Environmental Controls On-Site Structures

Due to its potentially explosive nature, LFG shall not be allowed to accumulate within any enclosed structure at the Site. To protect the occupants, an under slab vent system for each enclosed building shall be installed and continuously operated. The LFGMP (see Appendix F.1 of the 2013 Engineering Report, included in Appendix 20) describes the active sub-slab depressurization systems (SSDS) that have been designed for the under-slab of each enclosed building at the Site. These systems will have continuous explosive gas monitoring with local and remote alarm capabilities. The SSDS engineering drawings for the

golf course facilities (maintenance building and comfort station) are provided in Appendix F.3 of the 2013 Engineering Report, included in Appendix 20. The Community Park comfort station design was provided in the November 25, 2009, permit application.
Maintenance of the SSDS and their monitoring equipment will be performed in accordance with the operations, monitoring, and maintenance (OM&M) program for the Site's Landfill Gas management system (see Section 4.4.4). The design of any additional structures at the Site will be completed in accordance with New York City Department of Buildings requirements. The need for LFG mitigation systems for any future Site structures will be evaluated as part of their design

Low-permeability soil/bentonite collars ("soil collars") will be installed for all utility trenches that contain permeable bedding in order to prevent the migration of LFG into enclosed buildings at the Site. The soil collars will be installed around the water and sewer pipelines, within the trenches at the subsurface location where the pipeline crosses above the building foundation (the building line). Each soil collar will be passively vented as described in the LFGMP (see Appendix F.1 of the 2013 Engineering Report, included in Appendix 20) and as shown on the engineering design drawings in Appendix F.2 of the 2013 Engineering Report, included in Appendix 20. Similarly, conduit seals will be used for electrical conduits that are installed in trenches using permeable bedding materials. The conduit seals will be installed at the building lines. Other utility LFG controls include the under slab passive venting for the aboveground double-check valve (DCV) enclosure. The DCV enclosure is for the potable water supply line as it enters the golf course site. Detailed design drawings for the venting the DCV enclosures are provided in Appendix F.4 of the 2013 Engineering Report, included in Appendix 20. The need for LFG venting for any future Site subsurface vaults will be evaluated as part of their design.

## 4.3 Municipal Solid Waste (MSW)

Municipal solid waste ("MSW") was generated throughout site development and excavation activities. MSW material was not utilized as fill material on-site after it was encountered and excavated during construction activities with the exception of MSW excavated and reused on-site in accordance with an Order On Consent issued by the NYSDEC and fully executed as of January 4, 2004 (Order On Consent No. R2-20030724-187). A copy of the executed consent order is included in Appendix 19. In accordance with Special Condition 8 of the 2014 Permit, upon encountering MSW during site development, the material was transported and properly secured into segregated stockpile locations prior to off-site disposal. MSW material consisted of metal, glass, tires, plastics, rubber, paper, fabrics, and miscellaneous debris not suitable for the shaping layer. Refer to Section 4.5 of this report to review further details regarding the minimum fill cover over top of the MSW.

Prior to stockpiling any excavated MSW, the existing ground surface was covered with an impermeable plastic membrane. The stockpile was then encircled with silt fence and the stockpile was covered with an impermeable plastic that was secured with sand bags after the MSW was stockpiled and prior to off-site disposal.

Waste characterization sampling was performed prior to off-site removal as required prior to acceptance by each solid waste facility. Prior to disposal, waste samples were collected from each of the stockpiles

and analyzed to determine if the material was hazardous and to determine a suitable NYSDEC facility for disposal by way of a permitted hauler. A January 22, 2010 letter approving Seneca Meadows Landfill as a disposal facility is included in Appendix 19.

Residual MSW excavated by Trump associated with utility and drilling work at the Golf Course stockpiled in the adjacent Waterfront Park have been removed.

### 4.3.1 Manifests

Manifests were collected for each load of MSW generated and disposed of off-site. Manifests were completed for each load of MSW prior to leaving the Site. Completed manifests contained the following information: driver signatures and appropriate transporter information, facility designation including the address for the facility that was receiving the material, a description of the material being transported, the site generator's mailing and site address, and a total quantity of the material leaving the Site. The weight of MSW was determined by weighing the material (in tons) during the loading process. The MSW was loaded with a pay loader with a scale attached to the bucket. A receipt for the weight of each load was printed and was presented to NYCDPR with the manifest for review. NYCDPR and/or their designated representative signed the manifests as the generator, and then the manifests were then presented to the IEM for final verification.

Copies of the MSW disposal manifests are included in Appendix 14.

Note that MSW manifests accounting for material prior to October 25, 2010 (i.e. Woodard & Curran's first day on-site as the IEM), cannot be retrieved and are not included in the appendix. The information was stored in a NYCDPR document repository that was damaged and the files have been lost. However, the FMRs prior to October 25, 2010 comment on the nature of this work.

## 4.4 Earthwork/Fill Placement

Earthwork and fill placement for this Project were performed in accordance with the Permit. A response received from NYSDEC on July 28, 2009 (included in Appendix C.2 of the 2013 Engineering Report, included in Appendix 20), provided additional clarification regarding what are considered active and passive recreational areas. As per this letter:

Active Recreation – "…all other areas that are not covered with a building or other impermeable cover system… are deemed active recreational areas."

Passive Recreation – "…the golf course is deemed a "passive recreational area" and is required to have a one foot thick cover layer over a demarcation layer."

Following this directive, NYCDPR requested clarification from NYSDEC regarding the demarcation layer requirement for the extent of the Golf Course. The request for clarification was based on the need for further specificity regarding the use of a demarcation layer on the Golf Course.

In response, NYSDEC and NYSDOH reviewed a summary of the analytical data for all the shaping material imported to the Site. Upon review of the data set, confirmatory analytical sampling of the in-place shaping material was requested by the NYSDEC and NYSDOH. NYCDPR conducted test pit sampling and analysis under an approved work plan and submitted the data to the NYSDEC on February 16, 2011.

In their letter dated March 9, 2011, the NYSDEC stated that "NYSDOH reviewed the shaping layer test pit data and determined that it confirmed existing shaping layer data." The NYSDEC and NYSDOH agreed that a demarcation layer would not be required at areas of the golf course having a fill thickness of five or more feet of combined shaping and cover layer materials. The March 9, 2011 letter is included in Appendix C.3 of the 2013 Engineering Report, included in Appendix 20.

The aforementioned directives were the basis for the earthwork, fill placement, and landfill capping process. Additional details related to shaping layer material placement, demarcation layer installation, cover layer material installation, and related construction is as follows.

### 4.4.1 Shaping Layer Material

The Permit requires a minimum of one foot of clean shaping layer material to be installed over top of the existing MSW prior to cover layer material placement. Specific to the Golf Course, grading and compaction activities associated with the shaping layer material were generally completed by hole, consistent with the golf course architect's design. Once grading and compaction of the shaping layer material was completed, NYCDPR completed topographic surveys of the newly graded shaping material layer to assist in determining the depth of clean shaping layer material that was present over the pre-existing landfill surface. These shaping layer material surveys were generated intermittently as shaping layer material installation was completed in sections of the Golf Course.

An analysis was conducted by the IEM, which compared compiled historic surveys from 1998 to the final shaping layer surface surveys completed by NYCDPR. The 1998 surveys included elevations representative of the landfill surface for the Site prior to the earthwork associated with the Project. Based on an analysis and comparison of the survey data, portions of the Site that had less than four feet of approved shaping layer material were identified in a series of earthwork analysis drawings that were provided to the NYSDEC. The earthwork analysis drawings are included in Appendix 10. These plans identify the depth of shaping layer material and show the general progression of shaping layer material filling across the Site. Figure SP-001 entitled "Shaping Layer Material Earthwork Analysis via Surveys" includes a site wide earthwork analysis compiled from the various Site surveys and earthwork analyses completed as construction progressed at the Site.

In areas identified on the earthwork analysis drawings to have less than one foot of clean, in-place shaping material, test pits were performed by the Contractor and observed by the IEM to verify that a minimum of one foot of shaping layer material was present over the MSW, per the plans and Permit requirements.

If areas were found to have less than the required one-foot minimum of shaping material and could not receive additional fill based on the design plans, these areas were adjusted by over excavating the MSW

and backfilling with clean shaping layer material. This process was necessary in order to maintain the designed grades and comply with the Permit conditions. With oversight by the IEM, areas with MSW encountered at shallow depths in the tests pits were excavated outwards from the test pit location until one foot of clean shaping layer material was present. See Figure SP-100 entitled "Shaping Layer Material Test Pit Plan", which includes test pit locations superimposed on an earthwork analysis that visually represents the frequency, location, and presence of MSW within the required one foot minimum shaping layer section prior to reshaping. All test pit locations and the limits of the over-excavation were GPS located by the IEM utilizing a handheld GPS unit. Test pit locations were spaced 50 feet apart over the entire areas that the survey analysis estimated to have less than one foot of shaping layer material. In addition, if MSW material was encountered within the one-foot minimum shaping layer, the frequency of test pits were increased at the IEM's discretion to more accurately determine the extent of over-excavation required. Observations of test pit activities associated with evaluating the shaping layer material thickness are detailed in the IEMs Daily Observation Reports.

### 4.4.2 Demarcation Layer

Consistent with Special Condition 14 of the 2014 Permit, a demarcation layer was installed at the Site, specifically the Golf Course, where the combined thickness of shaping layer and cover layer materials combined were less than five feet. For this Project, "demarcation layer" meant a brightly colored, permeable plastic material placed on top of the Site's shaping layer material and directly beneath the Site's final cover layer material that is easily recognizable during an excavation. The request was made for the protection of Site workers during any future excavation work beneath the cover layer at the Site. Demarcation layer material for this Project consisted of orange construction fencing for the Golf Course.

On July 10, 2012, the NYSDEC confirmed that a nine-inch thick asphalt and subbase layer for the cart paths did not require any underlying cover material or demarcation layer. A black geo-grid material was installed under the cart paths associated with the Golf Course as part of the design. A copy of the correspondence is included in Appendix 19.

On November 21, 2012, the NYSDEC notified NYCDPR that demarcation layer may be eliminated from under ponds as NYCDPR identified that demarcation layer was not required as part of the Permit. A copy of the November 21, 2012 correspondence is included in Appendix 19.

NYCDPR prepared a Demarcation Layer Plan based on a comparison of final design grades and the top of waste elevations extrapolated from soil boring data. The Demarcation Layer Plan is included in Appendix C.4 of the 2013 Engineering Report (Appendix 20). Field verification that the demarcation requirements were being met was performed continuously and routinely by the IEM to confirm Permit compliance as outlined in the shaping layer material section above. Based on the data gathered from the earthwork analysis plans and the test pit excavations, actual areas requiring demarcation layer were identified.

In instances where NYCDPR felt that the installation of demarcation material was not necessary, test pits were excavated to four feet below grade, spaced 50 feet apart, to determine if there was more than four feet of clean shaping layer material installed over MSW. If it was determined via test pits that there was

more than four feet of clean shaping layer material present, demarcation material was not installed. The reasoning assumed a one foot thick cover layer installation and considered the March 9, 2011 NYSDEC/NYSDOH correspondence determining that demarcation layer was not required if the combined fill thickness above MSW was five feet or greater. The March 9, 2011 correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

All areas with less than four feet of shaping layer material present that required the installation of demarcation layer material are identified on Figure SP-200 entitled "Demarcation Layer Plan". The limits of demarcation layer material, as represented on Figure SP-200, were located by the IEM using handheld GPS units at the time of installation, prior to cover layer material installation. Areas associated with the cart paths are also identified on Figure SP-200.

### 4.4.3 Cover Layer Material

Cover layer material was installed at the Site in accordance with the Permit. Special Condition 15(d) of the 2005 Permit required the following:

"The final placement (including topsoil), location, thickness, and detailed chemical limits of the final cover layers on the Site, including the community park and waterfront park, are subject to the specifications, directions and requirements determined by the NYS Department of Health (NYSDOH) to be applicable. It is the responsibility of the Permitees to obtain a written determination from NYSDOH.
The Permitees must provide the Department with a copy of NYSDOH's determination. No cover layer material may be placed on the Site, until the Department acknowledges receipt of NYSDOH's determination."

As required by Special Condition 15(d) of the 2005 Permit noted above, NYCDPR obtained such written determination from NYSDOH in a letter dated, August 2, 2006 included as Appendix C.3 of the 2013 Engineering Report (Appendix 20).

The NYSDEC's active recreational determination from July 28, 2009, required that NYCDPR install two feet of cover layer material and a demarcation layer throughout the Community Park. Soil probes confirmed extremely consistent and appropriate thickness of cover material throughout the Community Park and Golf Course.

For the Golf Course, the upper portion of the landfill was capped using Permit specified criteria for sand and/or topsoil material formally referred to as cover layer material. A sand material was used for the majority of the golf course cover layer with topsoil being used primarily in tree planting pits and other landscaped areas. The IEM observed capping activities associated with the cover layer material including, inspecting cover material at each source site and at the Site per the conditions set forth in the Permit and supporting reference documents. After installation of the shaping layer material and demarcation layer (as required), the cover layer material was installed. The IEM confirmed the depth of cover layer material placed on the Site in accordance with the Permit at the time of installation.

A minimum of one foot of cover layer material was placed over top of the shaping layer material consistent with the passive recreational determination at the Golf Course. Cover layer material was installed by means of either transporting stockpiled material that was previously inspected and approved by the IEM or by directly dumping the material in the work areas as it was imported to the Site. The material was then spread by bulldozers and specialty golf course shaping equipment. The IEM confirmed the depth of the cover layer material placed on the Golf Course area utilizing a graduated rod as the material was being installed.

Confirmation of the minimum of one foot of cover layer material installation on the Golf Course is included on Figure SP-200 entitled "Cover Layer Material Plan". This plan identifies the DOR report numbers and corresponding dates for when the IEM witnessed and measured a minimum of one foot of cover layer material being installed on the Golf Course. The cover layer material depth checks were completed by the IEM using a graduated rod to confirm that the final placement consisted of a minimum of one foot of cover layer material soil. Individual DORs documenting the IEM's observations are included in Appendix 5.

In addition to the IEM checking and confirming the minimum one foot thickness of cover layer material immediately upon installation, post-construction soil probes were completed in March 2015, and dug by hand to confirm the depth of cover layer material throughout the Golf Course. Prior to March 2015, once the site construction concluded and the vegetation was established throughout the Golf Course, an aerial survey (including topography) was performed by LAWS in Spring/Summer 2014 and provided to NYCDPR and subsequently to the IEM in December 2014. In addition, NYCDPR performed a Golf Course wide ground topographic field survey.

The IEM was provided with electronic AutoCAD files of both surveys that captured the final topography of the cover layer material surface. The IEM performed a cut/fill analysis using Civil 3D software by comparing each cover layer material survey to the previously generated shaping layer material surveyed surface (also field surveyed by NYCDPR). Based on a review of the cut/fill analysis results and subsequent discussions with the NYSDEC and NYCDPR, it was agreed by all parties that both survey results were inconclusive, and could not accurately reflect the thickness of the cover layer material on the Site. Since the 12-inch minimum cover layer material thickness could not be verified via survey, NYCDPR then moved forward with field investigations using handheld soil probing equipment in order to perform comprehensive Golf Course wide physical confirmation depth checks.

The IEM was on-site and witnessed all soil probes, and documented all soil probe locations and depth results using handheld GPS equipment. The soil probing work was completed by NYCDPR staff. Soil probe fieldwork commenced on March 11, 2015 and was completed on March 27, 2015. Soil probes were initially completed on a 50-foot grid but were increased to a 100-foot grid on March 19, 2015 based on the satisfactory initial field results and approval by the NYSDEC in an email dated March 18, 2015 (see Appendix 19 for the March 18, 2015 email).

Refer to Figure SP-003 entitled "Cover Layer Material Soil Probe Investigation Results" which illustrates the results of the soil probing investigation. The final results of the soil probing investigation were reviewed on-site with NYSDEC staff, and the NYSDEC required that NYCDPR correct an area in the vicinity of the Hole 14 Green, which resulted in cover soil layer thicknesses of 3 inches and 6 inches. NYSDEC staff stated that this area would require reconstruction in order to satisfy the intent of the 12-inch cover layer material thickness as required by the Permit. NYSDEC staff concluded that the remaining soil probe results sufficiently addressed the intent of the 12-inch cover layer material thickness Permit requirement, and the remaining Golf Course area did not require any further reconstruction or evaluation of the cover layer material.

As per the IEM's Daily Observation Reports, the IEM witnessed the subsequent field delineation the of the area deemed to be of insufficient cover layer material thickness (i.e. the area adjacent to Hole 14 that resulted in cover layer material depths of 3 inches and 6 inches via soil probe results) during the week of April 20, 2015. This was performed by using the soil probe equipment to accurately delineate the limits of the area having a cover layer material thickness of less than 12 inches, and resulted in an area of approximately 6 feet by 12 feet.

On May 4, 2015, the IEM observed the Trump Organization construction crew over-excavate the previously delineated areas that had less than 12 inches of required cover material, adjacent to Hole 14 Green. The area was over-excavated approximately 24 inches below grade, and 24 inches of Cover Material was backfilled and graded over the excavated area. The excavated area was GPS mapped using a hand held Trimble device. Excavated surplus shaping material was transported to a shaping stockpile adjacent to Pond P2.

Similar to the Golf Course, the 24 inch minimum cover layer/shaping layer materials thickness could not be verified via survey. NYCDPR moved forward with field investigations using soil probes in order to perform physical confirmation depth checks. The IEM was on-site and witnessed all soil probes, and documented all soil probe locations and depth results using handheld GPS equipment. The soil probing work was completed by a NYCDPR subcontractor. Soil probe fieldwork commenced on May 18, 2015 and was completed on May 22, 2015. Soil probes were completed on a 50-foot grid. Refer to Figure SP-004, entitled "Community Park Cover/Shaping Layer Material Soil Probe Investigation Results", which illustrates the results of the soil probing investigation.

#### 4.4.4 Greens and Tees Mix, Bunker Sand

Consistent with Section 2.1.2 "Cover Layer Fill Specifications" included in Volume #2 of the 2005 Engineering Report, environmental testing was not required, consistent with cover layer material requirements for the green and tees mix or bunker sand, and therefore was not completed for these materials.

On June 8, 2012, the NYSDEC confirmed that the sand material used for the tees, greens, and bunkers should not be counted towards the Permit stated allowable cover soil maximum. A copy of the June 8,

2012 correspondence is included in Appendix 19. NYCDPR's consultants estimated the required sand material volumes as follows: Tees and Greens (24,705 cubic yards), Driving Range Tee (3,025 cubic yards), and bunkers (6,076 cubic yards). Since these values were estimated, calculated by NYCDPR's consultants, it shall be noted that actual installed volumes may have fluctuated from the volumes identified above. This information is based on an email from Joe Voss to Faisal Choudhury on June 13, 2012.

Special Condition 15 of the 2005 Permit did require that the tees and greens mix imported to the site to be tested as per material testing requirements to meet the project technical specifications. Fertilizer and soil amendments could be applied on the tees and greens mix after spreading to construction specifications and finally grassed, as per the specifications provided by the agronomist.

#### 4.4.5 Topsoil

Topsoil was used on the Site, in lieu of sand, specifically in tree planting pits and other landscape areas. Any topsoil that was imported and used on the Site was approved and met all of the cover layer material Permit requirements including the specification included in Exhibit C of the 2005 Engineering Report.

## 4.5 Meetings

On a bi-weekly basis during construction of the Community Park and the Golf Course, progress meetings occurred in the NYCDPR field office trailer on the Site. Various representatives from NYCDPR, Trump, LAWS, KSE, TRC, the IEM, and appointed representatives attended the meetings to discuss construction progress, current issues, and scheduling.

Available meeting minutes from construction progress meetings are attached as Appendix 9.

## 4.6 As-Built Survey, Record Drawings, Deviations from Approved Design Plans

This section deals specifically with as built drawings, final record drawings and deviations that occurred during construction. It is further broken down into work performed in the Community Park, the Golf Course, the Waterfront Park, deviations to NYSDEC Permit as it pertained to fill importation quantities, modifications to the landfill gas vent trench and additions to the golf course made by the concessionaire.

#### 4.6.1 Community Park

The Community Park project consists of the following features and was designed by Thomas Balsley Associates:

- A softball field and smaller peewee/T-ball field with new drainage
- Two basketball courts
- New formalized park entrances
- Play areas for tots to pre-teens
- Seating areas and lawn for non-programmed activities
- A path and trail system that winds throughout the park
- A detention pond which collectives drainage from the eastern part of the golf course
- Foot bridges
- Shade structure

- Timber deck overlook
- Herbaceous plant materials
- Temporary below grade utilities to service a standard DPR Comfort Station (constructed under a separate contract),
- Below grade infrastructure to service Community Park lighting and fountains,
- Modifications to the Landfill Gas Vent Trench system
- New perimeter fence.
- New Comfort Station. (The comfort station construction is still in progress and expected to be completed in the Fall of 2015)

Deviations to the Community Park project consist of the following:

- The reconfiguration of the location of the perimeter fence on the south and west sides of the Community Park reducing the area of the site[1].
- One missing Vertical Landfill Gas vent just south of the most southerly entrance to the park.
- The relocation of a drain inlet in the softball field[2].
- The utilities servicing the Comfort Station are constructed as of December 10, 2015,[3] which represents the date in which the sanitary sewer connection was completed.

It is noted that below grade features were not examined during a NYCDPR field inspection conducted during July 2014. Community Park as-built information and documentation are included in Appendix 16 and includes a November 18, 2011 letter from LAWS indicating that the Community Park construction was completed as designed (exclusive of the comfort station) as well as three as-built drawings associated with the pond liner construction dated July 14, 2010 as prepared and certified by LAWS (Appendix 16).

### 4.6.2 Golf Course

The Ferry Point Park Golf Course project consisted of the following:

- A Maintenance Building with an active sub-slab depressurization system.
- A comfort station with as active sub-slab depressurization system, which includes a snack bar.
- A unenclosed rain shelter
- An 18 hole links style golf course
- A practice area
- Fill and topsoil importation
- A site drainage system and retention ponds
- A new irrigation pond and irrigation system
- All the necessary plumbing, electrical, gas, environmental monitoring and control devices for the golf course, maintenance facility and comfort station
- Roadway and parking area construction, paving, striping and drainage in compliance with the DEC permit
- Perimeter fencing and appropriate landscape screenings.

[1] See App. 4; Community Park Contract Drawings; Thomas Balsley Associates Constr. Dwg L1.3 & L1.6 dated 03/06/09, revised 09/30/09.

[2] See App. 4; Community Park Contract Drawings; Thomas Balsley Associates Constr. Sketch dated 2/11/09

[3] See App. 4; Community Park Contract Drawings; Thomas Balsley Associates Constr. Comfort Station Dwg P-2 dated 1/26/09

Deviations to the Golf Course consist of the following:

- The active venting system around the Irrigation Pond was converted into a passive system. Fiberglass manholes were changed to concrete manholes and additional piping added around the entire pond. Six (6) vertical passive vents were added, one at each box location and installed October 2014, following NYSDEC discussion. On May 22, 2015 the NYSDEC approved the removal of vertical passive vent #5 thereby leaving five (5) vertical passive vents in operation.
- Modifications to the grading plan did occur as well as minor modifications to drainage and are documented in "Ferry Point Site" visit notes produced by "Nicklaus" from 2010 through 2013 and as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- Retention ponds were lined as per NYSDEC requirements as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The golf cart path surface material was changed to asphalt and additional drainage was added as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The Clubhouse Parking Lot paved footprint was increase/installed as per NYSDEC Consent Order # R2-20100521-172. The Clubhouse Parking Lot was completed in May 2014 as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The irrigation pond pipe penetrations were revised as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The Turf Nursery was revised as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The active venting system inside of the Comfort Station was modified as per Integral Engineering, Inc. design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015). System is functioning, and requires the installation of sensor components of the vapor detection system. Contractor procurement for the installation of the sensor components is in its final stage of approval. Implementation is anticipated by Spring 2016 and the final signed and stamped as-built drawing will be submitted to NYSDEC following prompt inspection of the installation.

### 4.6.3 Waterfront Park

Construction has not begun in the area designated "Waterfront Park".

### 4.6.4 Additions to the Golf – Concessionaire

The concessionaire running the Golf Course is the Trump Organization. Since in their possession (NYCDPR Use Inspections were held for various parts of the project from September 2012 through March 2014) the following additions/deviations have occurred (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015, revised 4/23/2015, 6/25/2015 & 7/13/2015):

- The construction of a Golf Cart Barn (currently under construction)

- The construction of a sign (currently under construction) and curb line realignment
- The construction of a temporary clubhouse including temporary utility services (trailers placed upon the asphalt parking lot)
- The construction of a "starter" kiosk including utility services as well as minor golf cart path widening around it.
- The construction of a clock.
- The construction of a weather vane/station.
- Minor irrigation changes.
- Additional planting along the perimeter fence line. Removal of the aluminum fence along the Waterfront Park and the Golf Course and the installation of a fiber optic sonar alert system in its place (installation of the fiber optic sonar alert system occurred from July 25, 2015 to August 19, 2015 and was witnessed by the IEM).

# 5 Environmental Monitoring

## 5.1 SWPPP

On November 20, 2003, NYCDPR received an Acknowledgement of Notice of Intent for coverage under SPDES General Permit for Stormwater Discharges from Construction Activity (General Permit No. GP-02-01), permit identification number NYR10D547, which transitioned SPDES General Permit coverage previously held under GP-93-06. On May 12, 2009, NYCDPR received an Acknowledgement of Notice of Intent for coverage under SPDES General Permit GP-0-8-001; permit identification number NYR10R112, which was maintained throughout construction completion. A copy of the SPDES General Permit Acknowledgement and Notice of Intent are included in Appendix 1.

In compliance with NYSDEC guidelines for State Pollution Discharge Elimination System (SPDES) General Permit (GP-0-8-001) and General Condition 9 of the 2014 Permit, a Storm Water Pollution Prevention Plan (SWPPP) was implemented during the course of construction at the Site. All work was completed in compliance with the final SWPPP, dated December 22, 2009.

In addition to intermittent IEM SWPPP inspections, NYCDPR representatives also performed SWPPP inspections. NYCDPR performed bi-weekly inspections and associated Site Assessment Reports (filed at the FPP document repository) to ensure compliance with Permit requirements. SWPPP inspections were carried out through the spring of 2014. The SPDES permit will remain effective until completion of ongoing construction including the Golf Course Clubhouse.
Every possible action was taken to avoid non-compliance, such as turbid water leaving the Site. The following is a list of permanent features that were installed at the Site, beyond the SWPPP requirements:

- French drain at the eastern, western, and northern perimeters of the Site to control surface flow of stormwater;
- All ponds were lined, to prevent stormwater infiltration into the solid waste layer; and
- A new trash rack and rock outlet dam at the 60-inch Whitestone sewer outfall draining to the East River.

## 5.2 Landfill and Off-Site Gas Monitoring

The entire Ferry Point Site is equipped with a Landfill Gas (LFG) Management system to cover both on and off site monitoring. The systems purpose is to allow use of the site in its intended purpose as a golf course without having the occupants on the site and users of the golf course being exposed to harmful conditions that would be the direct result of the existence of the landfill. The Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, New York May/August/Oct 2013, referenced the summary of prior LFG efforts. These included preparation of a model for surface methane emissions using data collected during 2009 and 2010. Data for these studies also included a health impact analysis that is summarized in this final Certification Report and is attached with the 2013 Supplemental Engineering Report as an Appendix 20.

The generation rates for LFG were estimated as far back as 1999 using EPA Guidance documents and the results indicated the LFG rates for Ferry Point were consistent with municipal solid waste landfill rates for a facility of this era and overall age. The analysis in 2010 also evaluated hazardous air pollutants (HAPs) in areas of the course as well as community park. In 2011, NYSDEC concluded that there was not an ambient air impact from gas vent emissions and that there was no health impact in the park. This was a major component that allowed the discontinuation of monitoring the passive vents installed in 12 locations throughout the park. Monitoring of the passive vents is included as Appendix E.3 in the Supplemental Engineering Report (Appendix 20).

The following were included as components of the Ferry Point Park Landfill Gas Control System:

1. Irrigation Lake Venting System-Passive
2. Water Quality Ponds Venting System-Passive
3. Sub-Slab Depressurization Systems
    a. Maintenance Facility-Active
    b. Comfort Station in Golf Course-Active
    c. Comfort Station Community Park-Active
4. LFG Venting for subsurface utilities entering enclosed spaces-Passive
5. Perimeter Vent Trench-Passive
6. Perimeter Vent Trench/East-Passive
7. Golf Course 25 In-ground vents-Passive

The Ecology & Environment 2011 Landfill Gas Management Report describes in detail the landfill gas generation rates, composition, migration pathways and methods for diffusion (Appendix 20). It also discusses both the horizontal and vertical migration of LFG across the landfill. Figure 3-1 in the LFG Report (MSW Fill Progression Map, March 11, 2015) shows the historical fill progression that occurred over the landfill lifespan between 1951 to 1959 and how significant areas of open water was filled in over the life of the landfill .

As far back as 1999, Landfill Gas generation rates were noted to be low and in the range of .00004 cubic feet per minute per square foot or about 2cfm per acre of surface area. These generation rates provided discussion and recommendation for installation of an active system beneath planned structures. A 1999 Report referenced in the Ferry Point East Landfill Gas Management Plan did not recommend installation of active venting systems in open spaces with the exception of specific turf grass areas. The 1999 Report also included numerous LFG Control Systems including; interceptor and venting systems, impermeable liner systems for irrigation ponds, soil plugs and conduit seals for underground utilities that enter buildings (Appendix 20).

The main facility LFG management structure was the perimeter vent trench installed in 2001. The specific purpose was to prevent offsite migration of landfill gas. This was designed, and installed with oversight by TRC. The entire trench was installed along the eastern site boundary and allowed a gas barrier to be present between the site and the neighboring residential homes. Construction included extending the trench from the water's edge at Emerson Avenue along Balcom Avenue and the site boundary, approximately 1050 ft. past the intersection of Schley and Buttrick Avenues.

Monitoring of the venting trench began using a number of wells that were installed along the trench. In 2001 monitoring performed after the trench was installed indicated there was an off-site source of methane. This was identified by AKRF and further evaluation along the venting trench indicated there were additional off-site LFG readings. Test pits were identified to have MSW beyond the site and this was one potential source of the elevated readings. The second was the historic filling in the northeastern portion of the site on a former tidal or marsh wetland. No methane was reported in ambient air at that time and the source of methane was concluded by AKRF to have originated from an off-site source.

The initial facility LFG system was proposed to be installed as an active system. Following the 2009 landfill permit modification submittal, the conceptual passive LFG system was updated to include all areas not covered by enclosed structures. In summary, the passive LFG system meets a number of historic reports including the 1999 EAS (AKRF), 2002 referenced in the Landfill Gas Management Plan (Appendix 20) and Volume #2 Application for Modification to the Solid Waste Permit Engineering Report, June 30, 2005, Appendix 20) and was approved under the 2005 NYSDEC Part 360 permit (Appendix 1). In the 2009 DEC Part 360 Permit Modification Request (November 25, 2009, Appendix 20), an active system was recommended. Supplemental Site investigations and extraction testing was performed by TRC Engineers in the period between 2009 and 2010. This information was reviewed by Walsh Environmental Scientists and Engineers in 2010 (Ferry Point Landfill Gas Report, November 2010, Appendix 20). The resulting analysis and evaluation concluded that the Site was able to be operated safely with a passive venting system which was consistent with the 2005 Permit.

The July 2000 NYSDEC Part 360 Permit (Appendix 1) and February 2002 Part 360 Permit Modification (Appendix 1) approved by NYSDEC included numerous conditions related to material importation and capping. The permit was also specific in requiring the installation of a series of perimeter-based landfill gas monitoring wells. Twenty-one (21) perimeter monitoring wells were initially recommended and a final total of 25 were installed at intervals of approximately 250-300 ft. around the perimeter (PZ-01 to PZ-25),

(SH-21 Groundwater Monitoring Well Construction; November 8, 2011. The perimeter for purposes of these wells would be the edge of the golf course portion of the landfill and the adjacent residential neighborhood. An additional 56 monitoring points were required to be installed as the main component of the off-site monitoring network. The off-site wells were referenced in the modified 360 permit. The combined perimeter and off-site wells comprise the full gas monitoring system for the golf course fill area.

Modifications to the overall Landfill Gas Collection systems were based on and included the following:

- In 1986, a passive venting system was reportedly installed with outflow venting. In 2002, there was a plan presented by TRC to perform test pits in order to identify this system and more specifically, to identify the outflow vent location and to determine if connective piping was functioning. The system was never located and has not been able to be incorporated into any LFG system.
- 2005 Engineering Report Vol. 1 (June 30, 2005, Appendix 20) included several LFG components and systems that were aimed to maintain a similar program to the 1999 proposed EAS. This included active systems for all enclosed buildings and sealed penetrations for utility connections. All perimeter and off-site monitoring wells would be monitored bi-weekly for both methane and oxygen. Monitoring showed several points off-site with elevated levels indicating a source that was also located beyond the site. Groundwater was monitored on a monthly basis to evaluate water level in concert with the LFG trench elevation. Irrigation Lake and ponds were recommended to have gas-venting layers and liners installed at their base to allow for collection and discharge of gas collected from beneath them. Specific instances of impermeable barrier installation could be noted where turf health was necessary to be maintained. Most specifically, the 2005 Report did not recommend LFG venting systems in open space areas (Appendix 20).
- A 2009 Extraction Pilot test was conducted to better understand generation rates for on-site LFG. The interpretation of the results of this test prompted a proposal for a low-flow active LFG system that covered the overall golf course. The reason referenced in the Supplemental Engineering Report for the Solid Waste Facility Permit Application, October 13, Appendix 20) was that methane levels in the subsurface was not expected to be able to be made safe by the opening of the golf course. The irrigation pond system was also included in the plan to be connected to the landfill venting system. One caution in this report was the potential for pulling large volumes of ambient atmospheric air into the subsurface which could cause fires and explosions. The system included some forty control zones of extraction wells, green and tee collection piping all connected to vent flares with in-line fans. This system was never instituted.

Modifications to the gas monitoring system included the design and installation of a landfill gas (LFG) vent trench along much of the eastern park boundary. This trench extends from the water's edge at the foot of Emerson Avenue, along the entire length of the site boundary of Balcom Avenue and along Schley Avenue. The trench continues approximately 1050 linear feet to the west past the intersection of Schley and Buttrick Avenues. The trench totals just over 1 mile in length (5350 feet) and construction began in May 2001 and was completed by the end of December 2001. This trench does not cover the entire upland

perimeter. The remaining portion was covered with an existing trench along Miles Avenue. This was planned to remain following the golf course development and provided an effective cutoff for off-site migration in that direction. The final construction included the trench and drainage.

The LFG passive vent trench was designed to intercept landfill gases (primarily methane) originating and leaving the site. The limits of the municipal solid waste extend beyond the park boundaries and the LFG passive trench was not designed to facilitate collection of or negate the impact of gas generated from that material. The trench presents a sound engineering control that will intercept gas migrating through preferential pathways and other routes of least resistance that intersect it. The LFG trench acts to briefly capture LFG moving out of the park and then allows it to vent to the atmosphere. The trench is designed to have a very high relative permeability with increased porosity in comparison to the landfill waste material. As gas enters the trench is can easily and rapidly mix with ambient air in the pore space and then rise out where it can be discharge to the atmosphere. One of the key components of the trench is that the bottom remains into the water table. As long as the bottom of the trench is submerged in the shallow water table, LFGs at the Park cannot migrate beneath and beyond the trench.

The 25 perimeter monitoring wells (also referred to during the construction as piezometers) were located immediately adjacent to the LFG passive vent trench and along the site perimeter adjacent to Miles Avenue. The specific purpose was to provide consistent data comparing the trench bottom and top of the water table to identify locations where the water table may have dropped below the trench, thus indicating the ability for the trench to intercept and capture all LFG along its entire length.

The LFG passive vent trench was constructed of a geotextile wrapped stone envelope that extends from .5 ft. below the ground surface down to a depth of approximately 3 ft. below the surface of the water table. The upper .5 ft. of the trench has a loose covering of wood chips to allow LFG that has entered the trench to exit and discharge to the atmosphere. There were areas where the final depth of the trench only reached to 1 ft. below the water table. These locations were caused by an unstable sidewall after the groundwater table was reached. The trench was also constructed with horizontal perforated 4 to 6 inch polyethylene tubing placed beneath the wood chips near the top of the stone backfill. The horizontal tubing was installed to allow connection to vertical risers in the event the trench surface is covered at some point in the future with an impervious surface.

LFG monitoring has been performed in accordance with Special Condition 30 from the modified Solid Waste Permit (Response Action Plan, December 10, 2002, Appendix 19). This included monthly monitoring during construction in order to determine if water levels were maintained above the bottom of the trench. Specific protocols were required to be performed in the event groundwater was determined to be below the bottom of the trench.
The following Action Plan items were incorporated for low groundwater levels:

1. Evaluate methane concentrations in nearby perimeter methane monitoring wells and semi-permanent monitoring points. If methane concentrations measured are below site-

specific action levels (25% LEL), the normal frequency methane monitoring will continue and the groundwater level measurements will increase to bi-weekly.

2. When groundwater levels increase to fall back into the envelope of the recovery trench, measurements will return to monthly.
3. If groundwater remains below the trench bottom for one additional bi-weekly monitoring event but nearby well methane levels remain below the action level, groundwater monitoring will continue until such time as routine monitoring can be reinstated.
4. When groundwater is measured below the trench and methane levels are at or above the action level, both groundwater and methane measurements will continue at bi-weekly frequency.
5. If both groundwater and methane remain below the trench bottom and above the action level (respectively) for a second consecutive week, a recommendation for further action will be made to NYSDEC.

During the 2014 Solid Waste Facility issuance several references to continuing monitoring and the documents that would be covered under were made (DEC No. 2-6006-00014/00013 (2-6006-0014/00016 Permit Issuance – Solid Waste Management Facility (Tidal Wetlands), May 21, 2004, Appendix 1). The Ferry Point Park East Post Construction Custodial Care Plan is specifically called out as the governing set of protocols for this. Monthly LFG vent trench monitoring is to be performed during the duration of the permit (October 2013, Appendix 20). Additionally under Special Condition 25 there is continued monthly inspection required for the gas venting trench integrity as well as mulch cover. All repairs are required to be made within two weeks and therefore prior to the next inspection. The mulch cover is required to be replaced each spring. Trench maintenance is also described in the Supplemental Engineering Report, Volume 3, Appendix F (Appendix 20).

Landfill methane monitoring has shown from collection of data within the site to be above general action levels of 25%LEL as well as LEL from within the MSW layer. The resulting measurements between 2008 and 2009 supported the hypothesis that methane was generally present throughout the entire MSW layer rather than just from individual locations. Measurements from the shaping layer above the MSW indicated that concentrations decline rapidly once out of the fill layer. These measurements appear to present a better picture of the landfill gas presence and production because the extraction test performed in 2009 referenced a 2003 Journal of Air &Waste Management with fatal flaws for infiltration of atmospheric air into the landfill. In addition, the 2009 extraction test did not reportedly follow the EPA testing methods and would then incorrectly estimate the presence and production of methane. Testing reportedly used differential pressure at surrounding test wells. EPA specified determining radius of influence based on absolute pressures under static and active extraction conditions. EPA measures ambient air intrusion by percent volume of nitrogen and the testing identified ambient air intrusion by percent oxygen. The conclusions that were reached at that time indicated that atmospheric intrusion noted during the testing would have caused the LFG extraction rate to be significantly higher than actual LFG generation rates within the area of the pilot test. If the entire LFG generation rates were then based on pilot test results, the resulting estimate would be potentially far over the actual LFG generation. Historic data from monitoring indicated that LFG generation rates had sharply declined since the initial

2000 measurements began. The reduction was referenced largely as readings from over 100% LEL to non-detect. While there were a few exceptions, this overall reduction was credited to, among other things, the perimeter venting trench and overall LFG decline. One specific area in the vicinity of MW-0 found to continue to present elevated readings was believed to be impacted from an off-site source.

The Ferry Point Landfill Gas Report (November 2010, Appendix 20) was a summary of various testing across the landfill including flux chamber testing that was used to determine the surface emission rates from the overall landfill. The resulting emission rates were important in making the determinations for receptors and potential impacts of methane and hazardous air pollutants. During this review of testing data and as it was presented in several reports, no methane was detected in field measurements from any of the sample locations. This lack of detectable methane was attributed to rapid attenuation of methane as it passed from the MSW into the shaping material and out into the atmosphere. Hazardous air pollutants in the form of certain VOCs were detected in flux box sampling but all below the reported standards or at levels similar to those identified as background.

Testing within the Community Park was also conducted and methane was also not detected in flux box testing indicating it is not emitted at the ground surface at concentrations that are measureable. This meets NYCRR Part 360 criteria. Measurements from within the top 2 ft. of the shaping material were below 25% of the LEL which also falls within the NYCRR Part 360 requirements for on and off-site structures. Perimeter methane was below Part 360 criteria with the exception of the vicinity of MW-0 along Buttrick Avenue where methane was above 100% LEL. This particular area was beyond the site and consisted of early tidal marsh and pre-1945 MSW filling that is believed to be the contributing source of methane. All measurements from the Community Park vents were below ambient concentrations and well below NYSDEC standards indicating no impact above public exposure thresholds in the vicinity of the vents (Ferry Point Landfill Gas Management Plan, October 2011, Appendix 20).

Modelling of the emissions over several efforts conducted between 1999 to 2010 showed that methane levels were very low and in locations where methane was identified, levels were expected to continue to diminish over time. In order to provide adequate ventilation for enclosed spaces and especially where there is a source of ignition (electrical connections or machinery), mitigation methods would be implemented including Sub Slab depressurization systems (SSDS) at each building. This was further described as conservative as methane concentrations exceeded LEL within the MSW layer back during 2008/2009 in TRC testing of the subsurface. Also during this same monitoring period, methane was not present within the shaping material above the NYCRR Part 360 limit of 25% LEL in any location of proposed buildings. Passive venting of the MSW was recommended as a precautionary measure where no buildings were planned and active venting below or within building footprints.

The Golf Course portion of the Site also includes a sizable irrigation lake and water quality ponds. The purpose for these water bodies covers two positive issues. The first is to help control and limit precipitation and infiltration through the cover material and into the solid waste and the second is to help collect water for controlled release and irrigation. Golf course ponds are typically used for storage and

irrigation regardless of the overall construction. The ponds and lake were each designed to be lined in order to contain as much runoff as possible making it available for irrigation. A gas transmission layer was constructed beneath the irrigation lake. This was connected to perforated piping installed around the lake. The 2009 Part 360 Permit Modification Request included Contract drawings showing this piping as a passive venting system surrounding the lake (Appendix 20).

Water quality ponds were proposed to be lined up to the permanent water level capacity with low permeability low density polyethylene (LDPE) liners with the incorporation of a passive venting system. Ponds where MSW was encountered within the excavation would be lined for the entire volume.

The smaller ponds have also been designed and constructed with a gas transmission layer to promote passive venting. This layer consists of permeable gravel and perforated collection piping extending beneath the ponds and exiting from vent stacks that extend above the breathing zone. The drawings and specifications for the water quality pond liners and passive venting systems were included in the Supplemental Engineering Report Appendices (Appendix 20).

The Community Park portion of Ferry Point Park is located along the northeastern side of the site. This includes walking paths, open space and a single comfort station structure. The LFG components of the Community Park portion consist of 12 LFG vents and an active sub-slab depressurization system beneath the comfort station. Sampling and monitoring of the vents has shown that since at least 2011 there has been no measurable flow in the vents and detectable methane in 3 of the 12 vents. Ranges of methane were between 7.5% to 100% LEL as referenced in the 2011 Ferry Point Landfill Gas Management Plan (Appendix 20).

Twenty-five stand-alone vertical passive vents were installed across the golf course and twelve passive vents were installed in the Community Park. The total area not covered by buildings and water features is approximately 190 acres and the ratio of vents per acre is one per five acres. A greater ratio was applied to the community park which has twelve passive vents in open spaces. All landfill and community park vents operate based on changes to water level, atmospheric pressure and also production of landfill gas. Gas can move through the fill material to a point where it is able to be removed through a vent. Additional smaller gas volumes can move upward into the shaping material to be passed along the surface interface. Based on readings, these concentrations are both low and rapidly diffused indicating the overall volume is much lower.

Following the revision of the active venting proposal for the entire Site, the enclosed buildings and structures were left with the earlier requirement for active venting systems. This was required due to the explosive and accumulating nature of methane and other oxygen displacing gases that exist in landfill conditions as well as being precautionary to prevent the potential of accumulation of explosive gases in these locations. In order to protect occupants and visitors of enclosed structures from accumulation of LFG, active venting of the sub-slab area was recommended. The active sub-slab systems prevent accumulation of gas by actively removing it to the atmosphere and increase the flow of air beneath the buildings. This creates a change in pressure from beneath the slab and the inside of the building which

prevents LFG from entering the building in its more concentrated form. Once LFG leaves the confined space from beneath the landfill and mixes with ambient air, the concentrations are rapidly diminished to levels that are not detectable above background.

The three enclosed buildings (maintenance and two comfort stations) located on the Golf Course and Community Park were required to have SSDS incorporated into the slab design and foundation plan.

Two initial buildings within the golf course (maintenance and comfort station) and one in the community park (comfort station) were recommended to be outfitted with active sub slab venting systems. The maintenance building and comfort station in the golf course and comfort station in the Community Park were each proposed and were outfitted with an active SSDS. The designs were initially submitted in the 2009 DEC Part 360 Permit Modification Request (Appendix 20). Operation and maintenance of the systems (once active) is provided in the Operations, Monitoring and Maintenance Plan and in the Post Construction Custodial Care Plan. Systems will have monitoring, notification controls and remote capabilities in order to allow monitoring of conditions.

Sub slab systems for the three existing structures on site function in a similar fashion by reducing the air pressure beneath the foundation and inducing a slight negative pressure. The negative pressure prevents upward migration, accumulation and infiltration of LFG into the aboveground space. Systems can incorporate varying designs in order to accommodate structural requirements, utilities and layout of the overall building.

The maintenance building and community park systems consist of more typical sub slab systems with perforated piping placed in the backfill material above the municipal solid waste but beneath the foundation slab. Piping is connected to a vacuum blower that exhausts the sub slab gas from a high single point into the atmosphere. The comfort station within the golf course uses a similar manner of equipment with the major difference being the foundation design was modified to include the creation of isolated vaults sandwiched between the lower mat slab and upper floor. No access can be made into those vault spaces and they are filled with low density foam. Vent piping was installed into the sealed vaults and the vapor extraction system effectively creates a higher vacuum (negative pressure) in this vault space than would typically be seen below an open foundation. The piping penetrated the floor in the main portion of the building and was extended into the attic where the blower was mounted. Exhaust was vented through the top of the roof in a dedicated stack. The system was installed in March 2015 and put in operation prior to opening the golf course on April 1, 2015. The comfort system details are also described in the deviations section of this report.

The Maintenance building was constructed with a pile supported slab that covers the entire footprint of the building. The system was constructed as shown on drawings X-001.00 through X-006.00 (Contract drawings for: Construction of a Maintenance Building, A Comfort Station, and One Rain Shelter Within the Ferry Point Golf Course – Contract No. X1256-209M, November 11, 2011, Appendix 4). Prior to pouring the slab, the existing ground surface was prepared with geo-textile fabric, a minimum 12 in. layer of aggregate that is gas permeable to allow flow from all areas beneath the slab into the collection piping,

rigid insulation all covered by an impermeable barrier such as liquid boot or other equivalent. Liquid boot and all barriers used are compatible with the known and identified volatile organics identified at the site. Liquid boot was applied to provide a 60 mil thickness. A special capping material was also placed above the liquid boot to protect it from perforations when the rebar reinforcing rods were set in place. Six inch dia. PVC piping was installed beneath the center of the Maintenance Building floor and this was connected to a vertical riser that would exhaust through the roof. The blower was located as the piping exited the slab into the building and exhaust extended up through the roof. The system was combined with combustible gas meters located in each of the occupied spaces of the building that monitor the atmosphere in each area and are connected to a central alarm. Sub slab monitoring points were also installed along the length of one side of the building to allow for sampling. Each point was installed through the slab into the permeable aggregate and the penetration through the slab was sealed. This system was operational prior to the opening of the golf course as the building was being occupied prior to opening of the golf course.

The system in the comfort station at the Community Park was installed in a similar fashion with a smaller footprint building. This system was a single length piping system installed beneath the foundation using the same construction layering as the maintenance building. The blower and equipment has been completed and the system not yet initiated as that area is not currently open. The system is expected to become active in the very near future.

The comfort station within the golf course was also outfitted with an active system but the slab design for this building was modified so as not to require pile supports. This foundation design included a vapor barrier placed on the prepared subgrade. No MSW was exposed and the fill beneath the building was consistent with shaping material consisting of sand and gravel. A mat slab that was 1.5 ft. thick was poured over the vapor barrier and then 4 ft. vertical walls were formed on the slab to cover the perimeter as well as divide the slab into 4 roughly equal sections. The inner sections of the slab were then filled with solid foam up to just below the top of the walls. Six inch PVC piping similar to that used in the maintenance building sub slab was used and extended to the outer two segments. A vertical riser penetrated the floor inside of the building and was extended up into the attic space where the blower was located. The blower exhaust was directed out of the roof through a vent. The system was designed to create and maintain a lower pressure vacuum on the entire four-chamber sub slab area in order to prevent any sub slab gas from accumulating within that space. Pressure testing of the entire area showed that negative pressure was able to be generated and maintained between the mat slab and floor of the comfort station. This system was installed and began operating prior to opening of the golf course and occupation of the building.

Additional controls installed within the buildings included soil/bentonite collars around utilities servicing the buildings. Foundation penetrations were sealed with these engineering methods to prevent infiltration both into the void spaces and up through foundation slabs where utilities are installed. Additionally, soil/bentonite collars were installed in utility corridors where permeable pipe bedding was used in order to prevent LFG from migrating laterally. All conduit and utility penetrations into floor slabs

were also closed with soil/bentonite seals to prevent those corridors from acting as preferential pathways for LFG migration up into occupied spaces.

The Community Park Comfort Station was constructed in an area of MSW at shallow depths below grade and within the foundation envelope. The foundation was designed to incorporate piles for slab support. All utility trenches that were excavated to the building were installed in either shaping material or if MSW was encountered, it was over excavated and the trench backfilled with granular fill to allow all utilities to be place on bedding that did not contain MSW. During excavation, short duration and dewatering was occasionally necessary. Any water removed during dewatering was pumped a short distance away into existing trenches or other locations.

Off-Site monitoring for methane has been conducted back to the early 2000s. Probing was the primary early monitoring and assessment method. Probes were historically located on Schley, Buttrick, Balcom, Miles and Emerson Avenues. Since 2002, concentrations of methane have been lower than the LEL and this has been used to present the lack of significant source of methane at these off-site sources. In 2002, the Methane Monitoring Study (AKRF) identified the presence of buried MSW beyond the site boundaries. In addition to MSW, soils were logged and identified as fine organic deposits representative of the historic marsh deposits.

OM&M incorporates criteria from NYCRR Part 360-2.17(f) including the following:

- Concentrations of explosive gases must not exceed 25% of the LEL in on-site and off-site structures.
- Concentrations of explosive gases must not exceed LEL at the property boundary.

These requirements are being used to guide mandated additional monitoring under Special Conditions and to govern the construction of all future buildings. Several Special Conditions were included within the 2005 Part 360 Permit (Appendix 1) and are incorporated into regular OM&M and will continue moving forward until they are recommended for elimination as part of the permit.

Special Condition 26 includes the monthly monitoring and inspection of gas venting trenches to evaluate the mulch cover material. This will occur each spring following the winter months.

Special Condition 30 includes the monthly groundwater gauging in the perimeter piezometers in order to evaluate the depth to groundwater with respect to the bottom of the gas venting trench. This measurement will continue through the construction process and that period will be considered complete upon the approval of this Construction Certification Report. The monitoring specifies that id groundwater is measured below the bottom of the trench, DPR will implement Special Conditions monitoring. This is further described below in 5.2.2.

Special Conditions 31 includes specific notification and frequency monitoring if groundwater is identified below the bottom of the trench or if LEL of LFG is noted in adjacent monitoring probes.

Special Conditions 32 and 24 include the bi-weekly monitoring of specific perimeter gas wells and on-site monitoring wells. Results of the monitoring will direct more frequent sampling or monitoring and when monitoring may return to the regular schedule.

Special Condition 37 includes bi-weekly monitoring of the off-site gas monitoring network and the results of this monitoring will direct more frequent monitoring or testing.
Additional parameters were added in 2011 by NYSDEC to include hydrogen sulfide, VOCs and carbon monoxide, all were to be reported in parts per million (PPM) and temperature/pressure.

Work that will continue following construction is included in the Post Construction Custodial Care Plan (Appendix 20). That document covers the efforts beyond this report in order to effectively monitor and report on post construction conditions under the Part 360 Permit.
Monitoring during the entire construction period has been performed in accordance with the Landfill Gas Monitoring Plan and the approval of this Report will serve to conclude all construction monitoring.

The most recent and final documentation submitted under this construction effort is the Ferry Point Park Golf Course Irrigation Pond Vent Boxes Monitoring Final Report submitted in May 3, 2015 (Appendix 20). This Report summarized monitoring data and piping/vent/vale configurations around the irrigation pond at the golf course. The overall purpose for the preparation of the Report was to present information to NYSDEC prior to this Closure Certification Report in order to gain approval to close and remove one vent from the golf course area at vent box #5.

The Report describes and presents the configuration of the piping surrounding the irrigation pond and that the removal of this single vent would not have a detrimental effect on the overall LFG system. The entire lop surrounding the pond collects LFG under the conditions that have been evaluated and calculated over the landfill and that appears to be less than one cubic foot per minute. Based on measurements from specific vent box locations within the overall loop, the LEL readings concentrations indicate two possible theories; that methane may be coming from possibly one area and then slowly migrating or spreading to one or two other vent box areas or it may be concentrated in one area and is also being generated at much lower levels from one or two other areas.

In either case, the volume and rate of methane being generated is similar to much of the remainder of the landfill and while this area has actual vent pipes, the remainder of the landfill is direct vented to the atmosphere through the shaping layer. Removal of the single vent at Vent Box 5 will not impact the collection of methane within the underground passive piping but will only eliminate one outlet location. The valve placement at each box allows for multiple vents to be open or combinations of vents to be either open or closed. In addition, sections of the piping around the irrigation pond can be isolated. There is no specific plan other than to remove the single vent from the overall system and this would not impact the passive systems ability to remove methane from the subsurface.

Landfill and off-site gas monitoring was completed as required by the Permit Special Condition X during construction. The IEM accompanied American Environmental Solutions (AES) during landfill gas

monitoring activities at on-site and off-site locations during the course of construction. Monitoring results were transmitted to the NYSDEC by AES after monitoring was completed and monitoring reports were included in the bi-weekly FMRs for the corresponding periods. Landfill gas monitoring results are attached as Appendix C in each the FMRs which are included as Appendix 6. In addition, refer to Appendix 15 for the spreadsheet compilation of all LFG monitoring results to date in tabular and graphic format.

### 5.2.1 Bi-Weekly

Methane gas monitoring of the entire site was conducted on a bi-weekly basis. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR (Appendix 6). In addition, refer to Appendix 15 for the spreadsheet compilation of all LFG monitoring results to date in tabular and graphic format.

A review of the historic field data associated with the perimeter LFG vent trench monitoring program from 2001 to present was conducted to evaluate LFG trends at the Site relative to the perimeter passive LFG control (Ferry Point Park East Post Construction Custodial Care Plan, October 2013, Appendix 20) and showed the following:

- After the installation of the vent trench in 2001, methane levels in the vicinity of the LFG vent trench tended to decrease significantly within a year in most LFG monitoring wells;

- Methane levels remained relatively low and below regulatory limits from 2002 through 2004, except for a few wells that sporadically exceeded the regulatory limit;

- In 2005, the measured methane levels tended to increase, likely due to the installation of more reliable monitoring points (new monitoring points and repaired wells); and

- Results from 2008-2011 generally indicate relatively consistent levels of methane, with certain limited sporadic increases above regulatory limits.

Methane levels increased for several on-site perimeter wells, on-site interior wells and off-site semi-permanent wells located during the construction period between 2010 and 2014, especially for the wells located in the northeast portion and south portions of Ferry Point Park; however, the levels were significantly lower than the beginning of the monitoring program, and the levels decreased to zero by 2015 with the exception of two on-site perimeter wells (MW-14 and MW-15) located in the southern portion of the golf course, three on-site interior monitoring wells (MW-0, MW-4 and MW-19), and three off-site semi-permanent wells located on Buttrick Avenue (10, 12R and 14R). The last recorded monitoring event on April 10, 2015 (Special Conditions Landfill Gas Monitoring Report, April 13, 2015, Appendix 7) reported the following methane concentrations (% by volume) exceeding the site specific action level in eight locations:

- MW-0 - 4.5%

- MW-4R - 50.2%
- MW-19 - 83.8%
- MW-15 - 6.7%
- MW-14 - 33.4%
- Well 14R (Buttrick Avenue) - 1.6%
- Well 12R (Buttrick Avenue) - 28.6%
- Well 10 (Buttrick Avenue) - 10.1%

### 5.2.2 Special Conditions

In accordance with Special Conditions #34 and #37c of the November 18, 2005, Permit Modification (Appendix 1), if any individual monitoring point has a bi-weekly reading that equaled or exceeded 100% LEL, or three consecutive bi-weekly readings that were greater than 25% LEL, methane monitoring of these points was conducted on a weekly basis. Monitoring returned to the bi-weekly monitoring schedule once three consecutive readings were each less than the 25% LEL action level. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR. In addition, refer to Appendix 15 for the spreadsheet compilation of all LFG monitoring results to date in tabular and graphic format.

## 5.3 Piezometer Monitoring

On a monthly basis, groundwater elevation measurements were taken and recorded in all piezometer locations along the site perimeter vent trench in accordance with Special Condition 28 of the 2014 Permit. Measurements were manually taken using a portable water level meter. The IEM observed piezometer monitoring in the field and groundwater data was submitted to the NYSDEC. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR. Piezometer monitoring results were incorporated into the landfill gas monitoring reports attached as Appendix C in each bi-weekly FMR, which are included as Appendix 6.

## 5.4 Settlement Plate Monitoring

Short term settlement was performed with plates installed throughout the landfill in order to evaluate settlement and compaction during the fill placement and grading. The majority of the short term plates were installed following the importation of significant amounts of fill material when the areas had been brought near to or at final grade. The 2014 NYSDEC Permit Modification (2-6006-00014/00013) Special Condition #6 required short term settlement monitoring to meet those requirements incorporated in the January 2005 Settlement Evaluation and Long Term Monitoring Plan. Short term monitoring was performed in accordance with the early 2005 Plan and as construction progressed and as per Special Condition #6. Short term settlement plates were either removed or monitoring discontinued when long term monitoring plates were installed in accordance with the revised Permit. Long term settlement plates were installed throughout the landfill in areas shown on the Figure titled Ferry Point Golf Course Settlement Plate Locations 4/11/2012 by KS Engineers, P.C. The locations of the long term plates were identified to be in the same specific vicinity of the short term plates.

The overall Program for monitoring settlement began in 2002 with the construction of 7 instrumented test fills and installation of 6 settlement plates that were located across the site. Test fills varied between 10 to 18 ft. in thickness and the specific locations were placed where future settlement would be most critical (e.g. future green areas and where significant thicknesses of fill were necessary). The majority of the settlement plates were located in the eastern portion of the site at a time when most of the fill had been imported in order to begin monitoring on-going settlement for areas that had been filled for a period of 9 months or longer. Initial settlement monitoring was conducted for a period of over 2 years and monitoring results were transmitted to NYSDEC on a bi-weekly frequency.

Settlement recorded following June 2003 was recorded but noted to have been significantly influenced by the importation if fill and the loading that this had on the areas adjacent to the test fills. Initial settlement was noted to have a range between 3 and 23 inches with the greatest variation in the western section. This was believed to be the result of a significant compressible clay layer near the surface. The recorded measurements were compared by Langan to the estimated values that had been calculated and they were found to be comparative. One positive aspect of this initial measurement and comparison showed the site to be in an optimal character for surcharge as a result of placement of larger fill loads for shorter periods of time in order to maximize the settlement as early as possible and minimize post construction settlement that is a critical issue for the sensitive surface of a golf course.

The resulting settlement analysis provided a recommendation for fill placement and long term predicted settlement. This information and comparison to settlement data is critical in monitoring the underground utilities for maintenance and repair. Piping settlement would result in lower carrying capacity and therefore storm lines were designed to be oversized with welded ends to prevent separation. Sanitary lines were also designed with the additional anticipated settlement incorporated into their long term maintenance. Increased slope, HDPE piping and flexible joints were recommended where piping would pass through areas of different fill thicknesses and therefore a differential in overall settlement would be expected to occur. Recommendations for flexible connections capable of withstanding rotation and extension were made for sewer lines exiting structures.

Settlement over the golf course surface was presented following the initial evaluation and recommendations for anticipated settlement were determined to be within the initially anticipated settlement and possibly sooner for areas where more substantial thicknesses of material were placed. Additional influences on long term settlement will be thickness and depth to the compressible clay layer. The variation in settlement was estimated to be between 3 to 15 inches over a 30 year period. Non-uniform settlement is also anticipated over the life of the golf course due primarily to the variable thickness of imported material and could equal up to 6 inches. Slope stability is not anticipated to be adversely impacted as a result of the long term settlement anticipated at the site.

Areas where significant amounts of fill were identified to be placed, such as the area between the irrigation pond and Hole #1 was required to be placed in a more controlled manner in order to allow the pore pressure to be evenly reduced. This method would prevent slope failures caused by buildup of pore

pressure. Placement of fill was specified to be in 2 ft. lifts per week which would allow for dissipation of pore water in the clay layer.

Special Condition #7 of the revised 2014 NYSDEC Permit specified long term settlement requirements and that they would continue to conform to those established in the earlier permit. Locations of the replacement long term settlement plates shown on the 2012 Figure were referenced and approved as part of the 2014 Permit Modification.

Long term settlement monitoring will be performed at the initially 8 recommended settlement monitoring plates located throughout the golf course for a period of 30 years following completion of construction.

The plates are located in variable subsurface conditions but in general have been placed where the greatest concentrations of fill material have been placed in connection with the thickest compressible soil layers. The locations were also chosen to be adjacent to underground utilities such as water and sewer mains and/or adjacent to green areas where differential settlement is most critical.

The date being used as the construction completion is April 1, 2015. This was described in the March 30, 2015 executed letter between NYSDEC and NYCDPR which referenced the Substantial Completion of Construction Certification allowing the golf course to open on April 1, 2015. The letter states that NYSDEC and NYCDPR agree that the April 1, 2015 opening of the golf course constitutes completion of the filling operation on the Site and construction of the earthwork portion of the Project as contemplated under the NYSDEC Permit (No. 2-6006-00014/00013 and 2-6006-00014/00016). As a result of this completion date, monitoring will continue until April 1, 2045 or until a point that NYSDEC authorizes monitoring to cease if it is prior to April 1, 2045.

Long term settlement will be documented as it is referenced in the Post Construction Custodial Care Plan (October 2013). This includes providing NYSDEC with an annual inspection report certified by a licensed NYS professional engineer. The monitoring will document the following information during the timeframes referenced:

1. Beginning within 60 days of the approval of this Engineering Certification Report and continuing for a period of 5 years, the quarterly monitoring results will be summarized and submitted on an annual basis.
2. Immediately following the initial 5 year period and continuing for an additional 5 years (10 years from the date of Engineering Certification Report approval) monitoring will continue on a reduced bi-annual basis and the results will be summarized annually.
3. Immediately following the year 10 bi-annual report summaries, monitoring will be performed and reported on a reduced annual basis. This annual monitoring and reporting will continue for the duration of the 30 year period or for 20 years.
4. Following the initial 5 year quarterly monitoring period, NYCDPR may petition NYSDEC for a decrease in the monitoring frequency or for cessation of monitoring altogether. In the event that NYSDEC approves terminating the monitoring for any monitoring plates, NYCDPR will evaluate the settlement plates for either abandonment or removal. This evaluation will be performed within

the first year following approval of monitoring cessation. The abandonment or removal documentation will be signed and certified by a NYS licensed professional engineer and provided to NYSDEC within the concurrent post closure reporting period after the completion of the work.

Special Conditions 6 and 7 of the 2014 Permit and the recommendations provided in the Settlement Evaluation and Long-Term Monitoring Plan dated January 26, 2005, prepared by Langan Engineering and Environmental Services, Inc. set forth settlement monitoring requirements related to the placement of fill material across the Site. A copy of the Settlement Evaluation and Long Term Monitoring Plan is included in Appendix 20. Settlement plate monitoring was performed on-site in accordance with the Permit. Settlement monitoring reports are attached as Appendix D in each of the FMRs, which are included as Appendix 6. Monitoring was conducted on-site as follows. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR.

### 5.4.1 Short Term

The short-term settlement monitoring program began in December 2002 with the bi-weekly monitoring of seven test fills and six settlement plates located throughout the Site. Test fills consisted of an engineered soil fill ranging from 10 to 18 feet deep, generally located on-site in areas where significant thicknesses of fill were required. Settlement plates consisted of a subsurface plate beneath a casing and a flush-mount monitoring access port, similar to a monitoring well. Settlement plates that were part of the short-term settlement monitoring program were generally located in areas of the Site already at or close to final grade. The Settlement Evaluation and Long-Term Monitoring Plan recommended the following adjustments be made to the monitoring program during construction:

- Test fills that obstructed construction activities should be replaced with a settlement plate to be monitored near the location of the test fill.

- Settlement plates that needed to be moved for construction purposes should be relocated to the same general area and monitored until long-term monitoring points were installed.

Monitoring at short-term monitoring points was discontinued as required due to interference with ongoing construction. In an email correspondence dated May 1, 2012, included in Appendix H of the 2013 Engineering Report (Appendix 20), the NYSDEC informed NYCDPR that these short-term monitoring locations did not need to be replaced as long as construction at the Site progressed. As construction was concluded in each area of the Site, long-term monitoring plates were to be installed as described below. Short-term settlement monitoring continued to be performed bi-weekly at the Site until October 14, 2013. The design of the long term settlement monitoring points is presented in a January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. and outlined in a May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by New York State Department of Environmental Conservation. These documents outline the long term settlement plate monitoring locations, detail and required monitoring intervals. Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. As previously stated, the monitoring and reporting schedule will be

modified as the post construction period extends into the future. This has been included in the Post Construction Custodial Care Plan (October 2013).

The following summarizes the efforts with respect to conformance to project design documents:

The approved May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by NYSDEC refers to Appendix H of an October 15, 2013 *Supplemental Engineering Report* for a long term monitoring location plan. Appendix H of the permit which is included as Appendix 20 here, references and includes the April 11, 2012 *Ferry Point Golf Course Settlement Plate Locations* plan prepared by KS Engineers, P.C.

The February 20, 2014 *Ferry Point Golf Course as Built Drawing* prepared by Contractors Line & Grade South, LLC shows the as-built locations of the long term settlement monitoring plates in conformance with the above referenced April 11, 2012 KS Engineers plan. An additional monitoring point between golf course Hole 6 and Hole 7 was added and approved in the May 1, 2012 *Re: Settlement Plates Email* prepared by NYSDEC.

A January 26, 2005 Settlement Evaluation and Long-Term Monitoring Plan prepared by Langan Engineering and Environmental Services, Inc. states that:

> *"These settlement points will be utilized to determine future settlements during the golf course operation. They should be installed once filling operations are completed to within 1 foot of final grades or in other words, during placement of soil cover materials. After their installation, monitoring of the settlement points should be performed once every other month until the construction is complete. Subsequent monitoring should be performed once every 3 months during the first year of golf park operation and once every 6 months for the second year."*

The description above is a deviation from the Post Construction Custodial Care Plan where quarterly monitoring and annual summary reporting will be performed for an initial period of 5 years followed by an opportunity to evaluate and proposed changes. The frequency would without any additional recommendation be reduced to semi-annually following 5 years. This reference accepts a switch to semi-annual monitoring and annual reporting following the first year. This is the only approved change in the settlement monitoring plan outside of the approved 2013 document.

The data from the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran indicate that settlement plate monitoring was conducted every two weeks in conformance with the minimum requirements of the above referenced monitoring plan.

Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. Results of the monitoring are available in the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran.

The November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran do not document any non-conformance issues regarding the construction of the long-term settlement monitoring locations. A settlement monitoring plate detail is provided in the January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. does not identify any deviations from the location plan and all long term settlement plates installed were specifically located as replacements for short term plates installed earlier during construction

### 5.4.2 Long Term

The design of the long term settlement monitoring points is presented in a January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. and outlined in a May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by New York State Department of Environmental Conservation. These documents outline the long term settlement plate monitoring locations, detail and required monitoring intervals. Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. As previously stated, the monitoring and reporting schedule will be modified as the post construction period extends into the future. This has been included in the Post Construction Custodial Care Plan (October 2013).

The following summarizes the efforts with respect to conformance to project design documents:

The approved h, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by NYSDEC refers to Appendix H of an October 15, 2013 *Supplemental Engineering Report* for a long term monitoring location plan. Appendix H of the permit which is included as Appendix 20 here, references and includes the April 11, 2012 *Ferry Point Golf Course Settlement Plate Locations* plan prepared by KS Engineers, P.C

The February 20, 2014 *Ferry Point Golf Course as Built Drawing* prepared by Contractors Line & Grade South, LLC shows the as-built locations of the long term settlement monitoring plates in conformance with the above referenced April 11, 2012 KS Engineers plan. An additional monitoring point between golf course Hole 6 and Hole 7 was added and approved in the May 1, 2012 *Re: Settlement Plates Email* prepared by NYSDEC.

A January 26, 2005 Settlement Evaluation and Long-Term Monitoring Plan prepared by Langan Engineering and Environmental Services, Inc. states that:

> *"These settlement points will be utilized to determine future settlements during the golf course operation. They should be installed once filling operations are completed to within 1 foot of final grades or in other words, during placement of soil cover materials. After their installation, monitoring of the settlement points should be performed once every other month until the construction is complete. Subsequent monitoring should be performed once every 3 months during the first year of golf park operation and once every 6 months for the second year."*

The description above is a deviation from the Post Construction Custodial Care Plan where quarterly monitoring and annual summary reporting will be performed for an initial period of 5 years followed by an opportunity to evaluate and proposed changes. The frequency would without any additional recommendation be reduced to semi-annually following 5 years. This reference accepts a switch to semi-annual monitoring and annual reporting following the first year. This is the only approved change in the settlement monitoring plan outside of the approved 2013 document.

The data from the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran indicate that settlement plate monitoring was conducted every two weeks in conformance with the minimum requirements of the above referenced monitoring plan.

Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. Results of the monitoring are available in the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran.

The November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran do not document any non-conformance issues regarding the construction of the long-term settlement monitoring locations. A settlement monitoring plate detail is provided in the January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. does not identify any deviations from the location plan and all long term settlement plates installed were specifically located as replacements for short term plates installed earlier during construction

The long term settlement monitoring was performed at the locations shown on the revised Settlement Plate Location Plan and a sketch that includes an additional monitoring point between golf course Hole 6 and Hole 7 included in Appendix H of the Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, NY dated May 31, 2012 (Revised August 31, 2012, October 15, 2013) as described in Appendix I of that report. These locations were approved by NYSDEC in an email dated May 1, 2012. The long-term settlement monitoring points were installed as construction was completed in each area of the Site. Upon installation, the long-term settlement plates were monitored in accordance with the criteria set forth in Special Condition 7 of the Permit.

As a component of this Report section the following list of documents were used:

- A January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc.;
- A May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by New York State Department of Environmental Conservation;
- A April 11, 2012 *Ferry Point Golf Course Settlement Plate Locations* plan prepared by KS Engineers, P.C.;
- A November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran;
- A undated *additional settlement plate sketch;*
- A February 20, 2014 *Ferry Point Golf Course as Built Drawing* prepared by Contractors Line & Grade

South, LLC; and,
- A May 1, 2012 *Re: Settlement Plates Email* prepared by NYSDEC.

The long term settlement monitoring was performed at the locations shown on the revised Settlement Plate Location Plan and a sketch that includes an additional monitoring point between golf course Hole 6 and Hole 7 included in Appendix H of the 2013 Engineering Report and as described in Appendix I of that report. These locations were approved by NYSDEC in an email dated May 1, 2012, which is included in Appendix H of the 2013 Engineering Report (Appendix 20). The long-term settlement monitoring points were installed as construction was completed in each area of the Site. Upon installation, the long-term settlement plates were monitored in accordance with the criteria set forth in Special Condition 7 of the 2014 Permit.

## 5.5 Groundwater Monitoring

The overall setting of the Ferry Point Park Site with respect to the groundwater regime can be described as an area covering approximately 220 acres bounded along the waters of the East River to the south, Saint Raymond's Cemetery to the north, Balcom and Emerson Avenues to the east and the Bronx-Whitestone Bridge and ramp to the west. The entire site was a former operating municipal solid waste landfill that ended accepting fill material in the 1960's. The overall landfill footprint extended beyond the boundary of the Ferry point Park Site. The period of operation predated the existence of current Solid Waste Facility design and construction requirements and therefore, no groundwater assessment or survey was performed for the construction or during operations of the landfill.

A review of aerial photography was conducted at the time this report was being prepared. The photographs are available on the New York City public website and include those showing the overall site and surrounding area from a period beginning in 1924 and up until 2012. The earliest photo of 1924 shows nearly the entire footprint of the Ferry point Park Site was formerly open water, existing as a large bay of the East River. A review of the 1951 aerial photograph of the same scale shows the northwest portion of the landfill site was filled with what appears to be very light colored fill material. The photo shows filling operations to be expanding from the northwest corner outward and based upon the extreme contrast in color of existing land and fill material to be sand material possibly sourced from in-water dredge operations. This practice was performed in many other areas of the City at this time when harbor deepening and widening took place from 1940 onward. There were no photos between 1951 and 1996 and so there was no further photographic record in this collection to show the progression of landfilling. This period of filling (pre-1951) predated the DSNY recordkeeping and existence and there would not be any expected record of the placement of this fill in Sanitation Department documents. The existence of these photos is important to present the hydrogeologic origin of site groundwater for comparison to that of other groundwater. This history places the entire Site at the base of a larger drainage basin and in direct connection with the East River system of salt and brackish waters. Using this as the basis for the hydrogeologic model, shallow groundwater at the Site would now be considered to be part of the upland groundwater table as a result of the filling and extension of the shoreline into the river. Groundwater

within the fill material could be expected to be tidally influenced but the inland limit of this influence would be dictated by the fill material, its composition and compaction.

As part of the Volume #1 Application for Modification to the Solid Waste Management Facility Permit for Construction of the Ferry Point Park Recreation Facility Engineering Report (June 30, 2005; Appendix 20), a specific groundwater impact assessment was presented. This was based on a qualitative assemblage of data and information from other related studies but not specifically from a focused groundwater evaluation.
A May 31, 2005 letter on the Influence of Fill Placement on Groundwater prepared by Langan Engineering assessed the impact of fill material on the groundwater (found in Appendix VII of Volume #1 Application for Modification to the Solid Waste Management for Construction of Ferry Point Park Recreation Facility Engineering Report, June 30, 2005, Appendix 20). This was based upon information and conditions gathered during geotechnical evaluations and site history knowledge. The findings presented at that time indicated the development of the Ferry Point Park Site as a golf course would not further impact or change groundwater flow patterns or conditions and would therefore not further impact the East River beyond the existing conditions.

Much of the description presented in the Langan assessment focused on the site development and the addition of engineering controls that would become part of the site. These included: paved path and parking areas, significant stormwater collection systems, site grading to control flow, control devices and systems as well as importation and capping of the entire site with a varied but significant layer of clean cover materials that would all have a positive impact and reduce the amount of surface water filtering through the landfill and into the groundwater. The overall completed site development in the 2005 Engineering Report included a total of 26 acres of impervious area and collection of stormwater in detention facilities (Appendix 20).

A total of 26 piezometers were installed to monitor shallow groundwater along and immediately adjacent to the Landfill Gas passive trench. These piezometers, while used for depth to groundwater measurements are not incorporated into the groundwater evaluation as they were specifically used to assist in the design and monitoring of the LFG vent trench. The principal purpose for the piezometers and their association with the LFG trench was to monitor the level of groundwater to determine if groundwater levels went below the LFG passive recovery trench. Groundwater elevation measurements collected from the piezometer locations along the site perimeter vent trench (Special Condition 28) are addressed in section 5.3 (Piezometer Monitoring) of this report. Section 5.5 addresses the baseline groundwater monitoring requirements established in 2010.

The NYSDEC Permit issued on November 18, 2005 for the construction of the 222 acre golf course did not include a specific requirement for a groundwater monitoring plan outside of the singular focus of monitoring groundwater elevation for landfill gas control in the trenches (Appendix 1). In 2010, NYSDEC requested additional information regarding groundwater conditions and if any new, relevant information was available to verify the conclusions of the geotechnical portion of the 2005 Engineering Report (June

30, 2005, Appendix 20). As no information was available, recommendations were made in 2011 by NYSDEC for the installation of a monitoring well network.

A Technical Memorandum was prepared by Ecology & Environment Engineering, P.C. (E&E) outlining the field procedures for establishing reference point groundwater characterization methods including the installation, development, sampling, well gauging and slug testing of 11 new monitoring wells at the Site (Technical Memorandum re: Field Sampling Procedures for Ferry Point Site – Reference Groundwater Characterization, September 19, 2011, Appendix 20). At the time of monitoring well installation (February 2012), construction activities were well underway and estimated to be 80% complete. The baseline characterization was expected to capture the potential measurable impacts to groundwater. Future monitoring is expected to capture the impacts representing a more complete construction condition

The well installation program included consistent and standard well installation and construction methods, well development, baseline sampling, water level survey and aquifer testing. A figure showing the well construction details and installation elevations and locations is presented as S-H21 dated 11/8/2011. Well construction methods included the installation of shallow 2 inch diameter PVC wells with 10 ft. of slotted screen penetrating into the upper surface of the water table and standard construction finishing. All of the wells were developed and monitored using consistent criteria (turbidity, pH, conductivity and temperature), Table 1 and 2, respectively, Fieldwork Summary Report (as part of Groundwater Characterization) (May 31, 2012; Appendix 20). Each of the newly installed wells was then sampled to establish the initial baseline conditions and each was surveyed to determine groundwater level and flow direction conditions. Basic site hydrogeological information was also characterized during this effort, including direction of flow, groundwater elevation gradients, and flow velocity. Based on the initial measurements, flow direction was found to be relatively consistent in that groundwater flow was in the south-southeasterly direction toward the East River (Figure 1, Fieldwork Summary Report, May 31, 2012, Appendix 20). There was one important item noted from the initial conditions assessment and this was the lack of measureable tidal influence on any of the monitoring wells.

One soil sample was collected from each borehole from the shaping material zone with an additional quality assurance sample collected from MW-02. The soils were sampled for synthetic precipitate leaching procedure (SPLP) semi-volatile organic compounds (SVOCs), PCB/pesticides, metals, and cyanide. Seven metals and one SVOC (phenol) were detected in the 13 samples sent to the laboratory
SPLP analysis. For comparison purposes, these results are shown along with the NYSDEC Technical and Operational Guidance Standard 1.1.1, for Class GA groundwater. Four metals, and one SVOC (phenol) were detected with concentrations higher than the comparison standard (Table 6, Fieldwork Summary Report, May 31, 2012, Appendix 20).

Slug testing was performed on each of the wells to evaluate hydraulic conductivity and while this is not a critical measurement for wells installed within landfill material, it is useful in evaluating the consistency of all wells in the system. The results of the slug testing presented a fairly uniform range of hydraulic conductivities within the landfill material.

The results of the baseline groundwater analysis showed that with the exception of metals, the analytical results were in line with a landfill of this type and age. All metal detections were higher than the NYSDEC Class GA groundwater standard, which was used for comparison purposes. It is noted that these samples had high turbidities (e.g., greater than 1000 NTU) and this likely impacted the metals test results. Phenolics and ammonia leachate parameters were also detected higher than the comparison standard (Table 7, Fieldwork Summary Report, May 31, 2012, Appendix 20). As a result, NYSDEC requested that both filtered and unfiltered samples be collected. If the results were consistent, subsequent events would be completed using filtered samples only for the inorganic parameters (May 8, 2012 Ferry Point Groundwater Characterization Conference Call, May 9, 2012, Appendix 20). Filtered and unfiltered groundwater samples were collected during subsequent events.

NYSDEC also provided DPR with requirements for future groundwater monitoring (e.g., Post Construction Monitoring) in their FPP Groundwater Characterization Monitoring Objective on May 8, 2012 (Appendix 20). The objective included the following requirements: reference point/background characterization in three quarterly rounds of sampling for all parameters listed in 6 NYCRR Subpart 360-2.11 baseline parameters. Following completion of the characterization sampling, baseline sampling would continue on a biannual basis after the initial three quarterly rounds until the FPP landfill end use (golf course) is operational. Table 5-X below summarizes the reference point/background characterization events.

Table 5-1. Summary of Reference Point/Background Characterization Events

| Sampling Frequency | Wells Sampled | Status |
|---|---|---|
| Quarterly 1 | GMW-1 – GWM-11 | Completed February 2012 |
| Quarterly 2 | GMW-1 – GWM-11 | Completed May 2012 |
| Quarterly 3 | GMW-1 – GWM-11 | Completed August 2012 |
| Bi-Annual | GMW-1 -GMW-11 | Completed March 2013 |
| Bi-Annual | GMW-1, GMW-2, GMW-3, GMW-4, GMW-5, GMW-6, GMW-7, GMW-8, and GMW-10 | Completed March 2014 |
| Bi-Annual | GMW-2, GMW-3, GMW-4, GMW-5, GMW-6, GMW-7 and GMW-8 | June 20, 2014 |
| | GMW-1, GMW-7, GMW-10, and GMW-11 | July 31, 2014 |

The three quarterly sample events were completed without modification. The Bi-Annual events were modified following the March 2013 event due to construction of the golf course which limited access to the Site. The modifications include the following:

- No September 2013 Bi-Annual sample event.
- No sample was collected from GMW-9 (well was dry) and GMW-11 (access) during the March 2014 sample event.
- The second biannual sample event for 2014 was split into two events completed in June and July. GMW-9 was not sampled. Groundwater samples were collected from the site on July 22, 2014; however the samples were not analyzed due to compliance issues with the Standard Operating Procedures.

Table 5-1 presents the overall groundwater and analysis date for monitoring wells GMW-1 through GMW-11 covering the period between February 2012 through July 2014 and are consistent with the baseline sample events: metals, phenolics and ammonia compounds, isolated and sporadic VOCs (except for chlorobenzene detected in well GMW-01 and GMW-06 during multiple events) and SVOCs (primarily PAHs) were detected above the NYSDEC Technical and Operational Guidance Class GA Groundwater Criteria. The Class GA Groundwater Criteria were used for screening purposes as groundwater is not used for potable resources. The results of the filtered (dissolved) metals samples are significantly lower than the non-filtered metals samples and in most cases exceedances of non-filtered samples are non-detect or below the Class GA Groundwater Criteria in the filtered samples.

In accordance with the Post Construction Custodial Care Plan (Appendix 20), groundwater monitoring will be performed at all 11 permanent monitoring wells throughout the golf course. Approval of this Closure Certification Report signifies the commencement of operations at the golf course beginning the period of post construction monitoring. Sampling will be performed on an annual basis with collection and analysis of groundwater for those constituents listed in 6 NYCRR Part 360-2.11 routine parameters. This sampling information and data will be summarized and included with the overall annual facility monitoring and inspection report. Monitoring and reporting will begin 60 days following the approval of this closure report and will continue for a period of three years.

Following the completion of the initial 3 year post-operations monitoring, DPR may submit documentation to NYSDEC to request a reduction in sampling or complete cessation of sampling. The initial 3 year period will form the data set to be used in the event a reduction or change in monitoring is requested. The goal of the monitoring will be to provide data showing if the park adversely impacts water quality with respect to leachate quality or quantity and to compare the 2013 permit performance criteria to existing and current conditions.

Should a request for modification or cessation be approved, monitoring wells will be assessed for abandonment or removal within a 1 year period following the ending point of monitoring. Closure documentation will be provided by a New York Professional Engineer during the same annual reporting period.

Upon commencement of operation of the golf course, the frequency of groundwater monitoring changes to annual with samples being analyzed for all constituents listed in 6 NYCRR Subpart Part 360-

2.11 routine parameters and parameters of concern identified during the reference point characterization period. The golf course began operation in April 2015 and post construction monitoring will be initiated in September 2015. Post construction groundwater monitoring is discussed in detail in Section 5.7.4.

Design documents for the groundwater monitoring wells are included in Appendix G.2 of the 2013 Engineering Report (Appendix 20). An initial sampling event was completed in February 2012 and included the testing activities described below.

Groundwater monitoring results are attached in Appendix 15.

## 5.6 Deed Restriction

Special Condition 32 of the 2014 Permit requires that the Permittee executes and files a NYSDEC approved deed restriction, which shall run with the land in perpetuity, and shall recite and require compliance with the Part 360 Permit's provisions as regards to the custodial care requirements described in Appendix I of the 2013 Engineering Report (Appendix 20).

NYCDPR is in the process of reviewing the language in Attachment A transmitted with the 2014 Permit, and will use this language as the model for the deed restriction. NYCDPR will contact the NYSDEC in the event NYCDPR has any proposed additions, deletions, and/or revisions to the general text of Attachment A.

## 5.7 Post Construction Monitoring

Post construction monitoring of the Golf Course, Community Park, and Waterfront Park is the responsibility of NYCDPR and will be completed as required by the Permit. Post closure monitoring will be completed in accordance with the plans set forth in Ferry Point Park East Post Construction Custodial Care Plan dated October 2013 included as Appendix I of the 2013 Engineering Report (Appendix 20).

The following table includes each monitoring component, the frequency, and the duration of monitoring dependent upon the cessation of activity:

| Component | Frequency | Duration |
|---|---|---|
| Final Cover System | Quarterly | 5 years |
| LFG System | Quarterly | 5 years |
| Infrastructure | Bi-Annually<br>Annually | 10 years<br>15 years |
| Groundwater Monitoring | Annually | 3 years* |
| Long Term Settlement Plates | Quarterly | 5 years* |
| Parking Lot Asphalt Cover (April & October) | Bi-Annually<br>Annually | 5 years*<br>20 years* |

*Denotes Dependent on Cessation of Activity

NYCDPR will not be performing post-construction monitoring for the Waterfront Park portion of the Site until construction is complete and approved, and will restrict public access until such time.

NYCDPR is in the process of engaging a full service environmental firm to conduct the post construction monitoring requirements and will complete the post construction monitoring required to comply with the Permit in accordance with the Post Construction Custodial Care Plan and as follows.

### 5.7.1 Golf Course Operations

The Site will be operated as part of the New York City Department of Parks and Recreation system. The Community Park and the Waterfront Park will be operated and maintained by the NYCDPR Borough of the Bronx Operations and Maintenance division or an appointed representative. NYCDPR has entered into a contract with a golf course concessionaire, Trump Ferry Point LLC to implement post construction care necessary to maintain the Golf Course for operational purposes. Golf Course maintenance and operations exclude those requirements specific to post construction monitoring and maintenance of existing environmental conditions and infrastructure as installed by NYCDPR and specifically defined in this report as being landfill gas systems, groundwater monitoring, and long-term settlement plates.

### 5.7.2 Landfill Gas Monitoring

NYCDPR will implement post construction monitoring necessary to fulfill the requirements of the Post Construction Custodial Care Plan for landfill gas monitoring. The landfill gas monitoring program includes monitoring for on-site and off-site landfill gas wells, piezometers, passive vent trench, passive vents, sub-slab depressurization systems, and Irrigation Lake venting system. Any necessary repairs or maintenance required as a result of inspection and monitoring activities will be the responsibility of NYCDPR or an appointed representative.

The Site's landfill gas management system will be inspected and monitored in accordance with the Operations, Monitoring, & Maintenance ("OM&M") actions presented in Section 6 of the Landfill Gas Management Plan ("LFGMP") located in Appendix F.1 of the 2013 Engineering Report (Appendix 20).

Monitoring and inspection will commence concurrently within 60 days of the approval of this construction certification report unless otherwise noted within the OM&M plan. Adjustments to monitoring frequencies will be requested of NYSDEC upon meeting the performance criteria thresholds identified in Section 6.3.4.2 of the LFGMP. NYCDPR will submit a request with supporting documentation to NYSDEC 30 days prior to the desired date of the proposed change in monitoring. NYCDPR will not change monitoring frequencies until the request has been approved.

### 5.7.3 Long Term Settlement Monitoring

NYCDPR will implement post construction monitoring necessary to fulfill the requirements of the Post Construction Custodial Care Plan for nine settlement monitoring plates on the Golf Course.

Monitoring will commence concurrently within 60 days of the approval of this construction certification report for a period of three years. Based on the results of the initial five years of monitoring, NYCDPR may

petition for decreased monitoring or a cessation in monitoring frequencies. NYCDPR will not change monitoring frequencies until the request has been approved.

### 5.7.4 Groundwater Characterization Monitoring

NYCDPR will implement post construction monitoring to fulfill the requirements of the Ferry Point Park East Post Construction Custodial Care Plan (October 2013). Groundwater monitoring will be performed at the eleven well locations located within the golf course.

Upon commencement of operation of the golf course (April 2015), groundwater sampling will take place annually with samples being analyzed for constituents listed in 6 NYCRR Subpart Part 360-2.11 routine parameters. The results of the groundwater sampling will be presented in a groundwater monitoring report and a summary will be submitted to NYSDEC as a part of the annual monitoring and inspection report. Monitoring and inspection will commence concurrently within 60 days of the approval of the construction certification report for a period of three years with the goal of demonstrating whether operation of the park adversely impacts on water quality with respect to leachate quality or quantity, and whether operation of the park meets the performance criteria established in the Permit.

Post Closure monitoring is anticipated to be conducted on the following schedule:

| Sampling Frequency | Requirement | Wells Sampled | Status |
|---|---|---|---|
| Annual - Year 1 | Post-Construction Monitoring | GMW-1 – GWM-11 | Anticipated September 2015 |
| Annual - Year 2 | Post-Construction Monitoring | GMW-1 – GWM-11 | Anticipated September 2016 |
| Annual Year 3 | Post-Construction Monitoring | GMW-1 – GWM-11 | Anticipated September 2017 |

Upon completion of 3 years of post-operation annual routine groundwater sampling, DPR may submit documentation to NYSDEC in furtherance of a request to reduce or cease groundwater sampling at the Ferry Point Park golf course (Ferry Point Park East Post Construction Custodial Care Plan, October 2013). The Groundwater monitoring and sampling program will cease either at the three year completion or ten years from the date of the initial groundwater sampling event. When the request for cessation is accepted, the groundwater monitoring wells will be evaluated for either abandonment or removal within the first year of the cessation of monitoring. The abandonment or removal documentation, signed and

certified by a licensed NYS Engineer will be provided to DEC within the concurrent post closure reporting period after the completion of the work.

Monitoring and inspection will commence concurrently within 60 days of the approval of this construction certification report for a period of three years. Upon completion of three years of post-operation annual routine groundwater sampling NYCDPR may submit documentation to the NYSDEC in furtherance of a request to reduce or cease groundwater sampling at the golf course. NYCDPR agrees to perform operational groundwater sampling, data analysis and reporting for a minimum of three years after construction, with the goal of demonstrating whether operation of the park adversely impacts water quality with respect to leachate quality or quantity, and whether operation of the park meets the performance criteria established in the Permit. NYCDPR will not change monitoring frequencies until the request has been approved.

### 5.7.5 Final Cover System

The integrity of the final cover system will be inspected routinely by NYCDPR, or their duly appointed representative, to fulfill the requirements of the Post Construction Custodial Care Plan. Inspections and maintenance will be completed in association with the Maintenance Guidelines for Trump Golf Links at Ferry Point Park included in Appendix I of the 2013 Engineering Report (Appendix 20).

Monitoring and inspection will commence within 60 days of the submittal of this construction certification report and then undertaken annually within 30 days of the submittal of the initial report. NYCDPR agrees to a rolling five-year plan, whereby NYCDPR may petition to modify or terminate the final cover inspection requirements by demonstrating that the integrity of the final cover system has been maintained in accordance with performance criteria established in the Permit.

### 5.7.6 Parking Lot Asphalt Cover (Consent Order)

During 2010, fill material from a JFK Airport source site was brought on-site and placed in seven different stockpiles. The material was believed to be in conformance with permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. On January 10, 2011, NYCDPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to this fill material, which was used to construct the base of the clubhouse and maintenance facility parking lots.

Specific requirements within the Consent Order as they pertain to post construction operations are as follows:

From Consent Order No R2-20100521-172: “Attachment “A” Proposed Handling of Ferry Point Park Soil Stockpile, Item 6, Once the asphalt top course is installed, the asphalt surfaces of the clubhouse and maintenance facility parking lots will be inspected during April and October every year by a licensed professional engineer (“engineer”) who is registered to practice in New York State. Within thirty days (30) days of such inspections, the engineer will submit to the Department a stamped and certified written detail report, including photo documentation, regarding the condition of the asphalt surfaces and their

adequacy, including photo documentation, regarding the condition of the asphalt surfaces and their adequacy to effectively function as covers. A description of any needed repairs will be included in the engineer's report.

Item 7, any repairs deemed necessary by the engineer must be completed by New York City Department of Parks and Recreation ("NYC Parks") within fifteen (15) days of the notification by the Department to NYCDPR to begin such repairs. A certification, including supporting written and photo documentation must be submitted by NYC Parks within fifteen (15) days after completion of repairs."

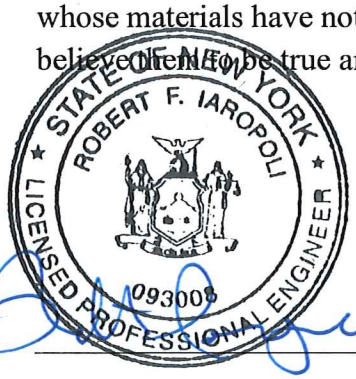
# 6 Summary

Construction activity at the Site began in July 2000 and concluded in July 2014 with physical completion of the Golf Course. Although the Golf Course construction is complete, some incidental work continues to occur at the Site associated with specific improvements necessary for golf course operations by the golf course concessionaire. Construction activity included clearing and grubbing, excavation, grading, importation of fill material, construction of the Community Park and Golf Course and associated appurtenances, installation of site utilities and infrastructure, installation of plantings, and installation of asphalt parking lot. A representative of the NYCDPR was present during all construction activities. To the best of our knowledge, a representative of the IEM was present during all earth moving and soil importation activities. For this project, fill importation followed the Permit requirements and resulted in a large scale earthwork fill conducted in general accordance with NYSDEC requirements as documented in the daily, bi-weekly, and quarterly reports and as summarized herein.

# 7 Certification

Certification Statement

I, Robert Iaropoli, PE, LS, an employee of the New York City Department of Parks and Recreation, exercising independent judgment and discretion do hereby certify that this Final Construction Certification Report was prepared under my direction and supervision. This Final Construction Certification Report was prepared in accordance with the NYSDEC requirements in 6 NYCRR Part 360, the current Part 360 Permit and approved Part 360 Permit Modification documents. The information contained herein is based upon: 1) Work which I have personally inspected both during and after construction from November 2012 to date; 2) Information provided to me by those directly employed by or under contract with the New York City Parks and Recreation and the New York City Department of Design and Construction as construction project managers;3) Design Consultants; 4) Contractors responsible for construction pursuant to their contracts except as indicated; and 5) third parties, such as manufactures, suppliers, etc., whose materials have not been personally verified by me for accuracy and/or adequacy but believe them to be true and accurate[4].



Robert Iaropoli, PE, LS

## EXECUTIVE SUMMARY

Maser Consulting P.A. (Maser Consulting), on behalf of The Trump Organization, has prepared this Certification Report for the construction of the permanent Clubhouse at the Trump Ferry Point Golf Links located at 500 Hutchinson River Parkway, Bronx, New York. This report has been prepared pursuant to 6 NYCRR Part 360 of the New York State Solid Waste Management Program and the 2013 Ferry Point Park East Post Construction Custodial Care Plan. This report also includes a summary of a supplemental project to install a new gas main as part of the Clubhouse Construction project.

Acting as the Independent Environmental Monitor (IEM), Maser Consulting witnessed, recorded and confirmed construction of the new Trump Links Clubhouse, including the installation of support pilings, importation of suitable materials used for cover; the application, installation and testing of the Liquid Boot® Vapor Barrier System and the associated Sub-slab Depressurization System (SSDS); and the installation, calibration and testing of the interior Methane Detection System. For each construction and testing component, Maser Consulting confirms compliance with the Permits, plans and specifications of the project. Minor deviations to the plans and specifications are noted in this report and in the As-Built documents contained herein. Minor deviations to the specifications were the result of two main issues: the need to relocate system components to avoid conflicts and interferences with utilities and appurtenances; and the substitution of the materials of construction that were equivalent or superior to the original specifications.

The IEM also monitored, tested and confirmed that soil materials imported for the new Clubhouse construction were derived from pre-approved sources. The IEM conducted periodic surveillance of trucks being loaded at the approved facilities and transported to the Construction Site. For material imports, the IEM visually evaluated loads and scanned loads with direct reading instruments for signs of contamination. Only those loads meeting project permit and specifications standards were permitted to be unloaded at the site.

At times when imported soil materials had to be stockpiled on-site, the IEM took steps to ensure that a controlled staging area was secured. The staging area was established in the parking lot to the west of the new Clubhouse site. The IEM also took steps to ensure that the stockpile was properly covered to prevent erosion by wind and water, and that catch basins in the parking lot were properly protected to ensure that sediments would not enter the storm water system. Weekly erosion control inspections were conducted by the IEM in accordance with NYSDEC's Construction Site Management Program. The IEM immediately communicated deficiencies in the erosion control features to the General Contractor (JCS) such that immediate mitigative action could be taken.

Maser Consulting also acted as the IEM for a supplemental project associated with the new Clubhouse construction. The supplemental project consisted of the installation of an approximately 5,500-foot long, 6-inch diameter gas pipeline installation. The new gas supply line was deemed necessary to provide heating, ventilation, air conditioning and other utility service to the new Clubhouse. The gas pipeline was connected to a Consolidated Edison main located north of the clubhouse along Schley Avenue. The pipeline route generally traverses the western property line before turning east toward the new clubhouse in the vicinity of the Clubhouse parking lot. As IEM for this supplemental project, Maser Consulting witnessed, recorded and confirmed that the gas pipeline installation was conducted in accordance and incompliance with the project permits, plans and specifications.

Similar to the Clubhouse construction project, cover material importation was required for the gas main installation project. The IEM took appropriate measures to ensure that the source material was inspected and tested. Soil quality analytical results have been included within this report. Analyzed permit parameters were found to be acceptable. The IEM also visually assessed and field screened each load to ensure that the quality of the material met project permit requirements and project plans and specifications.

Appendix M – Minutes of Weekly Construction Progress Meetings
Appendix N – Hampton-Clarke Project No. 8081617 Report dated September 14, 2018
Appendix O – Drawings titled "Methane Monitoring System Ceiling Plan (As Built)" prepared by EAI dated February 11, 2019 & "Vapor Remediation Floor Plan (As Built Monitoring Pt Layout as of 8/1/18)" prepared by French & Parrello with annotations by EAI dated August 1, 2018
Appendix P – CETCO/Minerals Technologies Letter to EAI Inc. re: "Liquid Boot Spraying Temp" dated November 9, 2017 & EAI Inc. letter to Maser Consulting P.A. re: "Vapor Remediation System Installation, Ferry Point Clubhouse, Ferry Point Park, Bronx, NY" dated October 18, 2019
Appendix Q – Drawings titled "Ferry Point Clubhouse, 500 Hutchinson Parkway, Bronx, NY" showing new gas line prepared by Victor Famulari Architect P.C. dated July 25, 2018
Appendix R – DORs for Installation of New 6-Inch Gas Line to Clubhouse

# I. INTRODUCTION

## A. Purpose

This Final Construction Certification Report for the Trump Ferry Point Golf Links clubhouse is submitted to the New York State Department of Environmental Conservation (NYSDEC) and the New York City Department of Parks & Recreation (NYCDPR) upon completion of the construction of a new clubhouse at Ferry Point Park East. Built on top of a former municipal landfill, the major elements of the Clubhouse construction project consisted of the installation of over 200 steel support pilings driven through the former landfill material and into competent rock at an average depth of 75 below grade. During the support piling installation, Maser Consulting (acting as the IEM) measured the ambient air quality for signs of methane gas release from the subsurface. When detected on rare occasions, immediate measures were taken to mitigate methane from the work and breathing zones with the use of engineering controls including physical barriers and the use of industrial explosion-proof fans to ventilate the work zones.

Following the installation of the support pilings, Maser Consulting observed the installation of two added protective elements – a Liquid Boot® Vapor Barrier System and a corresponding SSDS. Both systems were designed to mitigate the intrusion of methane and other landfill gases into the new Clubhouse.

As a means to assess the effectiveness of the Vapor Barrier and the SSDS, a Methane Detection System was installed inside the new Clubhouse. The methane detection system consists of a network of in-floor methane sampling ports as well as a series of methane detectors located throughout the main banquet and reception areas as well as in the smaller offices, the kitchen and other employee and publicly-accessible areas.

This report certifies that the construction of the Liquid Boot® vapor barrier system and the SSDS for the new clubhouse have been completed in accordance with the 6 NYCRR Part 360 Solid Waste Management Permit for Ferry Point Park (copy provided as **Appendix A**). This report further certifies that Methane Detection system was also installed, tested and calibrated in compliance with the project permits, plans and specifications.

## B. Report Organization

This report has been generated to provide a written post-construction certification report to comply with the requirements of the above-referenced Part 360 Permit. The narrative and supporting information provided in this report have been organized such that any individual, especially those not familiar with the new clubhouse construction, can gain a concise understanding of the history of improvements at the Site (a former solid waste management facility, i.e. landfill).

The report has been organized into the following sections:

- Section I which briefly describes the purpose and scope of the project, provides details pertaining to the Site background including a Site description, key agencies involved, and permitting history

- Section II describes the Part 360 Permits and modifications, Permit reference documents, nonconformance issues, operational upsets, emergencies, and unusual circumstances, and reporting completed associated with the new clubhouse

- Section III details the fill importation Quality Assurance / Quality Control (QA/QC) program, specifically source site reviews for cover layer material, on-site fill importation inspection, trucking manifests, rejected trucks and materials, fill tracking, and total carcinogenic semi-volatile organic compound (SVOC) tracking

- Section IV provides details related to construction activities on-site including construction of the new clubhouse, environmental controls such as landfill gas monitoring, municipal solid waste handling, earthwork and fill placement, demarcation layer, construction progress meetings, and deviations from the approved design plans and/or Permit requirements with as-built surveys

- Section V details the environmental monitoring completed during the Project including Stormwater Pollution Prevention Plan (SWPPP) erosion control inspections.

- Section VI provides a summary of the report

- Section VII provides report certification

## C. Background Information

### a. Project Scope

Ferry Point Park in the Bronx (the "Site") is a former landfill covering 222 acres that is bounded by the Bronx-Whitestone Bridge and Hutchinson River Parkway to the west; Balcom, Miles, and Emerson Avenues to the east; Schley Avenue and St. Raymond's Cemetery to the north; and the East River to the south. The project was originally managed under Ferry Point Partners, LLC and was taken over solely by the City of New York Department of Parks and Recreation in October 2007.

The original project scope included the construction of three main elements including a golf course, a community park, and a waterfront park over the 222-acre Site as follows:

- An 18-hole golf course with practice facility, driving range, clubhouse, maintenance facility, irrigation lake, stormwater retention ponds, and a parking lot (192.5 acres);
- A passive recreation waterfront park with walkways and a comfort station (19.5 acres); and
- A community park with baseball fields, basketball court, walkways, comfort station, and landscaped stormwater retention area (10 acres)

A new element of the project was initiated in 2017 with the construction of a permanent clubhouse in the southern corner of the Site. The project began in July 2017 and was completed in August 2018.

A supplemental component of the Clubhouse project was deemed necessary when the existing 2-inch gas service line to the facility was determined to not be capable of providing the volume of gas necessary to support the heating, ventilation and air conditioning units as well as other facility utilities such as the kitchen and other amenities. Construction of the Gas Main Installation began in late August 2018 and was substantially completed by November 2018.

## b. Project Site[1]

The origins of the site date back to the early 1900s. At that time, an available 1900 map of the Bronx showed the western edge of the site which now contains the expressway and Whitestone Bridge was a long narrow peninsula extending out to the same area that the northern landing of the Whitestone Bridge now extends. Immediately east of this peninsula was a large open bay which is the area that the Ferry Point Golf Course is now located. Northeast of the bay and well inland was the Baxter Creek that drained into the bay. The eastern landfall of this embayment area is a larger peninsula that contains roadways and a residential development. The road patterns do not resemble the roadways that currently exist in that area and appear to have been changed.

A 1938 aerial photo showing the construction of the Whitestone Bridge shows the Bay, mooring, residential area and land to the west to be virtually the same as shown in the 1900 map. The significant change is in the widening of the western peninsula where the expressway was being constructed leading to the bridge ramps. The widening was not significant at this time but a rectangular area in the extreme northwest corner of what is now the site appears to be filled and graded – possibly to support construction staging area for the bridge/expressway. Areas of filling can be readily identified in the photograph by the contrasting lighter color typically indicative of sandy dredge sand placement. Other areas along the shoreline can be seen as containing a lighter-colored band of fill material and this includes much of the new Ferry Point Park located west of the Whitestone Bridge. Much of the park area was filled and graded by 1938. Bulkheads were constructed with linear components to present a smooth shoreline but one that does not appear to contain a beach where water diminishes in depth to 0. Photos of the eastern area of the bay where mooring and docks can be seen showing large vessels moored against the shore. This would indicate the water had significant depth all of the way to the center of the bay.

Aerial photographs from the 1950s show a drastic change in the area currently referred to as the site. Large expansion of the filling that was evident in 1938-39 up in the northeast corner can be clearly seen. The filling extends well into the bay and it appears that a connective bridge

[1] *Reference: "Ferry Point Park Golf Course & Community Park, Bronx New York, Final Construction Certification Report, NYSDEC Permit #2-6006-00014 / 00013 (SW)" prepared by the City of New York Department of Parks and Recreation dated October 19, 2015 – a.k.a. the 2015 Final Construction Certification Report*

was constructed from the eastern shore to the fill area. It is difficult to discern if this is a usable structure for crossing or if it had some other purpose. The filling operation appears from the photo to consist of the same light-colored material that was placed in the Ferry Point Park and from photos showing a large number of barges in the water filled with material of the same light color. There is specific documentation that presents the specific origin and consistency of the material. but from the prior aerials showing filling and this large expansion, it appears to be of a similar origin which would be dredge sand. In the 1951 aerial, no specific municipal solid waste dumping and disposal can be seen; however, records indicate the landfill operated during this approximate time period. It is therefore assumed that municipal solid waste was disposed shortly after the photo was taken. The landfilling shown in the aerial may have been the initial construction of the upper portion of the landfill with the tidal gate or bridge closing in the upper bay area. Additional aerials of the landfilling were not identified and more recent aerials document the completion of filling as well as the more recent golf course construction.

What can be discerned from this compilation of photos is that the landfill could be located in an area that may have been open water as well as some area that was previously reclaimed land with dredge material.

The Site operated as a landfill from before 1951 to the 1960s. The landfill reportedly accepted municipal solid waste during its operating period and was closed and covered in the mid-1960s, with additional closure operations conducted more recently in the 1980s. Prior Site use was determined from historic aerial photographs from 1938 thru 1991. The aerial photographs span the entire operational period of the prior landfill, from its initial operations to the present, and provides substantial information about the Site's development.

### c. Key Agencies

The following were the key agencies associated with the project providing oversight, administration, design, construction, and monitoring services. The following is not intended to be an exhaustive list of involved entities related to the Project:

Primary Regulatory Agency:
New York State Department of Environmental Conservation Region 2 ("NYSDEC")

Project Permittee:
City of New York Department of Parks & Recreation ("NYCDPR")

Primary Design, Engineering, Construction, and Monitoring Consultants:
Hart Howerton Planning, Architecture and Landscape Architecture, P.C. ("Hart Howerton")
French & Parrello Associates ("FPA")

Independent Environmental Monitor ("IEM"):
Maser Consulting P.A. ("Maser Consulting")
Woodard & Curran ("W&C")

General Contractor:
Golf Course Clubhouse: JCS Construction Group, Inc. ("JCS")

Subcontractor for the SSDS and Liquid Boot® Vapor Barrier Installation:
EAI, Inc. ("EAI")

Golf Course Concessionaire/Operator:
The Trump Organization ("Trump")

See **Appendix B** for a list of project participants.

### d. Independent Environmental Monitor

The requirement for an IEM on this project was associated with an increased level of monitoring exceeding normal review and oversight practices of the NYSDEC in order to protect public health and the environment. The increased level of review and oversight for this Project was mainly associated with the effort required for evaluation of fill material sources, source site testing and inspection, importation of the fill material, environmental monitoring required at the clubhouse construction site, and later along the gas main installation route. IEM services were also necessary during the installation of over 200 support piles through the former waste pile located beneath the new Clubhouse.

In accordance with Special Condition 24 of the 2014 Permit (**Appendix A**), NYCDPR was responsible to retain an IEM, accountable to NYSDEC, to provide environmental oversight of activities authorized under the Permit including but not limited to the quantification, importation and placement of fill, and the monitoring of the clubhouse construction site. Particular activities performed by the IEM for this Project included the following:

- Report deviations from or non-compliance with permitted activities to NYSDEC;
- Evaluate and inspect fill sources;
- Evaluate, monitor and mitigate methane intrusions during the installation of steel support pilings for the new clubhouse foundation;
- Witness source site investigation, sampling, and compare lab test results to Permit requirements;
- Visual and Photoionization Detector (PID) inspection of imported fill materials to the Site;
- Monitor offloading of trucks and reject unacceptable materials from being dumped on the Site and used for construction;
- Monitor environmental sampling on the Site (i.e. landfill gas);
- Monitor fill operations on the Site, particularly the installation of minimum thickness of shaping layer and cover layer materials as well as demarcation layer installation;
- Complete and submit Daily Observation Reports to NYCDPR;
- Complete weekly Erosion Control Reports; and
- Attend weekly Construction Progress Report meetings

The selection, continued retention, discharge, or replacement of the IEM was subject to the approval of NYSDEC at its sole discretion.

### e. Project and Part 360 Permitting History

The following represents an overview of project and permitting history outlining key events:

On May 21, 2014 NYSDEC issued Permit No. 2-6006-00014 / 000013 for a Solid Waste Management Facility for the Ferry Point Park Golf Course; this permit establishes an IEM. A copy of this permit is provided in **Appendix A**.

On June 12, 2017 the Ferry Point Park SSDS Plan prepared by FPA for the proposed permanent clubhouse was submitted to NYSDEC. A copy of this submittal is provided in **Appendix C**.

On June 22, 2017 NYSDEC issued a letter to The Trump Organization approving the Ferry Point Park SSDS Plan. A copy of this letter is provided in **Appendix D**.

On June 7, 2018 Maser Consulting (through The Trump Organization) submitted a Construction Certification for the SSDS to NYSDEC to allow for the temporary, one-day opening of the new clubhouse on June 11, 2018. A copy of this submittal is provided in **Appendix E**.

On July 2, 2018 NYSDEC issued a review letter with comments on the June 7, 2018 Maser Consulting Construction Certification for the SSDS. A copy of this letter is provided in **Appendix F**.

On July 11, 2018 Maser Consulting provided a letter response to NYSDEC's July 2, 2018 review letter. A copy of this letter response is provided in **Appendix G**.

### f. Construction Drawings

Construction drawings for the SSDS are included in **Appendix C**.

## II. PART 360 PERMIT

### A. Part 360 Permits and Modifications

The following permit was issued for this Project:

NYSDEC Permit No. 2-6006-00014 / 000013 (Solid Waste Management Facility – Ferry Point Park Golf Course, Bronx NY) issued on May 21, 2014 (copy provided in **Appendix A**).

### B. Reference Documents

Refer to the 2015 Final Construction Certification Report for a list of Permit reference documents. These documents support the original Permit and/or provide basis for subsequent permits renewals and modifications.

### C. Non-Conformance Issues

In accordance with Special Condition 24 of the 2014 Permit, the IEM reported on Permit-related non-conformance issues during the duration of construction of the permanent clubhouse and on the gas main installation project. Non-conforming issues identified during the construction of the new facility were immediately addressed and remedied so that activities were in conformance with applicable plans, specifications and permits.

### D. Operational Upsets, Emergencies, and Unusual Circumstances

No evidence of security breaches, unauthorized entries, injuries, fires, theft, vandalism etc. were observed during construction of the permanent clubhouse. The only post-construction upset was related to damage caused to the outdoor lighting system from wildlife borrowing and chewing. Corrective measures were undertaken with normal and routine maintenance actions by The Trump Organization maintenance staff.

### E. Reporting

The IEM was responsible for daily and weekly reporting to the NYCDPR regarding the status of the work. The IEM participated in weekly on-site construction meetings and submitted weekly Erosion Control Reports during the construction period. Daily Observation Reports ("DOR") were also submitted to the NYCDPR for review and comment.

The IEM reported to the NYCDPR on a generally daily basis on the following information: weather conditions, fill materials imported to the site, detailed notes of construction activities, and non-conformance issues related to the Permit conditions. Non-conformance issues were immediately addressed by the contractors under the supervision of the IEM. The IEM also reported weekly to the NYCDPR on the construction status and pertinent observations regarding the erosion control measures around the construction site and at the imported soil stockpile area.

DORs are provided in **Appendix I** beginning on July 19, 2017 through February 5, 2019.

### F. Authorized Fill Volumes

Imported fill material was derived from two pre-approved sources, one for cover material associated with the new Clubhouse and one for cover material used in the installation of the new 6-inch gas main.

New York Recycling located at 475 Exterior Road, Bronx, NY was the source of the material used for the new Clubhouse. A table in **Appendix K** indicates the volumes of material imported from this facility. This material met the soil quality standards set forth in the Permit requirements. During the course of the importation process, the material was re-sampled in order to reconfirm its quality. Analytical testing data can be reviewed in **Appendix J**. A total of 1,062 cubic yards of material was imported from this source site between November 2017 and March 2018.

Ranco Sand and Gravel located at 151 South Street, Manorville, New York was the source site for materials imported for the gas main installation project. A site source inspection was conducted in advance of the imports and analytical testing was performed to establish that imported material would meet all Permit conditions and requirements. A table in **Appendix L** provides a summary of the imports from Ranco Sand & Gravel. A of total 690 cubic yards of material was imported between September and October 2018.

# III. FILL IMPORTATION QA/QC PROGRAM

## A. Background

Fill material importation for construction of the permanent clubhouse commenced on November 27, 2017 and the last day for fill import was March 12, 2018. The fill importation QA/QC program implemented for the Project based on the Permit and associated reference documents was adhered to. The fill importation consisted of two main components: source site reviews and on-site inspections. A source site review was conducted by the IEM prior to fill material being imported to the Site and additional visual and PID inspections were completed by the IEM upon the material entering the Site at the IEM inspection area and again once the material was dumped at the work or stockpile location on the Site.

## B. Source Site Reviews

Prior to cover layer material being imported to the Site, each potential source was thoroughly evaluated by the IEM. An environmental review was performed for proposed source sites in accordance with Special Condition 24 of the 2014 Permit. The source site review process criteria were specified in the Report on Fill Management, Operations and Maintenance, prepared by TRC on May 16, 2000, and revised June 30, 2005 (Volume #2 of the 2005 Engineering Report). The source site review process was modified over time as compared to the original process outlined in the various engineering reports and permit modification requests. The process generally consisted of the following main components:

- NYCDPR would notify the IEM of a new potential source site. NYCDPR would provide the IEM with the site name and location as well as any available historical site information and soil environmental analytical results that existed for the potential source site.

- Once NYCDPR confirmed that their desire to move forward with pursuing the potential source site, NYCDPR authorized the IEM to retrieve available site information. NYCDPR then completed an initial review of the existing site information, generated a sampling plan, and provided the results of the initial review and sampling plan to the IEM. NYCDPR then authorized the IEM to conduct a desktop review of the existing site information, available soil environmental analytical results, and NYCDPR's sampling plan. The IEM provided NYCDPR with comments related to their review and their sampling plan in consultation with NYSDEC. Once a final sampling plan was agreed upon, the source site investigation was initiated and executed per the NYCDPR sampling plan with IEM oversight. For source sites with in-situ material, test pits

were typically completed with additional soil samples inspected, collected, and analyzed in accordance with the Permit requirements. Once the sampling was completed, the IEM reviewed sample results and the IEM generated a memorandum summarizing the review process and provided recommendations and requirements necessary for NYCDPR to address in order to continue pursuing the potential source site. The recommendations typically included conditions associated with overseeing the excavation, loading, and importing of the source site material to the Site in accordance with the Permit. The IEM submitted the memo of recommendations to NYSDEC for review and comment prior to issuing the final memorandum to NYCDPR. NYSDEC would provide final comments and approval of the source site with any additional required conditions.

- If NYCDPR determined that the potential source site was worth pursuing considering site-specific conditions, schedules, etc., they coordinated with the source site operator and IEM on importation schedule and requirements. The IEM provided oversight to confirm that the loading, hauling, and overall import of the approved material was completed in accordance with the memorandum of recommendations, NYSDEC conditions, and the Permit.

- The IEM provided oversight during export from the approved source sites on an as needed basis and provided oversight at each source site during additional sampling activities if the source site was exporting more than the minimum sampling frequency outlined in the Permit (i.e. 10,000 cubic yards for shaping layer material and 2,000 cubic yards for cover layer material).

If at any time during the review process there were reasons for concern identified by the IEM resulting in the potential source site being classified as a "complex" source site, NYSDEC became the primary reviewer and made final recommendations related to additional site investigation requirements or approval/rejection of the potential source site with support from the IEM. A complex source site was defined by the presence of an abundance of or particular Recognized Environmental Concerns ("RECs") and NYSDEC made decisions related to approval and/or associated conditions for further evaluation or import of the fill material.

For both source sites used in this Construction Project, no complex source site determinations were made.

Details of source site review and site testing activities are included in the report text and specific DORs. Source site review supporting information and testing data is included in the 2015 Final Construction Certification Report.

### C. Cover Layer Material

Materials accepted for use as cover layer on the Site were sampled prior to acceptance and after each additional 2,000 cubic yards. As per the 2005 Permit modification, the parameters for cover layer material included the complete analyte list of TAGM 4046 for total VOCs, total SVOCs, total pesticides and herbicides, total PCBs, total metals, sulfur, and asbestos.

Based on source site reviews and site testing activities, the cover layer material imported to the Site met the following chemical limits:

| Analyte | Shaping Layer |
|---|---|
| **RCRA Metals (mg/kg = ppm)** | |
| Arsenic | 28 |
| Barium | 2,000 |
| Cadmium | 20 |
| Chromium | 1,000 |
| Copper | 1,000 |
| Lead | 400 |
| Mercury | 0.57 |
| Selenium | 11 |
| Silver | 100 |
| **TCLP Metals (mg/l)** | |
| Arsenic | 5.0 |
| Barium | 100.0 |
| Cadmium | 1.0 |
| Chromium | 5.0 |
| Lead | 5.0 |
| Mercury | 0.2 |
| Selenium | 1.0 |
| Silver | 5.0 |

| **Other** | |
| Asbestos | 0.50% |
| Total Sulfur | 0.50% |

N/A = Not Available
SB = Site Background
* = Total SVOCs must be less that 500ppm. Total carcinogenic SVOCs must be less than 3 ppm if any one of the cSVOCs** exceeds TAGM.
** = cSVOC list includes: Benzo(a)pyrene, Dibenzo(a,h)anthracene, Benzo(a)anthracene, Benzo(b)fluoranthene, Indeno(1,2,3-cd)pyrene, Benzo(k)fluoranthene, and Chrysene.
*** = Some forms of Cyanide are complex and very stable while other forms are pH dependent and hence are very unstable. Site-specific form(s) of Cyanide should be taken into consideration when establishing soil cleanup objective
**** = Background levels for lead vary widely. Average levels in undeveloped, rural areas may range from 4-61 ppm. Average background levels in metropolitan or suburban areas or near highways are much higher and typically range from 200-500 ppm.
MDL = Method Detection Limit

### a. New York Recycling

Details of the New York Recycling (475 Exterior Street, Bronx NY) source site review and site testing for this cover layer material source site are included in the DORs. Analytical sampling and testing was completed at the site in September 2017. A site inspection was performed concurrently with the sampling event.

Approximately 1,062 cubic yards of cover layer material were imported to the Site from this source site for construction of the permanent clubhouse between November 2017 and March 2018. The majority of the material was used to raise the grade elevation in the immediate vicinity of the Clubhouse foundation and the landscape beds surrounding same.

### b. Ranco Sand & Stone

The source site review for Ranco Sand & Stone (151 South Street, Manorville NY) consisted of an August 25, 2018 site visit to collect samples of this cover layer material for laboratory analysis; results are included in **Appendix N**. Results indicated that analyzed parameters met the permit standards.

Approximately 690 cubic yards of cover layer material were imported to the Site from this source site for cover material related to the gas main installation project.

## D. On-Site Fill Importation Inspections

### c. Process

As required under Special Condition 24 of the 2014 Permit, fill importation was inspected at the Site by the IEM. Fill material volume (truck volume) was measured and recorded for each delivery of fill material as it arrived on-site by NYCDPR's appointed representative. The fill material was then inspected by the IEM at the entrance to the Site. At this time, the fill material was visually inspected and field screened for signs of contamination. The visual inspection included observations of the material, disturbing the material with a shovel, and close-up observations of the material retrieved by shovel while still in the truck or trailer. Field screening of the fill material was executed using a PID. If the fill material failed to meet the Permit requirements for reasons such as a PID reading above ambient air, the presence of asphalt, concrete or brick components, or some other unauthorized debris, the load was rejected immediately prior to dumping. If the material was rejected, the truck was not allowed to dump on-site and was directed to exit the site immediately.

During the material imports for the Clubhouse and the gas main installation project, the IEM found no reason to reject the imported loads. Loads met the visual and field screening tests and were subsequently accepted.

If the fill material passed the initial inspection at the IEM observation area, either it was allowed to dump directly at a work location for immediate use as cover layer material or it was transported to, and dumped at, a stockpile location. At the dump location, the IEM screened the fill material visually and with a PID for a second time prior to spreading if dumped at an active work location. If the fill material did not meet the permit requirements at the dump location, it was immediately rejected, loaded back onto the same truck, and transported off-site. During the material imports for the Clubhouse and the gas main installation project, the IEM found no reason to reject the imported loads. Loads met the visual and field screening tests and were subsequently accepted.

#### d. Trucking Manifests

Trucking manifests were utilized for imported cover layer materials. A three-part manifest form was completed to track each load of material from origination at the source site to destination at the Site. The manifest contained information including but not limited to a manifest number, the source site name and address, the truck driver's name, truck and trailer license plate numbers, volume of material, as well as the time of departure from the source site and arrival time at the Site. Copies of fill import manifests are provided in **Appendix K**.

#### e. Rejected Trucks & Materials

Materials imported to the Site met the IEM's importation inspections, and none were rejected.

### E. Fill Tracking

Testing per 2,000 cubic yards for cover layer material is included in Special Condition 14 of the 2014 Permit).

Cover layer material volumes were tracked based upon the calculated volumes within each truck. This provided for the most accurate and consistent approach to monitoring the volume of imported fill materials. Prior to receipt of the calculated volumes, the IEM tracked estimated volumes as trucks dumped on the Site.

The total volume of cover layer material imported to the Site for construction of the permanent clubhouse was 1,530 cubic yards (truck volume) or 0.39 percent of the authorized amount under the Permit.

### F. Total Carcinogenic Semi-Volatile Organic Compound Tracking

As identified in Special Condition 14 of the 2014 Permit, the NYSDEC Acting Regional Director letter dated October 25, 2006 authorized the import of shaping material with a total carcinogenic SVOC (tcSVOC) level of up to 10 parts per million (ppm), which would not otherwise be acceptable, provided the tcSVOC weighted average of all imported material is equal to or less than 3 ppm at the end of each quarter. The tcSVOC weighted average is defined as the sum of the products of the material volume and the material tcSVOC, for each material source, divided by the total volume of the material imported. The weighted average was calculated over the course of construction and the final weighted average for shaping layer and cover layer materials imported to the Site was 0.70 ppm, less than the 3 ppm maximum. The total carcinogenic SVOC weighted average table and computations are included in the 2015 Final Construction Certification Report for materials imported to the Site after November 18, 2005.

SVOCs were sampled for New York Recycling on September 28, 2017. The tcSVOC level did not exceed 10 ppm. A copy of the laboratory report is provided in **Appendix J**.

SVOCs were sampled for Ranco Sand & Stone on August 25, 2018. The tcSVOC level did not exceed 10 ppm. A copy of the laboratory report is provided in **Appendix N**.

# IV. PERMANENT CLUBHOUSE CONSTRUCTION

## A. General

From July 2017-September 2018, Trump Golf Links at Ferry Point constructed a permanent clubhouse facility. The 14,100 square foot one-story building is located in the far southern section of the Site (immediately west of the 18th fairway) and includes locker rooms, showers, a bar room, a kitchen and associated facilities, ballrooms, administrative offices and a golf pro shop. The Trump Organization contracted with JCS Construction, Inc. to build this facility on piles, as it was formerly a landfill.

## B. Environmental Controls / Construction

### a. Landfill Gas Monitoring

Steel beams were driven to intermediate depths of approximately 40 feet, welded to another steel beam of the same length, driven to completion depths of approximately 75 feet, then cut to grade. Prior to welding/cutting, the piles were checked at the inlet (i.e. ground surface elevation) with a four-gas MiniRAE Meter. The meter alarm was triggered if concentrations of carbon monoxide, hydrogen sulfide, oxygen and methane (as Lower Explosive Limit) were above OSHA exposure limits; the alarm was not triggered for the vast majority of field activities, and on the few occasions when triggered, soil was placed over the inlet until the meter alarm was not triggered prior to welding/cutting activities. As an added measure of protection, when the meter alarm activated, explosion-proof industrial ventilation fans were activated to vent the work area and disperse gases emanating from the subsurface.

### b. Imported Soils Monitoring

Fifty-nine (59) loads of soil (approximately 1,062 cubic yards) were imported from New York Recycling, a donor source located at 475 Exterior Street in the Bronx; and 27 loads of soil (approximately 690 cubic yards) were imported from Ranco Sand & Stone, a donor source located at 151 South Street in Manorville NY. Air monitoring performed during the course of the workday revealed no detections above background on the PID. Visual observation and PID monitoring of each load of soil from New York Recycling and from Ranco Sand & Stone showed no evidence of VOCs or visual signs of debris within the material.

### C. Municipal Solid Waste

A Royal Carting commercial municipal solid waste (MSW) six-yard container was available on Site during the duration of clubhouse construction activities. MSW was not encountered or generated during digging, earth-moving or excavation activities associated with the new clubhouse or the gas main installation activities.

### D. Earthwork / Fill Placement

Earthwork and fill placement for this Project were performed in accordance with the Permit.

#### a. Cover Layer Material

Cover layer material was installed at the Site in accordance with the 2014 Permit (**Appendix A**).

Imported soil from New York Recycling and from Ranco Sand & Stone was backfilled and graded around the perimeter of the concrete sub-structure. The soil from New York Recycling was characterized as brown fine-coarse sand with occasional crushed stone roughly 1-1.5 inches in diameter. Materials imported from Ranco Sand & Gravel was characterized as clean, well-rounded white to gray medium sands.

#### b. Topsoil

Topsoil was used on the Site (in lieu of sand) specifically in tree planting pits and other landscape areas. Topsoil was imported from commercially available sources (i.e. Home Depot) and used on the Site as approved. This material met the cover layer material Permit requirements including the specification included in the 2014 Permit.

### E. Meetings

On a weekly basis during construction of the permanent clubhouse, progress meetings were held in the JCS field office trailer or in the temporary clubhouse on site. Various representatives from NYCDPR, the Trump Organization, JCS and the IEM (Maser Consulting) attended the meetings to discuss construction progress, current issues and scheduling.

Available meeting minutes from construction progress meetings are provided in **Appendix M**.

### F. SSDS / Liquid Boot® Installation

From November 2-7, 2017 the SSDS was installed. Lateral collection piping was laid, and the SSDS pits were excavated and connected to the lateral collection piping. The IEM provided oversight, including taking measurements of the as-built SSDS component installed locations for use in this report.

Stone cover was then poured over the SSDS prior to Liquid Boot® installation.

From November 8-15, 2017 the stone cover was lined (base fabric), sprayed with Liquid Boot®, and allowed to cure. Smoke testing was then performed, with leaks identified and resprayed. Coupon samples were measured to ensure that the cured thickness met the design requirement. Once smoke testing, coupon measurements and leak repairs were complete, a cover fabric was placed over the floor footprint prior to pouring the slab.

On two separate occasions after the initial spraying, curing and smoke testing of the vapor barrier, repairs had to be made to the barrier layer. IEM observations of damage to the cover fabric provided the impetus for additional spraying and testing. The first event took place in January/February of 2018 when weather conditions and mild temperatures prevailed. A final smoke test and barrier layer repair took place before the concrete floor was poured and once the Clubhouse was being enclosed. During both re-spray events, defects were located, repaired and re-tested for integrity. Like the previous smoke tests, the final smoke test indicated no signs of vapor barrier leaks, tears or defects.

On one occasion, Liquid Boot® was sprayed at temperatures below the recommended 45 degrees F. However, it was determined by experienced applicators and inspectors—based on site specific conditions—that the curing of the spray was acceptable. See documentation from CETCO/Minerals Technologies (the Liquid Boot® manufacturer) dated November 9, 2017 (**Appendix P**).

A letter of completion provided by EAI is provided in **Appendix P**.

### G. Six-Inch Gas Main Construction

In July 2018, the existing 2-inch gas service line was determined by FPA engineers to be insufficient to support the demands of the new Clubhouse facility. A new 6-inch gas main was required to meet the demand. Installed between August and October 2018, the new main provides sufficient volumes of natural gas to support the new Clubhouse facility and its amenities.

The new gas line was connected to a Con Ed main located on Schley Drive, north of the golf course. The new pipeline runs along the western perimeter of the site along fairways #6, #7 and #8. The line doglegs to the west side of the maintenance area and generally follows the service cart path along the west side of the property. The line turns to the east toward the new Clubhouse in the general vicinity of the parking lot.

The service connection to the Clubhouse is located in a vault approximately 50 feet west of the Clubhouse, near the driveway entrance.

Architect drawings for this gas main are provided in **Appendix Q**. DORs are provided in **Appendix R** beginning on August 24, 2018 through October 22, 2018.

### H. Record Drawings & Deviations from Approved Design Plans

The permanent clubhouse project consisted of the following features and was designed by Hart Howerton and FPA:

- Golf pro shop
- Women's and men's locker rooms
- Dining room
- Bar/grill
- Kitchen
- Terraces
- Offices
- Vestibule and porch
- SSDS/Vapor Barrier

Deviations to the permanent clubhouse construction project were as follows:

- Drawing No. FO-500.00 "Vapor Remediation Underslab Plan" – lateral piping to SSDS pits DP-2B & DP-2C built approximately 2 feet offset from design due to piping conflicts
- Drawing No. FO-501.00 "Vapor Remediation Floor Plan" – riser piping for fan units SF-1 & SF built within walls to conceal system and prevent unauthorized access; gas sensors in Hall 124, Vestibule 101 & Electrical 113 ceilings built approximately 3-5 feet from design due to piping conflicts; monitoring point MP-1 built approximately 9 feet from design due to piping conflicts; monitoring point MP-8 built approximately 50 feet from design due to piping conflicts; monitoring point MP-9 built approximately 14 feet from design due to piping conflicts; monitoring point MP-10 built approximately 14 feet from design due to piping conflicts; monitoring point MP-2 was installed at the location shown in the Plan, however, it appears to have been tiled-over and is no longer accessible as a sampling point
- Drawing No. FO-502.00 "Vapor Remediation Attic & Mezzanine Plan" – fan unit SF-1 built approximately 10 feet to the left of design due to piping conflicts
- Drawing No. FO-504.00 "Vapor Remediation Details" – detail 1B built using hollow (instead of solid) concrete blocks; 'Methane Gas Sensor Detail (option 1)' & 'Methane Gas Sensor Detail (option 2)' added for sensor plenum boxes
- Drawing No. SD201 "Methane Monitoring System Ceiling Plan (As Built)" – methane gas sensor S16 built approximately 5 feet from design due to piping conflicts; methane gas sensor S19 built approximately 4.5 feet from design due to piping conflicts; methane gas sensor S28 built approximately 5 feet from design due to piping conflicts

Copies of the drawings issued for construction are provided in **Appendix C**. Copies of the drawings showing deviations from design are provided in **Appendices E and O**.

## V. ENVIRONMENTAL MONITORING

### A. Stormwater Pollution Prevention Plan (SWPPP)

The IEM performed weekly erosion control inspections to ensure compliance with Permit requirements. Erosion control inspections were carried out through the duration of permanent clubhouse construction. The SPDES permit remained effective until completion of ongoing construction including the permanent clubhouse. Copies of erosion control inspection reports are provided in **Appendix H**.

### B. Landfill Gas Monitoring

NYCDPR will implement post-construction monitoring necessary to fulfill the requirements of the Post-Construction Custodial Care Plan for landfill gas monitoring per the 2015 Final Construction Certification Report.

## VI. SUMMARY

Construction of a permanent clubhouse in the southern corner of the Site began in July 2017 and was substantially completed in October 2018. Activities included clearing and grubbing, excavation, installation of support pilings, grading, importation of fill material, construction of the permanent clubhouse with a protective vapor barrier system and associated SSDS and associated appurtenances, installation, testing and calibration of an interior methane detection system, installation of utilities and infrastructure, installation of plantings, and installation of a new gas main. A representative of the IEM was present during construction activities. For this project, fill importation and SSDS/Vapor Barrier construction followed the Permit and NYSDEC requirements as documented in the DORs as summarized herein.

## VII. CERTIFICATION

Certification Statement

I, Donald Bowman, an employee of Maser Consulting P.A. and a Registered Professional Engineer licensed by the State of New York, exercising independent judgment and discretion do hereby certify that this Subslab Depressurization System (SSDS) for the Trump Golf Links at Ferry Point Clubhouse was constructed under my direction and supervision. The information contained herein is based upon: (1) work which I have personally inspected both during and after construction from July 2017 to date; (2) information provided to me by those directly employed by Maser Consulting P.A.; (3) Design Consultants; and (4) contractors responsible for construction pursuant to their contracts except as indicated[2].

I certify that, from July 2017 to date, Maser Consulting representatives observed the installation of the critical elements of the SSDS for the Trump Golf Links at Ferry Point Clubhouse, with the following deviations from design:

- Drawing No. FO-500.00 "Vapor Remediation Underslab Plan" – lateral piping to SSDS pits DP-2B & DP-2C built approximately 2 feet offset from design due to piping conflicts
- Drawing No. FO-501.00 "Vapor Remediation Floor Plan" – riser piping for fan units SF-1 & SF built within walls to conceal system and prevent unauthorized access; gas sensors in Hall 124, Vestibule 101 & Electrical 113 ceilings built approximately 3-5 feet from design due to piping conflicts; monitoring point MP-1 built approximately 9 feet from design due to piping conflicts; monitoring point MP-8 built approximately 50 feet from design due to piping conflicts; monitoring point MP-9 built approximately 14 feet from design due to piping conflicts; monitoring point MP-10 built approximately 14 feet from design due to piping conflicts; monitoring point MP-2 was installed at the location shown in the Plan, however it appears to have been tiled-over and is no longer accessible as a sampling point
- Drawing No. FO-502.00 "Vapor Remediation Attic & Mezzanine Plan" – fan unit SF-1 built approximately 10 feet to the left of design due to piping conflicts
- Drawing No. FO-504.00 "Vapor Remediation Details" – detail 1B built using hollow (instead of solid) concrete blocks; 'Methane Gas Sensor Detail (option 1)' & 'Methane Gas Sensor Detail (option 2)' added for sensor plenum boxes

[2] Certification means a statement of professional opinion based upon investigation, analysis, knowledge and belief that is stated to be true and accurate. 6 NYCRR Part 360-1.2(b)24.

- Drawing No. SD201 "Methane Monitoring System Ceiling Plan (As Built)" – methane gas sensor S16 built approximately 5 feet from design due to piping conflicts; methane gas sensor S19 built approximately 4.5 feet from design due to piping conflicts; methane gas sensor S28 built approximately 5 feet from design due to piping conflicts

Re: DEC No. 2-6006-00014/000013 (2-6006-00014/00016)
Permit Issuance - Solid Waste Management Facility (Tidal Wetlands)
Ferry Point Park Golf Course, Bronx, NY

Dear Ms Zias:

Enclosed are permits for the referenced facility. Please read all conditions carefully. Please provide a copy of the permit and all attachments to the document repository established for this project.

Special Conditions 28, 29, 32, 37, 38 and 39, among others, specify post permit submittals, please make a note of the submission deadlines. To assist the development of a deed restriction for the project site, Attachment A, to this notice contains draft language of the conditions to be specified in the restrictive covenant.

If you have questions on the specific solid waste management conditions, please contact Sam Arakhan at 718-482- 4894. If you have questions regarding marine resources issues and the development of the waterfront park contact Susan Maresca at 718-482-6464. If you have any other questions regarding the administration of this permit, please contact Michelle Moore at 718-4982-4967.

Sincerely,

John F. Cryan
Regional Permit Administrator

## DECLARATION OF COVENANTS AND RESTRICTIONS

**THIS COVENANT** made this __ day of _____, 2014, by the City of New York ("City"), a municipal corporation organized and existing under the laws of the State of New York, acting by and through the New York City Department of Parks and Recreation ("DPR") and having an office for the transaction of business 830 Fifth Avenue, New York, New York, 10021, and the New York City Department of Citywide Administrative Services ("DCAS"), having an office for the transaction of business at 1 Centre Street, New York, New York, 10007, in favor of the New York State Department of Environmental Conservation ("Department"), an agency of the State of New York, with offices at 625 Broadway, Albany, New York, 12233;

**WHEREAS,** DPR has jurisdiction pursuant to the New York City Charter over certain municipal parkland in the Borough and County of the Bronx, New York, known as "Ferry Point Park", which was the site of a former municipal landfill;

**WHEREAS**, pursuant to the New York State Environmental Conservation Law, Article 27, Title 7 and regulations promulgated pursuant thereto at 6 NYCRR Part 360, the Department has issued DPR a Solid Waste Management Permit (DEC Permit No. 2-6006-00014/00013-0)(the "Permit"), annexed hereto as Attachment A, to construct a Golf Course, Community Park and Waterfront Park (hereinafter "the Project") on the eastern portion of Ferry Point Park, a 222 acre parcel bounded by Bronx-Whitestone Bridge to the West, Balcom, Miles and Emerson Avenues to the East, Schley Avenue and St. Raymond's Cemetery to the North and the East River to the South (the "Site"), said parcel comprising Block 5583, Lot 100 and a portion Block 6522, Lot 1, as shown on the Bronx County Tax Map and more particularly depicted on the map attached hereto as Attachment B;

**WHEREAS,** the Permittee is authorized to import a total of 2,514,000 cubic yards of in-place fill material to the Site, which fill material shall consist of approximately 2,120,000 cubic yards of select exempt construction and demolition (C&D) debris for the shaping layer, and approximately 394,000 cubic yards of cover material, to be used in constructing the Project;

**WHEREAS,** Special Condition 17 requires the Permittee to implement a Groundwater Monitoring Program as described in section 4.5 of the Supplemental Engineering Report, Volume 1, dated October 15, 2013 (hereinafter the "Supplemental Engineering Report");

**WHEREAS,** Special Condition 26 requires the Permittee to perform monthly monitoring of the Landfill Gas Passive Venting Trenches for the duration of the Permit, and, thereafter, to monitor the Landfill Gas Passive Venting Trenches as described in the Supplemental Engineering Report, Volume 3, Appendix F;

**WHEREAS,** Special Condition 28 requires the Permittee, during the duration of the Permit, to inspect the Landfill Gas Passive Venting Trenches monthly to verify the integrity of the venting trenches and their mulch cover, and, thereafter, to maintain the Landfill Gas Passive Venting Trenches after the completion of construction of the Project, in the manner described in the Supplemental Engineering Report, Volume 3, Appendix F;

**WHEREAS,** Special Condition 29 requires the Permittee, until the completion of the Project, to conduct monthly monitoring of the depth of ground water in each piezometer installed at the gas venting trenches, and, thereafter, such piezometer monitoring shall be performed in accordance with the Supplemental Engineering Report, Volume 3, Appendix F, Section 6;

**WHEREAS,** Special Condition 32 requires the Permittee to execute and file a Department approved deed restriction, which shall run with the land in perpetuity, and shall recite and require compliance with the Permit's provisions as regards to the custodial care requirements described in the Supplemental Engineering Report, Volume 3, Appendix I;

**WHEREAS,** Special Condition 33 requires the Permittee to conduct bi-weekly monitoring of the On and Off-site Gas Monitoring Networks;

**WHEREAS,** Special Condition 34 requires the Permittee to maintain, and upgrade if required, the On and Off-site Gas Monitoring Networks during facility construction and after completion of the Project;

**WHEREAS,** Special Condition 35 requires the Permittee, upon Department approval of the Permittee's written post-construction certification report, to implement the custodial care plan described in the Supplemental Engineering Report, Volume 3, Appendix I;

**WHEREAS,** Special Condition 36 requires Permittee, should the Project be abandoned, to close, monitor and maintain after closure the entire 222 acre Site, in accordance with 6 NYCRR Sect. 360-2.15 as a landfill in operation since 2000;

**WHEREAS,** Special Conditions 17, 26, 28, 29, 33 and 34, require the installation, maintenance and operation of the Groundwater Monitoring Program, the Landfill Gas Passive Venting Trenches, the piezometers, and the On and Off-site Gas Monitoring Networks, on the perimeter of the site and off-site, for the purposes of monitoring groundwater and Landfill Gas and/or preventing Landfill Gas from migrating from the Site (hereinafter "Engineering Controls") said Engineering Controls being more particularly depicted on the map attached hereto as Attachment C.

**WHEREAS,** Special Condition 32 of the Permit requires the City of New York to execute and file a deed restriction for the real property beneath the site to run with the land in perpetuity, and that the deed restriction recites and requires compliance with the Permit's provisions as regards to Groundwater monitoring, the maintenance of Landfill Gas venting trenches, the piezometers, the On-site Landfill Gas Monitoring Network, including perimeter monitoring wells, the Off-site Landfill Gas Monitoring Network, and the criteria for abandonment of the site as specified in Special Condition 36 of the Permit;

**NOW THEREFORE**, pursuant to its terms, this covenant runs with the land and:

(1) requires the maintenance and operation of the Engineering Controls as set forth in Special Conditions 17, 26, 28, 29, 33 and 34 of the Permit;

(2) prevents modification or alteration of the Engineering Controls except as otherwise set forth in Special Conditions 17, 26, 28, 29, 33 and 34 of the Permit or in any subsequent written authorization by the Department or its successor agency;

(3) unless prior written approval by the Department or its successor agency is first obtained, there shall be no construction, use or occupancy of the Site that results in the disturbance or excavation of the Site which threatens the integrity of the Engineering Controls, or which results in unacceptable human exposure to contaminated soils;

(4) the owner of the Site shall not disturb, remove, or otherwise interfere with the installation, use, operation, and maintenance of Engineering Controls required by the Permit and the Supplemental Engineering Report, unless in each instance the owner first obtains a written waiver of such prohibition from the Department or its successor agency;

(5) the owner of the Site shall prohibit the Site from ever being used for purposes other than for the Project described in the Permit, without the express written waiver of such prohibition by the Department or its successor agency;

(6) the owner of the Site shall provide a periodic certification, prepared and submitted by a professional engineer or other environmental professional acceptable to the Department or its successor agency, which will certify that the Engineering Controls put in place are unchanged from the previous certification, comply with the Permit and the Supplemental Engineering Report, and have not been impaired;

(7) this Declaration is and shall be a covenant that shall run with the land and shall be binding upon all future owners of the Site, and shall provide that the owner and its successors and assigns consent to enforcement by the Department or its successor agency of the prohibitions and restrictions that the Permit requires be recorded, and hereby covenant not to contest the authority of the Department or its successor agency to seek enforcement;

(8) any deed of conveyance of the Site, or any portion thereof, shall recite, unless the Department or its successor agency has consented to the termination of such covenants and restrictions, that said conveyance is subject to this Declaration of Covenants and Restrictions;

(9) in the event that the Project is abandoned, requires closure, monitoring and maintenance of the Site as a landfill in operation since 2000, in accordance with 6 NYCRR Part 360-2.15 and Special Condition 36 of the Permit; and

(10) may be modified by mutual agreement of the City or its successors and the Department or its successor agency.

**IN WITNESS WHEREOF**, the undersigned have executed this instrument on the day(s) written below.

**PROJECT/FACILITY NAME:** Ferry Point Park Golf Course Construction

**PROJECT/FACILITY ADDRESS:** Eastern portion of Ferry Point Park, bounded by the Bronx Whitestone Bridge, Balcom, Miles and Emerson Avenues, Schley Avenue and the East River, Bronx County. Block 5583, Lot 100, Block 5622, Lot 1

**DESCRIPTION OF AUTHORIZED ACTIVITY:**

Construction of a Golf Course, Community Park and Waterfront Park on 222 acres of Ferry Point Park, requiring a total of approximately 2,514,000 cubic yards of material in-place volume. This material will be imported to the Site by truck and consist exclusively of: 1) recognizable and uncontaminated concrete or concrete products (including steel or fiberglass reinforcing rods that are embedded in the concrete), brick, soil, sand, gravel, and rock (hereafter referred to in this permit as select exempt construction and demolition debris) totaling approximately 2,120,000 in-place cubic yards for the shaping layer, and 2) approximately 394,000 in-place cubic yards of cover material. The imported material will be used to attain the final approved grades and contours.

All work associated with the authorized activity described above shall comply with all of the applicable provisions of 6 NYCRR Part 360 (Solid Waste Management Regulations), effective 29 September 1997. By acceptance of this permit, the Permittee agrees that this permit is contingent upon strict compliance with the ECL, all applicable regulations, and the General Conditions and Special Conditions included herein.

| **REGIONAL PERMIT ADMINISTRATOR:** John F. Cryan | **ADDRESS:** NYS Department of Environmental Conservation<br>47-40 21st Street, Long Island City, NY 11101 | |
|---|---|---|
| **AUTHORIZED SIGNATURE:** John F. Cryan | **DATE** May 21, 2014 | Page 1 of 17 |

**NOTIFICATION OF OTHER PERMITTEE OBLIGATIONS**

**Item A: Permittee Accepts Legal Responsibility and Agrees to Indemnification**

The Permittee has accepted expressly, by the execution of its application for the subject work, the full legal responsibility for all damages and costs, direct or indirect, of whatever nature and by whomever suffered, for liability it incurs resulting from activity conducted pursuant to this permit or in noncompliance with this permit and has agreed to indemnify and save harmless the State from suits, actions, damages, and costs of every name and description resulting from such activity.

**Item B: No Right to Trespass or Interfere with Riparian Rights**

This permit does not convey to the Permittee any right to trespass upon the lands or interfere with the riparian rights of others in order to perform the subject work nor does it authorize the impairment of any rights, title, or interest in real or personal property held or vested in a person not a party to the permit.

**GENERAL CONDITIONS**

**General Condition 1: Facility Inspection by the Department**

The subject facility, including relevant records, is subject to inspection at reasonable hours and intervals by an authorized representative of the Department of Environmental Conservation (the Department) to determine whether the Permittee is complying with this permit and the ECL. Such representative may order the subject work suspended pursuant to ECL 71-0301 and SAPA 401(3).

The Permittee must provide a person to accompany the Department's representative during an inspection of the subject facility when the Department provides written or verbal notification to the Permittee at least 24 hours prior to such inspection.

A copy of this permit, including all general and special conditions therein, all amendments thereto, and all documents referenced therein must be available for inspection by the Department at the project site at all times that activity associated with the subject work is occurring. Failure to produce a copy of such permit, conditions, amendments, or documents upon request by a Department representative is a violation of this permit.

Any sign provided by the Department with this permit must be protected from the weather and posted in a conspicuous location at the subject work site throughout the period during which any of the subject work occurs.

**General Condition 2: Relationship of this Permit to Other Department Orders and Determinations**

Unless expressly provided for by the Department, this permit does not modify, supersede, or rescind any order or determination previously issued by the Department or any of the terms, conditions, or requirements contained in such order or determination.

**General Condition 3: Applications for Permit Renewals or Modifications**

The Permittee must submit a separate written application to the Department for renewal, modification, or transfer of this permit, including but not limited to a change in facility operator. Such application must include any forms or supplemental information the Department requires. Any renewal, modification, or transfer granted by the Department must be in writing. The Permittee must submit a renewal application at least:

a) 180 days before expiration of permits for State Pollutant Discharge Elimination System (SPDES), Hazardous Waste Management Facilities, major Air Pollution Control (APC) and Solid Waste Management Facilities; and
b) 30 days before the expiration of all other permit types.

Submission of applications for permit renewal, modification, or transfer are to be submitted to:
NYSDEC Regional Permit Administrator, Region 2, 47-40 21 Street, Long Island City, NY 11101 (tel. 718/482-4997).

**General Condition 4: Permit Modifications, Suspensions, and Revocations by the Department**

The Department reserves the right to modify, suspend, or revoke this permit when:

a) the scope of the permitted activity is exceeded or a violation of any condition of the permit or provisions of the ECL and pertinent regulations is found;
b) the permit was obtained by misrepresentation or failure to disclose relevant facts;
c) new material information is discovered; or
d) environmental conditions, relevant technology, or applicable law or regulation have materially changed since the permit was issued.

**General Condition 5: Compliance with Other Regulatory Requirements**

The Permittee is responsible for obtaining any other permits, approvals, lands, easements, and rights-of-way that may be required for the subject work. The Permittee and its independent contractors, employees, agents, and assigns must comply with all applicable local, State, and federal regulatory requirements.

**General Condition 6: Permittee to Ensure that its Contractors to Comply with Permit**

The Permittee must ensure that its independent contractors, employees, agents, and assigns read, understand, and comply with this permit, including all General and Special Conditions herein, in general, and General Condition No. 5, above, in particular. Such persons must be subject to the same sanctions for violations of this permit as those prescribed for the Permittee.

**ADDITIONAL GENERAL CONDITIONS FOR ARTICLE 27 and 6 NYCRR Part 360 (Solid Waste Management Facilities)**

7. That if future operations by the State of New York require an alteration in the position of the structure or work herein authorized, or if, in the opinion of the Department it shall cause unreasonable obstruction to the free navigation of said waters or flood flows or endanger the health, safety or welfare of the people of the State, or cause loss or destruction of the natural resources of the State, the owner may be ordered by the Department to remove or alter the structural work, obstructions, or hazards caused thereby without expense to the State, and if, upon the expiration or revocation of this permit, the structure, fill, excavation, or other modification of the watercourse hereby authorized must not be completed, the owners, must, without expense to the State, and to such extent and in such time and manner as the Department may require, remove all or any portion of the uncompleted structure or fill and restore to its former condition the navigable and flood capacity of the watercourse. No claim shall be made against the State of New York on account of any such removal or alteration.
8. The State of New York must in no case be liable for any damage or injury to the structure or work herein authorized which may be caused by or result from future operations undertaken by the State for the conservation or improvement of navigation, or for other purposes, and no claim or right to compensation shall accrue from any such damage.
9. All necessary precautions must be taken to preclude contamination of any wetland or waterway by suspended solids, sediments, fuels, solvents, lubricants, epoxy coatings, paints, concrete, leachate, or any other environmentally deleterious materials associated with the project. Any creosote-treated lumber must be weathered for at least six months before it is brought to the subject work site.
10. Any material dredged in association with the work herein permitted must be removed evenly, without leaving large refuse piles, ridges across the bed of a waterway or flood plain, or deep holes that may have a tendency to cause damage to navigable channels, the banks of a waterway, water quality, sediment quality, or benthic habitat.
11. There must be no unreasonable interference with navigation by the work herein authorized.
12. If upon the expiration or revocation of this permit, the project hereby authorized has not been completed, the Permittee must, without expense to the State, and to such extent and in such time and manner as the Department may require, remove all or any portion of the uncompleted structure or fill and restore the site to its former condition. No claim shall be made against the State of New York on account of any such removal or alteration.
13. If granted under Article 36, this permit does not signify in any way that the project will be free from flooding.
14. If granted under 6 NYCRR Part 608, the Department hereby certifies that the subject project will not contravene effluent limitations or other limitations or standards under Sections 301, 302, 303, 306, and 307 of the Clean Water Act of 1977 (PL 95-217) provided that all of the conditions listed herein are met.
15. In accordance with Title 19, Part 600.4 (c) of the New York Code of Rules and Regulations, the Department hereby certifies that the action described and approved in this permit, if located within the Coastal Zone, is consistent to the maximum extent practicable with the policies and purposes of the New York City Waterfront Revitalization Program.

## SPECIAL CONDITIONS

### Site Work

1. All activities authorized by this permit shall conform to all documents supporting the original permit, DEC No. 2-6006-00014/00011, dated July 17, 2000 ,and modified October 18, 2002 , November 18, 2005 and December 27, 2005 as modified by the following:

- Technical Environmental Assessment for the Ferry Point Park Recreation Facility prepared by Allee, King, Rosen and Fleming dated February 11, 2002 and amended September 29, 2004;
- Geotechnical Engineering Study prepared by Langan Engineering and Environmental Services, Inc. dated July 2, 2002;
- Response to Request for Additional Information prepared by TRC Raymond Keyes Associates dated July 2, 2002;
- Fill Procurement Protocol shall be as per the Department letters dated May 21, 2001 and May 23, 2001 from John Nehila to Steve Kass;
- Ferry Point Park: Offsite Methane Monitoring-Bronx, New York prepared by AKRF, Inc., October 12, 2001;
- Landfill Gas (LFG) Passive Vent Trench Along Miles And Emerson Avenues Plan and Detail, V-1, Sheet 1 of 4 prepared by TRC with checked date 02/04/02 ;
- Landfill Gas (LFG) Passive Vent Trench Along Balcom, Miles And Schley Avenues Plan and Detail, V-2, Sheet 2 of 4 prepared by TRC with checked date 02/04/02 ;
- Landfill Gas (LFG) Passive Vent Trench Along Northern Property Boundary Plan and Detail, V-3, Sheet 3 of 4 prepared by TRC with checked date 02/04/02;

**SPECIAL CONDITIONS**
**ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities)**

- LFG Vent Trench and Piezometer Network Profile, V-4, Sheet 4 of 4 prepared by TRC with checked date 02/04/02;
- Landfill Gas (LFG) Passive Vent Trench Along Balcom, And Schley Avenues Plan and Detail, C-2, Sheet 1 of 1 prepared by TRC with checked date 07/20/01;
- Landfill Gas (LFG) Passive Vent Trench Along Balcom between Sampson & Dewey Avenues Plan and Detail, C-1, Sheet 1 of 1 prepared by TRC with checked date 03/09/01;
- Volume#1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associates, dated June 30, 2005. (revised)

- Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, NY, Vol. 1 - 3 dated May 31, 2012 and last revised October 15, 2013.

**SPECIAL CONDITIONS**
**ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )**

2. Activities authorized by this permit include development of a golf course and parks, as well as the construction of associated structures, utility lines, gas venting and control systems. All aspects of the project must be constructed in accordance with the Department approved design plans, specifications and documents noted in Special Condition # 1. All physical aspects of the project including project location referenced in this permit shall be referred to as the "Site." All construction aspects of the permitted activities referenced in this permit shall be referred to as the "Project."

3. In accordance with "Item A" of the Notification of Other Permittee Obligations" found on page 2 of this permit, the Department in general accepts no liability for the structural integrity and/or the adequacy of the buildings and/or foundation designs of the proposed buildings or other structures associated with the development of the golf course. In addition, the Department specifically does not guarantee nor accept liability in regards to the measures proposed to prevent the subsidence of any buildings, foundations and other structures built on or adjacent to the Site, or to prevent the migration of explosive gas.

4. All operations at the Site shall occur Monday through Saturday during daylight hours, between sunrise and sunset, unless otherwise authorized by the Department.

5. All truck traffic entering and leaving the Site shall use only authorized truck traffic routes, and conform to the construction traffic management plans noted in Exhibit K of Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, New York, Engineering Report, prepared by TRC Raymond Keyes Associates, dated June 30, 2005 (revised).

a) All truckers shall receive written instruction on the truck access routes to and from the Site.

b) All trucks entering the site shall be tarped or sufficiently covered to comply with local and state highway regulations. The Site access and exit routes shall be maintained so that they are free from dust, dirt and debris resulting from the truck traffic.

6. Short-term settlement monitoring must strictly conform to the recommendations listed in the Settlement Evaluation and Long Term Monitoring Plan, Ferry Point Golf Course Ferry Point Park, Bronx, NY, prepared by Langan Engineering and Environmental Services, Inc., dated January 26, 2005. As construction progresses and long term plates are installed, short term plates do not need to be re-installed.

7. The long-term settlement monitoring must strictly conform to the recommendations listed in the Settlement Evaluation and Long Term Monitoring Plan, Ferry Point Golf Course Ferry Point Park, Bronx, NY, prepared by Langan Engineering and Environmental Services, Inc., dated January 26, 2005.

a) The long-term monitoring shall be performed for locations shown in Appendix H of the October 15, 2013 supplemental engineering report as described in Appendix I of the October 15, 2013 supplemental engineering report.

b) All monitoring points must be maintained in proper working condition. If any points are unable to be sampled for any reason, they must be repaired within two weeks of such detection and re-tested.

## Fill Importation

8. The Permittees are authorized to import a total of 2,514,000 cubic yards of in-place fill material to the Site. The fill material shall consist of approximately 2,120,000 cubic yards of select exempt construction and demolition (C&D) debris for the shaping layer, and approximately 394,000 cubic yards of cover material. The imported material shall be used on Site to attain the final approved grades and contours approved by the Department, and referenced on plans made a part of this permit.

a) The use of asphalt as fill material on the Site is prohibited.

b) The use of dredge spoils as fill material on the Site is prohibited.

c) There shall be no mechanical separation of steel and fiberglass reinforcing rods from concrete and concrete products at the Site.

d) No size reduction or material processing may occur on Site, except with earth moving equipment in the course of placement. However, the breakdown and removal of stumps and wood previously left on Site by the New York City Department of Sanitation (DOS) is permitted.

e) All solid waste material excavated from the Site shall be properly secured immediately, and then removed from the Site and legally disposed of within seven (7) days.

f) All unauthorized solid waste or fill material found on the Site shall be properly secured immediately, and then removed and legally disposed of within five (5) days of its discovery by Permittees.

g) All select exempt construction and demolition (C&D) debris for the shaping layer and the cover layer material must be free of all non-exempt C&D recognizable debris.

9. The quantification of all imported fill material shall be continuously tracked by both truck volume, and periodic topographic survey of the imported in-place fill volume. Since compacted in-place fill volumes will not equal truck volumes of fill, a 41.7 percent (41.7%) correction factor shall be applied for shaping layer material and a correction factor of 18 percent (18%) shall be applied for cover material. The correction factor for converting truck volume into in-place volume may be modified by the Department.

10. The Permittees must cease the importation of fill material if:

a) The final approved grades are attained prior to the permitted amount of fill material being imported;

b) 2,120,000 cubic yards of select exempt construction and demolition debris for the shaping layer, as measured by in-place fill volume determined through topographic survey, are accepted. All material imported to the Site is considered shaping layer material, unless testing determines otherwise; or

c) 394,000 cubic yards of cover layer material, as measured by in-place volume, are accepted.

**SPECIAL CONDITIONS**

**ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )**

11. Use of fill material from DEC registered construction and demolition debris processing facilities (DEC registered C&D facilities or registration facilities) requires written Departmental approval. Such requests must be submitted to the Department for approval not less than ten (10) business days prior to any proposed date for importation from the new locations. No fill material may be received from unapproved facilities or locations. DEC registered construction and demolition debris processing facilities (DEC registered C&D facilities or registration facilities) may be used to obtain select exempt construction and demolition debris for fill material to the Department for its approval prior to use. The subsequent transportation and use of fill material from other additional registration facilities requires written Departmental approval. Such requests must be submitted to the Department for approval not less than ten (10) business days prior to any proposed date for importation from the new locations. No fill material may be received from unapproved facilities or locations.

12. Select exempt construction and demolition debris to be used as fill material at the Site may be accepted from DEC registered C&D facilities as approved pursuant to Special Condition #11, provided that the facilities segregate and clearly mark each stockpile with a specific identification number, the date each stockpile was started and the date when it was sampled by the Permittees. The Department shall be notified by Permittees at least 24 hours before any sampling event at a DEC registered C&D facility. All sampling reports shall be transmitted to the Department or the IEM directly from the certified testing laboratory.

13. The Permittee shall be responsible for ensuring that cover layer material is procured from a DEC approved source, and it meets all permit specifications.

a) If cover layer material is manufactured, the soil used in its manufacture must not originate from any industrial sites, brownfield site, historical fill site or DEC registered C&D facilities.

14. The Permittee shall be responsible for ensuring that the shaping and cover layer materials meet sections 4.2.1 and section 4.3 of the October 15, 2013 Supplemental Engineering Report, Volume 1, as well as the following:

a) In order for select exempt construction and demolition debris material to be used on Site, it must be sampled both prior to acceptance and after the importation of each additional 10,000 cubic yards (in truck volumes). Each soil sample is to be analyzed for Toxicity Characteristic Leachate Procedure (TCLP), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and metals (including Resource Conservation and Recovery Act (RCRA) metals).

b) Cover layer material must be sampled prior to acceptance and after the importation of each additional 2,000 cubic yards (in truck volumes). Each soil sample is to be analyzed for the entire analyte list in the NYSDEC Technical and Administrative Guidance Memorandum (TAGM) 4046, total volatile organic compounds (VOCs), total semi- volatile organic compounds (SVOCs), pesticides and herbicides, polychlorinated biphenyls (PCBs), and metals (including Resource Conservation and Recovery Act (RCRA) metals).

c) The shaping layer must meet the following chemical limits:

i. Total carcinogenic SVOC levels (weighted average as calculated by formula provided in 10/25/06 letter from NYSDEC) must be less than 3 ppm by completion of construction; maximum carcinogenic SVOCs level from individual source must be 10 ppm or less. The following are the list of carcinogenic SVOCs that are subject to this 3 ppm limit: Benzo(a)pyrene, Dibenzo(a,h)anthracene, Benzo(a)anthracene, Benzo(b)fluoranthene, Indeno(1,2,3-cd)pyrene, Benzo(k)fluoranthene, and Chrysene.

ii. Total SVOCs must be less than 500 ppm

iii. Metals:

- Arsenic less than 28 ppm;
- Barium less than 2,000 ppm;
- Cadmium less than 20 ppm;
- Chromium less than 1,000 ppm;
- Copper less than 1000 ppm;
- Lead less than 400 ppm;
- Mercury less than 0.57 ppm
- Selenium less than 11 ppm
- Silver less than 100 ppm

iv. Asbestos for all layers must be 0.5% or less

v. Total sulfur for all layers must be 0.5% or less

vi. Total PCBs less than 10 ppm

vii. Total Pesticides less than 10 ppm

viii. VOCs (all individual analytes less than TAGM 4046)

d) The final placement of shaping and cover layer materials is subject to installation of a demarcation layer at locations where combined shaping and cover layers thickness are less than five (5) feet.

e) All shaping and cover layer material placed after the final placement of shaping and cover layer must meet the 6NYCRR Part 375 protection of public health restricted residential Part 375-6.8(b) SCOs.

15. The major components (greens, contours, heights and top soil) of the cover layer shall meet the Nicklaus Design Technical Specification, as noted in Exhibit C of the June 30, 2005 Engineering Report, and as follows:

- Greens - Greens mix imported to the site shall be tested as per material testing requirements. Fertilizer and soil amendments may be applied on the greens mix after spreading to construction specifications and finally grassed, as per the specifications provided by the agronomist.
- Topsoil - Topsoil imported shall be consistent with native topsoil, and shall be free of rock and debris greater than three quarters of an inch, as per Exhibit C of the Engineering Report. Soil amendments, fertilizer applications and seed may be applied to tee, fairway and rough areas, as per Exhibit C of the June 30, 2005 Engineering Report.

16. The Department may conduct joint sampling or take split samples as necessary for verification purposes.

**Groundwater**

17. The Permittee shall implement a groundwater monitoring program as described in section 4.5 of the Supplemental Engineering Report, Volume 1, dated October 15, 2013.

**Fill Progression Monitoring**

18. The Permittee shall place grade stakes indicating elevations for proposed final grades of fill and cover material.

19. The Permittee shall place benchmarks throughout the Site, in a manner acceptable to the Department, for the purpose of periodically measuring and surveying fill elevations. Benchmarks are to be maintained at all times. If it becomes necessary, they shall be repaired promptly.

**Project Completion Schedule**

20. The project shall progress according to the Construction Schedule provided in Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associates, dated June 30, 2005 (as revised), Exhibit A, and as updated in section 3.1 of the Supplemental Engineering Report dated October 15, 2013. The effective date for implementation of the construction schedule is the effective date of this permit.

21. In accordance with the approved plan in Special Condition #1, placement of fill material in each section of the Site shall not exceed the designed and approved final contours for each section.

22. Only cover material may be stockpiled in a section upon completion of the placement of fill material for the shaping layer in that section as per design calculations. In addition, cover material may be stockpiled in a section where the completion of fill placement has not occurred, if such stockpile is segregated and secured from construction and demolition debris used for the shaping layer.

23. Upon completion of filling operations to approved grades in a section, the Permittees shall commence the rough shaping and placement of cover material, and the installation of drainage, irrigation and utilities, as per Construction Schedule noted in Special Condition # 20. Prior to placement of this cover material, Permittee must comply with the requirements of Special Condition # 15(d).

**Independent Environmental Monitor**

24. An Independent Environmental Monitor (IEM), accountable to the Department, shall be retained by the Permittee to provide environmental oversight of all activities authorized by this permit for the duration of its permitted term, including, but not limited to, the quantification, importation and placement of fill, and the monitoring of the Site.

SPECIAL CONDITIONS

ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )

a) It shall be the IEM"s responsibility to provide notice of any deviation from the activities authorized by this permit and any deviation from New York State Environmental Regulations (6NYCRR Part 360) to the Department immediately, but in no event later than 24 hours after such deviation is detected. This notification must include the date and time of the potential non-compliance, the nature of the non-compliance, any corrective action, and any additional measures the IEM will be undertaking to track the issue until corrected. Should the IEM be uncertain as to whether such a deviation has occurred, the matter shall be promptly reported to the Department for a determination. For the purposes of this permit, a deviation(s) shall mean any of the following:

   i. An apparent violation of any condition of this permit;

   ii. An apparent violation of Federal, State or Local Law;

   iii. A material difference between construction or monitoring data obtained by the Permittees or their consultants, and that obtained by the IEM;

   iv. Any receipt of fill that does not meet the specifications authorized in this permit;

   v. Any receipt of fill from a site not authorized under the permit or by the Department.

   vi. Any condition, activity or occurrence that may endanger or pose a threat to public health, safety or the environment.

b) Notwithstanding any other reporting this permit requires, the IEM shall submit a detailed written report to the Department no less frequently than every three months detailing the IEM"s activities at the Site, the estimated total volume of fill material (including cover material) received during the reporting period based on truck volume, the total volume of fill in place at the Site, the percentage of filling to final grades, and the number(s) of trucks prohibited from entering the Site. The report also shall summarize any site meetings amongst the Permittee, its consultants or others, verify that all samples taken and monitoring done at the Site by the Permittee or consultants conform to this permit, detail any substantive change in the condition of the Site or project, fully explain any deviations occurring during the reporting period and their disposition, and describe any other occurrence, circumstance or condition that may have a bearing upon the safe and environmentally sound operation of the Project or Site.

c) The IEM must be approved by the Department prior to the finalization of any contractual agreement with the Permittee, and the initial receipt of any fill material at the Site.

d) The continued retention, discharge, or replacement of the IEM shall be at the sole discretion of the Department. The Permittee waive any right to seek judicial review of the Department's exercise of that discretion. The Permittees must fully pay all invoices and bills from the IEM within sixty days of submission. The IEM or its Department approved representative shall be present on Site whenever it is open. Under no circumstances shall Project activities, including the receipt or management of fill, take place while the IEM or its designated representative is absent from the Site.

**SPECIAL CONDITIONS**
**ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )**

e) The Department shall have access to any information obtained by the IEM at any time. The IEM shall keep all information including, but not limited to, fill records, inspection reports, field notes, monitoring data, graphics, databases, financial records, minutes of meetings and other information in a form approved by the Department

f) The IEM, if an individual, shall possess a New York State Professional Engineer license. If an engineering firm serves as the IEM, the firm must provide an employee of that firm who is a New York State licensed professional engineer to perform all functions and certifications noted in Section 1.1 of the Engineering Report referenced in Special Condition No. 1 above. In addition, the IEM shall:

i. monitor all aspects of the Permittees" fill operations at the Ferry Point Park ("FPP") facility;

ii. have unrestricted access to all personnel employed by the Permittee at the FPP facility, and to all files and records maintained by the Permittees at the FPP facility pursuant to this permit;

iii. inspect the proposed sources of fill, review the documentation about the sources of the material, including without limitation, any off-site sampling, and certify as to the acceptability of the material for use at the Site, in accordance with the criteria specified in the Engineering Report, Section 2. The IEM shall notify the Department at least 24 hours before any on-site sampling;

iv. visually inspect each truckload of imported fill material at the Site, and undertake reasonable verification activities including directing, where appropriate, verification sampling, analysis and certification by the IEM on a Project specific tracking form that it meets criteria for acceptable fill at the Site;

v. inspect each truckload of material upon its dumping on Site with a Photo-Ionization Detector (PID).

vi. prohibit any truck from leaving the dumping area before the load has been inspected, and the manifest signed by the IEM. If any load is rejected, the rejected fill material shall be reloaded onto the same truck immediately and legally transported off-site. However, if the rejected fill material is a DEC regulated solid waste or hazardous waste, it must be segregated immediately and secured on-site, until it is removed by a DEC permitted hauler for appropriate disposal. Such regulated or hazardous waste must be removed from the Site within 3 days of its discovery;

vii. monitor the off loading of all material at the unloading station. No truck shall be allowed to off load unless the IEM is present. Such truck shall only be allowed to leave the station after the load is tested and found acceptable.

viii. certify that the sampling of material at the project Site conforms to the permit requirements, and review the results of all laboratory tests;

ix. notify the Department daily about the receipt of unacceptable material or any violations of conditions set forth in this permit;

x. maintain files on Site of fill sampling data, site histories, and internal manifest (tracking) forms;

xi. report and certify to the Department that the on-site gas well monitoring has been conducted as required by this permit. Notify the Department immediately if levels exceed 25% of the lower explosive limit (LEL) in any gas monitoring well;

xii. certify that: (a) all grades of the shaping layer of a section are correct prior to the placement of cover material on that section; (b) a minimum of two feet of fill material covers the existing municipal solid waste layer; and (c) the final cover layer meets the appropriate specifications of the Engineering Report noted in Special Condition #1;

xiii. during fill delivery and earthwork, submit bi-weekly reports to the Department summarizing all Site activities set forth by this permit. Each report shall provide details of all rejected fill material, quantify the amount of material imported onto the Site using truck volumes, and the results of all on-site gas monitoring for that period;

xiv. review the final post-construction report and provide comments to the Department on whether the fill operation was performed in accordance with the permit documents and including any deviations thereof. These comments must be submitted by the IEM to the Department within sixty (60) calendar days of the receipt of the final post construction report, certify that the fill operation was performed in accordance with the permit documents. The certified post-construction report must be submitted by the IEM to the Department within sixty (60) calendar days after the completion of the earthwork portion of the Project;

xv. report all operational upsets, emergencies, unusual circumstances (including, but not limited to, unauthorized entries, security breaches, equipment breakdowns, fires, thefts, acts of vandalism, and on-site accidents) to the Regional Solid Waste Engineer by telephone (at 718/482-4996) within 24 hours of the occurrence, and in writing within 3 business days advising the engineer of the nature of the event, and providing a description of how the event was handled.

**Gas Venting Trench**

25. During the duration of this permit, the Permittee shall inspect the gas venting trench monthly to verify the integrity of the venting trench and its mulch cover. The Permittee shall maintain the gas venting trench at all times, and promptly repair any soil washouts of the mulch cover, as necessary. If any portion of the venting trench or mulch cover is found in need of repair, this fact must be reported to the IEM immediately and all necessary repairs must be made within two weeks of discovery.

**SPECIAL CONDITIONS**

**ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )**

(SC 25 continued) In addition, the mulch cover shall be replaced, at a minimum, every spring to maintain the effectiveness of the gas venting trench. The Permittee shall maintain the gas venting trench after the completion of construction of the golf course in the manner described in the Supplemental Engineering Report, Volume 3, Appendix F.

26. Monthly monitoring of the gas venting trench shall continue for the duration of the permit.

27. **As required by the Custodial Care Plan**: Gas venting trench inspection reports shall include the inspection date, the name of inspector, and a description of repairs, monitoring results and maintenance performed. A log of these self-inspections must be maintained including the dates, times and results of the inspections.

**Piezometers**

28. The Permittee shall conduct monthly monitoring of the depth of ground water in each piezometer installed at the gas venting trench, until the completion of the construction of the golf course. All readings shall be submitted to the Department in a monthly report.

a) **As required by the Custodial Care Plan**: Post-construction piezometers monitoring shall be performed in accordance with the Supplemental Engineering Report dated October 15, 2013, Volume 3, Appendix F, Section 6.

29. Within sixty (60) days of receipt of this permit, the Permittee shall submit a Response Action Plan to the Department. This Plan shall set forth the measures to be implemented by the Permittee, if the piezometer readings indicate that the groundwater table has dropped below the depth of the gas venting trench during the post construction monitoring period.

30. The Permittee shall sample the perimeter gas monitoring wells #0, #1A, #1 to #3, #5 to #12, and #14 to #18, and the on-site monitoring wells #13 and #19 on a bi-weekly basis to detect any explosive gas migration. Copies of the bi-weekly monitoring field notes shall be electronically mailed to the Department within 24 hours after the sampling event and a copy of this report shall be submitted to the Department within 3 business days and reported to the IEM immediately and all necessary repairs must be made within two weeks of discovery.

31. All perimeter gas monitoring wells should be tested at least on a bi-weekly basis. However, if any individual monitoring point has a bi-weekly reading that equals or exceeds 100% LEL or three consecutive bi-weekly reading are greater than 25% LEL, a modified methane gas action plan shall be implemented by the Permittee. Such plan shall require, at minimum, weekly testing of the individual monitoring point(s) with the elevated readings. The Department also may require any additional measures it deems necessary. Any individual point under the modified methane gas action plan may return to the regular bi-weekly monitoring schedule, when three (3) consecutive weekly readings are all less than the 25% LEL action level.

SPECIAL CONDITIONS

ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )

**Deed Restriction**

32. Within thirty (30) days of the date of the issuance of this permit, the Permittee shall submit a draft Deed Restriction to the Regional Permit Administrator. The deed restriction, which shall run with the land in perpetuity, shall recite and require compliance with this permit's provisions as regards to the custodial care requirements described in the Supplemental Engineering Report dated October 15, 2013, Volume 3, Appendix I. The deed restriction must be filed within six (6) months of the issuance date of this permit.

**Off-site Gas Monitoring Network**

33. The Permittee shall conduct bi-weekly monitoring of the Off-site Gas Monitoring Network. A copy of the bi-weekly monitoring field notes shall be electronically mailed to the Department within 24 hours, and a copy of the monitoring report shall be submitted to the Department within 3 days of the completion of each round of monitoring.

a) **As required by the Custodial Care Plan**. Each bi-weekly monitoring report shall include the geoprobe monitoring point(s) installed on or near Buttrick, Schley, Balcom, Miles and Emerson Avenues, as described in the methane monitoring reports referenced in Special Condition #1 of this permit.

34. The Permittee shall maintain, and upgrade if required, the Off-site Gas Monitoring Network during facility construction and after completion of the golf course.

a) The Permittees may request Departmental approval to substitute for all, or part of, the Off-site Gas Monitoring Network by installing geoprobe soil gas monitoring points of a placement and design suitable to the Department. Such points must be at linear intervals no greater than 50 feet (on 50-foot centers) along either segments of the perimeter boundary of the gas venting trench or the drainage ditch.

b) If any point used for off-site gas monitoring is found to require repairs, this fact must be reported to the IEM immediately and all necessary repairs must be made within two weeks of discovery. A copy of the off-site gas monitoring well results also must be sent to the New York City Housing Authority.

c) All off-site gas monitoring points shall be tested on a bi-weekly basis. If any individual monitoring point has a bi-weekly reading that equals or exceeds 100% LEL, or three consecutive bi-weekly readings that are greater than 25% LEL, sampling of that point shall be done weekly. Any individual point under the later modified methane gas action plan may return to the regular bi-weekly monitoring schedule, if there are three (3) consecutive weekly readings all less than the 25% LEL action level.

d) None of the requirements specified in Special Conditions Nos. 26 through 34, 36 (a) through (c) may be terminated without written approval from the Department.

SPECIAL CONDITIONS

ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )

**Ferry Point Park East Post Construction Custodial Care Plan ( Custodial Care Plan)**

35. Upon Department approval of the Permittee's written post construction certification report, Permittee shall implement the Custodial Care Plan described in Supplemental Engineering Report dated October 15, 2013, Volume 3, Appendix I, as referenced in Special Condition No. 1.

**Project Abandonment and Environmentally Sound Closure**

36. Should the Project be abandoned, the entire 222 acre Site must be closed, monitored and maintained after closure in accordance with 6 NYCRR Sect. 360-2.15 as a landfill in operation since 2000.

a) Within one hundred and twenty (120) days after notice from the Department that the Site has been deemed abandoned, the Permittee shall implement the custodial care plan contained in the Supplemental Engineering Report dated October 15, 2013, Volume 3, Appendix I, as referenced in Special Condition No. 1.
b) For the purpose of this permit, abandonment shall mean any of the following:
    i. Filling operations authorized under this permit cease for a period of 12 consecutive months, as provided in 6NYCRR sect 360-1.11(f);
    ii. Failure to complete the Project within 12 months of the issuance of this permit, as determined by the Department, by the expiration date of this permit; or
    iii. Termination of this Project as a result of enforcement action by the Department or another government agency for non compliance with this permit, or with applicable Federal, State or Local Law.
c) The terms of this Special Provision shall govern, if in conflict with the terms of General Condition No. 12.

**Waterfront Park**

37. Within one hundred and eighty (180) days of the effective date of this permit, provide three hard copies and one copy on CD of revised design plans for the Waterfront Park, to the Regional Permit Administrator. Include in this submission details on the extent of adjacent area and tidal wetlands encroachment, water balance, proposed mitigation (including mitigation for the pool barge), implementation plans and staging.

SPECIAL CONDITIONS

ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )

## Submittals

38. Within sixty (60) days of completion of the filling operation on the Site and construction of the earthwork portion of the Project, the Permittees shall provide:

a) as-built drawings of the Project, signed by a professional engineer licensed in New York State for DEC's approval. The post construction as built drawings shall, at a minimum, include detailed cross-sections illustrating the depth of fill placed and location of all utilities and associated structures, road ways, demarcation layer and storm water drainage control structures for the Project. The as-built plans also shall include the location of all monitoring and control systems and devices (including gas control and monitoring, water quality and elevation monitoring and settlement monitoring).

b) a written post-construction certification report for review and approval by the Department and certification by the Independent Environmental Monitor. This report shall include approved "as-built" drawings demonstrating that the earthwork and filling operation was accomplished in accordance with the Department approved plans and this permit. If as-built drawings are not approved by DEC within 120 days of the completion of the filling operation, the Site is deemed abandoned, as per Special Condition No. 36. This report and the as-built drawings cannot be done or submitted by the IEM.

39. Within ninety (90) days of approval of the post construction certification report, the Permittee shall submit an amended subsurface operations plan which includes relevant post construction storm water pollution prevention maintenance documentation as per the State Pollution Discharge Elimination System (SPDES) general permit for storm water discharges from construction activity.

40. Within sixty (60) days of the effective date of the permit, the Permittee shall submit a full size (24 inches by 36 inches) scaled, signed and sealed drawing showing construction of the irrigation lake passive venting system.

41. Thirty (30) days after approval of the construction certification report, the Permittee must provide to the Regional Solid Waste Engineer, a revised Table 6-1 (noted in the engineering report referenced in Special Condition #1 above).

42. Prior to the installation of any sub slab depressurization systems for onsite buildings, the Permittee must secure written approval of these systems from the NYS Department of Environmental Conservation and the NYS Department of Health.

43. All reports and written submissions shall be sent in duplicate to the regional office of the DEC, with an additional copy to DEC Central Office, and another copy to the document repository as noted below. Each submission shall have a transmittal page, which references the DEC permit number and the relevant Special Condition number.

SPECIAL CONDITIONS

ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )

Samsudeen Arakhan
Regional Materials Management Engineer
NYS DEC, Region 2
47-40 21st Street
Long Island City, NY 11101

John Cryan
Regional Permit Administrator
NYSDEC, Region 2
47-40 21st Street
Long Island City, N.Y. 11101

David Vitale, Bureau Chief
Bureau of Solid Waste, Reduction, and Recycling
NYS DEC
625 Broadway
Albany, NY 12233-7253

FPP Golf Course Document Repository
New York City Department of Parks and Recreation
1 Bronx River Parkway
Bronx, NY 10462-2869

44. All notifications to the Department, as referenced in Special Conditions of this permit, shall be made to the Regional Materials Management Engineer, NYS DEC, 47-40 21st Street, Long Island City, NY 11101. All immediate, 24-hour, verbal or expedited notifications shall be made by telephone and electronic mail to the attention of Samsudeen Arakhan, Regional Solid Materials Engineer at: 718-482-4996 (phone) / skarakha@gw.dec.state.ny.us (email), or other numbers subsequently provided by the Department.

45. Copies of reports generated or reviewed by the Independent Environmental Monitor shall be maintained at the document repository referenced in Special Condition No. 43 above.

**End of Special Conditions**

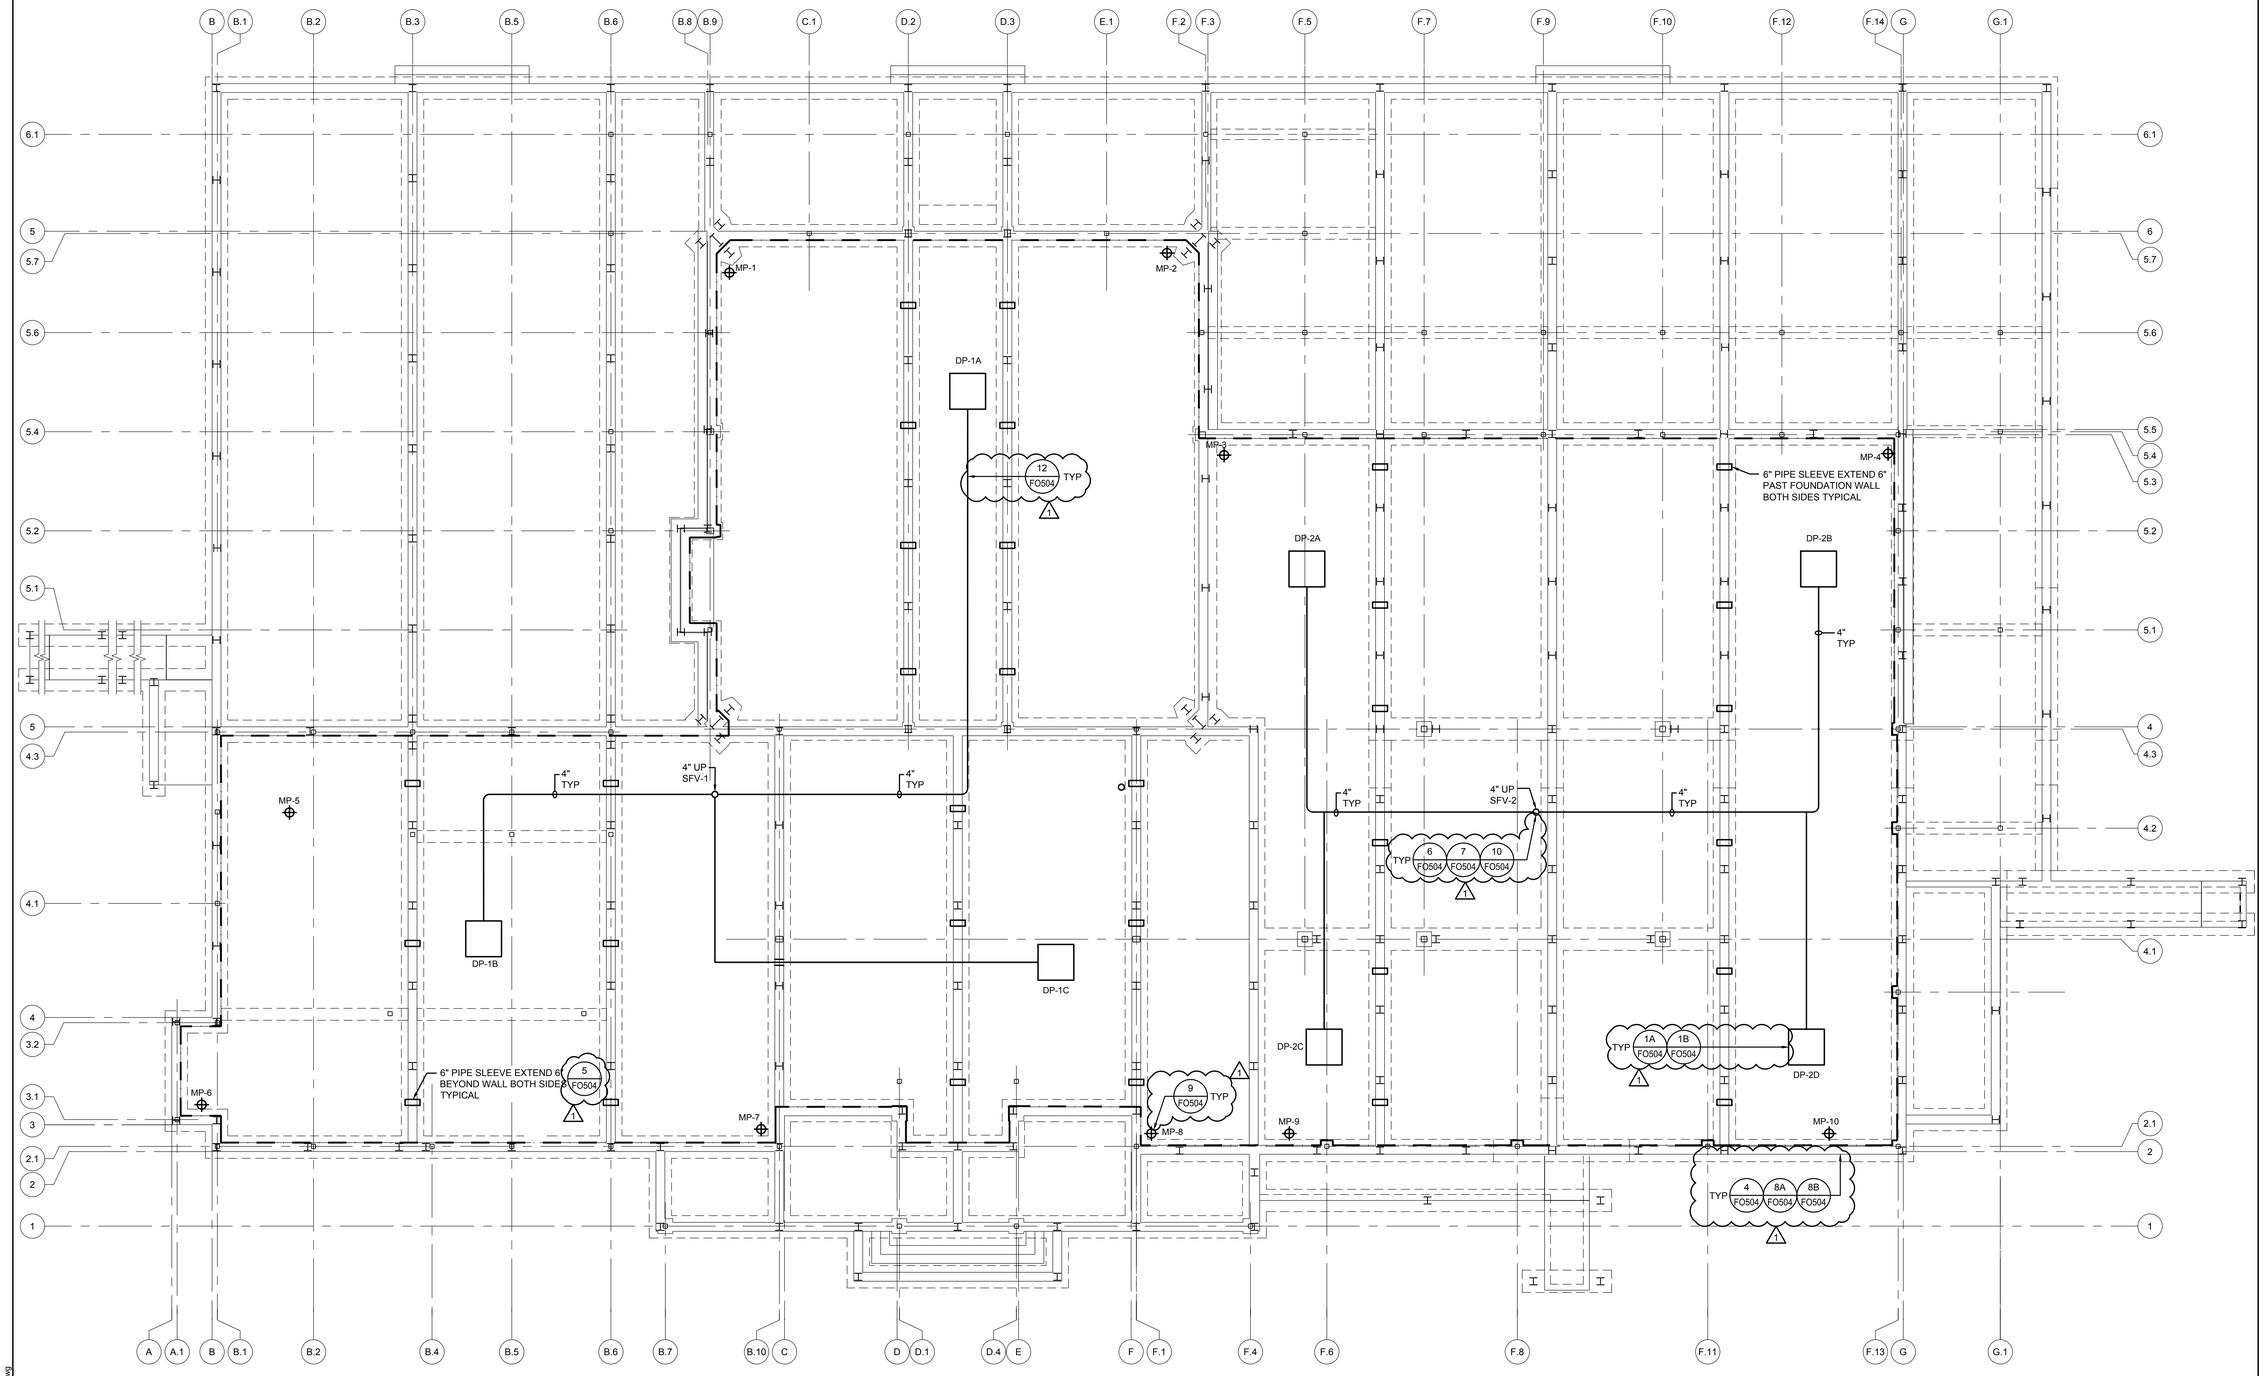
# APPENDIX C

## SSDS Construction Drawings Submitted by FPA to NYSDEC dated June 12, 2017



## UNDERSLAB PLAN

SCALE: 1/8" = 1'-0"

NOTES :

1. DRAWINGS NOT TO BE USED FOR STRUCTURAL, ARCHITECTURAL OR OTHER REFERENCE EXCEPT FOR SUB-SLAB DEPRESSURIZATION SYSTEM.
2. THE EXTENTS OF BUILDING CONSTRUCTION BENEATH THE FLOOR SLABS SHALL BE LINED WITH GAS VAPOR BARRIER. AS PART OF BUILDING CONSTRUCTION. THE GAS VAPOR BARRIER SHALL ALSO BE APPLIED VERTICALLY TO BELOW GRADE WALLS AND WALLS OF PITS AND SUMPS AS SHOWN AND SPECIFIED.
3. SLOPE HORIZONTAL PIPE UNIFORMLY A MINIMUM OF 1% TOWARD SUB-SLAB DEPRESSION SYSTEM PITS OR TO CONDENSATE DRAINS WHEN PIPING CANNOT BE SLOPED TO PIT.
4. SECURE VERTICAL RISER TO WALL IN ACCORDANCE WITH ARCHITECTURAL AND PLUMBING REQUIREMENTS.
5. ELECTRICAL WIRING AND EQUIPMENT NOT SHOWN. REFER TO ELECTRICAL DRAWINGS AND SPECIFICATIONS FOR REFERENCES.
6. SEAL ALL JOINTS IN SLAB ON GRADE, INCLUDING BUT NOT LIMITED TO, CONTROL JOINTS, EXPANSION JOINTS, CRACKS, WALL JOINTS, PENETRATIONS ETC. WITH NON-CRACKING CAULK. POLYURETHANE TYPE PREFERRED.
7. COORDINATE GAS VENTING SYSTEM WITH ALL TRADES, INCLUDE VENTING SYSTEM PIPING ON COORDINATION DRAWINGS.
8. ALL GAS VENTS SHALL BE CONTINUOUS FROM UNDERSLAB STONE BASE TO 36" ABOVE ROOF LINE OR PARAPET (WHICHEVER IS HIGHER). ALL VENTS SHALL BE 10'-0" MIN FROM LOT LINES, OUTSIDE AIR INTAKES, WINDOWS, ETC.
9. DRAWING ILLUSTRATES WALLS AND ALL SLAB ON GRADE FLOOR AREAS. COORDINATE THIS WORK WITH ARCHITECTURAL, MECHANICAL, AND STRUCTURAL PLANS.
10. ALL GAS VENT PIPING SHALL BE PVC PIPING. WHERE PIPING IS LOCATED IN RETURN AIR PLENUMS CHANGE MATERIAL TO NO-HUB CAST IRON PIPE.
11. LABEL GAS PIPING AT INTERVALS OF NOT MORE THAN 25 FT IN CONCEALED LOCATIONS AND NOT MORE THAN 50 FT ON EXPOSED AND NOT LESS THAN ONCE IN ANY ROOM OR SPACE.
12. GAS VAPOR BARRIER TO BE INSTALLED IMMEDIATELY BELOW FLOOR SLAB AS INDICATED ON THE STRUCTURAL DRAWINGS. PROVIDE 12" MINIMUM CLEAN #57 STONE SUB-BASE FOR GAS MITIGATION SYSTEM.
13. SLOPE HORIZONTAL PIPE A MINIMUM OF 1% UNIFORMLY TOWARD SUCTION PITS.
14. REFER TO SPECIFICATION FOR ADDITIONAL SUB-SLAB DEPRESSURIZATION SYSTEM AND ACCESSORIES REQUIREMENTS.

## LEGEND

- EXTENT OF GAS PERMEABLE AGGREGATE LAYER BENEATH FLOOR SLAB
- 4" SCHEDULE 80 PVC PIPE
- SFV-1 — SUCTION FAN VERTICAL 4" RISER AND IDENTIFICATION NUMBER. EXTEND THRU ATTIC TO SUCTION FAN
- MP-1 — SUB-SLAB MONITORING POINT AND IDENTIFICATION NUMBER
- DP-1A — SUB-SLAB DEPRESURAIZATION PIT AND IDENTIFICATION NUMBER

FOR CONSTRUCTION

PROVIDE LIQUID BOOT GAS VAPOR BARRIER SYSTEM UNDER SLAB AS MANUFACTURED BY CETCO CONSISTING OF ULTRASHIELD G-1000, 60 DRY MILS LIQUID BOOT AND LIQUID BOOT BASE FABRIC. SYSTEM SHALL INSTALLED BY AUTHORIZED INSTALLER. REFER TO DETAILS FOR ADDITIONAL INFORMATION. REFER TO CONTRACT DOCUMENTS FOR LOCATIONS OF PENETRATIONS THROUGH THE SLAB.

OFFSET VENT ABOVE CEILING AT ROOF AND EXTEND THROUGH ROOF APPROXIMATELY 3' FROM PARAPET WALLS AND TERMINATE 24" ABOVE FINISHED ROOF.

VAPOR REMEDIATION ATTIC & MEZZANINE PLAN

PROJECT #: 14-534
DRAWN BY:
CHECKED BY: FRM

DRAWING NO:
FO-502.00

O:\GK\9600\9634 - Ferry Point Clubhouse\CADD\DWG\9634.001 - FO-502.dwg

COPYRIGHT © 2015, FRENCH & PARRELLO ASSOCIATES, PA - THE COPYING OR REUSE OF THIS DOCUMENT, OR PORTIONS THEREOF, WITHOUT THE WRITTEN PERMISSION OF FRENCH & PARRELLO ASSOCIATES, PA IS PROHIBITED. DUE TO INHERENT ERRORS IN REPRODUCTION METHODS, ERRORS MAY OCCUR WHEN SCALING THIS DRAWING.

# VAPOR REMEDIATION GENERAL NOTES

A. SCOPE

1. ALL CONSTRUCTION SHALL COMPLY WITH THE NYSDEC APPROVED POST CONSTRUCTION CUSTODIAL CARE PLAN DATED OCTOBER 2013, PREPARED BY NYC DPR, INCLUDING THE APPROPRIATE HANDLING OF COVER, SOIL, SHAPING LAYER MATERIAL, DEMARCATION LAYER MATERIALS, AND MSW, AND INSPECTION AND CONSTRUCTION CERTIFICATION REQUIREMENTS.
2. THE GAS MITIGATION SYSTEM IS TO BE INSTALLED BY A LICENSED GAS MITIGATION CONTRACTOR IN THE STATE OF NEW YORK. CONTRACTOR TO SUBMIT DESIGN SHOP DRAWINGS FOR REVIEW PRIOR TO CONSTRUCTION.
3. THE REQUIREMENTS ADDRESSED IN THE GAS MITIGATION SYSTEM (GMS) INCLUDE THE FOLLOWING CATEGORIES OF CONTRACTOR ACTIVITY: GENERAL PRACTICES, WORKER HEALTH AND SAFETY, SYSTEMS INSTALLATION, MATERIALS, MONITORS AND LABELING, POST-MITIGATION TESTING, AND CONTRACTS AND DOCUMENTATION.

B. IMPLEMENTATION

1. THE GMS INCLUDES REQUIREMENTS FOR INSTALLATION OF GAS REMEDIATION SYSTEMS AND PROVIDES A BASIS FOR EVALUATING THE QUALITY OF THOSE INSTALLATIONS. IT MAY BE ADOPTED BY STATE REGULATORY AGENCIES FOR STATE OR LOCAL GAS MITIGATION CONTRACTOR LICENSURE PROGRAMS. IT MAY ALSO BE USED AS A REFERENCE DURING INSPECTION OF IN-PROGRESS OR COMPLETED GAS MITIGATION WORK.
2. CONTRACTORS SHALL PERSONALLY CONDUCT FOLLOW-UP INSPECTION OF ANY GAS MITIGATION SYSTEMS INSTALLED BY THEIR FIRM OR BY SUBCONTRACTORS TO INSURE CONFORMANCE WITH THE REQUIREMENTS OF THE GMS. THIS REQUIREMENT SHALL INCLUDE THE POST-MITIGATION TESTING PRESCRIBED IN THIS SPECIFICATION.
3. THOSE PROVISIONS OF THE GMS THAT ARE CONSIDERED TO BE MANDATORY ARE PREFACED BY THE TERM "SHALL." PROVISIONS THAT ARE CONSIDERED GOOD PRACTICE BUT WHICH ARE NOT MANDATORY ARE PREFACED BY THE TEGMS "SHOULD" OR "RECOMMENDED."

C. LIMITATIONS

1. ALTHOUGH THE PROVISIONS OF THE GMS HAVE BEEN CAREFULLY REVIEWED FOR POTENTIAL CONFLICTS WITH OTHER REGULATORY REQUIREMENTS, ADHERENCE TO THE GMS DOES NOT GUARANTEE COMPLIANCE WITH THE APPLICABLE CODES OR REGULATIONS OF ANY OTHER FEDERAL, STATE, OR LOCAL AGENCY HAVING JURISDICTION.
2. WHERE DISCREPANCIES EXIST BETWEEN PROVISIONS OF THE GMS AND LOCAL CODES OR REGULATIONS, LOCAL CODES SHALL TAKE PRECEDENCE. HOWEVER, WHERE COMPLIANCE WITH LOCAL CODES NECESSITATES A DEVIATION FROM THE GMS, EPA RECOMMENDS THAT RPP LISTED MITIGATION SERVICE PROVIDERS (MITIGATION CONTRACTORS) REPORT THE DEVIATION IN WRITING TO THE APPROPRIATE EPA REGIONAL OFFICE AND THE APPROPRIATE STATE REGULATORY OFFICIAL WITHIN 30 DAYS. IT SHOULD BE NOTED THAT EPA IS NOT REQUIRING THE REPORTING THAT IS RECOMMENDED IN THIS PARAGRAPH. STATES WITH GAS MITIGATION CONTRACTOR CERTIFICATION PROGRAMS MAY REQUIRE THAT CONTRACTORS GIVE PRIOR NOTIFICATION OF THEIR INTENT TO DEVIATE FROM THE GMS FOR RESEARCH OR OTHER PURPOSES.
3. THE GMS IS NOT INTENDED TO BE USED AS A DESIGN MANUAL, AND COMPLIANCE WITH ITS PROVISIONS WILL NOT GUARANTEE REDUCTION OF INDOOR GAS CONCENTRATIONS TO ANY SPECIFIC LEVEL.
4. BECAUSE OF THE WIDE VARIATION IN BUILDING DESIGN, SIZE, OPERATION AND USE, THE GMS DOES NOT INCLUDE DETAILED GUIDANCE ON HOW TO SELECT THE MOST APPROPRIATE MITIGATION STRATEGY FOR A GIVEN BUILDING. THAT GUIDANCE IS PROVIDED IN THE DOCUMENTS REFERENCED IN IN THIS SPECIFICATION.
5. CONTRACTORS WHO EXPECT TO DEVIATE FROM PROVEN GAS MITIGATION TECHNOLOGIES AND METHODS FOR PURPOSES OF RESEARCH ON INNOVATIVE MITIGATION TECHNIQUES, SHALL OBTAIN PRIOR APPROVAL FROM STATE REGULATORY OFFICES, DOCUMENT THE NON-STANDARD TECHNIQUES, AND INFORM THE CLIENT OF THE DEVIATION FROM STANDARD PROCEDURES. IN CASES WHERE GAS MITIGATION IS NOT REGULATED BY THE STATE, CONTRACTORS SHALL OBTAIN PRIOR APPROVAL FROM A REGIONAL EPA OFFICE.

D. WORKER HEALTH AND SAFETY

1. CONTRACTORS SHALL COMPLY WITH ALL OSHA, STATE AND LOCAL STANDARDS OR REGULATIONS RELATING TO WORKER SAFETY AND OCCUPATIONAL GAS EXPOSURE. APPLICABLE REFERENCES IN THE CODE OF FEDERAL REGULATIONS AND NIOSH PUBLICATIONS.
2. IN ADDITION TO THE OSHA AND NIOSH STANDARDS, THE FOLLOWING REQUIREMENTS THAT ARE SPECIFICALLY OR UNIQUELY APPLICABLE FOR THE SAFETY AND PROTECTION OF GAS MITIGATION WORKERS SHALL BE MET:
   a. THE CONTRACTOR SHALL ADVISE WORKERS OF THE HAZARDS OF EXPOSURE TO GAS AND THE NEED TO APPLY PROTECTIVE MEASURES WHEN WORKING IN AREAS OF ELEVATED GAS CONCENTRATIONS.
   b. THE CONTRACTOR SHALL HAVE A WORKER PROTECTION PLAN ON FILE THAT IS AVAILABLE TO ALL EMPLOYEES AND IS APPROVED BY ANY STATE OR LOCAL REGULATING AGENCIES THAT REQUIRE SUCH A PLAN. EXCEPTION: A WORKER PROTECTION PLAN IS NOT REQUIRED FOR A CONTRACTOR WHO IS A SOLE PROPRIETOR UNLESS REQUIRED BY STATE OR LOCAL REGULATIONS.
   c. THE CONTRACTOR SHALL ENSURE THAT APPROPRIATE SAFETY EQUIPMENT SUCH AS HARD HATS, FACE SHIELDS, EAR PLUGS, STEEL-TOE BOOTS AND PROTECTIVE GLOVES ARE AVAILABLE ON THE JOB SITE DURING CUTTING, DRILLING, GRINDING, POLISHING, DEMOLISHING OR OTHER ACTIVITY ASSOCIATED WITH GAS MITIGATION PROJECTS.
   d. ALL ELECTRICAL EQUIPMENT USED DURING GAS MITIGATION PROJECTS SHALL BE PROPERLY GROUNDED. CIRCUITS USED AS A POWER SOURCE SHOULD BE PROTECTED BY GROUND-FAULT CIRCUIT INTERRUPTERS (GFCI).
   e. WHEN WORK IS REQUIRED AT ELEVATIONS ABOVE THE GROUND OR FLOOR, THE CONTRACTOR SHALL ENSURE THAT LADDERS OR SCAFFOLDING ARE SAFELY INSTALLED AND OPERATED.
   f. WORK AREAS SHALL BE VENTILATED TO REDUCE WORKER EXPOSURE TO GAS DECAY PRODUCTS, DUST, OR OTHER AIRBORNE POLLUTANTS. IN WORK AREAS WHERE VENTILATION IS IMPRACTICAL OR WHERE VENTILATION CANNOT REDUCE GAS LEVELS TO LESS THAN 0.3 WL (BASED ON A SHORT TERM DIAGNOSTIC TEST, E.G., GRAB SAMPLE), THE CONTRACTOR SHALL ENSURE THAT RESPIRATORY PROTECTION CONFOGMS WITH THE REQUIREMENTS IN THE NIOSH GUIDE TO INDUSTRIAL RESPIRATORY PROTECTION. ( (NOTE: IF UNABLE TO MAKE WORKING LEVEL MEASUREMENTS, A GAS LEVEL OF 30 PCI/L SHALL BE USED.)
   g. WHERE COMBUSTIBLE MATERIALS EXIST IN THE SPECIFIC AREA OF THE BUILDING WHERE GAS MITIGATION WORK IS TO BE CONDUCTED AND THE CONTRACTOR IS CREATING ANY TEMPERATURES HIGH ENOUGH TO INDUCE A FLAME, THE CONTRACTOR SHALL ENSURE THAT FIRE EXTINGUISHERS SUITABLE FOR TYPE A, B, AND C FIRES ARE AVAILABLE IN THE IMMEDIATE WORK AREA.
   h. PENDING DEVELOPMENT OF AN APPROVED PERSONAL GAS EXPOSURE DEVICE AND A PROTOCOL FOR ITS USE, CONTRACTORS SHALL RECORD EMPLOYEE EXPOSURE TO GAS AT EACH WORK SITE, BASED ON:
      1) THE HIGHEST PRE-MITIGATION INDOOR GAS OR WORKING LEVEL MEASUREMENT AVAILABLE, AND
      2) THE TIME EMPLOYEES ARE EXPOSED (WITHOUT RESPIRATOR PROTECTION) AT THAT LEVEL

      (NOTE: THIS APPROACH IS NOT INTENDED TO PRECLUDE THE ALTERNATIVE USE OF ON-SITE GAS OR GAS DECAY PRODUCT MEASUREMENTS TO DETERMINE EXACT EXPOSURE.) CONSISTENT WITH OSHA PERMISSIBLE EXPOSURE LIMITS, CONTRACTORS SHALL ENSURE THAT EMPLOYEES ARE EXPOSED TO NO MORE THAN 4 WORKING LEVEL MONTHS (WLM) OVER A 12 MONTH PERIOD. (AN EQUILIBRIUM RATIO OF 50 PERCENT SHALL BE USED TO CONVERT GAS EXPOSURE TO WLM.)
   i. WHEN MITIGATION WORK REQUIRES THE USE OF SEALANTS, ADHESIVES, PAINTS, OR OTHER SUBSTANCES THAT MAY BE HAZARDOUS TO HEALTH, CONTRACTORS SHALL PROVIDE EMPLOYEES WITH THE APPLICABLE MATERIAL SAFETY DATA SHEETS (MSDS) AND EXPLAIN THE REQUIRED SAFETY PROCEDURES.

E. SYSTEMS REQUIREMENT

1. ALL GAS MITIGATION SYSTEMS SHALL BE INSTALLED AS PERMANENT, INTEGRAL ADDITIONS TO THE BUILDING, EXCEPT WHERE A TEMPORARY SYSTEM HAS BEEN INSTALLED.
2. ALL GAS MITIGATION SYSTEMS SHALL BE INSTALLED TO AVOID THE CREATION OF OTHER HEALTH, SAFETY, OR ENVIRONMENTAL HAZARDS TO BUILDING OCCUPANTS, SUCH AS BACKDRAFTING OF NATURAL DRAFT COMBUSTION APPLIANCES.
3. ALL GAS MITIGATION SYSTEMS SHALL MAXIMIZE GAS REDUCTION AND IN CONSIDERATION OF THE NEED TO MINIMIZE EXCESS ENERGY USAGE, TO AVOID COMPROMISING MOISTURE AND TEMPERATURE CONTROLS AND OTHER COMFORT FEATURES, AND TO MINIMIZE NOISE.
4. ALL GAS MITIGATION SYSTEMS AND THEIR COMPONENTS SHALL COMPLY WITH THE LAWS, ORDINANCES, CODES, AND REGULATIONS OF RELEVANT JURISDICTIONAL AUTHORITIES, INCLUDING APPLICABLE MECHANICAL, ELECTRICAL, BUILDING, PLUMBING, ENERGY, AND FIRE PREVENTION CODES.

F. SYSTEMS INSTALLATION

1. GENERAL REQUIREMENTS
   a. ALL COMPONENTS OF GAS MITIGATION SYSTEMS INSTALLED IN COMPLIANCE WITH PROVISIONS OF THE GMS SHALL ALSO BE IN COMPLIANCE WITH THE APPLICABLE MECHANICAL, ELECTRICAL, BUILDING, PLUMBING, ENERGY AND FIRE PREVENTION CODES, STANDARDS, AND REGULATIONS OF THE LOCAL JURISDICTION.
   b. THE CONTRACTOR SHALL OBTAIN ALL REQUIRED LICENSES AND PERMITS, AND DISPLAY THEM IN THE WORK AREAS AS REQUIRED BY LOCAL ORDINANCES.
   c. WHERE PORTIONS OF STRUCTURAL FRAMING MATERIAL MUST BE REMOVED TO ACCOMMODATE GAS VENT PIPES, MATERIAL REMOVED SHALL BE NO GREATER THAN THAT PERMITTED FOR PLUMBING INSTALLATIONS BY APPLICABLE BUILDING OR PLUMBING CODES.
   d. WHERE INSTALLATION OF A GAS MITIGATION SYSTEM REQUIRES PIPES OR DUCTS TO PENETRATE A FIREWALL OR OTHER FIRE RESISTANCE RATED WALL OR FLOOR, PENETRATIONS SHALL BE PROTECTED IN ACCORDANCE WITH APPLICABLE BUILDING, MECHANICAL, FIRE, AND ELECTRICAL CODES.
2. GAS VENT PIPE INSTALLATION REQUIREMENTS
   a. ALL JOINTS AND CONNECTIONS IN GAS MITIGATION SYSTEMS USING PLASTIC VENT PIPES SHALL BE PERMANENTLY SEALED WITH ADHESIVES AS SPECIFIED BY THE MANUFACTURER OF THE PIPE MATERIAL USED. JOINTS OR CONNECTIONS IN OTHER VENT PIPE MATERIALS SHALL BE MADE AIR TIGHT.
   b. ATTIC AND EXTERNAL PIPING RUNS IN AREAS SUBJECT TO SUBFREEZING CONDITIONS SHOULD BE PROTECTED TO AVOID THE RISK OF VENT PIPE FREEZE-UP.
   c. GAS VENT PIPES SHALL BE FASTENED TO THE STRUCTURE OF THE BUILDING WITH HANGERS, STRAPPING, OR OTHER SUPPORTS THAT WILL ADEQUATELY SECURE THE VENT MATERIAL. EXISTING PLUMBING PIPES, DUCTS, OR MECHANICAL EQUIPMENT SHALL NOT BE USED TO SUPPORT OR SECURE A GAS VENT PIPE.
   d. SUPPORTS FOR GAS VENT PIPES SHALL BE INSTALLED AT LEAST EVERY 6 FEET ON HORIZONTAL RUNS. VERTICAL RUNS SHALL BE SECURED EITHER ABOVE OR BELOW THE POINTS OF PENETRATION THRU FLOORS, CEILINGS, AND ROOFS, OR AT LEAST EVERY 8 FEET ON RUNS THAT DO NOT PENETRATE FLOORS, CEILINGS, OR ROOFS.
   e. TO PREVENT BLOCKAGE OF AIR FLOW INTO THE BOTTOM OF GAS VENT PIPES, THESE PIPES SHALL BE SUPPORTED OR SECURED IN A PERMANENT MANNER THAT PREVENTS THEIR DOWNWARD MOVEMENT TO THE BOTTOM OF SUCTION PITS OR SUMP PITS, OR INTO THE SOIL BENEATH AN AGGREGATE LAYER UNDER A SLAB.
   f. GAS VENT PIPES SHALL BE INSTALLED IN A CONFIGURATION THAT ENSURES THAT ANY RAIN WATER OR CONDENSATION WITHIN THE PIPES DRAINS DOWNWARD INTO THE GROUND BENEATH THE SLAB OR SOIL-GAS RETARDER MEMBRANE.
   g. GAS VENT PIPES SHALL NOT BLOCK ACCESS TO ANY AREAS REQUIRING MAINTENANCE OR INSPECTION. GAS VENTS SHALL NOT BE INSTALLED IN FRONT OF OR INTERFERE WITH ANY LIGHT, OPENING, DOOR, WINDOW OR EQUIPMENT ACCESS AREA REQUIRED BY CODE. IF GAS VENT PIPES ARE INSTALLED IN SUMP PITS, THE SYSTEM SHALL BE DESIGNED WITH REMOVABLE OR FLEXIBLE COUPLINGS TO FACILITATE REMOVAL OF THE SUMP PIT COVER FOR SUMP PUMP MAINTENANCE.
3. GAS VENT FAN INSTALLATION REQUIREMENTS
   a. VENT FANS USED IN GAS MITIGATION SYSTEMS SHALL BE SEALED TO REDUCE THE POTENTIAL FOR LEAKAGE OF SOIL GAS FROM THE FAN HOUSING.
   b. GAS VENT FANS SHALL BE SIZED TO PROVIDE THE PRESSURE DIFFERENCE AND AIR FLOW CHARACTERISTICS NECESSARY TO ACHIEVE THE GAS REDUCTION GOALS ESTABLISHED FOR THE SPECIFIC MITIGATION PROJECT
   c. GAS VENT FANS USED IN ACTIVE SOIL DEPRESSURIZATION OR BLOCK WALL DEPRESSURIZATION SYSTEMS SHALL NOT BE INSTALLED BELOW GROUND NOR IN THE CONDITIONED (HEATED/COOLED) SPACE OF A BUILDING, NOR IN ANY BASEMENT, CRAWLSPACE, OR OTHER INTERIOR LOCATION DIRECTLY BENEATH THE CONDITIONED SPACES OF A BUILDING. ACCEPTABLE LOCATIONS FOR GAS VENT FANS INCLUDE ATTICS NOT SUITABLE FOR OCCUPANCY (INCLUDING ATTICS OVER OCCUPIED) OR ON THE EXTERIOR OF THE BUILDING.
   d. GAS VENT FANS SHALL BE INSTALLED IN A CONFIGURATION THAT AVOIDS CONDENSATION BUILDUP IN THE FAN HOUSING. WHENEVER POSSIBLE, FANS SHOULD BE INSTALLED IN VERTICAL RUNS OF THE VENT PIPE.
   e. GAS VENT FANS MOUNTED ON THE EXTERIOR OF BUILDINGS SHALL BE RATED FOR OUTDOOR USE OR INSTALLED IN A WATER TIGHT PROTECTIVE HOUSING.
   f. GAS VENT FANS SHALL BE MOUNTED AND SECURED IN A MANNER THAT MINIMIZES TRANSFER OF VIBRATION TO THE STRUCTURAL FRAMING OF THE BUILDING.
   g. TO FACILITATE MAINTENANCE AND FUTURE REPLACEMENT, GAS VENT FANS SHALL BE INSTALLED IN THE VENT PIPE USING REMOVABLE COUPLINGS OR FLEXIBLE CONNECTIONS THAT CAN BE TIGHTLY SECURED TO BOTH THE FAN AND THE VENT PIPE.
5. SEALING REQUIREMENTS
   a. SUMP PITS THAT PERMIT ENTRY OF SOIL-GAS OR THAT WOULD ALLOW CONDITIONED AIR TO BE DRAWN INTO A SUB-SLAB DEPRESSURIZATION SYSTEM SHALL BE COVERED AND SEALED. THE COVERS ON SUMPS THAT PREVIOUSLY PROVIDED PROTECTION OR RELIEF FROM SURFACE WATER COLLECTION SHALL BE FITTED WITH A WATER OR MECHANICALLY TRAPPED DRAIN. WATER TRAPS SHOULD BE FITTED WITH AN AUTOMATIC SUPPLY OF PRIMING WATER.
   b. OPENINGS AROUND GAS VENT PIPE PENETRATIONS OF THE SLAB, THE FOUNDATION WALLS, OR THE CRAWLSPACE SOIL-GAS RETARDER MEMBRANE SHALL BE CLEANED, PREPARED, AND SEALED IN A PERMANENT, AIR-TIGHT MANNER USING COMPATIBLE CAULKS OR OTHER SEALANT MATERIALS. OPENINGS AROUND OTHER UTILITY PENETRATIONS OF THE SLAB, WALLS, OR SOIL-GAS RETARDER SHALL ALSO BE SEALED.
   c. OPENINGS, PERIMETER CHANNEL DRAINS, OR CRACKS THAT EXIST WHERE THE SLAB MEETS THE FOUNDATION WALL (FLOOR-WALL JOINT), SHALL BE SEALED WITH URETHANE CAULK OR EQUIVALENT MATERIAL. WHEN THE OPENING OR CHANNEL IS GREATER THAN 1/2 INCH IN WIDTH, A FOAM BACKER ROD OR OTHER COMPARABLE FILLER MATERIAL SHALL BE INSERTED IN THE CHANNEL BEFORE APPLICATION OF THE SEALANT. THIS SEALING TECHNIQUE SHALL BE DONE IN A MANNER THAT RETAINS THE CHANNEL FEATURE AS A WATER CONTROL SYSTEM. OTHER OPENINGS OR CRACKS IN SLABS OR AT EXPANSION OR CONTROL JOINTS SHOULD ALSO BE SEALED. OPENINGS OR CRACKS THAT ARE DETERMINED TO BE INACCESSIBLE OR BEYOND THE ABILITY OF THE CONTRACTOR TO SEAL SHALL BE DISCLOSED TO THE CLIENT AND INCLUDED IN THE DOCUMENTATION.
   d. WHEN INSTALLING BASEBOARD-TYPE SUCTION SYSTEMS, ALL SEAMS AND JOINTS IN THE BASEBOARD MATERIAL SHALL BE JOINED AND SEALED USING MATERIALS RECOMMENDED BY THE MANUFACTURER OF THE BASEBOARD SYSTEM. BASEBOARDS SHALL BE SECURED TO WALLS AND FLOORS WITH ADHESIVES DESIGNED AND RECOMMENDED FOR SUCH INSTALLATIONS. IF A BASEBOARD SYSTEM IS INSTALLED ON A BLOCK WALL FOUNDATION, THE TOPS OF THE BLOCKWALL SHALL BE CLOSED AND SEALED.

G. ELECTRICAL REQUIREMENTS

1. WIRING FOR ALL ACTIVE GAS MITIGATION SYSTEMS SHALL CONFORM TO PROVISIONS OF THE NATIONAL ELECTRIC CODE AND ANY ADDITIONAL LOCAL REGULATIONS.
2. WIRING MAY NOT BE LOCATED IN OR CHASED THRU THE MITIGATION INSTALLATION DUCTING OR ANY OTHER HEATING OR COOLING DUCTWORK.
3. GAS MITIGATION FANS INSTALLED ON THE EXTERIOR OF BUILDINGS SHALL BE HARD-WIRED INTO AN ELECTRICAL CIRCUIT. PLUGGED FANS SHALL NOT BE USED OUTDOORS.
4. IF THE RATED ELECTRICITY REQUIREMENTS OF A GAS MITIGATION SYSTEM FAN EXCEEDS 50 PERCENT OF THE CIRCUIT CAPACITY INTO WHICH IT WILL BE CONNECTED, OR IF THE TOTAL CONNECTED LOAD ON THE CIRCUIT (INCLUDING THE GAS VENT FAN) EXCEEDS 80 PERCENT OF THE CIRCUIT'S RATED CAPACITY, A SEPARATE, DEDICATED CIRCUIT SHALL BE INSTALLED TO POWER THE FAN.
5. AN ELECTRICAL DISCONNECT SWITCH OR CIRCUIT BREAKER SHALL BE INSTALLED IN GAS MITIGATION SYSTEM FAN CIRCUITS TO PERMIT DEACTIVATION OF THE FAN FOR MAINTENANCE OR REPAIR BY THE BUILDING OWNER OR SERVICING CONTRACTOR (DISCONNECT SWITCHES ARE NOT REQUIRED WITH PLUGGED FANS).

H. MATERIALS

1. ALL MITIGATION SYSTEM ELECTRICAL COMPONENTS SHALL BE U.L. LISTED OR OF EQUIVALENT SPECIFICATIONS.
2. AS A MINIMUM, ALL PLASTIC VENT PIPES IN MITIGATION SYSTEMS SHALL BE MADE OF SCHEDULE 80 PVC OR EQUIVALENT PIPING MATERIAL.
3. VENT PIPE FITTINGS IN A MITIGATION SYSTEM SHALL BE OF THE SAME MATERIAL AS THE VENT PIPES.
4. CLEANING SOLVENTS AND ADHESIVES USED TO JOIN PLASTIC PIPES AND FITTINGS SHALL BE AS RECOMMENDED BY MANUFACTURERS FOR USE WITH THE TYPE OF PIPE MATERIAL USED IN THE MITIGATION SYSTEM.
5. WHEN SEALING CRACKS IN SLABS AND OTHER SMALL OPENINGS AROUND PENETRATIONS OF THE SLAB AND FOUNDATION WALLS, CAULKS AND SEALANTS DESIGNED FOR SUCH APPLICATION SHALL BE USED. URETHANE SEALANTS ARE RECOMMENDED BECAUSE OF THEIR DURABILITY.
6. WHEN SEALING HOLES FOR PLUMBING ROUGH-IN OR OTHER LARGE OPENINGS IN SLABS AND FOUNDATION WALLS THAT ARE BELOW THE GROUND SURFACE, NON-SHRINK MORTAR, GROUTS, EXPANDING FOAM, OR SIMILAR MATERIALS DESIGNED FOR SUCH APPLICATION SHALL BE USED.

I. MONITORS AND LABELING

1. ALL ACTIVE SOIL DEPRESSURIZATION AND BLOCK WALL DEPRESSURIZATION GAS MITIGATION SYSTEMS SHALL INCLUDE A MECHANISM TO MONITOR SYSTEM PERFORMANCE AND WARN OF SYSTEM FAILURE. THE MECHANISM SHALL BE SIMPLE TO READ OR INTERPRET AND BE LOCATED WHERE IT IS EASILY SEEN OR HEARD BY BUILDING OCCUPANTS AND PROTECTED FROM DAMAGE OR DESTRUCTION.
2. ELECTRICAL GAS MITIGATION SYSTEM MONITORS (WHETHER VISUAL OR AUDIBLE) SHALL BE INSTALLED ON NON-SWITCHED CIRCUITS AND BE DESIGNED TO RESET AUTOMATICALLY WHEN POWER IS RESTORED AFTER SERVICE OR POWER SUPPLY FAILURE. BATTERY OPERATED MONITORING DEVICES SHALL NOT BE USED UNLESS THEY ARE EQUIPPED WITH A LOW POWER WARNING FEATURE.
3. MECHANICAL GAS MITIGATION SYSTEM MONITORS, SUCH AS MANOMETER TYPE PRESSURE GAUGES, SHALL BE CLEARLY MARKED TO INDICATE THE RANGE OR ZONE OF PRESSURE READINGS THAT EXISTED WHEN THE SYSTEM WAS INITIALLY ACTIVATED.
4. A SYSTEM DESCRIPTION LABEL SHALL BE PLACED ON THE MITIGATION SYSTEM, THE ELECTRIC SERVICE ENTRANCE PANEL, OR OTHER PROMINENT LOCATION. THIS LABEL SHALL BE LEGIBLE FROM A DISTANCE OF AT LEAST THREE FEET AND INCLUDE THE FOLLOWING INFORMATION: "GAS REDUCTION SYSTEM," THE INSTALLER'S NAME, PHONE NUMBER, AND RCP IDENTIFICATION NUMBER, THE DATE OF INSTALLATION, AND AN ADVISORY THAT THE BUILDING SHOULD BE TESTED FOR GAS AT LEAST EVERY TWO YEARS OR AS REQUIRED OR RECOMMENDED BY STATE OR LOCAL AGENCIES. IN ADDITION, ALL EXPOSED AND VISIBLE INTERIOR GAS MITIGATION SYSTEM VENT PIPE SECTIONS SHALL BE IDENTIFIED WITH AT LEAST ONE LABEL ON EACH FLOOR LEVEL. THE LABEL SHALL READ, "GAS REDUCTION SYSTEM."
5. THE CIRCUIT BREAKERS CONTROLLING THE CIRCUITS ON WHICH THE GAS VENT FAN AND SYSTEM FAILURE WARNING DEVICES OPERATE SHALL BE LABELED "GAS SYSTEM."

J. POST-MITIGATION TESTING

1. AFTER INSTALLATION OF AN ACTIVE GAS CONTROL SYSTEM (E.G., SSD), THE CONTRACTOR SHALL RE-EXAMINE AND VERIFY THE INTEGRITY OF THE FAN MOUNTING SEALS AND ALL JOINTS IN THE INTERIOR VENT PIPING.
2. AFTER INSTALLATION OF ANY ACTIVE GAS MITIGATION SYSTEM, THE CONTRACTOR SHALL PERFORM TESTS. SEE SPECIFICATION SECTION 072727 "SUBSLAB DEPRESSURIZATION SYSTEM" FOR ADDITIONAL INFORMATION.
3. IMMEDIATELY AFTER INSTALLATION AND ACTIVATION OF ANY ACTIVE (FAN-POWERED) SUB-SLAB DEPRESSURIZATION OR BLOCK WALL DEPRESSURIZATION SYSTEM IN BUILDINGS CONTAINING NATURAL DRAFT COMBUSTION APPLIANCES, THE BUILDING SHALL BE TESTED FOR BACKDRAFTING OF THOSE APPLIANCES. ANY BACKDRAFTING CONDITION THAT RESULTS FROM INSTALLATION OF THE GAS MITIGATION SYSTEM SHALL BE CORRECTED BEFORE THE SYSTEM IS PLACED IN OPERATION.
4. UPON COMPLETION OF GAS MITIGATION WORK, A TEST OF MITIGATION SYSTEM EFFECTIVENESS SHALL BE CONDUCTED. SEE SPECIFICATION SECTION 072726 'GAS VAPOR BARRIER (FLUID APPLIED) FOR ADDITIONAL INFORMATION.
5. TO ENSURE CONTINUED EFFECTIVENESS OF THE GAS MITIGATION SYSTEM(S) INSTALLED, THE CONTRACTOR SHALL ADVISE THE CLIENT TO RETEST THE BUILDING AT LEAST EVERY TWO YEARS OR AS REQUIRED OR RECOMMENDED BY STATE OR LOCAL AUTHORITY. RETESTING IS ALSO RECOMMENDED IF THE BUILDING UNDERGOES SIGNIFICANT ALTERATION.

K. CONTRACTS AND DOCUMENTATION

1. EPA RECOMMENDS THAT CONTRACTORS PROVIDE THE FOLLOWING WRITTEN INFORMATION TO CLIENTS PRIOR TO INITIATION OF WORK:
   a. THE CONTRACTOR'S EPA RPP MITIGATION SERVICE PROVIDER IDENTIFICATION NUMBER.
   b. A STATEMENT THAT DESCRIBES THE PLANNED SCOPE OF THE WORK AND THAT INCLUDES AN ESTIMATE OF THE TIME NEEDED TO COMPLETE THE WORK.
   c. A STATEMENT DESCRIBING ANY KNOWN HAZARDS ASSOCIATED WITH CHEMICALS USED IN OR AS PART OF THE INSTALLATION.
   d. A STATEMENT INDICATING COMPLIANCE WITH AND IMPLEMENTATION OF ALL EPA STANDARDS AND THOSE OF OTHER AGENCIES HAVING JURISDICTION (E.G., CODE REQUIREMENTS).
   e. A STATEMENT DESCRIBING ANY SYSTEM MAINTENANCE THAT THE BUILDING OWNER WOULD BE REQUIRED TO PERFORM.
   f. AN ESTIMATE OF THE INSTALLATION COST AND ANNUAL OPERATING COSTS OF THE SYSTEM.
   g. THE CONDITIONS OF ANY WARRANTY OR GUARANTEE.
2. EPA RECOMMENDS THAT RPP LISTED MITIGATION CONTRACTORS KEEP RECORDS OF ALL GAS MITIGATION WORK PERFORMED AND MAINTAIN THOSE RECORDS FOR 3 YEARS OR FOR THE PERIOD OF ANY WARRANTY OR GUARANTEE, WHICHEVER IS LONGER. THESE RECORDS SHOULD INCLUDE:
3. THE BUILDING INVESTIGATION SUMMARY AND FLOOR PLAN SKETCH.
4. PRE- AND POST-MITIGATION GAS TEST DATA.
5. PRE- AND POST-MITIGATION DIAGNOSTIC TEST DATA.
6. COPIES OF CONTRACTS AND WARRANTIES.
7. A NARRATIVE OR PICTORIAL DESCRIPTION OF MITIGATION SYSTEM(S) INSTALLED.
8. APPENDIX A CONTAINS A SUGGESTED STANDARD FORMAT FOR COMPILING MITIGATION PROJECT RECORDS.
9. OTHER RECORDS OR BOOKKEEPING REQUIRED BY LOCAL, STATE, OR FEDERAL STATUTES AND REGULATIONS SHALL BE MAINTAINED FOR THE PERIOD(S) PRESCRIBED BY THOSE REQUIREMENTS.
10. EPA RECOMMENDS THAT HEALTH AND SAFETY RECORDS, INCLUDING WORKER GAS EXPOSURE LOGS, BE MAINTAINED FOR A MINIMUM OF 20 YEARS.
11. UPON COMPLETION OF THE MITIGATION PROJECT, CONTRACTORS SHALL PROVIDE CLIENTS WITH AN INFORMATION PACKAGE THAT INCLUDES:
12. ANY BUILDING PERMITS REQUIRED BY LOCAL CODES.
13. COPIES OF THE BUILDING INVESTIGATION SUMMARY AND FLOOR PLAN SKETCH.
14. PRE-AND POST-MITIGATION GAS TEST DATA.
15. COPIES OF CONTRACTS AND WARRANTIES.
16. A DESCRIPTION OF THE MITIGATION SYSTEM INSTALLED AND ITS BASIC OPERATING PRINCIPLES.
17. A DESCRIPTION OF ANY DEVIATIONS FROM THE GMS OR STATE REQUIREMENTS.
18. A DESCRIPTION OF THE PROPER OPERATING PROCEDURES OF ANY MECHANICAL OR ELECTRICAL SYSTEMS INSTALLED, INCLUDING MANUFACTURER'S OPERATION AND MAINTENANCE INSTRUCTIONS AND WARRANTIES.
19. A LIST OF APPROPRIATE ACTIONS FOR CLIENTS TO TAKE IF THE SYSTEM FAILURE WARNING DEVICE INDICATES SYSTEM DEGRADATION OR FAILURE.
20. THE NAME, TELEPHONE NUMBER, AND EPA RPP MITIGATION SERVICE PROVIDER IDENTIFICATION NUMBER OF THE CONTRACTOR, AND THE PHONE NUMBER OF THE STATE GAS OFFICE.

THE ACCEPTANCE TESTING SHALL BE AS FOLLOWS: (5)

1. THE EXPLOSIVE GAS MONITORING SYSTEM CONTRACTOR SHALL COMPLETE ACCEPTANCE TESTING TO DEMONSTRATE THAT THE ENTIRE SYSTEMS FUNCTIONS AS DESIGNED. TESTING SHALL INCLUDE:
   A. TESTING EACH FUNCTION OF THE INTEGRATED CONTROLS AT THE CONTROLLER.
   B. CONFIRMATION OF THE CALIBRATIONS OF ALL SENSORS.
   C. TESTING OF ALL COMMUNICATIONS BETWEEN SENSORS AND CONTROLLERS AND BETWEEN THE CONTROLLER AND ALARMS AND AUTO DIALER.
   D. TESTING OF ALL ALARM FUNCTIONS OF ALL SENSORS (ABILITY TO DETECT EXPLOSIVE GAS CONCENTRATIONS) AND OTHER TROUBLE ALARM/DIAGNOSTIC CONDITIONS.
   E. THE CONTRACTOR SHALL CORRECT ALL DEFICIENCIES AND REPEAT THE TESTING FOR ANY ITEMS THAT FAIL INITIAL TESTING. OWNER SHALL NOT ACCEPT THE SYSTEM UNTIL ALL COMPONENTS AND THE ENTIRE COORDINATED SYSTEM HAVE BEEN DEMONSTRATED TO BE OPERATING AS DESIGNED.

Re: Ferry Point Park
SSDS/Foundation Drawings – Trump Golf Links Clubhouse

Dear Mr. Roediger,

New York State Department of Environmental Conservation (department) staff have reviewed the Ferry Point Park Sub-Slab Depressurization System plan and included attachments, prepared by French & Parrello Associates, which was provided by your letter dated June 12th, 2017.

The above-referenced plan appears to comply with the applicable regulations, and, therefore, is approved on the following conditions:

1) The alarm set point for the gas monitoring system is set to 25% LEL.

2) On the completion of the project and prior to occupancy of the building, a construction certification letter from a New York State registered professional engineer must be sent to the department for approval stating that the Ferry Point Park Sub-Slab Depressurization System and Foundation was constructed in accordance with the above-referenced plan and attachments. If there are deviations to the construction, they must be specified.

If you have any questions you may contact me at 718-482-4996.

Sincerely yours,

Kenneth B. Brezner

FPP_SSDSFoundation_Plan_Approval.2017-06-22.Letter.docx

## Certification Statement

I, Donald Bowman, an employee of Maser Consulting P.A. and a Registered Professional Engineer licensed by the State of New York, exercising independent judgment and discretion do hereby certify that this Subslab Depressurization System (SSDS) for the Trump Golf Links at Ferry Point Clubhouse was constructed under my direction and supervision. The information contained herein is based upon: (1) work which I have personally inspected both during and after construction from July 2017 to date; (2) information provided to me by those directly employed by Maser Consulting P.A.; (3) Design Consultants; and (4) contractors responsible for construction pursuant to their contracts except as indicated[1].

I certify that, from July 2017 to date, Maser Consulting representatives observed the installation of the critical elements of the SSDS for the Trump Golf Links at Ferry Point Clubhouse, with the following deviations from design:

- Drawing No. FO-500.00 "Vapor Remediation Underslab Plan" – lateral piping to SSDS pits DP-2B & DP-2C built approximately 2 feet offset from design due to piping conflicts
- Drawing No. FO-501.00 "Vapor Remediation Floor Plan" – riser piping for fan units SF-1 & SF built within walls to conceal system and prevent unauthorized access; gas sensors in Hall 124, Vestibule 101 & Electrical 113 ceilings built approximately 3-5 feet from design due to piping conflicts
- Drawing No. FO-502.00 "Vapor Remediation Attic & Mezzanine Plan" – fan unit SF-1 built approximately 10 feet to the left of design due to piping conflicts
- Drawing No. FO-504.00 "Vapor Remediation Details" – detail 1B built using hollow (instead of solid) concrete blocks; 'Methane Gas Sensor Detail (option 1)' & 'Methane Gas Sensor Detail (option 2)' added for sensor plenum boxes

[1] Certification means a statement of professional opinion based upon investigation, analysis, knowledge and belief that is stated to be true and accurate. 6 NYCRR Part 360-1.2(b)24.

Site Summary[1]

Ferry Point Park in the Bronx (the "Site") is a former landfill covering 222 acres that is bound by the Bronx-Whitestone Bridge and Hutchinson River Parkway to the west, Balcom/Miles/Emerson Avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south. The project was originally managed under Ferry Point Partners, LLC and was taken over solely by the City of New York Department of Parks and Recreation in October 2007.

The origins of the site back to the early 1900s. At that time an available 1900 map of the Bronx showed the western edge of the site which now contains the expressway and Whitestone Bridge was a long narrow peninsula extending out to the same area that the northern landing of the Whitestone Bridge now extends. Immediately east of this peninsula was a large open bay which is the area that the Ferry Point Golf Course is now located. Northeast of the bay and well inlandwas the Baxter Creek that drained into the bay. The eastern landfall of this embayment area is a larger peninsula that contains roadways and a residential development. The road patterns do not resemble the roadways that currently exist in that area and appear to have been changed.

A 1938 aerial photo showing the construction of the Whitestone Bridge shows the Bay, mooring, residential area and land to the west to be virtually the same as shown in the 1900 map. The significant change is in the widening of the western peninsula where the expressway was being constructed leading to the bridge ramps. The widening was not significant at this time but a rectangular area in the extreme northwest corner of what is now the site appears to be filled and graded – possibly to support construction staging area for the bridge/expressway. Areas of filling can be readily identified in the photograph by the contrasting lighter color typically indicative of sandy dredge sand placement. Other areas along the shoreline can be seen as containing a lighter colored band of fill material and this includes much of the new Ferry Point Park located west of the Whitestone Bridge. Much of the park area was filled and graded by 1938. Bulkheads were constructed with linear components to present a smooth shoreline but one that does not appear to contain a beach where water diminishes in depth to 0. Photos of the eastern area of the bay where mooring and docks can be seen showing large vessels moored against the shore. This would indicate the water had significant depth all of the way to the center of the bay.

Aerial photographs from the 1950s show a drastic change in the area currently referred to as the site. Large expansion of the filling that was evident in 1938-39 up in the northeast corner can be clearly seen. The filling extends well into the bay and it appears that a connective bridge was constructed from the eastern shore to the fill area. It is difficult to discern if this is a usable structure for crossing or if it had some other purpose. The filling operation appears from the photo to consist of the same light-colored material that was placed in the Ferry Point Park and from photos showing a large number of barges in the water filled with material of the same light color. There is specific documentation that presents the specific origin and consistency of the

[1] Reference: "Ferry Point Park Golf Course & Community Park, Bronx New York, Final Construction Certification Report, NYSDEC Permit #2-6006-00014 / 00013 (SW)" prepared by the City of New York Department of Parks and Recreation dated October 19, 2015

material. but from the prior aerials showing filling and this large expansion, it appears to be of a similar origin which would be dredge sand. In the 1951 aerial, no specific municipal solid waste dumping and disposal can be seen; however, records indicate the landfill operated during this approximate time period. It is therefore assumed that municipal solid waste was disposed shortly after the photo was taken. The landfilling shown in the aerial may have been the initial construction of the upper portion of the landfill with the tidal gate or bridge closing in the upper bay area. Additional aerials of the landfilling were not identified and more recent aerials document the completion of filling as well as the more recent golf course construction.

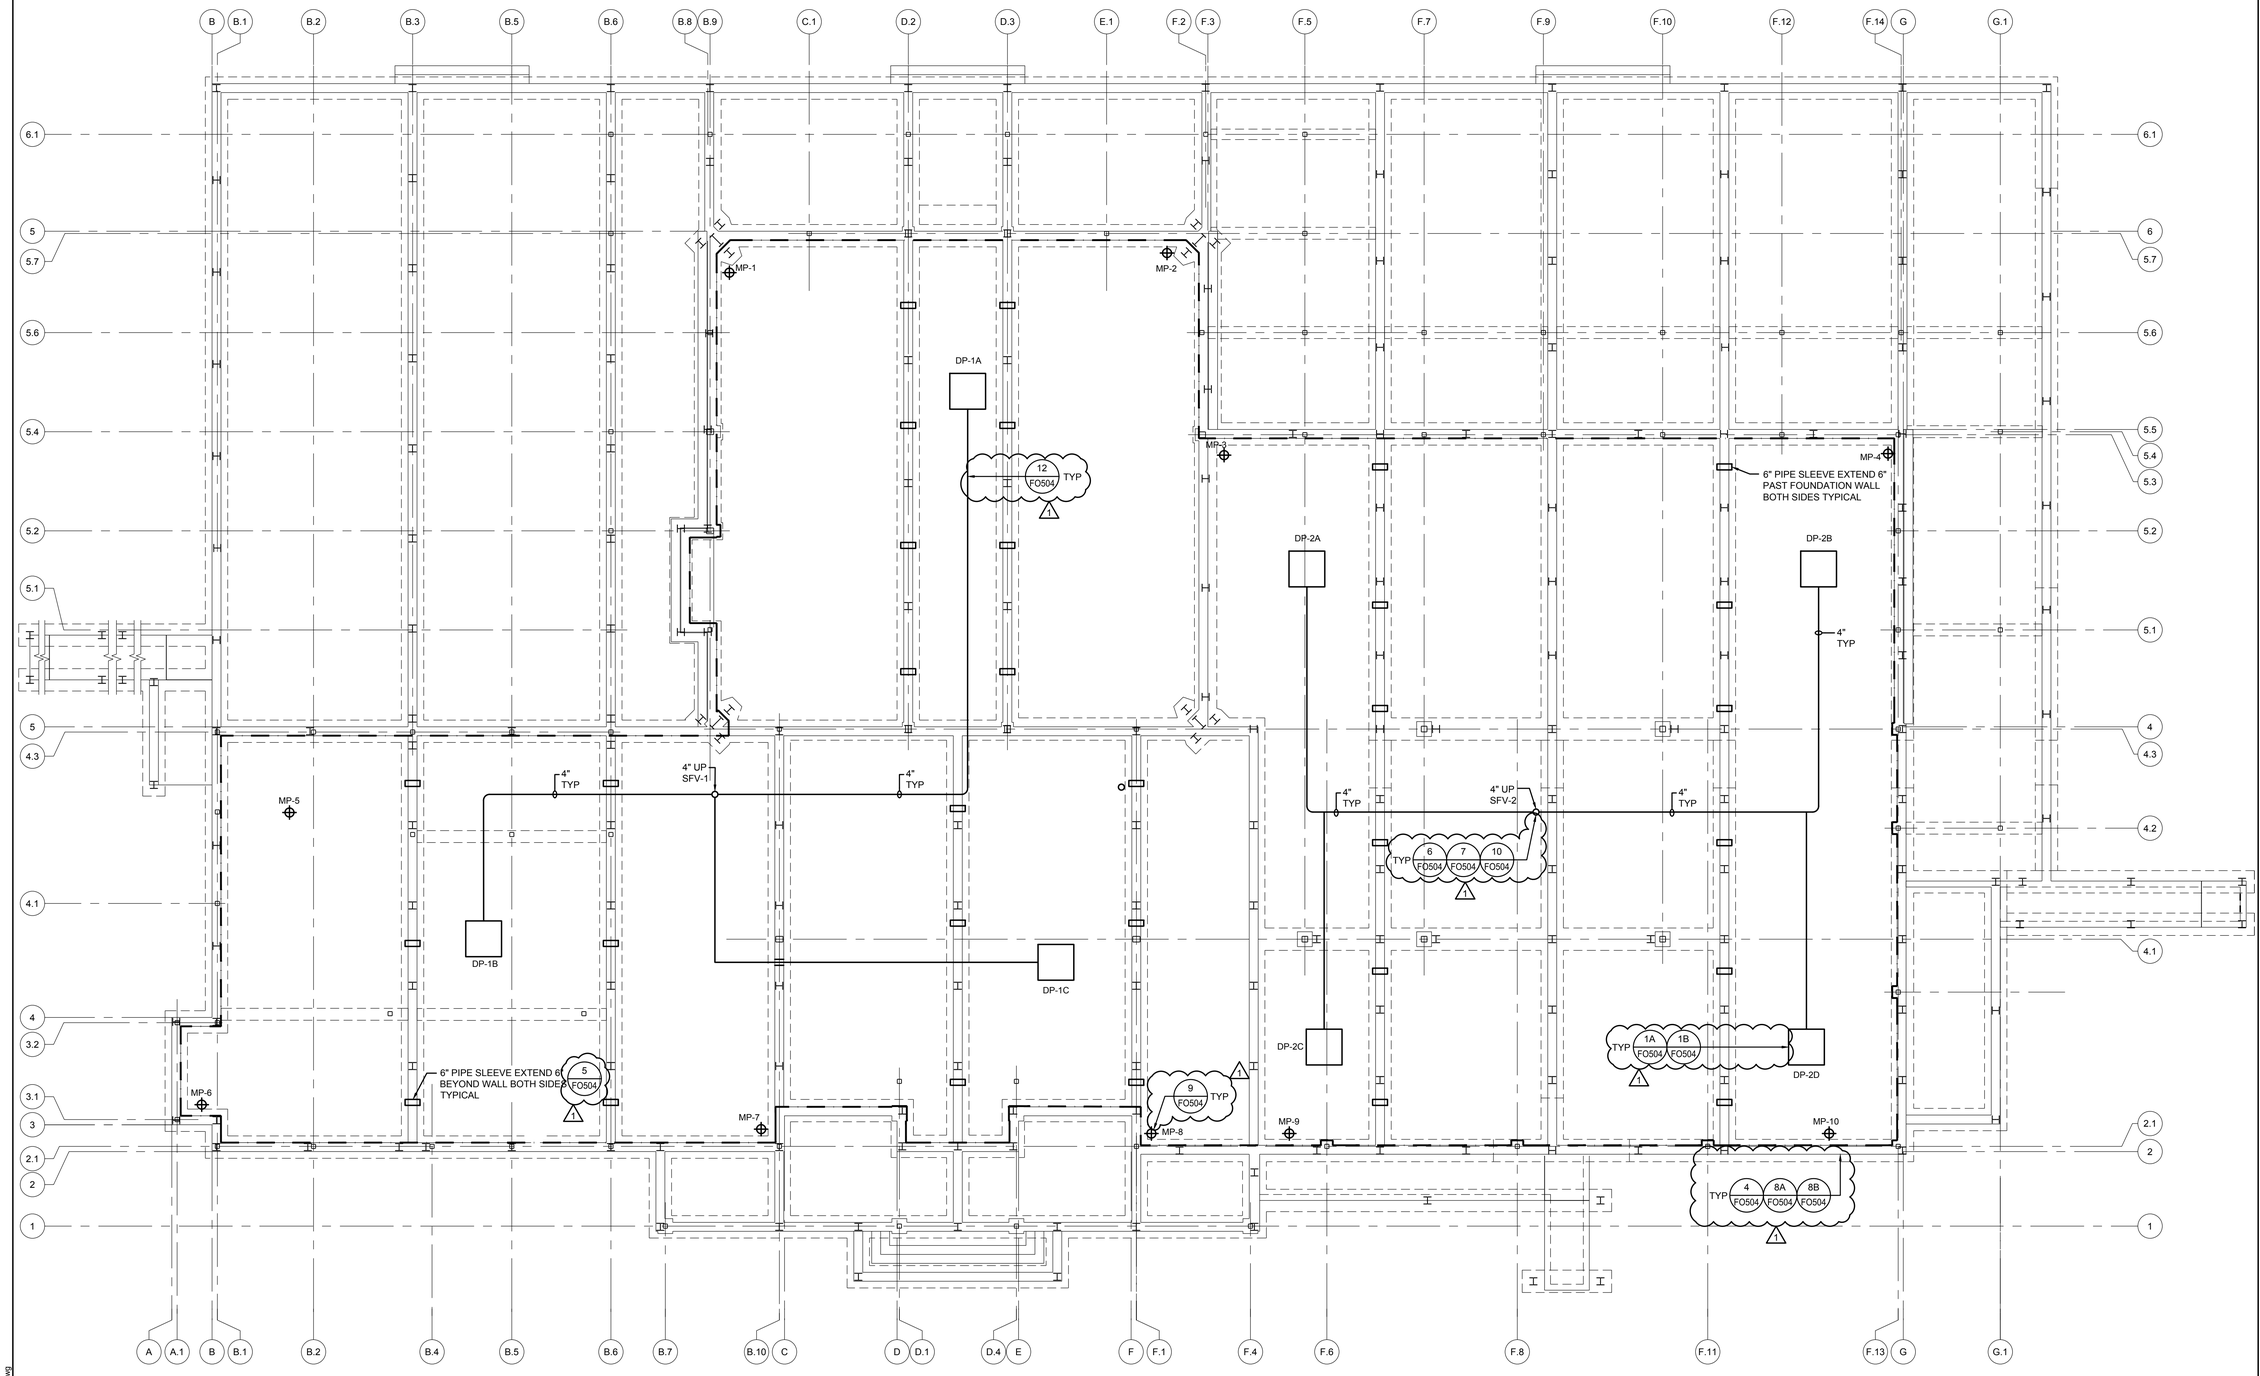
What can be discerned from this compilation of photos is that the landfill could be located in an area that may have been open water as well as some area that was previously reclaimed land with dredge material.

The Site operated as a landfill from before 1951 to the 1960s. The landfill reportedly accepted municipal solid waste during its operating period and was closed and covered in the mid-1960s, with additional closure operations conducted more recently in the 1980s. Prior Site use was determined from historic aerial photographs from 1938 thru 1991. The aerial photographs span the entire operational period of the prior landfill, from its initial operations to the present, and provides substantial information about the Site's development.

The original project scope included the construction of three main elements including a golf course, a community park, and a waterfront park over the 222-acre Site as follows:

- An 18-hole golf course with practice facility, driving range, clubhouse, maintenance facility, irrigation lake, stormwater retention ponds, and a parking lot (192.5 acres);
- A passive recreation waterfront park with walkways and a comfort station (19.5 acres); and
- A community park with baseball fields, basketball court, walkways, comfort station, and landscaped stormwater retention area (10 acres)

Construction of a permanent clubhouse in the southern corner of the site began in July 2017, with a projected completion date of June 2018.



## UNDERSLAB PLAN

SCALE: 1/8" = 1'-0"

NOTES :

1. DRAWINGS NOT TO BE USED FOR STRUCTURAL, ARCHITECTURAL OR OTHER REFERENCE EXCEPT FOR SUB-SLAB DEPRESSURIZATION SYSTEM.
2. THE EXTENTS OF BUILDING CONSTRUCTION BENEATH THE FLOOR SLABS SHALL BE LINED WITH GAS VAPOR BARRIER. AS PART OF BUILDING CONSTRUCTION. THE GAS VAPOR BARRIER SHALL ALSO BE APPLIED VERTICALLY TO BELOW GRADE WALLS AND WALLS OF PITS AND SUMPS AS SHOWN AND SPECIFIED.
3. SLOPE HORIZONTAL PIPE UNIFORMLY A MINIMUM OF 1% TOWARD SUB-SLAB DEPRESSION SYSTEM PITS OR TO CONDENSATE DRAINS WHEN PIPING CANNOT BE SLOPED TO PIT.
4. SECURE VERTICAL RISER TO WALL IN ACCORDANCE WITH ARCHITECTURAL AND PLUMBING REQUIREMENTS.
5. ELECTRICAL WIRING AND EQUIPMENT NOT SHOWN. REFER TO ELECTRICAL DRAWINGS AND SPECIFICATIONS FOR REFERENCES.
6. SEAL ALL JOINTS IN SLAB ON GRADE, INCLUDING BUT NOT LIMITED TO, CONTROL JOINTS, EXPANSION JOINTS, CRACKS, WALL JOINTS, PENETRATIONS ETC. WITH NON-CRACKING CAULK. POLYURETHANE TYPE PREFERRED.
7. COORDINATE GAS VENTING SYSTEM WITH ALL TRADES, INCLUDE VENTING SYSTEM PIPING ON COORDINATION DRAWINGS.
8. ALL GAS VENTS SHALL BE CONTINUOUS FROM UNDERSLAB STONE BASE TO 36" ABOVE ROOF LINE OR PARAPET (WHICHEVER IS HIGHER). ALL VENTS SHALL BE 10'-0" MIN FROM LOT LINES, OUTSIDE AIR INTAKES, WINDOWS, ETC.
9. DRAWING ILLUSTRATES WALLS AND ALL SLAB ON GRADE FLOOR AREAS. COORDINATE THIS WORK WITH ARCHITECTURAL, MECHANICAL, AND STRUCTURAL PLANS.
10. ALL GAS VENT PIPING SHALL BE PVC PIPING. WHERE PIPING IS LOCATED IN RETURN AIR PLENUMS CHANGE MATERIAL TO NO-HUB CAST IRON PIPE.
11. LABEL GAS PIPING AT INTERVALS OF NOT MORE THAN 25 FT IN CONCEALED LOCATIONS AND NOT MORE THAN 50 FT ON EXPOSED AND NOT LESS THAN ONCE IN ANY ROOM OR SPACE.
12. GAS VAPOR BARRIER TO BE INSTALLED IMMEDIATELY BELOW FLOOR SLAB AS INDICATED ON THE STRUCTURAL DRAWINGS. PROVIDE 12" MINIMUM CLEAN #57 STONE SUB-BASE FOR GAS MITIGATION SYSTEM.
13. SLOPE HORIZONTAL PIPE A MINIMUM OF 1% UNIFORMLY TOWARD SUCTION PITS.
14. REFER TO SPECIFICATION FOR ADDITIONAL SUB-SLAB DEPRESSURIZATION SYSTEM AND ACCESSORIES REQUIREMENTS.

## LEGEND

- EXTENT OF GAS PERMEABLE AGGREGATE LAYER BENEATH FLOOR SLAB
- 4" SCHEDULE 80 PVC PIPE
- SFV-1 — SUCTION FAN VERTICAL 4" RISER AND IDENTIFICATION NUMBER. EXTEND THRU ATTIC TO SUCTION FAN
- MP-1 — SUB-SLAB MONITORING POINT AND IDENTIFICATION NUMBER
- DP-1A — SUB-SLAB DEPRESURAIZATION PIT AND IDENTIFICATION NUMBER

FOR CONSTRUCTION

PROVIDE LIQUID BOOT GAS VAPOR BARRIER SYSTEM UNDER SLAB AS MANUFACTURED BY CETCO CONSISTING OF ULTRASHIELD G-1000, 60 DRY MILS LIQUID BOOT AND LIQUID BOOT BASE FABRIC. SYSTEM SHALL INSTALLED BY AUTHORIZED INSTALLER. REFER TO DETAILS FOR ADDITIONAL INFORMATION. REFER TO CONTRACT DOCUMENTS FOR LOCATIONS OF PENETRATIONS THROUGH THE SLAB.

OFFSET VENT ABOVE CEILING AT ROOF AND EXTEND THROUGH ROOF APPROXIMATELY 3' FROM PARAPET WALLS AND TERMINATE 24" ABOVE FINISHED ROOF.

VAPOR REMEDIATION ATTIC & MEZZANINE PLAN

PROJECT #: 14-534
DRAWN BY:
CHECKED BY: FRM

DRAWING NO:
FO-502.00

O:\GK\9600\9634 - Ferry Point Clubhouse\CADD\DWG\9634.001 - FO-502.dwg

COPYRIGHT © 2015, FRENCH & PARRELLO ASSOCIATES, PA - THE COPYING OR REUSE OF THIS DOCUMENT, OR PORTIONS THEREOF, WITHOUT THE WRITTEN PERMISSION OF FRENCH & PARRELLO ASSOCIATES, PA IS PROHIBITED. DUE TO INHERENT ERRORS IN REPRODUCTION METHODS, ERRORS MAY OCCUR WHEN SCALING THIS DRAWING.

# VAPOR REMEDIATION GENERAL NOTES

A. SCOPE

1. ALL CONSTRUCTION SHALL COMPLY WITH THE NYSDEC APPROVED POST CONSTRUCTION CUSTODIAL CARE PLAN DATED OCTOBER 2013, PREPARED BY NYC DPR, INCLUDING THE APPROPRIATE HANDLING OF COVER, SOIL, SHAPING LAYER MATERIAL, DEMARCATION LAYER MATERIALS, AND MSW, AND INSPECTION AND CONSTRUCTION CERTIFICATION REQUIREMENTS.
2. THE GAS MITIGATION SYSTEM IS TO BE INSTALLED BY A LICENSED GAS MITIGATION CONTRACTOR IN THE STATE OF NEW YORK. CONTRACTOR TO SUBMIT DESIGN SHOP DRAWINGS FOR REVIEW PRIOR TO CONSTRUCTION.
3. THE REQUIREMENTS ADDRESSED IN THE GAS MITIGATION SYSTEM (GMS) INCLUDE THE FOLLOWING CATEGORIES OF CONTRACTOR ACTIVITY: GENERAL PRACTICES, WORKER HEALTH AND SAFETY, SYSTEMS INSTALLATION, MATERIALS, MONITORS AND LABELING, POST-MITIGATION TESTING, AND CONTRACTS AND DOCUMENTATION.

B. IMPLEMENTATION

1. THE GMS INCLUDES REQUIREMENTS FOR INSTALLATION OF GAS REMEDIATION SYSTEMS AND PROVIDES A BASIS FOR EVALUATING THE QUALITY OF THOSE INSTALLATIONS. IT MAY BE ADOPTED BY STATE REGULATORY AGENCIES FOR STATE OR LOCAL GAS MITIGATION CONTRACTOR LICENSURE PROGRAMS. IT MAY ALSO BE USED AS A REFERENCE DURING INSPECTION OF IN-PROGRESS OR COMPLETED GAS MITIGATION WORK.
2. CONTRACTORS SHALL PERSONALLY CONDUCT FOLLOW-UP INSPECTION OF ANY GAS MITIGATION SYSTEMS INSTALLED BY THEIR FIRM OR BY SUBCONTRACTORS TO INSURE CONFORMANCE WITH THE REQUIREMENTS OF THE GMS. THIS REQUIREMENT SHALL INCLUDE THE POST-MITIGATION TESTING PRESCRIBED IN THIS SPECIFICATION.
3. THOSE PROVISIONS OF THE GMS THAT ARE CONSIDERED TO BE MANDATORY ARE PREFACED BY THE TERM "SHALL." PROVISIONS THAT ARE CONSIDERED GOOD PRACTICE BUT WHICH ARE NOT MANDATORY ARE PREFACED BY THE TEGMS "SHOULD" OR "RECOMMENDED."

C. LIMITATIONS

1. ALTHOUGH THE PROVISIONS OF THE GMS HAVE BEEN CAREFULLY REVIEWED FOR POTENTIAL CONFLICTS WITH OTHER REGULATORY REQUIREMENTS, ADHERENCE TO THE GMS DOES NOT GUARANTEE COMPLIANCE WITH THE APPLICABLE CODES OR REGULATIONS OF ANY OTHER FEDERAL, STATE, OR LOCAL AGENCY HAVING JURISDICTION.
2. WHERE DISCREPANCIES EXIST BETWEEN PROVISIONS OF THE GMS AND LOCAL CODES OR REGULATIONS, LOCAL CODES SHALL TAKE PRECEDENCE. HOWEVER, WHERE COMPLIANCE WITH LOCAL CODES NECESSITATES A DEVIATION FROM THE GMS, EPA RECOMMENDS THAT RPP LISTED MITIGATION SERVICE PROVIDERS (MITIGATION CONTRACTORS) REPORT THE DEVIATION IN WRITING TO THE APPROPRIATE EPA REGIONAL OFFICE AND THE APPROPRIATE STATE REGULATORY OFFICIAL WITHIN 30 DAYS. IT SHOULD BE NOTED THAT EPA IS NOT REQUIRING THE REPORTING THAT IS RECOMMENDED IN THIS PARAGRAPH. STATES WITH GAS MITIGATION CONTRACTOR CERTIFICATION PROGRAMS MAY REQUIRE THAT CONTRACTORS GIVE PRIOR NOTIFICATION OF THEIR INTENT TO DEVIATE FROM THE GMS FOR RESEARCH OR OTHER PURPOSES.
3. THE GMS IS NOT INTENDED TO BE USED AS A DESIGN MANUAL, AND COMPLIANCE WITH ITS PROVISIONS WILL NOT GUARANTEE REDUCTION OF INDOOR GAS CONCENTRATIONS TO ANY SPECIFIC LEVEL.
4. BECAUSE OF THE WIDE VARIATION IN BUILDING DESIGN, SIZE, OPERATION AND USE, THE GMS DOES NOT INCLUDE DETAILED GUIDANCE ON HOW TO SELECT THE MOST APPROPRIATE MITIGATION STRATEGY FOR A GIVEN BUILDING. THAT GUIDANCE IS PROVIDED IN THE DOCUMENTS REFERENCED IN IN THIS SPECIFICATION.
5. CONTRACTORS WHO EXPECT TO DEVIATE FROM PROVEN GAS MITIGATION TECHNOLOGIES AND METHODS FOR PURPOSES OF RESEARCH ON INNOVATIVE MITIGATION TECHNIQUES, SHALL OBTAIN PRIOR APPROVAL FROM STATE REGULATORY OFFICES, DOCUMENT THE NON-STANDARD TECHNIQUES, AND INFORM THE CLIENT OF THE DEVIATION FROM STANDARD PROCEDURES. IN CASES WHERE GAS MITIGATION IS NOT REGULATED BY THE STATE, CONTRACTORS SHALL OBTAIN PRIOR APPROVAL FROM A REGIONAL EPA OFFICE.

D. WORKER HEALTH AND SAFETY

1. CONTRACTORS SHALL COMPLY WITH ALL OSHA, STATE AND LOCAL STANDARDS OR REGULATIONS RELATING TO WORKER SAFETY AND OCCUPATIONAL GAS EXPOSURE. APPLICABLE REFERENCES IN THE CODE OF FEDERAL REGULATIONS AND NIOSH PUBLICATIONS.
2. IN ADDITION TO THE OSHA AND NIOSH STANDARDS, THE FOLLOWING REQUIREMENTS THAT ARE SPECIFICALLY OR UNIQUELY APPLICABLE FOR THE SAFETY AND PROTECTION OF GAS MITIGATION WORKERS SHALL BE MET:
   a. THE CONTRACTOR SHALL ADVISE WORKERS OF THE HAZARDS OF EXPOSURE TO GAS AND THE NEED TO APPLY PROTECTIVE MEASURES WHEN WORKING IN AREAS OF ELEVATED GAS CONCENTRATIONS.
   b. THE CONTRACTOR SHALL HAVE A WORKER PROTECTION PLAN ON FILE THAT IS AVAILABLE TO ALL EMPLOYEES AND IS APPROVED BY ANY STATE OR LOCAL REGULATING AGENCIES THAT REQUIRE SUCH A PLAN. EXCEPTION: A WORKER PROTECTION PLAN IS NOT REQUIRED FOR A CONTRACTOR WHO IS A SOLE PROPRIETOR UNLESS REQUIRED BY STATE OR LOCAL REGULATIONS.
   c. THE CONTRACTOR SHALL ENSURE THAT APPROPRIATE SAFETY EQUIPMENT SUCH AS HARD HATS, FACE SHIELDS, EAR PLUGS, STEEL-TOE BOOTS AND PROTECTIVE GLOVES ARE AVAILABLE ON THE JOB SITE DURING CUTTING, DRILLING, GRINDING, POLISHING, DEMOLISHING OR OTHER ACTIVITY ASSOCIATED WITH GAS MITIGATION PROJECTS.
   d. ALL ELECTRICAL EQUIPMENT USED DURING GAS MITIGATION PROJECTS SHALL BE PROPERLY GROUNDED. CIRCUITS USED AS A POWER SOURCE SHOULD BE PROTECTED BY GROUND-FAULT CIRCUIT INTERRUPTERS (GFCI).
   e. WHEN WORK IS REQUIRED AT ELEVATIONS ABOVE THE GROUND OR FLOOR, THE CONTRACTOR SHALL ENSURE THAT LADDERS OR SCAFFOLDING ARE SAFELY INSTALLED AND OPERATED.
   f. WORK AREAS SHALL BE VENTILATED TO REDUCE WORKER EXPOSURE TO GAS DECAY PRODUCTS, DUST, OR OTHER AIRBORNE POLLUTANTS. IN WORK AREAS WHERE VENTILATION IS IMPRACTICAL OR WHERE VENTILATION CANNOT REDUCE GAS LEVELS TO LESS THAN 0.3 WL (BASED ON A SHORT TERM DIAGNOSTIC TEST, E.G., GRAB SAMPLE), THE CONTRACTOR SHALL ENSURE THAT RESPIRATORY PROTECTION CONFOGMS WITH THE REQUIREMENTS IN THE NIOSH GUIDE TO INDUSTRIAL RESPIRATORY PROTECTION. ( (NOTE: IF UNABLE TO MAKE WORKING LEVEL MEASUREMENTS, A GAS LEVEL OF 30 PCI/L SHALL BE USED.)
   g. WHERE COMBUSTIBLE MATERIALS EXIST IN THE SPECIFIC AREA OF THE BUILDING WHERE GAS MITIGATION WORK IS TO BE CONDUCTED AND THE CONTRACTOR IS CREATING ANY TEMPERATURES HIGH ENOUGH TO INDUCE A FLAME, THE CONTRACTOR SHALL ENSURE THAT FIRE EXTINGUISHERS SUITABLE FOR TYPE A, B, AND C FIRES ARE AVAILABLE IN THE IMMEDIATE WORK AREA.
   h. PENDING DEVELOPMENT OF AN APPROVED PERSONAL GAS EXPOSURE DEVICE AND A PROTOCOL FOR ITS USE, CONTRACTORS SHALL RECORD EMPLOYEE EXPOSURE TO GAS AT EACH WORK SITE, BASED ON:
      1) THE HIGHEST PRE-MITIGATION INDOOR GAS OR WORKING LEVEL MEASUREMENT AVAILABLE, AND
      2) THE TIME EMPLOYEES ARE EXPOSED (WITHOUT RESPIRATOR PROTECTION) AT THAT LEVEL

      (NOTE: THIS APPROACH IS NOT INTENDED TO PRECLUDE THE ALTERNATIVE USE OF ON-SITE GAS OR GAS DECAY PRODUCT MEASUREMENTS TO DETERMINE EXACT EXPOSURE.) CONSISTENT WITH OSHA PERMISSIBLE EXPOSURE LIMITS, CONTRACTORS SHALL ENSURE THAT EMPLOYEES ARE EXPOSED TO NO MORE THAN 4 WORKING LEVEL MONTHS (WLM) OVER A 12 MONTH PERIOD. (AN EQUILIBRIUM RATIO OF 50 PERCENT SHALL BE USED TO CONVERT GAS EXPOSURE TO WLM.)
   i. WHEN MITIGATION WORK REQUIRES THE USE OF SEALANTS, ADHESIVES, PAINTS, OR OTHER SUBSTANCES THAT MAY BE HAZARDOUS TO HEALTH, CONTRACTORS SHALL PROVIDE EMPLOYEES WITH THE APPLICABLE MATERIAL SAFETY DATA SHEETS (MSDS) AND EXPLAIN THE REQUIRED SAFETY PROCEDURES.

E. SYSTEMS REQUIREMENT

1. ALL GAS MITIGATION SYSTEMS SHALL BE INSTALLED AS PERMANENT, INTEGRAL ADDITIONS TO THE BUILDING, EXCEPT WHERE A TEMPORARY SYSTEM HAS BEEN INSTALLED.
2. ALL GAS MITIGATION SYSTEMS SHALL BE INSTALLED TO AVOID THE CREATION OF OTHER HEALTH, SAFETY, OR ENVIRONMENTAL HAZARDS TO BUILDING OCCUPANTS, SUCH AS BACKDRAFTING OF NATURAL DRAFT COMBUSTION APPLIANCES.
3. ALL GAS MITIGATION SYSTEMS SHALL MAXIMIZE GAS REDUCTION AND IN CONSIDERATION OF THE NEED TO MINIMIZE EXCESS ENERGY USAGE, TO AVOID COMPROMISING MOISTURE AND TEMPERATURE CONTROLS AND OTHER COMFORT FEATURES, AND TO MINIMIZE NOISE.
4. ALL GAS MITIGATION SYSTEMS AND THEIR COMPONENTS SHALL COMPLY WITH THE LAWS, ORDINANCES, CODES, AND REGULATIONS OF RELEVANT JURISDICTIONAL AUTHORITIES, INCLUDING APPLICABLE MECHANICAL, ELECTRICAL, BUILDING, PLUMBING, ENERGY, AND FIRE PREVENTION CODES.

F. SYSTEMS INSTALLATION

1. GENERAL REQUIREMENTS
   a. ALL COMPONENTS OF GAS MITIGATION SYSTEMS INSTALLED IN COMPLIANCE WITH PROVISIONS OF THE GMS SHALL ALSO BE IN COMPLIANCE WITH THE APPLICABLE MECHANICAL, ELECTRICAL, BUILDING, PLUMBING, ENERGY AND FIRE PREVENTION CODES, STANDARDS, AND REGULATIONS OF THE LOCAL JURISDICTION.
   b. THE CONTRACTOR SHALL OBTAIN ALL REQUIRED LICENSES AND PERMITS, AND DISPLAY THEM IN THE WORK AREAS AS REQUIRED BY LOCAL ORDINANCES.
   c. WHERE PORTIONS OF STRUCTURAL FRAMING MATERIAL MUST BE REMOVED TO ACCOMMODATE GAS VENT PIPES, MATERIAL REMOVED SHALL BE NO GREATER THAN THAT PERMITTED FOR PLUMBING INSTALLATIONS BY APPLICABLE BUILDING OR PLUMBING CODES.
   d. WHERE INSTALLATION OF A GAS MITIGATION SYSTEM REQUIRES PIPES OR DUCTS TO PENETRATE A FIREWALL OR OTHER FIRE RESISTANCE RATED WALL OR FLOOR, PENETRATIONS SHALL BE PROTECTED IN ACCORDANCE WITH APPLICABLE BUILDING, MECHANICAL, FIRE, AND ELECTRICAL CODES.
2. GAS VENT PIPE INSTALLATION REQUIREMENTS
   a. ALL JOINTS AND CONNECTIONS IN GAS MITIGATION SYSTEMS USING PLASTIC VENT PIPES SHALL BE PERMANENTLY SEALED WITH ADHESIVES AS SPECIFIED BY THE MANUFACTURER OF THE PIPE MATERIAL USED. JOINTS OR CONNECTIONS IN OTHER VENT PIPE MATERIALS SHALL BE MADE AIR TIGHT.
   b. ATTIC AND EXTERNAL PIPING RUNS IN AREAS SUBJECT TO SUBFREEZING CONDITIONS SHOULD BE PROTECTED TO AVOID THE RISK OF VENT PIPE FREEZE-UP.
   c. GAS VENT PIPES SHALL BE FASTENED TO THE STRUCTURE OF THE BUILDING WITH HANGERS, STRAPPING, OR OTHER SUPPORTS THAT WILL ADEQUATELY SECURE THE VENT MATERIAL. EXISTING PLUMBING PIPES, DUCTS, OR MECHANICAL EQUIPMENT SHALL NOT BE USED TO SUPPORT OR SECURE A GAS VENT PIPE.
   d. SUPPORTS FOR GAS VENT PIPES SHALL BE INSTALLED AT LEAST EVERY 6 FEET ON HORIZONTAL RUNS. VERTICAL RUNS SHALL BE SECURED EITHER ABOVE OR BELOW THE POINTS OF PENETRATION THRU FLOORS, CEILINGS, AND ROOFS, OR AT LEAST EVERY 8 FEET ON RUNS THAT DO NOT PENETRATE FLOORS, CEILINGS, OR ROOFS.
   e. TO PREVENT BLOCKAGE OF AIR FLOW INTO THE BOTTOM OF GAS VENT PIPES, THESE PIPES SHALL BE SUPPORTED OR SECURED IN A PERMANENT MANNER THAT PREVENTS THEIR DOWNWARD MOVEMENT TO THE BOTTOM OF SUCTION PITS OR SUMP PITS, OR INTO THE SOIL BENEATH AN AGGREGATE LAYER UNDER A SLAB.
   f. GAS VENT PIPES SHALL BE INSTALLED IN A CONFIGURATION THAT ENSURES THAT ANY RAIN WATER OR CONDENSATION WITHIN THE PIPES DRAINS DOWNWARD INTO THE GROUND BENEATH THE SLAB OR SOIL-GAS RETARDER MEMBRANE.
   g. GAS VENT PIPES SHALL NOT BLOCK ACCESS TO ANY AREAS REQUIRING MAINTENANCE OR INSPECTION. GAS VENTS SHALL NOT BE INSTALLED IN FRONT OF OR INTERFERE WITH ANY LIGHT, OPENING, DOOR, WINDOW OR EQUIPMENT ACCESS AREA REQUIRED BY CODE. IF GAS VENT PIPES ARE INSTALLED IN SUMP PITS, THE SYSTEM SHALL BE DESIGNED WITH REMOVABLE OR FLEXIBLE COUPLINGS TO FACILITATE REMOVAL OF THE SUMP PIT COVER FOR SUMP PUMP MAINTENANCE.
3. GAS VENT FAN INSTALLATION REQUIREMENTS
   a. VENT FANS USED IN GAS MITIGATION SYSTEMS SHALL BE SEALED TO REDUCE THE POTENTIAL FOR LEAKAGE OF SOIL GAS FROM THE FAN HOUSING.
   b. GAS VENT FANS SHALL BE SIZED TO PROVIDE THE PRESSURE DIFFERENCE AND AIR FLOW CHARACTERISTICS NECESSARY TO ACHIEVE THE GAS REDUCTION GOALS ESTABLISHED FOR THE SPECIFIC MITIGATION PROJECT
   c. GAS VENT FANS USED IN ACTIVE SOIL DEPRESSURIZATION OR BLOCK WALL DEPRESSURIZATION SYSTEMS SHALL NOT BE INSTALLED BELOW GROUND NOR IN THE CONDITIONED (HEATED/COOLED) SPACE OF A BUILDING, NOR IN ANY BASEMENT, CRAWLSPACE, OR OTHER INTERIOR LOCATION DIRECTLY BENEATH THE CONDITIONED SPACES OF A BUILDING. ACCEPTABLE LOCATIONS FOR GAS VENT FANS INCLUDE ATTICS NOT SUITABLE FOR OCCUPANCY (INCLUDING ATTICS OVER OCCUPIED) OR ON THE EXTERIOR OF THE BUILDING.
   d. GAS VENT FANS SHALL BE INSTALLED IN A CONFIGURATION THAT AVOIDS CONDENSATION BUILDUP IN THE FAN HOUSING. WHENEVER POSSIBLE, FANS SHOULD BE INSTALLED IN VERTICAL RUNS OF THE VENT PIPE.
   e. GAS VENT FANS MOUNTED ON THE EXTERIOR OF BUILDINGS SHALL BE RATED FOR OUTDOOR USE OR INSTALLED IN A WATER TIGHT PROTECTIVE HOUSING.
   f. GAS VENT FANS SHALL BE MOUNTED AND SECURED IN A MANNER THAT MINIMIZES TRANSFER OF VIBRATION TO THE STRUCTURAL FRAMING OF THE BUILDING.
   g. TO FACILITATE MAINTENANCE AND FUTURE REPLACEMENT, GAS VENT FANS SHALL BE INSTALLED IN THE VENT PIPE USING REMOVABLE COUPLINGS OR FLEXIBLE CONNECTIONS THAT CAN BE TIGHTLY SECURED TO BOTH THE FAN AND THE VENT PIPE.
5. SEALING REQUIREMENTS
   a. SUMP PITS THAT PERMIT ENTRY OF SOIL-GAS OR THAT WOULD ALLOW CONDITIONED AIR TO BE DRAWN INTO A SUB-SLAB DEPRESSURIZATION SYSTEM SHALL BE COVERED AND SEALED. THE COVERS ON SUMPS THAT PREVIOUSLY PROVIDED PROTECTION OR RELIEF FROM SURFACE WATER COLLECTION SHALL BE FITTED WITH A WATER OR MECHANICALLY TRAPPED DRAIN. WATER TRAPS SHOULD BE FITTED WITH AN AUTOMATIC SUPPLY OF PRIMING WATER.
   b. OPENINGS AROUND GAS VENT PIPE PENETRATIONS OF THE SLAB, THE FOUNDATION WALLS, OR THE CRAWLSPACE SOIL-GAS RETARDER MEMBRANE SHALL BE CLEANED, PREPARED, AND SEALED IN A PERMANENT, AIR-TIGHT MANNER USING COMPATIBLE CAULKS OR OTHER SEALANT MATERIALS. OPENINGS AROUND OTHER UTILITY PENETRATIONS OF THE SLAB, WALLS, OR SOIL-GAS RETARDER SHALL ALSO BE SEALED.
   c. OPENINGS, PERIMETER CHANNEL DRAINS, OR CRACKS THAT EXIST WHERE THE SLAB MEETS THE FOUNDATION WALL (FLOOR-WALL JOINT), SHALL BE SEALED WITH URETHANE CAULK OR EQUIVALENT MATERIAL. WHEN THE OPENING OR CHANNEL IS GREATER THAN 1/2 INCH IN WIDTH, A FOAM BACKER ROD OR OTHER COMPARABLE FILLER MATERIAL SHALL BE INSERTED IN THE CHANNEL BEFORE APPLICATION OF THE SEALANT. THIS SEALING TECHNIQUE SHALL BE DONE IN A MANNER THAT RETAINS THE CHANNEL FEATURE AS A WATER CONTROL SYSTEM. OTHER OPENINGS OR CRACKS IN SLABS OR AT EXPANSION OR CONTROL JOINTS SHOULD ALSO BE SEALED. OPENINGS OR CRACKS THAT ARE DETERMINED TO BE INACCESSIBLE OR BEYOND THE ABILITY OF THE CONTRACTOR TO SEAL SHALL BE DISCLOSED TO THE CLIENT AND INCLUDED IN THE DOCUMENTATION.
   d. WHEN INSTALLING BASEBOARD-TYPE SUCTION SYSTEMS, ALL SEAMS AND JOINTS IN THE BASEBOARD MATERIAL SHALL BE JOINED AND SEALED USING MATERIALS RECOMMENDED BY THE MANUFACTURER OF THE BASEBOARD SYSTEM. BASEBOARDS SHALL BE SECURED TO WALLS AND FLOORS WITH ADHESIVES DESIGNED AND RECOMMENDED FOR SUCH INSTALLATIONS. IF A BASEBOARD SYSTEM IS INSTALLED ON A BLOCK WALL FOUNDATION, THE TOPS OF THE BLOCKWALL SHALL BE CLOSED AND SEALED.

G. ELECTRICAL REQUIREMENTS

1. WIRING FOR ALL ACTIVE GAS MITIGATION SYSTEMS SHALL CONFORM TO PROVISIONS OF THE NATIONAL ELECTRIC CODE AND ANY ADDITIONAL LOCAL REGULATIONS.
2. WIRING MAY NOT BE LOCATED IN OR CHASED THRU THE MITIGATION INSTALLATION DUCTING OR ANY OTHER HEATING OR COOLING DUCTWORK.
3. GAS MITIGATION FANS INSTALLED ON THE EXTERIOR OF BUILDINGS SHALL BE HARD-WIRED INTO AN ELECTRICAL CIRCUIT. PLUGGED FANS SHALL NOT BE USED OUTDOORS.
4. IF THE RATED ELECTRICITY REQUIREMENTS OF A GAS MITIGATION SYSTEM FAN EXCEEDS 50 PERCENT OF THE CIRCUIT CAPACITY INTO WHICH IT WILL BE CONNECTED, OR IF THE TOTAL CONNECTED LOAD ON THE CIRCUIT (INCLUDING THE GAS VENT FAN) EXCEEDS 80 PERCENT OF THE CIRCUIT'S RATED CAPACITY, A SEPARATE, DEDICATED CIRCUIT SHALL BE INSTALLED TO POWER THE FAN.
5. AN ELECTRICAL DISCONNECT SWITCH OR CIRCUIT BREAKER SHALL BE INSTALLED IN GAS MITIGATION SYSTEM FAN CIRCUITS TO PERMIT DEACTIVATION OF THE FAN FOR MAINTENANCE OR REPAIR BY THE BUILDING OWNER OR SERVICING CONTRACTOR (DISCONNECT SWITCHES ARE NOT REQUIRED WITH PLUGGED FANS).

H. MATERIALS

1. ALL MITIGATION SYSTEM ELECTRICAL COMPONENTS SHALL BE U.L. LISTED OR OF EQUIVALENT SPECIFICATIONS.
2. AS A MINIMUM, ALL PLASTIC VENT PIPES IN MITIGATION SYSTEMS SHALL BE MADE OF SCHEDULE 80 PVC OR EQUIVALENT PIPING MATERIAL.
3. VENT PIPE FITTINGS IN A MITIGATION SYSTEM SHALL BE OF THE SAME MATERIAL AS THE VENT PIPES.
4. CLEANING SOLVENTS AND ADHESIVES USED TO JOIN PLASTIC PIPES AND FITTINGS SHALL BE AS RECOMMENDED BY MANUFACTURERS FOR USE WITH THE TYPE OF PIPE MATERIAL USED IN THE MITIGATION SYSTEM.
5. WHEN SEALING CRACKS IN SLABS AND OTHER SMALL OPENINGS AROUND PENETRATIONS OF THE SLAB AND FOUNDATION WALLS, CAULKS AND SEALANTS DESIGNED FOR SUCH APPLICATION SHALL BE USED. URETHANE SEALANTS ARE RECOMMENDED BECAUSE OF THEIR DURABILITY.
6. WHEN SEALING HOLES FOR PLUMBING ROUGH-IN OR OTHER LARGE OPENINGS IN SLABS AND FOUNDATION WALLS THAT ARE BELOW THE GROUND SURFACE, NON-SHRINK MORTAR, GROUTS, EXPANDING FOAM, OR SIMILAR MATERIALS DESIGNED FOR SUCH APPLICATION SHALL BE USED.

I. MONITORS AND LABELING

1. ALL ACTIVE SOIL DEPRESSURIZATION AND BLOCK WALL DEPRESSURIZATION GAS MITIGATION SYSTEMS SHALL INCLUDE A MECHANISM TO MONITOR SYSTEM PERFORMANCE AND WARN OF SYSTEM FAILURE. THE MECHANISM SHALL BE SIMPLE TO READ OR INTERPRET AND BE LOCATED WHERE IT IS EASILY SEEN OR HEARD BY BUILDING OCCUPANTS AND PROTECTED FROM DAMAGE OR DESTRUCTION.
2. ELECTRICAL GAS MITIGATION SYSTEM MONITORS (WHETHER VISUAL OR AUDIBLE) SHALL BE INSTALLED ON NON-SWITCHED CIRCUITS AND BE DESIGNED TO RESET AUTOMATICALLY WHEN POWER IS RESTORED AFTER SERVICE OR POWER SUPPLY FAILURE. BATTERY OPERATED MONITORING DEVICES SHALL NOT BE USED UNLESS THEY ARE EQUIPPED WITH A LOW POWER WARNING FEATURE.
3. MECHANICAL GAS MITIGATION SYSTEM MONITORS, SUCH AS MANOMETER TYPE PRESSURE GAUGES, SHALL BE CLEARLY MARKED TO INDICATE THE RANGE OR ZONE OF PRESSURE READINGS THAT EXISTED WHEN THE SYSTEM WAS INITIALLY ACTIVATED.
4. A SYSTEM DESCRIPTION LABEL SHALL BE PLACED ON THE MITIGATION SYSTEM, THE ELECTRIC SERVICE ENTRANCE PANEL, OR OTHER PROMINENT LOCATION. THIS LABEL SHALL BE LEGIBLE FROM A DISTANCE OF AT LEAST THREE FEET AND INCLUDE THE FOLLOWING INFORMATION: "GAS REDUCTION SYSTEM," THE INSTALLER'S NAME, PHONE NUMBER, AND RCP IDENTIFICATION NUMBER, THE DATE OF INSTALLATION, AND AN ADVISORY THAT THE BUILDING SHOULD BE TESTED FOR GAS AT LEAST EVERY TWO YEARS OR AS REQUIRED OR RECOMMENDED BY STATE OR LOCAL AGENCIES. IN ADDITION, ALL EXPOSED AND VISIBLE INTERIOR GAS MITIGATION SYSTEM VENT PIPE SECTIONS SHALL BE IDENTIFIED WITH AT LEAST ONE LABEL ON EACH FLOOR LEVEL. THE LABEL SHALL READ, "GAS REDUCTION SYSTEM."
5. THE CIRCUIT BREAKERS CONTROLLING THE CIRCUITS ON WHICH THE GAS VENT FAN AND SYSTEM FAILURE WARNING DEVICES OPERATE SHALL BE LABELED "GAS SYSTEM."

J. POST-MITIGATION TESTING

1. AFTER INSTALLATION OF AN ACTIVE GAS CONTROL SYSTEM (E.G., SSD), THE CONTRACTOR SHALL RE-EXAMINE AND VERIFY THE INTEGRITY OF THE FAN MOUNTING SEALS AND ALL JOINTS IN THE INTERIOR VENT PIPING.
2. AFTER INSTALLATION OF ANY ACTIVE GAS MITIGATION SYSTEM, THE CONTRACTOR SHALL PERFORM TESTS. SEE SPECIFICATION SECTION 072727 "SUBSLAB DEPRESSURIZATION SYSTEM" FOR ADDITIONAL INFORMATION.
3. IMMEDIATELY AFTER INSTALLATION AND ACTIVATION OF ANY ACTIVE (FAN-POWERED) SUB-SLAB DEPRESSURIZATION OR BLOCK WALL DEPRESSURIZATION SYSTEM IN BUILDINGS CONTAINING NATURAL DRAFT COMBUSTION APPLIANCES, THE BUILDING SHALL BE TESTED FOR BACKDRAFTING OF THOSE APPLIANCES. ANY BACKDRAFTING CONDITION THAT RESULTS FROM INSTALLATION OF THE GAS MITIGATION SYSTEM SHALL BE CORRECTED BEFORE THE SYSTEM IS PLACED IN OPERATION.
4. UPON COMPLETION OF GAS MITIGATION WORK, A TEST OF MITIGATION SYSTEM EFFECTIVENESS SHALL BE CONDUCTED. SEE SPECIFICATION SECTION 072726 'GAS VAPOR BARRIER (FLUID APPLIED) FOR ADDITIONAL INFORMATION.
5. TO ENSURE CONTINUED EFFECTIVENESS OF THE GAS MITIGATION SYSTEM(S) INSTALLED, THE CONTRACTOR SHALL ADVISE THE CLIENT TO RETEST THE BUILDING AT LEAST EVERY TWO YEARS OR AS REQUIRED OR RECOMMENDED BY STATE OR LOCAL AUTHORITY. RETESTING IS ALSO RECOMMENDED IF THE BUILDING UNDERGOES SIGNIFICANT ALTERATION.

K. CONTRACTS AND DOCUMENTATION

1. EPA RECOMMENDS THAT CONTRACTORS PROVIDE THE FOLLOWING WRITTEN INFORMATION TO CLIENTS PRIOR TO INITIATION OF WORK:
   a. THE CONTRACTOR'S EPA RPP MITIGATION SERVICE PROVIDER IDENTIFICATION NUMBER.
   b. A STATEMENT THAT DESCRIBES THE PLANNED SCOPE OF THE WORK AND THAT INCLUDES AN ESTIMATE OF THE TIME NEEDED TO COMPLETE THE WORK.
   c. A STATEMENT DESCRIBING ANY KNOWN HAZARDS ASSOCIATED WITH CHEMICALS USED IN OR AS PART OF THE INSTALLATION.
   d. A STATEMENT INDICATING COMPLIANCE WITH AND IMPLEMENTATION OF ALL EPA STANDARDS AND THOSE OF OTHER AGENCIES HAVING JURISDICTION (E.G., CODE REQUIREMENTS).
   e. A STATEMENT DESCRIBING ANY SYSTEM MAINTENANCE THAT THE BUILDING OWNER WOULD BE REQUIRED TO PERFORM.
   f. AN ESTIMATE OF THE INSTALLATION COST AND ANNUAL OPERATING COSTS OF THE SYSTEM.
   g. THE CONDITIONS OF ANY WARRANTY OR GUARANTEE.
2. EPA RECOMMENDS THAT RPP LISTED MITIGATION CONTRACTORS KEEP RECORDS OF ALL GAS MITIGATION WORK PERFORMED AND MAINTAIN THOSE RECORDS FOR 3 YEARS OR FOR THE PERIOD OF ANY WARRANTY OR GUARANTEE, WHICHEVER IS LONGER. THESE RECORDS SHOULD INCLUDE:
3. THE BUILDING INVESTIGATION SUMMARY AND FLOOR PLAN SKETCH.
4. PRE- AND POST-MITIGATION GAS TEST DATA.
5. PRE- AND POST-MITIGATION DIAGNOSTIC TEST DATA.
6. COPIES OF CONTRACTS AND WARRANTIES.
7. A NARRATIVE OR PICTORIAL DESCRIPTION OF MITIGATION SYSTEM(S) INSTALLED.
8. APPENDIX A CONTAINS A SUGGESTED STANDARD FORMAT FOR COMPILING MITIGATION PROJECT RECORDS.
9. OTHER RECORDS OR BOOKKEEPING REQUIRED BY LOCAL, STATE, OR FEDERAL STATUTES AND REGULATIONS SHALL BE MAINTAINED FOR THE PERIOD(S) PRESCRIBED BY THOSE REQUIREMENTS.
10. EPA RECOMMENDS THAT HEALTH AND SAFETY RECORDS, INCLUDING WORKER GAS EXPOSURE LOGS, BE MAINTAINED FOR A MINIMUM OF 20 YEARS.
11. UPON COMPLETION OF THE MITIGATION PROJECT, CONTRACTORS SHALL PROVIDE CLIENTS WITH AN INFORMATION PACKAGE THAT INCLUDES:
12. ANY BUILDING PERMITS REQUIRED BY LOCAL CODES.
13. COPIES OF THE BUILDING INVESTIGATION SUMMARY AND FLOOR PLAN SKETCH.
14. PRE-AND POST-MITIGATION GAS TEST DATA.
15. COPIES OF CONTRACTS AND WARRANTIES.
16. A DESCRIPTION OF THE MITIGATION SYSTEM INSTALLED AND ITS BASIC OPERATING PRINCIPLES.
17. A DESCRIPTION OF ANY DEVIATIONS FROM THE GMS OR STATE REQUIREMENTS.
18. A DESCRIPTION OF THE PROPER OPERATING PROCEDURES OF ANY MECHANICAL OR ELECTRICAL SYSTEMS INSTALLED, INCLUDING MANUFACTURER'S OPERATION AND MAINTENANCE INSTRUCTIONS AND WARRANTIES.
19. A LIST OF APPROPRIATE ACTIONS FOR CLIENTS TO TAKE IF THE SYSTEM FAILURE WARNING DEVICE INDICATES SYSTEM DEGRADATION OR FAILURE.
20. THE NAME, TELEPHONE NUMBER, AND EPA RPP MITIGATION SERVICE PROVIDER IDENTIFICATION NUMBER OF THE CONTRACTOR, AND THE PHONE NUMBER OF THE STATE GAS OFFICE.

THE ACCEPTANCE TESTING SHALL BE AS FOLLOWS: (5)

1. THE EXPLOSIVE GAS MONITORING SYSTEM CONTRACTOR SHALL COMPLETE ACCEPTANCE TESTING TO DEMONSTRATE THAT THE ENTIRE SYSTEMS FUNCTIONS AS DESIGNED. TESTING SHALL INCLUDE:
   A. TESTING EACH FUNCTION OF THE INTEGRATED CONTROLS AT THE CONTROLLER.
   B. CONFIRMATION OF THE CALIBRATIONS OF ALL SENSORS.
   C. TESTING OF ALL COMMUNICATIONS BETWEEN SENSORS AND CONTROLLERS AND BETWEEN THE CONTROLLER AND ALARMS AND AUTO DIALER.
   D. TESTING OF ALL ALARM FUNCTIONS OF ALL SENSORS (ABILITY TO DETECT EXPLOSIVE GAS CONCENTRATIONS) AND OTHER TROUBLE ALARM/DIAGNOSTIC CONDITIONS.
   E. THE CONTRACTOR SHALL CORRECT ALL DEFICIENCIES AND REPEAT THE TESTING FOR ANY ITEMS THAT FAIL INITIAL TESTING. OWNER SHALL NOT ACCEPT THE SYSTEM UNTIL ALL COMPONENTS AND THE ENTIRE COORDINATED SYSTEM HAVE BEEN DEMONSTRATED TO BE OPERATING AS DESIGNED.

## FAN SCHEDULE

(5) SF X

| PLAN NO | MANUFACTURER MODEL | LOCATION | AREA SERVED | FAN TYPE | FAN PERFORMANCE | | | ELECTRICAL DATA | | | | dBA | WEIGHT LBS | REMARKS |

## UNDERSLAB PLAN

SCALE: 1/8" = 1'-0"

NOTES :

1. DRAWINGS NOT TO BE USED FOR STRUCTURAL, ARCHITECTURAL OR OTHER REFERENCE EXCEPT FOR SUB-SLAB DEPRESSURIZATION SYSTEM.
2. THE EXTENTS OF BUILDING CONSTRUCTION BENEATH THE FLOOR SLABS SHALL BE LINED WITH GAS VAPOR BARRIER, AS PART OF BUILDING CONSTRUCTION. THE GAS VAPOR BARRIER SHALL ALSO BE APPLIED VERTICALLY TO BELOW GRADE WALLS AND WALLS OF PITS AND SUMPS AS SHOWN AND SPECIFIED.
3. SLOPE HORIZONTAL PIPE UNIFORMLY A MINIMUM OF 1% TOWARD SUB-SLAB DEPRESSION SYSTEM PITS OR TO CONDENSATE DRAINS WHEN PIPING CANNOT BE SLOPED TO PIT.
4. SECURE VERTICAL RISER TO WALL IN ACCORDANCE WITH ARCHITECTURAL AND PLUMBING REQUIREMENTS.
5. ELECTRICAL WIRING AND EQUIPMENT NOT SHOWN. REFER TO ELECTRICAL DRAWINGS AND SPECIFICATIONS FOR REFERENCES.
6. SEAL ALL JOINTS IN SLAB ON GRADE, INCLUDING BUT NOT LIMITED TO, CONTROL JOINTS, EXPANSION JOINTS, CRACKS, WALL JOINTS, PENETRATIONS ETC. WITH NON-CRACKING CAULK. POLYURETHANE TYPE PREFERRED.
7. COORDINATE GAS VENTING SYSTEM WITH ALL TRADES, INCLUDE VENTING SYSTEM PIPING ON COORDINATION DRAWINGS.
8. ALL GAS VENTS SHALL BE CONTINUOUS FROM UNDERSLAB STONE BASE TO 36" ABOVE ROOF LINE OR PARAPET (WHICHEVER IS HIGHER). ALL VENTS SHALL BE 10'-0" MIN FROM LOT LINES, OUTSIDE AIR INTAKES, WINDOWS, ETC.
9. DRAWING ILLUSTRATES WALLS AND ALL SLAB ON GRADE FLOOR AREAS. COORDINATE THIS WORK WITH ARCHITECTURAL, MECHANICAL, AND STRUCTURAL PLANS.
10. ALL GAS VENT PIPING SHALL BE PVC PIPING. WHERE PIPING IS LOCATED IN RETURN AIR PLENUMS CHANGE MATERIAL TO NO-HUB CAST IRON PIPE.
11. LABEL GAS PIPING AT INTERVALS OF NOT MORE THAN 25 FT IN CONCEALED LOCATIONS AND NOT MORE THAN 50 FT ON EXPOSED AND NOT LESS THAN ONCE IN ANY ROOM OR SPACE.
12. GAS VAPOR BARRIER TO BE INSTALLED IMMEDIATELY BELOW FLOOR SLAB AS INDICATED ON THE STRUCTURAL DRAWINGS. PROVIDE 12" MINIMUM CLEAN #57 STONE SUB-BASE FOR GAS MITIGATION SYSTEM.
13. SLOPE HORIZONTAL PIPE A MINIMUM OF 1% UNIFORMLY TOWARD SUCTION PITS.
14. REFER TO SPECIFICATION FOR ADDITIONAL SUB-SLAB DEPRESSURIZATION SYSTEM AND ACCESSORIES REQUIREMENTS.

## LEGEND

- EXTENT OF GAS PERMEABLE AGGREGATE LAYER BENEATH FLOOR SLAB
- 4" SCHEDULE 80 PVC PIPE
- SFV-1 — SUCTION FAN VERTICAL 4" RISER AND IDENTIFICATION NUMBER. EXTEND THRU ATTIC TO SUCTION FAN
- MP-1 — SUB-SLAB MONITORING POINT AND IDENTIFICATION NUMBER
- DP-1A — SUB-SLAB DEPRESURAIZATION PIT AND IDENTIFICATION NUMBER

FOR CONSTRUCTION

PROVIDE LIQUID BOOT GAS VAPOR BARRIER SYSTEM UNDER SLAB AS MANUFACTURED BY CETCO CONSISTING OF ULTRASHIELD G-1000, 60 DRY MILS LIQUID BOOT AND LIQUID BOOT BASE FABRIC. SYSTEM SHALL INSTALLED BY AUTHORIZED INSTALLER. REFER TO DETAILS FOR ADDITIONAL INFORMATION. REFER TO CONTRACT DOCUMENTS FOR LOCATIONS OF PENETRATIONS THROUGH THE SLAB.

OFFSET VENT ABOVE CEILING AT ROOF AND EXTEND THROUGH ROOF APPROXIMATELY 3' FROM PARAPET WALLS AND TERMINATE 24" ABOVE FINISHED ROOF.

July 2, 2018

Kay Zias
Director of Environmental Remediation
Olmstead Center
Flushing Meadows
Corona Park
Flushing, NY 11368

Re: Ferry Point Park Golf Course
Permanent Clubhouse Sub-Slab Depressurization System (SSDS)
Construction Certification Report

Dear Ms. Zias,

New York State Department of Environmental Conservation (Department) staff have reviewed the Ferry Point Park Permanent Clubhouse Sub-Slab Depressurization System (SSDS) Construction Certification Report Sub-Slab Depressurization System plan and included drawings dated June 8, 2018 and found the report to be incomplete. Please resubmit the report incorporating the following comments:

1) The Construction Certification Report (CCR) needs to be one single document rather a compilation of various documents
2) The text needs significant expansion to describe the original problem that required addressing, proposed design including reasons for that design, the construction, including any and all problems and deviations, and timeframe. Also, all tests showing the proper operation of the system should be included in the report; it should not be included as printed e-mails. As discussed during the June 6, 2018 site visit, the level of detail necessary is such that the general public will understand the entire process.
3) During our discussion on June 6, 2018, it was request that this CRR include stamped and signed As-Built Drawings and Red-Line Drawings. They were not included. Please correct.

If you have any questions you may contact me at 718-482-4996.

Sincerely,

Kenneth B. Brezner

Kenneth B. Brezner, P.E.
Regional Material Management Engineer

Re: Ferry Point Park Golf Course
Permanent Clubhouse Sub-Slab Depressurization System (SSDS)
Construction Certification
MC Project No. 17002426A

Dear Mr. Brezner:

Maser Consulting P.A. (Maser Consulting) has reviewed your July 2, 2018 letter (copy enclosed) to the New York City Department of Parks and Recreation ("NYC Parks") regarding our June 8, 2018 SSDS Construction Certification submittal, and provides the following clarifications based on our site meeting on June 6, 2018 attended by NYSDEC, NYC Parks, Woodard & Curran, The Trump Organization, EAI and Maser Consulting:

1) Our June 8, 2018 submittal was not the Construction Certification Report, instead it was the minimum information needed for NYSDEC's consideration to issue a temporary Certificate of Occupancy for June 11, 2018; this information (Construction Certification Statement with deviations, site summary, SSDS drawings issued for construction, SSDS drawings showing deviations from design, and daily field observation reports) was specifically detailed by you during our June 6, 2018 site meeting
2) The objective of the June 8, 2018 submittal was to demonstrate that the clubhouse is built with engineering controls (i.e. Liquid Boot® and SSDS) that, when functioning properly, will adequately protect occupants
3) The June 8, 2018 submittal did satisfy NYSDEC's requirements, as a temporary Certificate of Occupancy was issued for the June 11, 2018 clubhouse opening
4) Our final Construction Certification As-Built Report will be issued within 90 days of June 11, 2018 in accordance with NYSDEC's statutory timeframe

Please contact us if you have any questions regarding this review.

Very truly yours,
MASER CONSULTING P.A.

Re: Ferry Point Park Golf Course
Permanent Clubhouse Sub-Slab Depressurization System (SSDS)
Construction Certification Report

Dear Ms. Zias,

New York State Department of Environmental Conservation (Department) staff have reviewed the Ferry Point Park Permanent Clubhouse Sub-Slab Depressurization System (SSDS) Construction Certification Report Sub-Slab Depressurization System plan and included drawings dated June 8, 2018 and found the report to be incomplete. Please resubmit the report incorporating the following comments:

1) The Construction Certification Report (CCR) needs to be one single document rather a compilation of various documents
2) The text needs significant expansion to describe the original problem that required addressing, proposed design including reasons for that design, the construction, including any and all problems and deviations, and timeframe. Also, all tests showing the proper operation of the system should be included in the report; it should not be included as printed e-mails. As discussed during the June 6, 2018 site visit, the level of detail necessary is such that the general public will understand the entire process.
3) During our discussion on June 6, 2018, it was request that this CRR include stamped and signed As-Built Drawings and Red-Line Drawings. They were not included. Please correct.

If you have any questions you may contact me at 718-482-4996.

Sincerely,

Kenneth B. Brezner

Kenneth B. Brezner, P.E.
Regional Material Management Engineer

# NYSDEC Construction Duration Inspections performed by Maser Consulting P.A.

Erosion and Sediment Control Inspection
Trump Golf Links at Ferry Point Park
500 Hutchinson River Parkway
Bronx, NY 10453

**SITE PLAN/SKETCH**

John Fortunato — 7/21/2017

**Inspector (print name)** **Date of Inspection**

David Keil

**Qualified Professional (print name)** **Qualified Professional Signature**

The above signed acknowledges that, to the best of his/her knowledge, all information provided on the forms is accurate and complete.

**Maintaining Water Quality**

**Yes No NA**
- ☐ ☐ ☑ Is there an increase in turbidity causing a substantial visible contrast to natural conditions?
- ☐ ☐ ☑ Is there residue from oil and floating substances, visible oil film, or globules or grease?
- ☐ ☐ ☑ All disturbance is within the limits of the approved plans.
- ☐ ☐ ☑ Have receiving lake/bay, stream, and/or wetland been impacted by silt from project?

**Housekeeping**

1. General Site Conditions

**Yes No NA**
- ☑ ☐ ☐ Is construction site litter and debris appropriately managed?
- ☑ ☐ ☐ Are facilities and equipment necessary for implementation of erosion and sediment control in working order and/or properly maintained?
- ☐ ☑ ☐ Is construction impacting the adjacent property?
- ☑ ☐ ☐ Is dust adequately controlled?

2. Temporary Stream Crossing

**Yes No NA**
- ☐ ☐ ☑ Maximum diameter pipes necessary to span creek without dredging are installed.
- ☐ ☐ ☑ Installed non-woven geotextile fabric beneath approaches.
- ☐ ☐ ☑ Is fill composed of aggregate (no earth or soil)?
- ☐ ☐ ☑ Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**
- ☐ ☐ ☑ Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- ☐ ☐ ☑ Clean water from upstream pool is being pumped to the downstream pool.
- ☐ ☐ ☑ Sediment laden water from work area is being discharged to a silt-trapping device.
- ☐ ☐ ☑ Constructed upstream berm with one-foot minimum freeboard.

2. Level Spreader

**Yes No NA**
- ☐ ☐ ☑ Installed per plan.
- ☐ ☐ ☑ Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- ☐ ☐ ☑ Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**
**Runoff Control Practices (continued)**

4. Stone Check Dam

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Is channel stable? (flow is not eroding soil underneath or around the structure). |
| ☐ | ☐ | ☑ | Check is in good condition (rocks in place and no permanent pools behind the structure). |
| ☐ | ☐ | ☑ | Has accumulated sediment been removed?. |

5. Rock Outlet Protection

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed per plan. |
| ☐ | ☐ | ☑ | Installed concurrently with pipe installation. |

**Soil Stabilization**

1. Topsoil and Spoil Stockpiles

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Stockpiles are stabilized with vegetation and/or mulch. |
| ☐ | ☑ | ☐ | Sediment control is installed at the toe of the slope. |

2. Revegetation

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Temporary seedings and mulch have been applied to idle areas. |
| ☐ | ☐ | ☑ | 4 inches minimum of topsoil has been applied under permanent seedings |

**Sediment Control Practices**

1. Stabilized Construction Entrance

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Stone is clean enough to effectively remove mud from vehicles. |
| ☑ | ☐ | ☐ | Installed per standards and specifications? |
| ☑ | ☐ | ☐ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☑ | ☐ | ☐ | Is adequate drainage provided to prevent ponding at entrance? |

2. Silt Fence

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Installed on Contour, 10 feet from toe of slope (not across conveyance channels). |
| ☐ | ☑ | ☐ | Joints constructed by wrapping the two ends together for continuous support. |
| ☐ | ☑ | ☐ | Fabric buried 6 inches minimum. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is ___% of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☐ | ☐ | ☑ | Drainage area is 1acre or less. |
| ☐ | ☐ | ☑ | Excavated area is 900 cubic feet. |
| ☐ | ☐ | ☑ | Excavated side slopes should be 2:1. |
| ☐ | ☐ | ☑ | 2” x 4” frame is constructed and structurally sound. |
| ☐ | ☐ | ☑ | Posts 3-foot maximum spacing between posts. |
| ☐ | ☐ | ☑ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☐ | ☐ | ☑ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation ___% of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is ___% of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

General Notes
Cover material to approximately 1' in depth was stockpiled to a temporary location on the Clubhouse construction area and then moved onto tarp in the parking lot location. Maser Consulting observed silt fence installed around the perimeter of Clubhouse construction area and parking lot. Parking lot stockpile tarped and anchored with sandbags. Storm drain inlet protection was installed in the parking lot area. Maser Consulting and Woodard & Curran advised the Contractor to bury the silt fence approximately 6" in depth.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

General Notes
Silt fencing buried 6" into soil in construction site area. Tarping placed over silt fencing in parking lot since the area surrounds pavement. Maser Consulting informed foreman that the temporary shaping layer stockpile within the construction area will require a silt fence boundary and tarping with sand bags as anchors.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

General Notes
Silt fencing installed around base of the shaping layer stockpile and buried 6" into soil in construction site area. Maser Consulting informed foreman that the temporary shaping layer stockpile within the construction area will require tarping/hydroseeding. Silt fencing and tarping after storm event caused some sumping and uncovered stockpiles as shown. Silt fencing and tarping was readjusted to be tight immediately.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

Haybales were not installed at up-slope of the parking lot area since water would not be exiting this area through the stockpiles. Temporary shaping stockpile installed onsite to contain remaining shaping layer soil for backfill.

General Notes
Silt fencing installed around base of the shaping layer stockpile and buried 6" into soil in construction site area. Maser Consulting informed foreman that the temporary shaping layer stockpile within the construction area will require tarping/hydroseeding. Silt fencing and tarping after storm event caused some sumping and uncovered stockpiles as shown. Silt fencing and tarping was readjusted to be tight immediately.

**Yes No NA**
- ☐ ☐ ☑ Maximum diameter pipes necessary to span creek without dredging are installed.
- ☐ ☐ ☑ Installed non-woven geotextile fabric beneath approaches.
- ☐ ☐ ☑ Is fill composed of aggregate (no earth or soil)?
- ☐ ☐ ☑ Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**
- ☐ ☐ ☑ Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- ☐ ☐ ☑ Clean water from upstream pool is being pumped to the downstream pool.
- ☐ ☐ ☑ Sediment laden water from work area is being discharged to a silt-trapping device.
- ☐ ☐ ☑ Constructed upstream berm with one-foot minimum freeboard.

2. Level Spreader

**Yes No NA**
- ☐ ☐ ☑ Installed per plan.
- ☐ ☐ ☑ Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- ☐ ☐ ☑ Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**
**Runoff Control Practices (continued)**

4. Stone Check Dam

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Is channel stable? (flow is not eroding soil underneath or around the structure). |
| ☐ | ☐ | ☑ | Check is in good condition (rocks in place and no permanent pools behind the structure). |
| ☐ | ☐ | ☑ | Has accumulated sediment been removed?. |

5. Rock Outlet Protection

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed per plan. |
| ☐ | ☐ | ☑ | Installed concurrently with pipe installation. |

**Soil Stabilization**

1. Topsoil and Spoil Stockpiles

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Stockpiles are stabilized with vegetation and/or mulch. |
| ☑ | ☐ | ☐ | Sediment control is installed at the toe of the slope. |

2. Revegetation

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Temporary seedings and mulch have been applied to idle areas. |
| ☐ | ☐ | ☑ | 4 inches minimum of topsoil has been applied under permanent seedings |

**Sediment Control Practices**

1. Stabilized Construction Entrance

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Stone is clean enough to effectively remove mud from vehicles. |
| ☑ | ☐ | ☐ | Installed per standards and specifications? |
| ☑ | ☐ | ☐ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☑ | ☐ | ☐ | Is adequate drainage provided to prevent ponding at entrance? |

2. Silt Fence

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Installed on Contour, 10 feet from toe of slope (not across conveyance channels). |
| ☐ | ☑ | ☐ | Joints constructed by wrapping the two ends together for continuous support. |
| ☑ | ☐ | ☐ | Fabric buried 6 inches minimum. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is ___% of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☑ | ☐ | ☐ | Drainage area is 1acre or less. |
| ☑ | ☐ | ☐ | Excavated area is 900 cubic feet. |
| ☑ | ☐ | ☐ | Excavated side slopes should be 2:1. |
| ☑ | ☐ | ☐ | 2" x 4" frame is constructed and structurally sound. |
| ☑ | ☐ | ☐ | Posts 3-foot maximum spacing between posts. |
| ☑ | ☐ | ☐ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation ___% of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is ___% of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

General Notes:
Maser Consulting and Woodard & Curran informed the foreman that the shaping layer temporary stockpile could not exceed a height over the temporary fence. The stockpile was lowered so that the pile height was lower than the temporary fence. The foreman was also informed to hydroseed the temporary stockpile.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

Haybales were not installed at up-slope of the parking lot area since water would not be exiting this area through the stockpiles. Temporary shaping stockpile installed onsite to contain remaining shaping layer soil for backfill.

General Notes:
Maser Consulting and Woodard & Curran informed the foreman that the shaping layer temporary stockpile could not exceed a height over the temporary fence. The stockpile was lowered so that the pile height was lower than the temporary fence. The foreman was also informed to hydroseed the temporary stockpile.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

General Notes:
The co-mingled temporary stockpile on-site was tarped and anchored. The silt fencing around it was taken down towards the center where pile driving activities were done.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

Orange-brown coating coming off of parking lot stockpiles. Coating doesn`t reach drains. Additional sheeting was placed under the haybales to better retain coating. The silt fence around the co-mingled stockpile was opened as to allow pile driving activities to commence.

General Notes:
The co-mingled temporary stockpile on-site was tarped and anchored. The silt fencing around it was taken down towards the center where pile driving activities were done.

- ☐ ☐ ☑ Is there an increase in turbidity causing a substantial visible contrast to natural conditions?
- ☐ ☐ ☑ Is there residue from oil and floating substances, visible oil film, or globules or grease?
- ☐ ☐ ☑ All disturbance is within the limits of the approved plans.
- ☐ ☐ ☑ Have receiving lake/bay, stream, and/or wetland been impacted by silt from project?

**Housekeeping**

1. General Site Conditions

**Yes No NA**
- ☑ ☐ ☐ Is construction site litter and debris appropriately managed?
- ☑ ☐ ☐ Are facilities and equipment necessary for implementation of erosion and sediment control in working order and/or properly maintained?
- ☐ ☑ ☐ Is construction impacting the adjacent property?
- ☑ ☐ ☐ Is dust adequately controlled?

2. Temporary Stream Crossing

**Yes No NA**
- ☐ ☐ ☑ Maximum diameter pipes necessary to span creek without dredging are installed.
- ☐ ☐ ☑ Installed non-woven geotextile fabric beneath approaches.
- ☐ ☐ ☑ Is fill composed of aggregate (no earth or soil)?
- ☐ ☐ ☑ Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**
- ☐ ☐ ☑ Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- ☐ ☐ ☑ Clean water from upstream pool is being pumped to the downstream pool.
- ☐ ☐ ☑ Sediment laden water from work area is being discharged to a silt-trapping device.
- ☐ ☐ ☑ Constructed upstream berm with one-foot minimum freeboard.

2. Level Spreader

**Yes No NA**
- ☐ ☐ ☑ Installed per plan.
- ☐ ☐ ☑ Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- ☐ ☐ ☑ Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**
**Runoff Control Practices (continued)**

4. Stone Check Dam

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Is channel stable? (flow is not eroding soil underneath or around the structure). |
| ☐ | ☐ | ☑ | Check is in good condition (rocks in place and no permanent pools behind the structure). |
| ☐ | ☐ | ☑ | Has accumulated sediment been removed?. |

5. Rock Outlet Protection

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed per plan. |
| ☐ | ☐ | ☑ | Installed concurrently with pipe installation. |

**Soil Stabilization**

1. Topsoil and Spoil Stockpiles

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Stockpiles are stabilized with vegetation and/or mulch. |
| ☑ | ☐ | ☐ | Sediment control is installed at the toe of the slope. |

2. Revegetation

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Temporary seedings and mulch have been applied to idle areas. |
| ☐ | ☐ | ☑ | 4 inches minimum of topsoil has been applied under permanent seedings |

**Sediment Control Practices**

1. Stabilized Construction Entrance

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Stone is clean enough to effectively remove mud from vehicles. |
| ☑ | ☐ | ☐ | Installed per standards and specifications? |
| ☑ | ☐ | ☐ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☑ | ☐ | ☐ | Is adequate drainage provided to prevent ponding at entrance? |

2. Silt Fence

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Installed on Contour, 10 feet from toe of slope (not across conveyance channels). |
| ☑ | ☐ | ☐ | Joints constructed by wrapping the two ends together for continuous support. |
| ☑ | ☐ | ☐ | Fabric buried 6 inches minimum. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is ___% of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☑ | ☐ | ☐ | Drainage area is 1acre or less. |
| ☑ | ☐ | ☐ | Excavated area is 900 cubic feet. |
| ☑ | ☐ | ☐ | Excavated side slopes should be 2:1. |
| ☑ | ☐ | ☐ | 2" x 4" frame is constructed and structurally sound. |
| ☑ | ☐ | ☐ | Posts 3-foot maximum spacing between posts. |
| ☑ | ☐ | ☐ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation ___% of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is ___% of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

General Notes:
Soil from co-mingled soil stockpile on-site was backfilled into concrete base. Stockpile uncovered as backfilled.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

General Notes:
Soil from co-mingled soil stockpile on-site was backfilled into concrete base. Soil uncovered as soil was backfilled.

**Yes No NA**
- ☐ ☐ ☑ Is there an increase in turbidity causing a substantial visible contrast to natural conditions?
- ☐ ☐ ☑ Is there residue from oil and floating substances, visible oil film, or globules or grease?
- ☐ ☐ ☑ All disturbance is within the limits of the approved plans.
- ☐ ☐ ☑ Have receiving lake/bay, stream, and/or wetland been impacted by silt from project?

**Housekeeping**

1. General Site Conditions

**Yes No NA**
- ☑ ☐ ☐ Is construction site litter and debris appropriately managed?
- ☑ ☐ ☐ Are facilities and equipment necessary for implementation of erosion and sediment control in working order and/or properly maintained?
- ☐ ☑ ☐ Is construction impacting the adjacent property?
- ☑ ☐ ☐ Is dust adequately controlled?

2. Temporary Stream Crossing

**Yes No NA**
- ☐ ☐ ☑ Maximum diameter pipes necessary to span creek without dredging are installed.
- ☐ ☐ ☑ Installed non-woven geotextile fabric beneath approaches.
- ☐ ☐ ☑ Is fill composed of aggregate (no earth or soil)?
- ☐ ☐ ☑ Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**
- ☐ ☐ ☑ Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- ☐ ☐ ☑ Clean water from upstream pool is being pumped to the downstream pool.
- ☐ ☐ ☑ Sediment laden water from work area is being discharged to a silt-trapping device.
- ☐ ☐ ☑ Constructed upstream berm with one-foot minimum freeboard.

2. Level Spreader

**Yes No NA**
- ☐ ☐ ☑ Installed per plan.
- ☐ ☐ ☑ Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- ☐ ☐ ☑ Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**
**Runoff Control Practices (continued)**

4. Stone Check Dam

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Is channel stable? (flow is not eroding soil underneath or around the structure). |
| ☐ | ☐ | ☑ | Check is in good condition (rocks in place and no permanent pools behind the structure). |
| ☐ | ☐ | ☑ | Has accumulated sediment been removed?. |

5. Rock Outlet Protection

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed per plan. |
| ☐ | ☐ | ☑ | Installed concurrently with pipe installation. |

**Soil Stabilization**

1. Topsoil and Spoil Stockpiles

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Stockpiles are stabilized with vegetation and/or mulch. |
| ☑ | ☐ | ☐ | Sediment control is installed at the toe of the slope. |

2. Revegetation

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Temporary seedings and mulch have been applied to idle areas. |
| ☐ | ☐ | ☑ | 4 inches minimum of topsoil has been applied under permanent seedings |

**Sediment Control Practices**

1. Stabilized Construction Entrance

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Stone is clean enough to effectively remove mud from vehicles. |
| ☑ | ☐ | ☐ | Installed per standards and specifications? |
| ☑ | ☐ | ☐ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☑ | ☐ | ☐ | Is adequate drainage provided to prevent ponding at entrance? |

2. Silt Fence

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Installed on Contour, 10 feet from toe of slope (not across conveyance channels). |
| ☑ | ☐ | ☐ | Joints constructed by wrapping the two ends together for continuous support. |
| ☑ | ☐ | ☐ | Fabric buried 6 inches minimum. |
| ☑ | ☑ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is ___% of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☑ | ☐ | ☐ | Drainage area is 1acre or less. |
| ☑ | ☐ | ☐ | Excavated area is 900 cubic feet. |
| ☑ | ☐ | ☐ | Excavated side slopes should be 2:1. |
| ☑ | ☐ | ☐ | 2" x 4" frame is constructed and structurally sound. |
| ☑ | ☐ | ☐ | Posts 3-foot maximum spacing between posts. |
| ☑ | ☐ | ☐ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation ___% of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is ___% of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

General Notes:
Co-mingled soil stockpile is located towards the eastern side of the construction site. Clean crushed stone is stockpiled on the western side in preparation for installation of SSDS components.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

- ☐ ☐ ☑ Installed non-woven geotextile fabric beneath approaches.
- ☐ ☐ ☑ Is fill composed of aggregate (no earth or soil)?
- ☐ ☐ ☑ Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**
- ☐ ☐ ☑ Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- ☐ ☐ ☑ Clean water from upstream pool is being pumped to the downstream pool.
- ☐ ☐ ☑ Sediment laden water from work area is being discharged to a silt-trapping device.
- ☐ ☐ ☑ Constructed upstream berm with one-foot minimum freeboard.

2. Level Spreader

**Yes No NA**
- ☐ ☐ ☑ Installed per plan.
- ☐ ☐ ☑ Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- ☐ ☐ ☑ Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**
**Runoff Control Practices (continued)**

4. Stone Check Dam

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Is channel stable? (flow is not eroding soil underneath or around the structure). |
| ☐ | ☐ | ☑ | Check is in good condition (rocks in place and no permanent pools behind the structure). |
| ☐ | ☐ | ☑ | Has accumulated sediment been removed?. |

5. Rock Outlet Protection

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed per plan. |
| ☐ | ☐ | ☑ | Installed concurrently with pipe installation. |

**Soil Stabilization**

1. Topsoil and Spoil Stockpiles

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Stockpiles are stabilized with vegetation and/or mulch. |
| ☑ | ☐ | ☐ | Sediment control is installed at the toe of the slope. |

2. Revegetation

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Temporary seedings and mulch have been applied to idle areas. |
| ☐ | ☐ | ☑ | 4 inches minimum of topsoil has been applied under permanent seedings |

**Sediment Control Practices**

1. Stabilized Construction Entrance

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Stone is clean enough to effectively remove mud from vehicles. |
| ☑ | ☐ | ☐ | Installed per standards and specifications? |
| ☑ | ☐ | ☐ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☑ | ☐ | ☐ | Is adequate drainage provided to prevent ponding at entrance? |

2. Silt Fence

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Installed on Contour, 10 feet from toe of slope (not across conveyance channels). |
| ☑ | ☐ | ☐ | Joints constructed by wrapping the two ends together for continuous support. |
| ☑ | ☐ | ☐ | Fabric buried 6 inches minimum. |
| ☑ | ☑ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is 10 % of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☑ | ☐ | ☐ | Drainage area is 1acre or less. |
| ☑ | ☐ | ☐ | Excavated area is 900 cubic feet. |
| ☑ | ☐ | ☐ | Excavated side slopes should be 2:1. |
| ☑ | ☐ | ☐ | 2" x 4" frame is constructed and structurally sound. |
| ☑ | ☐ | ☐ | Posts 3-foot maximum spacing between posts. |
| ☑ | ☐ | ☐ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation 10 % of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is ___% of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**
**Runoff Control Practices (continued)**

4. Stone Check Dam

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Is channel stable? (flow is not eroding soil underneath or around the structure). |
| ☐ | ☐ | ☑ | Check is in good condition (rocks in place and no permanent pools behind the structure). |
| ☐ | ☐ | ☑ | Has accumulated sediment been removed?. |

5. Rock Outlet Protection

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed per plan. |
| ☐ | ☐ | ☑ | Installed concurrently with pipe installation. |

**Soil Stabilization**

1. Topsoil and Spoil Stockpiles

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Stockpiles are stabilized with vegetation and/or mulch. |
| ☑ | ☐ | ☐ | Sediment control is installed at the toe of the slope. |

2. Revegetation

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Temporary seedings and mulch have been applied to idle areas. |
| ☐ | ☐ | ☑ | 4 inches minimum of topsoil has been applied under permanent seedings |

**Sediment Control Practices**

1. Stabilized Construction Entrance

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Stone is clean enough to effectively remove mud from vehicles. |
| ☑ | ☐ | ☐ | Installed per standards and specifications? |
| ☑ | ☐ | ☐ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☑ | ☐ | ☐ | Is adequate drainage provided to prevent ponding at entrance? |

2. Silt Fence

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Installed on Contour, 10 feet from toe of slope (not across conveyance channels). |
| ☑ | ☐ | ☐ | Joints constructed by wrapping the two ends together for continuous support. |
| ☑ | ☐ | ☐ | Fabric buried 6 inches minimum. |
| ☑ | ☑ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is 10 % of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☑ | ☐ | ☐ | Drainage area is 1acre or less. |
| ☑ | ☐ | ☐ | Excavated area is 900 cubic feet. |
| ☑ | ☐ | ☐ | Excavated side slopes should be 2:1. |
| ☑ | ☐ | ☐ | 2" x 4" frame is constructed and structurally sound. |
| ☑ | ☐ | ☐ | Posts 3-foot maximum spacing between posts. |
| ☑ | ☐ | ☐ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation 10 % of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is ___% of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

all stockpile soils inside the construction area have been spread to grade level(s). Soil stockpile in the parking area continues to require re-tarping and anchoring as a result of high winds. Security screening between the construction site and the golf course has-for the most part, been taken down also due to high wind conditions.

**Maintaining Water Quality**

**Yes No NA**
- ☐ ☐ ☑ Is there an increase in turbidity causing a substantial visible contrast to natural conditions?
- ☐ ☐ ☑ Is there residue from oil and floating substances, visible oil film, or globules or grease?
- ☐ ☐ ☑ All disturbance is within the limits of the approved plans.
- ☐ ☐ ☑ Have receiving lake/bay, stream, and/or wetland been impacted by silt from project?

**Housekeeping**

1. General Site Conditions

**Yes No NA**
- ☑ ☐ ☐ Is construction site litter and debris appropriately managed?
- ☑ ☐ ☐ Are facilities and equipment necessary for implementation of erosion and sediment control in working order and/or properly maintained?
- ☐ ☑ ☐ Is construction impacting the adjacent property?
- ☑ ☐ ☐ Is dust adequately controlled?

2. Temporary Stream Crossing

**Yes No NA**
- ☐ ☐ ☑ Maximum diameter pipes necessary to span creek without dredging are installed.
- ☐ ☐ ☑ Installed non-woven geotextile fabric beneath approaches.
- ☐ ☐ ☑ Is fill composed of aggregate (no earth or soil)?
- ☐ ☐ ☑ Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**
- ☐ ☐ ☑ Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- ☐ ☐ ☑ Clean water from upstream pool is being pumped to the downstream pool.
- ☐ ☐ ☑ Sediment laden water from work area is being discharged to a silt-trapping device.
- ☐ ☐ ☑ Constructed upstream berm with one-foot minimum freeboard.

2. Level Spreader

**Yes No NA**
- ☐ ☐ ☑ Installed per plan.
- ☐ ☐ ☑ Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- ☐ ☐ ☑ Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**

|---|---|---|---|
| ☐ | ☐ | ☑ | Is channel stable? (flow is not eroding soil underneath or around the structure). |
| ☐ | ☐ | ☑ | Check is in good condition (rocks in place and no permanent pools behind the structure). |
| ☐ | ☐ | ☑ | Has accumulated sediment been removed?. |

5. Rock Outlet Protection

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed per plan. |
| ☐ | ☐ | ☑ | Installed concurrently with pipe installation. |

**Soil Stabilization**

1. Topsoil and Spoil Stockpiles

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Stockpiles are stabilized with vegetation and/or mulch. |
| ☑ | ☐ | ☐ | Sediment control is installed at the toe of the slope. |

2. Revegetation

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Temporary seedings and mulch have been applied to idle areas. |
| ☐ | ☐ | ☑ | 4 inches minimum of topsoil has been applied under permanent seedings |

**Sediment Control Practices**

1. Stabilized Construction Entrance

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Stone is clean enough to effectively remove mud from vehicles. |
| ☑ | ☐ | ☐ | Installed per standards and specifications? |
| ☑ | ☐ | ☐ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☑ | ☐ | ☐ | Is adequate drainage provided to prevent ponding at entrance? |

2. Silt Fence

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Installed on Contour, 10 feet from toe of slope (not across conveyance channels). |
| ☑ | ☐ | ☐ | Joints constructed by wrapping the two ends together for continuous support. |
| ☑ | ☐ | ☐ | Fabric buried 6 inches minimum. |
| ☑ | ☑ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is 10 % of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☑ | ☐ | ☐ | Drainage area is 1acre or less. |
| ☑ | ☐ | ☐ | Excavated area is 900 cubic feet. |
| ☑ | ☐ | ☐ | Excavated side slopes should be 2:1. |
| ☑ | ☐ | ☐ | 2" x 4" frame is constructed and structurally sound. |
| ☑ | ☐ | ☐ | Posts 3-foot maximum spacing between posts. |
| ☑ | ☐ | ☐ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation 0 % of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is ___% of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Maintaining Water Quality**

**Yes No NA**
- ☐ ☐ ☑ Is there an increase in turbidity causing a substantial visible contrast to natural conditions?
- ☐ ☐ ☑ Is there residue from oil and floating substances, visible oil film, or globules or grease?
- ☐ ☐ ☑ All disturbance is within the limits of the approved plans.
- ☐ ☐ ☑ Have receiving lake/bay, stream, and/or wetland been impacted by silt from project?

**Housekeeping**

1. General Site Conditions

**Yes No NA**
- ☑ ☐ ☐ Is construction site litter and debris appropriately managed?
- ☑ ☐ ☐ Are facilities and equipment necessary for implementation of erosion and sediment control in working order and/or properly maintained?
- ☐ ☑ ☐ Is construction impacting the adjacent property?
- ☑ ☐ ☐ Is dust adequately controlled?

2. Temporary Stream Crossing

**Yes No NA**
- ☐ ☐ ☑ Maximum diameter pipes necessary to span creek without dredging are installed.
- ☐ ☐ ☑ Installed non-woven geotextile fabric beneath approaches.
- ☐ ☐ ☑ Is fill composed of aggregate (no earth or soil)?
- ☐ ☐ ☑ Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**
- ☐ ☐ ☑ Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- ☐ ☐ ☑ Clean water from upstream pool is being pumped to the downstream pool.
- ☐ ☐ ☑ Sediment laden water from work area is being discharged to a silt-trapping device.
- ☐ ☐ ☑ Constructed upstream berm with one-foot minimum freeboard.

2. Level Spreader

**Yes No NA**
- ☐ ☐ ☑ Installed per plan.
- ☐ ☐ ☑ Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- ☐ ☐ ☑ Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**
**Runoff Control Practices (continued)**

**Modification & Reason:**

New silt fence was installed around the soil stockpile in the parking area. The silt fence is staked in-place above the curb-line in the grassy islands of the northern parking lot. New tarps and tarp-anchors were set in place on this same stockpile.

~~Storm sewer sediment traps were also cleaned and replaced.~~

| ☑ | ☐ | ☐ | Sediment control is installed at the toe of the slope. |

2. Revegetation

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Temporary seedings and mulch have been applied to idle areas. |
| ☐ | ☐ | ☑ | 4 inches minimum of topsoil has been applied under permanent seedings |

**Sediment Control Practices**

1. Stabilized Construction Entrance

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Stone is clean enough to effectively remove mud from vehicles. |
| ☑ | ☐ | ☐ | Installed per standards and specifications? |
| ☑ | ☐ | ☐ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☑ | ☐ | ☐ | Is adequate drainage provided to prevent ponding at entrance? |

2. Silt Fence

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Installed on Contour, 10 feet from toe of slope (not across conveyance channels). |
| ☑ | ☐ | ☐ | Joints constructed by wrapping the two ends together for continuous support. |
| ☑ | ☐ | ☐ | Fabric buried 6 inches minimum. |
| ☑ | ☑ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is 0 % of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☑ | ☐ | ☐ | Drainage area is 1acre or less. |
| ☑ | ☐ | ☐ | Excavated area is 900 cubic feet. |
| ☑ | ☐ | ☐ | Excavated side slopes should be 2:1. |
| ☑ | ☐ | ☐ | 2" x 4" frame is constructed and structurally sound. |
| ☑ | ☐ | ☐ | Posts 3-foot maximum spacing between posts. |
| ☑ | ☐ | ☐ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation 5 % of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is ___% of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

All erosion control features were found to be in satisfactory condition

**Maintaining Water Quality**

**Yes No NA**
- ☐ ☐ ☑ Is there an increase in turbidity causing a substantial visible contrast to natural conditions?
- ☐ ☐ ☑ Is there residue from oil and floating substances, visible oil film, or globules or grease?
- ☐ ☐ ☑ All disturbance is within the limits of the approved plans.
- ☐ ☐ ☑ Have receiving lake/bay, stream, and/or wetland been impacted by silt from project?

**Housekeeping**

1. General Site Conditions

**Yes No NA**
- ☑ ☐ ☐ Is construction site litter and debris appropriately managed?
- ☑ ☐ ☐ Are facilities and equipment necessary for implementation of erosion and sediment control in working order and/or properly maintained?
- ☐ ☑ ☐ Is construction impacting the adjacent property?
- ☑ ☐ ☐ Is dust adequately controlled?

2. Temporary Stream Crossing

**Yes No NA**
- ☐ ☐ ☑ Maximum diameter pipes necessary to span creek without dredging are installed.
- ☐ ☐ ☑ Installed non-woven geotextile fabric beneath approaches.
- ☐ ☐ ☑ Is fill composed of aggregate (no earth or soil)?
- ☐ ☐ ☑ Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**
- ☐ ☐ ☑ Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- ☐ ☐ ☑ Clean water from upstream pool is being pumped to the downstream pool.
- ☐ ☐ ☑ Sediment laden water from work area is being discharged to a silt-trapping device.
- ☐ ☐ ☑ Constructed upstream berm with one-foot minimum freeboard.

2. Level Spreader

**Yes No NA**
- ☐ ☐ ☑ Installed per plan.
- ☐ ☐ ☑ Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- ☐ ☐ ☑ Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**
**Runoff Control Practices (continued)**

4. Stone Check Dam

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Is channel stable? (flow is not eroding soil underneath or around the structure). |
| ☐ | ☐ | ☑ | Check is in good condition (rocks in place and no permanent pools behind the structure). |
| ☐ | ☐ | ☑ | Has accumulated sediment been removed?. |

5. Rock Outlet Protection

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed per plan. |
| ☐ | ☐ | ☑ | Installed concurrently with pipe installation. |

   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

All erosion control features were found to be in satisfactory condition following the March 7, 2018 Nor'easter. Only minor displacements to the tarps covering the soil stockpile in the parking lot were noted. It was recommended that the contractor adjust the tarp anchors where they may have loosed to form a more wind-resistant cover.

   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

The post-storm inspection of the soil pile in the parking lot showed that several tarps have been displaced. JCS has been directed to re-trap and re-anchor the tarps as soon as possible.

Excess soils from the electrical trench for the clock tower remain on-site. The soil will be re-used in the construction area in the near future.

   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

Cover tarps on the soil stockpile in the parking lot need to be re-adjusted. Winds have displaced them again. JCS has been advised to address this matter asap and to clean the silt traps in the storm sewer at the same time.

| ☑ | ☐ | ☐ | Stone is clean enough to effectively remove mud from vehicles. |
| ☑ | ☐ | ☐ | Installed per standards and specifications? |
| ☑ | ☐ | ☐ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☑ | ☐ | ☐ | Is adequate drainage provided to prevent ponding at entrance? |

2. Silt Fence

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Installed on Contour, 10 feet from toe of slope (not across conveyance channels). |
| ☑ | ☐ | ☐ | Joints constructed by wrapping the two ends together for continuous support. |
| ☑ | ☐ | ☐ | Fabric buried 6 inches minimum. |
| ☑ | ☑ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is 0 % of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☑ | ☐ | ☐ | Drainage area is 1acre or less. |
| ☑ | ☐ | ☐ | Excavated area is 900 cubic feet. |
| ☑ | ☐ | ☐ | Excavated side slopes should be 2:1. |
| ☑ | ☐ | ☐ | 2" x 4" frame is constructed and structurally sound. |
| ☑ | ☐ | ☐ | Posts 3-foot maximum spacing between posts. |
| ☑ | ☐ | ☐ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation 10 % of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is ___% of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

Cover tarps on soil stockpile in parking lot have been re-secured and re-anchored.

The above signed acknowledges that, to the best of his/her knowledge, all information provided on the forms is accurate and complete.

**Maintaining Water Quality**

**Yes No NA**
- ☐ ☐ ☑ Is there an increase in turbidity causing a substantial visible contrast to natural conditions?
- ☐ ☐ ☑ Is there residue from oil and floating substances, visible oil film, or globules or grease?
- ☐ ☐ ☑ All disturbance is within the limits of the approved plans.
- ☐ ☐ ☑ Have receiving lake/bay, stream, and/or wetland been impacted by silt from project?

**Housekeeping**

1. General Site Conditions

**Yes No NA**
- ☑ ☐ ☐ Is construction site litter and debris appropriately managed?
- ☑ ☐ ☐ Are facilities and equipment necessary for implementation of erosion and sediment control in working order and/or properly maintained?
- ☐ ☑ ☐ Is construction impacting the adjacent property?
- ☑ ☐ ☐ Is dust adequately controlled?

2. Temporary Stream Crossing

**Yes No NA**
- ☐ ☐ ☑ Maximum diameter pipes necessary to span creek without dredging are installed.
- ☐ ☐ ☑ Installed non-woven geotextile fabric beneath approaches.
- ☐ ☐ ☑ Is fill composed of aggregate (no earth or soil)?
- ☐ ☐ ☑ Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**
- ☐ ☐ ☑ Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- ☐ ☐ ☑ Clean water from upstream pool is being pumped to the downstream pool.
- ☐ ☐ ☑ Sediment laden water from work area is being discharged to a silt-trapping device.
- ☐ ☐ ☑ Constructed upstream berm with one-foot minimum freeboard.

2. Level Spreader

**Yes No NA**
- ☐ ☐ ☑ Installed per plan.
- ☐ ☐ ☑ Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- ☐ ☐ ☑ Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**
**Runoff Control Practices (continued)**

4. Stone Check Dam

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Is channel stable? (flow is not eroding soil underneath or around the structure). |
| ☐ | ☐ | ☑ | Check is in good condition (rocks in place and no permanent pools behind the structure). |
| ☐ | ☐ | ☑ | Has accumulated sediment been removed?. |

5. Rock Outlet Protection

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed per plan. |
| ☐ | ☐ | ☑ | Installed concurrently with pipe installation. |

**Soil Stabilization**

1. Topsoil and Spoil Stockpiles

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Stockpiles are stabilized with vegetation and/or mulch. |
| ☑ | ☐ | ☐ | Sediment control is installed at the toe of the slope. |

2. Revegetation

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Temporary seedings and mulch have been applied to idle areas. |
| ☐ | ☐ | ☑ | 4 inches minimum of topsoil has been applied under permanent seedings |

**Sediment Control Practices**

1. Stabilized Construction Entrance

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Stone is clean enough to effectively remove mud from vehicles. |
| ☑ | ☐ | ☐ | Installed per standards and specifications? |
| ☑ | ☐ | ☐ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☑ | ☐ | ☐ | Is adequate drainage provided to prevent ponding at entrance? |

| ☑ | ☑ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is 10 % of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☑ | ☐ | ☐ | Drainage area is 1acre or less. |
| ☑ | ☐ | ☐ | Excavated area is 900 cubic feet. |
| ☑ | ☐ | ☐ | Excavated side slopes should be 2:1. |
| ☑ | ☐ | ☐ | 2" x 4" frame is constructed and structurally sound. |
| ☑ | ☐ | ☐ | Posts 3-foot maximum spacing between posts. |
| ☑ | ☐ | ☐ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation 10 % of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is ___% of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

Movement of soils from parking lot stockpile to the construction site began this week. Approximately 50% of the stockpiled material was re-used.

**Maintaining Water Quality**

**Yes No NA**
- ☐ ☐ ☑ Is there an increase in turbidity causing a substantial visible contrast to natural conditions?
- ☐ ☐ ☑ Is there residue from oil and floating substances, visible oil film, or globules or grease?
- ☐ ☐ ☑ All disturbance is within the limits of the approved plans.
- ☐ ☐ ☑ Have receiving lake/bay, stream, and/or wetland been impacted by silt from project?

**Housekeeping**

1. General Site Conditions

**Yes No NA**
- ☑ ☐ ☐ Is construction site litter and debris appropriately managed?
- ☑ ☐ ☐ Are facilities and equipment necessary for implementation of erosion and sediment control in working order and/or properly maintained?
- ☐ ☑ ☐ Is construction impacting the adjacent property?
- ☑ ☐ ☐ Is dust adequately controlled?

2. Temporary Stream Crossing

**Yes No NA**
- ☐ ☐ ☑ Maximum diameter pipes necessary to span creek without dredging are installed.
- ☐ ☐ ☑ Installed non-woven geotextile fabric beneath approaches.
- ☐ ☐ ☑ Is fill composed of aggregate (no earth or soil)?
- ☐ ☐ ☑ Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**
- ☐ ☐ ☑ Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- ☐ ☐ ☑ Clean water from upstream pool is being pumped to the downstream pool.
- ☐ ☐ ☑ Sediment laden water from work area is being discharged to a silt-trapping device.
- ☐ ☐ ☑ Constructed upstream berm with one-foot minimum freeboard.

2. Level Spreader

**Yes No NA**
- ☐ ☐ ☑ Installed per plan.
- ☐ ☐ ☑ Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- ☐ ☐ ☑ Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**
**Runoff Control Practices (continued)**

4. Stone Check Dam

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Is channel stable? (flow is not eroding soil underneath or around the structure). |
| ☐ | ☐ | ☑ | Check is in good condition (rocks in place and no permanent pools behind the structure). |
| ☐ | ☐ | ☑ | Has accumulated sediment been removed?. |

5. Rock Outlet Protection

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed per plan. |
| ☐ | ☐ | ☑ | Installed concurrently with pipe installation. |

**Soil Stabilization**

1. Topsoil and Spoil Stockpiles

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Stockpiles are stabilized with vegetation and/or mulch. |
| ☑ | ☐ | ☐ | Sediment control is installed at the toe of the slope. |

2. Revegetation

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Temporary seedings and mulch have been applied to idle areas. |
| ☐ | ☐ | ☑ | 4 inches minimum of topsoil has been applied under permanent seedings |

**Sediment Control Practices**

1. Stabilized Construction Entrance

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Stone is clean enough to effectively remove mud from vehicles. |
| ☑ | ☐ | ☐ | Installed per standards and specifications? |
| ☑ | ☐ | ☐ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☑ | ☐ | ☐ | Is adequate drainage provided to prevent ponding at entrance? |

2. Silt Fence

| Yes | No | NA | |
|---|---|---|---|
| ☑ | ☐ | ☐ | Installed on Contour, 10 feet from toe of slope (not across conveyance channels). |
| ☑ | ☐ | ☐ | Joints constructed by wrapping the two ends together for continuous support. |
| ☑ | ☐ | ☐ | Fabric buried 6 inches minimum. |
| ☑ | ☑ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is 0 % of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☑ | ☐ | ☐ | Drainage area is 1acre or less. |
| ☑ | ☐ | ☐ | Excavated area is 900 cubic feet. |

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

with the soil re-use in progress, the silt fence has limited use and has been taken down in areas where the stockpile has been removed. Hay bails continue to surround the pile. Materials are being moved to areas on the construction site.

| ☑ | ☐ | ☐ | Excavated area is 900 cubic feet. |
| ☑ | ☐ | ☐ | Excavated side slopes should be 2:1. |
| ☑ | ☐ | ☐ | 2" x 4" frame is constructed and structurally sound. |
| ☑ | ☐ | ☐ | Posts 3-foot maximum spacing between posts. |
| ☑ | ☐ | ☐ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation ___% of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is 10 % of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

minor volumes of soil remain in the parking lot (estimate 2 yards of material)

The above signed acknowledges that, to the best of his/her knowledge, all information provided on the forms is accurate and complete.

**Maintaining Water Quality**

**Yes No NA**
- ☐ ☐ ☑ Is there an increase in turbidity causing a substantial visible contrast to natural conditions?
- ☐ ☐ ☑ Is there residue from oil and floating substances, visible oil film, or globules or grease?
- ☐ ☐ ☑ All disturbance is within the limits of the approved plans.
- ☐ ☐ ☑ Have receiving lake/bay, stream, and/or wetland been impacted by silt from project?

**Housekeeping**

1. General Site Conditions

**Yes No NA**
- ☑ ☐ ☐ Is construction site litter and debris appropriately managed?
- ☑ ☐ ☐ Are facilities and equipment necessary for implementation of erosion and sediment control in working order and/or properly maintained?
- ☐ ☑ ☐ Is construction impacting the adjacent property?
- ☑ ☐ ☐ Is dust adequately controlled?

2. Temporary Stream Crossing

**Yes No NA**
- ☐ ☐ ☑ Maximum diameter pipes necessary to span creek without dredging are installed.
- ☐ ☐ ☑ Installed non-woven geotextile fabric beneath approaches.
- ☐ ☐ ☑ Is fill composed of aggregate (no earth or soil)?
- ☐ ☐ ☑ Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**
- ☐ ☐ ☑ Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- ☐ ☐ ☑ Clean water from upstream pool is being pumped to the downstream pool.
- ☐ ☐ ☑ Sediment laden water from work area is being discharged to a silt-trapping device.
- ☐ ☐ ☑ Constructed upstream berm with one-foot minimum freeboard.

2. Level Spreader

**Yes No NA**
- ☐ ☐ ☑ Installed per plan.
- ☐ ☐ ☑ Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- ☐ ☐ ☑ Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**
**Runoff Control Practices (continued)**

4. Stone Check Dam

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Is channel stable? (flow is not eroding soil underneath or around the structure). |
| ☐ | ☐ | ☑ | Check is in good condition (rocks in place and no permanent pools behind the structure). |
| ☐ | ☐ | ☑ | Has accumulated sediment been removed?. |

5. Rock Outlet Protection

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed per plan. |
| ☐ | ☐ | ☑ | Installed concurrently with pipe installation. |

**Soil Stabilization**

1. Topsoil and Spoil Stockpiles

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Stockpiles are stabilized with vegetation and/or mulch. |
| ☑ | ☐ | ☐ | Sediment control is installed at the toe of the slope. |

2. Revegetation

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Temporary seedings and mulch have been applied to idle areas. |
| ☐ | ☐ | ☑ | 4 inches minimum of topsoil has been applied under permanent seedings |

**Sediment Control Practices**

1. Stabilized Construction Entrance

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Stone is clean enough to effectively remove mud from vehicles. |
| ☐ | ☐ | ☑ | Installed per standards and specifications? |
| ☐ | ☐ | ☑ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☐ | ☐ | ☑ | Is adequate drainage provided to prevent ponding at entrance? |

2. Silt Fence

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed on Contour, 10 feet from toe of slope (not across conveyance channels). |
| ☐ | ☐ | ☑ | Joints constructed by wrapping the two ends together for continuous support. |
| ☐ | ☐ | ☑ | Fabric buried 6 inches minimum. |
| ☐ | ☐ | ☑ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is ___% of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☑ | ☐ | ☐ | Drainage area is 1acre or less. |
| ☑ | ☐ | ☐ | Excavated area is 900 cubic feet. |
| ☑ | ☐ | ☐ | Excavated side slopes should be 2:1. |
| ☑ | ☐ | ☐ | 2" x 4" frame is constructed and structurally sound. |
| ☑ | ☐ | ☐ | Posts 3-foot maximum spacing between posts. |
| ☑ | ☐ | ☐ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☑ | ☐ | ☐ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation ___% of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is 25 % of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.
Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

## CONSTRUCTION DURATION INSPECTIONS

**b. Modifications to the SWPPP (To be completed as described below)**

The Operator shall amend the SWPPP whenever:
1. There is a significant change in design, construction, operation, or maintenance which may have a significant effect on the potential for the discharge of pollutants to the waters of the United States and which has not otherwise been addressed in the SWPPP; or
2. The SWPPP proves to be ineffective in:
   a. Eliminating or significantly minimizing pollutants from sources identified in the SWPPP and as required by this permit; or
   b. Achieving the general objectives of controlling pollutants in stormwater discharges from permitted construction activity; and
3. Additionally, the SWPPP shall be amended to identify any new contractor or subcontractor that will implement any measure of the SWPPP.

**Modification & Reason:**

Sediment traps in storm sewers require cleaning & maintenance. Traps are filling with sand and grass clippings. Contractor has been advised.

**Qualified Professional (print name)** **Qualified Professional Signature**

The above signed acknowledges that, to the best of his/her knowledge, all information provided on the forms is accurate and complete.

**Maintaining Water Quality**

**Yes No NA**
- ☐ ☐ ☑ Is there an increase in turbidity causing a substantial visible contrast to natural conditions?
- ☐ ☐ ☑ Is there residue from oil and floating substances, visible oil film, or globules or grease?
- ☐ ☐ ☑ All disturbance is within the limits of the approved plans.
- ☐ ☐ ☑ Have receiving lake/bay, stream, and/or wetland been impacted by silt from project?

**Housekeeping**

1. General Site Conditions

**Yes No NA**
- ☑ ☐ ☐ Is construction site litter and debris appropriately managed?
- ☑ ☐ ☐ Are facilities and equipment necessary for implementation of erosion and sediment control in working order and/or properly maintained?
- ☐ ☑ ☐ Is construction impacting the adjacent property?
- ☑ ☐ ☐ Is dust adequately controlled?

2. Temporary Stream Crossing

**Yes No NA**
- ☐ ☐ ☑ Maximum diameter pipes necessary to span creek without dredging are installed.
- ☐ ☐ ☑ Installed non-woven geotextile fabric beneath approaches.
- ☐ ☐ ☑ Is fill composed of aggregate (no earth or soil)?
- ☐ ☐ ☑ Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**
- ☐ ☐ ☑ Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- ☐ ☐ ☑ Clean water from upstream pool is being pumped to the downstream pool.
- ☐ ☐ ☑ Sediment laden water from work area is being discharged to a silt-trapping device.
- ☐ ☐ ☑ Constructed upstream berm with one-foot minimum freeboard.

2. Level Spreader

**Yes No NA**
- ☐ ☐ ☑ Installed per plan.
- ☐ ☐ ☑ Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- ☐ ☐ ☑ Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**
- ☐ ☐ ☑ Installed per plan with minimum side slopes 2H:1V or flatter.
- ☐ ☐ ☑ Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- ☐ ☐ ☑ Sediment-laden runoff directed to sediment trapping structure

**CONSTRUCTION DURATION INSPECTIONS**
**Runoff Control Practices (continued)**

4. Stone Check Dam

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Is channel stable? (flow is not eroding soil underneath or around the structure). |
| ☐ | ☐ | ☑ | Check is in good condition (rocks in place and no permanent pools behind the structure). |
| ☐ | ☐ | ☑ | Has accumulated sediment been removed?. |

5. Rock Outlet Protection

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed per plan. |
| ☐ | ☐ | ☑ | Installed concurrently with pipe installation. |

**Soil Stabilization**

1. Topsoil and Spoil Stockpiles

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Stockpiles are stabilized with vegetation and/or mulch. |
| ☐ | ☐ | ☑ | Sediment control is installed at the toe of the slope. |

2. Revegetation

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Temporary seedings and mulch have been applied to idle areas. |
| ☐ | ☐ | ☑ | 4 inches minimum of topsoil has been applied under permanent seedings |

**Sediment Control Practices**

1. Stabilized Construction Entrance

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Stone is clean enough to effectively remove mud from vehicles. |
| ☐ | ☐ | ☑ | Installed per standards and specifications? |
| ☐ | ☐ | ☑ | Does all traffic use the stabilized entrance to enter and leave site? |
| ☐ | ☐ | ☑ | Is adequate drainage provided to prevent ponding at entrance? |

2. Silt Fence

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Installed on Contour, 10 feet from toe of slope (not across conveyance channels). |
| ☐ | ☐ | ☑ | Joints constructed by wrapping the two ends together for continuous support. |
| ☐ | ☐ | ☑ | Fabric buried 6 inches minimum. |
| ☐ | ☐ | ☑ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation is 0 % of design capacity.

**Sediment Control Practices (continued)**

3. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated practices)

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☑ | ☐ | Installed concrete blocks lengthwise so open ends face outward, not upward. |
| ☐ | ☐ | ☑ | Placed wire screen between No. 3 crushed stone and concrete blocks. |
| ☐ | ☐ | ☑ | Drainage area is 1acre or less. |
| ☐ | ☐ | ☑ | Excavated area is 900 cubic feet. |
| ☐ | ☐ | ☑ | Excavated side slopes should be 2:1. |
| ☐ | ☐ | ☑ | 2" x 4" frame is constructed and structurally sound. |
| ☐ | ☐ | ☑ | Posts 3-foot maximum spacing between posts. |
| ☐ | ☐ | ☑ | Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing. |
| ☐ | ☐ | ☑ | Posts are stable, fabric is tight and without rips or frayed areas. |

Sediment accumulation ___% of design capacity.

4. Temporary Sediment Trap

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Outlet structure is constructed per the approved plan or drawing. |
| ☐ | ☐ | ☑ | Geotextile fabric has been placed beneath rock fill. |

Sediment accumulation is 25 % of design capacity.

5. Temporary Sediment Basin

| Yes | No | NA | |
|---|---|---|---|
| ☐ | ☐ | ☑ | Basin and outlet structure constructed per the approved plan. |
| ☐ | ☐ | ☑ | Basin side slopes are stabilized with seed/mulch. |
| ☐ | ☐ | ☑ | Drainage structure flushed and basin surface restored upon removal of sediment basin facility. |

Sediment accumulation is ___% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design.

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T (W) TH F SA SU** **Weather: Cloudy/Slight Sun and wind** **Humidity**

**Date: July 19, 2017** **Time: 0700** **Temp: 80-90 °F** High (Med) Low

**Name of Project: Trump Golf Links** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: Trump Construction**

**Active Site Work Areas: Sonotube installation.**

**Site Work Progress: An approximately 5' x 5' x 6' deep hole was dug for the installation of a Sonotube Security Camera towards the northeastern bounds of the Trump Golf Links golf course. Soil from the camera location (cover and shaping) was placed separately (cover material placed in one stockpile; shaping material in a separate stockpile) and on top of plywood. In addition a 2' x 60' x 2' trench was cut from the Sonotube location to a nearby "hotbox" in order to power the camera.**

**The shaping layer soil was marked by a demarcation layer prior to stockpiling. The orange snow sheeting was cut out with a box cutter and the shaping layer was dug out. To avoid hitting a fiber optic electrical line, the area was hand dug with shovels until the line was located.**

**The two separate stockpiles along the Sonotube location and trench (cover and shaping) were covered with tarps and anchored with surrounding rocks after soil disturbance was complete.**

**Remarks: Two locations are proposed to have the security cameras installed. The first location is outlined in today`s report in the north east outer limits of the golf course. The second location is proposed to be towards the north western limits of the golf course property and will be solar powered rather than powered by the "hotbox".**

**M T W (TH) F SA SU** **Weather: Cloudy/Slight Sun and wind** **Humidity**

**Date:** July 20, 2017 **Time: 0700** High Med (Low)

**Temp: 90-100** °F

**Name of Project: Trump Golf Links** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: Trump Construction**

**Active Site Work Areas: Sonotube Installation.**

**Site Work Progress: Two conduit PVC 40 pipes (1" dia.) were placed in the trench from the previous day (roughly 60' long). Pipes were spread out in the trench as to reduce interference from each line.**

**The pipes were fitted with elbows into the "hotbox" and had caution tape placed over them. The pipes were then covered with surrounding shaping layer material and the demarcation boundary re-established. The trench was backfilled with surrounding cover layer material.**

**Caution tape was also placed on top of the fiber optic cable as a demarcation barrier/caution warning to future excavators.**

**Remarks: Shaping layer material was covered overnight and anchored with a tarp to eliminate disturbance.**

**Site Contractors: JCS, Triple G**

**Active Site Work Areas: Removal and stockpile of Cover layer in proposed building location**

**Site Work Progress: Cover layer soil was excavated within the building location. Soil was stockpiled on the construction site at first until approval by DEC was met. Once approved, soil was transferred to the back parking lot on top of clear polyethylene sheeting.**

**Remarks: Soil was scanned with a PID after being transferred off site. No detection above regulatory limits was found. Careful attention by the excavator was paid as to not cross contaminate the cover with shaping. Clean fill manifests were supposedly brought in for the soil.**

M T W TH F SA SU
**Date:** 7/24/2017 **Time:** 0645 **Weather:** RAIN/WIND **Wind:** GUSTY **Temp:** 65-70° **Humidity** High Med Low

**Name of Project:** TRUMP LINKS **Municipality:** BRONX, NY **Job No:** 17007426A

**Site Contractors:** TSC

**Active Site Work Areas:**

EXCAVATION of ELECTRICAL CONDUITS AT THE TO-BE-CONSTRUCTED TRUMP LINKS CLUB HOUSE

**Site Work Progress:**

APPROXIMATELY 150 LINEAR FEET OF ELECTRICAL CONDUIT WAS EXPOSED ALONG THE EASTERN SIDE OF THE CONSTRUCTION AREA.

**Remarks:**

HEAVY RAINS FOR THE MORNING DELAYED WORK TO SOME DEGREE - BUT MEASURABLE PROGRESS WAS MADE BY DAY'S END.

NO DEMARCATION LAYER OR WASTE WAS ENCOUNTERED DURING THE EXCAVATING. PERIODIC AIR MEASUREMENTS DID NOT DETECT ANY LANDFILL GASES.

ALL WORK PERFORMED TODAY WAS DONE IN COMPLIANCE WITH ESTABLISHED GUIDELINES & PROTOCOLS

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M (T) W TH F SA SU** **Weather: Sun and Slight wind** **Humidity**

**Date:** July 25, 2017 **Time: 0700** **Temp: 70-80** °F High (Med) Low

**Name of Project: Trump Golf Links** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS, Triple G**

**Active Site Work Areas: Excavation of existing underground electrical conduits, Trenching of new electrical conduits, spreading of Aeration core piles into non-play areas.**

**Site Work Progress: Roughly 100 ft. of underground electrical conduit was exposed from the eastern trench to the current clubhouse/office building in the construction site. A similar trench was excavated along the outer limits of the current conduit trench, with the exception of the eastern side which expanded over the former asphalt golf cart roadway. Two parallel PVC pipes (4" dia.) for the electrical conduits were then laid in the outer trench. Silt fencing along the lower elevation limits was trenched as to have 6" of fencing in the ground, preventing erosion/ runoff. The upgradient area of the aeration piles was excavated and aeration soil was distributed behind Hole 18 in a non-playing area of the golf course.**

**Remarks: Water accumulated towards the center of the construction area from the previous rain event. JCS proposes to dig the soil with the water and see if there is recharge. If recharge occurs-against expectation, water will be pumped and containerized in advance of off-site disposal at an approved facility.**

**No detection from the down-wind gas monitor was seen, with the exception of % oxygen which peaked at 21.7% (up from 20.9). PID readings were found from 10:00 to 10:30 am around the perimeter of the excavation at 0.8 ppm (average) and 2.5 ppm (peak). Readings inside the trailer were found 0.0 ppm and the PID was recalibrated inside the trailer. No odor was observed on site and readings returned to 0.0 ppm after 10:30 am; humidity may have affected PID. Silt fencing was installed between the aeration core and hole 18.**

**Site Photographs:** (Yes) No

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T (W) TH F SA SU** **Weather: Sun and Slight wind** **Humidity**

**Date:** July 26, 2017 **Time: 0700** **Temp: 70-80** °F High Med (Low)

**Name of Project: Trump Golf Links** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS, Triple G, Trump Construction**

**Active Site Work Areas: Accumulation of trenching and cover soil stockpile, Trenching of proposed electrical conduits, Aeration pile excavation and stockpiling in non-play area behind Hole 18.**

**Site Work Progress: Brown fine-course sand from the proposed conduit trench at the southern end of the construction area and soil from the cover layer stockpile was moved to the north-eastern end. PVC 40 (4" dia.) piping was installed along the eastern and southern reaches of the conduit trench. Roughly 4 – 6" of excavated soil (shaping and cover layer materials) around the trench was placed on top of the conduit piping and electrical warning label tape was placed on top. Aeration core stockpiling continued behind Hole 18. Roughly 1/4 of the pile up gradient of the aeration pile was hauled with two alternating John Deere tractors piling roughly 3' high, silt fenced at the stockpile location. Trenching for new conduit moved roughly 10' south into asphalt. Asphalt stockpile moved north roughly 25' (see Photo #3).**

**Remarks: Rain water accumulation from the previous storm event was trenched to act as a retention basin. Bulk of the water mass either percolated through soil or evaporated (no recharge). Fencing towards the southern part of the construction area was offset roughly 10' in order to follow site construction plans and allow for trenching next to office building. Silt fencing in this area was reinstalled on the outer temporary fencing side (asphalt blocking inside) and anchored with sandbags.**

**No detections from the PID or gas monitor were encountered throughout the day, with the exception of oxygen at 20.5% (down from 20.9).**

**Site Photographs:** (Yes) No

**Additional Action Required by Project Mgr. or Eng.:**

**YES (NO)**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W (TH) F SA SU** **Weather: Sun and Slight wind** **Humidity**

**Date: July 27, 2017** **Time: 0700** **Temp: 70-80** °F (High) Med Low

**Name of Project: Trump Golf Links** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS, Triple G**

**Active Site Work Areas: Stockpiling of soil, Trenching and installation of new electrical conduits, Pile driving preparation.**

**Site Work Progress: New electrical conduit piping in the vicinity of the existing club house building was completed. Warning label tape was placed on top of the 40 PVC (4" dia.) electrical conduit. Trench was later backfilled with original cover material. Electrical wiring was installed through the conduit piping. Shaping layer soil was stockpiled to roughly 20'. Sediment and erosion control plans are proposed to be installed for the stockpile (silt fence, tarped, etc.) once the pile is completely gathered. The "Septic box" was prepared to be relocated away from pile driving activities (disconnection of PVC piping and wiring). Pile driving locations were leveled to grade as needed and marked out. Soil from the piles was gray fine to course sand with rock fragments and moved next to shaping layer stockpile.**

**Remarks: Rain water accumulation from the previous storm event lowered about 7-9". High humidity throughout the day resulting in a "spotty" PID; readings fluctuated from 3-10 ppm on and off site. No gas detections were made throughout the day. Conduit piping openings were covered with duct tape to prevent water infiltration. PVC 40 (3" dia.) drainage lines into the septic tank were broken when attempting to locate the lines. Water accumulation from the line was drained back into the septic box. Repairs to be made.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W TH (F) SA SU** **Weather: Sun and heavy fog** **Humidity**

**Date: July 28, 2017** **Time: 0700** **Temp: 70-80** °F **(High) Med Low**

**Name of Project: Trump Golf Links** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS, Triple G, Trump Construction**

**Active Site Work Areas: Construction site for proposed new Club House; soil stockpiling in parking area.**
**Activities included: Grading in construction area; stockpiling of shaping material in the parking area with erosion controls; stockpiling of co-mingled material with erosion controls; stockpiling of aeration cores with controls and removal of septic box.**

**Site Work Progress: Shaping layer soil was stockpiled in the back parking lot from grading activities taking place to the southeast. Sheeting and silt fencing was installed prior to soil stocking. Sheeting was placed over the concrete curb with silt fencing underneath and anchored with large rocks on top. The stock pile lies next to the cover layer material pile with no observable cross-contamination or co-mingling of materials. Stockpiles are to be covered with a tarp, anchored with sand bags, and have hay bales surrounding them once completed. Drainage and erosion controls are in place. Brown shaping soil derived from "Septic" box removal was added to the stockpile on the construction site. The stockpile will have a silt fence surrounding it and either tarping or seeding once stockpiling is complete. Roughly half of the aeration core material has been relocated to the nearby placement location. Odors are very potent in the aeration pile location and aeration stockpile area. A PID peak reading 12.7 ppm (Likely due to humidity).**

**Remarks: Very high humidity and heavy fog; PID not working properly even with hydrophobic filter. Some rain water accumulation from the previous storm event remains in the construction area. PID is calibrated every morning within the JCS construction trailer with Isobutylene (100 ppm). Trevor from Woodard and Curran recommended using a newer model such as the MiniRAE 3000, as it is less sensitive to moisture. Large boulders (4' dia.) were encountered during the grading activities. These will be segregated and stockpiled in the construction area until removed from site.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**(M) T W TH F SA SU** **Weather: Sun, slight wind** **Humidity**

**Date: July 31, 2017** **Time: 0700** **Temp: 70-80** °F High Med (Low)

**Name of Project: Trump Golf Links** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G, Trump Construction, GZA Environmental, Bryans Quality Plus Pile Driving**

**Active Site Work Areas: Construction site for proposed new Club House**

**Activities included: PDA Test Pile Driving, Shaping layer stockpiling in construction area; Asphalt stockpiling away from backfill materials; stockpiling of aeration cores with controls and removal of septic box.**

**Site Work Progress: Shaping layer on the eastern bounds of the construction site was stockpiled as depicted in Photo # 4. Soil in this area had trace amounts of construction material such as rebar, blasting rope/materials and scrap metal. These types of materials were previously noted in a meeting from July 17, 2017 that they may be encountered. A water tight roll off was ordered to store any municipal solid waste that may be encountered. The shaping layer stockpile was spread-out (lowered) so as not to exceed the height of the construction fence and to minimize to migration of sediments that could potentially be transported by high winds.**

**PDA test piles were installed to a depth of 70'. Steel beams were roughly 40' length wise and were welded throughout the interlocking joints. In-between welds, the breathing zone area was scanned with a PID MiniRAE 2000 showing 0.0 ppm for all piles. For additional safety, a MAXX AIR PRO portable fan was set up as an engineering control to vent any gases arising from the piles.**

**Leftover asphalt from new electrical conduit trenching activities was stockpiled from stockpiled soil. Asphalt is being temporary staged prior to off-site disposal.**

**Aeration core stockpiling continued with about half of the pile remaining. Some odors were detected but a scan on the area with the PID/gas detectors indicated no sustained readings. The PID MiniRAE 2000 showed 0.0 ppm. Test Drive Piling began with gas monitoring and engineering controls throughout the process.**

**Remarks: Low humidity; PID working properly. PID readings of about 0.7 ppm were encountered during disturbance of the shaping layer with construction debris around 13:50 to 14:00. PID readings were not detected throughout the day. A newer model such as the MiniRAE 3000 was proposed to be ordered for better PID readings. Gas monitoring indicated that oxygen sporadically increased to 23.0% (up from 20.9%).**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M (T) W TH F SA SU** **Weather: Sun, slight wind** **Humidity**

**Date: August 1, 2017 Time: 0700** **Temp: 70-85 °F** High (Med) Low

**Name of Project: Trump Golf Links** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G, Trump Construction, Bryans Quality Plus Pile Driving**

**Active Site Work Areas: Construction site for proposed new Club House**

**Activities included: Pile driving and welding of steel beams. Soil and erosion control plans for co-mingled soil stockpile on site. Aeration core stock piling**

**Site Work Progress:**

**Twelve piles were driven to a depth of about 35'. Of those twelve, seven were welded and driven to about 70'. Steel beams were roughly 40' length wise and were welded between the interlocking wedge plates of each beam and across the flange. Before welding, the piles were monitored at ground surface elevation (without ventilation fan) with a 4-gas MiniRAE Meter. If no detections were found above the Lower Explosive Limit (LEL) for methane gas (determined by OSHA), welding was deemed safe and a Maxx Air Pro industrial fan was placed next to the base of the beam and turned on for additional safety. Industrial fire safety equipment (fire extinguisher) is present near driving piles.**

**A silt fence was installed around the co-mingled soil stockpile and trenched (6" of fence in the ground). Tarping/seeding is proposed to be placed on top of the pile within the week.**

**Aeration core stockpiling continued. About of 1/3 of the pile remains.**

**Remarks: PID hits were detected during marking activities (spray paint). Gas meter detections were found for carbon monoxide (32 ppm peak) during welding activities (attributed to exhaust fumes from the welder itself). Oxygen content was found to increase to 21.4% (up from 20.9%) from 12:00 to 13:00.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T (W) TH F SA SU** **Weather: Sun, slightly cloudy** **Humidity**

**Date: August 2, 2017 Time: 0700** **Temp: 70-85 °F** (High) Med Low

**Name of Project: Trump Golf Links** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G, Trump Construction, Bryans Quality Plus Pile Driving**

**Active Site Work Areas: Construction site for proposed new Club House**

**Activities included: Pile driving and welding of steel beams. Aeration core stock piling.**

**Site Work Progress:**

**Twelve piles were driven to a depth of about 35'. Of those twelve, seven were welded and driven to about 70'. Steel beams were roughly 40' length wise and were welded between the interlocking wedge plates of each beam and across the flange. Before welding, the piles were monitored with the four-gas meter as per protocol. The ventilation fan was not in use during the monitoring. During welding activities that fan was utilized for an added measure of safety.The 4-gas MiniRAE Meter was mounted to a PVC pipe and placed next to the pile during all welding and driving. Industrial fire safety equipment (fire extinguisher) is present near driving piles.**

**Remarks: Grindings and cuttings from beams tended to hit the 4-gas monitor. To protect the instrument, the meter was placed in a protected position with the tubing extending into the pile hole. The gas monitor was then observed from a safe distance with a set of binoculars. Hydrogen sulfide and LEL were found in low concentrations briefly when grindings hit the monitor of 0.8 ppm and 2% (Not high enough to trigger alarm systems).**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W (TH) F SA SU** **Weather: Sunny, slightly cloudy** **Humidity**

**Date: August 3, 2017 Time: 0700** **Temp: 70-85 °F** (High) Med Low

**Name of Project: Trump Golf Links** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G, Trump Construction, Bryans Quality Plus Pile Driving**

**Active Site Work Areas: Construction site for proposed new Club House, Aeration core piling behind Hole 18**

**Activities included: Pile driving and welding of steel beams. Aeration core stock piling.**

**Site Work Progress:**

**Nine piles were driven to depth a depth of roughly 40' and four piles were driven to roughly 70'. Before welding, the piles were checked at the inlet (ground surface elevation) with a 4-gas MiniRAE Meter. If no alarms were triggered by the meter, an industrial fan was turned on, pointed towards the pile location, and welding was conducted. The meter alarm is triggered if concentrations of the carbon monoxide, hydrogen sulfide, oxygen, and methane are above OSHA exposure limits. The 4-gas MiniRAE Meter was mounted to a PVC pipe and placed next to the pile during all welding and driving. A piece of construction debris was laid on top of the meter to prevent damage from welding activities. A fire extinguisher was present near driving piles.**

**Aeration core stockpile relocation was completed and grass seeding was placed over the old stockpile location. The new stockpile location (Behind Hole 18) was roughly 8' high and 100' in length.**

**Small asphalt pile still remains on-site, bulk majority was disposed of off-site when the asphalt was originally broken up.**

**Remarks: No alarms were triggered with the exception of carbon monoxide early in the day. Closer investigation of OSHA Permissible Exposure Limits (PEL) indicated that 200 ppm was the recommended PEL for carbon monoxide. Inspection of the meter determined that the PEL was actually set to the Time Weighted Average (TWA) of 35 ppm. The 4-gas meter alarm was thus changed to the correct 200 ppm alarm limit for carbon monoxide. No alarm triggers occurred after this. Hydrogen sulfide was detected at a peak 1.2 ppm during the pile driving, below all OSHA exposure limits.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W TH (F) SA SU** **Weather: Thunderstorms, Sunny & slightly cloudy** **Humidity**

**Date: August 4, 2017 Time: 0700** **Temp: 70-85 °F** (High) Med Low

**Name of Project: Trump Golf Links** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G, Bryans Quality Plus Pile Driving**

**Active Site Work Areas: Construction site for proposed new Club House**

**Activities included: Pile driving and welding of steel beams.**

**Site Work Progress:**

**Nine piles were driven to their completion depths of roughly 70'. Before welding, the piles were checked at the inlet (ground surface elevation) with a 4-gas MiniRAE Meter. The 4-gas MiniRAE Meter was mounted to a PVC pipe and placed next to the pile during welding and pile driving. The 4-gas MiniRAE Meter was calibrated in the field successfully. A piece of construction debris was placed on top of the meter to prevent damage from welding activities. A fire extinguisher was present near pile driving and welding activities. The meter alarm is triggered if concentrations of the carbon monoxide, hydrogen sulfide, oxygen, and methane are above OSHA exposure limits; the alarm was not triggered for these four gases during today's activities. Since no alarms were triggered by the meter, an explosion-proof? industrial fan was turned on, pointed toward the pile location, and welding was conducted.**

**Approximately xx tons (truckloads?) of cover material was excavated and transported to its dedicated stockpile area. Approximately yy tons (truckloads?) of shaping material was excavated and transported to its dedicated stockpile area.**

**Remarks: Thunderstorms occurred early in the morning in the morning from 7:00 to 9:30, no piles were driven during this time. After the thunderstorms passed, conditions were sunny with some clouds. Large pools of water (from the storm event) remained on site. Silt fencing was inspected for the cover and shaping material stockpiles and the perimeter of the construction site with no soil visibly penetrating the haybale barriers.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**(M) T W TH F SA SU** **Weather: Rain, light to heavy** **Humidity**

**Date: August 7, 2017 Time: 0700** **Temp: 70 °F** (High) Med Low

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G, Bryans Quality Plus Pile Driving**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: Pile driving and welding of steel beams**

**Site Work Progress:**

**Four piles were driven to their completion depths of approximately 75 feet, three piles were driven to their intermediate depths of approximately 40 feet, and six completed pilings were cut to grade by the welder. Before welding/cutting, the piles were checked at the inlet (ground surface elevation) with a 4-gas MiniRAE Meter. The 4-gas MiniRAE Meter was mounted to a PVC pipe and placed next to the pile during welding and pile driving. A piece of construction debris was placed on top of the meter to prevent damage from welding activities. A fire extinguisher was present near pile driving and welding activities and a fan was turned on, aimed at the active piling. The meter alarms is triggered if concentrations of carbon monoxide, hydrogen sulfide, oxygen and methane (as Lower Explosive Limit) are above OSHA exposure limits; the alarm was not triggered for these four gases during today's activities.**

**Remarks: Rain was light to heavy for this workday, and site activities (including pile driving and cutting) concluded at 1400. Silt fencing and haybales were observed for the stockpiles and the perimeter of the construction site with no soil visibly penetrating the barriers.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T (W) TH F SA SU** **Weather: Sunny and slightly cloudy** **Humidity**

**Date: August 9, 2017 Time: 0700** High (Med) Low

**Temp: 70 - 80** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G, Bryans Quality Plus Pile Driving**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: Pile driving and welding of steel beams**

**Site Work Progress:**

**Seven piles were driven to their completion depths of approximately 75 feet and three completed pilings were cut to grade by the welder. Before welding/cutting, the piles were checked at the inlet (ground surface elevation) with a 4-gas Q RAE Meter II. The 4-gas Q RAE II Meter was mounted to a PVC pipe and placed next to the pile during welding and pile driving. A piece of construction debris was placed on top of the meter to prevent damage from welding activities. A fire extinguisher was present near pile driving and welding activities and a fan was turned on, aimed at the active piling. The meter alarms is set to trigger if concentrations of carbon monoxide, hydrogen sulfide, oxygen and methane (as Lower Explosive Limit) are above OSHA exposure limits; the alarm was not triggered for these four gases or on the PID during today's activities.**

**Remarks: The Q RAE II gas meter and he MiniRAE 2000 PID were calibrated and used prior to welding and pile driving as an added measure of safety. A new Q RAE III gas meter was delivered from Pine Environmental LLC and switched with the old Q RAE II meter at 14:30. The new meter was calibrated on site and placed with the same setup as the Q RAE II (PVC joint mounted with cover for protection).**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**(M) T W TH F SA SU** **Weather: Sunny, cloudy later in day** **Humidity**

**Date: August 14, 2017 Time: 0700 – 17:00** High Med (Low)

**Temp: 70 - 85** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G, Bryans Quality Plus Pile Driving**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: Pile driving and welding of steel beams, concrete perimeter preparation**

**Site Work Progress:**

**Ten piles were driven to their completion depths of approximately 75 feet. Before welding/cutting, the piles were checked at the inlet (ground surface elevation) with a 4-gas Q RAE Meter III. A piece of construction debris was placed on top of the meter to prevent damage from welding activities. A fire extinguisher was present near pile driving and welding activities and a fan was turned on, aimed at the active piling during welding. The meter alarms are triggered if concentrations of carbon monoxide, hydrogen sulfide, oxygen and methane (as Lower Explosive Limit) are above OSHA exposure limits. The alarm was triggered for pile P-155, with 51% LEL for methane towards the end of the work day. This pile was driven down to roughly 37' and no welding was done on it. The pile was labeled "CAUTION METHANE" and welders were informed not to work on it. The pile will be rescanned with the 4-gas meter before any further work resumes. Work will only be allowed if safe conditions are re-established.**

**Remarks: A water line leading into the temporary clubhouse building was cracked during trenching for new clubhouse concrete perimeter. Water was determined to be clean municipal water which was pumped onto a grassy area next to the temporary clubhouse on-site. The leak has been fixed.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M (T) W TH F SA SU** **Weather: Sunny and slightly cloudy, Rainy later in day** **Humidity (High) Med Low**

**Date: August 15, 2017 Time: 0700 – 16:45** **Temp: 70 - 80 °F**

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G, Bryans Quality Plus Pile Driving**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: Pile driving and welding of steel beams, concrete base preparation**

**Site Work Progress:**

**Two piles were driven to their completion depths of approximately 75 feet, ten piles were cut to grade level, and 2 piles were driven halfway to the completion depth of approximately 37'. Before welding/cutting, the piles were monitored at the inlet (ground surface elevation) with a 4-gas Q RAE Meter III. Welding is not permitted when combustible gases are present. As an added measure of safety, any space between the pile and the surrounding soils was filled and foot-tamped to eliminate any open pathways. In addition—as an engineering control, the fan was used to ventilate the immediate area and to dissipate any potential vapors. A fire extinguisher was also present. The meter alarms are set to trigger if concentrations of carbon monoxide, hydrogen sulfide, oxygen and methane (as Lower Explosive Limit) are measured above OSHA exposure limits. At two pile locations, the meter was triggered for LEL methane at pile P-155 (51%) and P-154 (13%). The space between the piles were filled with surrounding co-mingled soil and the industrial fan was used to ventilate the work zone. No LEL (0%) was detected after filling and ventilation. A PID MiniRAE 2000 is being used as backup to the 4-gas meter.**

**Remarks: The JUNTAN pile driver developed minor hydraulic leaks which led to a stoppage of work until the problem was fixed. Leaking hydraulic fluid was captured in a 5-gallon bucket and stored on-site. The hydraulic leak was quickly fixed, however rain later in the day prevented welding from resuming.**

**The asphalt and construction debris stockpiles were loaded on to a disposal truck and transported off-site to a disposal facility. No leftover debris was observed on the former stockpile soil location.**

**Date: August 16, 2017 Time: 0700 – 17:00** High (Med) Low

**Temp: 70 - 85** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: Triple G, Bryans Quality Plus Pile Driving**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: Pile driving and welding of steel beams, concrete base preparation, soil and erosion inspection**

**Site Work Progress:**

**10 piles were driven to their completion depths of approximately 70 feet and 2 piles were driven to halfway completion depth of roughly 37'. Before welding/cutting, the piles were checked at the inlet (ground surface elevation) with a 4-gas Q RAE Meter III. A piece of construction debris was placed on top of the meter to prevent damage from welding activities. A fire extinguisher was present near pile driving and welding activities and a fan was turned on, aimed at the active piling during welding. The meter alarms are triggered if concentrations of carbon monoxide, hydrogen sulfide, oxygen and methane (as Lower Explosive Limit) are above OSHA exposure limits; the meter was triggered for pile P-80 for methane LEL at 99%. The pile was at it`s completion depth of 70 feet when the gas was detected. An odor was present at the pile and surrounding co-mingled soil was filled into the inlet. The inlet was then rescanned reading 0% for methane LEL. Later in the day the pile was rescanned showing 5% LEL (below the alarm trigger) and was labeled to have the fan turned on prior to cutting. The pile was not cut today. A PID MiniRAE 2000 was on site as backup if the 4-gas meter wasn`t working properly.**

**Remarks: Boulders roughly 3-4' in diameter were hit on pile P-80. An excavator was brought in and the boulders were dug out to roughly 4' below ground surface. No municipal solid waste was encountered; trace amounts of construction debris was observed in the shaping soil.**

**The area where leakage was seen on August 15 from the JUNTAN pile driver was inspected. Some visual staining was present (roughly 5 gallons of soil). JCS agreed to have the soil placed into buckets and set aside until later disposed of.**

**JCS was notified to hydro seed the on-site co-mingled soil stockpile. Currently the Triple-G is scheduling the hydro seeder to arrive on-site as soon as possible.**

**Site Contractors: Triple G, Bryans Quality Plus Pile Driving**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: Pile driving and welding of steel beams, concrete base preparation, Soil and erosion inspection**

**Site Work Progress:**

**9 piles were driven to their completion depths of approximately 70 feet. Before welding/cutting, the piles were checked at the inlet (ground surface elevation) with a 4-gas Q RAE Meter III. No alarm triggers were activated at any time and all safety measures (ventilation fan, fire extinguisher etc) were in-place during the operations.**

**Remarks: Piles P-110 and P-105 had methane's level detected of 5% and 6% (below alarm limit). The inlets of the piles were covered in surrounding co-mingled soil for safety. No readings were detected after piles were covered.**

**Areas were trenched roughly 10 ft. deeper for certain piles per specs for concrete slabs. No municipal solid waste observed.**

**Currently the co-mingled pile is now scheduled to be tarped and anchored with sandbags rather than hydro seeding. Tarping is expected to take place on August 23, 2017. Storm water inlet drains were covered with sediment erosion catch basins all around the parking lot construction area.**

**Soils previously stained with oil from the pile driver leakage was disposed of properly.**

**Site Contractors: Triple G, Bryans Quality Plus Pile Driving**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: Pile driving and welding of steel beams, concrete base preparation**

**Site Work Progress:**

**7 piles were driven to their completion depths of approximately 75 feet. Before welding/cutting, the piles were checked at the inlet (ground surface elevation) with a 4-gas Q RAE Meter III. The meter was triggered for one (1) pile over OSHA Lower Explosive Limit (LEL) standards of 10%. Mitigation measures were taken to eliminate the vapor migration pathway. A PID MiniRAE2000 was used as a backup to the 4-gas meter.**

**Remarks: Pile P-38 was the only pile to trigger the alarm limits for methane at completion depth (~70'). A reading of 17% of the LEL was measured. The void space between the pile and surrounding soil was filled with co-mingled soil. No readings (0%) were detected after the gap was closed. The fan was re-oriented to maximize ventilation.**

**Additional pile driving beyond the 80 foot level--remains pending at the piles that will support the future access ramp to the clubhouse located on the north side of the building. The engineer of record will determine if further driving is necessary. When that decision is made, appropriate measures will be enacted.**

**Activities included: Pile driving and welding of steel beams, concrete base preparation**

**Site Work Progress:**

**8 piles were driven to their completion depths of approximately 75 feet. Two (2) piles were driven to 82'. Three (3) piles were driven to 40'. Before welding/cutting, the piles were checked at the inlet (ground surface elevation) with a 4-gas Q RAE Meter III. The meter was triggered for one (1) pile over OSHA Lower Explosive Limit (LEL) standards for methane. Mitigation measures were taken before welding was allowed to continue. A PID MiniRAE2000 is used as a backup to the 4-gas meter.**

**Remarks:**

**Piles driven past 80' were located in the northern end of the clubhouse building for the proposed ramp for heavy vehicles. Cement that was poured yesterday August 31, 2017 has cured. Some soil from the co-mingled soil stockpile on-site was used to backfill the outer bounds of the cement.**

**Pile P-16 was found to have high levels of methane (91%) after being driven 40'. The industrial fan was turned on and pointed towards the pile. Soil cuttings were placed and tamped around the pile. No methane detections were recorded and work was allowed to proceed. The 4-gas meter was placed adjacent to the pile. The alarm was not triggered during welding.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M (T) W TH F SA SU** **Weather: Cloudy** **Wind: Low** **Humidity**

**Date: September 26, 2017** **Time: 0700 – 1530** High (Med) Low

**Temp: 72-88** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: Triple G Contractors**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: Footing concrete form removal, environmental air monitoring**

**Site Work Progress:**

**There was no backfilling taking place during the day, excess soil from around the perimeter of the building footprint was compiled into one area in the north corner of the site (east of job trailer), contractor spent most of the day setting concrete forms for foundation walls on top of footings. Air was continuously monitored during all soil movement activities. A 4-gas meter was placed near the temporary clubhouse and continuously monitored. The perimeter of the construction site was also scanned with a PID throughout the day.**

**Remarks:**

**No detections were found above ambient levels throughout the day from either the PID nor 4-gas meter.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T (W) TH F SA SU** **Weather: Cloudy** **Wind: Low** **Humidity**

**Date: September 27, 2017** **Time: 0700 – 1500** High (Med) Low

**Temp: 68 - 88** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: Triple G Contractors, Trimble Surveying, JCS Construction**

**Active Site Work Areas: Construction site for proposed new Clubhouse, Soil Stockpile Staging Area in Parking Lot**

**Activities included: Cutting & bending of re-enforcing bar, survey, movement of soils from parking lot staging area to the construction site, environmental air monitoring.**

**The excavation located behind the 7th green-which had been opened to install an isolation valve for the irrigation system-was properly backfilled. (No valve was installed as the location was determined to be infeasible).**

**Offsite: soil samples were collected at New York Recycling located at 475 Exterior Road Bronx, NY. Sample results will help determine whether the material is suitable of importation to the Ferry Point construction site.**

**Site Work Progress:**

**The contractor spent the day preparing re-enforcement bars in advance of an upcoming concrete pour.**

**Approximately 110 cubic yards of soil was taken from the soil stockpile in the parking lot and moved to three locations on the construction site. The material will be utilized to raise grade level on the construction site at some point in the near future.**

**Air monitoring was performed during the soil movement activities.**

**Remarks:**

**Air monitoring identified no detections above background levels throughout the day from either the PID nor 4-gas meter. Soil samples collected at New York Recycling were delivered to Hampton Clarke/Veritech labs.**

**Site Photographs:** (Yes) No

**Additional Action Required by Project Mgr. or Eng.:**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T (W) TH F SA SU** **Weather: Cloudy** **Wind: Low** **Humidity**

**Date: September 27, 2017** **Time: 0700 – 1500** High (Med) Low

**Temp: 68 - 88** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Offsite Work Area: Irrigation pipeline behind the 7th Green**

**Trump Links Maintenance personnel had opened an excavation behind the 7th Green during the week of September 20. The purpose of the excavation was to install a new isolation valve in the irrigation line so that sections of the golf course could be isolated in the event of and irrigation line leak. Total size of the excavation was approximately 8 feet long, 8 feet wide and 6 feet deep. Based on discussions with a contractor, no isolation valve was installed. The location was deemed to be infeasible. The excavated soils were segregated; cover material on the north side of the excavation; shaping material on the south side. No demarcation barrier or waste was observed. Excavation was covered with plywood sheets supported by 2inch x 10 inch planks.**

**Site Work Progress:**

**After determining that the location was not suitable for the installation of an isolation valve, Trump Maintenance personnel, backfilled the excavation. Material that had been segregated was placed back into the hole in the same stratigraphic sequence. Materials were compacted in lifts of approximately 1 foot each using a small backhoe. All excavated material was successfully replaced into the hole—leaving no excess material for disposal. The vegetative layer at the surface was restored to the extent practical. Maintenance personnel are expected to seed the area.**

**Remarks:**

**Air monitoring data collected from the open excavation and during the backfilling activities, recorded no detections above background.**

**Site Photographs:** (Yes) No

**Additional Action Required by Project Mgr. or Eng.:**

**YES (NO)**

**Date: September 27, 2017** **Time: 0700 – 1500** High (Med) Low

**Temp: 68 - 88** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Offsite Work Area: Offsite Shaping Layer Material Sampling and Investigation: New York Recycling, 475 Exterior Street, Bronx, NY**

**It is noted that this site was previously reviewed and approved (desktop level) by Woodard Curran and NYSDEC during the pre-closure phase of the project.**

**New York Recycling NYSDEC Permit # 03W87**

**Site Work Progress:**

**Soil sampling was conducted at New York Recycling located at 475 Exterior Street. Facility Manager Roger Freitas sectioned-off an approximately 2,500 cubic yard area from which the composite sample was collected. It is noted that the sample for VOC's was a discrete grab sample. Soils were screened with a PID with no indications of contamination. The soil pile was also inspected for signs of asphalt, slag, brick, concrete and other debris. No unauthorized debris was observed in the soil pile. A shovel was used to dig into the pile approximately 1 to 2 feet. Thereafter a dedicated trowel was used to collect representative point samples from approximately 12 locations. Samples were composited in a stainless steel bowl and troweled into the laboratory-supplied sample jars. Samples were placed on ice under chain of custody control.**

**Remarks:**

**Samples were delivered to Hampton Clarke Labs in Fairfield, NJ. Analyses to include all the parameters noted in "Table 1 Chemical Permit Limits Ferry Point" as provided by Woodard Curran.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W TH (F) SA SU** **Weather: Sunny and Cloudy** **Wind: Light-midium** **Humidity**

**Date: November 3, 2017** **Time: 0700 – 1300** **Temp: 56 - 60** °F (High) Med Low

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: Triple G Contractors, JCS Construction**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: Continued installation of sub-grade plumbing and electrical conduits; SSDS installation of crushed stone, PVC piping, and concrete cage pits**

**Site Work Progress:**

**The second installation of the SSDS piping was advanced by EAI and inspected by Maser Consulting. The configuration consisted of header 4" dia. Schedule 80 PVC piping connecting to four (4) sub-slab depressurization pits and one (1) riser 4" dia. Schedule 80 PVC pipe.**

**Deviations to the original EAI site plan denoted as Drawing No. SD004 were made to account for as-built utilities. The pit locations did not change, however the PVC piping was altered slightly. Minor changes includeded PVC piping entering from a different pit side and removal of unnecessary elbows. All pits were constructed based on EAI's approved spec, which slightly differs from the SD004 spec in regard to the concrete block configuration and steel rods. DP-2B was the only pit left unconstructed at the end of the day however, Triple G will be installing the final pit prior to liquid boot installation.**

**As-built dimensions were measured for both first and second SSDS piping advancements.**

**A 4-gas meter was kept on-hand and checked periodically throughout the day.**

**Remarks:**

**Air monitoring identified no detections above background on the PID or the 4-gas meter.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**(M) T W TH F SA SU** **Weather: 100% cloudy; misty in the morning, some showers in the afternoon**

**Humidity** (High) Med Low

**Date: November 6, 2017** **Time: 8:00am**

**Temp: 64** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G, EAI (Newark, NJ)**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: SSDS installation**

**Site Work Progress:**

**The 7th and final SSDS pit (DP-2B) was excavated and connected to the lateral SSDS collection piping. EAI stated that low point drains were installed in the lateral collection piping at intervals of no more than 20 feet. Measurements of the SSDS system component installed locations were taken for use in the P.E.'s as-built report. The vent risers were found to be uncovered, and temporary duct tape covers were placed over these two open pipes; the standing water needs to be removed from these pipes, and more permanent covers need to cap these pipes until construction of the remaining piping to the roof begins.**

**A fire extinguisher was present near work activities. The VRAE meter alarms is triggered if concentrations of carbon monoxide, hydrogen sulfide, oxygen and methane (as Lower Explosive Limit) are above OSHA exposure limits; the alarm was not triggered for these four gases during morning and afternoon walkarounds of today's activities.**

**A walkdown of the soil stockpiles for erosion and sediment control was conducted, with the haybales and tarps found to be satisfactory.**

**Tomorrow's planned activities include pouring stone cover over the lateral SSDS collection piping, with Liquid Boot® installation planned for Wednesday/Thursday of this week.**

**Remarks:**

**Site Photographs:** (Yes) No

**Additional Action Required by Project Mgr. or Eng.:**

**YES (NO)**

**Site Contractors: Triple G Contractors, JCS Construction, EAI (Liquid Boot Application)**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: spreading of crushed stone for use in SSDS; weekly construction meeting; application of base layer and liquid boot application in the northwestern section of new clubhouse.**

**Site Work Progress:**

**20ML thick vapor barrier base layer was placed over completed floor sections in the northwest corner of the clubhouse. Application of Liquid Boot was delayed until ambient temperatures reached and climbed above 45 degrees. Two floor sections were completed before a pump malfunction forced an early shutdown. Liquid Boot will cure overnight. Smoke and swatch thickness testing will be performed tomorrow. Air monitoring was performed around the perimeter of the construction area and at select locations.**

**Remarks:**

**Base layer was measured at a thickness of 20.5 ML. Vapor barrier base layers were overlapped a minimum of 6 inches as per the specification. Liquid Boot spray was also applied as per specifications and only when ambient temperatures climbed above 45 degrees.**

**Air monitoring identified no detections above background on the PID or the 4-gas meter.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W (TH) F SA SU** **Weather: Sunny/Partialy Cloudy** **Wind: Low Wind** **Humidity**

**Date: November 9, 2017** **Time: 0700 – 1500** High (Med) Low

**Temp: 40 - 55** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: Triple G Contractors, JCS Construction, EAI (Liquid Boot Application)**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: Spreading of crushed stone for use in SSDS; application of base layer geomembrane and liquid boot in the northwestern section of new clubhouse.**

**Site Work Progress:**

**The floor sections where liquid boot was applied on November 8th were smoke tested today. A total of five (5) coupon samples (1 per concrete section) were taken from the area designated as Area A. The coupon sampling frequency complies with the specifications. Four (4) smoke tests were performed in Area A. Representatives Ethan and Jen from Woodard & Curran were present during the smoke test. A protective geotextile fabric was placed on top of the liquid boot section following successful smoke testing and coupon thickness testing.**

**A 20 mil thick geomembrane base layer (VI-20) and liquid boot was placed over the completed floor sections in Area B. This area is south of Area A. After 6 hours of curing time, Area B was smoke tested. A total of three (3) coupon samples and (4) smoke tests were performed in Area B. Portions of the area where smoke was visibly escaping the barrier were re-sprayed with liquid boot. A protective geotextile fabric was placed over the barrier following successful testing.**
**Smoke testing was also performed on the SSDS piping network to confirm no blockages. During the test, visible smoke was observed from pits DP-1A and DP-1C.**

**Air monitoring was performed around the perimeter of the construction area and at select locations.**

**Remarks:**

**Coupon samples were measured with digital calipers. Coupon thicknesses met or exceeded the 60 ml specification with most coupons measuring thicknesses of 70-90 mils. Vapor barrier base layers were overlapped a minimum of 6 inches as per the specification. Liquid Boot spray was also applied as per specifications and only when ambient temperatures climbed above 45 degrees. Air monitoring identified no detections above background on the PID or the 4-gas meter.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**(M) T W TH F SA SU** **Weather: Sunny, Partially cloudy** **Wind: Medium** **Humidity**

**Date: November 27, 2017** **Time: 0700 – 1530** High Med (Low)

**Temp: 40 - 45** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: Triple G Contractors, JCS Construction**

**Active Site Work Areas: Construction site for proposed new Clubhouse, Clean Soil Fill \Imported to Site, Steel beam frame construction continued.**

**Activities included: Visual and PID inspection of clean fill imports from New York Recycling 475 Exterior Street.**

**Site Work Progress:**

**Soil was filled around the eastern perimeter of the concrete sub-structure (future patio). Prior to filling the soil was visually inspected for any solid debris. The soil was characterized as brown fine-course sand with gravel/rock fragments roughly 1-1.5" in diameter. Once dumped, the fill was visually inspected again and scanned with a PID. All loads were found to be acceptable. Clean fill was imported by DJCI Trucking LLC and IEV Trucking Corp. Two trucks were loaded and unloaded continuously throughout the day. Soil Manifests were completed for all loads.**

**Remarks:**

**There were no PID readings recorded on the imported materials. All loads passed visual and PID screenings**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W (TH) F SA SU** **Weather: Cloudy** **Wind: Low** **Humidity**

**Date: November 30, 2017** **Time: 0700 – 1430** High Med (Low)

**Temp: 40 - 45** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: Triple G Contractors, JCS Construction**

**Active Site Work Areas: Construction site for proposed new Clubhouse, Clean Soil Fill, Steel beam frame construction**

**Activities included: Inspection of clean fill.**

**Site Work Progress:**

**Approximately 180 $yd^3$ of clean fill was imported to the site today (10 loads; 18 $yd^3$ each). Soil was backfilled around the eastern, northern, and western perimeters of the concrete sub-structure. Prior to filling the soil was visually inspected for any solid debris. The soil was characterized as brown fine-course sand with occasional crushed stone roughly 1-1.5" thick in diameter. Once dumped the fill was visually inspected a second time and scanned with a PID. Clean fill was imported by DJCI Trucking LLC and IEV Trucking Corp. Two trucks were loaded and unloaded continuously throughout the day.**

**Remarks:**

**Two loads were brought onto the site yesterday November 29, 2017—and segregated for inspection. The loads were visually inspected and scanned with a PID. Manifests for the loads were collected from the truck drivers.**

**No readings were detected on the PID. No staining or solid waste was observed in any of the imported materials.**

**Total loads of fill imported: 11/27/2017 (14 Loads), 11/29/2017 (2 Loads), 11/30/2017 (10 Loads)**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W (TH) F SA SU** **Weather: Mostly sunny** **Humidity**

**Date: December 7, 2017** **Time: 6 : 10 am** High (Med) Low

**Temp: 37-45** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G; DJCI (soils transporter)**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: Soils Importing**

**Site Work Progress:**

**Importation of 7 loads of soil (~ 126 cubic yards) from New York Recycling, a donor source located at 475 Exterior Street in the Bronx. Air monitoring performed during the course of the workday revealed no detections above background on the photoionization detector (PID). Visual observation and PID monitoring of each load of soil from New York Recycling showed no evidence of VOCs or visual signs of debris within the material.**

**Imported soil was backfilled and graded around the northern and eastern perimeters of the concrete sub-structure. The soil was characterized as brown fine-course sand with occasional crushed stone roughly 1-1.5 inches thick in diameter. Fill was imported by DJCI Trucking LLC, with a single truck loaded and unloaded throughout the day.**

**A fire extinguisher was present near work activities. A Royal Carting 4-cubic yard municipal solid waste (MSW) commercial container was present near the work area, should MSW be generated from construction activities. A walkdown of the soil stockpiles for erosion and sediment control was conducted, with the haybales and tarps found to be satisfactory.**

**Tomorrow's planned activities include continuation of soils importing from New York Recycling, and EAI resuming smoke testing and repairs of the vapor barrier.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W TH (F) SA SU** **Weather: Mostly Cloudy** **Wind: Moderate** **Humidity**

**Date: December 8, 2017** **Time: 0600 – 1500** **Temp: 30-40 °F** High Med (Low)

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: Triple G Contractors, JCS Construction, DJCI Trucking (Soil Transpiration), EAI Environmental**

**Active Site Work Areas: Construction site for proposed new Clubhouse, Clean Soil Fill, Steel beam frame construction**

**Activities included: Inspection of clean fill.**

**Site Work Progress:**

**One DJCI truck was running throughout the day hauling in approximately 108 $yd^3$ of clean fill to the site today (6 loads; 18 $yd^3$ each). Visual observation and PID monitoring of each load of soil from New York Recycling showed no evidence of VOC's or signs of large debris within the soil.**
**The soil was characterized as brown fine-course sand with recycled crushed concrete stone 1-1.5" thick in diameter.**
**Imported soil was dumped and stock piled on the south-southwest side of the building. Some of the imported soil was used for backfilling around the steps leading to the patio bar and grill area on the eastern side of the clubhouse. Backfilling was completed using 1ft lifts and compacted using a jumping jack compactor.**
**EAI was onsite today to perform spot treatment of all locations where the LiquidBoot barrier was damaged causing holes to be put in the LiquidBoot. Smoke testing was performed a second time to help in locating all damaged areas of the Liquid Boot.**
**EAI said no coupon thickness testing was required because everything already passed the thickness test during the first smoke test.**
**The plan for Monday December 11th 2017, is for the steel structure of the building to continue being put up as well as the rebar for the floor slab to begin being installed.**

**Remarks:**

**No readings were detected on the PID. No staining or solid waste was observed in any of the imported materials.**

**All material imported for the day passed visual and PID inspections.**

**Date: December 18, 2017** **Time: 0600-1200** High Med Low

**Temp: 30-38** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: Triple G Contractors, JCS Construction, NV5 (Re-bar work, concrete pour, concrete testing); EAI (smoke testing)**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: reinforcing bar installation by subcontractors; smoke testing by EAI, air monitoring and concrete pouring.**

**Site Work Progress:**

**Steel reinforcing bar installation continued on the south side of the new clubhouse; smoke testing of the vapor barrier was completed in advance of the concrete pour. Smoke testing revealed several areas of the liquid boot barrier to have been compromised during the re-bar installation. All vapor barrier defects were properly repaired with trowel grade by EAI in advance of the concrete pour. This was the third and final round of smoke testing.**

**Air monitoring revealed no detections above background on the PID.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M (T) W TH F SA SU** **Weather: sunny & clear** **Wind:light** **Humidity**

**Date: March 6, 2018** **Time: 0800 - 1600** High Med (Low)

**Temp: 40-45** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G, IEV Trucking**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: general work tasks, soil importation from New York Recycling, trenching of new electical conduit for clock tower relocation, oversight of EAI SSDS installations**

**Site Work Progress:**

**Club House: General work tasks being performed by subcontractors including roof shingles and cupola installation**

**No SSDS work was conducted as EAI was not on-site as scheduled.**

**Inspection of former aeration core disposal area and former excavation site near the 7th green. Tarps and sand bags for the soil stockpile in the Parking Lot were being secured inadvance of tomorrow's forecast nor'easter.**

**Soil importation from New York Recylcing: a total of 108 cubic yards in 6 loads. Maser visited New York Recycling to confirm that stockpiled materials from that facility (which were sampled in September 2017) were still being used as the source of fill material for the new club house construction site.**

**Trenching for the installation of new electrical conduit to the new location of the clock tower. Trench is approximately 40 feet long, 2 feet deep, 18 inches wide. No obervations of demarcation layer, odors, smells, debris or PID readings.**

**Site Photographs:** (Yes) No

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W (TH) F SA SU** **Weather: increasing clouds** **Wind:light** **Humidity**

**Date: March 8, 2018** **Time: 0800 - 1200** High Med (Low)

**Temp: 35- 40** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS Construction, Triple G**

**Active Site Work Areas: Construction site for proposed new Clubhouse**

**Activities included: general work tasks, excavation to install the new foundation for the soon-to-be relocated clock tower, weekly construction meeting.**

**Site Work Progress:**

**Club House: General work tasks being performed by subcontractors.**

**Assessment of tarps covering the soil stockpile in the Parking Lot and other erosion control features. All found to be in satisfactory condition-with only minor displacements--following yesterday's nor'easter. Recommended to JCS that the tarp anchors be re-adjusted at the earliest opportunity.**

**Excavation for the installation of the new clock tower foundation was completed. The excavation is approximately 4 feet long, 4 feet wide and 4 feet deep. No groundwater, debris, smells or wastes were observed. The demarcation barrier was not encountered. Surplus cover and shaping material is being stockpiled adjacent to the construction area until it is ready to be used on-site and appropriately covered.**

**Temp: 60** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS, Triple G**

**Active Site Work Areas: Interior and exterior work at the new club house.**

**Activities included: oversight of new cart path installation**

**Site Work Progress:**

**Interior work at the new club house continues. There were no new excavations for the cart path installation at the rear of the clubhouse. However a 6-inch layer of crushed stone and 4 inches of asphalt was installed along a 600 foot long pathway at the rear of the club house for the new cart path. A 2-inch thick layer of sealing material will be applied over the asphalt according to the contractor. Once completed, this will bring the total cover thickness to 12-inches. Soil from the parking lot stockpile remains in the parking lot—although there are plans to re-use this material on the construction site soon. Contractor will provide Maser with advanced notice of the work schedule. Trenching for the installation of pipe for the stormwater system has been completed. There were no obsevations of MSW, the demarcation barrier or debris in the trenches. Surplus materials are being stockpiled and temporarily covered before re-use on site. No odors or PID readings recorded.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W (TH) F SA SU** **Weather: most sunny skies** **Wind: breezey** **Humidity**

**Date: April 26, 2018** **Time: 1000 - 1500** High Med (Low)

**Temp: 55-65** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS, Triple G, EAI**

**Active Site Work Areas: Interior and exterior work at the new club house.**

**Activities included: weekly construction meeting, movement of soils, SSDS piping, blower and monitor installation. Inspection of Erosion Control meaures.**

**Site Work Progress:**

**EAI resumed the installation of SSDS piping by installing the riser on the northern SSDS pit into the utility spaces above the new offices. Piping for the southern SSDS pit was also configured and later connected to the SSDS blower. SSDS monitors were also installed. SSDS Sensors will be installed once their proposed new locations are reviewed and approved.**

**Soils (imported earlier from NY Recycling) were relocated from the front of the clubhouse to the rear of the building—to elevate the grade levels. Soils from the parking lot stockpile remain in-place in the parking lot.**

**Minor trenching work was implemented for the irrigation system between the club house and the new cart path. Excavations were shallow (12") and through soils that were relocated to the rear of the building—with no potential to encounter MSW.**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W (TH) F SA SU** **Weather: overcast, drizzle** **Wind: light** **Humidity**

**Date: May 31, 2018** **Time: 1000 - 1430** (High) Med Low

**Temp: 60** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426A**

**Site Contractors: JCS, Triple G, EAI**

**Active Site Work Areas: Interior and exterior work at the new club house.**

**The previous sewer pump installation was found to have been performed incorrectly. The unit will have to be re-excavated, re-oriented and piped.**

**Con Ed is on site for the installation of natural gas supply lines to the new club house. Trenching was performed to facilitate gas pipe installation. Excavations were shallow and through materials that were previously imported from NY Reclycling. Excavations did not encounter any demarcation barriers, MSW or debris. No odors or PID readings were recorded.**

**EAI continues installation of SSDS components including sensors and monitors. EAI reinstalled the suction blower on the southern side of the club house—which had been dismantled to allow the trades to install components of the HVAC-without interference.**

**Site Work Progress:**

**EAI continues work on SSDS component installations. Senors and monitors were installed. Sampling and calibration lines were prepared for installation.**

**Trenching for gas line installation was performed on the western (front) side of the clubhouse. Con Ed will be installing the servce line.**

**Weekly Erosion Control Inspections were conducted.**

**Site Photographs:** (Yes) No

**Additional Action Required by Project Mgr. or Eng.:**

**YES (NO)**

# DAILY FIELD OBSERVATION REPORT

**M T W TH F SA SU** **Weather:** Weather **Wind:** 0-5 mph **Humidity**
**Date:** 8-24-2018 **Time:** 7:30 (High Med Low)
**Temp:** 90+

**Name of Project:** Trump Links Golf Course - Ferry Point **Municipality:** Bronx, NY **Job No:** 17002426C

**Site Contractors:** Bellisimo Masonry & Construction (Anthony)

**Active Site Work Areas:** Proposed Gas Main installation & excavation

**Site Work Progress:** Arrived on-site at 7:30am

8:00am - Was informed by that excavation cannot commence until umbrella insurance issue is resolved.

9:00 am laying down plywood and began digging up the telecom line.

10:30am - met with Joe Rodinger. He explained that the demarcation barrier is a caution that says the msw is approximately 1-4 feet below that.

Standard SOP (according to Joe) is that we can dig to depth, replace demarcation barrier with a new one and then sand, pipe, etc.

Demarcation barrier varies from 10"-24". Barrier closest to road has no shaping material on top.

13:15 - Called and spoke to Anthony of Bellisimo, was told I was not needed anymore today.

**Remarks:** N/A

**Site Photographs:** Yes **Additional Action Required by Project Mgr. or Eng.: (YES NO)**

# DAILY FIELD OBSERVATION REPORT

**M T (W) TH F SA SU** **Weather:** Weather **Wind:** 0-5 mph **Humidity** (High) Med Low)
**Date:** 9-5-2018 **Time:** 7:30 **Temp:** 90+

**Name of Project:** Trump Links Golf Course - Ferry Point **Municipality:** Bronx, NY **Job No:** 17002426C

**Site Contractors:** Bellisimo Masonry & Construction (Anthony)

**Active Site Work Areas:** Proposed Gas Main installation & excavation

**Site Work Progress:** Arrived on-site at 7:30am

Upon arrival, gas meter located in Chris' office was not working. Called Pine Environmental and had them deliver a new one.

7:45am - Began preliminary observations, asphalt in front on maintenance garage has been saw cut, had to offset in fron of bay door No. due to natural gas cap.

8:30am - ConEd arrived on-site.

9:15am - Orange Demarcation barrier is being laid down in trench (See attached map for location) (BLUE AREA)

9:20am - 3" of sand is being laid on top of orange demarcation barrier (Checking with measured broom stick handle)

10:00am - Anthony (Bellisimo) began removal asphalt layer from north and east side of the maintenance garage.
10:10am - Measured trench in asphalt - ranged from 36"-42"

**Remarks:** N/A

11:00am - Spoke to ConEd workers, they explained the bonding process. 20 min of intense heat (400-450 degrees) to bond two sections together and 20 minutes for the pieces to cool down before they can be placed in trench.

11:15am - Anthony (Bellisimo) began trenching across golf cart path (See attached map, YELLOW AREA). Steel plate placed over trench.

11:40am - Pine Environmental delivered new gas meter

12:00pm - ConEd front loader broke down, need to replace with new one

13:30pm - New front loader arrives and bonding continues
14:30 - Anthony (Bellisimo) was trenching along east side of maintenance garage. Exposed current 4"gas line (See attached map, GREEN AREA)

15:40pm - Orange demarcation barrier has been laid with 3" of sand on top from Buttrick Avenue to where the trench first crosses the golf cart path (See attached map)

15:45pm - 8 sections of new 6" gas pipe has been bonded and placed in trench.

16:30pm - Trenching has ended for the day

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T (W) TH F SA SU** **Weather: Cloudy/Slightly Rainy** **Wind: light to mild** **Humidity**

**Date: September 12, 2018** **Time: 0900 - 1700** **Temp: 60 - 70** °F (High) Med Low

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426C**

**Site Contractors: Bellisimo Masonry & Construction (Anthony)**

**Active Site Work Areas: Gas Main Installation pipeline - Backfilling in the Trenches North of Maintenance Garage**

**Piping welded around trench bends for installation by Con Edison.**

**No 4-gas meter measurements above background levels.**

**Site Work Progress: Trenches in various locations were backfilled north of the maintenance building. Toward the northern end of the course near Buttrick & Dewey Ave prior backfilling and near the maintenance building area, clean cover sand was backfilled to a minimum of 3" thick above the gas pipe and shaping material soil was covered over. Areas near the intersection of the golf course were backfilled with a minimum of 3" thick clean fill sand at the base of the trench. Thickness of the clean fill above and below pipes were measured every 10' throughout the trench.**

**79,500 lbs of clean cover fill from Ranco Sand & Stone was delivered to the site and stored at the maintenance building.**

**Con Edison welded and installed plastic 6-inch pipe at trench bends near the trail intersection of the gas installation .**

**Site Photographs:** (Yes) No

**Additional Action Required by Project Mgr. or Eng.:**

**YES (NO)**

**Observed By: John Fortunato**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W (TH) F SA SU** **Weather: Cloudy/Slightly Rainy** **Wind: light to mild** **Humidity**

**Date: September 13, 2018** **Time: 0800 - 1500** High (Med) Low

**Temp: 60 - 70** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426C**

**Site Contractors: Bellisimo Masonry & Construction (Anthony)**

**Active Site Work Areas: Gas Main Installation pipeline – Excavating Trenches South of Maintenance Garage toward clubhouse**

**Piping welded around trench bends for installation by Con Edison.**

**No 4-gas meter measurements above background levels.**

**Site Work Progress: Roughly 500' of trench south of the maintenance building from the rear entrance along the path to the clubhouse was excavated. Trench depth ranged from 30 – 40" below ground surface. Near the fence line of the trench, gravel, plastic piping, and plastic liner was encountered. Roughly 10' of perforated pipe was damaged during the disturbance. The contractor (Anthony) was notified to repair the drainage area. Unmarked utilities were also encountered, but were not damaged. All materials were stocked onto plywood panels adjacent to the trench. Shaping layer soil was placed on one side of the trench, while cover sand was placed on the oppostie side for later backfilling.**

**Excess shaping material from backfilling activities was stockpiled in the bin northwest end of the maintenance building.**

**Con Edison continued welding and installing plastic 6-inch pipe at trenches north of the maintenance building.**

**Site Photographs:** (Yes) No

**Additional Action Required by Project Mgr. or Eng.:**

**YES (NO)**

# DAILY FIELD OBSERVATION REPORT – ENVIRONMENTAL

**M T W TH (F) SA SU** **Weather: Cloudy/Slightly Sunny** **Wind: light to mild** **Humidity**

**Date: September 14, 2018** **Time: 0800 - 1500** High (Med) Low

**Temp: 60 - 70** °F

**Name of Project: Trump Golf Links – Ferry Point Park** **Municipality: Bronx, NY** **Job No: 17002426C**

**Site Contractors: Bellisimo Masonry & Construction (Anthony)**

**Active Site Work Areas: Gas Main Installation – Excavating Trenches South of Maintenance Garage toward clubhouse, Backfilling Trenches North of Maintenance Garage**

**Piping installed in southern trenches by Con Edison.**

**No 4-gas meter measurements above background levels.**

**Site Work Progress: Roughly 400' of trench south of the maintenance building along the western property line was excavated. Trench depth ranged from 30 – 40" below ground surface. Gravel, plastic piping, and plastic liner was encountered. Roughly 2' of perforated pipe was damaged during the disturbance. The contractor (Anthony) was notified to repair the drainage area. Portions of the trench were primarily composed of gravel from a drainage system and will be backfilled. Asphalt was cut and concrete was broken on the eastern rear gate prior to trenching. All materials were stocked onto plywood panels along the trench. Shaping layer soil was placed on one side while cover sand soil was placed on the other.**

**Roughly 20' of clean cover soil was backfilled over piping in trenches north of the maintenance building to a minimum thickness of 3". Caution tape was placed on top of the backfilled sand.**

**Con Edison performed a pressure tests on the pipeline sections near the automated gate located south of the maintenance garage. The test was successful with no leaks in the system. Plastic 6" pipe was installed in the trenches south of the maintenance building. The trench was not backfilled with 3" minimum of bedding. Anthony and Con Edison were notified that clean cover sand must be backfilled on the bedding of the trench either prior to installation or worked around the piping. Con Edison responded that the bedding will be installed.**

**Active Site Work Areas: topping of backfilled areas with cover material to bring grade a minimum of 27" above the top of the gas line. Cover material was imported from Ranco Sand & Stone. Miscellaneous work throughout the job site as Con Edison was not on-site today.**

**No 4-gas meter measurements above background levels.**

**Site Work Progress: areas of the gas line on the northern side of the golf course were prepared with cover material. Work areas include the gas line route along Fairways #6, #7 and #8.**

# HC Case Narrative

**Client:** Maser Consulting
**Project:** Trump Links

**HC Project:** 7092827

*This case narrative is in the form of an exception report. Method specific and/or QA/QC anomalies related to this report only are detailed below.*

## Volatile Organic Analysis:

The Method Blank Spike for batch 64307 had recoveries outside QC limits. Please refer to the applicable Form 3 for the recoveries.

The MS/MSD RPD, Matrix Spike and Matrix Spike Duplicate for batch 64307 had recoveries outside QC limits. Please refer to the applicable Form 3 for the recoveries.

## TCLP Volatile Organic Analysis:

The Method Blank Spike for batch 64316 had recoveries outside QC limits. Please refer to the applicable Form 3 for the recoveries.

The MS/MSD RPD, Matrix Spike and Matrix Spike Duplicate for batch 64316 had recoveries outside QC limits. Please refer to the applicable Form 3 for the recoveries.

## Base Neutral/Acid Extractable Analysis:

Sample AD00298-002 was analyzed at a dilution due to high concentration of target analytes.

The Method Blank Spike for batch 63050 and 63067 had recoveries outside QC limits. Please refer to the applicable Form 3 for the recoveries.

The MS/MSD RPD, Matrix Spike and Matrix Spike Duplicate for batch 63050 had recoveries outside QC limits. Please refer to the applicable Form 3 for the recoveries.

## PCB Analysis:

Data conforms to method requirements.

## Pesticide Analysis:

The Matrix Spike and Matrix Spike Duplicate for batch 63043 had recoveries outside QC limits. Please refer to the applicable Form 3 for the recoveries.

## Herbicide Analysis:

Data conforms to method requirements.

## Metals Analysis:

Due to contamination in LCS/LCSMR, batch 62650 was reset for Ba.

The Matrix Spike and Matrix Spike Duplicate for batch 62650 had recoveries outside QC limits. Please refer to the applicable Form 5/7 for the recoveries.

The RPD between the QC sample and the Method Replicate had recoveries outside QC limits in batches 62644 and 62650. Please refer to the applicable Form 6/9 for the recoveries.

The MS/MSD RPD had recoveries outside QC limits in batch 62650. Please refer to the applicable Form 6/9 for the recoveries.

The serial dilution for batches 62644 and 62650 is outside QC limits for one or more analytes. Please refer to the applicable Form 6/9 for the recoveries.

## TCLP Metals Analysis:

Data conforms to method requirements.

## Wet Chemistry Analysis:

Sample AD00298-002 was analyzed for Reactivity using SW-846 7.3. SW-846 7.3 is not a NELAP accredited parameter.

## Subcontracted Analysis:

Please refer to attached subcontracted laboratory report. Sample AD00298-001 submitted to eurofins for Dioxin Scan (1613) analysis, PCDD & PCDF (8290) analysis, and Organophosphorous Pesticides (8141) analysis.

# HC Reporting Limit Definitions/Data Qualifiers

## REPORTING DEFINITIONS

**DF** = Dilution Factor

**MDL** = Method Detection Limit

**RL*** = Reporting Limit

**ND** = Not Detected

**RT** = Retention Time

**NA** = Not Applicable

**Samples with elevated Reporting Limits (RLs) as a result of a dilution may not achieve client reporting limits in some cases. The elevated RLs are unavoidable consequences of sample dilution required to quantitate target analytes that exceed the calibration range of the instrument.*

## DATA QUALIFIERS

**A-** Indicates that the Tentatively Identified Compound (TIC) is suspected to be an aldol-condensation product. These compounds are by-products of acetone and methylene chloride used in the extraction process.

**B-** Indicates analyte was present in the Method Blank and sample.

**d-** For Pesticide and PCB analysis, the concentration between primary and secondary columns is greater than 40%. The lower concentration is generally reported.

**E-** Indicates the concentration exceeded the upper calibration range of the instrument.

**J-** Indicates the value is estimated because it is either a Tentatively Identified Compound (TIC) or the reported concentration is greater than the MDL but less than the RL. For samples results between the MDL and RL there is a possibility of false positives or misidentification at the quantitation levels. Additionally, the acceptance criteria for QC samples may not be met.

**R-** Retention Time is out.

**Y-** Indicates a contaminant found in the blank at less than 10% of the concentration of a contaminant found in the sample.

## CHAIN OF CUSTODY RECORD

7092827 0013

Project # (Lab Use Only): 7092827

Page 1 of 1

### 3) Reporting Requirements (Please Circle)

| Turnaround | Report Type | Electronic Data Deliv. |
|---|---|---|
| When Available: | Summary | NJ Hazsite |
| 1 Business Day (100%)* | Results + QC (Waste) | Excel Reg: NJ / NY / PA |
| 2 Business Days (75%)* | Reduced: | EnviroData |
| 3 Business Days (50%)* | [ ] NJ [✓] NY | EQuIS: |
| 4 Business Days (35%)* | [ ] PA [ ] Other___ | [ ] 4-File [ ] EZ |
| 5 Business Days (25%) | NJ Full / NY ASP CatB | [ ] NYDEC |
| 8 Business Days (Stand.) | NY ASP CatA | [ ] Region 2 or 5 |
| Other: | | Other: |

* Expedited TAT Not Always Available. Please Check with Lab.

### Customer Information

1a) Customer: Prater Consulting
Address: 50 Chestnut Ridge Road
Montvale, NJ 07645
1b) Email/Cell/Fax/Ph: (201) 937-3515
1c) Send Invoice to: D. Keil
1d) Send Report to: D. Keil

### Project Information

2a) Project: Trump Links
2b) Project Mgr: D. Keil
2c) Project Location (City/State): 475 Exterior Bronx, NY
2d) Quote/PO # (If Applicable):

FOR LAB USE ONLY ↓

Batch # A100298

===> Check If Contingent ===>

**Matrix Codes**
DW - Drinking Water; S - Soil; A - Air
GW - Ground Water; SL - Sludge
WW - Waste Water; OL - Oil
OT - Other (please specify under item 9, Comments)

7) Analysis (specify methods & parameter lists)

<=== Check If Contingent <===

10) Relinquished by: D. Keil
Accepted by:
Date: 9/25/17
Time: 15:15

11) Sampler (print name):
Date:

Additional Notes

### Comments, Notes, Special Requirements, HAZARDS

Indicate if low-level methods required to meet current groundwater standards (SPLP for soil):
- [ ] BN or BNA (8270D SIM)
- [ ] VOC (8260C SIM or 8011)
- [ ] SPLP (BN, BNA, Metals)
- [ ] 1,4 Dioxane

For NJ LSRP projects, indicate which standards need to be met:
- [ ] NJDEP GWQS
- [ ] NJDEP SRS
- [ ] NJDEP SPLP
- [ ] Other (specify):

Check if applicable:
- [ ] Project-Specific Reporting Limits
- [ ] High Contaminant Concentrations
- [ ] NJ LSRP Project (also check boxes above/right)

Cooler Temperature: 2 ° 3

Please note NUMBERED items. If not completed your analytical work may be delayed.
A fee of $5/sample will be assessed for storage should sample not be activated for any analysis.

Internal use: sampling plan (check box) HC [ ] or client [ ] FSP#

# PROJECT MODIFICATIONS

**Client:** MASER
**Project:** Trump Links

**HC Project #:**7092827

csmith192.168.1.73
10/3/2017 12:04:19 PM

---

Per David Kiel, The Total VO and TCLP VO are grab samples; expedite all analysis possible to a 4 day TAT.

# CONDITION UPON RECEIPT

Batch Number AD00298 Entered By: Ricardo
Date Entered 9/28/2017 4:04:00 PM

| | | |
|---|---|---|
| 1 | Yes | Is there a corresponding COC included with the samples? |
| 2 | Yes | Are the samples in a container such as a cooler or Ice chest? |
| 3 | NO | Are the COC seals intact? |
| 4 | T0056 | <--- Thermometer ID. Please specify the Temperature inside the container (in degC).<br>2.3 |
| 5 | Yes | Are the samples refrigerated (where required)/have they arrived on ice? |
| 6 | Yes | Are the samples within the holding times for the parameters listed on the COC? IF no, list parameters and samples: |
| 7 | Yes | Are all of the sample bottles intact? If no, specify sample numbers broken/leaking |
| 8 | Yes | Are all of the sample labels or numbers legible? If no specify: |
| 9 | Yes | Do the contents match the COC? If no, specify |
| 10 | Yes | Is there enough sample sent for the analyses listed on the COC? If no, specify: |
| 11 | Yes | Are samples preserved correctly? |
| 12 | Yes | Was temperature blank present (Place comment below if not)? If not was temperature of samples verified? |
| 13 | NA | Other comments ...Specify |
| 14 | NA | Corrective actions (Specify item number and corrective action taken). |

***Flags***

***a - failed the min rf criteria***

***c - failed the minimum correlation coeff criteria(if applicable)***

***Note:*** Avg Rsd: 12.5

***Corr 1 = Correlation Coefficient for linear Eq.***

***Corr 2 = Correlation Coefficient for quad Eq.***

***Fit = Indicates whether Avg RF, Linear, or Quadratic Curve was used for compound.***

# Form 6
## Initial Calibration

Method: EPA 8260C

Instrument: GCMS_6

**Internal Standard Areas**

Upper Limit = + 100% of internal standard area from daily cal or mid pt.

Lower Limit = - 50% of internal standard area from daily cal or mid pt.

**Flags:**

A - Indicates the compound failed the internal standard area criteria

R - Indicates the compound failed the internal standard retention time criteria.

**Retention Times:** Limit = within +/- 0.5 min of internal standard retention time from the daily cal or mid pt.

| I3 = | 1,4-Dichlorobenzene-d4 | I6 = | | 524 Internal Standard concentration =5ug/L |

**Internal Standard Areas**

Upper Limit = + 100% of internal standard area from daily cal or mid pt.

Lower Limit = - 50% of internal standard area from daily cal or mid pt.

**Flags:**

A - Indicates the compound failed the internal standard area criteria

R - Indicates the compound failed the internal standard retention time criteria.

**Retention Times:** Limit = within +/- 0.5 min of internal standard retention time from the daily cal or mid pt.

***Flags***

***a - failed the min rf criteria***

***c - failed the minimum correlation coeff criteria(if applicable)***

***Note:*** Avg Rsd: 12.5

***Corr 1 = Correlation Coefficient for linear Eq.***

***Corr 2 = Correlation Coefficient for quad Eq.***

***Fit = Indicates whether Avg RF, Linear, or Quadratic Curve was used for compound.***

***Flags***
***a - failed the min rf criteria***
***c - failed the minimum correlation coeff criteria(if applicable)***

***Note:*** Avg Rsd: 12.5
***Corr 1 = Correlation Coefficient for linear Eq.***
***Corr 2 = Correlation Coefficient for quad Eq.***
***Fit = Indicates whether Avg RF, Linear, or Quadratic Curve was used for compound.***

Method: EPA 8260C

*Flags*
*a - failed the min rf criteria*
*c - failed the minimum correlation coeff criteria(if applicable)*

*Note:* Avg Rsd: 12.5
*Corr 1 = Correlation Coefficient for linear Eq.*
*Corr 2 = Correlation Coefficient for quad Eq.*
*Fit = Indicates whether Avg RF, Linear, or Quadratic Curve was used for compound.*

Worksheet #: 439254

***Total Target Concentration*** 9.9

ColumnID: (^) Indicates results from 2nd column

*U - Indicates the compound was analyzed but not detected.*
*B - Indicates the analyte was found in the blank as well as in the sample.*
*E - Indicates the analyte concentration exceeds the calibration range of the instrument.*
*R - Retention Time Out*
*J - Indicates an estimated value when a compound is detected at less than the specified detection limit.*
*d - Pesticide %Diff>40% between columns due to coelution. Lower concentration usea*
*Chlordane (Total) is sum of a-Chlordane and y-Chlordane.*

Worksheet #: 439254

***Total Target Concentration*** 0

ColumnID: (^) Indicates results from 2nd column

*U - Indicates the compound was analyzed but not detected.*
*B - Indicates the analyte was found in the blank as well as in the sample.*
*E - Indicates the analyte concentration exceeds the calibration range of the instrument.*
*R - Retention Time Out*
*J - Indicates an estimated value when a compound is detected at less than the specified detection limit.*
*d - Pesticide %Diff>40% between columns due to coelution. Lower concentration usea*
*Chlordane (Total) is sum of a-Chlordane and y-Chlordane.*

Avg Rsd: 9.45

***Flags***

***a - failed the min rf criteria***

***c - failed the minimum correlation coeff criteria(if applicable)***

***Note:***

***Corr 1 = Correlation Coefficient for linear Eq.***

***Corr 2 = Correlation Coefficient for quad Eq.***

***Fit = Indicates whether Avg RF, Linear, or Quadratic Curve was used for compound.***

***Flags***

***a - failed the min rf criteria***

***c - failed the minimum correlation coeff criteria(if applicable)***

***Note:*** Avg Rsd: 10.7

***Corr 1 = Correlation Coefficient for linear Eq.***

***Corr 2 = Correlation Coefficient for quad Eq.***

***Fit = Indicates whether Avg RF, Linear, or Quadratic Curve was used for compound.***

***Flags***

***a - failed the min rf criteria***

***c - failed the minimum correlation coeff criteria(if applicable)***

***Note:*** Avg Rsd: 10.7

***Corr 1 = Correlation Coefficient for linear Eq.***

***Corr 2 = Correlation Coefficient for quad Eq.***

***Fit = Indicates whether Avg RF, Linear, or Quadratic Curve was used for compound.***

**625/8270 Internal Standard concentration = 40 mg/L (in final extract)**
**624/8260 Internal Standard concentration = 30ug/L**
**524 Internal Standard concentration =5ug/L**

**Internal Standard Areas**

Upper Limit = + 100% of internal standard area from daily cal or mid pt.

Lower Limit = - 50% of internal standard area from daily cal or mid pt.

**Flags:**

A - Indicates the compound failed the internal standard area criteria

R - Indicates the compound failed the internal standard retention time criteria.

**Retention Times:** Limit = within +/- 0.5 min of internal standard retention time from the daily cal or mid pt.

**625/8270 Internal Standard concentration = 40 mg/L (in final extract)**
**624/8260 Internal Standard concentration = 30ug/L**
**524 Internal Standard concentration =5ug/L**

**Internal Standard Areas**

Upper Limit = + 100% of internal standard area from daily cal or mid pt.

Lower Limit = - 50% of internal standard area from daily cal or mid pt.

**Flags:**

A - Indicates the compound failed the internal standard area criteria

R - Indicates the compound failed the internal standard retention time criteria.

**Retention Times:** Limit = within +/- 0.5 min of internal standard retention time from the daily cal or mid pt.

***Flags***

c - failed the initial calibration criteria(if applicable)

***Note:***

Col = Column Number
Mr = MultiPeak Analyte 0=single peak analyte..>0=multi peak analyte (i.e. pcb/chlordane etc..)
Fit = Indicates whehter Avg RF, Linear, or Quadratic Curve was used for compound.
Corr 1 = Correlation Coefficient for linear Eq.
Corr 2 = Correlation Coefficient for quad Eq.

All Response Factors = Response Factors / 10000
Initial Calibration Criteria: either %RSD <=20 or Corr >= .995
Columns: Signal #1 db-1701 : Signal #2 db-608

^Lvl: These compounds use a single pt calibration as specified by the method. The file used to update this calibration point is listed in the header under level #

Worksheet #: 439173

***Total Target Concentration*** 0.0082

ColumnID: (^) Indicates results from 2nd column

*U - Indicates the compound was analyzed but not detected.*
*B - Indicates the analyte was found in the blank as well as in the sample.*
*E - Indicates the analyte concentration exceeds the calibration range of the instrument.*
*R - Retention Time Out*
*J - Indicates an estimated value when a compound is detected at less than the specified detection limit.*
*d - Pesticide %Diff>40% between columns due to coelution. Lower concentration used*
*Chlordane (Total) is sum of a-Chlordane and y-Chlordane.*

Worksheet #: 439202

***Total Target Concentration*** 0

ColumnID: (^) Indicates results from 2nd column

*U - Indicates the compound was analyzed but not detected.*
*B - Indicates the analyte was found in the blank as well as in the sample.*
*E - Indicates the analyte concentration exceeds the calibration range of the instrument.*
*R - Retention Time Out*
*J - Indicates an estimated value when a compound is detected at less than the specified detection limit.*
*d - Pesticide %Diff>40% between columns due to coelution. Lower concentration used*
*Chlordane (Total) is sum of a-Chlordane and y-Chlordane.*
