15. REGULATORY INFORMATION

SARA 302 Components
No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components
This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

SAFETY DATA SHEET

Issuing Date no data available **Revision Date** 29-Oct-2015 **Revision Number** 1

1. IDENTIFICATION OF THE SUBSTANCE/PREPARATION AND OF THE COMPANY/UNDERTAKING

Product identifier

Product Number	**019**
Product Name	**Hexavalent Chromium - 1000 mg/L, 125 mL**
Synonyms	None

Recommended use of the chemical and restrictions on use

Recommended Use	Laboratory use only
Uses advised against	No information available

Details of the supplier of the safety data sheet

Supplier	ERA a Waters Company
Supplier Address	16341 Table Mountain Parkway, Golden, CO 80403 USA
Non-Emergency Telephone Number	+1-303-431-8454
Supplier Email	sdsinfo@waters.com

Emergency telephone number

Company Emergency Phone Number	In case of EMERGENCY call CHEMTREC Day or Night Within USA and Canada: 800-424-9300 International Call Collect: +1-703-527-3887

2. HAZARDS IDENTIFICATION

Classification

This chemical is considered hazardous by the 2012 OSHA Hazard Communication Standard (29 CFR 1910.1200).

Respiratory sensitization	Category 1
Skin sensitization	Category 1
Germ cell mutagenicity	Category 1B
Carcinogenicity	Category 1A
Reproductive Toxicity	Category 1B

GHS Label elements, including precautionary statements

Emergency Overview

Signal word **Danger**

Hazard Statements

May cause allergy or asthma symptoms or breathing difficulties if inhaled
May cause an allergic skin reaction
May cause genetic defects
May cause cancer
May damage fertility or the unborn child

Appearance Yellow **Physical state** Liquid->Liquid **Odor** Odorless

Precautionary Statements - Prevention
Obtain special instructions before use
Do not handle until all safety precautions have been read and understood
Use personal protective equipment as required
Avoid breathing dust/fume/gas/mist/vapors/spray
In case of inadequate ventilation wear respiratory protection
Contaminated work clothing should not be allowed out of the workplace
Wear protective gloves
Precautionary Statements - Response
IF exposed or concerned: Get medical advice/attention
Specific treatment (see supplemental first aid instructions on this label)
Skin
IF ON SKIN: Wash with plenty of soap and water
If skin irritation or rash occurs: Get medical advice/attention
Wash contaminated clothing before reuse
Inhalation
IF INHALED: If breathing is difficult, remove victim to fresh air and keep at rest in a position comfortable for breathing
If experiencing respiratory symptoms: Call a POISON CENTER or doctor/physician

Precautionary Statements - Storage
Store locked up
Precautionary Statements - Disposal
Dispose of contents/container to an approved waste disposal plant

Hazards not otherwise classified (HNOC)

Not applicable
Unknown Toxicity
0 % of the mixture consists of ingredient(s) of unknown toxicity
Other information

Harmful to aquatic life with long lasting effects
Repeated or prolonged skin contact may cause allergic reactions with susceptible persons
Interactions with Other Chemicals
No information available.

3. COMPOSITION/INFORMATION ON INGREDIENTS

Note: only the components contributing to the product's GHS hazard classification are listed in this section.

Synonyms None.

Chemical Name	CAS-No	Percent
Potassium Dichromate	7778-50-9	0.25

4. FIRST AID MEASURES

First aid measures

General Advice	Show this safety data sheet to the doctor in attendance.
Eye contact	Rinse thoroughly with plenty of water, also under the eyelids. If symptoms persist, call a physician.
Skin contact	Wash with soap and water. May cause an allergic skin reaction. In the case of skin irritation or allergic reactions see a physician.
Inhalation	MAY CAUSE ALLERGIC RESPIRATORY REACTION. If breathing has stopped, give artificial respiration. Get medical attention immediately. Remove to fresh air. Avoid direct contact with skin. Use barrier to give mouth-to-mouth resuscitation. Seek immediate medical attention/advice.
Ingestion	May produce an allergic reaction. If an allergic reaction occurs, stop use and seek medical help right away. Do NOT induce vomiting. Rinse mouth immediately and drink plenty of

water. Never give anything by mouth to an unconscious person. Call a physician or poison control center immediately.

Self-protection of the first aider Ensure that medical personnel are aware of the material(s) involved, take precautions to protect themselves and prevent spread of contamination. Avoid contact with skin, eyes or clothing. Avoid direct contact with skin. Use barrier to give mouth-to-mouth resuscitation. Use personal protective equipment as required. Wear personal protective clothing (see section 8).

Most important symptoms and effects, both acute and delayed

Most Important Symptoms and Effects Itching. Rashes. Hives. May cause allergy or asthma symptoms or breathing difficulties if inhaled. Coughing and/ or wheezing.

Indication of any immediate medical attention and special treatment needed

Notes to Physician May cause sensitization in susceptible persons. Treat symptomatically.

5. FIRE-FIGHTING MEASURES

Suitable Extinguishing Media

Use extinguishing measures that are appropriate to local circumstances and the surrounding environment.

Unsuitable Extinguishing Media

CAUTION: Use of water spray when fighting fire may be inefficient.

Specific hazards arising from the chemical

Product is or contains a sensitizer. May cause sensitization by skin contact. May cause sensitization by inhalation and skin contact.

Uniform Fire Code Sensitizer: Liquid

Hazardous Combustion Products

Carbon oxides.

Explosion Data

Sensitivity to Mechanical Impact No.

Sensitivity to Static Discharge No.

Protective equipment and precautions for firefighters

As in any fire, wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH (approved or equivalent) and full protective gear.

6. ACCIDENTAL RELEASE MEASURES

Personal precautions, protective equipment and emergency procedures

Personal precautions Avoid contact with skin, eyes or clothing. Use personal protective equipment as required. Ensure adequate ventilation. Evacuate personnel to safe areas. Keep people away from and upwind of spill/leak.

Other Information Refer to protective measures listed in Sections 7 and 8.

Environmental precautions

Environmental precautions Refer to protective measures listed in Sections 7 and 8. Prevent further leakage or spillage if safe to do so.

Methods and material for containment and cleaning up

Methods for containment Prevent further leakage or spillage if safe to do so.

Methods for cleaning up Pick up and transfer to properly labeled containers. Soak up with inert absorbent material.

7. HANDLING AND STORAGE

Precautions for safe handling

Handling Handle in accordance with good industrial hygiene and safety practice. Avoid contact with skin, eyes or clothing. Do not eat, drink or smoke when using this product. Take off contaminated clothing and wash before reuse. Ensure adequate ventilation. In case of insufficient ventilation, wear suitable respiratory equipment.

Conditions for safe storage, including any incompatibilities

Storage Keep containers tightly closed in a dry, cool and well-ventilated place. Store locked up. Keep out of the reach of children.

Incompatible Products None known based on information supplied.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Control parameters

Exposure Guidelines

Chemical Name	ACGIH TLV	OSHA PEL	NIOSH IDLH
Potassium Dichromate 7778-50-9	TWA: 0.05 mg/m^3 Cr	TWA: 5 µg/m^3 Action Level: 2.5 µg/m^3 Cr (vacated) Ceiling: 0.1 mg/m^3 Ceiling: 0.1 mg/m^3 CrO3 applies to any operations or sectors for which the Hexavalent Chromium standard [29 CFR 1910.1026] is stayed or is otherwise not in effect	IDLH: 15 mg/m^3 Cr(VI) TWA: 0.0002 mg/m^3 Cr

ACGIH TLV: American Conference of Governmental Industrial Hygienists - Threshold Limit Value OSHA PEL: Occupational Safety and Health Administration - Permissible Exposure Limits NIOSH IDLH Immediately Dangerous to Life or Health

Appropriate engineering controls

Engineering Measures Showers
Eyewash stations
Ventilation systems

Individual protection measures, such as personal protective equipment

Eye/face protection Wear safety glasses with side shields (or goggles).

Skin and body protection Wear protective gloves and protective clothing.

Respiratory protection No protective equipment is needed under normal use conditions. If exposure limits are exceeded or irritation is experienced, ventilation and evacuation may be required.

Hygiene Measures Handle in accordance with good industrial hygiene and safety practice. Avoid contact with skin, eyes or clothing. Wear suitable gloves and eye/face protection. Do not eat, drink or smoke when using this product. Take off contaminated clothing and wash before reuse. Wash hands before breaks and immediately after handling the product.

9. PHYSICAL AND CHEMICAL PROPERTIES

Physical and Chemical Properties

Physical state Liquid->Liquid
Appearance Yellow
Color No information available
Odor Odorless
Odor Threshold No information available

Property	Values	Remarks Method
pH	5	None known
Melting / freezing point	no data available	None known
Boiling point / boiling range	no data available	None known
Flash Point	no data available	None known
Evaporation Rate	no data available	None known
Flammability (solid, gas)	no data available	None known

Flammability Limit in Air		
Upper flammability limit	no data available	
Lower flammability limit	no data available	
Vapor pressure	no data available	None known
Vapor density	no data available	None known
Specific Gravity	1	None known
Water Solubility	Soluble in water	None known
Solubility in other solvents	no data available	None known
Partition coefficient: n-octanol/water	no data available	None known
Autoignition temperature	no data available	None known
Decomposition temperature	no data available	None known
Kinematic viscosity	no data available	None known
Dynamic viscosity	no data available	None known
Explosive properties	no data available	
Oxidizing properties	no data available	

Other Information

Softening Point	no data available
Particle Size	no data available
Particle Size Distribution	

10. STABILITY AND REACTIVITY

Reactivity

no data available.

Chemical stability
Stable under recommended storage conditions.
Possibility of Hazardous Reactions
None under normal processing.
Hazardous Polymerization
Hazardous polymerization does not occur.
Conditions to avoid
None known based on information supplied.
Incompatible materials
None known based on information supplied.
Hazardous Decomposition Products
Carbon oxides.

11. TOXICOLOGICAL INFORMATION

Information on likely routes of exposure

Product Information	.
Inhalation	May cause allergy or asthma symptoms or breathing difficulties if inhaled. Specific test data for the substance or mixture is not available. May cause sensitization in susceptible persons. (based on components).
Eye contact	Specific test data for the substance or mixture is not available.
Skin contact	Specific test data for the substance or mixture is not available. Repeated or prolonged skin contact may cause allergic reactions with susceptible persons. (based on components).
Ingestion	Specific test data for the substance or mixture is not available. May cause additional affects as listed under "Inhalation".

Component Information

Chemical Name	Oral LD50	Dermal LD50	Inhalation LC50
Potassium Dichromate 7778-50-9	= 25 mg/kg (Rat) = 48 mg/kg (Rat)	= 1150 mg/kg (Rabbit) = 14 mg/kg (Rabbit)	-

Information on toxicological effects

Symptoms Itching. Rashes. Hives. Symptoms of allergic reaction may include rash, itching, swelling, trouble breathing, tingling of the hands and feet, dizziness, lightheadedness, chest pain, muscle pain, or flushing. Coughing and/ or wheezing.

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Sensitization May cause sensitization in susceptible persons. May cause sensitization by skin contact. May cause sensitization by inhalation.

Mutagenic Effects There is no data for this product. Contains a known or suspected mutagen.

Carcinogenicity The table below indicates whether each agency has listed any ingredient as a carcinogen.

Chemical Name	ACGIH	IARC	NTP	OSHA
Potassium Dichromate 7778-50-9	A1	Group 1	Known	X

ACGIH (American Conference of Governmental Industrial Hygienists)
A1 - Known Human Carcinogen
IARC (International Agency for Research on Cancer)
Group 1 - Carcinogenic to Humans
NTP (National Toxicology Program)
Known - Known Carcinogen
OSHA (Occupational Safety and Health Administration of the US Department of Labor)
X - Present

Reproductive toxicity Contains a known or suspected reproductive toxin.

STOT - single exposure No information available.

STOT - repeated exposure No information available.

Chronic toxicity No known effect based on information supplied. Prolonged exposure may cause chronic effects. Repeated contact may cause allergic reactions in very susceptible persons. Contains a known or suspected mutagen. Possible risk of irreversible effects. Contains a known or suspected carcinogen. Contains a known or suspected reproductive toxin.

Target Organ Effects Skin. Respiratory system. Eyes. May affect the genetic material in germ cells (sperm and eggs). Gastrointestinal tract (GI). Reproductive system.

Aspiration Hazard No information available.

Numerical measures of toxicity Product Information

The following values are calculated based on chapter 3.1 of the GHS document

ATEmix (oral)
40,000.00 mg/kg
ATEmix (inhalation-dust/mist)
20.04 mg/L

12. ECOLOGICAL INFORMATION

Ecotoxicity
Harmful to aquatic life with long lasting effects.

Chemical Name	Toxicity to Algae	Toxicity to Fish	Toxicity to Microorganisms	Daphnia Magna (Water Flea)
Potassium Dichromate 7778-50-9		96h LC50: > 139 mg/L (Cyprinus carpio) 96h LC50: 113.6 - 155.7 mg/L (Lepomis macrochirus) 96h LC50: = 320 mg/L (Lepomis macrochirus) 96h LC50: 65.6 - 137.6 mg/L (Lepomis macrochirus) 96h LC50: = 12.3 mg/L (Oncorhynchus mykiss) 96h LC50: 21.209 - 30.046 mg/L (Oryzias latipes) 96h LC50: 15.41 - 30.36 mg/L (Pimephales promelas) 96h LC50: 14 - 20.9 mg/L (Pimephales promelas) 96h LC50: 24.81 - 34.55 mg/L (Poecilia reticulata) 96h LC50: 23 - 41.2 mg/L (Poecilia reticulata) 96h LC50: = 26 mg/L (Morone saxatilis)		

Persistence and Degradability
No information available.
Bioaccumulation
No information available

Other adverse effects
No information available.

13. DISPOSAL CONSIDERATIONS

Waste treatment methods

Disposal methods This material, as supplied, is not a hazardous waste according to Federal regulations (40 CFR 261). This material could become a hazardous waste if it is mixed with or otherwise comes in contact with a hazardous waste, if chemical additions are made to this material, or if the material is processed or otherwise altered. Consult 40 CFR 261 to determine whether the altered material is a hazardous waste. Consult the appropriate state, regional, or local regulations for additional requirements.

Contaminated Packaging Dispose of contents/containers in accordance with local regulations.

This product contains one or more substances that are listed with the State of California as a hazardous waste.

Chemical Name	California Hazardous Waste
Potassium Dichromate 7778-50-9	Toxic Corrosive Ignitable

SAFETY DATA SHEET

Version 6.8
Revision Date 08/28/2024
Print Date 08/29/2024

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifiers

Product name : Indeno[1,2,3-*cd*]pyrene

Product Number : 48499
Brand : Supelco
CAS-No. : 193-39-5

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Laboratory chemicals, Synthesis of substances

1.3 Details of the supplier of the safety data sheet

Company : Sigma-Aldrich Inc.
3050 SPRUCE ST
ST. LOUIS MO 63103
UNITED STATES

Telephone : +1 314 771-5765
Fax : +1 800 325-5052

1.4 Emergency telephone

Emergency Phone # : 800-424-9300 CHEMTREC (USA) +1-703-527-3887 CHEMTREC (International) 24 Hours/day; 7 Days/week

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)

Carcinogenicity (Category 2), H351

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal Word Warning

Hazard Statements
H351 Suspected of causing cancer.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada
MilliporeSigma

Precautionary Statements

P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and understood.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

SECTION 3: Composition/information on ingredients

3.1 Substances

Formula	:	$C_{22}H_{12}$
Molecular weight	:	276.33 g/mol
CAS-No.	:	193-39-5
EC-No.	:	205-893-2

Component	Classification	Concentration
Indeno[1,2,3-cd]pyrene		
	Carc. 2; H351	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

SECTION 4: First aid measures

4.1 Description of first-aid measures

General advice
Show this material safety data sheet to the doctor in attendance.

If inhaled
After inhalation: fresh air. Call in physician.

In case of skin contact
In case of skin contact: Take off immediately all contaminated clothing. Rinse skin with water/ shower. Consult a physician.

In case of eye contact
After eye contact: rinse out with plenty of water. Call in ophthalmologist. Remove contact lenses.

If swallowed
After swallowing: immediately make victim drink water (two glasses at most). Consult a physician.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media
Water Foam Carbon dioxide (CO2) Dry powder

Unsuitable extinguishing media
For this substance/mixture no limitations of extinguishing agents are given.

5.2 Special hazards arising from the substance or mixture
Carbon oxides
Combustible.
Development of hazardous combustion gases or vapours possible in the event of fire.

5.3 Advice for firefighters
Stay in danger area only with self-contained breathing apparatus. Prevent skin contact by keeping a safe distance or by wearing suitable protective clothing.

5.4 Further information
Prevent fire extinguishing water from contaminating surface water or the ground water system.

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures
Advice for non-emergency personnel: Avoid inhalation of dusts. Avoid substance contact. Ensure adequate ventilation. Evacuate the danger area, observe emergency procedures, consult an expert.
For personal protection see section 8.

6.2 Environmental precautions
Do not let product enter drains.

6.3 Methods and materials for containment and cleaning up
Cover drains. Collect, bind, and pump off spills. Observe possible material restrictions (see sections 7 and 10). Take up dry. Dispose of properly. Clean up affected area. Avoid generation of dusts.

6.4 Reference to other sections
For disposal see section 13.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Advice on safe handling
Work under hood. Do not inhale substance/mixture.

Hygiene measures
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities

Storage conditions
Tightly closed. Dry. Keep locked up or in an area accessible only to qualified or authorized persons.

Storage class
Storage class (TRGS 510): 11: Combustible Solids

7.3 Specific end use(s)

Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Ingredients with workplace control parameters
Contains no substances with occupational exposure limit values.

8.2 Exposure controls

Appropriate engineering controls
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.

Personal protective equipment

Eye/face protection
Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU). Safety glasses

Skin protection
Handle with impervious gloves.

This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).

Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Break through time: 480 min
Material tested:KCL 741 Dermatril® L

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:KCL 741 Dermatril® L

Body Protection
protective clothing

Respiratory protection
Recommended Filter type: Filter type P3
The entrepeneur has to ensure that maintenance, cleaning and testing of respiratory protective devices are carried out according to the instructions of the producer. These measures have to be properly documented.
required when dusts are generated.
Our recommendations on filtering respiratory protection are based on the following standards: DIN EN 143, DIN 14387 and other accompanying standards relating to the used respiratory protection system.

Control of environmental exposure
Do not let product enter drains.

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: solid
b)	Odor	No data available
c)	Odor Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	163.6 °C (326.5 °F)
f)	Initial boiling point and boiling range	No data available
g)	Flash point	()Not applicable
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	No data available
k)	Vapor pressure	No data available
l)	Vapor density	No data available
m)	Density	No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

	Relative density	No data available
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	No data available
p)	Autoignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information
No data available

SECTION 10: Stability and reactivity

10.1 Reactivity
The following applies in general to flammable organic substances and mixtures: in correspondingly fine distribution, when whirled up a dust explosion potential may generally be assumed.

10.2 Chemical stability
The product is chemically stable under standard ambient conditions (room temperature) .

10.3 Possibility of hazardous reactions
No data available

10.4 Conditions to avoid
no information available

10.5 Incompatible materials
Strong oxidizing agents

10.6 Hazardous decomposition products
In the event of fire: see section 5

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity
Oral: No data available
Inhalation: No data available
Dermal: No data available

Skin corrosion/irritation
Remarks: No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Serious eye damage/eye irritation
Remarks: No data available

Respiratory or skin sensitization
No data available

Germ cell mutagenicity
No data available

Carcinogenicity
This product is or contains a component that has been reported to be possibly carcinogenic based on its IARC, ACGIH, NTP, or EPA classification.

IARC: 2B - Group 2B: Possibly carcinogenic to humans (Indeno[1,2,3-cd]pyrene)

NTP: RAHC - Reasonably anticipated to be a human carcinogen (Indeno[1,2,3-cd]pyrene)

OSHA: No component of this product present at levels greater than or equal to 0.1% is on OSHA's list of regulated carcinogens.

Reproductive toxicity
No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

11.2 Additional Information

To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

SECTION 12: Ecological information

12.1 Toxicity
No data available

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Endocrine disrupting properties
No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

12.7 Other adverse effects

No data available

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product

Waste material must be disposed of in accordance with the national and local regulations. Leave chemicals in original containers. No mixing with other waste. Handle uncleaned containers like the product itself.

SECTION 14: Transport information

DOT (US)

Not dangerous goods

IMDG

Not dangerous goods

IATA

Not dangerous goods

Further information

Not classified as dangerous in the meaning of transport regulations.

SECTION 15: Regulatory information

CERCLA Reportable Quantity

Components	CAS-No.	Component RQ (lbs)	Calculated product RQ (lbs)
Indeno[1,2,3-cd]pyrene	193-39-5	100	100

SARA 304 Extremely Hazardous Substances Reportable Quantity

This material does not contain any components with a section 304 EHS RQ.

SARA 302 Extremely Hazardous Substances Threshold Planning Quantity

This material does not contain any components with a section 302 EHS TPQ.

SARA 311/312 Hazards : Chronic Health Hazard

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SARA 313 : The following components are subject to reporting levels established by SARA Title III, Section 313:

Indeno[1,2,3-cd]pyrene	193-39-5	>= 90 - <= 100 %

US State Regulations

Massachusetts Right To Know

Indeno[1,2,3-cd]pyrene 193-39-5

Pennsylvania Right To Know

Indeno[1,2,3-cd]pyrene 193-39-5

Maine Chemicals of High Concern

Product does not contain any listed chemicals

Vermont Chemicals of High Concern

Product does not contain any listed chemicals

Washington Chemicals of High Concern

Product does not contain any listed chemicals

California Prop. 65

WARNING: This product can expose you to chemicals including Indeno[1,2,3-cd]pyrene, which is/are known to the State of California to cause cancer. For more information go to www.P65Warnings.ca.gov.

The ingredients of this product are reported in the following inventories:

TSCA : All substances listed as active on the TSCA inventory

TSCA list

No substances are subject to a Significant New Use Rule.

No substances are subject to TSCA 12(b) export notification requirements.

SECTION 16: Other information

Further information

The information is believed to be correct but is not exhaustive and will be used solely as a guideline, which is based on current knowledge of the chemical substance or mixture and is applicable to appropriate safety precautions for the product. It does not represent any guarantee of the properties of the product. Sigma-Aldrich Corporation and its Affiliates shall not be held liable for any damage resulting from handling or from contact with the above product. See www.sigma-aldrich.com and/or the reverse side of invoice or packing slip for additional terms and conditions of sale.

SAFETY DATA SHEET

according to Regulation (EC) No. 1907/2006

Version 6.8
Revision Date 30.05.2024
Print Date 16.09.2024
GENERIC EU MSDS - NO COUNTRY SPECIFIC DATA - NO OEL DATA

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifiers

Product name	:	Iron
Product Number	:	12310
Brand	:	Aldrich
REACH No.	:	01-2119462838-24-XXXX
CAS-No.	:	7439-89-6

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Manufacture of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich Inc. 3050 SPRUCE ST ST. LOUIS MO 63103 UNITED STATES
Telephone	:	+1 314 771-5765
Fax	:	+1 800 325-5052

1.4 Emergency telephone

Emergency Phone #	:	800-424-9300 CHEMTREC (USA) +1-703-527-3887 CHEMTREC (International) 24 Hours/day; 7 Days/week

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

Flammable solids, (Category 1)	H228: Flammable solid.
Self-heating substances and mixtures, (Category 1)	H251: Self-heating; may catch fire.

2.2 Label elements

Labelling according Regulation (EC) No 1272/2008

The life science business of Merck operates as MilliporeSigma in the US and Canada

Pictogram	
Signal Word	Danger
Hazard Statements	
H228	Flammable solid.
H251	Self-heating; may catch fire.
Precautionary Statements	
P210	Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking.
P235	Keep cool.
P240	Ground and bond container and receiving equipment.
P241	Use explosion-proof electrical/ ventilating/ lighting/ equipment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam to extinguish.
Supplemental Hazard Statements	none

Reduced Labeling (<= 125 ml)

Pictogram	
Signal Word	Danger
Hazard Statements	
H251	Self-heating; may catch fire.
Precautionary Statements	
P235	Keep cool.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
Supplemental Hazard Statements	none

2.3 Other hazards

This substance/mixture contains no components considered to be either persistent, bioaccumulative and toxic (PBT), or very persistent and very bioaccumulative (vPvB) at levels of 0.1% or higher.

Ecological information:
The substance/mixture does not contain components considered to have endocrine disrupting properties according to REACH Article 57(f) or Commission Delegated regulation (EU) 2017/2100 or Commission Regulation (EU) 2018/605 at levels of 0.1% or higher.
Toxicological information:
The substance/mixture does not contain components considered to have endocrine disrupting properties according to REACH Article 57(f) or Commission Delegated regulation (EU) 2017/2100 or Commission Regulation (EU) 2018/605 at levels of 0.1% or higher.

SECTION 3: Composition/information on ingredients

3.1 Substances

Formula	:	Fe
Molecular weight	:	55,85 g/mol
CAS-No.	:	7439-89-6
EC-No.	:	231-096-4

No components need to be disclosed according to the applicable regulations.

SECTION 4: First aid measures

4.1 Description of first-aid measures

General advice
Show this material safety data sheet to the doctor in attendance.

If inhaled
After inhalation: fresh air.

In case of skin contact
In case of skin contact: Take off immediately all contaminated clothing. Rinse skin with water/ shower.

In case of eye contact
After eye contact: rinse out with plenty of water. Remove contact lenses.

If swallowed
After swallowing: make victim drink water (two glasses at most). Consult doctor if feeling unwell.

4.2 Most important symptoms and effects, both acute and delayed

The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed

No data available

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media
Water Foam Carbon dioxide (CO2) Dry powder

Unsuitable extinguishing media
For this substance/mixture no limitations of extinguishing agents are given.

5.2 Special hazards arising from the substance or mixture

Iron oxides
Combustible.
Development of hazardous combustion gases or vapours possible in the event of fire.

5.3 Advice for firefighters

In the event of fire, wear self-contained breathing apparatus.

The life science business of Merck operates as MilliporeSigma in the US and Canada

5.4 Further information
Suppress (knock down) gases/vapors/mists with a water spray jet.

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures
Advice for non-emergency personnel: Avoid inhalation of dusts. Avoid substance contact. Ensure adequate ventilation. Keep away from heat and sources of ignition. Evacuate the danger area, observe emergency procedures, consult an expert.
For personal protection see section 8.

6.2 Environmental precautions
Do not let product enter drains. Risk of explosion.

6.3 Methods and materials for containment and cleaning up
Observe possible material restrictions (see sections 7 and 10). Take up dry. Dispose of properly. Clean up affected area. Avoid generation of dusts.

6.4 Reference to other sections
For disposal see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Advice on protection against fire and explosion
Keep away from open flames, hot surfaces and sources of ignition.Take precautionary measures against static discharge.

Hygiene measures
Change contaminated clothing. Wash hands after working with substance.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities

Storage conditions
Tightly closed. Keep away from heat and sources of ignition.

Storage class
Storage class (TRGS 510): 4.2: Pyrophoric and self-heating hazardous materials

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Ingredients with workplace control parameters

8.2 Exposure controls

Personal protective equipment

Eye/face protection
Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU). Safety glasses

Body Protection
Flame retardant antistatic protective clothing.

Respiratory protection
required when dusts are generated.
Our recommendations on filtering respiratory protection are based on the following standards: DIN EN 143, DIN 14387 and other accompanying standards relating to the used respiratory protection system.
Recommended Filter type: Filter type P1

The entrepeneur has to ensure that maintenance, cleaning and testing of respiratory protective devices are carried out according to the instructions of the producer. These measures have to be properly documented.

Control of environmental exposure
Do not let product enter drains. Risk of explosion.

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

a)	Physical state	powder
b)	Color	light gray
c)	Odor	odorless
d)	Melting point/freezing point	Melting point/range: 1.538 °C at 1.023 hPa
e)	Initial boiling point and boiling range	2.861 °C at 1.013 hPa
f)	Flammability (solid, gas)	The substance or mixture is a flammable solid with the category 1.
g)	Upper/lower flammability or explosive limits	No data available
h)	Flash point	Not applicable
i)	Autoignition temperature	The substance or mixture is classified as self heating with the category 1.

The life science business of Merck operates as MilliporeSigma in the US and Canada

j)	Decomposition temperature	No data available
k)	pH	Not applicable
l)	Viscosity	Viscosity, kinematic: No data available Viscosity, dynamic: No data available
m)	Water solubility	insoluble
n)	Partition coefficient: n-octanol/water	Not applicable for inorganic substances
o)	Vapor pressure	Not applicable
p)	Density	7,87 g/cm3 at 20 °C
	Relative density	7,87 at 20 °C
q)	Relative vapor density	
r)	Particle characteristics	No data available
s)	Explosive properties	Not classified as explosive.
t)	Oxidizing properties	The substance or mixture is not classified as oxidizing.

9.2 Other safety information

Dust explosion class St1

SECTION 10: Stability and reactivity

10.1 Reactivity

Self-heating; may catch fire.
The following applies in general to flammable organic substances and mixtures: in correspondingly fine distribution, when whirled up a dust explosion potential may generally be assumed.

10.2 Chemical stability

The product is chemically stable under standard ambient conditions (room temperature) .

10.3 Possibility of hazardous reactions

No data available

10.4 Conditions to avoid

no information available

10.5 Incompatible materials

Strong acids

10.6 Hazardous decomposition products

In the event of fire: see section 5

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - 7.500 mg/kg
Remarks: (Lit.)
Inhalation: No data available
Dermal: No data available

Skin corrosion/irritation
Remarks: No skin irritation

Serious eye damage/eye irritation
Eyes - Rabbit
Result: No eye irritation
(OECD Test Guideline 405)
Remarks: (Lit.)

Respiratory or skin sensitization
Did not cause sensitization on laboratory animals.

Germ cell mutagenicity
Test system: S. typhimurium
Method: OECD Test Guideline 471
Result: Not mutagenic in Ames Test.
Remarks: (Lit.)

Carcinogenicity
No data available

Reproductive toxicity
Did not show teratogenic effects in animal experiments.
Animal testing did not show any effects on fertility.

Specific target organ toxicity - single exposure
The substance or mixture is not classified as specific target organ toxicant, single exposure.

Specific target organ toxicity - repeated exposure
The substance or mixture is not classified as specific target organ toxicant, repeated exposure.

Aspiration hazard
No data available

11.2 Additional Information

Endocrine disrupting properties

Product:

Assessment	The substance/mixture does not contain components considered to have endocrine disrupting properties according to REACH Article 57(f) or Commission Delegated regulation (EU) 2017/2100 or Commission Regulation (EU) 2018/605 at levels of 0.1% or higher.

To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

The life science business of Merck operates as MilliporeSigma in the US and Canada

SECTION 12: Ecological information

12.1 Toxicity

Toxicity to fish static test - Morone saxatilis - 13,6 mg/l - 96 h

12.2 Persistence and degradability

Not applicable

12.3 Bioaccumulative potential

No data available

12.4 Mobility in soil

No data available

12.5 Results of PBT and vPvB assessment

This substance/mixture contains no components considered to be either persistent, bioaccumulative and toxic (PBT), or very persistent and very bioaccumulative (vPvB) at levels of 0.1% or higher.

12.6 Endocrine disrupting properties

Product:

Assessment : The substance/mixture does not contain components considered to have endocrine disrupting properties according to REACH Article 57(f) or Commission Delegated regulation (EU) 2017/2100 or Commission Regulation (EU) 2018/605 at levels of 0.1% or higher.

12.7 Other adverse effects

No data available

SECTION 13: Disposal considerations

13.1 Waste treatment methods

No data available

SECTION 14: Transport information

14.1 UN number

ADR/RID: 3178 IMDG: 3178 IATA: 3178

14.2 UN proper shipping name

ADR/RID: FLAMMABLE SOLID, INORGANIC, N.O.S. (Iron Powder,)
IMDG: FLAMMABLE SOLID, INORGANIC, N.O.S. (Iron Powder,)
IATA: Flammable solid, inorganic, n.o.s. (Iron Powder,)

The life science business of Merck operates as MilliporeSigma in the US and Canada

14.3 Transport hazard class(es)

ADR/RID: 4.1	IMDG: 4.1	IATA: 4.1

14.4 Packaging group

ADR/RID: III	IMDG: III	IATA: III

14.5 Environmental hazards

ADR/RID: no	IMDG Marine pollutant: no	IATA: no

14.6 Special precautions for user

Tunnel restriction code : (E)

Further information : No data available

SECTION 15: Regulatory information

15.1 Safety, health and environmental regulations/legislation specific for the substance or mixture

This material safety data sheet complies with the requirements of Regulation (EC) No. 1907/2006.

Other regulations

Take note of Dir 94/33/EC on the protection of young people at work.

15.2 Chemical Safety Assessment

For this product a chemical safety assessment was not carried out

SECTION 16: Other information

SAFETY DATA SHEET

Version 4.7
Revision Date 12/29/2015
Print Date 02/07/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	Lead
Product Number	:	391352
Brand	:	Aldrich
CAS-No.	:	7439-92-1

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Synthesis of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Acute toxicity, Oral (Category 4), H302
Carcinogenicity (Category 2), H351
Reproductive toxicity (Category 2), H361
Specific target organ toxicity - repeated exposure (Category 2), H373
Acute aquatic toxicity (Category 1), H400
Chronic aquatic toxicity (Category 1), H410

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word Warning

Hazard statement(s)

H302	Harmful if swallowed.
H351	Suspected of causing cancer.
H361	Suspected of damaging fertility or the unborn child.
H373	May cause damage to organs through prolonged or repeated exposure.
H410	Very toxic to aquatic life with long lasting effects.

Precautionary statement(s)

P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and

	understood.
P260	Do not breathe dust/ fume/ gas/ mist/ vapours/ spray.
P264	Wash skin thoroughly after handling.
P270	Do not eat, drink or smoke when using this product.
P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P301 + P312 + P330	IF SWALLOWED: Call a POISON CENTER or doctor/ physician if you feel unwell. Rinse mouth.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.
P391	Collect spillage.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Formula	:	Pb
Molecular weight	:	207.20 g/mol
CAS-No.	:	7439-92-1
EC-No.	:	231-100-4

Hazardous components

Component	Classification	Concentration
Lead		
	Acute Tox. 4; Carc. 2; Repr. 2; STOT RE 2; Aquatic Acute 1; Aquatic Chronic 1; H302, H351, H361, H373, H410	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Wash off with soap and plenty of water. Consult a physician.

In case of eye contact
Flush eyes with water as a precaution.

If swallowed
Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture
Lead oxides

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
No data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Use personal protective equipment. Avoid dust formation. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

6.3 Methods and materials for containment and cleaning up
Pick up and arrange disposal without creating dust. Sweep up and shovel. Keep in suitable, closed containers for disposal.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid contact with skin and eyes. Avoid formation of dust and aerosols.Further processing of solid materials may result in the formation of combustible dusts. The potential for combustible dust formation should be taken into consideration before additional processing occurs.
Provide appropriate exhaust ventilation at places where dust is formed.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.

Keep in a dry place.
Storage class (TRGS 510): Non-combustible, acute toxic Cat.3 / toxic hazardous materials or hazardous materials causing chronic effects

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
	Remarks	See 1910.1025		
Lead	7439-92-1	TWA	0.05 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Confirmed animal carcinogen with unknown relevance to humans		
		TWA	0.05 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Central Nervous System impairment Hematologic effects Peripheral Nervous System impairment Substances for which there is a Biological Exposure Index or Indices (see BEI® section) Confirmed animal carcinogen with unknown relevance to humans		

		TWA	0.05 mg/m3	USA. NIOSH Recommended Exposure Limits
		See Appendix C		

Biological occupational exposure limits

Component	CAS-No.	Parameters	Value	Biological specimen	Basis
Lead	7439-92-1	Lead	30µg/ 100 ml	In blood	ACGIH - Biological Exposure Indices (BEI)
	Remarks	Not critical			
		Lead	30µg/ 100 ml	In blood	ACGIH - Biological Exposure Indices (BEI)
		Not critical			

8.2 Exposure controls

Appropriate engineering controls
Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection
Safety glasses with side-shields conforming to EN166 Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Complete suit protecting against chemicals, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face particle respirator type N100 (US) or type P3 (EN 143) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: powder
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: 327.4 °C (621.3 °F) - lit.
f)	Initial boiling point and boiling range	1,740 °C (3,164 °F) - lit.
g)	Flash point	Not applicable
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	No data available
k)	Vapour pressure	No data available
l)	Vapour density	No data available
m)	Relative density	No data available
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	No data available
p)	Auto-ignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information

No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity

No data available

10.2 Chemical stability

Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions

No data available

10.4 Conditions to avoid

No data available

10.5 Incompatible materials

Strong acids

10.6 Hazardous decomposition products

Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
No data available

Inhalation: No data available

Dermal: No data available

No data available

Skin corrosion/irritation
No data available

Serious eye damage/eye irritation
No data available

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity

Rat
Cytogenetic analysis

Carcinogenicity

Limited evidence of carcinogenicity in animal studies

IARC:	2B - Group 2B: Possibly carcinogenic to humans (Lead)
NTP:	Reasonably anticipated to be a human carcinogen (Lead)
	Reasonably anticipated to be a human carcinogenThe reference note has been added by TD based on the background information of the NTP. (Lead)
OSHA:	1910.1025 (Lead)
	OSHA specifically regulated carcinogen (Lead)

Reproductive toxicity
Suspected human reproductive toxicant

Reproductive toxicity - Rat - Inhalation
Effects on Newborn: Biochemical and metabolic.

Reproductive toxicity - Rat - Oral
Effects on Newborn: Behavioral.

Reproductive toxicity - Mouse - Oral
Effects on Fertility: Female fertility index (e.g., # females pregnant per # sperm positive females; # females pregnant per # females mated). Effects on Fertility: Pre-implantation mortality (e.g., reduction in number of implants per female; total number of implants per corpora lutea).

Developmental Toxicity - Rat - Inhalation
Effects on Embryo or Fetus: Fetotoxicity (except death, e.g., stunted fetus). Specific Developmental Abnormalities: Blood and lymphatic system (including spleen and marrow).

Developmental Toxicity - Rat - Oral
Specific Developmental Abnormalities: Blood and lymphatic system (including spleen and marrow). Effects on Newborn: Growth statistics (e.g., reduced weight gain).

Developmental Toxicity - Rat - Oral
Effects on Embryo or Fetus: Fetotoxicity (except death, e.g., stunted fetus). Effects on Embryo or Fetus: Fetal death.

Developmental Toxicity - Mouse - Oral
Effects on Embryo or Fetus: Fetotoxicity (except death, e.g., stunted fetus). Effects on Embryo or Fetus: Fetal death.

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
May cause damage to organs through prolonged or repeated exposure.

Aspiration hazard
No data available

Additional Information
RTECS: OF7525000

anemia

Stomach - Irregularities - Based on Human Evidence
Stomach - Irregularities - Based on Human Evidence

12. ECOLOGICAL INFORMATION

12.1 Toxicity

Toxicity to fish	mortality LOEC - Oncorhynchus mykiss (rainbow trout) - 1.19 mg/l - 96.0 h
	LC50 - Micropterus dolomieui - 2.2 mg/l - 96.0 h
	mortality NOEC - Salvelinus fontinalis - 1.7 mg/l - 10.0 d
Toxicity to daphnia and other aquatic invertebrates	mortality LOEC - Daphnia (water flea) - 0.17 mg/l - 24 h
	mortality NOEC - Daphnia (water flea) - 0.099 mg/l - 24 h
Toxicity to algae	mortality EC50 - Skeletonema costatum - 7.94 mg/l - 10 d

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential

Bioaccumulation	Oncorhynchus kisutch - 2 Weeks - 150 µg/l
	Bioconcentration factor (BCF): 12

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.
Very toxic to aquatic life with long lasting effects.

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 3077 Class: 9 Packing group: III
Proper shipping name: Environmentally hazardous substances, solid, n.o.s. (Lead)
Reportable Quantity (RQ): 10 lbs

Poison Inhalation Hazard: No

IMDG
UN number: 3077 Class: 9 Packing group: III EMS-No: F-A, S-F
Proper shipping name: ENVIRONMENTALLY HAZARDOUS SUBSTANCE, SOLID, N.O.S. (Lead)
Marine pollutant:yes
IATA
UN number: 3077 Class: 9 Packing group: III
Proper shipping name: Environmentally hazardous substance, solid, n.o.s. (Lead)

Further information
EHS-Mark required (ADR 2.2.9.1.10, IMDG code 2.10.3) for single packagings and combination packagings containing inner packagings with Dangerous Goods > 5L for liquids or > 5kg for solids.

15. REGULATORY INFORMATION

SARA 302 Components
No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components
The following components are subject to reporting levels established by SARA Title III, Section 313:

	CAS-No.	Revision Date
Lead	7439-92-1	1994-04-01

SARA 311/312 Hazards
Acute Health Hazard, Chronic Health Hazard

Massachusetts Right To Know Components

	CAS-No.	Revision Date
Lead	7439-92-1	1994-04-01

Pennsylvania Right To Know Components

	CAS-No.	Revision Date
Lead	7439-92-1	1994-04-01

New Jersey Right To Know Components

	CAS-No.	Revision Date
Lead	7439-92-1	1994-04-01

California Prop. 65 Components

	CAS-No.	Revision Date
WARNING! This product contains a chemical known to the State of California to cause cancer. Lead	7439-92-1	1989-07-10
WARNING: This product contains a chemical known to the State of California to cause birth defects or other reproductive harm. Lead	7439-92-1	1989-07-10

16. OTHER INFORMATION

Full text of H-Statements referred to under sections 2 and 3.

Acute Tox.	Acute toxicity
Aquatic Acute	Acute aquatic toxicity
Aquatic Chronic	Chronic aquatic toxicity
Carc.	Carcinogenicity
H302	Harmful if swallowed.
H351	Suspected of causing cancer.
H361	Suspected of damaging fertility or the unborn child.
H373	May cause damage to organs through prolonged or repeated exposure.

H400	Very toxic to aquatic life.
H410	Very toxic to aquatic life with long lasting effects.

HMIS Rating

Health hazard:	1
Chronic Health Hazard:	*
Flammability:	0
Physical Hazard	0

NFPA Rating

Health hazard:	1
Fire Hazard:	0
Reactivity Hazard:	0

Further information

Version: 4.7 Revision Date: 12/29/2015 Print Date: 02/07/2016

SAFETY DATA SHEET

Version 5.7
Revision Date 05/27/2015
Print Date 02/23/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	Lindane
Product Number	:	233390
Brand	:	Aldrich
Index-No.	:	602-043-00-6
CAS-No.	:	58-89-9

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Manufacture of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Acute toxicity, Oral (Category 3), H301
Acute toxicity, Inhalation (Category 4), H332
Acute toxicity, Dermal (Category 4), H312
Carcinogenicity (Category 2), H351
Effects on or via lactation, H362
Specific target organ toxicity - repeated exposure (Category 2), H373
Acute aquatic toxicity (Category 1), H400
Chronic aquatic toxicity (Category 1), H410

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word: Danger

Hazard statement(s)

H301	Toxic if swallowed.
H312 + H332	Harmful in contact with skin or if inhaled
H351	Suspected of causing cancer.
H362	May cause harm to breast-fed children.
H373	May cause damage to organs through prolonged or repeated exposure.
H410	Very toxic to aquatic life with long lasting effects.

Precautionary statement(s)

P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and understood.
P260	Do not breathe dust/ fume/ gas/ mist/ vapours/ spray.
P263	Avoid contact during pregnancy/ while nursing.
P264	Wash skin thoroughly after handling.
P270	Do not eat, drink or smoke when using this product.
P271	Use only outdoors or in a well-ventilated area.
P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P301 + P310 + P330	IF SWALLOWED: Immediately call a POISON CENTER or doctor/ physician. Rinse mouth.
P302 + P352 + P312	IF ON SKIN: Wash with plenty of soap and water. Call a POISON CENTER or doctor/ physician if you feel unwell.
P304 + P340 + P312	IF INHALED: Remove person to fresh air and keep comfortable for breathing. Call a POISON CENTER or doctor/ physician if you feel unwell.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.
P363	Wash contaminated clothing before reuse.
P391	Collect spillage.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Synonyms	:	1α,2α,3β,4α,5α,6β-Hexachlorocyclohexane γ-BHC
Formula	:	$C_6H_6Cl_6$
Molecular weight	:	290.83 g/mol
CAS-No.	:	58-89-9
EC-No.	:	200-401-2
Index-No.	:	602-043-00-6

Hazardous components

Component	Classification	Concentration
γ-1,2,3,4,5,6-Hexachlorocyclohexane		
	Acute Tox. 3; Acute Tox. 4; Carc. 2; Lact. ; STOT RE 2; Aquatic Acute 1; Aquatic Chronic 1; H301, H312 + H332, H351, H362, H373, H410	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Wash off with soap and plenty of water. Take victim immediately to hospital. Consult a physician.

In case of eye contact
Flush eyes with water as a precaution.

If swallowed
Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture
Carbon oxides, Hydrogen chloride gas

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
No data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Wear respiratory protection. Avoid dust formation. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

6.3 Methods and materials for containment and cleaning up
Pick up and arrange disposal without creating dust. Sweep up and shovel. Keep in suitable, closed containers for disposal.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid contact with skin and eyes. Avoid formation of dust and aerosols.Further processing of solid materials may result in the formation of combustible dusts. The potential for combustible dust formation should be taken into consideration before additional processing occurs.
Provide appropriate exhaust ventilation at places where dust is formed.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.
Storage class (TRGS 510): Non-combustible, acute toxic Cat.3 / toxic hazardous materials or hazardous materials causing chronic effects

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
γ-1,2,3,4,5,6-Hexachlorocyclohexane	58-89-9	TWA	0.500000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Central Nervous System impairment Liver damage Confirmed animal carcinogen with unknown relevance to humans Danger of cutaneous absorption		
		TWA	0.500000 mg/m3	USA. NIOSH Recommended Exposure Limits
		Potential for dermal absorption		
		TWA	0.500000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		Skin designation		

8.2 Exposure controls

Appropriate engineering controls
Avoid contact with skin, eyes and clothing. Wash hands before breaks and immediately after handling the product.

Personal protective equipment

Eye/face protection
Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Complete suit protecting against chemicals, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face particle respirator type N100 (US) or type P3 (EN 143) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: solid
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: 113 - 115 °C (235 - 239 °F) - lit.
f)	Initial boiling point and boiling range	No data available
g)	Flash point	No data available
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	No data available
k)	Vapour pressure	No data available
l)	Vapour density	No data available
m)	Relative density	1.85 g/cm3
n)	Water solubility	8.35 g/l at 25 °C (77 °F)
o)	Partition coefficient: n-octanol/water	Pow: 3.5 at 22 °C (72 °F)
p)	Auto-ignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information

No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity

No data available

10.2 Chemical stability

Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions

No data available

10.4 Conditions to avoid

No data available

10.5 Incompatible materials

Strong oxidizing agents

10.6 Hazardous decomposition products

Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - 88.0 mg/kg

LC50 Inhalation - Rat - 4 h - 1,560 mg/m3

Dermal: No data available

No data available

Skin corrosion/irritation
Skin - Rabbit
Result: No skin irritation

Serious eye damage/eye irritation
Eyes - Rabbit
Result: No eye irritation

Respiratory or skin sensitisation
Will not occur

Germ cell mutagenicity
No data available

Carcinogenicity

IARC:	2B - Group 2B: Possibly carcinogenic to humans (γ-1,2,3,4,5,6-Hexachlorocyclohexane)
NTP:	Reasonably anticipated to be a human carcinogenThe reference note has been added by TD based on the background information of the NTP. (γ-1,2,3,4,5,6-Hexachlorocyclohexane)
OSHA:	No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
Effects on or via lactation

No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: GV4900000

Neurotoxic effects., Cyanosis, Headache, Nausea, Incoordination., Tremors, Vomiting, Dizziness, Seizures., Unconsciousness

Reproductive system. - Irregularities - Based on Human Evidence
Reproductive system. - Irregularities - Based on Human Evidence

12. ECOLOGICAL INFORMATION

12.1 Toxicity

Toxicity to fish	LC50 - Cyprinus carpio (Carp) - 0.2 mg/l - 96.0 h
	LC50 - Cyprinodon variegatus (sheepshead minnow) - 0.9 - 1.3 mg/l - 96.0 h
	LC50 - Oncorhynchus mykiss (rainbow trout) - 0.03 - 0.28 mg/l - 48.0 h
	NOEC - Oncorhynchus mykiss (rainbow trout) - 0.056 mg/l - 3.0 d
	LC50 - Oncorhynchus mykiss (rainbow trout) - 0.038 mg/l - 96.0 h

	LOEC - Oncorhynchus mykiss (rainbow trout) - 0.1 mg/l - 3.0 d
Toxicity to daphnia and other aquatic invertebrates	EC50 - Daphnia magna (Water flea) - 0.80 - 6.50 mg/l - 48 h
	LOEC - Daphnia (water flea) - 0.021 mg/l - 7 d
Toxicity to algae	EC50 - Algae - 4.00 mg/l - 72 h

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential

Bioaccumulation	Pimephales promelas (fathead minnow) - 304 d - 0.0091 mg/l
	Bioconcentration factor (BCF): 674

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
Very toxic to aquatic life with long lasting effects.
An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifiers

Product name : Magnesium

Product Number : 266302
Brand : Sigma-Aldrich
Index-No. : 012-002-00-9
CAS-No. : 7439-95-4

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Laboratory chemicals, Synthesis of substances

Uses advised against : The product is being supplied under the TSCA R&D Exemption (40 CFR Section 720.36). It is the recipient's responsibility to comply with the requirements of the R&D exemption. The product may not be used for a non-exempt commercial purpose under TSCA unless appropriate consent is granted in writing by MilliporeSigma.

1.3 Details of the supplier of the safety data sheet

Company : Sigma-Aldrich Inc.
3050 SPRUCE ST
ST. LOUIS MO 63103
UNITED STATES

Telephone : +1 314 771-5765
Fax : +1 800 325-5052

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)

Flammable solids (Category 1), H228
Self-heating chemicals (Category 1), H251
Chemicals which, in contact with water, emit flammable gases (Category 2), H261

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal Word	Danger
Hazard Statements	
H228	Flammable solid.
H251	Self-heating; may catch fire.
H261	In contact with water releases flammable gas.
Precautionary Statements	
P210	Keep away from heat/ sparks/ open flames/ hot surfaces. No smoking.
P223	Do not allow contact with water.
P231 + P232	Handle under inert gas. Protect from moisture.
P235 + P410	Keep cool. Protect from sunlight.
P240	Ground/bond container and receiving equipment.
P241	Use explosion-proof electrical/ ventilating/ lighting/ equipment.
P280	Wear protective gloves/ eye protection/ face protection.
P335 + P334	Brush off loose particles from skin. Immerse in cool water/ wrap in wet bandages.
P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam to extinguish.
P402 + P404	Store in a dry place. Store in a closed container.
P403 + P235	Store in a well-ventilated place. Keep cool.
P407	Maintain air gap between stacks/ pallets.
P420	Store away from other materials.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS

Combustible dust

SECTION 3: Composition/information on ingredients

3.1 Substances

Formula	:	Mg
Molecular weight	:	24.31 g/mol
CAS-No.	:	7439-95-4
EC-No.	:	231-104-6
Index-No.	:	012-002-00-9

No components need to be disclosed according to the applicable regulations.

For the full text of the H-Statements mentioned in this Section, see Section 16.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 4: First aid measures

4.1 Description of first-aid measures

General advice
Show this material safety data sheet to the doctor in attendance.

If inhaled
After inhalation: fresh air.

In case of skin contact
In case of skin contact: Take off immediately all contaminated clothing. Rinse skin with water/ shower.

In case of eye contact
After eye contact: rinse out with plenty of water. Remove contact lenses.

If swallowed
After swallowing: make victim drink water (two glasses at most). Consult doctor if feeling unwell.

4.2 Most important symptoms and effects, both acute and delayed

The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed

No data available

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media
Special powder against metal fire Cover with dry sand or cement.

Unsuitable extinguishing media
Foam Water

5.2 Special hazards arising from the substance or mixture

Magnesium oxide
Not combustible.
May not get in touch with: Water
Ambient fire may liberate hazardous vapours.

5.3 Advice for firefighters

In the event of fire, wear self-contained breathing apparatus.

5.4 Further information

none

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Advice for non-emergency personnel: Avoid inhalation of dusts. Avoid substance contact. Ensure adequate ventilation. Keep away from heat and sources of ignition. Evacuate the danger area, observe emergency procedures, consult an expert.
For personal protection see section 8.

6.2 Environmental precautions

Do not let product enter drains. Risk of explosion.

6.3 Methods and materials for containment and cleaning up

Observe possible material restrictions (see sections 7 and 10). Take up dry. Dispose of properly. Clean up affected area. Avoid generation of dusts.

6.4 Reference to other sections

For disposal see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Advice on safe handling
Keep workplace dry. Do not allow product to come into contact with water.

Advice on protection against fire and explosion
Keep away from open flames, hot surfaces and sources of ignition.Take precautionary measures against static discharge.

Hygiene measures
Change contaminated clothing. Wash hands after working with substance.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities

Storage conditions
Tightly closed. Keep away from heat and sources of ignition.
Never allow product to get in contact with water during storage.

Storage class
Storage class (TRGS 510): 4.2: Pyrophoric and self-heating hazardous materials

7.3 Specific end use(s)

Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Ingredients with workplace control parameters
Contains no substances with occupational exposure limit values.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

8.2 Exposure controls

Appropriate engineering controls
Change contaminated clothing. Wash hands after working with substance.

Personal protective equipment

Eye/face protection
Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU). Safety glasses

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the EC approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Flame retardant antistatic protective clothing.

Respiratory protection
Recommended Filter type: Filter type P1
The entrepeneur has to ensure that maintenance, cleaning and testing of respiratory protective devices are carried out according to the instructions of the producer. These measures have to be properly documented.
required when dusts are generated.
Our recommendations on filtering respiratory protection are based on the following standards: DIN EN 143, DIN 14387 and other accompanying standards relating to the used respiratory protection system.

Control of environmental exposure
Do not let product enter drains. Risk of explosion.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: chips
b)	Odor	No data available
c)	Odor Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/ range: 648 °C (1198 °F) - lit.
f)	Initial boiling point and boiling range	1,090 °C 1,994 °F - lit.
g)	Flash point	()No data available
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	May form combustible dust concentrations in air.
j)	Upper/lower flammability or explosive limits	No data available
k)	Vapor pressure	1 hPa at 621 °C (1150 °F)
l)	Vapor density	No data available
m)	Density	1.74 g/mL at 25 °C (77 °F) - lit.
	Relative density	No data available
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	No data available
p)	Autoignition temperature	The substance or mixture is classified as self heating with the category 1.
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	none

9.2 Other safety information

No data available

SECTION 10: Stability and reactivity

10.1 Reactivity

Self-heating; may catch fire.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

10.2 Chemical stability
The product is chemically stable under standard ambient conditions (room temperature) .

10.3 Possibility of hazardous reactions
Risk of ignition or formation of inflammable gases or vapours with:
Oxidizing agents
alkalines
Halogenated hydrocarbon
halogens
Alcohols
nitrates
acids
Water

10.4 Conditions to avoid
Exposure to moisture. Exposure to air.
Moisture.

10.5 Incompatible materials
No data available

10.6 Hazardous decomposition products
In the event of fire: see section 5

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity
Oral: No data available
Inhalation: No data available
Dermal: No data available

Skin corrosion/irritation
Remarks: No data available

Serious eye damage/eye irritation
No data available

Respiratory or skin sensitization
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

IARC: No ingredient of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

NTP: No ingredient of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is on OSHA's list of regulated carcinogens.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Reproductive toxicity
No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

11.2 Additional Information

burning sensation, Cough, wheezing, laryngitis, Shortness of breath, Headache, Nausea, Vomiting, chills, Fever, fatigue, muscle pain, joint pain, rash, Anorexia.
To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

Liver - Irregularities - Based on Human Evidence

Liver - Irregularities - Based on Human Evidence

SECTION 12: Ecological information

12.1 Toxicity
No data available

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Endocrine disrupting properties
No data available

12.7 Other adverse effects
No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product
Waste material must be disposed of in accordance with the national and local regulations. Leave chemicals in original containers. No mixing with other waste. Handle uncleaned containers like the product itself.

SECTION 14: Transport information

DOT (US)
UN number: 1869 Class: 4.1 Packing group: III
Proper shipping name: Magnesium
Reportable Quantity (RQ):
Poison Inhalation Hazard: No

IMDG
UN number: 1869 Class: 4.1 Packing group: III EMS-No: F-G, S-G
Proper shipping name: MAGNESIUM

IATA
UN number: 1869 Class: 4.1 Packing group: III
Proper shipping name: Magnesium

SECTION 15: Regulatory information

CERCLA Reportable Quantity

This material does not contain any components with a CERCLA RQ.

SARA 304 Extremely Hazardous Substances Reportable Quantity

This material does not contain any components with a section 304 EHS RQ.

SARA 302 Extremely Hazardous Substances Threshold Planning Quantity

This material does not contain any components with a section 302 EHS TPQ.

SARA 311/312 Hazards	:	Fire Hazard Reactivity Hazard Chronic Health Hazard
SARA 313	:	This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

US State Regulations

Massachusetts Right To Know

No components are subject to the Massachusetts Right to Know Act.

Maine Chemicals of High Concern

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Product does not contain any listed chemicals

Vermont Chemicals of High Concern

Product does not contain any listed chemicals

Washington Chemicals of High Concern

Product does not contain any listed chemicals

The ingredients of this product are reported in the following inventories:

TSCA : All substances listed as active on the TSCA inventory

TSCA list

No substances are subject to a Significant New Use Rule.

No substances are subject to TSCA 12(b) export notification requirements.

SECTION 16: Other information

Further information

The information is believed to be correct but is not exhaustive and will be used solely as a guideline, which is based on current knowledge of the chemical substance or mixture and is applicable to appropriate safety precautions for the product. It does not represent any guarantee of the properties of the product. Sigma-Aldrich Corporation and its Affiliates shall not be held liable for any damage resulting from handling or from contact with the above product. See www.sigma-aldrich.com and/or the reverse side of invoice or packing slip for additional terms and conditions of sale.

Copyright 2020 Sigma-Aldrich Co. LLC. License granted to make unlimited paper copies for internal use only.

The branding on the header and/or footer of this document may temporarily not visually match the product purchased as we transition our branding. However, all of the information in the document regarding the product remains unchanged and matches the product ordered. For further information please contact mlsbranding@sial.com.

Version: 6.6 Revision Date: 09/06/2024 Print Date: 09/07/2024

operates as MilliporeSigma in the US and Canada

SAFETY DATA SHEET

Version 4.6
Revision Date 03/02/2015
Print Date 02/07/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	Manganese
Product Number	:	463728
Brand	:	Aldrich
CAS-No.	:	7439-96-5

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Manufacture of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Substances and mixtures, which in contact with water, emit flammable gases (Category 1), H260
Acute aquatic toxicity (Category 3), H402
Chronic aquatic toxicity (Category 3), H412

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word: Danger

Hazard statement(s)

H260	In contact with water releases flammable gases which may ignite spontaneously.
H412	Harmful to aquatic life with long lasting effects.

Precautionary statement(s)

P223	Keep away from any possible contact with water, because of violent reaction and possible flash fire.
P231 + P232	Handle under inert gas. Protect from moisture.
P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P335 + P334	Brush off loose particles from skin. Immerse in cool water/ wrap in wet bandages.

P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam for extinction.
P402 + P404	Store in a dry place. Store in a closed container.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Formula	:	Mn
Molecular weight	:	54.94 g/mol
CAS-No.	:	7439-96-5
EC-No.	:	231-105-1

Hazardous components

Component	Classification	Concentration
Manganese		
	Water-react. 1; Aquatic Acute 3; Aquatic Chronic 3; H260, H412	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Wash off with soap and plenty of water. Consult a physician.

In case of eye contact
Rinse thoroughly with plenty of water for at least 15 minutes and consult a physician.

If swallowed
Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Dry powder Carbon dioxide (CO2)

Unsuitable extinguishing media
Water

5.2 Special hazards arising from the substance or mixture
Manganese/manganese oxides

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
No data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures

Use personal protective equipment. Avoid dust formation. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust.
For personal protection see section 8.

6.2 Environmental precautions

Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

6.3 Methods and materials for containment and cleaning up

Sweep up and shovel. Contain spillage, and then collect with an electrically protected vacuum cleaner or by wet-brushing and place in container for disposal according to local regulations (see section 13). Do not flush with water. Keep in suitable, closed containers for disposal.

6.4 Reference to other sections

For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling

Avoid contact with skin and eyes. Avoid formation of dust and aerosols.
Provide appropriate exhaust ventilation at places where dust is formed.Keep away from sources of ignition - No smoking.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities

Keep container tightly closed in a dry and well-ventilated place.
Never allow product to get in contact with water during storage.

Moisture sensitive. Keep in a dry place.

7.3 Specific end use(s)

Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
Manganese	7439-96-5	TWA	0.200000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Central Nervous System impairment Adopted values or notations enclosed are those for which changes are proposed in the NIC See Notice of Intended Changes (NIC)		
		C	5 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		Ceiling limit is to be determined from breathing-zone air samples.		
		C	5.000000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		Ceiling limit is to be determined from breathing-zone air samples.		

		TWA	1.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		ST	3.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		TWA	1.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		ST	3.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		C	5.000000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		Ceiling limit is to be determined from breathing-zone air samples.		
		TWA	1.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		ST	3.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		TWA	0.200000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Central Nervous System impairment Adopted values or notations enclosed are those for which changes are proposed in the NIC See Notice of Intended Changes (NIC) varies		
		TWA	0.100000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Central Nervous System impairment 2014 Adoption varies		
		TWA	0.020000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Central Nervous System impairment 2014 Adoption varies		
		TWA	0.1 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Central Nervous System impairment varies		
		TWA	0.02 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Central Nervous System impairment varies		

8.2 Exposure controls

Appropriate engineering controls
Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection
Safety glasses with side-shields conforming to EN166 Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Body Protection
impervious clothing, Flame retardant protective clothing, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face particle respirator type N100 (US) or type P3 (EN 143) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: powder Colour: grey
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: 1,244 °C (2,271 °F) - lit.
f)	Initial boiling point and boiling range	1,962 °C (3,564 °F) - lit.
g)	Flash point	Not applicable
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	No data available
k)	Vapour pressure	No data available
l)	Vapour density	No data available
m)	Relative density	7.3 g/mL at 25 °C (77 °F)
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	No data available
p)	Auto-ignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information
No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions
Reacts violently with water.

10.4 Conditions to avoid
Exposure to moisture

10.5 Incompatible materials
acids, Halogens, Bases, Phosphorus, Sulphur oxides, Peroxides

10.6 Hazardous decomposition products
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - 9,000 mg/kg

Inhalation: No data available

Dermal: No data available

No data available

Skin corrosion/irritation
Skin - Rabbit
Result: Mild skin irritation - 24 h

Serious eye damage/eye irritation
Eyes - Rabbit
Result: Mild eye irritation - 24 h

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

Carcinogenicity - Rat - Intramuscular
Tumorigenic:Equivocal tumorigenic agent by RTECS criteria. Tumorigenic:Tumors at site or application.

IARC:	No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.
ACGIH:	No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by ACGIH.
NTP:	No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.
OSHA:	No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
No data available

May cause reproductive disorders.

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: OO9275000

Men exposed to manganese dusts showed a decrease in fertility. Chronic manganese poisoning primarily involves the central nervous system. Early symptoms include languor, sleepiness and weakness in the legs. A stolid mask-like appearance of the face, emotional disturbances such as uncontrollable laughter and a spastic gait with tendency to fall in walking are findings in more advanced cases. High incidence of pneumonia has been found in workers exposed to the dust or fume of some manganese compounds.

Stomach - Irregularities - Based on Human Evidence
Stomach - Irregularities - Based on Human Evidence

12. ECOLOGICAL INFORMATION

12.1 Toxicity

Toxicity to daphnia and other aquatic invertebrates	EC50 - Daphnia magna (Water flea) - 40 mg/l - 48 h

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.
Harmful to aquatic life.

No data available

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Burn in a chemical incinerator equipped with an afterburner and scrubber but exert extra care in igniting as this material is highly flammable. Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 3208 Class: 4.3 Packing group: I
Proper shipping name: Metallic substance, water-reactive, n.o.s. (Manganese)

Poison Inhalation Hazard: No

IMDG
UN number: 3208 Class: 4.3 Packing group: I EMS-No: F-G, S-N
Proper shipping name: METALLIC SUBSTANCE, WATER-REACTIVE, N.O.S. (Manganese)

IATA

Version: 4.6 Revision Date: 03/02/2015 Print Date: 02/07/2016

SAFETY DATA SHEET

Version 6.12
Revision Date 07/27/2024
Print Date 07/28/2024

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifiers

Product name	:	*m*-Cresol
Product Number	:	W353000
Brand	:	Aldrich
Index-No.	:	604-004-00-9
CAS-No.	:	108-39-4

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Synthesis of substances
Uses advised against	:	The product is being supplied under the TSCA R&D Exemption (40 CFR Section 720.36). It is the recipient's responsibility to comply with the requirements of the R&D exemption. The product may not be used for a non-exempt commercial purpose under TSCA unless appropriate consent is granted in writing by MilliporeSigma.

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich Inc. 3050 SPRUCE ST ST. LOUIS MO 63103 UNITED STATES
Telephone	:	+1 314 771-5765
Fax	:	+1 800 325-5052

1.4 Emergency telephone

Emergency Phone #	:	800-424-9300 CHEMTREC (USA) +1-703-527-3887 CHEMTREC (International) 24 Hours/day; 7 Days/week

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)

Flammable liquids (Category 4), H227
Acute toxicity, Oral (Category 3), H301
Acute toxicity, Dermal (Category 3), H311

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Skin corrosion (Category 1B), H314
Serious eye damage (Category 1), H318
Short-term (acute) aquatic hazard (Category 2), H401
Long-term (chronic) aquatic hazard (Category 3), H412

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram	
Signal Word	Danger
Hazard Statements	
H227	Combustible liquid.
H301 + H311	Toxic if swallowed or in contact with skin.
H314	Causes severe skin burns and eye damage.
H401	Toxic to aquatic life.
H412	Harmful to aquatic life with long lasting effects.
Precautionary Statements	
P210	Keep away from heat/ sparks/ open flames/ hot surfaces. No smoking.
P264	Wash skin thoroughly after handling.
P270	Do not eat, drink or smoke when using this product.
P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P301 + P310 + P330	IF SWALLOWED: Immediately call a POISON CENTER/ doctor. Rinse mouth.
P301 + P330 + P331	IF SWALLOWED: Rinse mouth. Do NOT induce vomiting.
P303 + P361 + P353	IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water/ shower.
P304 + P340 + P310	IF INHALED: Remove person to fresh air and keep comfortable for breathing. Immediately call a POISON CENTER/ doctor.
P305 + P351 + P338 + P310	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER/ doctor.
P362	Take off contaminated clothing and wash before reuse.
P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam to extinguish.
P403 + P235	Store in a well-ventilated place. Keep cool.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

SECTION 3: Composition/information on ingredients

3.1 Substances

Synonyms : 3-Methylphenol

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Formula	:	C_7H_8O
Molecular weight	:	108.14 g/mol
CAS-No.	:	108-39-4
EC-No.	:	203-577-9
Index-No.	:	604-004-00-9

Component	Classification	Concentration
meta-Cresol		
	Flam. Liq. 4; Acute Tox. 3; Skin Corr. 1B; Eye Dam. 1; Aquatic Acute 2; Aquatic Chronic 3; H227, H301, H311, H314, H318, H401, H412	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

SECTION 4: First aid measures

4.1 Description of first-aid measures

General advice
First aiders need to protect themselves. Show this material safety data sheet to the doctor in attendance.

If inhaled
After inhalation: fresh air. Call in physician.

In case of skin contact
In case of skin contact: Take off immediately all contaminated clothing. Rinse skin with water/ shower. Call a physician immediately.

In case of eye contact
After eye contact: rinse out with plenty of water. Immediately call in ophthalmologist. Remove contact lenses.

If swallowed
If swallowed: give water to drink (two glasses at most). Seek medical advice immediately. In exceptional cases only, if medical care is not available within one hour, induce vomiting (only in persons who are wide awake and fully conscious), administer activated charcoal (20 - 40 g in a 10% slurry) and consult a doctor as quickly as possible. Do not attempt to neutralise.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media
Water Foam Carbon dioxide (CO2) Dry powder

Unsuitable extinguishing media
For this substance/mixture no limitations of extinguishing agents are given.

5.2 Special hazards arising from the substance or mixture

Carbon oxides
Combustible.
Vapors are heavier than air and may spread along floors.
Forms explosive mixtures with air on intense heating.
Development of hazardous combustion gases or vapours possible in the event of fire.

5.3 Advice for firefighters

Stay in danger area only with self-contained breathing apparatus. Prevent skin contact by keeping a safe distance or by wearing suitable protective clothing.

5.4 Further information

Remove container from danger zone and cool with water. Prevent fire extinguishing water from contaminating surface water or the ground water system.

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Advice for non-emergency personnel: Do not breathe vapors, aerosols. Avoid substance contact. Ensure adequate ventilation. Keep away from heat and sources of ignition.
Evacuate the danger area, observe emergency procedures, consult an expert.
For personal protection see section 8.

6.2 Environmental precautions

Do not let product enter drains.

6.3 Methods and materials for containment and cleaning up

Cover drains. Collect, bind, and pump off spills. Observe possible material restrictions (see sections 7 and 10). Take up carefully with liquid-absorbent material (e.g. Chemizorb®). Dispose of properly. Clean up affected area.

6.4 Reference to other sections

For disposal see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Advice on protection against fire and explosion
Keep away from open flames, hot surfaces and sources of ignition.Take precautionary measures against static discharge.

Hygiene measures

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities

Storage conditions
Tightly closed. Keep in a well-ventilated place. Keep locked up or in an area accessible only to qualified or authorized persons.

Moisture sensitive.

Storage class
Storage class (TRGS 510): 6.1A: Combustible, acute toxic Cat. 1 and 2 / very toxic hazardous materials

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Ingredients with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
meta-Cresol	108-39-4	TWA	2.3 ppm 10 mg/m3	USA. NIOSH Recommended Exposure Limits
		TWA	5 ppm 22 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
	Remarks	Skin designation		
		TWA	20 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Not classifiable as a human carcinogen Danger of cutaneous absorption		
		PEL	5 ppm 22 mg/m3	California permissible exposure limits for chemical contaminants (Title 8, Article 107)
		Skin		

8.2 Exposure controls

Appropriate engineering controls
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Personal protective equipment

Eye/face protection
Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU). Tightly fitting safety goggles

Skin protection
This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Full contact
Material: Chloroprene
Minimum layer thickness: 0.65 mm
Break through time: 480 min
Material tested:KCL 720 Camapren®

This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Splash contact
Material: Latex gloves
Minimum layer thickness: 0.6 mm
Break through time: 60 min
Material tested:Lapren® (KCL 706 / Aldrich Z677558, Size M)

Body Protection
protective clothing

Respiratory protection
Recommended Filter type: Filter A-(P3)
The entrepeneur has to ensure that maintenance, cleaning and testing of respiratory protective devices are carried out according to the instructions of the producer. These measures have to be properly documented.
required when vapours/aerosols are generated. Our recommendations on filtering respiratory protection are based on the following standards: DIN EN 143, DIN 14387 and other accompanying standards relating to the used respiratory protection system.

Control of environmental exposure
Do not let product enter drains.

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: liquid Color: colorless, light yellow
b)	Odor	phenol-like

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

c)	Odor Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/ range: 8 - 10 °C (46 - 50 °F) - lit.
f)	Initial boiling point and boiling range	203 °C 397 °F - lit.
g)	Flash point	86 °C (187 °F) - closed cup
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	Upper explosion limit: 1.35 %(V) Lower explosion limit: 1.06 %(V)
k)	Vapor pressure	< 1 hPa at 20 °C (68 °F)
l)	Vapor density	3.73 - (Air = 1.0)
m)	Density	1.034 g/cm3 at 25 °C (77 °F) - lit.
	Relative density	1.0320 °C
n)	Water solubility	22.7 g/l at 25 °C (77 °F)
o)	Partition coefficient: n-octanol/water	log Pow: 1.96 - Bioaccumulation is not expected.
p)	Autoignition temperature	559 °C (1038 °F) at 1,013 hPa
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	Not classified as explosive.
t)	Oxidizing properties	none

9.2 Other safety information

Dissociation constant	10.09 at 25 °C (77 °F)
Relative vapor density	3.73 - (Air = 1.0)

SECTION 10: Stability and reactivity

10.1 Reactivity

Forms explosive mixtures with air on intense heating.
A range from approx. 15 Kelvin below the flash point is to be rated as critical.

10.2 Chemical stability

The product is chemically stable under standard ambient conditions (room temperature) .

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

10.3 Possibility of hazardous reactions

Violent reactions possible with:
Strong oxidizing agents
Nitric acid
fuming sulfuric acid
chlorosulfonic acid
alkalines
Iron
Lead

10.4 Conditions to avoid

Strong heating.

10.5 Incompatible materials

No data available

10.6 Hazardous decomposition products

In the event of fire: see section 5

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - male - 242 mg/kg
(OECD Test Guideline 401)
Symptoms: If ingested, severe burns of the mouth and throat, as well as a danger of perforation of the esophagus and the stomach.
Symptoms: mucosal irritations, Cough, Shortness of breath, Possible damages:, damage of respiratory tract
Inhalation: Corrosive to respiratory system.
LD50 Dermal - Rabbit - 620 mg/kg
Remarks: Behavioral:Somnolence (general depressed activity).
Behavioral:Tetany.
(RTECS)

Skin corrosion/irritation
Skin - Rabbit
Result: Causes burns. - 24 h
Remarks: (ECHA)
Remarks: Classified according to Regulation (EU) 1272/2008, Annex VI (Table 3.1/3.2)

Serious eye damage/eye irritation
Remarks: Causes serious eye damage.

Respiratory or skin sensitization
No data available

Germ cell mutagenicity
Test Type: Ames test
Test system: Escherichia coli/Salmonella typhimurium
Metabolic activation: with and without metabolic activation
Method: OECD Test Guideline 471

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Result: negative
Test Type: Mutagenicity (mammal cell test): chromosome aberration.
Test system: Chinese hamster lung cells
Metabolic activation: with and without metabolic activation
Method: OECD Test Guideline 473
Result: positive
Test Type: In vitro mammalian cell gene mutation test
Test system: mouse lymphoma cells
Metabolic activation: with and without metabolic activation
Method: OECD Test Guideline 476
Result: negative

Test Type: Chromosome aberration test
Species: Mouse
Cell type: Bone marrow
Application Route: Oral
Method: OECD Test Guideline 475
Result: negative

Carcinogenicity

IARC: No ingredient of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

NTP: No ingredient of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is on OSHA's list of regulated carcinogens.

Reproductive toxicity
No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

11.2 Additional Information

Repeated dose toxicity - Rat - male - Oral - 13 Weeks - NOAEL (No observed adverse effect level) - 50 mg/kg

RTECS: GO6125000
Material is extremely destructive to tissue of the mucous membranes and upper respiratory tract, eyes, and skin., Cough, Shortness of breath, Headache, Nausea
To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

After absorption:

Systemic effects:

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Headache
Nausea
Vomiting
Dizziness
agitation, spasms
respiratory arrest
Unconsciousness

Damage to:

Central nervous system
Liver
Kidney

This substance should be handled with particular care.

Stomach - Irregularities - Based on Human Evidence

Stomach - Irregularities - Based on Human Evidence

SECTION 12: Ecological information

12.1 Toxicity

Toxicity to fish	static test LC50 - Salvelinus fontinalis - 7.6 mg/l - 96 h Remarks: (ECHA)
	static test LC50 - Oncorhynchus mykiss (rainbow trout) - 8.6 mg/l - 96 h Remarks: (ECHA)
	static test LC50 - Salmo trutta (brown trout) - 8.4 mg/l - 96 h Remarks: (ECHA)
Toxicity to daphnia and other aquatic invertebrates	flow-through test EC50 - Daphnia pulicaria - > 99.5 mg/l - 48 h (US-EPA)
Toxicity to fish(Chronic toxicity)	flow-through test NOEC - Pimephales promelas (fathead minnow) - 1.35 mg/l - 32 d (OECD Test Guideline 210) Remarks: The value is given in analogy to the following substances: p-cresol
Toxicity to daphnia and other aquatic invertebrates(Chronic toxicity)	semi-static test NOEC - Daphnia magna (Water flea) - 1 mg/l - 21 d Remarks: (ECHA) The value is given in analogy to the following substances: p-cresol

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

12.2 Persistence and degradability

Biodegradability aerobic - Exposure time 10 d
Result: 96 % - Inherently biodegradable.
(OECD Test Guideline 302B)

12.3 Bioaccumulative potential

Bioaccumulation Leuciscus idus (Golden orfe) - 3 d
- 0.05 mg/l(meta-Cresol)

Bioconcentration factor (BCF): 17 - 20

12.4 Mobility in soil

No data available

12.5 Results of PBT and vPvB assessment

PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Endocrine disrupting properties

No data available

12.7 Other adverse effects

Biological effects:
Hazard for drinking water supplies.
Change in the flavour characteristics of fish protein.
Discharge into the environment must be avoided.

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product

Waste material must be disposed of in accordance with the national and local regulations. Leave chemicals in original containers. No mixing with other waste. Handle uncleaned containers like the product itself.

SECTION 14: Transport information

DOT (US)

UN number: 2076 Class: 6.1 (8) Packing group: II
Proper shipping name: Cresols, liquid
Reportable Quantity (RQ): 100 lbs
Reportable Quantity (RQ): 100 lbs
Poison Inhalation Hazard: No

IMDG

UN number: 2076 Class: 6.1 (8) Packing group: II EMS-No: F-A, S-B
Proper shipping name: CRESOLS, LIQUID

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

IATA
UN number: 2076 Class: 6.1 (8) Packing group: II
Proper shipping name: Cresols, liquid

SECTION 15: Regulatory information

CERCLA Reportable Quantity

Components	CAS-No.	Component RQ (lbs)	Calculated product RQ (lbs)
meta-Cresol	108-39-4	100	100
meta-Cresol	108-39-4	100	100 (D024)

SARA 304 Extremely Hazardous Substances Reportable Quantity

This material does not contain any components with a section 304 EHS RQ.

SARA 302 Extremely Hazardous Substances Threshold Planning Quantity

This material does not contain any components with a section 302 EHS TPQ.

SARA 311/312 Hazards : Fire Hazard
Acute Health Hazard
Chronic Health Hazard

SARA 313 : The following components are subject to reporting levels established by SARA Title III, Section 313:

meta-Cresol 108-39-4 >= 90 - <= 100 %

Clean Air Act

This product neither contains, nor was manufactured with a Class I or Class II ODS as defined by the U.S. Clean Air Act Section 602 (40 CFR 82, Subpt. A, App.A + B).
The following chemical(s) are listed as HAP under the U.S. Clean Air Act, Section 112 (40 CFR 61):
meta-Cresol 108-39-4 >= 90 - <= 100 %
This product does not contain any chemicals listed under the U.S. Clean Air Act Section 112(r) for Accidental Release Prevention (40 CFR 68.130, Subpart F).
The following chemical(s) are listed under the U.S. Clean Air Act Section 111 SOCMI Intermediate or Final VOC's (40 CFR 60.489):
meta-Cresol 108-39-4 >= 90 - <= 100 %

Clean Water Act

The following Hazardous Substances are listed under the U.S. CleanWater Act, Section 311, Table 116.4A:
meta-Cresol 108-39-4 >= 90 - <= 100 %
This product does not contain any Hazardous Chemicals listed under the U.S. CleanWater Act, Section 311, Table 117.3.
This product does not contain any toxic pollutants listed under the U.S. Clean Water Act Section 307
This product does not contain any priority pollutants related to the U.S. Clean Water Act

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

US State Regulations

Massachusetts Right To Know

meta-Cresol	108-39-4

Pennsylvania Right To Know

Emergency Phone # : 800-424-9300 CHEMTREC (USA) +1-703-527-3887 CHEMTREC (International) 24 Hours/day; 7 Days/week

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)

Acute toxicity, Inhalation (Category 2), H330
Reproductive toxicity (Category 1B), H360
Specific target organ toxicity - repeated exposure (Category 1), H372
Short-term (acute) aquatic hazard (Category 1), H400
Long-term (chronic) aquatic hazard (Category 1), H410

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal Word Danger

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Hazard statement(s)

H330	Fatal if inhaled.
H360	May damage fertility or the unborn child.
H372	Causes damage to organs through prolonged or repeated exposure.
H410	Very toxic to aquatic life with long lasting effects.

Precautionary statement(s)

P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and understood.
P260	Do not breathe dust/ fume/ gas/ mist/ vapors/ spray.
P264	Wash skin thoroughly after handling.
P270	Do not eat, drink or smoke when using this product.
P271	Use only outdoors or in a well-ventilated area.
P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P284	Wear respiratory protection.
P304 + P340 + P310	IF INHALED: Remove person to fresh air and keep comfortable for breathing. Immediately call a POISON CENTER/ doctor.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.
P391	Collect spillage.
P403 + P233	Store in a well-ventilated place. Keep container tightly closed.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

SECTION 3: Composition/information on ingredients

3.1 Substances

Formula	:	Hg
Molecular weight	:	200.59 g/mol
CAS-No.	:	7439-97-6
EC-No.	:	231-106-7
Index-No.	:	080-001-00-0

Component	Classification	Concentration
mercury		
	Acute Tox. 2; Repr. 1B; STOT RE 1; Aquatic Acute 1; Aquatic Chronic 1; H330, H360, H372, H400, H410 M-Factor - Aquatic Acute: 1 - Aquatic Chronic: 100	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 4: First aid measures

4.1 Description of first-aid measures

General advice
First aiders need to protect themselves. Show this material safety data sheet to the doctor in attendance.

If inhaled
After inhalation: fresh air. Immediately call in physician. If breathing stops: immediately apply artificial respiration, if necessary also oxygen.

In case of skin contact
In case of skin contact: Take off immediately all contaminated clothing. Rinse skin with water/ shower. Consult a physician.

In case of eye contact
After eye contact: rinse out with plenty of water. Call in ophthalmologist. Remove contact lenses.

If swallowed
After swallowing: immediately make victim drink water (two glasses at most). Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media
Use extinguishing measures that are appropriate to local circumstances and the surrounding environment.

Unsuitable extinguishing media
For this substance/mixture no limitations of extinguishing agents are given.

5.2 Special hazards arising from the substance or mixture
Mercury/mercury oxides.
Not combustible.
Ambient fire may liberate hazardous vapours.

5.3 Advice for firefighters
Stay in danger area only with self-contained breathing apparatus. Prevent skin contact by keeping a safe distance or by wearing suitable protective clothing.

5.4 Further information
Suppress (knock down) gases/vapors/mists with a water spray jet. Prevent fire extinguishing water from contaminating surface water or the ground water system.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Advice for non-emergency personnel: Do not breathe vapors, aerosols. Avoid substance contact. Ensure adequate ventilation. Evacuate the danger area, observe emergency procedures, consult an expert.
For personal protection see section 8.

6.2 Environmental precautions

Do not let product enter drains.

6.3 Methods and materials for containment and cleaning up

Soak up with inert absorbent material and dispose of as hazardous waste. Keep in suitable, closed containers for disposal. In some instances, a mercury spill kit may be used. Please consult with your site EHS representative to determine the most appropriate clean up method.Cover drains. Collect, bind, and pump off spills. Observe possible material restrictions (see sections 7 and 10). Take up carefully with liquid-absorbent material (e.g. Chemizorb®). Dispose of properly. Clean up affected area.

6.4 Reference to other sections

For disposal see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Advice on safe handling
Work under hood. Do not inhale substance/mixture. Avoid generation of vapours/aerosols.

Hygiene measures
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities

Storage conditions
Tightly closed. Keep in a well-ventilated place. Keep locked up or in an area accessible only to qualified or authorized persons.

Store under inert gas.

Storage class
Storage class (TRGS 510): 6.1B: Non-combustible, acute toxic Cat. 1 and 2 / very toxic hazardous materials

7.3 Specific end use(s)

Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Ingredients with workplace control parameters

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Component	CAS-No.	Value	Control parameters	Basis
mercury	7439-97-6	C	0.1 mg/m3	USA. NIOSH Recommended Exposure Limits
	Remarks	Potential for dermal absorption		
		CEIL	1.0mg/10m3	USA. Occupational Exposure Limits (OSHA) - Table Z-2
		TWA	0.05 mg/m3	USA. Table Z-1-A Limits for Air Contaminants (1989 vacated values)
		Skin notation		
		TWA	0.025 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Central Nervous System impairment Kidney damage Substances for which there is a Biological Exposure Index or Indices (see BEI® section) Not classifiable as a human carcinogen Danger of cutaneous absorption		
		TWA	0.05 mg/m3	USA. NIOSH Recommended Exposure Limits
		Potential for dermal absorption		

8.2 Exposure controls

Appropriate engineering controls
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.

Personal protective equipment

Eye/face protection
Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU). Safety glasses

Skin protection
This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN374 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:KCL 741 Dermatril® L

This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN374 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:KCL 741 Dermatril® L

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Body Protection
protective clothing

Respiratory protection
required when vapours/aerosols are generated.
Our recommendations on filtering respiratory protection are based on the following standards: DIN EN 143, DIN 14387 and other accompanying standards relating to the used respiratory protection system.

Control of environmental exposure
Do not let product enter drains.

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: liquid Color: silver, white
b)	Odor	odorless
c)	Odor Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: -38.87 °C (-37.97 °F) - lit.
f)	Initial boiling point and boiling range	356.6 °C 673.9 °F - lit.
g)	Flash point	()Not applicable
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	The product is not flammable.
j)	Upper/lower flammability or explosive limits	No data available
k)	Vapor pressure	< 0.01 hPa at 20 °C (68 °F) 1 hPa at 126 °C(259 °F)
l)	Vapor density	6.93 - (Air = 1.0)
m)	Density	13.55 g/cm3 at 25 °C (77 °F)
	Relative density	No data available
n)	Water solubility	0.00006 g/l at 25 °C (77 °F)
o)	Partition coefficient: n-octanol/water	Not applicable for inorganic substances
p)	Autoignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

s) Explosive properties No data available

t) Oxidizing properties none

9.2 Other safety information

Relative vapor density	6.93 - (Air = 1.0)

SECTION 10: Stability and reactivity

10.1 Reactivity
No data available

10.2 Chemical stability
The product is chemically stable under standard ambient conditions (room temperature) .

10.3 Possibility of hazardous reactions
Risk of explosion with:
Acetylene
Alkali metals
Aluminum
Amines
Ammonia
chlorine dioxide
Potassium
sodium
oxalic acid
perchlorates
Risk of ignition or formation of inflammable gases or vapours with:
Chlorine
silanes
Oxygen
Generates dangerous gases or fumes in contact with:
Nitric acid
Exothermic reaction with:
Bromine
Metals
acetylidene
Oxygen

10.4 Conditions to avoid
no information available

10.5 Incompatible materials
Aluminum, Lead, Copper, silver, Zinc, zinc alloys, Tin

10.6 Hazardous decomposition products
In the event of fire: see section 5

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity
Oral: No data available
LC50 Inhalation - Rat - male - 2 h - < 27 mg/m3 - vapor

Dermal: No data available

Skin corrosion/irritation
No data available

Serious eye damage/eye irritation
No data available

Respiratory or skin sensitization
No data available

Germ cell mutagenicity
No data available

Carcinogenicity
This product is or contains a component that is not classifiable as to its carcinogenicity based on its IARC, ACGIH, NTP, or EPA classification.

IARC: No ingredient of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

NTP: No ingredient of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is on OSHA's list of regulated carcinogens.

Reproductive toxicity
Presumed human reproductive toxicant

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
Causes damage to organs through prolonged or repeated exposure.

Aspiration hazard
No data available

11.2 Additional Information

RTECS: OV4550000
To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

Stomach - Irregularities - Based on Human Evidence

Stomach - Irregularities - Based on Human Evidence

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 12: Ecological information

12.1 Toxicity

Toxicity to fish	mortality LC50 - Cyprinus carpio (Carp) - 0.160 mg/l - 96 h
Toxicity to fish(Chronic toxicity)	Remarks: No data available (mercury)

12.2 Persistence and degradability

The methods for determining biodegradability are not applicable to inorganic substances.

12.3 Bioaccumulative potential

Bioaccumulation	Carassius auratus (goldfish) - 1,789 d - 0.25 µg/l(mercury) Bioconcentration factor (BCF): 155,986

12.4 Mobility in soil

No data available

12.5 Results of PBT and vPvB assessment

PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Endocrine disrupting properties

No data available

12.7 Other adverse effects

No data available

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product

Waste material must be disposed of in accordance with the national and local regulations. Leave chemicals in original containers. No mixing with other waste. Handle uncleaned containers like the product itself. See www.retrologistik.com for processes regarding the return of chemicals and containers, or contact us there if you have further questions.

SECTION 14: Transport information

DOT (US)

UN number: 2809 Class: 8 (6.1) Packing group: III
Proper shipping name: Mercury
Reportable Quantity (RQ): 1 lbs
Reportable Quantity (RQ): 1 lbs
Poison Inhalation Hazard: No

IMDG

UN number: 2809 Class: 8 (6.1) Packing group: III EMS-No: F-A, S-B
Proper shipping name: MERCURY
Marine pollutant : yes

IATA

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

UN number: 2809 Class: 8 (6.1) Packing group: III
Proper shipping name: Mercury

SECTION 15: Regulatory information

SARA 302 Components
This material does not contain any components with a section 302 EHS TPQ.

SARA 313 Components
The following components are subject to reporting levels established by SARA Title III, Section 313:

	CAS-No.	Revision Date
mercury	7439-97-6	2015-11-23

SARA 311/312 Hazards
Acute Health Hazard, Chronic Health Hazard

Reportable Quantity : D009 lbs

Massachusetts Right To Know Components
No components are subject to the Massachusetts Right to Know Act.

Pennsylvania Right To Know Components

	CAS-No.	Revision Date
mercury	7439-97-6	2015-11-23

California Prop. 65 Components

	CAS-No.	Revision Date
, which is/are known to the State of California to cause birth defects or other reproductive harm. For more information go to www.P65Warnings.ca.gov.mercury	7439-97-6	2013-12-20

SECTION 16: Other information

Further information
The above information is believed to be correct but does not purport to be all inclusive and shall be used only as a guide. The information in this document is based on the present state of our knowledge and is applicable to the product with regard to appropriate safety precautions. It does not represent any guarantee of the properties of the product. Sigma-Aldrich Corporation and its Affiliates shall not be held liable for any damage resulting from handling or from contact with the above product. See www.sigma-aldrich.com and/or the reverse side of invoice or packing slip for additional terms and conditions of sale.

SAFETY DATA SHEET

Version 3.8
Revision Date 05/27/2016
Print Date 11/13/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	Methane
Product Number	:	295477
Brand	:	Aldrich
Index-No.	:	601-001-00-4
CAS-No.	:	74-82-8

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Synthesis of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	+1-703-527-3887 (CHEMTREC)

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Flammable gases (Category 1), H220
Gases under pressure (Compressed gas), H280
Simple Asphyxiant,

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word	Danger
Hazard statement(s)	
H220	Extremely flammable gas.
H280	Contains gas under pressure; may explode if heated. May displace oxygen and cause rapid suffocation.
Precautionary statement(s)	
P210	Keep away from heat/sparks/open flames/hot surfaces. No smoking.
P377	Leaking gas fire: Do not extinguish, unless leak can be stopped safely.
P381	Eliminate all ignition sources if safe to do so.
P410 + P403	Protect from sunlight. Store in a well-ventilated place.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Formula	:	CH_4
Molecular weight	:	16.04 g/mol
CAS-No.	:	74-82-8
EC-No.	:	200-812-7
Index-No.	:	601-001-00-4

Hazardous components

Component	Classification	Concentration
Methane		
	Flam. Gas 1; Press. Gas Compr. Gas; SA ; H220, H280,	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Wash off with soap and plenty of water. Consult a physician.

In case of eye contact
Flush eyes with water as a precaution.

If swallowed
Do NOT induce vomiting. Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture
No data available

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
Use water spray to cool unopened containers.

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Remove all sources of ignition. Evacuate personnel to safe areas. Beware of vapours accumulating to form explosive concentrations. Vapours can accumulate in low areas.

For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains.

6.3 Methods and materials for containment and cleaning up
Clean up promptly by sweeping or vacuum.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid inhalation of vapour or mist.
Use explosion-proof equipment.Keep away from sources of ignition - No smoking.Take measures to prevent the build up of electrostatic charge.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.

Contents under pressure.
Storage class (TRGS 510): Gases

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
Methane	74-82-8	TWA	1,000.000000 ppm	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Central Nervous System impairment Cardiac sensitization		
		See Appendix F: Minimal Oxygen Content Asphyxia 2015 Adoption		
		TWA	0.100000 mg/m3	USA. NIOSH Recommended Exposure Limits
		'Ca' in the presence of formaldehyde, acetaldehyde, or malonaldehyde. See Appendices A & C (Aldehydes).		
		TWA	0.100000 mg/m3	USA. NIOSH Recommended Exposure Limits
		'Ca' in the presence of formaldehyde, acetaldehyde, or malonaldehyde. See Appendices A & C (Aldehydes).		
		See Appendix F: Minimal Oxygen Content Asphyxia		
		TWA	0.1 mg/m3	USA. NIOSH Recommended Exposure Limits
		'Ca' in the presence of formaldehyde, acetaldehyde, or malonaldehyde. See Appendices A & C (Aldehydes).		

8.2 Exposure controls

Appropriate engineering controls
Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection
Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Fluorinated rubber
Minimum layer thickness: 0.7 mm
Break through time: 480 min
Material tested:Vitoject® (KCL 890 / Aldrich Z677698, Size M)

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.4 mm
Break through time: 60 min
Material tested:Camatril® (KCL 730 / Aldrich Z677442, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Impervious clothing, Flame retardant antistatic protective clothing., The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face respirator with multi-purpose combination (US) or type AXBEK (EN 14387) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: gaseous Colour: colourless
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: -183 °C (-297 °F) - lit.
f)	Initial boiling point and boiling range	-161 °C (-258 °F) - lit.
g)	Flash point	-188 °C (-306 °F) - closed cup
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower	Upper explosion limit: 15 %(V)

	flammability or explosive limits	Lower explosion limit: 5 %(V)
k)	Vapour pressure	No data available
l)	Vapour density	0.55 - (Air = 1.0)
m)	Relative density	0.716 g/cm3 at 25 °C (77 °F)
n)	Water solubility	3.5 g/l at 17 °C (63 °F)
o)	Partition coefficient: n-octanol/water	No data available
p)	Auto-ignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information

Relative vapour density 0.55 - (Air = 1.0)

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions
No data available

10.4 Conditions to avoid
Heat, flames and sparks.

10.5 Incompatible materials
Strong oxidizing agents

10.6 Hazardous decomposition products
Hazardous decomposition products formed under fire conditions. - Carbon oxides
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
No data available

Inhalation: No data available

Dermal: No data available

No data available

Skin corrosion/irritation
No data available

Serious eye damage/eye irritation
No data available

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

IARC: No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

NTP: No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
No data available

No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: PA1490000

To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

12. ECOLOGICAL INFORMATION

12.1 Toxicity
No data available

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects

No data available

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Burn in a chemical incinerator equipped with an afterburner and scrubber but exert extra care in igniting as this material is highly flammable. Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 1971 Class: 2.1

Proper shipping name: Methane, compressed
Reportable Quantity (RQ):

Poison Inhalation Hazard: No

IMDG
UN number: 1971 Class: 2.1 EMS-No: F-D, S-U
Proper shipping name: METHANE, COMPRESSED

IATA
UN number: 1971 Class: 2.1
Proper shipping name: Methane, compressed
IATA Passenger: Not permitted for transport

15. REGULATORY INFORMATION

SARA 302 Components
No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components
This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

SARA 311/312 Hazards
Fire Hazard

Massachusetts Right To Know Components

	CAS-No.	Revision Date
Methane	74-82-8	1993-04-24

Pennsylvania Right To Know Components

	CAS-No.	Revision Date
Methane	74-82-8	1993-04-24

New Jersey Right To Know Components

	CAS-No.	Revision Date
Methane	74-82-8	1993-04-24

California Prop. 65 Components
This product does not contain any chemicals known to State of California to cause cancer, birth defects, or any other reproductive harm.

16. OTHER INFORMATION

Full text of H-Statements referred to under sections 2 and 3.

	May displace oxygen and cause rapid suffocation.
Flam. Gas	Flammable gases
H220	Extremely flammable gas.
H280	Contains gas under pressure; may explode if heated.
Press. Gas	Gases under pressure
SA	Simple Asphyxiant

HMIS Rating

Health hazard:	0
Chronic Health Hazard:	
Flammability:	4
Physical Hazard	3

NFPA Rating

Health hazard:	0
Fire Hazard:	4
Reactivity Hazard:	0

* * *Section 2 - HAZARDS IDENTIFICATION* * *

Classification in accordance with 29 CFR 1910.1200

Acute Toxicity (Inhalation), Category 4
Skin Corrosion / Irritation, Category 2
Eye Damage / Irritation, Category 2A
Toxic to Reproduction, Category 2
Specific Target Organ Toxicity - Single Exposure, Category 1 (central nervous system and heart)
Specific Target Organ Toxicity - Single Exposure, Category 3 (respiratory system)
Specific Target Organ Toxicity - Repeated Exposure, Category 1 (central nervous system, heart, and liver)
Specific Target Organ Toxicity - Repeated Exposure, Category 2 (brain, lungs, and nervous system)
Hazardous to the Aquatic Environment - Acute Hazard, Category 2
Hazardous to the Aquatic Environment - Chronic Hazard, Category 2
Hazardous for the ozone layer, Category 1

GHS LABEL ELEMENTS

Symbol(s)

Signal Word

DANGER

Hazard Statement(s)

Harmful if inhaled
Causes skin irritation
Causes serious eye irritation
Suspected of damaging fertility or the unborn child
Causes damage to central nervous system and heart.
May cause respiratory tract irritation.
Causes damage to central nervous system, heart, and liver through prolonged or repeated exposure.
May cause damage to brain, lungs, nervous system through prolonged or repeated exposure.
Toxic to aquatic life with long lasting effects
Harms public health and the environment by destroying ozone in the upper atmosphere

Precautionary Statement(s)

Prevention

Obtain special instructions before use. Do not handle until all safety precautions have been read and understood. Use personal protective equipment as required. Do not breathe vapor or mist. Use only outdoors or in a well-ventilated area. Wear protective gloves and eye/face protection. Wash thoroughly after handling. Do not eat, drink or smoke when using this product. Avoid release to the environment.

Response

IF exposed: Call a POISON CENTER or doctor/physician. IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing. Call a POISON CENTER or doctor/physician if you feel unwell. IF ON SKIN: Wash with plenty of soap and water. If skin irritation occurs: Get medical advice/attention. Take off contaminated clothing and wash before reuse. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. If eye irritation persists: Get medical advice/attention. Collect spillage.

Storage

Store in a well-ventilated place. Keep container tightly closed. Store locked up.

Disposal

Dispose of in accordance with applicable regulations.
Refer to manufacturer/supplier for information on recovery/recycling.

* * *Section 3 - COMPOSITION / INFORMATION ON INGREDIENTS* * *

CAS	Component	Percent
71-55-6	METHYL CHLOROFORM	100

Component Related Regulatory Information

This product may be regulated, have exposure limits or other information identified as the following: Trichloroethane (25323-89-1).

* * *Section 4 - FIRST AID MEASURES* * *

Description of Necessary Measures

Inhalation

If adverse effects occur, remove to uncontaminated area. Give artificial respiration if not breathing. If breathing is difficult, oxygen should be administered by qualified personnel. Get immediate medical attention.

Skin

Wash skin with soap and water for at least 15 minutes while removing contaminated clothing and shoes. Get medical attention, if needed. Thoroughly clean and dry contaminated clothing and shoes before reuse.

Eyes

Flush eyes with plenty of water for at least 15 minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Then get immediate medical attention.

Ingestion

If vomiting occurs, keep head lower than hips to help prevent aspiration. If person is unconscious, turn head to side. Get medical attention immediately.

Most Important Symptoms/Effects

Acute

respiratory tract irritation, skin irritation, eye irritation, central nervous system depression, central nervous system damage, heart damage

Delayed

central nervous system damage, heart damage, liver damage, reproductive effects, lung damage, brain damage, nervous system damage

Indication of Immediate Medical Attention and Special Treatment

For inhalation, consider oxygen.

* * *Section 5 - FIRE FIGHTING MEASURES* * *

Suitable Extinguishing Media

carbon dioxide, regular dry chemical, water spray

Large fires: Use dry chemical, carbon dioxide, alcohol-resistant foam or water spray.

Unsuitable Extinguishing Media

Do not scatter spilled material with high-pressure water streams.

Specific Hazards Arising from the Chemical

Slight fire hazard.

Hazardous Combustion Products

Combustion: hydrogen chloride, phosgene, oxides of carbon

Fire Fighting Measures

Move container from fire area if it can be done without risk. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Cool containers with water spray until well after the fire is out. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tanks due to fire. Stay away from the ends of tanks. For tank, rail car or tank truck, evacuation radius: 800 meters (1/2 mile).

Special Protective Equipment and Precautions for Firefighters

Wear full protective fire fighting gear including self contained breathing apparatus (SCBA) for protection against possible exposure.

* * *Section 6 - ACCIDENTAL RELEASE MEASURES* * *

Personal Precautions, Protective Equipment and Emergency Procedures

Wear personal protective clothing and equipment, see Section 8. Avoid release to the environment.

Methods and Materials for Containment and Cleaning Up

Avoid heat, flames, sparks and other sources of ignition. Eliminate all ignition sources if safe to do so. Stop leak if possible without personal risk. **Small spills:** Absorb with sand or other non-combustible material. Collect spilled material in appropriate container for disposal. **Large spills:** Dike for later disposal. Remove sources of ignition. Keep unnecessary people away, isolate hazard area and deny entry. Notify Local Emergency Planning Committee and State Emergency Response Commission for release greater than or equal to RQ (U.S. SARA Section 304). If release occurs in the U.S. and is reportable under CERCLA Section 103, notify the National Response Center at (800)424-8802 (USA) or (202)426-2675 (USA).

* * *Section 7 - HANDLING AND STORAGE* * *

Precautions for Safe Handling

Obtain special instructions before use. Do not handle until all safety precautions have been read and understood. Use personal protective equipment as required. Do not breathe vapor or mist. Use only outdoors or in a well-ventilated area. Wear protective gloves and eye/face protection. Wash thoroughly after handling. Do not eat, drink, or smoke when using this product. Avoid release to the environment.

Conditions for Safe Storage, including any Incompatibilities

Store and handle in accordance with all current regulations and standards. Store in a well-ventilated place. Keep container tightly closed. Store locked up. Store in a cool, dry place. Keep separated from incompatible substances.

Incompatibilities combustible materials, bases, metals, oxidizing materials

* * *Section 8 - EXPOSURE CONTROLS / PERSONAL PROTECTION* * *

Component Exposure Limits

METHYL CHLOROFORM (71-55-6)

ACGIH:	350 ppm TWA 450 ppm STEL
Europe:	100 ppm TWA; 555 mg/m3 TWA 200 ppm STEL; 1110 mg/m3 STEL
OSHA (Final):	350 ppm TWA; 1900 mg/m3 TWA
OSHA (Vacated):	350 ppm TWA; 1900 mg/m3 TWA 450 ppm STEL; 2450 mg/m3 STEL
NIOSH:	350 ppm Ceiling (15 min); 1900 mg/m3 Ceiling (15 min)

Component Biological Limit Values

METHYL CHLOROFORM (71-55-6)

ACGIH: 40 ppm Medium: end-exhaled air Time: prior to last shift of workweek Parameter: Methyl chloroform; 10 mg/L Medium: urine Time: end of workweek Parameter: Trichloroacetic acid (nonspecific, semi-quantitative); 30 mg/L Medium: urine Time: end of shift at end of workweek Parameter: Total trichloroethanol (nonspecific, semi-quantitative); 1 mg/L Medium: blood Time: end of shift at end of workweek Parameter: Total trichloroethanol (nonspecific)

IDLH

700 ppm

Appropriate Engineering Controls

Provide local exhaust or process enclosure ventilation system. Ensure compliance with applicable exposure limits.

Individual Protection Measures, such as Personal Protective Equipment

Eyes/Face Protection

Wear splash resistant safety goggles with a faceshield. Provide an emergency eye wash fountain and quick drench shower in the immediate work area.

Skin Protection

Wear appropriate chemical resistant clothing.

Glove Recommendations

Wear appropriate chemical resistant gloves.

Respiratory Protection

The following respirators and maximum use concentrations are drawn from NIOSH and/or OSHA.

700 ppm

Any supplied-air respirator.

Any self-contained breathing apparatus with a full facepiece.
Emergency or planned entry into unknown concentrations or IDLH conditions -
Any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode.
Any supplied-air respirator with a full facepiece that is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode.
Escape -
Any air-purifying full-facepiece respirator (gas mask) with a chin-style, front-mounted or back-mounted organic vapor canister.
Any appropriate escape-type, self-contained breathing apparatus.

* * *Section 9 - PHYSICAL AND CHEMICAL PROPERTIES* * *

Physical State:	Liquid	**Appearance:**	clear, colorless liquid
Color:	colorless	**Physical Form:**	volatile liquid
Odor:	sweet odor	**Odor Threshold:**	44 - 100 ppm
pH:	Not available	**Melting/Freezing Point:**	-32 °C
Boiling Point:	74 °C	**Flash Point:**	>93.3 °C
Decomposition:	Not available	**Evaporation Rate:**	5.0 (butyl acetate=1)
LEL:	7.5 %	**UEL:**	12.5 %
Vapor Pressure:	100 mmHg @ 20 °C	**Henry's Law Constant:**	0.072 atm-cu m/mole @ 25°C
Vapor Density (air = 1):	4.55	**Specific Gravity (water=1):**	1.3390
Water Solubility:	0.078 % @ 25 °C	**Log KOW:**	2.49
KOC:	17823.79 estimated from water solubility	**Auto Ignition:**	537 °C
Viscosity:	0.858 cP @20 °C	**Volatility:**	100%
Molecular Weight:	133.40	**Molecular Formula:**	C-H3-C-Cl3

Other Property Information

No additional information is available.

Solvent Solubility

Soluble: acetone, benzene, chloroform, methanol, ethanol, carbon disulfide, ether, carbon tetrachloride, heptane

* * *Section 10 - STABILITY AND REACTIVITY* * *

Reactivity

No reactivity hazard is expected.

Chemical Stability

Stable at normal temperatures and pressure.

Possibility of Hazardous Reactions

Will not polymerize.

Conditions to Avoid

Avoid heat, flames, sparks and other sources of ignition. Containers may rupture or explode if exposed to heat.

Incompatible Materials

combustible materials, bases, metals, oxidizing materials

Hazardous Decomposition

Combustion: hydrogen chloride, phosgene, oxides of carbon

* * *Section 11 - TOXICOLOGICAL INFORMATION* * *

Acute and Chronic Toxicity

Component Analysis - LD50/LC50

The components of this material have been reviewed in various sources and the following selected endpoints are published:

METHYL CHLOROFORM (71-55-6)

Dermal LD50 Rabbit >15800 mg/kg; Inhalation LC50 Rat 18000 ppm 4 h; Oral LD50 Rat >2000 mg/kg

RTECS Acute Toxicity (selected)

The components of this material have been reviewed, and RTECS publishes the following endpoints:

METHYL CHLOROFORM (71-55-6)

Inhalation: 24400 mg/m3 Inhalation Cat LC50; 29492 ppm/10 minute(s) Inhalation Mouse LC50; 3911 ppm/2 hour Inhalation Mouse LC50
20000 ppm/2 hour Inhalation Rat LC50; 14250 ppm/7 hour Inhalation Rat LC50; 17000 ppm/4 hour Inhalation Rat LC50

Acute Toxicity Level

METHYL CHLOROFORM (71-55-6)

Slightly Toxic: inhalation, dermal absorption, ingestion

Information on Likely Routes of Exposure

Inhalation

irritation, changes in blood pressure, nausea, vomiting, diarrhea, difficulty breathing, irregular heartbeat, headache, drowsiness, dizziness, mood swings, loss of coordination, blood disorders, heart disorders, kidney damage, liver damage, convulsions, unconsciousness, coma, heart damage, reproductive effects

Ingestion

irritation, nausea, vomiting, diarrhea, stomach pain, irregular heartbeat, headache, drowsiness, dizziness, disorientation, loss of coordination, kidney damage, liver damage, convulsions, unconsciousness, coma, reproductive effects

Skin Contact

irritation (possibly severe)

Eye Contact

irritation

Immediate Effects

respiratory tract irritation, skin irritation, eye irritation, central nervous system depression, central nervous system damage, heart damage

Delayed Effects

central nervous system damage, heart damage, liver damage, reproductive effects, brain damage, lung damage, nervous system damage

Medical Conditions Aggravated by Exposure

heart or cardiovascular disorders, kidney disorders, liver disorders, skin disorders and allergies

Irritation/Corrosivity Data

respiratory tract irritation, skin irritation, eye irritation

RTECS Irritation

The components of this material have been reviewed, and RTECS publishes the following endpoints:

METHYL CHLOROFORM (71-55-6)

450 ppm/8 hour Eyes Man; 100 mg Eyes Rabbit mild; 2 mg/24 hour Eyes Rabbit severe; 5 gm/12 day(s) intermittent Skin Rabbit mild; 20 mg/24 hour Skin Rabbit moderate

Local Effects

METHYL CHLOROFORM (71-55-6)

Irritant: inhalation, skin, eye

Target Organs

METHYL CHLOROFORM (71-55-6)

central nervous system

Respiratory Sensitization

No data available.

Dermal Sensitization

No data available.

Carcinogenicity

Component Carcinogenicity

METHYL CHLOROFORM (71-55-6)

ACGIH: A4 - Not Classifiable as a Human Carcinogen

IARC: Monograph 71 [1999]; Supplement 7 [1987]; Monograph 20 [1979] (Group 3 (not classifiable))

RTECS Mutagenic

The components of this material have been reviewed, and RTECS publishes data for one or more components.

Reproductive Effects Data

Available data characterizes this substance as a reproductive hazard.

RTECS Reproductive Effects

The components of this material have been reviewed, and RTECS publishes the following endpoints:

METHYL CHLOROFORM (71-55-6)

2100 ppm Inhalation Rat TCLo (6 hour, pregnant 1-20 day(s)); 7000 ppm Inhalation Rat TCLo (3 hour, pregnant 13-19 day(s)); 43 mg/kg Oral Rat TDLo (pregnant 1-22 day(s), 21 day(s))

RTECS Tumorigenic

The components of this material have been reviewed, and RTECS publishes data for one or more components.

Additional Data

Alcohol may enhance the toxic effects. Stimulants such as epinephrine may induce ventricular fibrillation.

Specific Target Organ Toxicity - Single Exposure

central nervous system, heart, respiratory system

Specific Target Organ Toxicity - Repeated Exposure

central nervous system, heart, liver, brain, lungs, nervous system

Aspiration Hazard

Not expected to be an aspiration hazard.

* * *Section 12 - ECOLOGICAL INFORMATION* * *

Ecotoxicity

Toxic to aquatic life with long lasting effects.

Component Analysis - Aquatic Toxicity

METHYL CHLOROFORM (71-55-6)

Fish: 96 Hr LC50 Pimephales promelas: 35.2 - 50.7 mg/L [flow-through]; 96 Hr LC50 Lepomis macrochirus: 57 - 90 mg/L [static] (juvenile); 96 Hr LC50 Cyprinus carpio: 56 mg/L [flow-through]; 96 Hr LC50 Poecilia reticulata: 52.9 mg/L [flow-through]; 96 Hr LC50 Poecilia reticulata: 69.7 mg/L [static]; 96 Hr LC50 Pimephales promelas: 91 - 126 mg/L [static]; 96 Hr LC50 Oncorhynchus mykiss: 46 - 59 mg/L [static]

Algae: 96 Hr EC50 Pseudokirchneriella subcapitata: >500 mg/L

Invertebrate: 48 Hr LC50 Daphnia magna: >530 mg/L; 48 Hr EC50 Daphnia magna: 2384 mg/L; 48 Hr EC50 Daphnia magna: 9.7 - 12.8 mg/L [Static]

Persistence and Degradability

This material may biodegrade in soil and water.

Bioaccumulative Potential

Bioconcentration potential in aquatic organisms is low based on BCF value of 0.7-4.9.

Mobility

Expected to have high mobility in soil.

* * *Section 13 - DISPOSAL CONSIDERATIONS* * *

Disposal Methods

Dispose in accordance with all applicable regulations.

Component Waste Numbers

METHYL CHLOROFORM (71-55-6)

RCRA: waste number U226

* * *Section 14 - TRANSPORT INFORMATION* * *

US DOT Information

Shipping Name: 1,1,1-Trichloroethane
UN/NA #: UN2831 **Hazard Class:** 6.1 **Packing Group:** III

CHEMTREC®, Outside the USA: 001-703-527-3887

2. Hazard(s) identification

Classification
This chemical is considered hazardous by the 2012 OSHA Hazard Communication Standard (29 CFR 1910.1200)

Skin Corrosion/irritation	Category 2
Serious Eye Damage/Eye Irritation	Category 2
Carcinogenicity	Category 1B
Specific target organ toxicity (single exposure)	Category 3
Target Organs - Central nervous system (CNS), Respiratory system.	
Specific target organ toxicity - (repeated exposure)	Category 2
Target Organs - Liver, Kidney, Blood.	

Label Elements

Signal Word
Danger

Hazard Statements
Causes skin irritation
Causes serious eye irritation

May cause respiratory irritation
May cause drowsiness or dizziness
May cause cancer
May cause damage to organs through prolonged or repeated exposure

Precautionary Statements
Prevention
Obtain special instructions before use
Do not handle until all safety precautions have been read and understood
Use personal protective equipment as required
Wash face, hands and any exposed skin thoroughly after handling
Wear eye/face protection
Do not breathe dust/fume/gas/mist/vapors/spray
Use only outdoors or in a well-ventilated area
Response
IF exposed or concerned: Get medical attention/advice
Inhalation
IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing
Skin
IF ON SKIN: Wash with plenty of soap and water
If skin irritation occurs: Get medical advice/attention
Take off contaminated clothing and wash before reuse
Eyes
IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing
If eye irritation persists: Get medical advice/attention
Storage
Store locked up
Store in a well-ventilated place. Keep container tightly closed
Disposal
Dispose of contents/container to an approved waste disposal plant
Hazards not otherwise classified (HNOC)

WARNING! This product contains a chemical known in the State of California to cause cancer, birth defects or other reproductive harm.

3. Composition / information on ingredients

Component	CAS-No	Weight %
Methylene chloride	75-09-2	>99.5
Methyl alcohol	67-56-1	0 - 0.4
Cyclohexene	110-83-8	0 - 0.01
2-Methyl-2-butene	513-35-9	0 - 0.01

4. First-aid measures

General Advice If symptoms persist, call a physician.

Eye Contact Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Obtain medical attention.

Skin Contact Wash off immediately with plenty of water for at least 15 minutes. Obtain medical attention.

Inhalation Move to fresh air. If breathing is difficult, give oxygen. Obtain medical attention.

Ingestion Do not induce vomiting. Call a physician or Poison Control Center immediately.

Most important symptoms/effects Breathing difficulties. . Inhalation of high vapor concentrations may cause symptoms like headache, dizziness, tiredness, nausea and vomiting

Notes to Physician Treat symptomatically

5. Fire-fighting measures

Suitable Extinguishing Media Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

Unsuitable Extinguishing Media No information available

Flash Point No information available
Method - No information available

Autoignition Temperature 556 °C / 1032.8 °F
Explosion Limits
Upper 23 vol %
Lower 13 vol %
Sensitivity to Mechanical Impact No information available
Sensitivity to Static Discharge No information available

Specific Hazards Arising from the Chemical
Thermal decomposition can lead to release of irritating gases and vapors. Keep product and empty container away from heat and sources of ignition.

Hazardous Combustion Products
Carbon monoxide (CO) Carbon dioxide (CO_2) Hydrogen chloride gas Phosgene
Protective Equipment and Precautions for Firefighters
As in any fire, wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH (approved or equivalent) and full protective gear.

NFPA

Health	Flammability	Instability	Physical hazards
2	1	0	N/A

6. Accidental release measures

Personal Precautions Use personal protective equipment. Ensure adequate ventilation. Avoid contact with skin, eyes and clothing. Keep people away from and upwind of spill/leak.

Environmental Precautions Should not be released into the environment. See Section 12 for additional ecological information.

Methods for Containment and Clean Up Soak up with inert absorbent material. Keep in suitable, closed containers for disposal.

7. Handling and storage

Handling Wear personal protective equipment. Do not get in eyes, on skin, or on clothing. Avoid ingestion and inhalation. Use only under a chemical fume hood.

Storage Keep containers tightly closed in a dry, cool and well-ventilated place.

8. Exposure controls / personal protection

Exposure Guidelines

Component	ACGIH TLV	OSHA PEL	NIOSH IDLH

Legend

ACGIH - American Conference of Governmental Industrial Hygienists
OSHA - Occupational Safety and Health Administration
NIOSH IDLH: The National Institute for Occupational Safety and Health Immediately Dangerous to Life or Health

Engineering Measures Use only under a chemical fume hood. Ensure that eyewash stations and safety showers are close to the workstation location.

Personal Protective Equipment

Eye/face Protection Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133 or European Standard EN166.

Skin and body protection Wear appropriate protective gloves and clothing to prevent skin exposure.

Respiratory Protection Follow the OSHA respirator regulations found in 29 CFR 1910.134 or European Standard EN 149. Use a NIOSH/MSHA or European Standard EN 149 approved respirator if exposure limits are exceeded or if irritation or other symptoms are experienced.

Hygiene Measures Handle in accordance with good industrial hygiene and safety practice.

9. Physical and chemical properties

Physical State	Liquid
Appearance	Colorless
Odor	sweet
Odor Threshold	No information available
pH	Not applicable
Melting Point/Range	-97 °C / -142.6 °F
Boiling Point/Range	39 °C / 102.2 °F
Flash Point	No information available

Evaporation Rate	No information available
Flammability (solid,gas)	Not applicable
Flammability or explosive limits	
Upper	23 vol %
Lower	13 vol %
Vapor Pressure	20 mmHg @ 3502°C
Vapor Density	2.93 (Air = 1.0)
Specific Gravity	1.33
Solubility	No information available
Partition coefficient; n-octanol/water	No data available
Autoignition Temperature	556 °C / 1032.8 °F
Decomposition Temperature	No information available
Viscosity	No information available
Molecular Formula	C H2 Cl2
Molecular Weight	84.93

10. Stability and reactivity

Reactive Hazard None known, based on information available

Stability Stable under normal conditions.

Conditions to Avoid Incompatible products. Excess heat.

Incompatible Materials Strong oxidizing agents, Strong acids, Amines

Hazardous Decomposition Products Carbon monoxide (CO), Carbon dioxide (CO_2), Hydrogen chloride gas, Phosgene

Hazardous Polymerization Hazardous polymerization does not occur.

Hazardous Reactions None under normal processing.

11. Toxicological information

Acute Toxicity

Product Information

NTP: (National Toxicity Program)
Known - Known Carcinogen
Reasonably Anticipated - Reasonably Anticipated to be a Human Carcinogen

ACGIH: (American Conference of Governmental Industrial Hygienists)

A1 - Known Human Carcinogen
A2 - Suspected Human Carcinogen
A3 - Animal Carcinogen
ACGIH: (American Conference of Governmental Industrial Hygienists)

Mexico - Occupational Exposure Limits - Carcinogens

Mexico - Occupational Exposure Limits - Carcinogens
A1 - Confirmed Human Carcinogen
A2 - Suspected Human Carcinogen
A3 - Confirmed Animal Carcinogen
A4 - Not Classifiable as a Human Carcinogen
A5 - Not Suspected as a Human Carcinogen

Mutagenic Effects Mutagenic effects have occured in microorganisms.

Reproductive Effects Experiments have shown reproductive toxicity effects on laboratory animals.

Developmental Effects Developmental effects have occurred in experimental animals.

Teratogenicity No information available.

STOT - single exposure Central nervous system (CNS) Respiratory system
STOT - repeated exposure Liver Kidney Blood

Aspiration hazard No information available

Symptoms / effects,both acute and delayed Inhalation of high vapor concentrations may cause symptoms like headache, dizziness, tiredness, nausea and vomiting
Endocrine Disruptor Information No information available

Other Adverse Effects Tumorigenic effects have been reported in experimental animals. See actual entry in RTECS for complete information.

12. Ecological information

Ecotoxicity

.

Component	Freshwater Algae	Freshwater Fish	Microtox	Water Flea
Methylene chloride	EC50:>660 mg/L/96h	Pimephales promelas: LC50:193 mg/L/96h	EC50: 1 mg/L/24 h EC50: 2.88 mg/L/15 min	EC50: 140 mg/L/48h
Methyl alcohol	Not listed	Pimephales promelas: LC50 > 10000 mg/L 96h	EC50 = 39000 mg/L 25 min EC50 = 40000 mg/L 15 min EC50 = 43000 mg/L 5 min	EC50 > 10000 mg/L 24h
Cyclohexene	Not listed	Poecillia reticulata: 7.1 mg/L/96h	Not listed	Daphnia: EC50: 5.3 mg/L/48h
2-Methyl-2-butene	Not listed	Not listed	Not listed	EC50: = 3 mg/L, 48h (Daphnia magna)

Persistence and Degradability Persistence is unlikely based on information available.
Bioaccumulation/ Accumulation No information available.

Mobility Will likely be mobile in the environment due to its volatility.

Component	log Pow
Methylene chloride	1.25
Methyl alcohol	-0.74

Cyclohexene	3.27

13. Disposal considerations

Waste Disposal Methods Chemical waste generators must determine whether a discarded chemical is classified as a hazardous waste. Chemical waste generators must also consult local, regional, and national hazardous waste regulations to ensure complete and accurate classification.

Component	RCRA - U Series Wastes	RCRA - P Series Wastes
Methylene chloride - 75-09-2	U080	-
Methyl alcohol - 67-56-1	U154	-

14. Transport information

Legend:
X - Listed
E - Indicates a substance that is the subject of a Section 5(e) Consent order under TSCA.
F - Indicates a substance that is the subject of a Section 5(f) Rule under TSCA.
N - Indicates a polymeric substance containing no free-radical initiator in its inventory name but is considered to cover the designated polymer made with any free-radical initiator regardless of the amount used.
P - Indicates a commenced PMN substance
R - Indicates a substance that is the subject of a Section 6 risk management rule under TSCA.
S - Indicates a substance that is identified in a proposed or final Significant New Use Rule
T - Indicates a substance that is the subject of a Section 4 test rule under TSCA.
XU - Indicates a substance exempt from reporting under the Inventory Update Rule, i.e. Partial Updating of the TSCA Inventory Data Base Production and Site Reports (40 CFR 710(B).
Y1 - Indicates an exempt polymer that has a number-average molecular weight of 1,000 or greater.
Y2 - Indicates an exempt polymer that is a polyester and is made only from reactants included in a specified list of low concern reactants that comprises one of the eligibility criteria for the exemption rule.

SAFETY DATA SHEET

Version 6.15
Revision Date 09/07/2024
Print Date 09/08/2024

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifiers

Product name : *tert*-Butyl methyl ether

Product Number : 306975
Brand : Sigma-Aldrich
Index-No. : 603-181-00-X
CAS-No. : 1634-04-4

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Laboratory chemicals, Synthesis of substances

Uses advised against : The product is being supplied under the TSCA R&D Exemption (40 CFR Section 720.36). It is the recipient's responsibility to comply with the requirements of the R&D exemption. The product may not be used for a non-exempt commercial purpose under TSCA unless appropriate consent is granted in writing by MilliporeSigma.

1.3 Details of the supplier of the safety data sheet

Company : Sigma-Aldrich Inc.
3050 SPRUCE ST
ST. LOUIS MO 63103
UNITED STATES

Telephone : +1 314 771-5765
Fax : +1 800 325-5052

1.4 Emergency telephone

Emergency Phone # : 800-424-9300 CHEMTREC (USA) +1-703-527-3887 CHEMTREC (International) 24 Hours/day; 7 Days/week

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)

Flammable liquids (Category 2), H225
Skin irritation (Category 2), H315

For the full text of the H-Statements mentioned in this Section, see Section 16.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal Word: Danger

Hazard Statements

H225	Highly flammable liquid and vapor.
H315	Causes skin irritation.

Precautionary Statements

P210	Keep away from heat/ sparks/ open flames/ hot surfaces. No smoking.
P233	Keep container tightly closed.
P240	Ground/bond container and receiving equipment.
P241	Use explosion-proof electrical/ ventilating/ lighting/ equipment.
P242	Use only non-sparking tools.
P243	Take precautionary measures against static discharge.
P264	Wash skin thoroughly after handling.
P280	Wear protective gloves/ eye protection/ face protection.
P303 + P361 + P353	IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water/ shower.
P332 + P313	If skin irritation occurs: Get medical advice/ attention.
P362	Take off contaminated clothing and wash before reuse.
P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam to extinguish.
P403 + P235	Store in a well-ventilated place. Keep cool.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

---

SECTION 3: Composition/information on ingredients

3.1 Substances

Synonyms	:	MTBE Methyl tert-butyl ether
Formula	:	$C_5H_{12}O$
Molecular weight	:	88.15 g/mol
CAS-No.	:	1634-04-4
EC-No.	:	216-653-1
Index-No.	:	603-181-00-X

Component	Classification	Concentration
tert-butyl methyl ether		
	Flam. Liq. 2; Skin Irrit. 2; H225, H315	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 4: First aid measures

4.1 Description of first-aid measures

General advice
Show this material safety data sheet to the doctor in attendance.

If inhaled
After inhalation: fresh air.

In case of skin contact
In case of skin contact: Take off immediately all contaminated clothing. Rinse skin with water/ shower.

In case of eye contact
After eye contact: rinse out with plenty of water. Remove contact lenses.

If swallowed
After swallowing: caution if victim vomits. Risk of aspiration! Keep airways free. Pulmonary failure possible after aspiration of vomit. Call a physician immediately.

4.2 Most important symptoms and effects, both acute and delayed

The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed

No data available

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media
Carbon dioxide (CO2) Foam Dry powder

Unsuitable extinguishing media
For this substance/mixture no limitations of extinguishing agents are given.

5.2 Special hazards arising from the substance or mixture

Carbon oxides
Combustible.
Pay attention to flashback.
Vapors are heavier than air and may spread along floors.
Development of hazardous combustion gases or vapours possible in the event of fire.
Forms explosive mixtures with air at ambient temperatures.

5.3 Advice for firefighters

Stay in danger area only with self-contained breathing apparatus. Prevent skin contact by keeping a safe distance or by wearing suitable protective clothing.

5.4 Further information

Remove container from danger zone and cool with water. Prevent fire extinguishing water from contaminating surface water or the ground water system.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Advice for non-emergency personnel: Do not breathe vapors, aerosols. Avoid substance contact. Ensure adequate ventilation. Keep away from heat and sources of ignition. Evacuate the danger area, observe emergency procedures, consult an expert.
For personal protection see section 8.

6.2 Environmental precautions

Do not let product enter drains. Risk of explosion.

6.3 Methods and materials for containment and cleaning up

Cover drains. Collect, bind, and pump off spills. Observe possible material restrictions (see sections 7 and 10). Take up with liquid-absorbent material (e.g. Chemizorb®). Dispose of properly. Clean up affected area.

6.4 Reference to other sections

For disposal see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Advice on protection against fire and explosion
Keep away from open flames, hot surfaces and sources of ignition.Take precautionary measures against static discharge.

Hygiene measures
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities

Storage conditions
Keep container tightly closed in a dry and well-ventilated place. Keep away from heat and sources of ignition.

Storage class
Storage class (TRGS 510): 3: Flammable liquids

7.3 Specific end use(s)

Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Ingredients with workplace control parameters

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Component	CAS-No.	Value	Control parameters	Basis
tert-butyl methyl ether	1634-04-4	TWA	50 ppm	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Confirmed animal carcinogen with unknown relevance to humans		
		PEL	40 ppm 144 mg/m3	California permissible exposure limits for chemical contaminants (Title 8, Article 107)

8.2 Exposure controls

Appropriate engineering controls
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.

Personal protective equipment

Eye/face protection
Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU). Safety glasses

Skin protection
This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.4 mm
Break through time: 120 min
Material tested:Camatril® (KCL 730 / Aldrich Z677442, Size M)

Body Protection
Flame retardant antistatic protective clothing.

Respiratory protection
Recommended Filter type: Filter type AX
The entrepeneur has to ensure that maintenance, cleaning and testing of respiratory protective devices are carried out according to the instructions of the producer. These measures have to be properly documented.
required when vapours/aerosols are generated.
Our recommendations on filtering respiratory protection are based on the following standards: DIN EN 143, DIN 14387 and other accompanying standards relating to the used respiratory protection system.

Control of environmental exposure
Do not let product enter drains. Risk of explosion.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: liquid Color: colorless
b)	Odor	characteristic
c)	Odor Threshold	0.053 ppm
d)	pH	No data available
e)	Melting point/freezing point	Melting point: -108.6 °C (-163.5 °F) at 1,013 hPa
f)	Initial boiling point and boiling range	55 - 56 °C 131 - 133 °F - lit.
g)	Flash point	-28 °C (-18 °F) - closed cup
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	Upper explosion limit: 8.5 %(V) Lower explosion limit: 1.6 %(V)
k)	Vapor pressure	330 hPa at 25 °C (77 °F) - OECD Test Guideline 104
l)	Vapor density	No data available
m)	Density	0.74 g/cm3 at 25 °C (77 °F) - lit.
	Relative density	0.7420 °C
n)	Water solubility	42 g/l at 20 °C (68 °F) - OECD Test Guideline 105
o)	Partition coefficient: n-octanol/water	log Pow: 1.06 at 20 °C (68 °F) - OECD Test Guideline 107 - Bioaccumulation is not expected.
p)	Autoignition temperature	460 °C (860 °F) at 1013.0 hPa - DIN 51794
q)	Decomposition temperature	Distillable in an undecomposed state at normal pressure.
r)	Viscosity	0.409 mm2/s at 40 °C (104 °F) - OECD Test Guideline 114 - 0.464 mm2/s at 20 °C (68 °F) - OECD Test Guideline 114 -
s)	Explosive properties	No data available
t)	Oxidizing properties	none

9.2 Other safety information

Surface tension	72.5 mN/m at 1.07g/l at 21.5 °C (70.7 °F) - Surface tension

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 10: Stability and reactivity

10.1 Reactivity
Vapors may form explosive mixture with air.

10.2 Chemical stability
The product is chemically stable under standard ambient conditions (room temperature) .

10.3 Possibility of hazardous reactions
Violent reactions possible with:
Oxidizing agents
Strong acids
halogens
Strong bases

10.4 Conditions to avoid
Heat, flames and sparks.
Warming.

10.5 Incompatible materials
rubber, various plastics

10.6 Hazardous decomposition products
In the event of fire: see section 5

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - male and female - > 2,000 mg/kg
(OECD Test Guideline 401)
Symptoms: Nausea, Vomiting, Pulmonary failure possible after aspiration of vomit., Aspiration may cause pulmonary edema and pneumonitis.
LC50 Inhalation - Rat - male and female - 4 h - 85 mg/l - vapor

(OECD Test Guideline 403)
Symptoms: Possible damages:, mucosal irritations
LD50 Dermal - Rat - male and female - > 2,000 mg/kg
(OECD Test Guideline 402)

Skin corrosion/irritation
Skin - Rabbit
Result: Skin irritation - 4 h
(OECD Test Guideline 404)
Remarks: Drying-out effect resulting in rough and chapped skin.

Serious eye damage/eye irritation
Eyes - Rabbit
Result: No eye irritation

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

(OECD Test Guideline 405)

Respiratory or skin sensitization
Maximization Test - Guinea pig
Result: negative
(OECD Test Guideline 406)

Germ cell mutagenicity
Test Type: In vitro mammalian cell gene mutation test
Test system: Chinese hamster lung cells
Metabolic activation: with and without metabolic activation
Method: OECD Test Guideline 476
Result: negative
Test Type: Ames test
Test system: Salmonella typhimurium
Metabolic activation: with and without metabolic activation
Method: OECD Test Guideline 471
Result: negative
Test Type: Mutagenicity (mammal cell test): micronucleus.
Test system: mouse lymphoma cells
Metabolic activation: without metabolic activation
Method: OECD Test Guideline 473
Result: negative

Test Type: unscheduled DNA synthesis assay
Species: Mouse
Cell type: Liver cells
Application Route: inhalation (vapor)
Method: OECD Test Guideline 486
Result: negative

Test Type: Micronucleus test
Species: Mouse
Cell type: Bone marrow
Application Route: inhalation (vapor)
Method: US-EPA
Result: negative

Test Type: Mutagenicity (mammal cell test): chromosome aberration.
Species: Rat
Cell type: Bone marrow
Application Route: inhalation (vapor)
Method: US-EPA
Result: negative

Test Type: Transgenic rodent somatic cell gene mutation assay
Species: Rat
Cell type: Bone marrow
Application Route: inhalation (vapor)
Method: OECD Test Guideline 488
Result: negative

Carcinogenicity

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

IARC: No ingredient of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

NTP: No ingredient of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is on OSHA's list of regulated carcinogens.

Reproductive toxicity
No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

11.2 Additional Information

Repeated dose toxicity - Rat - male and female - Oral - 90 d - NOAEL (No observed adverse effect level) - 3,000 mg/kg
Remarks: Subchronic toxicity

RTECS: KN5250000
Nausea, Vomiting, Dizziness, Central nervous system depression, Aspiration or inhalation may cause chemical pneumonitis., MTBE (methyl-tert-butyl ether) is reported to metabolize to tert-butyl alcohol and formaldehyde by microsomal demethylation, MTBE (methyl-tert-butyl ether) should be considered a "potential human carcinogen" due to an increase in leydig interstitial cell tumors of testes in male rats and an increase in lymphomas, leukemias, and uterine sarcomas in female rats., In another unpublished study MTBE was shown to be carcinogenic due to "increased incidence of a rare type of kidney tumor" in male rats and an "increase in the incidence of hepatocellular adenomas" in female mice.
To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

Systemic effects:

After absorption of large quantities:

somnolence
Dizziness
agitation, spasms
CNS disorders
narcosis
Unconsciousness

Other dangerous properties can not be excluded.

Handle in accordance with good industrial hygiene and safety practice.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 12: Ecological information

12.1 Toxicity

Toxicity to fish	semi-static test LC50 - Menidia beryllina - 574 mg/l - 96 h (OECD Test Guideline 203)
Toxicity to daphnia and other aquatic invertebrates	flow-through test EC50 - Americamysis bahia (Mysid) - 187 mg/l - 96 h (US-EPA OPPTS 850.1035)
Toxicity to algae	static test IC50 - Pseudokirchneriella subcapitata (green algae) - 491 mg/l - 96 h
Toxicity to bacteria	static test EC10 - Pseudomonas putida - 710 mg/l - 18 h Remarks: (ECHA)
Toxicity to fish(Chronic toxicity)	flow-through test NOEC - Pimephales promelas (fathead minnow) - 299 mg/l - 31 d Remarks: (ECHA)
	flow-through test NOEC - Pimephales promelas (fathead minnow) - 450 mg/l - 31 d Remarks: (ECHA)
Toxicity to daphnia and other aquatic invertebrates(Chronic toxicity)	flow-through test NOEC - Daphnia magna (Water flea) - 51 mg/l - 21 d (OPPTS 850.1300)

12.2 Persistence and degradability

Biodegradability	aerobic - Exposure time 28 d Result: 0 % - Not readily biodegradable. (OECD Test Guideline 301D)

12.3 Bioaccumulative potential

Bioaccumulation	Cyprinus carpio (Carp) - 28 d at 25 °C(tert-butyl methyl ether) Bioconcentration factor (BCF): 1.5

12.4 Mobility in soil

No data available

12.5 Results of PBT and vPvB assessment

PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Endocrine disrupting properties

No data available

12.7 Other adverse effects

No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product
Waste material must be disposed of in accordance with the national and local regulations. Leave chemicals in original containers. No mixing with other waste. Handle uncleaned containers like the product itself.

SECTION 14: Transport information

DOT (US)
UN number: 2398 Class: 3 Packing group: II
Proper shipping name: Methyl tert-butyl ether
Reportable Quantity (RQ): 1000 lbs
Poison Inhalation Hazard: No

IMDG

Version 6.12
Revision Date 09/07/2024
Print Date 09/08/2024

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifiers

Product name : Naphthalene

Product Number : 147141
Brand : Aldrich
Index-No. : 601-052-00-2
CAS-No. : 91-20-3

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Laboratory chemicals, Synthesis of substances

Uses advised against : The product is being supplied under the TSCA R&D Exemption (40 CFR Section 720.36). It is the recipient's responsibility to comply with the requirements of the R&D exemption. The product may not be used for a non-exempt commercial purpose under TSCA unless appropriate consent is granted in writing by MilliporeSigma.

1.3 Details of the supplier of the safety data sheet

Company : Sigma-Aldrich Inc.
3050 SPRUCE ST
ST. LOUIS MO 63103
UNITED STATES

Telephone : +1 314 771-5765
Fax : +1 800 325-5052

1.4 Emergency telephone

Emergency Phone # : 800-424-9300 CHEMTREC (USA) +1-703-527-3887 CHEMTREC (International) 24 Hours/day; 7 Days/week

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)

Flammable solids (Category 2), H228
Carcinogenicity (Category 2), H351
Short-term (acute) aquatic hazard (Category 1), H400

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Long-term (chronic) aquatic hazard (Category 1), H410

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal Word Warning

Hazard Statements

H228	Flammable solid.
H351	Suspected of causing cancer.
H410	Very toxic to aquatic life with long lasting effects.

Precautionary Statements

P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and understood.
P210	Keep away from heat/ sparks/ open flames/ hot surfaces. No smoking.
P240	Ground/bond container and receiving equipment.
P241	Use explosion-proof electrical/ ventilating/ lighting/ equipment.
P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.
P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam to extinguish.
P391	Collect spillage.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

SECTION 3: Composition/information on ingredients

3.1 Substances

Formula	:	C10H8
Molecular weight	:	128.17 g/mol
CAS-No.	:	91-20-3
EC-No.	:	202-049-5
Index-No.	:	601-052-00-2

Component	Classification	Concentration
Naphthalene		
	Flam. Sol. 2; Carc. 2; Aquatic Acute 1; Aquatic Chronic 1; H228, H351, H400, H410	<= 100 %

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

For the full text of the H-Statements mentioned in this Section, see Section 16.

SECTION 4: First aid measures

4.1 Description of first-aid measures

General advice
Show this material safety data sheet to the doctor in attendance.

If inhaled
After inhalation: fresh air. Call in physician.

In case of skin contact
In case of skin contact: Take off immediately all contaminated clothing. Rinse skin with water/ shower. Consult a physician.

In case of eye contact
After eye contact: rinse out with plenty of water. Call in ophthalmologist. Remove contact lenses.

If swallowed
After swallowing: immediately make victim drink water (two glasses at most). Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media
Water Foam Carbon dioxide (CO2) Dry powder

Unsuitable extinguishing media
For this substance/mixture no limitations of extinguishing agents are given.

5.2 Special hazards arising from the substance or mixture
Carbon oxides
Combustible.
Vapors are heavier than air and may spread along floors.
Forms explosive mixtures with air on intense heating.
Development of hazardous combustion gases or vapours possible in the event of fire.

5.3 Advice for firefighters
Stay in danger area only with self-contained breathing apparatus. Prevent skin contact by keeping a safe distance or by wearing suitable protective clothing.

5.4 Further information
Remove container from danger zone and cool with water. Prevent fire extinguishing water from contaminating surface water or the ground water system.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Advice for non-emergency personnel: Avoid inhalation of dusts. Avoid substance contact. Ensure adequate ventilation. Keep away from heat and sources of ignition. Evacuate the danger area, observe emergency procedures, consult an expert.
For personal protection see section 8.

6.2 Environmental precautions

Do not let product enter drains. Risk of explosion.

6.3 Methods and materials for containment and cleaning up

Cover drains. Collect, bind, and pump off spills. Observe possible material restrictions (see sections 7 and 10). Take up dry. Dispose of properly. Clean up affected area. Avoid generation of dusts.

6.4 Reference to other sections

For disposal see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Advice on safe handling
Work under hood. Do not inhale substance/mixture.

Advice on protection against fire and explosion
Keep away from open flames, hot surfaces and sources of ignition.Take precautionary measures against static discharge.

Hygiene measures
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities

Storage conditions
Tightly closed. Keep away from heat and sources of ignition.

Storage class
Storage class (TRGS 510): 4.1B: Flammable solid hazardous materials

7.3 Specific end use(s)

Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Ingredients with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
Naphthalene	91-20-3	TWA	10 ppm	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Confirmed animal carcinogen with unknown relevance to humans Danger of cutaneous absorption		
		TWA	10 ppm 50 mg/m3	USA. NIOSH Recommended Exposure Limits
		ST	15 ppm 75 mg/m3	USA. NIOSH Recommended Exposure Limits
		TWA	10 ppm 50 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		PEL	0.1 ppm 0.5 mg/m3	California permissible exposure limits for chemical contaminants (Title 8, Article 107)
		Skin		

Biological occupational exposure limits

Component	CAS-No.	Parameters	Value	Biological specimen	Basis
Naphthalene	91-20-3	1-Naphthol + 2-Naphthol			ACGIH - Biological Exposure Indices (BEI)
	Remarks	End of shift (As soon as possible after exposure ceases)			

8.2 Exposure controls

Appropriate engineering controls
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.

Personal protective equipment

Eye/face protection
Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU). Safety glasses

Skin protection
This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Full contact
Material: Nitrile rubber

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:KCL 741 Dermatril® L

This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:KCL 741 Dermatril® L

Body Protection
Flame retardant antistatic protective clothing.

Respiratory protection
Recommended Filter type: Filter A-(P3)
The entrepeneur has to ensure that maintenance, cleaning and testing of respiratory protective devices are carried out according to the instructions of the producer. These measures have to be properly documented.
required when dusts are generated. Our recommendations on filtering respiratory protection are based on the following standards: DIN EN 143, DIN 14387 and other accompanying standards relating to the used respiratory protection system.

Control of environmental exposure
Do not let product enter drains. Risk of explosion.

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: flakes, granules Color: white
b)	Odor	aromatic
c)	Odor Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/ range: 80 - 82 °C (176 - 180 °F) - lit.
f)	Initial boiling point and boiling range	218 °C 424 °F - lit.
g)	Flash point	78.5 °C (173.3 °F) - closed cup - ISO 2719
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	The substance or mixture is a flammable solid with the category 2. - Flammability (solids)
j)	Upper/lower flammability or	Upper explosion limit: 5.9 %(V) Lower explosion limit: 0.9 %(V)

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

	explosive limits	
k)	Vapor pressure	0.072 hPa at 20 °C (68 °F) - OECD Test Guideline 104
l)	Vapor density	No data available
m)	Density	1.08 g/cm3 at 24.7 °C (76.5 °F) - OECD Test Guideline 109
	Relative density	No data available
n)	Water solubility	0.0308 g/l at 25 °C (77 °F) - OECD Test Guideline 105 - slightly soluble
o)	Partition coefficient: n-octanol/water	log Pow: 3.4 at 25 °C (77 °F) - OECD Test Guideline 107 - Bioaccumulation is not expected.
p)	Autoignition temperature	526 - 587 °C (979 - 1089 °F) at 1,013 hPa - DIN 51794
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	none

9.2 Other safety information

Surface tension 31.8 mN/m at 100.0 °C (212.0 °F)

SECTION 10: Stability and reactivity

10.1 Reactivity

Forms explosive mixtures with air on intense heating.
A range from approx. 15 Kelvin below the flash point is to be rated as critical.
The following applies in general to flammable organic substances and mixtures: in correspondingly fine distribution, when whirled up a dust explosion potential may generally be assumed.

10.2 Chemical stability

The product is chemically stable under standard ambient conditions (room temperature) .

10.3 Possibility of hazardous reactions

Violent reactions possible with:
Oxidizing agents
chromium(VI) oxide
benzoyl chloride
aluminium chloride
Risk of explosion with:
nitrogen oxides

10.4 Conditions to avoid

Heat, flames and sparks.
Strong heating.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

10.5 Incompatible materials
No data available

10.6 Hazardous decomposition products
In the event of fire: see section 5

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity
Oral: No data available
LC50 Inhalation - Rat - male and female - 4 h - > 0.4 mg/l - vapor

(OECD Test Guideline 403)
LD50 Dermal - Rabbit - 20,000 mg/kg
Remarks: (RTECS)

Skin corrosion/irritation
Skin - Rabbit
Result: No skin irritation - 24 h
Remarks: (ECHA)

Serious eye damage/eye irritation
Eyes - Rabbit
Result: No eye irritation - 24 h
Remarks: (ECHA)

Respiratory or skin sensitization
Maximization Test - Guinea pig
Result: negative
(OECD Test Guideline 406)

Germ cell mutagenicity
Test Type: Mutagenicity (mammal cell test): chromosome aberration.
Test system: Chinese hamster ovary cells
Metabolic activation: Metabolic activation
Method: OECD Test Guideline 473
Result: positive
Test Type: Ames test
Test system: Salmonella typhimurium
Metabolic activation: with and without metabolic activation
Method: OECD Test Guideline 471
Result: negative

Test Type: unscheduled DNA synthesis assay
Species: Rat
Cell type: Liver cells
Application Route: Oral
Method: OECD Test Guideline 486
Result: negative

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Test Type: Micronucleus test
Species: Mouse
Cell type: Bone marrow
Application Route: Intraperitoneal
Method: US-EPA
Result: negative
Remarks: (ECHA)

Carcinogenicity
Suspected of causing cancer.

IARC: 2B - Group 2B: Possibly carcinogenic to humans (Naphthalene)

No ingredient of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC. (Naphthalene)

NTP: RAHC - Reasonably anticipated to be a human carcinogen (Naphthalene)

No ingredient of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP. (Naphthalene)

OSHA: No component of this product present at levels greater than or equal to 0.1% is on OSHA's list of regulated carcinogens.

Reproductive toxicity
No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

11.2 Additional Information

Repeated dose toxicity - Rat - male and female - Oral - 91 Days - NOAEL (No observed adverse effect level) - 200 mg/kg - LOAEL (Lowest observed adverse effect level) - 400 mg/kg

Repeated dose toxicity - Mouse - male and female - Oral - 90 Days - NOAEL (No observed adverse effect level) - 100 mg/kg

Repeated dose toxicity - Rat - male and female - Dermal - 90 Days - NOAEL (No observed adverse effect level) - 1,000 mg/kg

Repeated dose toxicity - Rat - male and female - inhalation (vapor) - 90 Days - NOAEL (No observed adverse effect level) - 300 mg/kg

RTECS: QJ0525000
Absorption into the body leads to the formation of methemoglobin which in sufficient concentration causes cyanosis. Onset may be delayed 2 to 4 hours or longer., Naphthalene is retinotoxic and systemic absorption of its vapors above 15ppm, may result in:, cataracts,

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

optic neuritis, corneal injury, Eye irritation, Ingestion may provoke the following symptoms:, hemolytic anemia, hemoglobinuria, Nausea, Headache, Vomiting, Gastrointestinal disturbance, Convulsions, anemia, Kidney injury may occur., Seizures., Coma.
To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

After absorption:

Headache
Stomach/intestinal disorders
Tremors
Convulsions
Changes in the blood count

Other dangerous properties can not be excluded.

This substance should be handled with particular care.

Heart -

SECTION 12: Ecological information

12.1 Toxicity

Toxicity to fish	flow-through test LC50 - Oncorhynchus mykiss (rainbow trout) - 1.6 mg/l - 96 h (OECD Test Guideline 203)
Toxicity to daphnia and other aquatic invertebrates	static test EC50 - Daphnia magna (Water flea) - 2.16 mg/l - 48 h (OECD Test Guideline 202)
Toxicity to algae	static test EC50 - Pseudokirchneriella subcapitata (green algae) - 2.96 mg/l - 4 h (US-EPA) Remarks: (ECHA)
Toxicity to fish(Chronic toxicity)	flow-through test LC50 - Oncorhynchus kisutch (coho salmon) - 2.1 mg/l - 96 h Remarks: (ECHA)
	flow-through test NOEC - Oncorhynchus kisutch (coho salmon) - 0.37 mg/l - 40 Days Remarks: (ECHA)
Toxicity to daphnia and other aquatic invertebrates(Chronic toxicity)	static test NOEC - Daphnia pulex (Water flea) - 0.59 mg/l - 125 d Remarks: (ECHA)

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

12.2 Persistence and degradability

Biodegradability aerobic - Exposure time 28 d
Result: 2 % - Not readily biodegradable.
(OECD Test Guideline 302C)

12.3 Bioaccumulative potential

Bioaccumulation Cyprinus carpio (Carp) - 56 d
at 25 °C(Naphthalene)

Bioconcentration factor (BCF): 36.5 - 168
(OECD Test Guideline 305)

Remarks: Bioaccumulation is unlikely.

12.4 Mobility in soil

No data available

12.5 Results of PBT and vPvB assessment

PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Endocrine disrupting properties

No data available

12.7 Other adverse effects

No data available

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product

Waste material must be disposed of in accordance with the national and local regulations. Leave chemicals in original containers. No mixing with other waste. Handle uncleaned containers like the product itself.

SECTION 14: Transport information

DOT (US)

UN number: 1334 Class: 4.1 Packing group: III
Proper shipping name: Naphthalene, refined
Reportable Quantity (RQ): 100 lbs
Marine pollutant: yes Poison Inhalation Hazard: No

IMDG

UN number: 1334 Class: 4.1 Packing group: III EMS-No: F-A, S-G
Proper shipping name: NAPHTHALENE, REFINED

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Marine pollutant : yes

IATA
UN number: 1334 Class: 4.1 Packing group: III
Proper shipping name: Naphthalene, refined

SECTION 15: Regulatory information

CERCLA Reportable Quantity

Components	CAS-No.	Component RQ (lbs)	Calculated product RQ (lbs)
Naphthalene	91-20-3	100	100

SARA 304 Extremely Hazardous Substances Reportable Quantity
This material does not contain any components with a section 304 EHS RQ.

SARA 302 Extremely Hazardous Substances Threshold Planning Quantity
This material does not contain any components with a section 302 EHS TPQ.

SARA 311/312 Hazards : Fire Hazard
Acute Health Hazard
Chronic Health Hazard

SARA 313 : This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

US State Regulations

Massachusetts Right To Know
Naphthalene 91-20-3

Maine Chemicals of High Concern
Product does not contain any listed chemicals

Vermont Chemicals of High Concern
Product does not contain any listed chemicals

Washington Chemicals of High Concern
Product does not contain any listed chemicals

The ingredients of this product are reported in the following inventories:
TSCA : All substances listed as active on the TSCA inventory

TSCA list
No substances are subject to a Significant New Use Rule.

No substances are subject to TSCA 12(b) export notification requirements.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 16: Other information

Further information

The information is believed to be correct but is not exhaustive and will be used solely as a guideline, which is based on current knowledge of the chemical substance or mixture and is applicable to appropriate safety precautions for the product. It does not represent any guarantee of the properties of the product. Sigma-Aldrich Corporation and its Affiliates shall not be held liable for any damage resulting from handling or from contact with the above product. See www.sigma-aldrich.com and/or the reverse side of invoice or packing slip for additional terms and conditions of sale.

Copyright 2020 Sigma-Aldrich Co. LLC. License granted to make unlimited paper copies for internal use only.

The branding on the header and/or footer of this document may temporarily not visually match the product purchased as we transition our branding. However, all of the information in the document regarding the product remains unchanged and matches the product ordered. For further information please contact mlsbranding@sial.com.

SAFETY DATA SHEET

Revision Date 03-May-2012 **Revision Number** 2

SECTION 1. IDENTIFICATION OF THE SUBSTANCE/MIXTURE AND OF THE COMPANY/UNDERTAKING

Product Identifier

Product Description:	**n-Butylbenzene**
Cat No.	**107850000; 107850050; 107850500; 107852500**
Synonyms	1-Phenylbutane

Relevant identified uses of the substance or mixture and uses advised against

Recommended Use	Laboratory chemicals
Uses advised against	No Information available

Details of the supplier of the safety data sheet

Company
Acros Organics BVBA
Janssen Pharmaceuticalaan 3a
2440 Geel, Belgium
E-mail address begel.sdsdesk@thermofisher.com

Emergency Telephone Number
For information in the US, call: 001-800-ACROS-01
For information in Europe, call: +32 14 57 52 11

Emergency Number, Europe: +32 14 57 52 99
Emergency Number, US: 001-201-796-7100

CHEMTREC Phone Number, US: 001-800-424-9300
CHEMTREC Phone Number, Europe: 001-703-527-3887

SECTION 2. HAZARDS IDENTIFICATION

Classification of the substance or mixture
REGULATION (EC) No 1272/2008

Flammable liquids.	Category 3

Classification according to EU Directives 67/548/EEC or 1999/45/EC
For the full text of the R-phrases and H-Statements mentioned in this Section, see Section 16
R-phrase(s) none

Label Elements

SECTION 2. HAZARDS IDENTIFICATION

Signal Word **Warning**

Hazard Statements
H226 - Flammable liquid and vapor

Precautionary Statements - EU (§28, 1272/2008)
P210 - Keep away from heat/sparks/open flames/hot surfaces. - No smoking

Other Hazards

No information available.

SECTION 3. COMPOSITION/INFORMATION ON INGREDIENTS

Component	EC-No.	Weight %	CAS-No	67/548/EEC Classification	CLP Classification - Regulation (EC) No 1272/2008	REACH No.
Butyl benzene 104-51-8	EEC No. 203-209-7	> 99	104-51-8	-	Flam. Liq. 3 (H226)	-

For the full text of the R-phrases and H-Statements mentioned in this Section, see Section 16

SECTION 4. FIRST AID MEASURES

Description of first aid measures

Eye Contact Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Obtain medical attention.

Skin Contact Wash off immediately with soap and plenty of water while removing all contaminated clothes and shoes. Obtain medical attention.

Ingestion Do not induce vomiting. Clean mouth with water. Aspiration hazard. Get medical attention.

Inhalation Remove from exposure, lie down. Move to fresh air. If breathing is difficult, give oxygen. If not breathing, give artificial respiration. Obtain medical attention.

Notes to Physician Treat symptomatically

SECTION 5. FIRE-FIGHTING MEASURES

Extinguishing media

Suitable Extinguishing Media
Water spray. Carbon dioxide (CO_2). Dry chemical. Use water spray to cool unopened containers. chemical foam. Do not use a solid water stream as it may scatter and spread fire.

Extinguishing media which must not be used for safety reasons
No information available.

Special hazards arising from the substance or mixture

Combustible material. Flammable. Vapors may travel to source of ignition and flash back. Containers may explode when heated.

Advice for fire-fighters

As in any fire, wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH (approved or equivalent) and full protective gear.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Personal precautions, protective equipment and emergency procedures

Ensure adequate ventilation

Environmental precautions

Prevent further leakage or spillage if safe to do so

Methods and material for containment and cleaning up

Soak up with inert absorbent material (e.g. sand, silica gel, acid binder, universal binder, sawdust). Keep in suitable, closed containers for disposal.. Remove all sources of ignition. Use spark-proof tools and explosion-proof equipment.

SECTION 7. HANDLING AND STORAGE

Precautions for Safe Handling

Avoid contact with skin and eyes. Do not breathe dust. Do not breathe vapors or spray mist. Use explosion-proof equipment. Use only non-sparking tools.

Conditions for safe storage, including any incompatibilities

Keep in a dry, cool and well-ventilated place. Keep container tightly closed. Keep away from heat and sources of ignition.

Specific End Uses

SECTION 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Control parameters

Exposure limits	This product, as supplied, does not contain any hazardous materials with occupational exposure limits established by the region specific regulatory bodies.
Biological limit values	This product, as supplied, does not contain any hazardous materials with biological limits established by the region specific regulatory bodies.
Derived No Effect Level (DNEL)	No information available.
Predicted No Effect Concentration (PNEC)	No information available.

Exposure controls

Engineering Measures	Ensure adequate ventilation, especially in confined areas
Personal protective equipment	
Eye Protection	Goggles
Hand Protection	Protective gloves
Skin and body protection	Wear appropriate protective gloves and clothing to prevent skin exposure
Respiratory Protection	Follow the OSHA respirator regulations found in 29 CFR 1910.134 or European Standard EN 149. Use a NIOSH/MSHA or European Standard EN 149 approved respirator if exposure limits are exceeded or if irritation or other symptoms are experienced
Hygiene Measures	Handle in accordance with good industrial hygiene and safety practice
Environmental exposure controls	No information available.

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid
Appearance	Colorless
odor	odorless
pH	No information available.
Vapor Pressure	1.33 hPa @ 23 °C
Vapor Density	4.6
Boiling Point/Range	183°C / 361.4°F@ 760 mmHg
Melting Point/Range	-88°C / -126.4°F
Flash Point	59°C / 138.2°F
Autoignition Temperature	412°C / 773.6°F
Explosion Limits	
Lower	0.8
Upper	5.8
Water Solubility	Insoluble
Specific Gravity	0.860
Molecular Formula	C10 H14
Molecular Weight	134.22

SECTION 10. STABILITY AND REACTIVITY

Reactivity

Chemical Stability

Stable under normal conditions.

Possibility of Hazardous Reactions

Hazardous Polymerization	Hazardous polymerization does not occur.
Hazardous Reactions .	No information available.

Conditions to Avoid

Keep away from open flames, hot surfaces and sources of ignition, Incompatible products.

Incompatible Materials

Strong oxidizing agents, oxygen.

Hazardous Decomposition Products

Carbon monoxide (CO). Carbon dioxide (CO_2).

SECTION 11. TOXICOLOGICAL INFORMATION

Information on Toxicological Effects

Acute Toxicity

Product Information No acute toxicity information is available for this product

Component Information

Chronic Toxicity

Carcinogenicity	There are no known carcinogenic chemicals in this product
Sensitization	No information available.
Mutagenic Effects	No information available
Reproductive Effects	No information available.
Developmental Effects	No information available.
Target Organs	No information available.
Other Adverse Effects	The toxicological properties have not been fully investigated. See actual entry in RTECS for complete information

Endocrine Disruptor Information

SECTION 11. TOXICOLOGICAL INFORMATION

Component	EU - Endocrine Disrupters Candidate List	EU - Endocrine Disruptors - Evaluated Substances	Japan - Endocrine Disruptor Information
Butyl benzene	Group III Chemical		

SECTION 12. ECOLOGICAL INFORMATION

Toxicity

Ecotoxicity effects Contains no substances known to be hazardous to the environment or that are not degradable in waste water treatment plants

Persistence and degradability

No information available

Bioaccumulative potential

No information available.

Component	log Pow
Butyl benzene	4.2

Mobility in soil

Results of PBT and vPvB assessment

Other adverse effects

No information available

SECTION 13. DISPOSAL CONSIDERATIONS

Waste treatment methods

Waste from Residues / Unused Products Dispose of in accordance with local regulations

Contaminated Packaging Empty containers should be taken to local recyclers for disposal

SECTION 14. TRANSPORT INFORMATION

IMDG/IMO

SECTION 14. TRANSPORT INFORMATION

UN-No	2709
Hazard Class	3
Packing Group	III
Proper Shipping Name	BUTYLBENZENES

ADR

UN-No	2709
Hazard Class	3
Packing Group	III
Proper Shipping Name	BUTYLBENZENES

IATA

UN-No	2709
Hazard Class	3

Chemical Safety Assessment

SECTION 16. OTHER INFORMATION

Full text of R-phrases referred to under sections 2 and 3
No information available.

Revision Date 03-May-2012
Revision Summary

Reason for revision Not applicable
This safety data sheet complies with the requirements of Regulation (EC) No. 1907/2006
Disclaimer
The information provided on this Safety Data Sheet is correct to the best of our knowledge, information and belief at the date of its publication. The information given is designed only as a guide for safe handling, use, processing, storage, transportation, disposal and release and is not to be considered as a warranty or quality specification. The information relates only to the specific material designated and may not be valid for such material used in combination with any other material or in any process, unless specified in the text.

End of Safety Data Sheet

SAFETY DATA SHEET

Creation Date 04-Oct-2010 **Revision Date** 10-Feb-2015 **Revision Number** 1

1. Identification

Product Name **Nickel, powder**

Cat No. : **AC193610000; AC193610250; AC193611000; AC193615000**

Synonyms Raney alloy

Recommended Use Laboratory chemicals.

Uses advised against No Information available

Details of the supplier of the safety data sheet

Company
Fisher Scientific
One Reagent Lane
Fair Lawn, NJ 07410
Tel: (201) 796-7100

Entity / Business Name
Acros Organics
One Reagent Lane
Fair Lawn, NJ 07410

Emergency Telephone Number
For information **US** call: 001-800-ACROS-01 / **Europe** call: +32 14 57 52 11
Emergency Number **US:**001-201-796-7100 / **Europe:** +32 14 57 52 99
CHEMTREC Tel. No.**US:**001-800-424-9300 / **Europe:**001-703-527-3887

2. Hazard(s) identification

Classification
This chemical is considered hazardous by the 2012 OSHA Hazard Communication Standard (29 CFR 1910.1200)

Skin Sensitization	Category 1
Carcinogenicity	Category 2
Specific target organ toxicity - (repeated exposure)	Category 1
Target Organs - Kidney, Blood.	

Label Elements

Signal Word
Danger

Hazard Statements
May cause an allergic skin reaction
Causes damage to organs through prolonged or repeated exposure
Suspected of causing cancer

Precautionary Statements

Prevention
Obtain special instructions before use
Do not handle until all safety precautions have been read and understood
Wear protective gloves/protective clothing/eye protection/face protection
Do not breathe dust/fume/gas/mist/vapors/spray
Wash face, hands and any exposed skin thoroughly after handling
Do not eat, drink or smoke when using this product
Contaminated work clothing should not be allowed out of the workplace
Response
IF exposed or concerned: Get medical attention/advice
Skin
IF ON SKIN: Wash with plenty of soap and water
If skin irritation or rash occurs: Get medical advice/attention
Wash contaminated clothing before reuse
Storage
Store locked up
Disposal
Dispose of contents/container to an approved waste disposal plant
Hazards not otherwise classified (HNOC)
Harmful to aquatic life with long lasting effects

3. Composition / information on ingredients

Component	CAS-No	Weight %
Nickel powder	7440-02-0	>95

4. First-aid measures

Eye Contact Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Immediate medical attention is required.

Skin Contact Wash off immediately with plenty of water for at least 15 minutes. Immediate medical attention is required.

Inhalation Move to fresh air. If breathing is difficult, give oxygen. Do not use mouth-to-mouth resuscitation if victim ingested or inhaled the substance; induce artificial respiration with a respiratory medical device. Immediate medical attention is required.

Ingestion Do not induce vomiting. Call a physician or Poison Control Center immediately.

Most important symptoms/effects May cause allergic skin reaction. Symptoms of allergic reaction may include rash, itching, swelling, trouble breathing, tingling of the hands and feet, dizziness, lightheadedness, chest pain, muscle pain or flushing

Notes to Physician Treat symptomatically

5. Fire-fighting measures

Suitable Extinguishing Media Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

Unsuitable Extinguishing Media No information available

Flash Point No information available
Method - No information available

Autoignition Temperature 400 °C / 752 °F
Explosion Limits
Upper No data available
Lower No data available

Sensitivity to Mechanical Impact No information available
Sensitivity to Static Discharge No information available

Specific Hazards Arising from the Chemical
Combustible material.

Hazardous Combustion Products
Nickel oxides.
Protective Equipment and Precautions for Firefighters
As in any fire, wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH (approved or equivalent) and full protective gear. Thermal decomposition can lead to release of irritating gases and vapors.

NFPA

Health	Flammability	Instability	Physical hazards
3	1	0	N/A

6. Accidental release measures

Personal Precautions Ensure adequate ventilation. Use personal protective equipment. Keep people away from and upwind of spill/leak. Evacuate personnel to safe areas. Avoid dust formation.

Environmental Precautions Should not be released into the environment. See Section 12 for additional ecological information. Avoid release to the environment. Collect spillage.

Methods for Containment and Clean Up Sweep up or vacuum up spillage and collect in suitable container for disposal. Avoid dust formation.

7. Handling and storage

Handling Use only under a chemical fume hood. Wear personal protective equipment. Do not get in eyes, on skin, or on clothing. Avoid dust formation. Do not breathe vapors/dust. Do not ingest.

Storage Keep containers tightly closed in a dry, cool and well-ventilated place.

8. Exposure controls / personal protection

Exposure Guidelines

Component	ACGIH TLV	OSHA PEL	NIOSH IDLH
Nickel powder	TWA: 1.5 mg/m³	(Vacated) TWA: 1 mg/m³ TWA: 1 mg/m³	IDLH: 10 mg/m³ TWA: 0.015 mg/m³

Component	Quebec	Mexico OEL (TWA)	Ontario TWAEV
Nickel powder	TWA: 1 mg/m³	TWA: 1 mg/m³	TWA: 1 mg/m³

Legend

ACGIH - American Conference of Governmental Industrial Hygienists
OSHA - Occupational Safety and Health Administration
NIOSH IDLH: The National Institute for Occupational Safety and Health Immediately Dangerous to Life or Health

Engineering Measures Use only under a chemical fume hood. Ensure that eyewash stations and safety showers are close to the workstation location.

Personal Protective Equipment

Eye/face Protection Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133 or European Standard EN166.

Skin and body protection Wear appropriate protective gloves and clothing to prevent skin exposure.

Respiratory Protection Follow the OSHA respirator regulations found in 29 CFR 1910.134 or European Standard EN 149. Use a NIOSH/MSHA or European Standard EN 149 approved respirator if exposure limits are exceeded or if irritation or other symptoms are experienced.

Hygiene Measures Handle in accordance with good industrial hygiene and safety practice.

9. Physical and chemical properties

Physical State	Solid
Appearance	Brown
Odor	Odorless
Odor Threshold	No information available
pH	No information available
Melting Point/Range	1455 °C / 2651 °F
Boiling Point/Range	2730 °C / 4946 °F
Flash Point	No information available
Evaporation Rate	No information available
Flammability (solid,gas)	No information available
Flammability or explosive limits	
Upper	No data available
Lower	No data available
Vapor Pressure	1 mmHg @ 1810 °C
Vapor Density	No information available
Relative Density	No information available
Solubility	No information available
Partition coefficient; n-octanol/water	No data available
Autoignition Temperature	400 °C / 752 °F
Decomposition Temperature	No information available
Viscosity	No information available
Molecular Formula	Ni
Molecular Weight	58.7

10. Stability and reactivity

Reactive Hazard None known, based on information available

Stability Stable under normal conditions.

Conditions to Avoid Incompatible products. Excess heat. Avoid dust formation.

Incompatible Materials Strong oxidizing agents

Hazardous Decomposition Products Nickel oxides

Hazardous Polymerization Hazardous polymerization does not occur.

Hazardous Reactions None under normal processing.

11. Toxicological information

Acute Toxicity

Component Information

Component	LD50 Oral	LD50 Dermal	LC50 Inhalation
Nickel powder	9000 mg/kg (Rat)	Not listed	Not listed

Toxicologically Synergistic Products No information available

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Irritation No information available

Sensitization May cause sensitization by skin contact Nickel and nickel compounds may cause a form of dermatitis known as nickel itch. May cause an allergic skin reaction

Carcinogenicity The table below indicates whether each agency has listed any ingredient as a carcinogen.

Component	CAS-No	IARC	NTP	ACGIH	OSHA	Mexico
Nickel powder	7440-02-0	Group 2B	Reasonably Anticipated	Not listed	X	Not listed

IARC: (International Agency for Research on Cancer) *Group 2B - Possibly Carcinogenic to Humans*

Mutagenic Effects No information available

Reproductive Effects No information available.

Developmental Effects No information available.

Teratogenicity No information available.

STOT - single exposure None known
STOT - repeated exposure Kidney Blood

Aspiration hazard No information available

Symptoms / effects,both acute and delayed Symptoms of allergic reaction may include rash, itching, swelling, trouble breathing, tingling of the hands and feet, dizziness, lightheadedness, chest pain, muscle pain or flushing
Endocrine Disruptor Information No information available

Other Adverse Effects See actual entry in RTECS for complete information.

12. Ecological information

Ecotoxicity
Do not flush into surface water or sanitary sewer system. Do not allow material to contaminate ground water system. Do not empty into drains. Harmful to aquatic organisms, may cause long-term adverse effects in the aquatic environment.

Component	Freshwater Algae	Freshwater Fish	Microtox	Water Flea
Nickel powder	0.18 mg/L EC50 = 72 h 0.174 - 0.311 mg/L EC50 96 h	10.4 mg/L LC50 96 h 1.3 mg/L LC50 96 h 100 mg/L LC50 96 h	Not listed	1 mg/L EC50 = 48 h 100 mg/L EC50 > 48 h

Persistence and Degradability No information available
Bioaccumulation/ Accumulation No information available.

Mobility No information available.

13. Disposal considerations

Waste Disposal Methods Chemical waste generators must determine whether a discarded chemical is classified as a hazardous waste. Chemical waste generators must also consult local, regional, and national hazardous waste regulations to ensure complete and accurate classification.

14. Transport information

DOT
- **UN-No** UN3089

15. Regulatory information

International Inventories

Component	TSCA	DSL	NDSL	EINECS	ELINCS	NLP	PICCS	ENCS	AICS	IECSC	KECL
Nickel powder	X	X	-	231-111-4	-		X	-	X	X	X

Legend:
X - Listed
E - Indicates a substance that is the subject of a Section 5(e) Consent order under TSCA.
F - Indicates a substance that is the subject of a Section 5(f) Rule under TSCA.
N - Indicates a polymeric substance containing no free-radical initiator in its inventory name but is considered to cover the designated polymer made with any free-radical initiator regardless of the amount used.
P - Indicates a commenced PMN substance
R - Indicates a substance that is the subject of a Section 6 risk management rule under TSCA.
S - Indicates a substance that is identified in a proposed or final Significant New Use Rule
T - Indicates a substance that is the subject of a Section 4 test rule under TSCA.
XU - Indicates a substance exempt from reporting under the Inventory Update Rule, i.e. Partial Updating of the TSCA Inventory Data Base Production and Site Reports (40 CFR 710(B).
Y1 - Indicates an exempt polymer that has a number-average molecular weight of 1,000 or greater.
Y2 - Indicates an exempt polymer that is a polyester and is made only from reactants included in a specified list of low concern reactants that comprises one of the eligibility criteria for the exemption rule.

1 Identification

· **Product identifier**

· **Trade name:** **Nitrite Standard**

· **Article number:** 780016

· **Application of the substance / the mixture**
This product is for research use - Not for human or veterinary diagnostic or therapeutic use.

· **Details of the supplier of the safety data sheet**

· **Manufacturer/Supplier:**
Cayman Chemical Co.
1180 E. Ellsworth Rd.
Ann Arbor, MI 48108
USA

· **Information department:** Product safety department

· **Emergency telephone number:**
During normal opening times: +1 (734) 971-3335
US/CANADA: 800-424-9300
Outside US/CANADA: 703-741-5970

2 Hazard(s) identification

· **Classification of the substance or mixture**

GHS03 Flame over circle

Ox. Sol. 3 H272 May intensify fire; oxidizer.

GHS06 Skull and crossbones

Acute Tox. 3 H301 Toxic if swallowed.

GHS09 Environment

Aquatic Acute 1 H400 Very toxic to aquatic life.

GHS07

Skin Irrit. 2 H315 Causes skin irritation.

(Contd. on page 2)

Safety Data Sheet
acc. to OSHA HCS

Printing date 09/30/2022 Revision date 09/30/2022

Trade name: Nitrite Standard

(Contd. from page 1)

Eye Irrit. 2A	H319 Causes serious eye irritation.
STOT SE 3	H335 May cause respiratory irritation.

· **Label elements**
· **GHS label elements**
The product is classified and labeled according to the Globally Harmonized System (GHS).
· **Hazard pictograms**

GHS03 GHS06 GHS07 GHS09

· **Signal word** Danger

· **Hazard-determining components of labeling:**
Sodium nitrite
Tris base
· **Hazard statements**
H272 May intensify fire; oxidizer.
H301 Toxic if swallowed.
H315 Causes skin irritation.
H319 Causes serious eye irritation.
H335 May cause respiratory irritation.
H400 Very toxic to aquatic life.
· **Precautionary statements**

P210	Keep away from heat.
P220	Keep/Store away from clothing/combustible materials.
P221	Take any precaution to avoid mixing with combustibles.
P261	Avoid breathing dust/fume/gas/mist/vapors/spray
P264	Wash thoroughly after handling.
P270	Do not eat, drink or smoke when using this product.
P271	Use only outdoors or in a well-ventilated area.
P273	Avoid release to the environment.
P280	Wear protective gloves/protective clothing/eye protection/face protection.
P301+P310	If swallowed: Immediately call a poison center/doctor.
P321	Specific treatment (see on this label).
P330	Rinse mouth.
P302+P352	If on skin: Wash with plenty of water.
P304+P340	IF INHALED: Remove person to fresh air and keep comfortable for breathing.
P305+P351+P338	If in eyes: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P312	Call a poison center/doctor if you feel unwell.
P362+P364	Take off contaminated clothing and wash it before reuse.
P332+P313	If skin irritation occurs: Get medical advice/attention.
P337+P313	If eye irritation persists: Get medical advice/attention.
P370+P378	In case of fire: Use CO_2, powder or water spray to extinguish.
P391	Collect spillage.
P403+P233	Store in a well-ventilated place. Keep container tightly closed.
P405	Store locked up.
P501	Dispose of contents/container in accordance with local/regional/national/international regulations.

(Contd. from page 2)

· **Classification system:**
· **NFPA ratings (scale 0 - 4)**

Health = 2
Fire = 0
Reactivity = 0

· **HMIS-ratings (scale 0 - 4)**

Health = 2
Fire = 0
Reactivity = 0

· **Other hazards**
· **Results of PBT and vPvB assessment**
· **PBT:** Not applicable.
· **vPvB:** Not applicable.

3 Composition/information on ingredients

· **Chemical characterization: Mixtures**
· **Description:** Mixture of the substances listed below with nonhazardous additions.

· **Dangerous components:**

CAS: 77-86-1 RTECS: TY2900000	Tris base	63.68%
CAS: 7632-00-0 RTECS: RA1225000	Sodium nitrite	36.32%

4 First-aid measures

· **Description of first aid measures**
· **General information:**
Immediately remove any clothing soiled by the product.
In case of irregular breathing or respiratory arrest provide artificial respiration.
· **After inhalation:** In case of unconsciousness place patient stably in side position for transportation.
· **After skin contact:** Immediately wash with water and soap and rinse thoroughly.
· **After eye contact:**
Rinse opened eye for several minutes under running water. If symptoms persist, consult a doctor.
· **After swallowing:** Do not induce vomiting; immediately call for medical help.
· **Information for doctor:**
· **Most important symptoms and effects, both acute and delayed**
May cause anemia, cough, CNS depression, drowsiness, headache, heart damage, lassitude (weakness, exhaustion), liver damage, narcosis, reproductive effects, teratogenic effects.
No further relevant information available.
· **Indication of any immediate medical attention and special treatment needed**
No further relevant information available.

(Contd. on page 4)

Safety Data Sheet
acc. to OSHA HCS

Printing date 09/30/2022 Revision date 09/30/2022

Trade name: Nitrite Standard

(Contd. from page 3)

5 Fire-fighting measures

· **Extinguishing media**
· **Suitable extinguishing agents:**
Use fire fighting measures that suit the environment.
A solid water stream may be inefficient.
· **Special hazards arising from the substance or mixture** No further relevant information available.
· **Advice for firefighters**
· **Protective equipment:** No special measures required.

6 Accidental release measures

· **Personal precautions, protective equipment and emergency procedures** Not required.
· **Environmental precautions:**
Do not allow product to reach sewage system or any water course.
Inform respective authorities in case of seepage into water course or sewage system.
Do not allow to enter sewers/ surface or ground water.
· **Methods and material for containment and cleaning up:**
Dispose contaminated material as waste according to item 13.
Ensure adequate ventilation.
· **Reference to other sections**
See Section 7 for information on safe handling.
See Section 8 for information on personal protection equipment.
See Section 13 for disposal information.
· **Protective Action Criteria for Chemicals**

· **PAC-1:**		
77-86-1	Tris base	18 mg/m³
7632-00-0	Sodium nitrite	6.4 mg/m³

· **PAC-2:**		
77-86-1	Tris base	190 mg/m³
7632-00-0	Sodium nitrite	71 mg/m³

· **PAC-3:**		
77-86-1	Tris base	1,200 mg/m³
7632-00-0	Sodium nitrite	240 mg/m³

7 Handling and storage

· **Handling:**
· **Precautions for safe handling**
Thorough dedusting.
Ensure good ventilation/exhaustion at the workplace.
· **Information about protection against explosions and fires:** No special measures required.

· **Conditions for safe storage, including any incompatibilities**
· **Storage:** Store in accordance with information listed on the product insert.
· **Requirements to be met by storerooms and receptacles:** No special requirements.
· **Information about storage in one common storage facility:** Not required.
· **Further information about storage conditions:** Keep receptacle tightly sealed.

(Contd. on page 5)

Safety Data Sheet
acc. to OSHA HCS

Printing date 09/30/2022 Revision date 09/30/2022

Trade name: Nitrite Standard

(Contd. from page 4)

· **Specific end use(s)** No further relevant information available.

8 Exposure controls/personal protection

· **Additional information about design of technical systems:** No further data; see item 7.

· **Control parameters**
· **Components with limit values that require monitoring at the workplace:**
The product does not contain any relevant quantities of materials with critical values that have to be monitored at the workplace.
· **Additional information:** The lists that were valid during the creation were used as basis.

· **Exposure controls**
· **Personal protective equipment:**
· **General protective and hygienic measures:**
Keep away from foodstuffs, beverages and feed.
Immediately remove all soiled and contaminated clothing.
Wash hands before breaks and at the end of work.
Avoid contact with the eyes and skin.
· **Breathing equipment:**
In case of brief exposure or low pollution use respiratory filter device. In case of intensive or longer exposure use respiratory protective device that is independent of circulating air.
· **Protection of hands:**

Protective gloves

The glove material has to be impermeable and resistant to the product/ the substance/ the preparation.
Due to missing tests no recommendation to the glove material can be given for the product/ the preparation/ the chemical mixture.
Selection of the glove material on consideration of the penetration times, rates of diffusion and the degradation
· **Material of gloves**
The selection of the suitable gloves does not only depend on the material, but also on further marks of quality and varies from manufacturer to manufacturer. As the product is a preparation of several substances, the resistance of the glove material can not be calculated in advance and has therefore to be checked prior to the application.
· **Penetration time of glove material**
The exact break through time has to be found out by the manufacturer of the protective gloves and has to be observed.
· **Eye protection:**

Tightly sealed goggles

(Contd. on page 6)

9 Physical and chemical properties

· **Information on basic physical and chemical properties**	
· **General Information**	
· **Appearance:**	
Form:	Lyophilized powder
Color:	According to product specification
· **Odor:**	Characteristic
· **Odor threshold:**	Not determined.
· **pH-value:**	Not applicable.
· **Change in condition**	
Melting point/Melting range:	Undetermined.
Boiling point/Boiling range:	Undetermined.
· **Flash point:**	Not applicable.
· **Flammability (solid, gaseous):**	Not determined.
· **Decomposition temperature:**	Not determined.
· **Auto igniting:**	Product is not selfigniting.
· **Danger of explosion:**	Product does not present an explosion hazard.
· **Explosion limits:**	
Lower:	Not determined.
Upper:	Not determined.
· **Vapor pressure:**	Not applicable.
· **Density at 20 °C (68 °F):**	1.32233 g/cm³ (11.03484 lbs/gal)
· **Bulk density:**	1,322 kg/m³
· **Relative density**	Not determined.
· **Vapor density**	Not applicable.
· **Evaporation rate**	Not applicable.
· **Solubility in / Miscibility with**	
Water:	Soluble.
· **Partition coefficient (n-octanol/water):**	Not determined.
· **Viscosity:**	
Dynamic:	Not applicable.
Kinematic:	Not applicable.
· **Solvent content:**	
VOC content:	0.00 %
Solids content:	100.0 %
· **Other information**	No further relevant information available.

10 Stability and reactivity

· **Reactivity** No further relevant information available.
· **Chemical stability**
· **Thermal decomposition / conditions to be avoided:**
No decomposition if used according to specifications.

(Contd. on page 7)

Safety Data Sheet
acc. to OSHA HCS

Printing date 09/30/2022 Revision date 09/30/2022

Trade name: Nitrite Standard

(Contd. from page 6)

· **Possibility of hazardous reactions** No dangerous reactions known.
· **Conditions to avoid** No further relevant information available.
· **Incompatible materials:** No further relevant information available.
· **Hazardous decomposition products:** No dangerous decomposition products known.

11 Toxicological information

· **Information on toxicological effects**
· **Acute toxicity:**

· **LD/LC50 values that are relevant for classification:**		
ATE (Acute Toxicity Estimate)		
Oral	LD50	234 mg/kg (rat)

77-86-1 Tris base		
Oral	TDLO	3,000 ml/kg (mouse)
	LD50	5,500 mg/kg (mouse)
		5,900 mg/kg (rat)
	Intraperitoneal LD50	3,350 mg/kg (mouse)
	Intrapritoneal LD50	3,350 mg/kg (mouse)
7632-00-0 Sodium nitrite		
Oral	LDLO	321 mg/kg (man)
	LD50	175 mg/kg (mouse)
		85 mg/kg (rat)
	Subcutaneous LD50	96,600 µg/kg (rat)
	Intraperitoneal LD50	158 mg/kg (mouse)
	Subcutaneous LD50	150 mg/kg (mouse)

· **Primary irritant effect:**
· **on the skin:** Irritant to skin and mucous membranes.
· **on the eye:** Irritating effect.
· **Sensitization:** No sensitizing effects known.
· **Additional toxicological information:**
The product shows the following dangers according to internally approved calculation methods for preparations:
Toxic
Irritant

· **Carcinogenic categories**

· **IARC (International Agency for Research on Cancer)**
None of the ingredients is listed.

· **NTP (National Toxicology Program)**
None of the ingredients is listed.

· **OSHA-Ca (Occupational Safety & Health Administration)**
None of the ingredients is listed.

12 Ecological information

· **Toxicity**
· **Aquatic toxicity:** No further relevant information available.

Safety Data Sheet
acc. to OSHA HCS

Printing date 09/30/2022 Revision date 09/30/2022

Trade name: Nitrite Standard

(Contd. from page 7)

· **Persistence and degradability** No further relevant information available.
· **Behavior in environmental systems:**
· **Bioaccumulative potential** No further relevant information available.
· **Mobility in soil** No further relevant information available.
· **Ecotoxical effects:**
· **Remark:** Very toxic for fish
· **Additional ecological information:**
· **General notes:**
Water hazard class 3 (Self-assessment): extremely hazardous for water
Do not allow product to reach ground water, water course or sewage system, even in small quantities.
Danger to drinking water if even extremely small quantities leak into the ground.
Very toxic for aquatic organisms
· **Results of PBT and vPvB assessment**
· **PBT:** Not applicable.
· **vPvB:** Not applicable.
· **Other adverse effects** No further relevant information available.

13 Disposal considerations

· **Waste treatment methods**
· **Recommendation:**
Must not be disposed of together with household garbage. Do not allow product to reach sewage system.

· **Uncleaned packagings:**
· **Recommendation:** Disposal must be made according to official regulations.
· **Recommended cleansing agent:** Water, if necessary with cleansing agents.

14 Transport information

· **UN-Number**	
· **DOT, IMDG, IATA**	UN3077
· **UN proper shipping name**	
· **DOT**	Environmentally hazardous substance, solid, n.o.s.
· **IMDG**	ENVIRONMENTALLY HAZARDOUS SUBSTANCE, SOLID, N.O.S. (SODIUM NITRITE), MARINE POLLUTANT
· **IATA**	Environmentally hazardous substance, solid, n.o.s. (SODIUM NITRITE)
· **Transport hazard class(es)**	
· **DOT**	

· **Class**	9 Miscellaneous dangerous substances and articles

(Contd. on page 9)

Safety Data Sheet
acc. to OSHA HCS

Printing date 09/30/2022 Revision date 09/30/2022

Trade name: Nitrite Standard

(Contd. from page 8)

· **Label**	9
· **IMDG, IATA**	
· **Class**	9 Miscellaneous dangerous substances and articles
· **Label**	9
· **Packing group**	
· **DOT, IMDG, IATA**	III
· **Environmental hazards:**	
· **Marine pollutant:**	Symbol (fish and tree)
· **Special marking (IATA):**	Symbol (fish and tree)
· **Special precautions for user**	Warning: Miscellaneous dangerous substances and articles
· **Hazard identification number (Kemler code):**	90
· **EMS Number:**	F-A,S-F
· **Segregation groups**	Nitrites and their mixtures
· **Stowage Category**	A
· **Stowage Code**	SW23 When transported in BK3 bulk container, see 7.6.2.12 and 7.7.3.9.
· **Transport in bulk according to Annex II of MARPOL73/78 and the IBC Code**	Not applicable.
· **Transport/Additional information:**	
· **DOT**	
· **Quantity limitations**	On passenger aircraft/rail: 400 kg On cargo aircraft only: 400 kg
· **IMDG**	
· **Limited quantities (LQ)**	5 kg
· **Excepted quantities (EQ)**	Code: E1 Maximum net quantity per inner packaging: 30 g Maximum net quantity per outer packaging: 1000 g
· **IATA**	
· **Remarks:**	When sold in quantities of less than or equal to 1 mL, or 1 g, with an Excepted Quantity Code of E1, E2, E4, or E5, this item meets the De Minimis Quantities exemption, per IATA 2.6.10. Therefore packaging does not have to be labeled as Dangerous Goods/Excepted Quantity.
· **UN "Model Regulation":**	UN 3077 ENVIRONMENTALLY HAZARDOUS SUBSTANCE, SOLID, N.O.S. (SODIUM NITRITE), 9, III

15 Regulatory information

· **Safety, health and environmental regulations/legislation specific for the substance or mixture**
No further relevant information available.

(Contd. on page 10)

Safety Data Sheet
acc. to OSHA HCS

Printing date 09/30/2022 Revision date 09/30/2022

Trade name: Nitrite Standard

(Contd. from page 9)

· **Sara**

· **Section 355 (extremely hazardous substances):**

None of the ingredients is listed.

· **Section 313 (Specific toxic chemical listings):**

7632-00-0	Sodium nitrite

· **TSCA (Toxic Substances Control Act):**

All components have the value ACTIVE.

· **Hazardous Air Pollutants**

None of the ingredients is listed.

· **Proposition 65**

· **Chemicals known to cause cancer:**

None of the ingredients is listed.

· **Chemicals known to cause reproductive toxicity for females:**

None of the ingredients is listed.

· **Chemicals known to cause reproductive toxicity for males:**

None of the ingredients is listed.

· **Chemicals known to cause developmental toxicity:**

None of the ingredients is listed.

· **Carcinogenic categories**

· **EPA (Environmental Protection Agency)**

None of the ingredients is listed.

· **TLV (Threshold Limit Value)**

None of the ingredients is listed.

· **NIOSH-Ca (National Institute for Occupational Safety and Health)**

None of the ingredients is listed.

· **Chemical safety assessment:** A Chemical Safety Assessment has not been carried out.

16 Other information

All chemicals may pose unknown hazards and should be used with caution. This SDS applies only to the material as packaged. If this product is combined with other materials, deteriorates, or becomes contaminated, it may pose hazards not mentioned in this SDS. Cayman Chemical Company assumes no responsibility for incidental or consequential damages, including lost profits, arising from the use of these data. It shall be the user's responsibility to develop proper methods of handling and personal protection based on the actual conditions of use. While this SDS is based on technical data judged to be reliable, Cayman Chemical Company assumes no responsibility for the completeness or accuracy of the information contained herein.

· **Department issuing SDS:** Environment protection department.
· **Contact:** -
· **Date of preparation / last revision** 09/30/2022 / -
· **Abbreviations and acronyms:**
IMDG: International Maritime Code for Dangerous Goods
DOT: US Department of Transportation
IATA: International Air Transport Association
EINECS: European Inventory of Existing Commercial Chemical Substances
ELINCS: European List of Notified Chemical Substances
CAS: Chemical Abstracts Service (division of the American Chemical Society)

*

1 Identification

· **Product identifier**

· **Trade name: n-Propylbenzene Standard (1X1 mL)**

· **Part number:** EPA-1045-1
· **Application of the substance / the mixture** Reagents and Standards for Analytical Chemical Laboratory Use

· **Details of the supplier of the safety data sheet**
· **Manufacturer/Supplier:**
Agilent Technologies, Inc.
5301 Stevens Creek Blvd.
Santa Clara, CA 95051 USA

· **Information department:**
Telephone: 800-227-9770
e-mail: pdl-msds_author@agilent.com
· **Emergency telephone number:** CHEMTREC®: 1-800-424-9300

2 Hazard(s) identification

· **Classification of the substance or mixture**

GHS02 Flame

Flam. Liq. 2 H225 Highly flammable liquid and vapor.

GHS06 Skull and crossbones

Acute Tox. 3 H331 Toxic if inhaled.

GHS08 Health hazard

Carc. 2 H351 Suspected of causing cancer.
STOT SE 1 H370 Causes damage to organs.

· **Label elements**
· **GHS label elements** The product is classified and labeled according to the Globally Harmonized System (GHS).
· **Hazard pictograms**

GHS02 GHS06 GHS08

· **Signal word** Danger

· **Hazard-determining components of labeling:**
methanol
· **Hazard statements**
Highly flammable liquid and vapor.
Toxic if inhaled.
Suspected of causing cancer.

(Contd. on page 2)

(Contd. of page 1)

Causes damage to organs.

· **Precautionary statements**

Obtain special instructions before use.
Do not handle until all safety precautions have been read and understood.
Keep away from heat/sparks/open flames/hot surfaces. - No smoking.
Ground/bond container and receiving equipment.
Use explosion-proof electrical/ventilating/lighting/equipment.
Use only non-sparking tools.
Take precautionary measures against static discharge.
Do not breathe dust/fume/gas/mist/vapors/spray.
Wash thoroughly after handling.
Do not eat, drink or smoke when using this product.
Use only outdoors or in a well-ventilated area.
Wear protective gloves/protective clothing/eye protection/face protection.
If on skin (or hair): Take off immediately all contaminated clothing. Rinse skin with water/shower.
IF INHALED: Remove person to fresh air and keep comfortable for breathing.
IF exposed or concerned: Get medical advice/attention.
Specific treatment (see on this label).
In case of fire: Use for extinction: CO2, powder or water spray.
Store in a well-ventilated place. Keep container tightly closed.
Store in a well-ventilated place. Keep cool.
Store locked up.
Dispose of contents/container in accordance with local/regional/national/international regulations.

· **Classification system:**

· **NFPA ratings (scale 0 - 4)**

Health = 1
Fire = 3
Reactivity = 0

· **HMIS-ratings (scale 0 - 4)**

Health = *1
Fire = 3
Reactivity = 0

· **Other hazards**

· **Results of PBT and vPvB assessment**

· **PBT:** Not applicable.

· **vPvB:** Not applicable.

3 Composition/information on ingredients

· **Chemical characterization: Mixtures**

· **Description:** Mixture of the substances listed below with nonhazardous additions.

· **Dangerous components:**

67-56-1	methanol	99.368%
103-65-1	propylbenzene	0.632%

US

(Contd. on page 3)

(Contd. of page 2)

4 First-aid measures

· **Description of first aid measures**
· **General information:**
Immediately remove any clothing soiled by the product.
Remove breathing apparatus only after contaminated clothing have been completely removed.
In case of irregular breathing or respiratory arrest provide artificial respiration.
· **After inhalation:**
Supply fresh air or oxygen; call for doctor.
In case of unconsciousness place patient stably in side position for transportation.
· **After skin contact:** Immediately wash with water and soap and rinse thoroughly.
· **After eye contact:** Rinse opened eye for several minutes under running water. Then consult a doctor.
· **After swallowing:** If symptoms persist consult doctor.
· **Information for doctor:**
· **Most important symptoms and effects, both acute and delayed** No further relevant information available.
· **Indication of any immediate medical attention and special treatment needed**
No further relevant information available.

5 Fire-fighting measures

· **Extinguishing media**
· **Suitable extinguishing agents:**
CO2, extinguishing powder or water spray. Fight larger fires with water spray or alcohol resistant foam.
· **For safety reasons unsuitable extinguishing agents:** Water with full jet
· **Special hazards arising from the substance or mixture**
During heating or in case of fire poisonous gases are produced.
· **Advice for firefighters**
· **Protective equipment:** Mouth respiratory protective device.

6 Accidental release measures

· **Personal precautions, protective equipment and emergency procedures**
Mount respiratory protective device.
Wear protective equipment. Keep unprotected persons away.
· **Environmental precautions:** Do not allow to enter sewers/ surface or ground water.
· **Methods and material for containment and cleaning up:**
Absorb with liquid-binding material (sand, diatomite, acid binders, universal binders, sawdust).
Dispose contaminated material as waste according to item 13.
Ensure adequate ventilation.
· **Reference to other sections**
See Section 7 for information on safe handling.
See Section 8 for information on personal protection equipment.
See Section 13 for disposal information.
· **Protective Action Criteria for Chemicals**

· **PAC-1:**		
67-56-1	methanol	530 ppm
103-65-1	propylbenzene	3.7 ppm

(Contd. on page 4)

(Contd. of page 3)

· PAC-2:		
67-56-1	methanol	2,100 ppm
103-65-1	propylbenzene	41 ppm

· PAC-3:		
67-56-1	methanol	7200* ppm
103-65-1	propylbenzene	240 ppm

7 Handling and storage

· **Handling:**
· **Precautions for safe handling**
Ensure good ventilation/exhaustion at the workplace.
Open and handle receptacle with care.
Prevent formation of aerosols.
· **Information about protection against explosions and fires:**
Keep ignition sources away - Do not smoke.
Protect against electrostatic charges.
Keep respiratory protective device available.

· **Conditions for safe storage, including any incompatibilities**
· **Storage:**
· **Requirements to be met by storerooms and receptacles:** Store in a cool location.
· **Information about storage in one common storage facility:** Not required.
· **Further information about storage conditions:**
Keep receptacle tightly sealed.
Store in cool, dry conditions in well sealed receptacles.
· **Specific end use(s)** No further relevant information available.

8 Exposure controls/personal protection

· **Additional information about design of technical systems:** No further data; see item 7.

· **Control parameters**

· Components with limit values that require monitoring at the workplace:	
67-56-1 methanol	
PEL	Long-term value: 260 mg/m³, 200 ppm
REL	Short-term value: 325 mg/m³, 250 ppm Long-term value: 260 mg/m³, 200 ppm Skin
TLV	Short-term value: 328 mg/m³, 250 ppm Long-term value: 262 mg/m³, 200 ppm Skin; BEI

· Ingredients with biological limit values:	
67-56-1 methanol	
BEI	15 mg/L Medium: urine Time: end of shift Parameter: Methanol (background, nonspecific)

(Contd. on page 5)

(Contd. of page 4)

· **Additional information:** The lists that were valid during the creation were used as basis.

· **Exposure controls**
· **Personal protective equipment:**
· **General protective and hygienic measures:**
Keep away from foodstuffs, beverages and feed.
Immediately remove all soiled and contaminated clothing.
Wash hands before breaks and at the end of work.
Store protective clothing separately.
· **Breathing equipment:**
When used as intended with Agilent instruments, the use of the product under normal laboratory conditions and with standard practices does not result in significant airborne exposures and therefore respiratory protection is not needed.
Under an emergency condition where a respirator is deemed necessary, use a NIOSH or equivalent approved device/equipment with appropriate organic or acid gas cartridge.
· **Protection of hands:**
Although not recommended for constant contact with the chemicals or for clean-up, nitrile gloves 11-13 mil thickness are recommended for normal use. The breakthrough time is 1 hr. For cleaning a spill where there is direct contact of the chemical, butyl rubber gloves are recommended 12-15 mil thickness with breakthrough times exceeding 4 hrs. Supplier recommendations should be followed.
· **Material of gloves**
For normal use: nitrile rubber, 11-13 mil thickness
For direct contact with the chemical: butyl rubber, 12-15 mil thickness
· **Penetration time of glove material**
For normal use: nitrile rubber: 1 hour
For direct contact with the chemical: butyl rubber: >4 hours
· **Eye protection:**

Tightly sealed goggles

9 Physical and chemical properties

· **Information on basic physical and chemical properties**
· **General Information**
· **Appearance:**

Form:	Fluid
Color:	Colorless
· **Odor:**	Alcohol-like
· **Odor threshold:**	Not determined.
· **pH-value:**	Not determined.
· **Change in condition**	
Melting point/Melting range:	-98 °C (-144.4 °F)
Boiling point/Boiling range:	64.7 °C (148.5 °F)
· **Flash point:**	9 °C (48.2 °F)
· **Flammability (solid, gaseous):**	Not applicable.

(Contd. on page 6)

(Contd. of page 5)

· **Ignition temperature:**	455 °C (851 °F)
· **Decomposition temperature:**	Not determined.
· **Auto igniting:**	Product is not selfigniting.
· **Danger of explosion:**	Product is not explosive. However, formation of explosive air/vapor mixtures are possible.
· **Explosion limits:**	
Lower:	5.5 Vol %
Upper:	44 Vol %
· **Vapor pressure at 20 °C (68 °F):**	100 hPa (75 mm Hg)
· **Density at 20 °C (68 °F):**	0.80063 g/cm³ (6.68126 lbs/gal)
· **Relative density**	Not determined.
· **Vapor density**	Not determined.
· **Evaporation rate**	Not determined.
· **Solubility in / Miscibility with**	
Water:	Not miscible or difficult to mix.
· **Partition coefficient (n-octanol/water):**	Not determined.
· **Viscosity:**	
Dynamic:	Not determined.
Kinematic:	Not determined.
· **Solvent content:**	
Organic solvents:	100.0 %
VOC content:	100.00 %
	800.6 g/l / 6.68 lb/gal
Solids content:	0.0 %
· **Other information**	No further relevant information available.

10 Stability and reactivity

· **Reactivity** No further relevant information available.
· **Chemical stability**
· **Thermal decomposition / conditions to be avoided:** No decomposition if used according to specifications.
· **Possibility of hazardous reactions** No dangerous reactions known.
· **Conditions to avoid** No further relevant information available.
· **Incompatible materials:** No further relevant information available.
· **Hazardous decomposition products:** No dangerous decomposition products known.

11 Toxicological information

· **Information on toxicological effects**
· **Acute toxicity:**

· **LD/LC50 values that are relevant for classification:**		
ATE (Acute Toxicity Estimate)		
Inhalative	LC50/4 h	3.02 mg/L

(Contd. on page 7)

(Contd. of page 6)

67-56-1 methanol		
Oral	LD50	5,628 mg/kg (rat)
Dermal	LD50	15,800 mg/kg (rabbit)
103-65-1 propylbenzene		
Oral	LD50	6,040 mg/kg (rat)

· **Primary irritant effect:**
· **on the skin:** No irritant effect.
· **on the eye:** No irritating effect.
· **Sensitization:** No sensitizing effects known.
· **Additional toxicological information:**
The product shows the following dangers according to internally approved calculation methods for preparations:
Toxic

· **Carcinogenic categories**

· IARC (International Agency for Research on Cancer)
None of the ingredients is listed.

· NTP (National Toxicology Program)
None of the ingredients is listed.

· OSHA-Ca (Occupational Safety & Health Administration)
None of the ingredients is listed.

12 Ecological information

· **Toxicity**
· **Aquatic toxicity:** No further relevant information available.
· **Persistence and degradability** No further relevant information available.
· **Behavior in environmental systems:**
· **Bioaccumulative potential** No further relevant information available.
· **Mobility in soil** No further relevant information available.
· **Additional ecological information:**
· **General notes:**
Water hazard class 1 (Self-assessment): slightly hazardous for water
Do not allow undiluted product or large quantities of it to reach ground water, water course or sewage system.
· **Results of PBT and vPvB assessment**
· **PBT:** Not applicable.
· **vPvB:** Not applicable.
· **Other adverse effects** No further relevant information available.

13 Disposal considerations

· **Waste treatment methods**
· **Recommendation:**
Must not be disposed of together with household garbage. Do not allow product to reach sewage system.

(Contd. on page 8)

(Contd. of page 7)

· **Uncleaned packagings:**
· **Recommendation:** Disposal must be made according to official regulations.

*

14 Transport information

· **Not Regulated, De minimus Quantities**	-
· **UN-Number**	
· **DOT, IMDG, IATA**	UN1230
· **UN proper shipping name**	
· **DOT**	Methanol solution
· **IMDG, IATA**	METHANOL solution
· **Transport hazard class(es)**	
· **DOT**	

· **Class**	3 Flammable liquids
· **Label**	3, 6.1
· **IMDG**	

· **Class**	3 Flammable liquids
· **Label**	3/6.1
· **IATA**	

· **Class**	3 Flammable liquids
· **Label**	3 (6.1)
· **Packing group**	
· **DOT, IMDG, IATA**	II
· **Environmental hazards:**	Not applicable.
· **Special precautions for user**	Warning: Flammable liquids
· **Danger code (Kemler):**	336
· **EMS Number:**	F-E,S-D
· **Stowage Category**	B
· **Stowage Code**	SW2 Clear of living quarters.
· **Transport in bulk according to Annex II of MARPOL73/78 and the IBC Code**	Not applicable.

(Contd. on page 9)

(Contd. of page 8)

· **Transport/Additional information:**

· **DOT**

· **Quantity limitations**	On passenger aircraft/rail: 1 L On cargo aircraft only: 60 L

· **IMDG**

· **Limited quantities (LQ)**	1L
· **Excepted quantities (EQ)**	Code: E2 Maximum net quantity per inner packaging: 30 ml Maximum net quantity per outer packaging: 500 ml
· **UN "Model Regulation":**	UN 1230 METHANOL SOLUTION, 3 (6.1), II

15 Regulatory information

· **Safety, health and environmental regulations/legislation specific for the substance or mixture**

· **Sara**

· **Section 355 (extremely hazardous substances):**

None of the ingredients is listed.

· **Section 313 (Specific toxic chemical listings):**

67-56-1	methanol

· **TSCA (Toxic Substances Control Act):**

All ingredients are listed.

· **Proposition 65**

· **Chemicals known to cause cancer:**

None of the ingredients is listed.

· **Chemicals known to cause reproductive toxicity for females:**

None of the ingredients is listed.

· **Chemicals known to cause reproductive toxicity for males:**

None of the ingredients is listed.

· **Chemicals known to cause developmental toxicity:**

67-56-1	methanol

· **Carcinogenic categories**

· **EPA (Environmental Protection Agency)**

None of the ingredients is listed.

· **TLV (Threshold Limit Value established by ACGIH)**

None of the ingredients is listed.

· **NIOSH-Ca (National Institute for Occupational Safety and Health)**

None of the ingredients is listed.

· **Chemical safety assessment:** A Chemical Safety Assessment has not been carried out.

(Contd. on page 10)

(Contd. of page 9)

SAFETY DATA SHEET

Version 4.7
Revision Date 05/27/2015
Print Date 04/01/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	*o*-Cresol
Product Number	:	C85700
Brand	:	Sigma-Aldrich
Index-No.	:	604-004-00-9
CAS-No.	:	95-48-7

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Manufacture of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Acute toxicity, Oral (Category 3), H301
Acute toxicity, Dermal (Category 3), H311
Skin corrosion (Category 1B), H314
Serious eye damage (Category 1), H318
Acute aquatic toxicity (Category 2), H401
Chronic aquatic toxicity (Category 2), H411

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word: Danger

Hazard statement(s)

H301 + H311	Toxic if swallowed or in contact with skin
H314	Causes severe skin burns and eye damage.
H318	Causes serious eye damage.
H411	Toxic to aquatic life with long lasting effects.

Precautionary statement(s)

P260	Do not breathe dust or mist.
P264	Wash skin thoroughly after handling.
P270	Do not eat, drink or smoke when using this product.

P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P301 + P310 + P330	IF SWALLOWED: Immediately call a POISON CENTER or doctor/ physician. Rinse mouth.
P301 + P330 + P331	IF SWALLOWED: Rinse mouth. Do NOT induce vomiting.
P303 + P361 + P353	IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water/shower.
P304 + P340 + P310	IF INHALED: Remove person to fresh air and keep comfortable for breathing. Immediately call a POISON CENTER or doctor/ physician.
P305 + P351 + P338 + P310	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER or doctor/ physician.
P362	Take off contaminated clothing and wash before reuse.
P391	Collect spillage.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Synonyms : 2-Methylphenol

Formula : C_7H_8O
Molecular weight : 108.14 g/mol
CAS-No. : 95-48-7
EC-No. : 202-423-8
Index-No. : 604-004-00-9

Hazardous components

Component	Classification	Concentration
o-Cresol		
	Acute Tox. 3; Skin Corr. 1B; Eye Dam. 1; Aquatic Acute 2; Aquatic Chronic 2; H301 + H311, H314, H318, H411	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Take off contaminated clothing and shoes immediately. Wash off with soap and plenty of water. Take victim immediately to hospital. Consult a physician.

In case of eye contact
Rinse thoroughly with plenty of water for at least 15 minutes and consult a physician.Continue rinsing eyes during transport to hospital.

If swallowed
Do NOT induce vomiting. Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed

The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture
Carbon oxides

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
No data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Wear respiratory protection. Avoid dust formation. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

6.3 Methods and materials for containment and cleaning up
Pick up and arrange disposal without creating dust. Sweep up and shovel. Keep in suitable, closed containers for disposal.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid contact with skin and eyes. Avoid formation of dust and aerosols.Further processing of solid materials may result in the formation of combustible dusts. The potential for combustible dust formation should be taken into consideration before additional processing occurs.
Provide appropriate exhaust ventilation at places where dust is formed.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.

Air and light sensitive. Keep in a dry place.
Storage class (TRGS 510): Non-combustible, acute toxic Cat. 1 and 2 / very toxic hazardous materials

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
o-Cresol	95-48-7	TWA	5.000000 ppm 22.000000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
	Remarks	Skin contact does contribute to exposure.		

		TWA	5.000000 ppm	USA. ACGIH Threshold Limit Values (TLV)
		Eye, skin, & Upper Respiratory Tract irritation Adopted values or notations enclosed are those for which changes are proposed in the NIC 2010 Revision or addition to the notice of intended changes See Notice of Intended Changes (NIC) Danger of cutaneous absorption		
		TWA	2.300000 ppm 10.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		TWA	20.000000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Upper Respiratory Tract irritation Not classifiable as a human carcinogen Danger of cutaneous absorption		

8.2 Exposure controls

Appropriate engineering controls
Avoid contact with skin, eyes and clothing. Wash hands before breaks and immediately after handling the product.

Personal protective equipment

Eye/face protection
Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.4 mm
Break through time: 480 min
Material tested:Camatril® (KCL 730 / Aldrich Z677442, Size M)

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.2 mm
Break through time: 30 min
Material tested:Dermatril® P (KCL 743 / Aldrich Z677388, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Complete suit protecting against chemicals, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face particle respirator type N100 (US) or type P3 (EN 143) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: powder Colour: white
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	4.5 at 25.00000 g/l
e)	Melting point/freezing point	Melting point/range: 29 - 31 °C (84 - 88 °F) - lit.
f)	Initial boiling point and boiling range	191 °C (376 °F) - lit.
g)	Flash point	81.0 °C (177.8 °F) - closed cup
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	Upper explosion limit: 58 %(V) Lower explosion limit: 1.3 %(V)
k)	Vapour pressure	3.1 hPa (2.3 mmHg) at 60.0 °C (140.0 °F) 1.3 hPa (1.0 mmHg) at 38.2 °C (100.8 °F) 0.4 hPa (0.3 mmHg) at 20.0 °C (68.0 °F)
l)	Vapour density	No data available
m)	Relative density	1.05 g/cm3 at 20.00 °C (68.00 °F)
n)	Water solubility	25 g/l at 20 °C (68 °F)
o)	Partition coefficient: n-octanol/water	No data available
p)	Auto-ignition temperature	599.0 °C (1,110.2 °F)
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information

No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity

No data available

10.2 Chemical stability

Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions

No data available

10.4 Conditions to avoid

No data available

10.5 Incompatible materials

Oxidizing agents

10.6 Hazardous decomposition products

Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - 121.0 mg/kg
Remarks: Behavioral:Convulsions or effect on seizure threshold. Lungs, Thorax, or Respiration:Dyspnea. Gastrointestinal:Ulceration or bleeding from stomach.

LC50 Inhalation - Rat - 1 h - > 1,220 mg/m3
Remarks: Sense Organs and Special Senses (Nose, Eye, Ear, and Taste):Eye:Lacrimation. Behavioral:Somnolence (general depressed activity).

LD50 Dermal - Rabbit - 890.0 mg/kg

No data available

Skin corrosion/irritation
Skin - Rabbit
Result: Severe skin irritation - 24 h
(Draize Test)

Serious eye damage/eye irritation
Eyes - Rabbit
Result: Severe eye irritation
(Draize Test)

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

IARC:	No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.
NTP:	No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.
OSHA:	No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
No data available

No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: GO6300000

Material is extremely destructive to tissue of the mucous membranes and upper respiratory tract, eyes, and skin., spasm, inflammation and edema of the larynx, spasm, inflammation and edema of the bronchi, pneumonitis, pulmonary edema, burning sensation, Cough, wheezing, laryngitis, Shortness of breath, Headache, Nausea, Vomiting, Central nervous system depression, Diarrhoea, Gastrointestinal disturbance

Stomach - Irregularities - Based on Human Evidence

Stomach - Irregularities - Based on Human Evidence

12. ECOLOGICAL INFORMATION

12.1 Toxicity

Toxicity to fish	LC50 - Leuciscus idus (Golden orfe) - 10.00 mg/l - 96 h
Toxicity to daphnia and other aquatic invertebrates	Immobilization EC50 - Daphnia magna (Water flea) - 15.8 mg/l - 48 h
Toxicity to algae	EC50 - SELENASTRUM - 100.00 mg/l - 72 h

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.
Toxic to aquatic life with long lasting effects.

No data available

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 3455 Class: 6.1 (8) Packing group: II
Proper shipping name: Cresols, solid
Reportable Quantity (RQ): 100 lbs

Poison Inhalation Hazard: No

IMDG
UN number: 3455 Class: 6.1 (8) Packing group: II EMS-No: F-A, S-B
Proper shipping name: CRESOLS, SOLID

IATA
UN number: 3455 Class: 6.1 (8) Packing group: II
Proper shipping name: Cresols, solid

15. REGULATORY INFORMATION

SARA 302 Components
The following components are subject to reporting levels established by SARA Title III, Section 302:

	CAS-No.	Revision Date
o-Cresol	95-48-7	2007-07-01

SARA 313 Components

The following components are subject to reporting levels established by SARA Title III, Section 313:

	CAS-No.	Revision Date
o-Cresol	95-48-7	2007-07-01

Massachusetts Right To Know Components

	CAS-No.	Revision Date
o-Cresol	95-48-7	2007-07-01

Pennsylvania Right To Know Components

	CAS-No.	Revision Date
o-Cresol	95-48-7	2007-07-01

New Jersey Right To Know Components

	CAS-No.	Revision Date
o-Cresol	95-48-7	2007-07-01

California Prop. 65 Components

This product does not contain any chemicals known to State of California to cause cancer, birth defects, or any other reproductive harm.

16. OTHER INFORMATION

Full text of H-Statements referred to under sections 2 and 3.

Acute Tox.	Acute toxicity
Aquatic Acute	Acute aquatic toxicity
Aquatic Chronic	Chronic aquatic toxicity
Eye Dam.	Serious eye damage
H301	Toxic if swallowed.
H301 + H311	Toxic if swallowed or in contact with skin
H311	Toxic in contact with skin.
H314	Causes severe skin burns and eye damage.
H318	Causes serious eye damage.

HMIS Rating

Health hazard:	3
Chronic Health Hazard:	*
Flammability:	0
Physical Hazard	0

NFPA Rating

Health hazard:	3
Fire Hazard:	2
Reactivity Hazard:	0

SAFETY DATA SHEET

Version 4.10
Revision Date 11/12/2015
Print Date 02/07/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	*p*-Cresol
Product Number	:	W233706
Brand	:	Aldrich
Index-No.	:	604-004-00-9
CAS-No.	:	106-44-5

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Synthesis of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Acute toxicity, Oral (Category 3), H301
Acute toxicity, Dermal (Category 3), H311
Skin corrosion (Category 1B), H314
Serious eye damage (Category 1), H318
Acute aquatic toxicity (Category 2), H401
Chronic aquatic toxicity (Category 2), H411

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word: Danger

Hazard statement(s)

H301 + H311	Toxic if swallowed or in contact with skin
H314	Causes severe skin burns and eye damage.
H411	Toxic to aquatic life with long lasting effects.

Precautionary statement(s)

P260	Do not breathe dust or mist.
P264	Wash skin thoroughly after handling.
P270	Do not eat, drink or smoke when using this product.

P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P301 + P310	IF SWALLOWED: Immediately call a POISON CENTER or doctor/ physician.
P301 + P330 + P331	IF SWALLOWED: Rinse mouth. Do NOT induce vomiting.
P303 + P361 + P353	IF ON SKIN (or hair): Remove/ Take off immediately all contaminated clothing. Rinse skin with water/ shower.
P304 + P340	IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing.
P305 + P351 + P338	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P310	Immediately call a POISON CENTER or doctor/ physician.
P322	Specific measures (see supplemental first aid instructions on this label).
P361	Remove/Take off immediately all contaminated clothing.
P363	Wash contaminated clothing before reuse.
P391	Collect spillage.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Synonyms	:	4-Methylphenol
Formula	:	C_7H_8O
Molecular weight	:	108.14 g/mol
CAS-No.	:	106-44-5
EC-No.	:	203-398-6
Index-No.	:	604-004-00-9

Hazardous components

Component	Classification	Concentration
p-Cresol		
	Acute Tox. 3; Skin Corr. 1B; Eye Dam. 1; Aquatic Acute 2; Aquatic Chronic 2; H301 + H311, H314, H411	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Wash off with soap and plenty of water. Take victim immediately to hospital. Consult a physician.

In case of eye contact
Flush eyes with water as a precaution.

If swallowed
Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed

The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture
Carbon oxides

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
No data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Wear respiratory protection. Avoid dust formation. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

6.3 Methods and materials for containment and cleaning up
Pick up and arrange disposal without creating dust. Sweep up and shovel. Keep in suitable, closed containers for disposal.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid contact with skin and eyes. Avoid formation of dust and aerosols.
Provide appropriate exhaust ventilation at places where dust is formed.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.

hygroscopic Air and light sensitive. Handle and store under inert gas.

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
p-Cresol	106-44-5	TWA	2.3 ppm 10 mg/m3	USA. NIOSH Recommended Exposure Limits
		TWA	5 ppm 22 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
	Remarks	Skin designation The value in mg/m3 is approximate.		

		TWA	20 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Upper Respiratory Tract irritation Not classifiable as a human carcinogen Danger of cutaneous absorption		

8.2 Exposure controls

Appropriate engineering controls
Avoid contact with skin, eyes and clothing. Wash hands before breaks and immediately after handling the product.

Personal protective equipment

Eye/face protection
Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.4 mm
Break through time: 480 min
Material tested:Camatril® (KCL 730 / Aldrich Z677442, Size M)

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.2 mm
Break through time: 30 min
Material tested:Dermatril® P (KCL 743 / Aldrich Z677388, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Complete suit protecting against chemicals, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face particle respirator type N100 (US) or type P3 (EN 143) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: crystalline Colour: colourless
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing	Melting point/range: 31 - 37 °C (88 - 99 °F)

	point	Melting point/range: 32 - 34 °C (90 - 93 °F) - lit.
f)	Initial boiling point and boiling range	202 °C (396 °F) - lit.
g)	Flash point	85.0 °C (185.0 °F) - closed cup
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	Lower explosion limit: 1.1 %(V)
k)	Vapour pressure	1.3 hPa (1.0 mmHg) at 20.0 °C (68.0 °F)
l)	Vapour density	No data available
m)	Relative density	1.034 g/cm3 at 25 °C (77 °F)
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	log Pow: 1.94
p)	Auto-ignition temperature	559.0 °C (1,038.2 °F)
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information
No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions
No data available

10.4 Conditions to avoid
No data available

10.5 Incompatible materials
Oxidizing agents, Bases

10.6 Hazardous decomposition products
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - 207.0 mg/kg
Remarks: Sense Organs and Special Senses (Nose, Eye, Ear, and Taste):Olfaction:Other changes. Behavioral:Convulsions or effect on seizure threshold. Gastrointestinal:Ulceration or bleeding from stomach.

LC50 Inhalation - Rat - 1 h - > 710 mg/m3

LD50 Dermal - Rabbit - 301.0 mg/kg
Remarks: Behavioral:Tremor. Gastrointestinal:Changes in structure or function of salivary glands. Kidney, Ureter, Bladder:Other changes.

No data available

Skin corrosion/irritation
Skin - Rabbit
Result: Severe skin irritation - 24 h

Serious eye damage/eye irritation
Eyes - Rabbit
Result: Severe eye irritation

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

IARC:	No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.
NTP:	No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.
OSHA:	No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
No data available

No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: GO6475000

Material is extremely destructive to tissue of the mucous membranes and upper respiratory tract, eyes, and skin., spasm, inflammation and edema of the larynx, spasm, inflammation and edema of the bronchi, pneumonitis, pulmonary edema, laryngitis, Dizziness, Cardiovascular effects., Muscle cramps/spasms., Symptoms of exposure may include burning sensation, coughing, wheezing, laryngitis, shortness of breath, headache, nausea, and vomiting.

Kidney -

12. ECOLOGICAL INFORMATION

12.1 Toxicity

Toxicity to fish	LC50 - other fish - 16.00 - 24.00 mg/l - 24 h
	LC50 - Oncorhynchus mykiss (rainbow trout) - 7.9 mg/l - 96 h
Toxicity to daphnia and other aquatic invertebrates	LC50 - Daphnia magna (Water flea) - 1.4 mg/l - 48 h

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
Does not bioaccumulate.

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.
Toxic to aquatic life.

No data available

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 3455 Class: 6.1 (8) Packing group: II
Proper shipping name: Cresols, solid
Reportable Quantity (RQ): 100 lbs

Poison Inhalation Hazard: No

IMDG
UN number: 3455 Class: 6.1 (8) Packing group: II EMS-No: F-A, S-B
Proper shipping name: CRESOLS, SOLID

IATA
UN number: 3455 Class: 6.1 (8) Packing group: II
Proper shipping name: Cresols, solid

15. REGULATORY INFORMATION

SARA 302 Components
No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components
The following components are subject to reporting levels established by SARA Title III, Section 313:

	CAS-No.	Revision Date
p-Cresol	106-44-5	2007-07-01

SARA 311/312 Hazards
Acute Health Hazard

Massachusetts Right To Know Components

	CAS-No.	Revision Date
p-Cresol	106-44-5	2007-07-01

Pennsylvania Right To Know Components

	CAS-No.	Revision Date
p-Cresol	106-44-5	2007-07-01

New Jersey Right To Know Components

	CAS-No.	Revision Date
p-Cresol	106-44-5	2007-07-01

California Prop. 65 Components

This product does not contain any chemicals known to State of California to cause cancer, birth defects, or any other reproductive harm.

16. OTHER INFORMATION

Full text of H-Statements referred to under sections 2 and 3.

Acute Tox.	Acute toxicity
Aquatic Acute	Acute aquatic toxicity
Aquatic Chronic	Chronic aquatic toxicity
Eye Dam.	Serious eye damage
H301	Toxic if swallowed.
H301 + H311	Toxic if swallowed or in contact with skin
H311	Toxic in contact with skin.
H314	Causes severe skin burns and eye damage.

HMIS Rating

Health hazard:	3
Chronic Health Hazard:	
Flammability:	0
Physical Hazard	0

NFPA Rating

Health hazard:	3
Fire Hazard:	2
Reactivity Hazard:	0

It does not represent any guarantee of the properties of the product. Sigma-Aldrich Corporation and its Affiliates shall not be held liable for any damage resulting from handling or from contact with the above product. See www.sigma-aldrich.com and/or the reverse side of invoice or packing slip for additional terms and conditions of sale.

Preparation Information

Sigma-Aldrich Corporation
Product Safety – Americas Region
1-800-521-8956

Version: 4.10 Revision Date: 11/12/2015 Print Date: 02/07/2016

SAFETY DATA SHEET

Version 4.9
Revision Date 12/29/2015
Print Date 02/22/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	Pentachlorophenol
Product Number	:	P2604
Brand	:	Aldrich
Index-No.	:	604-002-00-8
CAS-No.	:	87-86-5

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Synthesis of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Acute toxicity, Oral (Category 3), H301
Acute toxicity, Inhalation (Category 2), H330
Acute toxicity, Dermal (Category 3), H311
Skin irritation (Category 2), H315
Eye irritation (Category 2A), H319
Carcinogenicity (Category 2), H351
Specific target organ toxicity - single exposure (Category 3), Respiratory system, H335
Acute aquatic toxicity (Category 1), H400
Chronic aquatic toxicity (Category 2), H411

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word: Danger

Hazard statement(s)

H301 + H311	Toxic if swallowed or in contact with skin
H315	Causes skin irritation.
H319	Causes serious eye irritation.
H330	Fatal if inhaled.
H335	May cause respiratory irritation.

H351	Suspected of causing cancer.
H400	Very toxic to aquatic life.
H411	Toxic to aquatic life with long lasting effects.

Precautionary statement(s)

P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and understood.
P260	Do not breathe dust/ fume/ gas/ mist/ vapours/ spray.
P264	Wash skin thoroughly after handling.
P270	Do not eat, drink or smoke when using this product.
P271	Use only outdoors or in a well-ventilated area.
P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P284	Wear respiratory protection.
P301 + P310 + P330	IF SWALLOWED: Immediately call a POISON CENTER or doctor/ physician. Rinse mouth.
P302 + P352 + P312	IF ON SKIN: Wash with plenty of soap and water. Call a POISON CENTER or doctor/ physician if you feel unwell.
P304 + P340 + P310	IF INHALED: Remove person to fresh air and keep comfortable for breathing. Immediately call a POISON CENTER or doctor/ physician.
P305 + P351 + P338	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.
P332 + P313	If skin irritation occurs: Get medical advice/ attention.
P337 + P313	If eye irritation persists: Get medical advice/ attention.
P362	Take off contaminated clothing and wash before reuse.
P391	Collect spillage.
P403 + P233	Store in a well-ventilated place. Keep container tightly closed.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Formula	:	C_6HCl_5O
Molecular weight	:	266.34 g/mol
CAS-No.	:	87-86-5
EC-No.	:	201-778-6
Index-No.	:	604-002-00-8

Hazardous components

Component	Classification	Concentration
Pentachlorophenol		
	Acute Tox. 3; Acute Tox. 2; Acute Tox. 3; Skin Irrit. 2; Eye Irrit. 2A; Carc. 2; STOT SE 3; Aquatic Acute 1; Aquatic Chronic 2; H301 + H311, H315, H319, H330, H335, H351, H400, H411	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice

Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Wash off with soap and plenty of water. Take victim immediately to hospital. Consult a physician.

In case of eye contact
Rinse thoroughly with plenty of water for at least 15 minutes and consult a physician.

If swallowed
Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture
Carbon oxides, Hydrogen chloride gas

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
No data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Wear respiratory protection. Avoid dust formation. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

6.3 Methods and materials for containment and cleaning up
Pick up and arrange disposal without creating dust. Sweep up and shovel. Keep in suitable, closed containers for disposal.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid contact with skin and eyes. Avoid formation of dust and aerosols.
Provide appropriate exhaust ventilation at places where dust is formed.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
Pentachlorophenol	87-86-5	TWA	0.500000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Central Nervous System impairment Upper Respiratory Tract irritation Eye irritation Cardiac impairment Adopted values or notations enclosed are those for which changes are proposed in the NIC See Notice of Intended Changes (NIC) Substances for which there is a Biological Exposure Index or Indices (see BEI® section) Confirmed animal carcinogen with unknown relevance to humans Danger of cutaneous absorption		
		TWA	0.500000 mg/m3	USA. NIOSH Recommended Exposure Limits
		Potential for dermal absorption		
		TWA	0.500000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		Skin designation		
		TWA	0.5 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Central Nervous System impairment Upper Respiratory Tract irritation Eye irritation Cardiac impairment 2015 Adoption Substances for which there is a Biological Exposure Index or Indices (see BEI® section) Confirmed animal carcinogen with unknown relevance to humans Danger of cutaneous absorption		
		STEL	1 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Central Nervous System impairment Upper Respiratory Tract irritation Eye irritation Cardiac impairment 2015 Adoption Substances for which there is a Biological Exposure Index or Indices (see BEI® section) Confirmed animal carcinogen with unknown relevance to humans Danger of cutaneous absorption		

Biological occupational exposure limits

Component	CAS-No.	Parameters	Value	Biological specimen	Basis
Pentachlorophenol	87-86-5	pentachlorophenol	2.0000 mg/g	Urine	ACGIH - Biological Exposure Indices (BEI)
	Remarks	Prior to last shift of workweek			
		Free PCP	5.0000 mg/l	In plasma	ACGIH - Biological Exposure Indices (BEI)
		End of shift (As soon as possible after exposure ceases)			
		pentachlorophenol		Urine	ACGIH - Biological Exposure Indices (BEI)

		Prior to last shift of workweek

8.2 Exposure controls

Appropriate engineering controls
Avoid contact with skin, eyes and clothing. Wash hands before breaks and immediately after handling the product.

Personal protective equipment

Eye/face protection
Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Splash contact
Material: Fluorinated rubber
Minimum layer thickness: 0.7 mm
Break through time: 120 min
Material tested:Vitoject® (KCL 890 / Aldrich Z677698, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Complete suit protecting against chemicals, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face particle respirator type N100 (US) or type P3 (EN 143) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: crystalline Colour: light red
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: 165 - 180 °C (329 - 356 °F)
f)	Initial boiling point and boiling range	310 °C (590 °F)
g)	Flash point	No data available
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower	No data available

	flammability or explosive limits	
k)	Vapour pressure	53.3 hPa (40.0 mmHg) at 211.2 °C (412.2 °F)
l)	Vapour density	No data available
m)	Relative density	1.978 g/mL at 25 °C (77 °F)
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	log Pow: 5.12
p)	Auto-ignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information
No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions
No data available

10.4 Conditions to avoid
No data available

10.5 Incompatible materials
Strong oxidizing agents, Strong bases

10.6 Hazardous decomposition products
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - 27 mg/kg
Remarks: Vascular:BP elevation not charactertized in autonomic section. Endocrine:Hyperglycemia. Nutritional and Gross Metabolic:Changes in:Body temperature increase.

LC50 Inhalation - Rat - 355 mg/m3
Remarks: Behavioral:Excitement. Behavioral:Muscle contraction or spasticity. Lungs, Thorax, or Respiration:Dyspnea.

LD50 Dermal - Rat - 96.0 mg/kg
Remarks: Behavioral:Excitement. Behavioral:Muscle contraction or spasticity. Lungs, Thorax, or Respiration:Dyspnea.

No data available

Skin corrosion/irritation
Skin - Rabbit
Result: Open irritation test - 24.00 h

Serious eye damage/eye irritation
Eyes - Rabbit
Result: Mild eye irritation - 24.00 h

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

The evidence for carcinogenicity of pentachlorophenol (PCP) is based on assays that utilized less than pure PCP. Contaminants of PCP include: tri- or tetra- chlorophenol, hexachlorobenzene, polychlorinated dibenzo-p-dioxins, or polychlorinated dibenzofurans. Indications are that positive evidence for carcinogenicity is from the contaminant(s) and not the PCP. This product is or contains a component that has been reported to be possibly carcinogenic based on its IARC, ACGIH, NTP, or EPA classification.

Limited evidence of carcinogenicity in animal studies

IARC:	2B - Group 2B: Possibly carcinogenic to humans (Pentachlorophenol)
NTP:	Reasonably anticipated to be a human carcinogen (Pentachlorophenol)
OSHA:	No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
No data available

Overexposure may cause reproductive disorder(s) based on tests with laboratory animals.

Specific target organ toxicity - single exposure
May cause respiratory irritation.

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: Not available

Convulsions

Kidney -

12. ECOLOGICAL INFORMATION

12.1 Toxicity

Toxicity to fish	LC50 - Cyprinodon variegatus (sheepshead minnow) - 0.16 - 0.5 mg/l - 96.0 h
	LC50 - Carassius auratus (goldfish) - 0.16 - 0.38 mg/l - 96.0 h
	LC50 - Oncorhynchus mykiss (rainbow trout) - 0.075 mg/l - 96.0 h
	NOEC - other fish - 0.01 mg/l - 24.0 h
	LOEC - other fish - 0.1 mg/l - 24.0 h
Toxicity to daphnia and other aquatic invertebrates	EC50 - Daphnia magna (Water flea) - 0.30 - 1.30 mg/l - 48 h
Toxicity to algae	EC50 - No information available. - 0.36 mg/l - 10 d
	EC50 - Chlorella vulgaris (Fresh water algae) - 10.30 mg/l - 96 h
	Growth inhibition EC50 - Scenedesmus quadricauda (Green algae) - 0.08 mg/l - 96 h

12.2 Persistence and degradability

Biodegradability Result: 99 % - Biodegradable

12.3 Bioaccumulative potential

Bioaccumulation Oncorhynchus mykiss (rainbow trout) - 144 h - 0.0912 mg/l

Bioconcentration factor (BCF): 482

12.4 Mobility in soil

No data available

12.5 Results of PBT and vPvB assessment

PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects

An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.
Very toxic to aquatic life with long lasting effects.

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product

Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber.

Contaminated packaging

Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)

UN number: 3155 Class: 6.1 Packing group: II
Proper shipping name: Pentachlorophenol
Reportable Quantity (RQ): 10 lbs

Poison Inhalation Hazard: No

IMDG

UN number: 3155 Class: 6.1 Packing group: II EMS-No: F-A, S-A
Proper shipping name: PENTACHLOROPHENOL
Marine pollutant: yes

IATA

UN number: 3155 Class: 6.1 Packing group: II
Proper shipping name: Pentachlorophenol

15. REGULATORY INFORMATION

SARA 302 Components

No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components

This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

SARA 311/312 Hazards

Acute Health Hazard, Chronic Health Hazard

Massachusetts Right To Know Components

	CAS-No.	Revision Date
Pentachlorophenol	87-86-5	2007-07-01

Pennsylvania Right To Know Components

	CAS-No.	Revision Date
Pentachlorophenol	87-86-5	2007-07-01

New Jersey Right To Know Components

California Prop. 65 Components

WARNING! This product contains a chemical known to the State of California to cause cancer.	CAS-No.	Revision Date
Pentachlorophenol	87-86-5	2007-09-28

16. OTHER INFORMATION

Full text of H-Statements referred to under sections 2 and 3.

Acute Tox.	Acute toxicity
Aquatic Acute	Acute aquatic toxicity
Aquatic Chronic	Chronic aquatic toxicity
Carc.	Carcinogenicity
Eye Irrit.	Eye irritation
H301	Toxic if swallowed.
H301 + H311	Toxic if swallowed or in contact with skin
H311	Toxic in contact with skin.
H315	Causes skin irritation.
H319	Causes serious eye irritation.
H330	Fatal if inhaled.
H335	May cause respiratory irritation.
H351	Suspected of causing cancer.
H400	Very toxic to aquatic life.

HMIS Rating

Health hazard:	3
Chronic Health Hazard:	*
Flammability:	0
Physical Hazard	1

NFPA Rating

Health hazard:	4
Fire Hazard:	0
Reactivity Hazard:	0

2. Hazard(s) identification

Classification
This chemical is considered hazardous by the 2012 OSHA Hazard Communication Standard (29 CFR 1910.1200)

Acute oral toxicity	Category 4

Label Elements

Signal Word
Warning

Hazard Statements
Harmful if swallowed

Precautionary Statements
Prevention
Wash face, hands and any exposed skin thoroughly after handling
Do not eat, drink or smoke when using this product
Ingestion
IF SWALLOWED: Call a POISON CENTER or doctor/physician if you feel unwell
Rinse mouth

Disposal
Dispose of contents/container to an approved waste disposal plant
Hazards not otherwise classified (HNOC)
Very toxic to aquatic life with long lasting effects

3. Composition / information on ingredients

Component	CAS-No	Weight %
Phenanthrene	85-01-8	>95

4. First-aid measures

General Advice If symptoms persist, call a physician.

Eye Contact Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Obtain medical attention.

Skin Contact Obtain medical attention. Wash off immediately with plenty of water for at least 15 minutes.

Inhalation Move to fresh air. If breathing is difficult, give oxygen. Obtain medical attention.

Ingestion Clean mouth with water and drink afterwards plenty of water. Get medical attention if symptoms occur.

Most important symptoms/effects None reasonably foreseeable.
Notes to Physician Treat symptomatically

5. Fire-fighting measures

Suitable Extinguishing Media Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

Unsuitable Extinguishing Media No information available

Flash Point No information available
Method - No information available

Autoignition Temperature Not applicable
Explosion Limits
Upper No data available
Lower No data available
Sensitivity to Mechanical Impact No information available
Sensitivity to Static Discharge No information available

Specific Hazards Arising from the Chemical
Do not allow run-off from fire fighting to enter drains or water courses.

Hazardous Combustion Products
Carbon monoxide (CO) Carbon dioxide (CO_2)
Protective Equipment and Precautions for Firefighters
As in any fire, wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH (approved or equivalent) and full protective gear.

NFPA

Health	Flammability	Instability	Physical hazards
1	1	0	N/A

6. Accidental release measures

Personal Precautions Ensure adequate ventilation. Use personal protective equipment. Avoid dust formation.

Environmental Precautions Do not flush into surface water or sanitary sewer system. Do not allow material to contaminate ground water system. Prevent product from entering drains. Local authorities should be advised if significant spillages cannot be contained. See Section 12 for additional ecological information. Avoid release to the environment. Collect spillage.

Methods for Containment and Clean Up Sweep up or vacuum up spillage and collect in suitable container for disposal. Keep in suitable, closed containers for disposal.

7. Handling and storage

Handling Wear personal protective equipment. Ensure adequate ventilation. Do not get in eyes, on skin, or on clothing. Avoid ingestion and inhalation. Avoid dust formation.

Storage Keep containers tightly closed in a dry, cool and well-ventilated place.

8. Exposure controls / personal protection

Exposure Guidelines This product does not contain any hazardous materials with occupational exposure limits established by the region specific regulatory bodies.

Engineering Measures Ensure adequate ventilation, especially in confined areas.

Personal Protective Equipment

- **Eye/face Protection** Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133 or European Standard EN166.
- **Skin and body protection** Long sleeved clothing.
- **Respiratory Protection** Follow the OSHA respirator regulations found in 29 CFR 1910.134 or European Standard EN 149. Use a NIOSH/MSHA or European Standard EN 149 approved respirator if exposure limits are exceeded or if irritation or other symptoms are experienced.
- **Hygiene Measures** Handle in accordance with good industrial hygiene and safety practice.

9. Physical and chemical properties

Physical State	Solid
Appearance	Beige
Odor	Odorless
Odor Threshold	No information available
pH	No information available
Melting Point/Range	95 - 101 °C / 203 - 213.8 °F
Boiling Point/Range	336 °C / 636.8 °F
Flash Point	No information available
Evaporation Rate	Not applicable
Flammability (solid,gas)	No information available
Flammability or explosive limits	
Upper	No data available
Lower	No data available
Vapor Pressure	1 mmHg @ 116 °C
Vapor Density	Not applicable
Relative Density	1.063
Solubility	Insoluble in water
Partition coefficient; n-octanol/water	No data available
Autoignition Temperature	Not applicable
Decomposition temperature	No information available
Viscosity	Not applicable
Molecular Formula	C14 H10
Molecular Weight	178.23

10. Stability and reactivity

Reactive Hazard None known, based on information available

Stability Stable under normal conditions.

Conditions to Avoid Incompatible products. Excess heat. Avoid dust formation.

Incompatible Materials Strong oxidizing agents

Hazardous Decomposition Products Carbon monoxide (CO), Carbon dioxide (CO_2)

Hazardous Polymerization Hazardous polymerization does not occur.

Hazardous Reactions None under normal processing.

11. Toxicological information

Acute Toxicity

Product Information
Component Information

Component	LD50 Oral	LD50 Dermal	LC50 Inhalation
Phenanthrene	1.8 g/kg (Rat)	Not listed	Not listed

Toxicologically Synergistic Products No information available

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Irritation No information available

Sensitization No information available

Carcinogenicity The table below indicates whether each agency has listed any ingredient as a carcinogen.

Component	CAS-No	IARC	NTP	ACGIH	OSHA	Mexico
Phenanthrene	85-01-8	Not listed	Not listed	Not listed	Not listed	Not listed

Mutagenic Effects No information available

Reproductive Effects No information available.

Developmental Effects No information available.

Teratogenicity No information available.

STOT - single exposure None known
STOT - repeated exposure None known

Aspiration hazard No information available

Symptoms / effects,both acute and delayed No information available

Endocrine Disruptor Information No information available

Other Adverse Effects The toxicological properties have not been fully investigated. See actual entry in RTECS for complete information.

12. Ecological information

Ecotoxicity
Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment. The product contains following substances which are hazardous for the environment.

Component	Freshwater Algae	Freshwater Fish	Microtox	Water Flea

Phenanthrene	Not listed	LC50 = 3.2 mg/L 96h	Not listed	LC50 = 0.35 mg/L 48h

Persistence and Degradability Insoluble in water May persist

Bioaccumulation/ Accumulation No information available.

Mobility . Is not likely mobile in the environment due its low water solubility.

Component	log Pow
Phenanthrene	4.46

13. Disposal considerations

Waste Disposal Methods Chemical waste generators must determine whether a discarded chemical is classified as a hazardous waste. Chemical waste generators must also consult local, regional, and national hazardous waste regulations to ensure complete and accurate classification.

15. Regulatory information

All of the components in the product are on the following Inventory lists: X = listed

International Inventories

Component	TSCA	DSL	NDSL	EINECS	ELINCS	NLP	PICCS	ENCS	AICS	IECSC	KECL
Phenanthrene	X	X	-	201-581-5	-		X	X	X	X	X

Legend:
X - Listed
E - Indicates a substance that is the subject of a Section 5(e) Consent order under TSCA.
F - Indicates a substance that is the subject of a Section 5(f) Rule under TSCA.
N - Indicates a polymeric substance containing no free-radical initiator in its inventory name but is considered to cover the designated polymer made with any free-radical initiator regardless of the amount used.
P - Indicates a commenced PMN substance
R - Indicates a substance that is the subject of a Section 6 risk management rule under TSCA.
S - Indicates a substance that is identified in a proposed or final Significant New Use Rule
T - Indicates a substance that is the subject of a Section 4 test rule under TSCA.
XU - Indicates a substance exempt from reporting under the Inventory Update Rule, i.e. Partial Updating of the TSCA Inventory Data Base Production and Site Reports (40 CFR 710(B).
Y1 - Indicates an exempt polymer that has a number-average molecular weight of 1,000 or greater.
Y2 - Indicates an exempt polymer that is a polyester and is made only from reactants included in a specified list of low concern reactants that comprises one of the eligibility criteria for the exemption rule.

SAFETY DATA SHEET

Version 6.10
Revision Date 09/06/2024
Print Date 09/06/2024

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifiers

Product name : Phenol

Product Number : P5566
Brand : Sigma-Aldrich
Index-No. : 604-001-00-2
CAS-No. : 108-95-2

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Laboratory chemicals, Synthesis of substances

Uses advised against : The product is being supplied under the TSCA R&D Exemption (40 CFR Section 720.36). It is the recipient's responsibility to comply with the requirements of the R&D exemption. The product may not be used for a non-exempt commercial purpose under TSCA unless appropriate consent is granted in writing by MilliporeSigma.

1.3 Details of the supplier of the safety data sheet

Company : Sigma-Aldrich Inc.
3050 SPRUCE ST
ST. LOUIS MO 63103
UNITED STATES

Telephone : +1 314 771-5765
Fax : +1 800 325-5052

1.4 Emergency telephone

Emergency Phone # : 800-424-9300 CHEMTREC (USA) +1-703-527-3887 CHEMTREC (International) 24 Hours/day; 7 Days/week

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)

Acute toxicity, Oral (Category 3), H301
Acute toxicity, Inhalation (Category 3), H331
Acute toxicity, Dermal (Category 3), H311

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Skin corrosion (Category 1B), H314
Serious eye damage (Category 1), H318
Germ cell mutagenicity (Category 2), H341
Specific target organ toxicity - repeated exposure (Category 2), Nervous system, Kidney, Liver, Skin, H373
Short-term (acute) aquatic hazard (Category 2), H401
Long-term (chronic) aquatic hazard (Category 2), H411

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal Word	Danger
Hazard Statements	
H301 + H311 + H331	Toxic if swallowed, in contact with skin or if inhaled.
H314	Causes severe skin burns and eye damage.
H341	Suspected of causing genetic defects.
H373	May cause damage to organs (Nervous system, Kidney, Liver, Skin) through prolonged or repeated exposure.
H411	Toxic to aquatic life with long lasting effects.
Precautionary Statements	
P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and understood.
P260	Do not breathe dust/ fume/ gas/ mist/ vapors/ spray.
P264	Wash skin thoroughly after handling.
P270	Do not eat, drink or smoke when using this product.
P271	Use only outdoors or in a well-ventilated area.
P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P301 + P310 + P330	IF SWALLOWED: Immediately call a POISON CENTER/ doctor. Rinse mouth.
P301 + P330 + P331	IF SWALLOWED: Rinse mouth. Do NOT induce vomiting.
P303 + P361 + P353	IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water/ shower.
P304 + P340 + P310	IF INHALED: Remove person to fresh air and keep comfortable for breathing. Immediately call a POISON CENTER/ doctor.
P305 + P351 + P338 + P310	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER/ doctor.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.
P362	Take off contaminated clothing and wash before reuse.
P391	Collect spillage.
P403 + P233	Store in a well-ventilated place. Keep container tightly closed.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS

Vesicant., Rapidly absorbed through skin.

SECTION 3: Composition/information on ingredients

3.1 Substances

Synonyms	:	Hydroxybenzene
Formula	:	C_6H_6O
Molecular weight	:	94.11 g/mol
CAS-No.	:	108-95-2
EC-No.	:	203-632-7
Index-No.	:	604-001-00-2

Component	Classification	Concentration
Phenol		
	Acute Tox. 3; Skin Corr. 1B; Eye Dam. 1; Muta. 2; STOT RE 2; Aquatic Acute 2; Aquatic Chronic 2; H301, H331, H311, H314, H318, H341, H373, H401, H411 Concentration limits: >= 3 %: Skin Corr. 1B, H314; 1 - < 3 %: Skin Irrit. 2, H315; 1 - < 3 %: Eye Irrit. 2, H319;	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

SECTION 4: First aid measures

4.1 Description of first-aid measures

General advice

First aiders need to protect themselves. Show this material safety data sheet to the doctor in attendance.

If inhaled

After inhalation: fresh air. Immediately call in physician. If breathing stops: immediately apply artificial respiration, if necessary also oxygen.

In case of skin contact

After contact with skin: rinse out with polyethylene glycol 400 or a mixture of polyethylene glycol 300/ethanol 2:1 and wash with plenty of water. If neither is available wash with plenty of water. Immediately take off contaminated clothing. Call a physician immediately.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

In case of eye contact
After eye contact: rinse out with plenty of water. Immediately call in ophthalmologist. Remove contact lenses.

If swallowed
If swallowed: give water to drink (two glasses at most). Seek medical advice immediately. In exceptional cases only, if medical care is not available within one hour, induce vomiting (only in persons who are wide awake and fully conscious), administer activated charcoal (20 - 40 g in a 10% slurry) and consult a doctor as quickly as possible. Do not attempt to neutralise.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media
Water Foam Carbon dioxide (CO2) Dry powder

Unsuitable extinguishing media
For this substance/mixture no limitations of extinguishing agents are given.

5.2 Special hazards arising from the substance or mixture
Carbon oxides
Combustible.
Vapors are heavier than air and may spread along floors.
Forms explosive mixtures with air on intense heating.
Development of hazardous combustion gases or vapours possible in the event of fire.

5.3 Advice for firefighters
Stay in danger area only with self-contained breathing apparatus. Prevent skin contact by keeping a safe distance or by wearing suitable protective clothing.

5.4 Further information
Remove container from danger zone and cool with water. Prevent fire extinguishing water from contaminating surface water or the ground water system.

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures
Advice for non-emergency personnel: Avoid generation and inhalation of dusts in all circumstances. Avoid substance contact. Ensure adequate ventilation. Keep away from heat and sources of ignition. Evacuate the danger area, observe emergency procedures, consult an expert.
For personal protection see section 8.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

6.2 Environmental precautions
Do not let product enter drains.

6.3 Methods and materials for containment and cleaning up
Cover drains. Collect, bind, and pump off spills. Observe possible material restrictions (see sections 7 and 10). Take up carefully. Dispose of properly. Clean up affected area. Avoid generation of dusts.

6.4 Reference to other sections
For disposal see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Advice on safe handling
Work under hood. Do not inhale substance/mixture.

Advice on protection against fire and explosion
Keep away from open flames, hot surfaces and sources of ignition.Take precautionary measures against static discharge.

Hygiene measures
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities

Storage conditions
Tightly closed. Dry. Keep in a well-ventilated place. Keep locked up or in an area accessible only to qualified or authorized persons.
Storage stability Recommended storage temperature
2 - 8 °C
Handle and store under inert gas. Light sensitive.

Storage class
Storage class (TRGS 510): 6.1A: Combustible, acute toxic Cat. 1 and 2 / very toxic hazardous materials

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Ingredients with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
Phenol	108-95-2	TWA	5 ppm	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Not classifiable as a human carcinogen		

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

		Danger of cutaneous absorption		
		TWA	5 ppm 19 mg/m3	USA. NIOSH Recommended Exposure Limits
		Potential for dermal absorption		
		C	15.6 ppm 60 mg/m3	USA. NIOSH Recommended Exposure Limits
		Potential for dermal absorption		
		TWA	5 ppm 19 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		Skin designation		
		PEL	5 ppm 19 mg/m3	California permissible exposure limits for chemical contaminants (Title 8, Article 107)
		Skin		

Biological occupational exposure limits

Component	CAS-No.	Parameters	Value	Biological specimen	Basis
Phenol	108-95-2	Phenol	250mg/g creatinine	Urine	ACGIH - Biological Exposure Indices (BEI)
	Remarks	End of shift (As soon as possible after exposure ceases)			

8.2 Exposure controls

Appropriate engineering controls
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.

Personal protective equipment

Eye/face protection
Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU). Tightly fitting safety goggles

Skin protection
This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Full contact
Material: Viton®
Minimum layer thickness: 0.7 mm
Break through time: 480 min
Material tested:Vitoject® (KCL 890 / Aldrich Z677698, Size M)

This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Splash contact
Material: Viton®
Minimum layer thickness: 0.7 mm
Break through time: 480 min
Material tested:Vitoject® (KCL 890 / Aldrich Z677698, Size M)

Body Protection
Flame retardant antistatic protective clothing.

Respiratory protection
Recommended Filter type: Filter A-(P3)
The entrepeneur has to ensure that maintenance, cleaning and testing of respiratory protective devices are carried out according to the instructions of the producer. These measures have to be properly documented.
required when dusts/vapours/aerosols are generated. Our recommendations on filtering respiratory protection are based on the following standards: DIN EN 143, DIN 14387 and other accompanying standards relating to the used respiratory protection system.

Control of environmental exposure
Do not let product enter drains.

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: solid
b)	Odor	stinging
c)	Odor Threshold	0.005 ppm
d)	pH	6.0
e)	Melting point/freezing point	Melting point/ range: 38 - 43 °C (100 - 109 °F)
f)	Initial boiling point and boiling range	181.8 °C 359.2 °F at 1,013 hPa
g)	Flash point	79.0 °C (174.2 °F) - closed cup
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	Upper explosion limit: 9.5 %(V) Lower explosion limit: 1.3 %(V)
k)	Vapor pressure	0.53 hPa at 20.0 °C (68.0 °F)
l)	Vapor density	3.2 at 20 °C(68 °F) - (Air = 1.0)
m)	Density	1.13 g/cm3 at 25 °C (77 °F) - DIN 51757
	Relative density	No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

n)	Water solubility	87 g/l at 25 °C (77 °F)
o)	Partition coefficient: n-octanol/water	log Pow: 1.47 at 30 °C (86 °F) - (ECHA), Bioaccumulation is not expected.
p)	Autoignition temperature	715 °C (1319 °F) at 1,013 hPa
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information

Surface tension	38.2 mN/m at 50.0 °C (122.0 °F)
Relative vapor density	3.2 at 20 °C (68 °F) - (Air = 1.0)

SECTION 10: Stability and reactivity

10.1 Reactivity

Forms explosive mixtures with air on intense heating.
A range from approx. 15 Kelvin below the flash point is to be rated as critical.
The following applies in general to flammable organic substances and mixtures: in correspondingly fine distribution, when whirled up a dust explosion potential may generally be assumed.

10.2 Chemical stability

The product is chemically stable under standard ambient conditions (room temperature) .
Contains the following stabilizer(s):
Hypophosphorous acid (0.15 %)

10.3 Possibility of hazardous reactions

Exothermic reaction with:
Aluminum
Aldehydes
halogens
hydrogen peroxide
iron(III) compounds
Oxidizing agents
Strong acids
Strong bases
formaldehyde
Risk of explosion with:
nitrites
nitrates
salts of oxyhalogenic acids
peroxi compounds

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

10.4 Conditions to avoid
Strong heating.

10.5 Incompatible materials
rubber, various plastics, various alloys, various metals

10.6 Hazardous decomposition products
In the event of fire: see section 5

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity
Acute toxicity estimate Oral - 100.1 mg/kg
(Calculation method)
Acute toxicity estimate Oral - 100.1 mg/kg
(Expert judgment)
Remarks: Classified according to Regulation (EU) 1272/2008, Annex VI (Table 3.1/3.2)
Acute toxicity estimate Inhalation - 4 h - 0.51 mg/l - dust/mist(Calculation method)

Acute toxicity estimate Inhalation - 4 h - 0.51 mg/l - dust/mist

(Expert judgment)
Symptoms: Irritation, Lung edema
Remarks: Classified according to Regulation (EU) 1272/2008, Annex VI (Table 3.1/3.2)
Acute toxicity estimate Dermal - 660 mg/kg
(Calculation method)
LD50 Dermal - Rat - female - 660 mg/kg
(OECD Test Guideline 402)
No data available

Skin corrosion/irritation
Skin - In vitro study
Result: Causes burns.
(OECD Test Guideline 431)

Serious eye damage/eye irritation
Eyes - Rabbit
Result: Corrosive
(OECD Test Guideline 405)
Remarks: Causes serious eye damage.
Risk of blindness!

Respiratory or skin sensitization
Sensitisation test: - Guinea pig
Result: negative
Remarks: (IUCLID)

Germ cell mutagenicity
Suspected of causing genetic defects.
Test Type: Mutagenicity (mammal cell test): chromosome aberration.
Test system: Chinese hamster ovary cells
Metabolic activation: Metabolic activation

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Method: OECD Test Guideline 473
Result: positive
Test Type: Mutagenicity (mammal cell test): micronucleus.
Test system: Chinese hamster ovary cells
Metabolic activation: with and without metabolic activation
Method: OECD Test Guideline 487
Result: positive

Carcinogenicity
This product is or contains a component that is not classifiable as to its carcinogenicity based on its IARC, ACGIH, NTP, or EPA classification.

IARC: No ingredient of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

NTP: No ingredient of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is on OSHA's list of regulated carcinogens.

Reproductive toxicity
No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
May cause damage to organs through prolonged or repeated exposure.
- Nervous system, Kidney, Liver, Skin
Remarks: Classified according to Regulation (EU) 1272/2008, Annex VI (Table 3.1/3.2)

Aspiration hazard
No data available

11.2 Additional Information

Material is extremely destructive to tissue of the mucous membranes and upper respiratory tract, eyes, and skin., spasm, inflammation and edema of the larynx, spasm, inflammation and edema of the bronchi, pneumonitis, pulmonary edema, burning sensation, Cough, wheezing, laryngitis, Shortness of breath, Headache, Nausea, Vomiting, Circulatory collapse, tachypnea, paralysis, Convulsions, Coma., necrosis of mouth and G.I. Tract, Jaundice, respiratory failure, cardiac arrest
To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

Stomach - Irregularities - Based on Human Evidence

Stomach - Irregularities - Based on Human Evidence

SECTION 12: Ecological information

12.1 Toxicity

Toxicity to fish flow-through test LC50 - Onchorhynchus clarki - 8.9 mg/l - 96 h

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

	(US-EPA)
Toxicity to daphnia and other aquatic invertebrates	static test EC50 - Ceriodaphnia dubia (water flea) - 3.1 mg/l - 48 h (US-EPA)
Toxicity to algae	static test EC50 - Pseudokirchneriella subcapitata (algae) - 61.1 mg/l - 96 h (US-EPA)
Toxicity to bacteria	static test IC50 - microorganisms - 21 mg/l - 24 h Remarks: (ECHA)
Toxicity to fish(Chronic toxicity)	semi-static test NOEC - Fish - 0.077 mg/l - 60 d Remarks: (ECHA)
Toxicity to daphnia and other aquatic invertebrates(Chronic toxicity)	semi-static test NOEC - Daphnia magna (Water flea) - 0.16 mg/l - 16 d Remarks: (ECHA)

12.2 Persistence and degradability

Biodegradability	aerobic - Exposure time 100 h Result: 62 % - Readily biodegradable. (OECD Test Guideline 301C)

12.3 Bioaccumulative potential

Bioaccumulation	Danio rerio (zebra fish) - 5 h at 25 °C - 2 mg/l(Phenol) Bioconcentration factor (BCF): 17.5 (OECD Test Guideline 305) Remarks: Does not bioaccumulate.

12.4 Mobility in soil

No data available

12.5 Results of PBT and vPvB assessment

PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Endocrine disrupting properties

No data available

12.7 Other adverse effects

No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product
Waste material must be disposed of in accordance with the national and local regulations. Leave chemicals in original containers. No mixing with other waste. Handle uncleaned containers like the product itself.

SECTION 14: Transport information

DOT (US)
UN number: 1671 Class: 6.1 Packing group: II
Proper shipping name: Phenol, solid
Reportable Quantity (RQ): 1000 lbs
Poison Inhalation Hazard: No

IMDG
UN number: 1671 Class: 6.1 Packing group: II EMS-No: F-A, S-A
Proper shipping name: PHENOL, SOLID
Marine pollutant : yes

IATA
UN number: 1671 Class: 6.1 Packing group: II
Proper shipping name: Phenol, solid

SECTION 15: Regulatory information

CERCLA Reportable Quantity

Components	CAS-No.	Component RQ (lbs)	Calculated product RQ (lbs)
Phenol	108-95-2	1000	1000

SARA 304 Extremely Hazardous Substances Reportable Quantity

Components	CAS-No.	Component RQ (lbs)	Calculated product RQ (lbs)
Phenol	108-95-2	1000	1000

SARA 302 Extremely Hazardous Substances Threshold Planning Quantity

Components	CAS-No.	Component TPQ (lbs)
Phenol	108-95-2	10000
Phenol	108-95-2	500*

*: Solid in the molten or powdered form (particles < 100 microns), in solution, or meeting the NFPA reactivity criteria

SARA 311/312 Hazards : Acute Health Hazard
Chronic Health Hazard

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SARA 313 : The following components are subject to reporting levels established by SARA Title III, Section 313:

Phenol	108-95-2	>= 90 - <= 100 %

US State Regulations

Massachusetts Right To Know

No components are subject to the Massachusetts Right to Know Act.

Maine Chemicals of High Concern

Product does not contain any listed chemicals

Vermont Chemicals of High Concern

Product does not contain any listed chemicals

Washington Chemicals of High Concern

Product does not contain any listed chemicals

The ingredients of this product are reported in the following inventories:

TSCA : All substances listed as active on the TSCA inventory

TSCA list

No substances are subject to a Significant New Use Rule.

No substances are subject to TSCA 12(b) export notification requirements.

SECTION 16: Other information

Further information

The information is believed to be correct but is not exhaustive and will be used solely as a guideline, which is based on current knowledge of the chemical substance or mixture and is applicable to appropriate safety precautions for the product. It does not represent any guarantee of the properties of the product. Sigma-Aldrich Corporation and its Affiliates shall not be held liable for any damage resulting from handling or from contact with the above product. See www.sigma-aldrich.com and/or the reverse side of invoice or packing slip for additional terms and conditions of sale.

SAFETY DATA SHEET

Version 3.10
Revision Date 03/03/2015
Print Date 02/07/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	Potassium
Product Number	:	244864
Brand	:	Aldrich
CAS-No.	:	7440-09-7

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Manufacture of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Substances and mixtures, which in contact with water, emit flammable gases (Category 1), H260
Skin corrosion (Category 1A), H314
Serious eye damage (Category 1), H318
Carcinogenicity (Category 1A), H350

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word: Danger

Hazard statement(s)

H260	In contact with water releases flammable gases which may ignite spontaneously.
H314	Causes severe skin burns and eye damage.
H318	Causes serious eye damage.
H350	May cause cancer.

Precautionary statement(s)

P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and understood.
P223	Keep away from any possible contact with water, because of violent reaction and possible flash fire.

P231 + P232	Handle under inert gas. Protect from moisture.
P260	Do not breathe dust or mist.
P264	Wash skin thoroughly after handling.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P281	Use personal protective equipment as required.
P301 + P330 + P331	IF SWALLOWED: Rinse mouth. Do NOT induce vomiting.
P303 + P361 + P353	IF ON SKIN (or hair): Remove/ Take off immediately all contaminated clothing. Rinse skin with water/ shower.
P304 + P340 + P310	IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing. Immediately call a POISON CENTER or doctor/ physician.
P305 + P351 + P338 + P310	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER or doctor/ physician.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.
P335 + P334	Brush off loose particles from skin. Immerse in cool water/ wrap in wet bandages.
P363	Wash contaminated clothing before reuse.
P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam for extinction.
P402 + P404	Store in a dry place. Store in a closed container.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS

Reacts violently with water.
May form explosive peroxides.

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.2 Mixtures

Formula : K
Molecular weight : 39.10 g/mol

Hazardous components

Component		Classification	Concentration
Potassium			
CAS-No. EC-No. Index-No.	7440-09-7 231-119-8 019-001-00-2	Water-react. 1; Skin Corr. 1A; Eye Dam. 1; H260, H314	>= 90 - <= 100 %
Paraffin oils			
CAS-No. EC-No.	8012-95-1 232-384-2	Carc. 1A; H350	>= 1 - < 5 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Take off contaminated clothing and shoes immediately. Wash off with soap and plenty of water. Consult a physician.

In case of eye contact
Rinse thoroughly with plenty of water for at least 15 minutes and consult a physician.Continue rinsing eyes during transport to hospital.

If swallowed
Do NOT induce vomiting. Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Dry powder

5.2 Special hazards arising from the substance or mixture
Carbon oxides, Potassium oxides

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
No data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Use personal protective equipment. Avoid dust formation. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains.

6.3 Methods and materials for containment and cleaning up
Sweep up and shovel. Contain spillage, and then collect with an electrically protected vacuum cleaner or by wet-brushing and place in container for disposal according to local regulations (see section 13). Do not flush with water. Keep in suitable, closed containers for disposal.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid formation of dust and aerosols.Further processing of solid materials may result in the formation of combustible dusts. The potential for combustible dust formation should be taken into consideration before additional processing occurs.
Provide appropriate exhaust ventilation at places where dust is formed.Keep away from sources of ignition - No smoking.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.
Never allow product to get in contact with water during storage.

Handle and store under inert gas.
Storage class (TRGS 510): Hazardous materials, which set free flammable gases upon contact with water

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
Paraffin oils	8012-95-1	STEL	10.000000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		TWA	5.000000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		TWA	5.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		ST	10.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		TWA	5.000000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		TWA	5.000000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Upper Respiratory Tract irritation 2014 Adoption Not classifiable as a human carcinogen		
		Upper Respiratory Tract irritation 2014 Adoption Exposure by all routes should be carefully controlled to levels as low as possible. Suspected human carcinogen		
		TWA	5.000000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		TWA	5.000000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		Upper Respiratory Tract irritation Exposure by all routes should be carefully controlled to levels as low as possible. Suspected human carcinogen		
		TWA	5.000000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Upper Respiratory Tract irritation Not classifiable as a human carcinogen		
		TWA	5.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		ST	10.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		Upper Respiratory Tract irritation Exposure by all routes should be carefully controlled to levels as low as possible. Suspected human carcinogen		

8.2 Exposure controls

Appropriate engineering controls

Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection
Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Complete suit protecting against chemicals, Flame retardant protective clothing, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face particle respirator type N100 (US) or type P3 (EN 143) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: Fragments Colour: grey
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: 64 °C (147 °F)
f)	Initial boiling point and boiling range	774 °C (1,425 °F) at 1,013 hPa (760 mmHg)
g)	Flash point	No data available
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower	No data available

	flammability or explosive limits	
k)	Vapour pressure	0.12 hPa (0.09 mmHg) at 260 °C (500 °F)
l)	Vapour density	No data available
m)	Relative density	0.860 g/cm3
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	No data available
p)	Auto-ignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information
No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions
Reacts violently with water.

10.4 Conditions to avoid
Exposure to moisture

10.5 Incompatible materials
Oxidizing agents, Strong oxidizing agents, Carbon oxides, Reacts violently with water., Reacts with water to generate Hydrogen gas.

10.6 Hazardous decomposition products
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
No data available

Inhalation: No data available

Dermal: No data available

No data available

Skin corrosion/irritation
No data available

Serious eye damage/eye irritation
No data available

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

IARC:	1 - Group 1: Carcinogenic to humans (Paraffin oils)
NTP:	Known to be human carcinogenThe reference note has been added by TD based on the background information of the NTP. (Paraffin oils)
OSHA:	No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
No data available
No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: Not available

Material is extremely destructive to tissue of the mucous membranes and upper respiratory tract, eyes, and skin., spasm, inflammation and edema of the larynx, spasm, inflammation and edema of the bronchi, pneumonitis, pulmonary edema, burning sensation, Cough, wheezing, laryngitis, Shortness of breath, Headache, Nausea

12. ECOLOGICAL INFORMATION

12.1 Toxicity
No data available

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
No data available

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Burn in a chemical incinerator equipped with an afterburner and scrubber but exert extra care in igniting as this material is highly flammable. Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)

UN number: 2257 Class: 4.3 Packing group: I
Proper shipping name: Potassium
Reportable Quantity (RQ):

Poison Inhalation Hazard: No

IMDG
UN number: 2257 Class: 4.3 Packing group: I EMS-No: F-G, S-N
Proper shipping name: POTASSIUM

IATA
UN number: 2257 Class: 4.3 Packing group: I
Proper shipping name: Potassium
IATA Passenger: Not permitted for transport

15. REGULATORY INFORMATION

SARA 302 Components
No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components
This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

SARA 311/312 Hazards
Reactivity Hazard, Acute Health Hazard, Chronic Health Hazard

Massachusetts Right To Know Components

	CAS-No.	Revision Date
Potassium	7440-09-7	1993-04-24

Paraffin oils	8012-95-1	2007-03-01

California Prop. 65 Components

WARNING! This product contains a chemical known to the State of California to cause cancer.	CAS-No.	Revision Date
Paraffin oils	8012-95-1	1987-02-27

16. OTHER INFORMATION

Full text of H-Statements referred to under sections 2 and 3.

Carc.	Carcinogenicity
Eye Dam.	Serious eye damage
H260	In contact with water releases flammable gases which may ignite spontaneously.
H314	Causes severe skin burns and eye damage.
H318	Causes serious eye damage.
H350	May cause cancer.
Skin Corr.	Skin corrosion
Water-react.	Substances and mixtures, which in contact with water, emit flammable gases

HMIS Rating
Health hazard: 3

Chronic Health Hazard:	*
Flammability:	4
Physical Hazard	2

NFPA Rating

Health hazard:	3
Fire Hazard:	4
Reactivity Hazard:	2
Special hazard.I:	W

SAFETY DATA SHEET

Creation Date 01-Jul-2010 **Revision Date** 10-Feb-2015 **Revision Number** 1

1. Identification

Product Name **Pyrene**

Cat No. : **AC180830000; AC180830250; AC180831000; AC180835000**

Synonyms Benzo[def]phenanthrene

Recommended Use Laboratory chemicals.

Uses advised against No Information available

Details of the supplier of the safety data sheet

Company
Fisher Scientific
One Reagent Lane
Fair Lawn, NJ 07410
Tel: (201) 796-7100

Entity / Business Name
Acros Organics
One Reagent Lane
Fair Lawn, NJ 07410

Emergency Telephone Number
For information **US** call: 001-800-ACROS-01 / **Europe** call: +32 14 57 52 11
Emergency Number **US:**001-201-796-7100 / **Europe:** +32 14 57 52 99
CHEMTREC Tel. No.**US:**001-800-424-9300 / **Europe:**001-703-527-3887

2. Hazard(s) identification

Classification
This chemical is considered hazardous by the 2012 OSHA Hazard Communication Standard (29 CFR 1910.1200)

Skin Corrosion/irritation	Category 2
Serious Eye Damage/Eye Irritation	Category 2
Specific target organ toxicity (single exposure)	Category 3
Target Organs - Central nervous system (CNS).	
Specific target organ toxicity - (repeated exposure)	Category 2
Target Organs - Liver.	

Label Elements

Signal Word
Warning

Hazard Statements
Causes skin irritation
Causes serious eye irritation
May cause drowsiness or dizziness
May cause damage to organs through prolonged or repeated exposure

Precautionary Statements
Prevention
Wear protective gloves/protective clothing/eye protection/face protection
Use only outdoors or in a well-ventilated area
Do not breathe dust/fume/gas/mist/vapors/spray
Wash face, hands and any exposed skin thoroughly after handling
Do not get in eyes, on skin, or on clothing
Response
Get medical attention/advice if you feel unwell
Inhalation
IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing
Skin
IF ON SKIN: Wash with plenty of soap and water
Take off contaminated clothing and wash before reuse
If skin irritation occurs: Get medical advice/attention
Eyes
IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing
If eye irritation persists: Get medical advice/attention
Storage
Store in a well-ventilated place. Keep container tightly closed
Store locked up
Disposal
Dispose of contents/container to an approved waste disposal plant
Hazards not otherwise classified (HNOC)
Very toxic to aquatic life with long lasting effects

3. Composition / information on ingredients

Component	CAS-No	Weight %
Pyrene	129-00-0	>95

4. First-aid measures

Eye Contact Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Obtain medical attention.

Skin Contact Wash off immediately with plenty of water for at least 15 minutes. Obtain medical attention.

Inhalation Move to fresh air. If breathing is difficult, give oxygen. Obtain medical attention.

Ingestion Do not induce vomiting. Obtain medical attention.

Most important symptoms/effects No information available.
Notes to Physician Treat symptomatically

5. Fire-fighting measures

Suitable Extinguishing Media Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

Unsuitable Extinguishing Media No information available

Flash Point	210 °C / 410 °F
Method -	No information available
Autoignition Temperature	No information available
Explosion Limits	
Upper	No data available
Lower	No data available
Sensitivity to Mechanical Impact	No information available
Sensitivity to Static Discharge	No information available

Specific Hazards Arising from the Chemical
Keep product and empty container away from heat and sources of ignition.

Hazardous Combustion Products
Carbon monoxide (CO) Carbon dioxide (CO_2)
Protective Equipment and Precautions for Firefighters
As in any fire, wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH (approved or equivalent) and full protective gear. Thermal decomposition can lead to release of irritating gases and vapors.

NFPA

Health	Flammability	Instability	Physical hazards
2	1	0	N/A

6. Accidental release measures

Personal Precautions	Ensure adequate ventilation. Use personal protective equipment. Avoid dust formation.
Environmental Precautions	Should not be released into the environment. See Section 12 for additional ecological information. Avoid release to the environment. Collect spillage.
Methods for Containment and Clean Up	Sweep up or vacuum up spillage and collect in suitable container for disposal. Avoid dust formation.

7. Handling and storage

Handling	Ensure adequate ventilation. Wear personal protective equipment. Avoid contact with skin, eyes and clothing. Avoid dust formation. Avoid breathing dust/fume/gas/mist/vapours/spray. Avoid ingestion and inhalation.
Storage	Keep containers tightly closed in a dry, cool and well-ventilated place.

8. Exposure controls / personal protection

Exposure Guidelines	This product does not contain any hazardous materials with occupational exposure limits established by the region specific regulatory bodies.
Engineering Measures	Ensure adequate ventilation, especially in confined areas. Ensure that eyewash stations and safety showers are close to the workstation location.

Personal Protective Equipment

Eye/face Protection	Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133 or European Standard EN166.
Skin and body protection	Wear appropriate protective gloves and clothing to prevent skin exposure.
Respiratory Protection	Follow the OSHA respirator regulations found in 29 CFR 1910.134 or European Standard EN 149. Use a NIOSH/MSHA or European Standard EN 149 approved respirator if exposure limits are exceeded or if irritation or other symptoms are experienced.

Hygiene Measures Handle in accordance with good industrial hygiene and safety practice.

9. Physical and chemical properties

Physical State	Solid
Appearance	Yellow
Odor	Odorless
Odor Threshold	No information available
pH	No information available
Melting Point/Range	148 - 152 °C / 298 - 306 °F
Boiling Point/Range	393 °C / 739.4 °F @ 760 mmHg
Flash Point	210 °C / 410 °F
Evaporation Rate	No information available
Flammability (solid,gas)	No information available
Flammability or explosive limits	
Upper	No data available
Lower	No data available
Vapor Pressure	No information available
Vapor Density	No information available
Relative Density	No information available
Solubility	No information available
Partition coefficient; n-octanol/water	No data available
Autoignition Temperature	No information available
Decomposition Temperature	No information available
Viscosity	No information available
Molecular Formula	C16 H10
Molecular Weight	202.25

10. Stability and reactivity

Reactive Hazard None known, based on information available

Stability Stable under normal conditions.

Conditions to Avoid Incompatible products. Excess heat. Avoid dust formation.

Incompatible Materials Strong oxidizing agents

Hazardous Decomposition Products Carbon monoxide (CO), Carbon dioxide (CO_2)

Hazardous Polymerization Hazardous polymerization does not occur.

Hazardous Reactions None under normal processing.

11. Toxicological information

Acute Toxicity

Product Information No acute toxicity information is available for this product

Component Information

Component	LD50 Oral	LD50 Dermal	LC50 Inhalation
Pyrene	2700 mg/kg (Rat)	Not listed	Not listed

Toxicologically Synergistic Products No information available

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Irritation Irritating to eyes and skin

Sensitization No information available

Carcinogenicity The table below indicates whether each agency has listed any ingredient as a carcinogen.

Component	CAS-No	IARC	NTP	ACGIH	OSHA	Mexico
Pyrene	129-00-0	Not listed	Not listed	Not listed	Not listed	Not listed

Mutagenic Effects No information available

Reproductive Effects No information available.

Developmental Effects No information available.

Teratogenicity No information available.

STOT - single exposure Central nervous system (CNS)
STOT - repeated exposure Liver

Aspiration hazard No information available

Symptoms / effects,both acute and delayed No information available
Endocrine Disruptor Information No information available

Other Adverse Effects Tumorigenic effects have been reported in experimental animals. The toxicological properties have not been fully investigated. See actual entry in RTECS for complete information.

12. Ecological information

Ecotoxicity
Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment. Do not empty into drains. Do not flush into surface water or sanitary sewer system. Do not allow material to contaminate ground water system.

Component	Freshwater Algae	Freshwater Fish	Microtox	Water Flea
Pyrene	Not listed	Oncorhynchus mykiss: LC50 > 2mg/L 96h	Not listed	EC50 48h 1.8 mg/L EC50 48h 0.002-0.003 mg/L

Persistence and Degradability No information available
Bioaccumulation/ Accumulation No information available.

Mobility .

Component	log Pow
Pyrene	4.88

13. Disposal considerations

Waste Disposal Methods Chemical waste generators must determine whether a discarded chemical is classified as a hazardous waste. Chemical waste generators must also consult local, regional, and national hazardous waste regulations to ensure complete and accurate classification.

14. Transport information

DOT

1.4 Emergency telephone

Emergency Phone # : 800-424-9300 CHEMTREC (USA) +1-703-527-3887 CHEMTREC (International) 24 Hours/day; 7 Days/week

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)

Flammable liquids (Category 3), H226
Acute toxicity, Oral (Category 4), H302
Short-term (acute) aquatic hazard (Category 1), H400
Long-term (chronic) aquatic hazard (Category 1), H410

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Signal Word	Warning
Hazard statement(s)	
H226	Flammable liquid and vapor.
H302	Harmful if swallowed.
H410	Very toxic to aquatic life with long lasting effects.
Precautionary statement(s)	
P210	Keep away from heat/ sparks/ open flames/ hot surfaces. No smoking.
P233	Keep container tightly closed.
P240	Ground/bond container and receiving equipment.
P241	Use explosion-proof electrical/ ventilating/ lighting/ equipment.
P242	Use only non-sparking tools.
P243	Take precautionary measures against static discharge.
P264	Wash skin thoroughly after handling.
P270	Do not eat, drink or smoke when using this product.
P273	Avoid release to the environment.
P280	Wear protective gloves/ eye protection/ face protection.
P301 + P312 + P330	IF SWALLOWED: Call a POISON CENTER/ doctor if you feel unwell. Rinse mouth.
P303 + P361 + P353	IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water/ shower.
P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam to extinguish.
P391	Collect spillage.
P403 + P235	Store in a well-ventilated place. Keep cool.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

SECTION 3: Composition/information on ingredients

3.1 Substances

Synonyms	:	2-Phenylbutane
Formula	:	$C_{10}H_{14}$
Molecular weight	:	134.22 g/mol
CAS-No.	:	135-98-8
EC-No.	:	205-227-0

Component	Classification	Concentration
sec-Butylbenzene		
	Flam. Liq. 3; Acute Tox. 4; Aquatic Acute 1; Aquatic Chronic 1; H226, H302, H400, H410 M-Factor - Aquatic Acute: 1	<= 100 %

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

For the full text of the H-Statements mentioned in this Section, see Section 16.

SECTION 4: First aid measures

4.1 Description of first-aid measures

General advice
Show this material safety data sheet to the doctor in attendance.

If inhaled
After inhalation: fresh air.

In case of skin contact
In case of skin contact: Take off immediately all contaminated clothing. Rinse skin with water/ shower.

In case of eye contact
After eye contact: rinse out with plenty of water. Remove contact lenses.

If swallowed
After swallowing: immediately make victim drink water (two glasses at most). Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed

The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed

No data available

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media
Carbon dioxide (CO2) Foam Dry powder

Unsuitable extinguishing media
For this substance/mixture no limitations of extinguishing agents are given.

5.2 Special hazards arising from the substance or mixture

Carbon oxides
Combustible.
Vapors are heavier than air and may spread along floors.
Forms explosive mixtures with air at elevated temperatures.
Development of hazardous combustion gases or vapours possible in the event of fire.

5.3 Advice for firefighters

In the event of fire, wear self-contained breathing apparatus.

5.4 Further information

Remove container from danger zone and cool with water. Prevent fire extinguishing water from contaminating surface water or the ground water system.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Advice for non-emergency personnel: Do not breathe vapors, aerosols. Avoid substance contact. Ensure adequate ventilation. Keep away from heat and sources of ignition. Evacuate the danger area, observe emergency procedures, consult an expert.
For personal protection see section 8.

6.2 Environmental precautions

Do not let product enter drains. Risk of explosion.

6.3 Methods and materials for containment and cleaning up

Cover drains. Collect, bind, and pump off spills. Observe possible material restrictions (see sections 7 and 10). Take up with liquid-absorbent material (e.g. Chemizorb®). Dispose of properly. Clean up affected area.

6.4 Reference to other sections

For disposal see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Advice on protection against fire and explosion
Keep away from open flames, hot surfaces and sources of ignition.Take precautionary measures against static discharge.

Hygiene measures
Change contaminated clothing. Preventive skin protection recommended. Wash hands after working with substance.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities

Storage conditions
Keep container tightly closed in a dry and well-ventilated place. Keep away from heat and sources of ignition.

Storage class
Storage class (TRGS 510): 3: Flammable liquids

7.3 Specific end use(s)

Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Ingredients with workplace control parameters
Contains no substances with occupational exposure limit values.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

8.2 Exposure controls

Appropriate engineering controls
Change contaminated clothing. Preventive skin protection recommended. Wash hands after working with substance.

Personal protective equipment

Eye/face protection
Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU). Safety glasses

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Fluorinated rubber
Minimum layer thickness: 0.7 mm
Break through time: 480 min
Material tested:Vitoject® (KCL 890 / Aldrich Z677698, Size M)

Splash contact
Material: Fluorinated rubber
Minimum layer thickness: 0.7 mm
Break through time: 480 min
Material tested:Vitoject® (KCL 890 / Aldrich Z677698, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the EC approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Flame retardant antistatic protective clothing.

Respiratory protection
Recommended Filter type: Filter type ABEK
The entrepeneur has to ensure that maintenance, cleaning and testing of respiratory protective devices are carried out according to the instructions of the producer. These measures have to be properly documented.
required when vapours/aerosols are generated.
Our recommendations on filtering respiratory protection are based on the following standards: DIN EN 143, DIN 14387 and other accompanying standards relating to the used respiratory protection system.

Control of environmental exposure
Do not let product enter drains. Risk of explosion.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: liquid, clear Color: colorless
b)	Odor	No data available
c)	Odor Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: 75.5 °C (167.9 °F) - lit.
f)	Initial boiling point and boiling range	173 - 174 °C 343 - 345 °F - lit.
g)	Flash point	52.0 °C (125.6 °F) - closed cup
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	Lower explosion limit: 0.8 %(V)
k)	Vapor pressure	No data available
l)	Vapor density	No data available
m)	Density	0.863 g/mL at 25 °C (77 °F) - lit.
	Relative density	No data available
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	No data available
p)	Autoignition temperature	418.0 °C (784.4 °F)
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information

No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 10: Stability and reactivity

10.1 Reactivity
Vapor/air-mixtures are explosive at intense warming.

10.2 Chemical stability
The product is chemically stable under standard ambient conditions (room temperature) .

10.3 Possibility of hazardous reactions
Violent reactions possible with:
Strong oxidizing agents

10.4 Conditions to avoid
Heating.

10.5 Incompatible materials
various plastics

10.6 Hazardous decomposition products
In the event of fire: see section 5

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - 1,926 mg/kg
Remarks: (RTECS)
Inhalation: No data available
LD50 Dermal - Rabbit - > 13,760 mg/kg
Remarks: (RTECS)
No data available

Skin corrosion/irritation
Skin - Rabbit
Result: Mild eye irritant - 24 h
Remarks: (RTECS)

Serious eye damage/eye irritation
Eyes - Rabbit
Result: Mild eye irritation - 24 h
Remarks: (RTECS)

Respiratory or skin sensitization
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

IARC: No ingredient of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

NTP: No ingredient of this product present at levels greater than or equal to 0.1% is

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is on OSHA's list of regulated carcinogens.

Reproductive toxicity
No data available
No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

11.2 Additional Information

RTECS: CY9100000
To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

After absorption:

Headache
Nausea
narcosis

Other dangerous properties can not be excluded.

Handle in accordance with good industrial hygiene and safety practice.

SECTION 12: Ecological information

12.1 Toxicity

Toxicity to daphnia and other aquatic invertebrates	semi-static test EC50 - Daphnia magna (Water flea) - 0.6 mg/l - 48 h (OECD Test Guideline 202) Remarks: (in analogy to similar products)
Toxicity to algae	static test ErC50 - Pseudokirchneriella subcapitata (green algae) - 0.42 mg/l - 72 h (OECD Test Guideline 201) Remarks: (in analogy to similar products)
	static test NOEC - Pseudokirchneriella subcapitata (green algae) - 0.26 mg/l - 72 h (OECD Test Guideline 201) Remarks: (in analogy to similar products)

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Endocrine disrupting properties
No data available

12.7 Other adverse effects
Discharge into the environment must be avoided.

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product
Waste material must be disposed of in accordance with the national and local regulations. Leave chemicals in original containers. No mixing with other waste. Handle uncleaned containers like the product itself.

SECTION 14: Transport information

DOT (US)
UN number: 2709 Class: 3 Packing group: III
Proper shipping name: Butyl benzenes
Reportable Quantity (RQ):
Marine pollutant: yes Poison Inhalation Hazard: No

IMDG
UN number: 2709 Class: 3 Packing group: III EMS-No: F-E, S-D
Proper shipping name: BUTYLBENZENES
Marine pollutant : yes
Marine pollutant : yes

IATA
UN number: 2709 Class: 3 Packing group: III
Proper shipping name: Butylbenzenes

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 15: Regulatory information

SARA 302 Components
This material does not contain any components with a section 302 EHS TPQ.

SARA 313 Components
This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

SARA 311/312 Hazards
Fire Hazard, Acute Health Hazard

Massachusetts Right To Know Components

	CAS-No.	Revision Date
sec-Butylbenzene	135-98-8	1993-04-24

Pennsylvania Right To Know Components

2. Hazard(s) identification

Classification
This chemical is considered hazardous by the 2012 OSHA Hazard Communication Standard (29 CFR 1910.1200)

Acute oral toxicity	Category 3
Acute Inhalation Toxicity - Dusts and Mists	Category 3
Specific target organ toxicity - (repeated exposure)	Category 2

Label Elements

Signal Word
Danger

Hazard Statements
Toxic if swallowed
Toxic if inhaled
May cause damage to organs through prolonged or repeated exposure

Precautionary Statements
Prevention

Wash face, hands and any exposed skin thoroughly after handling
Do not eat, drink or smoke when using this product
Use only outdoors or in a well-ventilated area
Do not breathe dust/fume/gas/mist/vapors/spray
Response
Get medical attention/advice if you feel unwell
Inhalation
IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing
Call a POISON CENTER or doctor/physician
Ingestion
IF SWALLOWED: Immediately call a POISON CENTER or doctor/physician
Rinse mouth
Storage
Store locked up
Store in a well-ventilated place. Keep container tightly closed
Disposal
Dispose of contents/container to an approved waste disposal plant
Hazards not otherwise classified (HNOC)
May cause long lasting harmful effects to aquatic life

3. Composition / information on ingredients

Component	CAS-No	Weight %
Selenium	7782-49-2	> 99.5

4. First-aid measures

Eye Contact Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes.

Skin Contact Wash off immediately with soap and plenty of water while removing all contaminated clothes and shoes.

Inhalation Remove from exposure, lie down. Move to fresh air. If breathing is difficult, give oxygen. If not breathing, give artificial respiration. Immediate medical attention is required.

Ingestion Do not induce vomiting. Never give anything by mouth to an unconscious person. Drink plenty of water. Call a physician immediately. If possible drink milk afterwards.

Most important symptoms/effects No information available.
Notes to Physician Treat symptomatically

5. Fire-fighting measures

Suitable Extinguishing Media Water spray. Carbon dioxide (CO_2). Dry chemical. chemical foam.

Unsuitable Extinguishing Media No information available

Flash Point No information available
Method - No information available

Autoignition Temperature No information available
Explosion Limits
Upper No data available
Lower No data available
Sensitivity to Mechanical Impact No information available
Sensitivity to Static Discharge No information available

Specific Hazards Arising from the Chemical

Vapors may form explosive mixtures with air.

Hazardous Combustion Products
None known
Protective Equipment and Precautions for Firefighters
As in any fire, wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH (approved or equivalent) and full protective gear.

NFPA

Health	Flammability	Instability	Physical hazards
3	0	0	N/A

6. Accidental release measures

Personal Precautions Ensure adequate ventilation. Use personal protective equipment.
Environmental Precautions See Section 12 for additional ecological information. Avoid release to the environment. Collect spillage.

Methods for Containment and Clean Up Sweep up or vacuum up spillage and collect in suitable container for disposal.

7. Handling and storage

Handling Avoid contact with skin and eyes. Do not breathe dust. Do not breathe vapors or spray mist. Use only in area provided with appropriate exhaust ventilation.

Storage Keep in a dry, cool and well-ventilated place. Keep container tightly closed. Keep under nitrogen.

8. Exposure controls / personal protection

Exposure Guidelines

Component	ACGIH TLV	OSHA PEL	NIOSH IDLH
Selenium	TWA: 0.2 mg/m³	(Vacated) TWA: 0.2 mg/m³	IDLH: 1 mg/m³ TWA: 0.2 mg/m³

Component	Quebec	Mexico OEL (TWA)	Ontario TWAEV
Selenium	TWA: 0.2 mg/m³	TWA: 0.2 mg/m³	TWA: 0.2 mg/m³

Legend

ACGIH - American Conference of Governmental Industrial Hygienists
OSHA - Occupational Safety and Health Administration
NIOSH IDLH: The National Institute for Occupational Safety and Health Immediately Dangerous to Life or Health

Engineering Measures Ensure that eyewash stations and safety showers are close to the workstation location.

Personal Protective Equipment

Eye/face Protection Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133 or European Standard EN166.

Skin and body protection Wear appropriate protective gloves and clothing to prevent skin exposure.

Respiratory Protection A NIOSH/MSHA approved air purifying dust or mist respirator or European Standard EN 149.

Hygiene Measures Handle in accordance with good industrial hygiene and safety practice.

9. Physical and chemical properties

Physical State	Powder Solid
Appearance	Grey
Odor	No information available
Odor Threshold	No information available
pH	No information available
Melting Point/Range	217 - 222 °C / 422.6 - 431.6 °F
Boiling Point/Range	685 °C / 1265 °F
Flash Point	No information available
Evaporation Rate	No information available
Flammability (solid,gas)	No information available
Flammability or explosive limits	
Upper	No data available
Lower	No data available
Vapor Pressure	1 mmHg @ 345 °C
Vapor Density	No information available
Relative Density	4.810
Solubility	No information available
Partition coefficient; n-octanol/water	No data available
Autoignition Temperature	No information available
Decomposition Temperature	No information available
Viscosity	No information available
Molecular Formula	Se
Molecular Weight	78.96

10. Stability and reactivity

Reactive Hazard None known, based on information available

Stability Stable under normal conditions.

Conditions to Avoid Incompatible products.

Incompatible Materials Acids, Strong oxidizing agents, Fluorine, oxygen, Metals

Hazardous Decomposition Products None under normal use conditions

Hazardous Polymerization Hazardous polymerization does not occur.

Hazardous Reactions None under normal processing.

11. Toxicological information

Acute Toxicity

Product Information No acute toxicity information is available for this product

Component Information

Component	LD50 Oral	LD50 Dermal	LC50 Inhalation
Selenium	6700 mg/kg (Rat)	Not listed	Not listed

Toxicologically Synergistic Products No information available

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Irritation No information available

Sensitization No information available

Carcinogenicity The table below indicates whether each agency has listed any ingredient as a carcinogen.

Component	CAS-No	IARC	NTP	ACGIH	OSHA	Mexico
Selenium	7782-49-2	Not listed	Not listed	Not listed	Not listed	Not listed

Mutagenic Effects No information available

Reproductive Effects No information available.

Developmental Effects No information available.

Teratogenicity No information available.

STOT - single exposure None known
STOT - repeated exposure None known

Aspiration hazard No information available

Symptoms / effects,both acute and delayed No information available
Endocrine Disruptor Information No information available

Other Adverse Effects The toxicological properties have not been fully investigated.

12. Ecological information

Ecotoxicity
Do not empty into drains.

Persistence and Degradability No information available
Bioaccumulation/ Accumulation No information available.

Mobility No information available.

13. Disposal considerations

Waste Disposal Methods Chemical waste generators must determine whether a discarded chemical is classified as a hazardous waste. Chemical waste generators must also consult local, regional, and national hazardous waste regulations to ensure complete and accurate classification.

14. Transport information

Print Date 02/09/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name : Silver

Product Number : 327093
Brand : Aldrich

CAS-No. : 7440-22-4

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Laboratory chemicals, Synthesis of substances

1.3 Details of the supplier of the safety data sheet

Company : Sigma-Aldrich
3050 Spruce Street
SAINT LOUIS MO 63103
USA

Telephone : +1 800-325-5832
Fax : +1 800-325-5052

1.4 Emergency telephone number

Emergency Phone # : (314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

Not a hazardous substance or mixture.

2.2 GHS Label elements, including precautionary statements

Not a hazardous substance or mixture.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Formula : Ag
Molecular weight : 107.87 g/mol
CAS-No. : 7440-22-4
EC-No. : 231-131-3

Hazardous components

Component	Classification	Concentration
Silver		
		<= 100 %

4. FIRST AID MEASURES

4.1 Description of first aid measures

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration.

In case of skin contact
Wash off with soap and plenty of water.

In case of eye contact
Flush eyes with water as a precaution.

If swallowed
Never give anything by mouth to an unconscious person. Rinse mouth with water.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture
Silver/silver oxides

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
No data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Avoid dust formation. Avoid breathing vapours, mist or gas.
For personal protection see section 8.

6.2 Environmental precautions
No special environmental precautions required.

6.3 Methods and materials for containment and cleaning up
Sweep up and shovel. Keep in suitable, closed containers for disposal.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Further processing of solid materials may result in the formation of combustible dusts. The potential for combustible dust formation should be taken into consideration before additional processing occurs.
Provide appropriate exhaust ventilation at places where dust is formed.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.

Air sensitive. Store under inert gas. Keep in a dry place.
Storage class (TRGS 510): Non Combustible Solids

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
Silver	7440-22-4	TWA	0.010000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		TWA	0.010000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		TWA	0.100000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Argyria		
		TWA	0.010000 mg/m3	USA. NIOSH Recommended Exposure Limits
		TWA	0.010000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		TWA	0.010000 mg/m3	USA. NIOSH Recommended Exposure Limits
		TWA	0.100000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Argyria		
		TWA	0.010000 mg/m3	USA. NIOSH Recommended Exposure Limits
		TWA	0.1 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Argyria		
		TWA	0.01 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants

8.2 Exposure controls

Appropriate engineering controls
General industrial hygiene practice.

Personal protective equipment

Eye/face protection
Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Choose body protection in relation to its type, to the concentration and amount of dangerous substances, and to the specific work-place., The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Respiratory protection is not required. Where protection from nuisance levels of dusts are desired, use type N95 (US) or type P1 (EN 143) dust masks. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
No special environmental precautions required.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: powder
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: 960 °C (1,760 °F) - lit.
f)	Initial boiling point and boiling range	2,212 °C (4,014 °F) - lit.
g)	Flash point	No data available
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	No data available
k)	Vapour pressure	No data available
l)	Vapour density	No data available
m)	Relative density	10.49 g/cm3
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	No data available
p)	Auto-ignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information
No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions
No data available

10.4 Conditions to avoid
No data available

10.5 Incompatible materials
Oxygen, Strong acids and strong bases

10.6 Hazardous decomposition products
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - male - > 5,000 mg/kg

Inhalation: No data available

Dermal: No data available

No data available

Skin corrosion/irritation
No data available

Serious eye damage/eye irritation
No data available

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

Carcinogenicity - Rat - Unreported
Tumorigenic:Tumors at site or application.

Carcinogenicity classification not possible from current data.

IARC:	No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.
NTP:	No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.
OSHA:	No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
No data available

No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: Not available

May cause argyria (a slate-gray or bluish discoloration of the skin and deep tissues due to the deposit of insoluble albuminate of silver).

12. ECOLOGICAL INFORMATION

12.1 Toxicity
No data available

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects

No data available

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Offer surplus and non-recyclable solutions to a licensed disposal company.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 3077 Class: 9 Packing group: III
Proper shipping name: Environmentally hazardous substances, solid, n.o.s. (Silver)
Reportable Quantity (RQ): 1 lbs

Poison Inhalation Hazard: No

IMDG
Not dangerous goods

IATA
Not dangerous goods

15. REGULATORY INFORMATION

SARA 302 Components
No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components
The following components are subject to reporting levels established by SARA Title III, Section 313:

	CAS-No.	Revision Date
Silver	7440-22-4	1993-04-24

SARA 311/312 Hazards
No SARA Hazards

Massachusetts Right To Know Components

	CAS-No.	Revision Date
Silver	7440-22-4	1993-04-24

Pennsylvania Right To Know Components

	CAS-No.	Revision Date

Silver	7440-22-4	1993-04-24

New Jersey Right To Know Components

	CAS-No.	Revision Date
Silver	7440-22-4	1993-04-24

California Prop. 65 Components

This product does not contain any chemicals known to State of California to cause cancer, birth defects, or any other reproductive harm.

16. OTHER INFORMATION

HMIS Rating

Health hazard:	0
Chronic Health Hazard:	
Flammability:	0
Physical Hazard	0

NFPA Rating

Health hazard:	0
Fire Hazard:	0
Reactivity Hazard:	0

SAFETY DATA SHEET

Revision Date 10-Feb-2015 **Revision Number** 1

1. Identification

Product Name **2-(2,4,5-Trichlorophenoxy)propionic acid**

Cat No. : **AC171700000; AC171700050**

Synonyms Silvex

Recommended Use Laboratory chemicals.

Uses advised against No Information available

Details of the supplier of the safety data sheet

Company
Fisher Scientific
One Reagent Lane
Fair Lawn, NJ 07410
Tel: (201) 796-7100

Entity / Business Name
Acros Organics
One Reagent Lane
Fair Lawn, NJ 07410

Emergency Telephone Number
For information **US** call: 001-800-ACROS-01 / **Europe** call: +32 14 57 52 11
Emergency Number **US:**001-201-796-7100 / **Europe:** +32 14 57 52 99
CHEMTREC Tel. No.**US:**001-800-424-9300 / **Europe:**001-703-527-3887

2. Hazard(s) identification

Classification
This chemical is considered hazardous by the 2012 OSHA Hazard Communication Standard (29 CFR 1910.1200)

Acute oral toxicity	Category 4
Skin Corrosion/irritation	Category 2
Serious Eye Damage/Eye Irritation	Category 2
Carcinogenicity	Category 2

Label Elements

Signal Word
Warning

Hazard Statements
Harmful if swallowed
Causes skin irritation
Causes serious eye irritation
Suspected of causing cancer

Precautionary Statements
Prevention
Obtain special instructions before use
Do not handle until all safety precautions have been read and understood
Use personal protective equipment as required
Wash face, hands and any exposed skin thoroughly after handling
Do not eat, drink or smoke when using this product
Wear eye/face protection
Response
IF exposed or concerned: Get medical attention/advice
Skin
IF ON SKIN: Wash with plenty of soap and water
If skin irritation occurs: Get medical advice/attention
Take off contaminated clothing and wash before reuse
Eyes
IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing
If eye irritation persists: Get medical advice/attention
Ingestion
IF SWALLOWED: Call a POISON CENTER or doctor/physician if you feel unwell
Rinse mouth
Storage
Store locked up
Disposal
Dispose of contents/container to an approved waste disposal plant
Hazards not otherwise classified (HNOC)
Very toxic to aquatic life with long lasting effects

3. Composition / information on ingredients

Component	CAS-No	Weight %
Silvex (2,4,5-TP)	93-72-1	97

4. First-aid measures

Eye Contact Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Obtain medical attention.

Skin Contact Wash off immediately with soap and plenty of water while removing all contaminated clothes and shoes. Obtain medical attention.

Inhalation Remove from exposure, lie down. Move to fresh air. Obtain medical attention.

Ingestion Clean mouth with water. Get medical attention.

Most important symptoms/effects No information available.
Notes to Physician Treat symptomatically

5. Fire-fighting measures

Suitable Extinguishing Media Water spray. Carbon dioxide (CO_2). Dry chemical. chemical foam.

Unsuitable Extinguishing Media No information available

Flash Point No information available
Method - No information available

Autoignition Temperature No information available
Explosion Limits
Upper No data available
Lower No data available
Sensitivity to Mechanical Impact No information available
Sensitivity to Static Discharge No information available

Specific Hazards Arising from the Chemical
Keep product and empty container away from heat and sources of ignition.

Hazardous Combustion Products
Hydrogen chloride gas Carbon monoxide (CO) Carbon dioxide (CO_2)
Protective Equipment and Precautions for Firefighters
As in any fire, wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH (approved or equivalent) and full protective gear.

NFPA

Health	Flammability	Instability	Physical hazards
2	0	0	N/A

6. Accidental release measures

Personal Precautions Ensure adequate ventilation. Use personal protective equipment.
Environmental Precautions See Section 12 for additional ecological information. Avoid release to the environment. Collect spillage.

Methods for Containment and Clean Up Avoid dust formation. Sweep up or vacuum up spillage and collect in suitable container for disposal. Do not let this chemical enter the environment.

7. Handling and storage

Handling Avoid contact with skin and eyes. Do not breathe dust. Do not breathe vapors or spray mist. Do not ingest.

Storage Keep in a dry, cool and well-ventilated place. Keep container tightly closed.

8. Exposure controls / personal protection

Exposure Guidelines This product does not contain any hazardous materials with occupational exposure limits established by the region specific regulatory bodies.

Engineering Measures Ensure adequate ventilation, especially in confined areas.

Personal Protective Equipment

Eye/face Protection Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133 or European Standard EN166.

Skin and body protection Wear appropriate protective gloves and clothing to prevent skin exposure.

Respiratory Protection Follow the OSHA respirator regulations found in 29 CFR 1910.134 or European Standard EN 149. Use a NIOSH/MSHA or European Standard EN 149 approved respirator if exposure limits are exceeded or if irritation or other symptoms are experienced.

Hygiene Measures Handle in accordance with good industrial hygiene and safety practice.

9. Physical and chemical properties

Physical State	Powder Solid
Appearance	Beige
Odor	Slight
Odor Threshold	No information available
pH	No information available
Melting Point/Range	177 - 181 °C / 350.6 - 357.8 °F
Boiling Point/Range	No information available
Flash Point	No information available
Evaporation Rate	No information available
Flammability (solid,gas)	No information available
Flammability or explosive limits	
Upper	No data available
Lower	No data available
Vapor Pressure	No information available
Vapor Density	No information available
Relative Density	1.209
Solubility	No information available
Partition coefficient; n-octanol/water	No data available
Autoignition Temperature	No information available
Decomposition Temperature	No information available
Viscosity	No information available
Molecular Formula	C9 H7 Cl3 O3
Molecular Weight	269.51

10. Stability and reactivity

Reactive Hazard None known, based on information available

Stability Stable under normal conditions.

Conditions to Avoid Incompatible products.

Incompatible Materials Strong oxidizing agents

Hazardous Decomposition Products Hydrogen chloride gas, Carbon monoxide (CO), Carbon dioxide (CO_2)

Hazardous Polymerization No information available.

Hazardous Reactions None under normal processing.

11. Toxicological information

Acute Toxicity

Product Information No acute toxicity information is available for this product

Component Information

Component	LD50 Oral	LD50 Dermal	LC50 Inhalation
Silvex (2,4,5-TP)	650 mg/kg (Rat)	3200 mg/kg (Rabbit)	Not listed

Toxicologically Synergistic Products No information available

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Irritation No information available

Sensitization No information available

Carcinogenicity The table below indicates whether each agency has listed any ingredient as a carcinogen.

Component	CAS-No	IARC	NTP	ACGIH	OSHA	Mexico
Silvex (2,4,5-TP)	93-72-1	Group 2B	Not listed	Not listed	X	Not listed

Mutagenic Effects No information available

Reproductive Effects No information available.

Developmental Effects No information available.

Teratogenicity No information available.

STOT - single exposure None known
STOT - repeated exposure None known

Aspiration hazard No information available

Symptoms / effects,both acute and delayed No information available
Endocrine Disruptor Information No information available

Other Adverse Effects See actual entry in RTECS for complete information.

12. Ecological information

Ecotoxicity
Do not empty into drains.

Persistence and Degradability No information available
Bioaccumulation/ Accumulation No information available.

Mobility No information available.

13. Disposal considerations

Waste Disposal Methods Chemical waste generators must determine whether a discarded chemical is classified as a hazardous waste. Chemical waste generators must also consult local, regional, and national hazardous waste regulations to ensure complete and accurate classification.

14. Transport information

DOT Not regulated
TDG Not regulated
IATA

SAFETY DATA SHEET

Version 4.11
Revision Date 03/05/2015
Print Date 02/07/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	Sodium
Product Number	:	483745
Brand	:	Aldrich
CAS-No.	:	7440-23-5

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Manufacture of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Substances and mixtures, which in contact with water, emit flammable gases (Category 1), H260
Skin corrosion (Category 1B), H314
Serious eye damage (Category 1), H318
Carcinogenicity (Category 1A), H350

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word: Danger

Hazard statement(s)

H260	In contact with water releases flammable gases which may ignite spontaneously.
H314	Causes severe skin burns and eye damage.
H318	Causes serious eye damage.
H350	May cause cancer.

Precautionary statement(s)

P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and understood.
P223	Keep away from any possible contact with water, because of violent reaction and possible flash fire.

P231 + P232	Handle under inert gas. Protect from moisture.
P260	Do not breathe dust or mist.
P264	Wash skin thoroughly after handling.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P281	Use personal protective equipment as required.
P301 + P330 + P331	IF SWALLOWED: Rinse mouth. Do NOT induce vomiting.
P303 + P361 + P353	IF ON SKIN (or hair): Remove/ Take off immediately all contaminated clothing. Rinse skin with water/ shower.
P304 + P340 + P310	IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing. Immediately call a POISON CENTER or doctor/ physician.
P305 + P351 + P338 + P310	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER or doctor/ physician.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.
P335 + P334	Brush off loose particles from skin. Immerse in cool water/ wrap in wet bandages.
P363	Wash contaminated clothing before reuse.
P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam for extinction.
P402 + P404	Store in a dry place. Store in a closed container.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS

Reacts violently with water.

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.2 Mixtures

Formula : Na
Molecular weight : 22.99 g/mol

Hazardous components

Component		Classification	Concentration
Sodium			
CAS-No. EC-No. Index-No.	7440-23-5 231-132-9 011-001-00-0	Water-react. 1; Skin Corr. 1B; Eye Dam. 1; H260, H314	>= 90 - <= 100 %
Paraffin oils			
CAS-No. EC-No.	8012-95-1 232-384-2	Carc. 1A; H350	>= 90 - <= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Take off contaminated clothing and shoes immediately. Wash off with soap and plenty of water. Consult a physician.

In case of eye contact
Rinse thoroughly with plenty of water for at least 15 minutes and consult a physician.Continue rinsing eyes during transport to hospital.

If swallowed
Do NOT induce vomiting. Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Dry powder

5.2 Special hazards arising from the substance or mixture
No data available

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
No data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Use personal protective equipment. Avoid dust formation. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains.

6.3 Methods and materials for containment and cleaning up
Sweep up and shovel. Contain spillage, and then collect with an electrically protected vacuum cleaner or by wet-brushing and place in container for disposal according to local regulations (see section 13). Do not flush with water. Keep in suitable, closed containers for disposal.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid formation of dust and aerosols.Further processing of solid materials may result in the formation of combustible dusts. The potential for combustible dust formation should be taken into consideration before additional processing occurs.
Provide appropriate exhaust ventilation at places where dust is formed.Keep away from sources of ignition - No smoking.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.
Never allow product to get in contact with water during storage.

Handle and store under inert gas. Air sensitive.
Storage class (TRGS 510): Hazardous materials, which set free flammable gases upon contact with water

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
Paraffin oils	8012-95-1	STEL	10.000000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		TWA	5.000000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		TWA	5.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		ST	10.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		TWA	5.000000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		TWA	5.000000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Upper Respiratory Tract irritation 2014 Adoption Not classifiable as a human carcinogen		
		Upper Respiratory Tract irritation 2014 Adoption Exposure by all routes should be carefully controlled to levels as low as possible. Suspected human carcinogen		
		TWA	5.000000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		TWA	5.000000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		Upper Respiratory Tract irritation Exposure by all routes should be carefully controlled to levels as low as possible. Suspected human carcinogen		
		TWA	5.000000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Upper Respiratory Tract irritation Not classifiable as a human carcinogen		
		TWA	5.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		ST	10.000000 mg/m3	USA. NIOSH Recommended Exposure Limits
		Upper Respiratory Tract irritation Exposure by all routes should be carefully controlled to levels as low as possible. Suspected human carcinogen		

8.2 Exposure controls

Appropriate engineering controls
Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection
Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Complete suit protecting against chemicals, Flame retardant protective clothing, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face particle respirator type N100 (US) or type P3 (EN 143) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: Pieces
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: 97.8 °C (208.0 °F) - lit.
f)	Initial boiling point and boiling range	883 °C (1,621 °F) - lit.
g)	Flash point	82 °C (180 °F)
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	No data available
k)	Vapour pressure	No data available
l)	Vapour density	No data available
m)	Relative density	0.97 g/cm3

n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	No data available
p)	Auto-ignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information
No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions
Reacts violently with water.

10.4 Conditions to avoid
Air Do not allow water to enter container.
Exposure to moisture

10.5 Incompatible materials
Oxidizing agents

10.6 Hazardous decomposition products
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
No data available

Inhalation: No data available

Dermal: No data available

No data available

Skin corrosion/irritation
No data available

Serious eye damage/eye irritation
No data available

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

IARC: 1 - Group 1: Carcinogenic to humans (Paraffin oils)

NTP: Known to be human carcinogenThe reference note has been added by TD based on the background information of the NTP. (Paraffin oils)

OSHA: No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
No data available
No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: Not available

burning sensation, Cough, wheezing, laryngitis, Shortness of breath, spasm, inflammation and edema of the larynx, spasm, inflammation and edema of the bronchi, pneumonitis, pulmonary edema, Material is extremely destructive to tissue of the mucous membranes and upper respiratory tract, eyes, and skin., Aspiration may lead to:, lipid pneumonia, Effects due to ingestion may include:, laxative effect, Gastrointestinal disturbance, To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

12. ECOLOGICAL INFORMATION

12.1 Toxicity
No data available

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
No data available

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Burn in a chemical incinerator equipped with an afterburner and scrubber but exert extra care in igniting as this material is highly flammable. Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 1428 Class: 4.3 Packing group: I
Proper shipping name: Sodium
Reportable Quantity (RQ): 10 lbs

Poison Inhalation Hazard: No

IMDG
UN number: 1428 Class: 4.3 Packing group: I EMS-No: F-G, S-N
Proper shipping name: SODIUM

IATA
UN number: 1428 Class: 4.3 Packing group: I
Proper shipping name: Sodium
IATA Passenger: Not permitted for transport

15. REGULATORY INFORMATION

SARA 302 Components
No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components
This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

SARA 311/312 Hazards
Reactivity Hazard, Acute Health Hazard, Chronic Health Hazard

Massachusetts Right To Know Components

	CAS-No.	Revision Date
Sodium	7440-23-5	1993-04-24

	CAS-No.	Revision Date
Sodium	7440-23-5	1993-04-24
Paraffin oils	8012-95-1	2007-03-01

California Prop. 65 Components

WARNING! This product contains a chemical known to the State of California to cause cancer.	CAS-No.	Revision Date
Paraffin oils	8012-95-1	1987-02-27

16. OTHER INFORMATION

Full text of H-Statements referred to under sections 2 and 3.

Carc.	Carcinogenicity
Eye Dam.	Serious eye damage
H260	In contact with water releases flammable gases which may ignite spontaneously.
H314	Causes severe skin burns and eye damage.
H318	Causes serious eye damage.
H350	May cause cancer.
Skin Corr.	Skin corrosion
Water-react.	Substances and mixtures, which in contact with water, emit flammable gases

HMIS Rating

Health hazard:	3
Chronic Health Hazard:	*
Flammability:	4
Physical Hazard	2

NFPA Rating

Health hazard:	3
Fire Hazard:	4
Reactivity Hazard:	2
Special hazard.I:	W

Version: 4.11 Revision Date: 03/05/2015 Print Date: 02/07/2016

Sulfate Standard, 100 ppm

Safety Data Sheet

according to Federal Register / Vol. 77, No. 58 / Monday, March 26, 2012 / Rules and Regulations

Date of issue: 04/18/2013 Revision date: 05/03/2018 Supersedes: 05/03/2018 Version: 1.1

SECTION 1: Identification

1.1. Identification

Product form : Mixtures

Product name : Sulfate Standard, 100 ppm

Product code : LC25500

1.2. Recommended use and restrictions on use

Use of the substance/mixture : For laboratory and manufacturing use only.

Recommended use : Laboratory chemicals

Restrictions on use : Not for food, drug or household use

1.3. Supplier

LabChem Inc
Jackson's Pointe Commerce Park Building 1000, 1010 Jackson's Pointe Court
Zelienople, PA 16063 - USA
T 412-826-5230 - F 724-473-0647
info@labchem.com - www.labchem.com

1.4. Emergency telephone number

Emergency number : CHEMTREC: 1-800-424-9300 or +1-703-741-5970

SECTION 2: Hazard(s) identification

2.1. Classification of the substance or mixture

GHS-US classification

Not classified

2.2. GHS Label elements, including precautionary statements

Not classified as a hazardous chemical.

Other hazards not contributing to the classification : None.

2.4. Unknown acute toxicity (GHS US)

Not applicable

SECTION 3: Composition/Information on ingredients

3.1. Substances

Not applicable

3.2. Mixtures

Name	Product identifier	%	GHS-US classification
Water	(CAS-No.) 7732-18-5	99.985	Not classified
Sodium Sulfate, Anhydrous	(CAS-No.) 7757-82-6	0.015	Not classified

Full text of hazard classes and H-statements : see section 16

SECTION 4: First-aid measures

4.1. Description of first aid measures

First-aid measures general : Never give anything by mouth to an unconscious person. If you feel unwell, seek medical advice (show the label where possible).

First-aid measures after inhalation : Allow victim to breathe fresh air. Allow the victim to rest.

First-aid measures after skin contact : Remove affected clothing and wash all exposed skin area with mild soap and water, followed by warm water rinse.

First-aid measures after eye contact : Rinse immediately with plenty of water. Obtain medical attention if pain, blinking or redness persists.

First-aid measures after ingestion : Rinse mouth. Do NOT induce vomiting. Obtain emergency medical attention.

4.2. Most important symptoms and effects (acute and delayed)

Symptoms/effects : Not expected to present a significant hazard under anticipated conditions of normal use.

4.3. Immediate medical attention and special treatment, if necessary

None. Treat symptomatically.

SECTION 5: Fire-fighting measures

5.1. Suitable (and unsuitable) extinguishing media

Suitable extinguishing media	:	Foam. Dry powder. Carbon dioxide. Water spray. Sand.
Unsuitable extinguishing media	:	Do not use a heavy water stream.

5.2. Specific hazards arising from the chemical

Fire hazard	:	Not flammable.
Explosion hazard	:	Not available.
Reactivity	:	None.

5.3. Special protective equipment and precautions for fire-fighters

Firefighting instructions	:	Use water spray or fog for cooling exposed containers. Exercise caution when fighting any chemical fire. Prevent fire-fighting water from entering environment.
Protection during firefighting	:	Do not enter fire area without proper protective equipment, including respiratory protection.

SECTION 6: Accidental release measures

6.1. Personal precautions, protective equipment and emergency procedures

General measures	:	None.

6.1.1. For non-emergency personnel

Emergency procedures	:	Evacuate unnecessary personnel.

6.1.2. For emergency responders

Protective equipment	:	Equip cleanup crew with proper protection.
Emergency procedures	:	Ventilate area.

6.2. Environmental precautions

Prevent entry to sewers and public waters. Notify authorities if liquid enters sewers or public waters.

6.3. Methods and material for containment and cleaning up

For containment	:	Dam up the liquid spill.
Methods for cleaning up	:	Soak up spills with inert solids, such as clay or diatomaceous earth as soon as possible. Collect spillage. Store away from other materials.

6.4. Reference to other sections

See Heading 8. Exposure controls and personal protection.

SECTION 7: Handling and storage

7.1. Precautions for safe handling

Precautions for safe handling	:	Wash hands and other exposed areas with mild soap and water before eating, drinking or smoking and when leaving work. Provide good ventilation in process area to prevent formation of vapor.

7.2. Conditions for safe storage, including any incompatibilities

Storage conditions	:	Keep only in the original container in a cool, well ventilated place away from : incompatible materials. Keep container closed when not in use.
Incompatible products	:	Strong bases. Strong acids.
Incompatible materials	:	Sources of ignition. Direct sunlight.

SECTION 8: Exposure controls/personal protection

8.1. Control parameters

Sodium Sulfate, Anhydrous (7757-82-6)
Not applicable

Water (7732-18-5)
Not applicable

8.2. Appropriate engineering controls

Appropriate engineering controls : Emergency eye wash fountains should be available in the immediate vicinity of any potential exposure.

8.3. Individual protection measures/Personal protective equipment

Personal protective equipment:

Safety glasses.

Hand protection:

Wear protective gloves.

Eye protection:

Chemical goggles or safety glasses

Respiratory protection:

Respiratory protection not required in normal conditions

Other information:

Do not eat, drink or smoke during use.

SECTION 9: Physical and chemical properties

9.1. Information on basic physical and chemical properties

Physical state	:	Liquid
Appearance	:	Clear, colorless liquid.
Color	:	Colorless
Odor	:	None.
Odor threshold	:	No data available
pH	:	No data available
Melting point	:	No data available
Freezing point	:	No data available
Boiling point	:	No data available
Flash point	:	No data available
Relative evaporation rate (butyl acetate=1)	:	No data available
Flammability (solid, gas)	:	Non flammable.
Vapor pressure	:	No data available
Relative vapor density at 20 °C	:	No data available
Relative density	:	No data available
Solubility	:	No data available
Log Pow	:	No data available
Auto-ignition temperature	:	No data available
Decomposition temperature	:	No data available
Viscosity, kinematic	:	No data available
Viscosity, dynamic	:	No data available
Explosion limits	:	No data available
Explosive properties	:	Not applicable.
Oxidizing properties	:	None.

9.2. Other information

No additional information available

SECTION 10: Stability and reactivity

10.1. Reactivity

None.

10.2. Chemical stability

Not established.

10.3. Possibility of hazardous reactions

Not established.

10.4. Conditions to avoid

Direct sunlight. Extremely high or low temperatures.

10.5. Incompatible materials

Strong acids. Strong bases.

10.6. Hazardous decomposition products

fume. Carbon monoxide. Carbon dioxide.

SECTION 11: Toxicological information

11.1. Information on toxicological effects

Likely routes of exposure : Skin and eye contact

Acute toxicity : Not classified

Sodium Sulfate, Anhydrous (7757-82-6)	
LD50 oral rat	10000 mg/kg
ATE US (oral)	10000 mg/kg

Water (7732-18-5)	
LD50 oral rat	≥ 90000 mg/kg
ATE US (oral)	90000 mg/kg body weight

Skin corrosion/irritation : Not classified

Serious eye damage/irritation : Not classified

Respiratory or skin sensitization : Not classified

Germ cell mutagenicity : Not classified
Based on available data, the classification criteria are not met

Carcinogenicity : Not classified

Reproductive toxicity : Not classified
Based on available data, the classification criteria are not met

Specific target organ toxicity – single exposure : Not classified

Specific target organ toxicity – repeated exposure : Not classified

Aspiration hazard : Not classified

Potential Adverse human health effects and symptoms : Based on available data, the classification criteria are not met.

SECTION 12: Ecological information

12.1. Toxicity

Sodium Sulfate, Anhydrous (7757-82-6)	
LC50 fish 1	13500 - 14500 ml/l
EC50 Daphnia 1	2564 mg/l

12.2. Persistence and degradability

Sulfate Standard, 100 ppm	
Persistence and degradability	Not established.

Sodium Sulfate, Anhydrous (7757-82-6)	
Persistence and degradability	Not established.

Water (7732-18-5)	
Persistence and degradability	Not established.

12.3. Bioaccumulative potential

Sulfate Standard, 100 ppm	
Bioaccumulative potential	Not established.

Sodium Sulfate, Anhydrous (7757-82-6)	
Bioaccumulative potential	Not established.

Water (7732-18-5)	
Bioaccumulative potential	Not established.

12.4. Mobility in soil

No additional information available

12.5. Other adverse effects

Other information : Avoid release to the environment.

SECTION 13: Disposal considerations

13.1. Disposal methods

Waste disposal recommendations : Dispose in a safe manner in accordance with local/national regulations.

Ecology - waste materials : Avoid release to the environment.

SECTION 14: Transport information

Department of Transportation (DOT)

In accordance with DOT

Not regulated

SECTION 15: Regulatory information

15.1. US Federal regulations

Sulfate Standard, 100 ppm
Listed on the United States TSCA (Toxic Substances Control Act) inventory

All components of this product are listed, or excluded from listing, on the United States Environmental Protection Agency Toxic Substances Control Act (TSCA) inventory

15.2. International regulations

CANADA

Sodium Sulfate, Anhydrous (7757-82-6)
Listed on the Canadian DSL (Domestic Substances List)

EU-Regulations

No additional information available

National regulations

Sodium Sulfate, Anhydrous (7757-82-6)
Not listed on the Canadian IDL (Ingredient Disclosure List)

15.3. US State regulations

California Proposition 65 - This product does not contain any substances known to the state of California to cause cancer, developmental and/or reproductive harm

SECTION 16: Other information

Revision date	:	05/03/2018
Other information	:	None.
NFPA health hazard	:	0 - Materials that, under emergency conditions, would offer no hazard beyond that of ordinary combustible materials.
NFPA fire hazard	:	0 - Materials that will not burn under typical fire conditions, including intrinsically noncombustible materials such as concrete, stone, and sand.
NFPA reactivity	:	0 - Material that in themselves are normally stable, even under fire conditions.

Hazard Rating		
Health	:	1 Slight Hazard - Irritation or minor reversible injury possible
Flammability	:	0 Minimal Hazard - Materials that will not burn
Physical	:	0 Minimal Hazard - Materials that are normally stable, even under fire conditions, and will NOT react with water, polymerize, decompose, condense, or self-react. Non-Explosives.
Personal protection	:	A A - Safety glasses

SDS US LabChem

Information in this SDS is from available published sources and is believed to be accurate. No warranty, express or implied, is made and LabChem Inc assumes no liability resulting from the use of this SDS. The user must determine suitability of this information for his application.

SAFETY DATA SHEET

Version 3.5
Revision Date 11/04/2015
Print Date 02/22/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	*tert*-Butylbenzene
Product Number	:	B90602
Brand	:	Aldrich
CAS-No.	:	98-06-6

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Synthesis of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Flammable liquids (Category 3), H226
Eye irritation (Category 2A), H319
Acute aquatic toxicity (Category 2), H401
Chronic aquatic toxicity (Category 2), H411

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word: Warning

Hazard statement(s)

H226	Flammable liquid and vapour.
H319	Causes serious eye irritation.
H411	Toxic to aquatic life with long lasting effects.

Precautionary statement(s)

P210	Keep away from heat/sparks/open flames/hot surfaces. No smoking.
P233	Keep container tightly closed.
P240	Ground/bond container and receiving equipment.
P241	Use explosion-proof electrical/ ventilating/ lighting/ equipment.
P242	Use only non-sparking tools.
P243	Take precautionary measures against static discharge.

P264	Wash skin thoroughly after handling.
P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P303 + P361 + P353	IF ON SKIN (or hair): Remove/ Take off immediately all contaminated clothing. Rinse skin with water/ shower.
P305 + P351 + P338	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P337 + P313	If eye irritation persists: Get medical advice/ attention.
P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam for extinction.
P391	Collect spillage.
P403 + P235	Store in a well-ventilated place. Keep cool.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Synonyms	:	2-Methyl-2-phenylpropane
Formula	:	$C_{10}H_{14}$
Molecular weight	:	134.22 g/mol
CAS-No.	:	98-06-6
EC-No.	:	202-632-4

Hazardous components

Component	Classification	Concentration
tert-Butylbenzene		
	Flam. Liq. 3; Eye Irrit. 2A; Aquatic Acute 2; Aquatic Chronic 2; H226, H319, H411	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Wash off with soap and plenty of water. Consult a physician.

In case of eye contact
Rinse thoroughly with plenty of water for at least 15 minutes and consult a physician.

If swallowed
Do NOT induce vomiting. Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed

The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed

No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
For small (incipient) fires, use media such as "alcohol" foam, dry chemical, or carbon dioxide. For large fires, apply water from as far as possible. Use very large quantities (flooding) of water applied as a mist or spray; solid streams of water may be ineffective. Cool all affected containers with flooding quantities of water.

5.2 Special hazards arising from the substance or mixture
Carbon oxides

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
Use water spray to cool unopened containers.

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Use personal protective equipment. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Remove all sources of ignition. Beware of vapours accumulating to form explosive concentrations. Vapours can accumulate in low areas.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

6.3 Methods and materials for containment and cleaning up
Contain spillage, and then collect with an electrically protected vacuum cleaner or by wet-brushing and place in container for disposal according to local regulations (see section 13).

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid contact with skin and eyes. Avoid inhalation of vapour or mist.
Keep away from sources of ignition - No smoking.Take measures to prevent the build up of electrostatic charge.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Store in cool place. Keep container tightly closed in a dry and well-ventilated place. Containers which are opened must be carefully resealed and kept upright to prevent leakage.

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters
Contains no substances with occupational exposure limit values.

8.2 Exposure controls

Appropriate engineering controls
Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection
Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Fluorinated rubber
Minimum layer thickness: 0.7 mm
Break through time: 480 min
Material tested:Vitoject® (KCL 890 / Aldrich Z677698, Size M)

Splash contact
Material: Fluorinated rubber
Minimum layer thickness: 0.7 mm
Break through time: 480 min
Material tested:Vitoject® (KCL 890 / Aldrich Z677698, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Impervious clothing, Flame retardant antistatic protective clothing., The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face respirator with multi-purpose combination (US) or type ABEK (EN 14387) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: liquid, clear Colour: colourless
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: -58 °C (-72 °F) - lit.
f)	Initial boiling point and boiling range	169 °C (336 °F) - lit.
g)	Flash point	34.0 °C (93.2 °F) - closed cup
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower	Lower explosion limit: 0.8 %(V)

	flammability or explosive limits	
k)	Vapour pressure	No data available
l)	Vapour density	No data available
m)	Relative density	0.867 g/cm3 at 25 °C (77 °F)
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	log Pow: 3.80
p)	Auto-ignition temperature	450.0 °C (842.0 °F)
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information
No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions
Vapours may form explosive mixture with air.

10.4 Conditions to avoid
Heat, flames and sparks.

10.5 Incompatible materials
Strong oxidizing agents

10.6 Hazardous decomposition products
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - 3,045 mg/kg
Remarks: Behavioral:Somnolence (general depressed activity). Behavioral:Tremor. Gastrointestinal:Changes in structure or function of salivary glands.

Inhalation: No data available

Dermal: No data available

No data available

Skin corrosion/irritation
No data available

Serious eye damage/eye irritation
No data available

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

IARC: No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

ACGIH: No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by ACGIH.

NTP: No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
No data available

No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: CY9120000

To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

12. ECOLOGICAL INFORMATION

12.1 Toxicity

Toxicity to fish	LC0 - Leuciscus idus (Golden orfe) - 44 mg/l - 48.0 h
	LC50 - Leuciscus idus (Golden orfe) - 65 mg/l - 48.0 h
Toxicity to daphnia and other aquatic invertebrates	LC50 - Daphnia magna (Water flea) - 41 mg/l - 24 h

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.
Toxic to aquatic life.

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Burn in a chemical incinerator equipped with an afterburner and scrubber but exert extra care in igniting as this material is highly flammable. Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 2709 Class: 3 Packing group: III
Proper shipping name: Butyl benzenes
Marine pollutant:yes
Poison Inhalation Hazard: No

IMDG
UN number: 2709 Class: 3 Packing group: III EMS-No: F-E, S-D
Proper shipping name: BUTYLBENZENES
Marine pollutant:yes

IATA
UN number: 2709 Class: 3 Packing group: III
Proper shipping name: Butylbenzenes

15. REGULATORY INFORMATION

SARA 302 Components
No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components
This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

SARA 311/312 Hazards
Fire Hazard, Acute Health Hazard

Massachusetts Right To Know Components
No components are subject to the Massachusetts Right to Know Act.

Pennsylvania Right To Know Components

	CAS-No.	Revision Date
tert-Butylbenzene	98-06-6	1993-04-24

New Jersey Right To Know Components

	CAS-No.	Revision Date
tert-Butylbenzene	98-06-6	1993-04-24

California Prop. 65 Components
This product does not contain any chemicals known to State of California to cause cancer, birth defects, or any other reproductive harm.

16. OTHER INFORMATION

Full text of H-Statements referred to under sections 2 and 3.

Aquatic Acute	Acute aquatic toxicity
Aquatic Chronic	Chronic aquatic toxicity
Eye Irrit.	Eye irritation
Flam. Liq.	Flammable liquids

H226	Flammable liquid and vapour.
H319	Causes serious eye irritation.
H401	Toxic to aquatic life.
H411	Toxic to aquatic life with long lasting effects.

HMIS Rating

Health hazard:	2
Chronic Health Hazard:	
Flammability:	3
Physical Hazard	0

NFPA Rating

Health hazard:	2
Fire Hazard:	3
Reactivity Hazard:	0

Further information

Copyright 2015 Sigma-Aldrich Co. LLC. License granted to make unlimited paper copies for internal use only.
The above information is believed to be correct but does not purport to be all inclusive and shall be used only as a guide. The information in this document is based on the present state of our knowledge and is applicable to the product with regard to appropriate safety precautions. It does not represent any guarantee of the properties of the product. Sigma-Aldrich Corporation and its Affiliates shall not be held liable for any damage resulting from handling or from contact with the above product. Preparation Information

Sigma-Aldrich Corporation
Product Safety – Americas Region
1-800-521-8956

Version: 3.5 Revision Date: 11/04/2015 Print Date: 02/22/2016

SAFETY DATA SHEET

Version 8.10
Revision Date 09/06/2024
Print Date 09/07/2024

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifiers

Product name : Tetrachloroethylene

Product Number : 371696
Brand : Sigma-Aldrich
Index-No. : 602-028-00-4
CAS-No. : 127-18-4

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Laboratory chemicals, Synthesis of substances

Uses advised against : The product is being supplied under the TSCA R&D Exemption (40 CFR Section 720.36). It is the recipient's responsibility to comply with the requirements of the R&D exemption. The product may not be used for a non-exempt commercial purpose under TSCA unless appropriate consent is granted in writing by MilliporeSigma.

1.3 Details of the supplier of the safety data sheet

Company : Sigma-Aldrich Inc.
3050 SPRUCE ST
ST. LOUIS MO 63103
UNITED STATES

Telephone : +1 314 771-5765
Fax : +1 800 325-5052

1.4 Emergency telephone

Emergency Phone # : 800-424-9300 CHEMTREC (USA) +1-703-527-3887 CHEMTREC (International) 24 Hours/day; 7 Days/week

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)

Skin irritation (Category 2), H315
Eye irritation (Category 2A), H319
Skin sensitization (Category 1), H317

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Carcinogenicity (Category 2), H351
Specific target organ toxicity - single exposure (Category 3), Central nervous system, H336
Short-term (acute) aquatic hazard (Category 2), H401
Long-term (chronic) aquatic hazard (Category 2), H411

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal Word	Warning
Hazard Statements	
H315	Causes skin irritation.
H317	May cause an allergic skin reaction.
H319	Causes serious eye irritation.
H336	May cause drowsiness or dizziness.
H351	Suspected of causing cancer.
H411	Toxic to aquatic life with long lasting effects.
Precautionary Statements	
P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and understood.
P261	Avoid breathing mist or vapors.
P264	Wash skin thoroughly after handling.
P271	Use only outdoors or in a well-ventilated area.
P272	Contaminated work clothing must not be allowed out of the workplace.
P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P302 + P352	IF ON SKIN: Wash with plenty of soap and water.
P304 + P340 + P312	IF INHALED: Remove person to fresh air and keep comfortable for breathing. Call a POISON CENTER/ doctor if you feel unwell.
P305 + P351 + P338	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.
P333 + P313	If skin irritation or rash occurs: Get medical advice/ attention.
P337 + P313	If eye irritation persists: Get medical advice/ attention.
P362	Take off contaminated clothing and wash before reuse.
P391	Collect spillage.
P403 + P233	Store in a well-ventilated place. Keep container tightly closed.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 3: Composition/information on ingredients

3.1 Substances

Synonyms	:	Perchloroethylene PCE
Formula	:	C_2Cl_4
Molecular weight	:	165.83 g/mol
CAS-No.	:	127-18-4
EC-No.	:	204-825-9
Index-No.	:	602-028-00-4

Component	Classification	Concentration
Tetrachlorethylene		
	Skin Irrit. 2; Eye Irrit. 2A; Skin Sens. 1; Carc. 2; STOT SE 3; Aquatic Acute 2; Aquatic Chronic 2; H315, H319, H317, H351, H336, H401, H411 Concentration limits: >= 20 %: STOT SE 3, H336;	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

SECTION 4: First aid measures

4.1 Description of first-aid measures

General advice
Show this material safety data sheet to the doctor in attendance.

If inhaled
After inhalation: fresh air. Call in physician.

In case of skin contact
In case of skin contact: Take off immediately all contaminated clothing. Rinse skin with water/ shower. Consult a physician.

In case of eye contact
After eye contact: rinse out with plenty of water. Call in ophthalmologist. Remove contact lenses.

If swallowed
After swallowing: immediately make victim drink water (two glasses at most). Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed

The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

4.3 Indication of any immediate medical attention and special treatment needed
No data available

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media
Water Foam Carbon dioxide (CO2) Dry powder

Unsuitable extinguishing media
For this substance/mixture no limitations of extinguishing agents are given.

5.2 Special hazards arising from the substance or mixture
Carbon oxides
Hydrogen chloride gas
Combustible.
Development of hazardous combustion gases or vapours possible in the event of fire.

5.3 Advice for firefighters
Stay in danger area only with self-contained breathing apparatus. Prevent skin contact by keeping a safe distance or by wearing suitable protective clothing.

5.4 Further information
Suppress (knock down) gases/vapors/mists with a water spray jet. Prevent fire extinguishing water from contaminating surface water or the ground water system.

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures
Advice for non-emergency personnel: Do not breathe vapors, aerosols. Avoid substance contact. Ensure adequate ventilation. Evacuate the danger area, observe emergency procedures, consult an expert.
For personal protection see section 8.

6.2 Environmental precautions
Do not let product enter drains.

6.3 Methods and materials for containment and cleaning up
Cover drains. Collect, bind, and pump off spills. Observe possible material restrictions (see sections 7 and 10). Take up with liquid-absorbent material (e.g. Chemizorb®). Dispose of properly. Clean up affected area.

6.4 Reference to other sections
For disposal see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Advice on safe handling
Work under hood. Do not inhale substance/mixture. Avoid generation of vapours/aerosols.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Hygiene measures
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities

Storage conditions
Tightly closed. Keep in a well-ventilated place. Keep locked up or in an area accessible only to qualified or authorized persons.

Storage class
Storage class (TRGS 510): 6.1C: Combustible, acute toxic Cat.3 / toxic compounds or compounds which causing chronic effects

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Ingredients with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
Tetrachlorethylene	127-18-4	TWA	25 ppm	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Confirmed animal carcinogen with unknown relevance to humans		
		STEL	100 ppm	USA. ACGIH Threshold Limit Values (TLV)
		Confirmed animal carcinogen with unknown relevance to humans		
		Potential Occupational Carcinogen		

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

		TWA	100 ppm	USA. Occupational Exposure Limits (OSHA) - Table Z-2
		CEIL	200 ppm	USA. Occupational Exposure Limits (OSHA) - Table Z-2
		Peak	300 ppm	USA. Occupational Exposure Limits (OSHA) - Table Z-2
		PEL	25 ppm 170 mg/m3	California permissible exposure limits for chemical contaminants (Title 8, Article 107)
		STEL	100 ppm 685 mg/m3	California permissible exposure limits for chemical contaminants (Title 8, Article 107)
		C	300 ppm	California permissible exposure limits for chemical contaminants (Title 8, Article 107)

Biological occupational exposure limits

Component	CAS-No.	Parameters	Value	Biological specimen	Basis
Tetrachlorethylene	127-18-4	Tetrachloro ethylene	3parts per million	In end-exhaled air	ACGIH - Biological Exposure Indices (BEI)
	Remarks	Prior to shift (16 hours after exposure ceases)			
		Tetrachloro ethylene	0.5 mg/l	In blood	ACGIH - Biological Exposure Indices (BEI)
		Prior to shift (16 hours after exposure ceases)			

8.2 Exposure controls

Appropriate engineering controls
Immediately change contaminated clothing. Apply preventive skin protection. Wash hands and face after working with substance.

Personal protective equipment

Eye/face protection
Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU). Safety glasses

Skin protection
This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Full contact
Material: Viton®
Minimum layer thickness: 0.7 mm

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Break through time: 480 min
Material tested:Vitoject® (KCL 890 / Aldrich Z677698, Size M)

This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.4 mm
Break through time: 240 min
Material tested:Camatril® (KCL 730 / Aldrich Z677442, Size M)

Body Protection
protective clothing

Respiratory protection
Recommended Filter type: Filter A (acc. to DIN 3181) for vapours of organic compounds
The entrepeneur has to ensure that maintenance, cleaning and testing of respiratory protective devices are carried out according to the instructions of the producer. These measures have to be properly documented.
required when vapours/aerosols are generated. Our recommendations on filtering respiratory protection are based on the following standards: DIN EN 143, DIN 14387 and other accompanying standards relating to the used respiratory protection system.

Control of environmental exposure
Do not let product enter drains.

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: liquid, clear Color: colorless
b)	Odor	No data available
c)	Odor Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/ range: -22 °C (-8 °F) - lit.
f)	Initial boiling point and boiling range	121 °C 250 °F - lit.
g)	Flash point	()No data available
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower	No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

	flammability or explosive limits	
k)	Vapor pressure	25.3 hPa at 25.0 °C (77.0 °F) 17.3 hPa at 20.0 °C(68.0 °F)
l)	Vapor density	No data available
m)	Density	1.623 g/cm3 at 25 °C (77 °F) - lit.
	Relative density	No data available
n)	Water solubility	0.15 g/l at 25 °C (77 °F)
o)	Partition coefficient: n-octanol/water	log Pow: 2.53 at 23 °C (73 °F) - Bioaccumulation is not expected.
p)	Autoignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information

Surface tension 32.1 mN/m at 20 °C (68 °F)

SECTION 10: Stability and reactivity

10.1 Reactivity

No data available

10.2 Chemical stability

The product is chemically stable under standard ambient conditions (room temperature) .

10.3 Possibility of hazardous reactions

Risk of explosion with:
Alkali metals
Aluminum
sodium amide
Barium
nitrogen dioxide
Oxygen
with
alkali hydroxides
Exothermic reaction with:
strong alkalis
Alkaline earth metals
strong alkalis
Light metals
Powdered metals

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Oxidizing agents
Strong acids
Strong bases
nitrous gases
Risk of ignition or formation of inflammable gases or vapours with:
zinc oxide
with
Aluminum

10.4 Conditions to avoid
no information available

10.5 Incompatible materials
various plastics

10.6 Hazardous decomposition products
In the event of fire: see section 5

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - male and female - 3,420 mg/kg
(OECD Test Guideline 401)
Remarks: (ECHA)
Inhalation: No data available
Dermal: No data available
No data available

Skin corrosion/irritation
Skin - Rabbit
Result: Skin irritation - 4 h
(OECD Test Guideline 404)
Remarks: (ECHA)

Serious eye damage/eye irritation
Eyes - Rabbit
Result: Mild eye irritation - 24 h
(Draize Test)
Remarks: (RTECS)

Respiratory or skin sensitization
Local lymph node assay (LLNA) - Mouse
Result: May cause sensitization by skin contact.
(OECD Test Guideline 429)
Remarks: (ECHA)

Germ cell mutagenicity
Test Type: Chromosome aberration test in vitro
Test system: Chinese hamster ovary cells
Metabolic activation: with and without metabolic activation
Method: OECD Test Guideline 473

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Result: negative
Remarks: (ECHA)
Test Type: Ames test
Test system: Salmonella typhimurium
Metabolic activation: without metabolic activation
Method: OECD Test Guideline 471
Result: negative
Remarks: (ECHA)

Test Type: Micronucleus test
Species: Mouse

Application Route: Intraperitoneal
Method: OECD Test Guideline 474
Result: negative
Remarks: (ECHA)

Carcinogenicity
Suspected of causing cancer.

IARC:	2A - Group 2A: Probably carcinogenic to humans (Tetrachlorethylene)
NTP:	RAHC - Reasonably anticipated to be a human carcinogen (Tetrachlorethylene)
OSHA:	No component of this product present at levels greater than or equal to 0.1% is on OSHA's list of regulated carcinogens.

Reproductive toxicity
No data available

Specific target organ toxicity - single exposure
May cause drowsiness or dizziness.

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

11.2 Additional Information

Repeated dose toxicity - Mouse - female - Oral - LOAEL (Lowest observed adverse effect level) - 390 mg/kg

RTECS: KX3850000
narcosis, Liver injury may occur., Kidney injury may occur.

SECTION 12: Ecological information

12.1 Toxicity

Toxicity to fish	flow-through test LC50 - Oncorhynchus mykiss (rainbow trout) - 5 mg/l - 96 h Remarks: (ECHA)

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Toxicity to daphnia and other aquatic invertebrates	EC50 - Daphnia magna (Water flea) - 7.50 mg/l - 48 h
Toxicity to algae	ErC50 - Chlamydomonas reinhardtii (green algae) - 3.64 mg/l - 72 h Remarks: (ECHA)
Toxicity to fish(Chronic toxicity)	flow-through test NOEC - Jordanella floridae - 1.99 mg/l - 10 d Remarks: (ECHA)
Toxicity to daphnia and other aquatic invertebrates(Chronic toxicity)	semi-static test NOEC - Daphnia magna (Water flea) - 0.51 mg/l - 28 d Remarks: (ECHA)

12.2 Persistence and degradability

Biodegradability	aerobic - Exposure time 28 d Result: 11 % - Not readily biodegradable. (OECD Test Guideline 301C)

12.3 Bioaccumulative potential

Bioaccumulation	Lepomis macrochirus (Bluegill) - 21 d - 0.00343 mg/l(Tetrachlorethylene) Bioconcentration factor (BCF): 49

12.4 Mobility in soil

No data available

12.5 Results of PBT and vPvB assessment

PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Endocrine disrupting properties

No data available

12.7 Other adverse effects

No data available

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product

Waste material must be disposed of in accordance with the national and local regulations. Leave chemicals in original containers. No mixing with other waste. Handle uncleaned containers like the product itself.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 14: Transport information

DOT (US)
UN number: 1897 Class: 6.1 Packing group: III
Proper shipping name: Tetrachloroethylene
Reportable Quantity (RQ): 100 lbs
Reportable Quantity (RQ): 100 lbs
Reportable Quantity (RQ): 10 lbs
Reportable Quantity (RQ): 10 lbs
Marine pollutant: yes Poison Inhalation Hazard: No

IMDG
UN number: 1897 Class: 6.1 Packing group: III EMS-No: F-A, S-A
Proper shipping name: TETRACHLOROETHYLENE
Marine pollutant : yes
Marine pollutant : yes

IATA
UN number: 1897 Class: 6.1 Packing group: III
Proper shipping name: Tetrachloroethylene

SECTION 15: Regulatory information

CERCLA Reportable Quantity

Components	CAS-No.	Component RQ (lbs)	Calculated product RQ (lbs)
Tetrachlorethylene	127-18-4	100	100
Tetrachlorethylene	127-18-4	100	100 (D039)
Tetrachlorethylene	127-18-4	10	10 (F001)
Tetrachlorethylene	127-18-4	10	10 (F002)

SARA 304 Extremely Hazardous Substances Reportable Quantity
This material does not contain any components with a section 304 EHS RQ.

SARA 302 Extremely Hazardous Substances Threshold Planning Quantity
This material does not contain any components with a section 302 EHS TPQ.

SARA 311/312 Hazards : Acute Health Hazard
Chronic Health Hazard

SARA 313 : The following components are subject to reporting levels established by SARA Title III, Section 313:

Tetrachlorethylene 127-18-4 >= 90 - <= 100 %

US State Regulations

Massachusetts Right To Know
Tetrachlorethylene 127-18-4

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Pennsylvania Right To Know

Tetrachlorethylene	127-18-4

Maine Chemicals of High Concern

Product does not contain any listed chemicals

Vermont Chemicals of High Concern

Tetrachlorethylene	127-18-4

Washington Chemicals of High Concern

Tetrachlorethylene	127-18-4

California Prop. 65

WARNING: This product can expose you to chemicals including Tetrachlorethylene, which is/are known to the State of California to cause cancer. For more information go to www.P65Warnings.ca.gov.

The ingredients of this product are reported in the following inventories:

TSCA : All substances listed as active on the TSCA inventory

TSCA list

No substances are subject to a Significant New Use Rule.

No substances are subject to TSCA 12(b) export notification requirements.

SECTION 16: Other information

Further information

The information is believed to be correct but is not exhaustive and will be used solely as a guideline, which is based on current knowledge of the chemical substance or mixture and is applicable to appropriate safety precautions for the product. It does not represent any guarantee of the properties of the product. Sigma-Aldrich Corporation and its Affiliates shall not be held liable for any damage resulting from handling or from contact with the above product. See www.sigma-aldrich.com and/or the reverse side of invoice or packing slip for additional terms and conditions of sale.

However, all of the information in the document regarding the product remains unchanged and matches the product ordered. For further information please contact mlsbranding@sial.com.

Version: 8.10 Revision Date: 09/06/2024 Print Date: 09/07/2024

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Safety Data Sheets (SDS)

SECTION 1-IDENTIFICATION

Product name: Toluene

Other names:-

Proper shipping name: Toluene

Recommended use of the chemical and restrictions on use:
The major use of toluene is as a mixture added to gasoline to improve octane ratings. Used as a solvent for paint, resins, lacquers inks & adhesives. Component of solvent blends and thinners. Used in the manufacture of chemicals, dyes, explosives, benzoic acid. Some grades of toluene may contain traces of xylene and benzene.
The use of a quantity of material in an unventilated or confined space may result in increased exposure and an irritating atmosphere developing. Before starting consider control of exposure by mechanical ventilation.
WARNING: Intentional misuse by concentrating/inhaling contents may be lethal.

Manufacturer/Supplier Name: Taiwan SM Corp., Kaohsiung plant
Address: NO.7, Industrial 1st Rd, Lin-Yuan Kaohsiung County 83203, Taiwan, R.O.C.
Phone No.: 886-7-6414511

Emergency phone No./Fax No.: 886-7-6414511 Ext. 221 (on duty), 886-7-6414517 (off duty)/886-7-6423828

SECTION 2-HAZARDS IDENTIFICATION

GHS Classification:

Flammable Liquid Category 2
Acute Toxicity (Oral) Category 4
Skin Corrosion/ Irritation Category 2
Serious Eye Damage/ Eye Irritation Category 2
Specific Target Organ Toxicity Repeated Exposure Category 2
Hazardous To The Aquatic Environment (Acute) Category 3
Aspiration Hazard Category 1

GHS Label elements:

Hazard symbols

Signal word

Danger

Hazard statements

Highly flammable liquid and vapor
Harmful if inhaled
Causes skin irritation
Causes serious eye irritation
May cause damage to organs through prolonged or repeated exposure.
May cause long lasting harmful effects to aquatic life.
May be fatal if swallowed and enters airways.

Precautionary statements

Use only in well ventilated area.
Control of exposure by mechanical ventilation in an unventilated or confined space.
Avoid breathing vapors and contact with skin and eyes.
Wear breathing apparatus/protective gloves/face protection.
Store in well-ventilated place.
Disposal must be in accordance with applicable federal, state, or local regulations.

Other hazards: —

SECTION 3-COMPOSITION/INFORMATION ON INGREDIENTS

CAS No.	Chemical Name	wt% by weight	EINECS No.
00108-88-3	Toluene	97.0 min.	203-625-9
Synonyms	**Methylbenzol; Methylbenzene; Toluol; Phenylmethane**		

SECTION 4-FIRST AID MEASURES

Description of necessary first aid measures

Eye:

1. Flush immediately with warm water for at least 20 minutes.
2. Ensure complete irrigation of the eye by keeping eyelids apart and away from eye and moving the eyelids by occasionally lifting the upper and lower lids.
3. If pain persists or recurs seek medical attention.
4. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

Skin:

1. Removing contaminated clothing, shoes, and leathery wearings, cleaning procedure is available before reused or waste treatment.
2. Washing affected area thoroughly with soap and water for at least 20 minutes.
3. Call a Physician if irritation develops or persists.

Ingestion:

1. If spontaneous vomiting appears imminent or occurs, hold patient's head down, lower than their hips to help avoid possible aspiration of vomits.
2. If victim is conscious and alert, give 2～4 cupfuls of milk/water to dilute the substance in stomach.
3. Never give anything by mouth to an unconscious person.
4. Don’t induce vomiting unless directed to do so by medical person.
5. If vomiting occurs, lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration.
6. Then seek for medical attention.

Inhalation:

1. Remove from further exposure and flush thoroughly with air.
2. Lay patient down. Keep warm and rested.
3. Prostheses such as false teeth, which may block airway, should be removed, where possible, prior to initiating first aid procedures.
4. If respiratory irritation, seek immediate medical assistance and call a physician.

Most important symptoms/effects, acute and delayed

Headache, fatigue, drowsiness, insomnia, anorexia and pain in limbs, nervousness, impairment of memory.

Indication of immediate medical attention and special treatment needed, if necessary

For acute or short term repeated exposures to toluene:

Inhalation:

1. Inhalation overexposure can produce toxic effects. Monitor for respiratory distress.
2. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.
3. This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals exposed to this material.
4. Administration of sympathomimetic drugs should be avoided.

Ingestion:

1. If ingested, this material presents a significant aspiration and chemical pneumonitis hazard.
2. Induction of emesis is not recommended.
3. Consider activated charcoal and/or gastric lavage.
4. If patient is obtunded, protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position.

SECTION 5-FIRE FIGHTING MEASURES

Extinguishing media

Foam、CO_2、Dry chemical、Water fog.

Specific hazards arising from the chemical

1. Liquid and vapor are highly flammable.
2. Severe fire hazard when exposed to heat, flame and/or oxidizers.
3. Vapor may travel a considerable distance to source of ignition.
4. Heating may cause expansion or decomposition leading to violent rupture of containers.
5. On combustion, may emit toxic fumes of carbon monoxide (CO).

Special protective equipment and precautions for fire-fighters

1. Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies.
2. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles.
3. Cover pooling liquid with foam.
4. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out.
5. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.
6. Be aware that burning liquid will float on water.
7. Notify appropriate authorities of potential fire and explosion hazard if liquid enter sewers or waterways

SECTION 6-ACCIDENTAL RELEASE MEASURES

Personal precautions, protective equipment and emergency procedure

1. Personal protective equipment (specified in Section 8)
   Eyes : Chemical safety goggles are recommended, and a face shield is added when needed.
   Skin : Wear appropriate protective gloves to avoid skin contact.
   Clothing: When direct contact is likely, use rubberized clothings, apron and boots.
   Respiratory : When limits are exceeded, wear a respirator approved by NIOSH/MSHA for protection against organic dust, mists and vapors.
2. Remove all sources of ignition. No smoking, naked lights or ignition sources. Ventilate area of leak or spill.
3. Keep unnecessary and unprotected personnel from entering. Evacuate personnel from the danger area. Consult with an expert about the emergency procedures.

Environmental precautions

1. Prevent spillage from entering drains, surface, and groundwater.
2. Contain and recover liquid when possible. Use non-sparking tools and equipment.
3. Collect liquid in an appropriate container or absorb with an inert material (e.g. vermiculite, dry sand, earth), and place in a chemical waste container.
4. Report the accidental spill/release to Local/State government.

Methods and materials for containment and cleaning up

Minor spill:

1. Remove all ignition sources.
2. Clean up all spills immediately.
3. Avoid breathing vapors and contact with skin and eyes.
4. Control personal contact by using protective equipment.
5. Contain and absorb small quantities with vermiculite or other absorbent material.
6. Wipe up.
7. Collect residues in a flammable waste container.

Major spill

1. Clear area of personnel and move upwind.
2. Alert emergency responders and tell them location and nature of hazard.
3. May be violently or explosively reactive.
4. Wear breathing apparatus plus protective gloves.
5. Prevent spillage from entering drains or water course.
6. No smoking, naked lights or ignition sources. Increase ventilation.
7. Stop leak if safe to do so.
8. Water spray or fog may be used to disperse/absorb vapor.
9. Contain spill with sand, earth or vermiculite.
10. Use only spark-free shovels and explosion proof equipment.
11. Collect recoverable product into labeled containers for recycling..
12. Absorb remaining product with sand, earth or vermiculite.
13. Collect solid residues and seal in labeled drums for disposal.
14. Wash area and prevent runoff into drains.
15. If contamination of drains or waterways occurs, advise emergency services.

SECTION 7-HANDLING AND STORAGE

Precautions for safe handling

1. Wash thoroughly after handling.
2. Use only in well ventilated area.
3. Ground and bond containers when transferring.
4. Use spark-free tools and explosion proof equipment.
5. Empty containers retain product residue (liquid/vapor), and can be dangerous.
6. Do not pressurize, cut, weld, braze, solder, drill, or expose empty containers to heat, sparks or open flames.

Conditions for safe storage, including any incompatibilities

1. Store in original containers in approved flame-proof area.
2. No smoking, naked lights, heat or ignition sources.
3. DO NOT store in pits, depressions, basements or areas where vapors may be trapped.
4. Keep containers securely sealed.
5. Store away from incompatible materials in a cool, dry well ventilated area.
6. Protect containers against physical damage and check regularly for leaks.
7. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles.
8. Ground all equipment containing this material.
9. Observe manufacturer's storing and handling recommendations.
10. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room. A refrigerated room is preferable for materials with a flash point temperature lower than 70°F (21°C).

SECTION 8-EXPOSURE CONTROLS, PERSONAL PROTECTION

OSHA - Final PELs : 200 ppm TWA.
OSHA Ceiling : 300ppm.
ACGIH : 50 ppm, skin -potential forcutaneous absorption.
NIOSH : 100 ppm TWA; 375 mg/m^3 TWA; 500 ppm IDLH.
Taiwan TWA : 100 ppm (skin).
Taiwan STEL : 125 ppm (skin).
Taiwan Ceiling : -------.
Taiwan BEI : 1 mg/l (before on duty).

Engineering control

1. Process should be located at least 17 meter (50 feet) away from open flames and all high temperature operations likely to cause ignition of the styrene monomer vapor.
2. In venting styrene monomer vapors, consideration should be given to possible halogenation of the vapors by low concentrations of free chlorine and bromine with the resultant formation of lacrimations.
3. Process should be designed so that the operator is not exposed to direct contact with Toluene or the vapor. The technical problems of designing equipment, providing adequate ventilation and operating procedures which promise maximum security and economy, can best be handled by competent engineers.
4. It is essential for safety that equipment be used and maintained as recommended by the manufacturer.
5. Tanks used to store or process Toluene should be closed vessels vented to a safe point of discharge in the outside atmosphere away from operating stations, roadways, and at least 17 meter (50 feet) from possible sources of ignitions. All sparks, flames, heated surface, or other sources of ignition should be kept away from all vents. It is advisable, to provide suction on vessels when inspection or observation openings are made, to minimize or eliminate escape of vapors.

Personal protective equipment

Eye Protection:
Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. Chemical goggles should be worn during transfer operations or when there is a likelihood of misting, splashing, or spraying of this material. A suitable emergency eye wash water and safety shower should be located near the work station.

Skin protection:
Wear impervious protective clothing, including boots, gloves, lab coat, apron or coveralls, as appropriate, to prevent skin contact.

Clothing:
Avoid skin contact. Wear long-sleeved fire-retardant garments (e.g., Nomex®) while working with flammable and combustible liquids. Additional chemical-resistant protective gear may be required if splashing or spraying conditions exist. This may include an apron, boots and additional facial protection. If product comes in contact with clothing, immediately remove soaked clothing and shower. Promptly remove and discard contaminated leather goods.

Respirators:
For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134). For airborne vapor concentrations that exceed the recommended protection factors for organic vapor respirators, use a full-face, positive-pressure, supplied air respirator. Due to fire and explosion hazards, do not enter atmospheres containing concentrations greater than 10% of the lower flammable limit of this product.

SECTION 9-PHYSICAL AND CHEMICAL PROPERTIES

Appearance : Transparent liquid	Upper/lower explosive limits : 1.2%～7.1%
Odour : pleasant aromatic petroleum odour	Vapor Pressure : 22 mmHg @20℃/68°F
Odour threshold : 0.16～37 ppm (detect) 1.9～69 ppm (recognition)	Vapor Density : 3.1 (air=1)
PH : Not available	Relative density : 0.86 (water=1)
Melting/Freezing Point : －95 ℃	Solubility in water : 54～58 mg/100 ml
Initial boiling point/boiling range : 110.6 ℃	Partition coefficient : 2.73 (n-octanol/water)
Flash point : 4.4 ℃ (closed cup)	Auto-ignition temperature : 480℃
Evaporation Rate : 2.24 (BuAc=1)	Decomposition temperature : Not available
Flammability (solid/gas) : Not available	Viscosity : 0.6 mPa.s max @20℃
Molecular Formula : $C_6H_5CH_3$	Molecular Weight : 92.056

SECTION 10-STABILITY AND REACTIVITY

Reactivity
Vapor is explosive when exposed to heat or flame

Chemical stability
Stable at room temperature in closed containers under normal storage and handling conditions.

Possibility of hazardous reaction
Has not been reported.

Condition to avoid
Product is highly flammable – Keep away from sources of ignition. Avoid the higher temperatures. Keep away from open fire, heating elements and heat radiating surface and prevent from forming of the vapours mixtures with air in explosion limits.

Incompatible materials
Heat, flame, strong oxidizers, nitric and sulfuric acids, chlorine, nitrogen tetraoxide; will attack some forms of plastics, rubber, coatings.

Hazardous decomposition products
Carbon monoxide, carbon dioxide, hydrocarbons.

SECTION 11-TOXICOLOGICAL INFORMATION

Routes of exposure
Eye, Skin, inhalation, Ingestion.

Symptoms (treatments as indicated in Section 4)
Eye: The liquid produces a high level of eye discomfort and is capable of causing pain and severe conjunctivitis. Corneal injury may develop, with possible permanent impairment of vision, if not promptly and adequately treated. There is evidence that material may produce eye irritation in some persons and produce eye damage 24 hours or more after instillation. Severe inflammation may be expected with pain. There may be damage to the cornea. Unless treatment is prompt and adequate there may be permanent loss of vision. Conjunctivitis can occur following repeated exposure.

Skin: Contact with the material may damage the health of the individual; systemic effects may result following absorption. The material may cause moderate inflammation of the skin either following direct contact or after a delay of some time. Repeated exposure can cause contact dermatitis which is characterized by redness, swelling and blistering. Entry into the blood-stream, through, for example, cuts, abrasions or lesions, may produce systemic injury with harmful effects. Examine the skin prior to the use of the material and ensure that any external damage is suitably protected.

Ingestion: Accidental ingestion of the material may be harmful; animal experiments indicate that ingestion of less than 150 gram may be fatal or may produce serious damage to the health of the individual. Swallowing of the liquid may cause aspiration into the lungs with the risk of chemical pneumonitis; serious consequences may result. (ICSC13733). Considered an unlikely route of entry in commercial/industrial environments. The liquid may produce gastrointestinal discomfort and may be harmful if swallowed. Ingestion may result in nausea, pain and vomiting. Vomit entering the lungs by aspiration may cause potentially lethal chemical pneumonitis.

Inhalation: Inhalation of vapours or aerosols (mists, fumes), generated by the material during the course of normal handling, may be damaging to the health of the individual. There is some evidence to suggest that the material can cause respiratory irritation in some persons. The body's response to such irritation can cause further lung damage. Inhalation of vapours may cause drowsiness and dizziness. This may be accompanied by sleepiness, reduced alertness, loss of reflexes, lack of co-ordination, and vertigo. Inhalation of high concentrations of gas/vapour causes lung irritation with coughing and nausea, central nervous depression with headache and dizziness, slowing of reflexes, fatigue and inco-ordination. If exposure to highly concentrated solvent atmosphere is prolonged this may lead to narcosis, unconsciousness, even coma and possible death. The use of a quantity of material in an unventilated or confined space may result in increased exposure and an irritating atmosphere developing. Before starting consider control of exposure by mechanical ventilation.

Chronic exposure: There has been some concern that this material can cause cancer or mutations but there is not enough data to make an assessment. Substance accumulation, in the human body, may occur and may cause some concern following repeated or long-term occupational exposure.

Toxicity
LD50: <870 mg/kg (rat, oral)
LC50: 6000 ppm/6h (rat, inhalation)

Chronic effect
Carcinogenicity:
ACGIH : A4-Not classifiable as a Human Carcinogen.
OSHA : Possible select carcinogen.
IARC : Group 3 carcinogen.

Epide miology: Not available.

Teratogenicity: Teratogenic effects have occurred in experimental animals.

Reproductive Effects: Adverse reproductive effects have occurred in experimental animals.

Neurotoxicity: Not available.

Mutagenicity: Not available.

SECTION 12-ECOLOGICAL INFORMATION

Ecotoxicity
LC_{50} (96 hr.) Fish: 7.3～22.8 mg/l
EC_{50} (48 hr.) Water flea: －
Biocencentration factor (BCF): 1.67～380

Persistence and degradability

1. The material are expected to form a slick on the surface of waters after release in calm sea conditions. This is expected to evaporate and enter the atmosphere where it will be degraded through reaction with hydroxyl radicals.
2. Some of the material will become associated with benthic sediments, and it is likely to be spread over a fairly wide area of sea floor. Marine sediments may be either aerobic or anaerobic. The material, in probability, is biodegradable, under aerobic conditions. Evidence also suggests that the hydrocarbons may be degradable under anaerobic conditions although such degradation in benthic sediments may be a relatively slow process.
3. Under aerobic conditions the material will degrade to water and carbon dioxide, while under aerobic processes it will produce water, methane, carbon dioxide and carbon dioxide.
4. Based on test results, as well as theoretical considerations, the potential for bioaccumulation may be high. Toxic effects are often observed in species such as blue mussel, daphnia, freshwater green algae, marine copepods and amphipods.

Half-life (Air): 10～104 hr
Half-life (Surface water): 96～528 hr
Half-life (Ground water): 168～672 hr
Half-life (Soil): 96～528 hr

Bioaccumulative potential
This material is not expected to significantly bioaccumulate.

Mobility in soil: －

Other adverse effects: －

SECTION 13-DISPOSAL CONSIDERATIONS

Residues and spilled material are hazardous waste due to ignitability. Disposal must be in accordance with applicable federal, state, or local regulations.
The container for this product can present explosion or fire hazards, even when emptied. To avoid risk of injury, do not cut, puncture, or weld on or near this container. Since the emptied containers retain product residue, follow label warnings even after container is emptied.

SECTION 14-TRANSPORTATION INFORMATION

US DOT	Shipping Name	Toluene	Hazard Labels

SECTION 15-REGULATORY INFORMATION

US FEDERAL

TSCA

CAS# 108-88-3 is listed on the TSCA inventory.

Health & Safety Reporting List

CAS# 108-88-3: Effective Date: 10/4/82; Sunset Date: 10/4/92

Chemical Test Rules

None of the chemicals in this product are under a Chemical Test Rule.

Section 12b

None of the chemicals are listed under TSCA Section 12b.

TSCA Significant New Use Rule

None of the chemicals in this material have a SNUR under TSCA.

SARA

Section 302 (RQ)

CAS# 108-88-3 : final RQ = 1000 pounds (454 kg)

Section 302 (TPQ)

None of the chemicals in this material have a TPQ.

SARA Codes

CAS# 108-88-3 : acute, flammable.

Section 313

This material contains Toluene (CAS# 108-88-3, 99% & 100%), which is subject to the reporting requirements of Section 313 of SARA Title III and 40 CFR Part 372.

Clean Air Act

CAS# 108-88-3 is listed as a hazardous air pollutant (HAP).

This material does not contain any Class 1 Ozone depletors.

This material does not contain any Class 2 Ozone depletors.

Clean Water Act

CAS# 108-88-3 is listed as a Hazardous Substance under the CWA.
CAS# 108-88-3 is listed as a Priority Pollutant under the Clean Water Act.
CAS# 108-88-3 is listed as a Toxic Pollutant under the Clean Water Act.

OSHA

None of the chemicals in this product are considered highly hazardous by OSHA.

STATE

Toluene can be found on the following state right to know lists: California, New Jersey, Florida, Pennsylvania, Minnesota, Massachusetts.
WARNING: This product contains Toluene, a chemical known to the state of California to cause birth defects or other reproductive harm.
California No Significant Risk Level: None of the chemicals in this product are listed.

European/International Regulations

European Labeling in Accordance with EC Directives

Hazard Symbols: XN F
Risk Phrases : R 10 Flammable.
R 20 Harmful by inhalation.
Safety Phrases : S 9 Keep container in a well-ventilated place.
S 16 Keep away from sources of ignition - No smoking.
S 25 Avoid contact with eyes.
S 29 Do not empty into drains.
S 33 Take precautionary measures against static discharges.

WGK (Water Danger/Protection)

CAS# 108-88-3: 2

United Kingdom Occupational Exposure Limits

CAS# 108-88-3: OES-United Kingdom, TWA 50 ppm TWA; 191 mg/m3 TWA.

1 Identification

· **Product identifier**

· **Trade name:** **Total Organic Carbon Std. 1000 mg/L (ppm), Certified**

· **Article number:** 9570

· **Details of the supplier of the safety data sheet**
· **Manufacturer/Supplier:**
Aqua Solutions, Inc.
6913 Highway 225
DEER PARK, TX 77536
USA
800-256-2586

· **Information department:**
Technical Coordinator
Sherman Nelson shermann@aquasolutions.org
· **Emergency telephone number:**
Chemtrec: 800-424-9300
Canutec: 613-996-6666

2 Hazard(s) identification

· **Classification of the substance or mixture**
The product is not classified, according to the Globally Harmonized System (GHS).

· **Label elements**
· **GHS label elements** Not Applicable
· **Hazard pictograms** Not Applicable
· **Signal word** Not Applicable
· **Hazard statements** Not Applicable
· **Precautionary statements**
If swallowed: Call a poison center/doctor if you feel unwell.
If on skin: Wash with plenty of water.
If in eyes: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
Dispose of contents/container in accordance with local/regional/national/international regulations.
· **Classification system:**
· **NFPA ratings (scale 0 - 4)**

Health = 0
Fire = 0
Reactivity = 0

· **HMIS-ratings (scale 0 - 4)**

Health = 1
Fire = 0
Reactivity = 0

· **Other hazards**
· **Results of PBT and vPvB assessment**
· **PBT:** Not applicable.
· **vPvB:** Not applicable.

3 Composition/information on ingredients

· **Chemical characterization: Mixtures**
· **Description:** Mixture of the substances listed below with nonhazardous additions.

· **Dangerous components:** Not Applicable

· **Table of Nonhazardous Ingredients**		
CAS: 7732-18-5	Water	99.558%
CAS: 7647-01-0	Hydrochloric Acid	0.23%
CAS: 877-24-7	Potassium Hydrogen Phthalate	0.212%

4 First-aid measures

· **Description of first aid measures**
· **General information:** No special measures required.
· **After inhalation:** Supply fresh air; consult doctor in case of complaints.
· **After skin contact:** Immediately rinse with water.
· **After eye contact:** Rinse opened eye for several minutes under running water. Then consult a doctor.
· **After swallowing:** If symptoms persist consult doctor.
· **Information for doctor:**
· **Most important symptoms and effects, both acute and delayed** No further relevant information available.
· **Indication of any immediate medical attention and special treatment needed**
No further relevant information available.

5 Fire-fighting measures

· **Extinguishing media**
· **Suitable extinguishing agents:** Use fire fighting measures that suit the environment.
· **Special hazards arising from the substance or mixture** No further relevant information available.
· **Advice for firefighters**
· **Protective equipment:** No special measures required.

6 Accidental release measures

· **Personal precautions, protective equipment and emergency procedures** Not required.
· **Environmental precautions:** Dilute with plenty of water.
· **Methods and material for containment and cleaning up:**
Absorb with liquid-binding material (sand, diatomite, acid binders, universal binders, sawdust).
Dispose contaminated material as waste according to item 13.
· **Reference to other sections**
See Section 7 for information on safe handling.
See Section 8 for information on personal protection equipment.
See Section 13 for disposal information.
· **Protective Action Criteria for Chemicals**

· **PAC-1:**		
CAS: 7647-01-0	Hydrochloric Acid	1.8 ppm
CAS: 877-24-7	Potassium Hydrogen Phthalate	9.6 mg/m³

(Contd. of page 2)

· **PAC-2:**		
CAS: 7647-01-0	Hydrochloric Acid	22 ppm
CAS: 877-24-7	Potassium Hydrogen Phthalate	110 mg/m³

· **PAC-3:**		
CAS: 7647-01-0	Hydrochloric Acid	100 ppm
CAS: 877-24-7	Potassium Hydrogen Phthalate	630 mg/m³

7 Handling and storage

· **Handling:**
· **Precautions for safe handling** No special measures required.
· **Information about protection against explosions and fires:** No special measures required.

· **Conditions for safe storage, including any incompatibilities**
· **Storage:**
· **Requirements to be met by storerooms and receptacles:** No special requirements.
· **Information about storage in one common storage facility:** Not required.
· **Further information about storage conditions:** None.
· **Specific end use(s)** No further relevant information available.

8 Exposure controls/personal protection

· **Additional information about design of technical systems:** No further data; see item 7.

· **Control parameters**
· **Components with limit values that require monitoring at the workplace:**
The product does not contain any relevant quantities of materials with critical values that have to be monitored at the workplace.
· **Additional information:** The lists that were valid during the creation were used as basis.

· **Exposure controls**
· **Personal protective equipment:**
· **General protective and hygienic measures:**
The usual precautionary measures for handling chemicals should be followed.
· **Breathing equipment:** Not required.
· **Protection of hands:**

Protective gloves

The glove material has to be impermeable and resistant to the product/ the substance/ the preparation.
Due to missing tests no recommendation to the glove material can be given for the product/ the preparation/ the chemical mixture.
Selection of the glove material on consideration of the penetration times, rates of diffusion and the degradation
· **Material of gloves**
The selection of the suitable gloves does not only depend on the material, but also on further marks of quality and varies from manufacturer to manufacturer. As the product is a preparation of several substances, the resistance of the glove material can not be calculated in advance and has therefore to be checked prior to the application.
· **Penetration time of glove material**
The exact break through time has to be found out by the manufacturer of the protective gloves and has to be observed.

9 Physical and chemical properties

· **Information on basic physical and chemical properties**	
· **General Information**	
· **Appearance:**	
Form:	Liquid
Color:	Clear
· **Odor:**	Odorless
· **Odor threshold:**	Not determined.
· **pH-value:**	Not determined.
· **Change in condition**	
Melting point/Melting range:	0 °C (32 °F)
Boiling point/Boiling range:	100 °C (212 °F)
· **Flash point:**	Not applicable.
· **Flammability (solid, gaseous):**	Not applicable.
· **Decomposition temperature:**	Not determined.
· **Auto igniting:**	Product is not selfigniting.
· **Danger of explosion:**	Product does not present an explosion hazard.
· **Explosion limits:**	
Lower:	Not determined.
Upper:	Not determined.
· **Vapor pressure at 20 °C (68 °F):**	23 hPa (17.3 mm Hg)
· **Density at 20 °C (68 °F):**	1.00113 g/cm³ (8.35443 lbs/gal)
· **Relative density**	Not determined.
· **Vapor density**	Not determined.
· **Evaporation rate**	Not determined.
· **Solubility in / Miscibility with**	
Water:	Fully miscible.
· **Partition coefficient (n-octanol/water):**	Not determined.
· **Viscosity:**	
Dynamic:	Not determined.
Kinematic:	Not determined.
· **Solvent content:**	
Water:	99.6 %
VOC content:	0.00 %
	0.0 g/l / 0.00 lb/gal
Solids content:	0.2 %
· **Other information**	No further relevant information available.

10 Stability and reactivity

· **Reactivity** No further relevant information available.
· **Chemical stability**
· **Thermal decomposition / conditions to be avoided:** No decomposition if used according to specifications.
· **Possibility of hazardous reactions** No dangerous reactions known.
· **Conditions to avoid** No further relevant information available.
· **Incompatible materials:** No further relevant information available.
· **Hazardous decomposition products:** No dangerous decomposition products known.

11 Toxicological information

· **Information on toxicological effects**
· **Acute toxicity:**
· **Primary irritant effect:**
· **on the skin:** No irritant effect.
· **on the eye:** No irritating effect.
· **Sensitization:** No sensitizing effects known.
· **Additional toxicological information:**
The product is not subject to classification according to internally approved calculation methods for preparations:
When used and handled according to specifications, the product does not have any harmful effects according to our experience and the information provided to us.

· **Carcinogenic categories**

· **IARC (International Agency for Research on Cancer)**
None of the ingredients is listed.

· **NTP (National Toxicology Program)**
None of the ingredients is listed.

· **OSHA-Ca (Occupational Safety & Health Administration)**
None of the ingredients is listed.

12 Ecological information

· **Toxicity**
· **Aquatic toxicity:** No further relevant information available.
· **Persistence and degradability** No further relevant information available.
· **Behavior in environmental systems:**
· **Bioaccumulative potential** No further relevant information available.
· **Mobility in soil** No further relevant information available.
· **Additional ecological information:**
· **General notes:** Not hazardous for water.
· **Results of PBT and vPvB assessment**
· **PBT:** Not applicable.
· **vPvB:** Not applicable.
· **Other adverse effects** No further relevant information available.

SAFETY DATA SHEET

Version 6.8
Revision Date 09/07/2024
Print Date 09/08/2024

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifiers

Product name : PCB No 28

Product Number : 35601
Brand : Sigma-Aldrich
Index-No. : 602-039-00-4
CAS-No. : 7012-37-5

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Laboratory chemicals, Synthesis of substances

Uses advised against : The product is being supplied under the TSCA R&D Exemption (40 CFR Section 720.36). It is the recipient's responsibility to comply with the requirements of the R&D exemption. The product may not be used for a non-exempt commercial purpose under TSCA unless appropriate consent is granted in writing by MilliporeSigma.

1.3 Details of the supplier of the safety data sheet

Company : Sigma-Aldrich Inc.
3050 SPRUCE ST
ST. LOUIS MO 63103
UNITED STATES

Telephone : +1 314 771-5765
Fax : +1 800 325-5052

1.4 Emergency telephone

Emergency Phone # : 800-424-9300 CHEMTREC (USA) +1-703-527-3887 CHEMTREC (International) 24 Hours/day; 7 Days/week

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)

Specific target organ toxicity - repeated exposure (Category 2), H373
Short-term (acute) aquatic hazard (Category 1), H400
Long-term (chronic) aquatic hazard (Category 1), H410

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

MilliporeSigma

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal Word: Warning

Hazard Statements

H373	May cause damage to organs through prolonged or repeated exposure.
H410	Very toxic to aquatic life with long lasting effects.

Precautionary Statements

P260	Do not breathe dust.
P273	Avoid release to the environment.
P314	Get medical advice/ attention if you feel unwell.
P391	Collect spillage.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

SECTION 3: Composition/information on ingredients

3.1 Substances

Synonyms	:	2,4,4'-Trichlorobiphenyl 2,4,4'-PCB
Formula	:	$C_{12}H_7Cl_3$
Molecular weight	:	257.54 g/mol
CAS-No.	:	7012-37-5
EC-No.	:	230-293-2
Index-No.	:	602-039-00-4

Component	Classification	Concentration
2,4,4'-Trichlorobiphenyl		
	STOT RE 2; Aquatic Acute 1; Aquatic Chronic 1; H373, H400, H410 Concentration limits: >= 0.005 %: STOT RE 2, H373; >= 0.005 %: STOT RE 2, H373; M-Factor - Aquatic Acute: 10 - Aquatic Chronic: 10	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 4: First aid measures

4.1 Description of first-aid measures

General advice
Show this material safety data sheet to the doctor in attendance.

If inhaled
After inhalation: fresh air. Call in physician.

In case of skin contact
In case of skin contact: Take off immediately all contaminated clothing. Rinse skin with water/ shower. Consult a physician.

In case of eye contact
After eye contact: rinse out with plenty of water. Call in ophthalmologist. Remove contact lenses.

If swallowed
After swallowing: immediately make victim drink water (two glasses at most). Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media
Water Foam Carbon dioxide (CO2) Dry powder

Unsuitable extinguishing media
For this substance/mixture no limitations of extinguishing agents are given.

5.2 Special hazards arising from the substance or mixture
Carbon oxides
Hydrogen chloride gas
Combustible.
Development of hazardous combustion gases or vapours possible in the event of fire.

5.3 Advice for firefighters
Stay in danger area only with self-contained breathing apparatus. Prevent skin contact by keeping a safe distance or by wearing suitable protective clothing.

5.4 Further information
Suppress (knock down) gases/vapors/mists with a water spray jet. Prevent fire extinguishing water from contaminating surface water or the ground water system.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Advice for non-emergency personnel: Avoid inhalation of dusts. Avoid substance contact. Ensure adequate ventilation. Evacuate the danger area, observe emergency procedures, consult an expert.
For personal protection see section 8.

6.2 Environmental precautions

Do not let product enter drains.

6.3 Methods and materials for containment and cleaning up

Cover drains. Collect, bind, and pump off spills. Observe possible material restrictions (see sections 7 and 10). Take up dry. Dispose of properly. Clean up affected area. Avoid generation of dusts.

6.4 Reference to other sections

For disposal see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Advice on safe handling
Work under hood. Do not inhale substance/mixture.

Hygiene measures
Change contaminated clothing. Preventive skin protection recommended. Wash hands after working with substance.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities

Storage conditions
Tightly closed. Dry.

Storage class
Storage class (TRGS 510): 11: Combustible Solids

7.3 Specific end use(s)

Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Ingredients with workplace control parameters

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Component	CAS-No.	Value	Control parameters	Basis
2,4,4'-Trichlorobiphenyl	7012-37-5	TWA	0.001 mg/m3	USA. NIOSH Recommended Exposure Limits
	Remarks	Potential Occupational Carcinogen		

8.2 Exposure controls

Appropriate engineering controls
Change contaminated clothing. Preventive skin protection recommended. Wash hands after working with substance.

Personal protective equipment

Eye/face protection
Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU). Safety glasses

Skin protection
Handle with impervious gloves.

This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).

Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:KCL 741 Dermatril® L

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:KCL 741 Dermatril® L

Body Protection
protective clothing

Respiratory protection
Recommended Filter type: Filter type P2
The entrepeneur has to ensure that maintenance, cleaning and testing of respiratory protective devices are carried out according to the instructions of the producer. These measures have to be properly documented.
required when dusts are generated.
Our recommendations on filtering respiratory protection are based on the following standards: DIN EN 143, DIN 14387 and other accompanying standards relating to the used respiratory protection system.

Control of environmental exposure
Do not let product enter drains.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: solid
b)	Odor	No data available
c)	Odor Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/ range: 56 °C (133 °F)
f)	Initial boiling point and boiling range	No data available
g)	Flash point	> 100.00 °C (> 212.00 °F)
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	No data available
k)	Vapor pressure	No data available
l)	Vapor density	No data available
m)	Density	No data available
	Relative density	No data available
n)	Water solubility	insoluble
o)	Partition coefficient: n-octanol/water	No data available
p)	Autoignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	none

9.2 Other safety information

No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 10: Stability and reactivity

10.1 Reactivity
The following applies in general to flammable organic substances and mixtures: in correspondingly fine distribution, when whirled up a dust explosion potential may generally be assumed.

10.2 Chemical stability
The product is chemically stable under standard ambient conditions (room temperature) .

10.3 Possibility of hazardous reactions
Violent reactions possible with:
strong oxidising agents

10.4 Conditions to avoid
no information available

10.5 Incompatible materials
No data available

10.6 Hazardous decomposition products
In the event of fire: see section 5

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity
Oral: No data available
Inhalation: No data available
Dermal: No data available

Skin corrosion/irritation
No data available

Serious eye damage/eye irritation
No data available

Respiratory or skin sensitization
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

IARC: 1 - Group 1: Carcinogenic to humans (2,4,4'-Trichlorobiphenyl)

NTP: No ingredient of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is on OSHA's list of regulated carcinogens.

Reproductive toxicity
No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
May cause damage to organs through prolonged or repeated exposure.

Aspiration hazard
No data available

11.2 Additional Information

RTECS: DV8840000
To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

SECTION 12: Ecological information

12.1 Toxicity

Toxicity to fish	LC50 - Pimephales promelas (fathead minnow) - > 0.16 mg/l - 96.0 h
Toxicity to daphnia and other aquatic invertebrates	EC50 - Daphnia magna (Water flea) - > 0.16 mg/l - 48 h

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Endocrine disrupting properties
No data available

12.7 Other adverse effects
No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product
Waste material must be disposed of in accordance with the national and local regulations. Leave chemicals in original containers. No mixing with other waste. Handle uncleaned containers like the product itself.

SECTION 14: Transport information

DOT (US)
UN number: 3432 Class: 9 Packing group: II
Proper shipping name: Polychlorinated biphenyls, solid
Reportable Quantity (RQ):
Marine pollutant: yes Poison Inhalation Hazard: No

IMDG
UN number: 3432 Class: 9 Packing group: II EMS-No: F-A, S-A
Proper shipping name: POLYCHLORINATED BIPHENYLS, SOLID
Marine pollutant : yes
Marine pollutant : yes

IATA
UN number: 3432 Class: 9 Packing group: II
Proper shipping name: Polychlorinated biphenyls, solid

SECTION 15: Regulatory information

CERCLA Reportable Quantity
This material does not contain any components with a CERCLA RQ.

SARA 304 Extremely Hazardous Substances Reportable Quantity
This material does not contain any components with a section 304 EHS RQ.

SARA 302 Extremely Hazardous Substances Threshold Planning Quantity
This material does not contain any components with a section 302 EHS TPQ.

SARA 311/312 Hazards : No SARA Hazards

SARA 313 : This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

US State Regulations

Massachusetts Right To Know
No components are subject to the Massachusetts Right to Know Act.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Pennsylvania Right To Know

2,4,4'-Trichlorobiphenyl 7012-37-5

Maine Chemicals of High Concern

Product does not contain any listed chemicals

Vermont Chemicals of High Concern

Product does not contain any listed chemicals

Washington Chemicals of High Concern

Product does not contain any listed chemicals

California Prop. 65

WARNING: This product can expose you to chemicals including 2,4,4'-Trichlorobiphenyl, which is/are known to the State of California to cause cancer and birth defects or other reproductive harm. For more information go to www.P65Warnings.ca.gov.

The ingredients of this product are reported in the following inventories:

TSCA : Product contains substance(s) not listed on TSCA inventory.

TSCA list

No substances are subject to a Significant New Use Rule.

The following substance(s) is/are subject to TSCA 12(b) export notification requirements:
2,4,4'-Trichlorobiphenyl 7012-37-5

SECTION 16: Other information

Further information

The information is believed to be correct but is not exhaustive and will be used solely as a guideline, which is based on current knowledge of the chemical substance or mixture and is applicable to appropriate safety precautions for the product. It does not represent any guarantee of the properties of the product. Sigma-Aldrich Corporation and its Affiliates shall not be held liable for any damage resulting from handling or from contact with the above product. See www.sigma-aldrich.com and/or the reverse side of invoice or packing slip for additional terms and conditions of sale.

SAFETY DATA SHEET
Xylene

SECTION 1: Identification of the substance/mixture and of the company/undertaking

Date issued	11.11.2013

1.1. Product identifier

Product name	Xylene
Chemical name	Xylene
Synonyms	Xylol, dimethyl benzene, xylenol
REACH Reg No.	01-2119488216-32-0000
CAS no.	1330-20-7
EC no.	215-535-7
Index no.	601-022-00-9
Article no.	13000000

1.2. Relevant identified uses of the substance or mixture and uses advised against

Use of the substance/preparation	For the preparation of paints and as a solvent. General purpose cleaner.

1.3. Details of the supplier of the safety data sheet

Manufacturer

Company name	Fred Holmberg & Co AB
Office address	Geijersgatan 8
Postal address	Box 60056
Postcode	S-216 10
City	Limhamn
Country	Sweden
Tel	+46 (0)40 15 79 20
Fax	+46 (0)40 16 22 95
E-mail	info@holmberg.se
Website	http://www.holmberg.se/en/

1.4. Emergency telephone number

Emergency telephone	112 (Europe)

SECTION 2: Hazards identification

2.1. Classification of substance or mixture

Classification according to 67/548/EEC or 1999/45/EC	Xi; R38 Xn; R20/21 R10
Classification according to Regulation (EC) No 1272/2008 [CLP/GHS]	Flam. Liq. 3; H226; Acute tox. 4; H312; Skin Irrit. 2; H315; Acute tox. 4; H332;

2.2. Label elements

Hazard Pictograms (CLP)

Signal word	Danger
Hazard statements	H226 Flammable liquid and vapour. H312 Harmful in contact with skin. H315 Causes skin irritation. H332 Harmful if inhaled.
Precautionary statements	P210 Keep away from heat/sparks/open flames/hot surfaces. – No smoking. P233 Keep container tightly closed. P243 Take precautionary measures against static discharge. P280 Wear protective gloves/protective clothing/eye protection/face protection. P301 + P310 IF SWALLOWED: Immediately call a POISON CENTER or doctor/physician. P303 + P361 + P353 IF ON SKIN (or hair): Remove/Take off immediately all contaminated clothing. Rinse skin with water/shower. P331 Do NOT induce vomiting. P403 + P235 Store in a well-ventilated place. Keep cool.

2.3. Other hazards

Other hazards	Not known.

SECTION 3: Composition/information on ingredients

3.2. Mixtures

Substance	Identification	Classification	Contents
Xylene	CAS no.: 1330-20-7 EC no.: 215-535-7 Index no.: 601-022-00-9	R10 Xn; R20/21 Xi; R38 Flam. Liq. 3; H226 Acute tox. 4; H332 Acute tox. 4; H312 Skin Irrit. 2; H315 Note : C	75 - 90 %
Ethylbenzene	CAS no.: 100-41-4 EC no.: 202-849-4 Index no.: 601-023-00-4 Synonyms: Ethylbenzene	F; R11 Xn; R20 Flam. Liq. 2; H225 Acute tox. 4; H332	10 - 25 %

Column headings	CAS no. = Chemical Abstracts Service; EU (Einecs or Elincs number) = European inventory of Existing Commercial Chemical Substances; Ingredient name = Name as specified in the substance list (substances that are not included in the substance list must be translated, if possible). Contents given in; %, %wt/wt, %vol/wt, %vol/vol, mg/m3, ppb, ppm, weight%, vol%
HH/HF/HE	T+ = Very toxic, T = Toxic, C = Corrosive, Xn = Harmful, Xi = Irritating, E = Explosive, O = Oxidizing, F+ = Extremly flammable, F = Very flammable, N = Environmental hazard

SECTION 4: First aid measures

4.1. Description of first aid measures

Inhalation	Move the exposed person to fresh air at once. Get medical attention if any discomfort continues.
Skin contact	Remove contaminated clothes and rinse skin thoroughly with water.
Eye contact	Immediately flush with plenty of water for up to 15 minutes. Remove any contact lenses and open eyes wide apart. Get medical attention if any discomfort continues.
Ingestion	NEVER MAKE AN UNCONSCIOUS PERSON VOMIT OR DRINK FLUIDS! Do not induce vomiting. Rinse mouth with water. Get medical attention.

4.2. Most important symptoms and effects, both acute and delayed

Information for health personnel	Treat Symptomatically. Do not give victim anything to drink if he is

unconscious.

4.3. Indication of any immediate medical attention and special treatment needed

Specific details on antidotes	No recommendation given.

SECTION 5: Firefighting measures

5.1. Extinguishing media

Suitable extinguishing media	Extinguish with alcohol-resistant foam, carbon dioxide, dry powder or water fog.

5.2. Special hazards arising from the substance or mixture

Fire and explosion hazards	Solvent vapours may form explosive mixtures with air.
Hazardous combustion products	Fire creates: Carbon monoxide (CO). Carbon dioxide (CO_2).

5.3. Advice for firefighters

Fire fighting procedures	No specific fire fighting procedure given.

SECTION 6: Accidental release measures

6.1. Personal precautions, protective equipment and emergency procedures

Personal protection measures	Ensure suitable personal protection (including respiratory protection) during removal of spillages in a confined area. Ventilate well. Stop leak if possible without risk. Avoid contact with skin and eyes. Do not breathe vapour.

6.2. Environmental precautions

Environmental precautionary measures	Avoid discharge into drains, water courses or onto the ground.

6.3. Methods and material for containment and cleaning up

Cleaning method	Dam and absorb spillages with sand, earth or other non-combustible material.

6.4. Reference to other sections

Other instructions	No recommendation given.

SECTION 7: Handling and storage

7.1. Precautions for safe handling

Handling	Keep away from heat, sparks and open flame. Take precautionary measures against static discharges. Mechanical ventilation may be required.

Protective Safety Measures

Advice on general occupational hygiene	Provide easy access to water supply and eye wash facilities.

7.2. Conditions for safe storage, including any incompatibilities

Storage	Keep away from heat, sparks and open flame. Ground container and transfer equipment to eliminate static electric sparks. Store in a cool and well-ventilated place.

7.3. Specific end use(s)

Specific use(s)	Not entered.

SECTION 8: Exposure controls/personal protection

8.1. Control parameters

DNEL / PNEC

Method of testing	Contents
DNEL	Group: Industrial Exposure route: Inhalation Exposure frequency: Short term (acute) Critical Component: Etylbenzen Value: 289 mg/kg/dag

DNEL	Group: Industrial Exposure route: Inhalation Exposure frequency: Long term (repeated) Critical Component: Etylbenzen Type of effect: Systemic effect Value: 77 mg/kg/dag
DNEL	Group: Industrial Exposure route: Dermal Exposure frequency: Long term (repeated) Critical Component: Etylbenzen Type of effect: Systemic effect Value: 180 mg/kg/dag
DNEL	Group: Consumer Exposure route: Inhalation Exposure frequency: Long term (repeated) Critical Component: Etylbenzen Type of effect: Systemic effect Value: 14,8 mg/kg/dag
DNEL	Group: Consumer Exposure route: Dermal Exposure frequency: Long term (repeated) Critical Component: Etylbenzen Type of effect: Systemic effect Value: 108 mg/kg/dag
DNEL	Group: Consumer Exposure route: Oral Exposure frequency: Long term (repeated) Critical Component: Etylbenzen Type of effect: Systemic effect Value: 1,6 mg/kg/dag
DNEL	Group: Industrial Exposure route: Inhalation Exposure frequency: Short term (acute) Critical Component: xylen Value: 442 mg/kg/dag
DNEL	Group: Industrial Exposure route: Inhalation Exposure frequency: Long term (repeated) Critical Component: xylen Type of effect: Systemic effect Value: 221 mg/kg/dag
DNEL	Group: Industrial Exposure route: Dermal Exposure frequency: Long term (repeated) Critical Component: xylen Type of effect: Systemic effect Value: 3182 mg/kg/dag
DNEL	Group: Consumer Exposure route: Inhalation Exposure frequency: Short term (acute) Critical Component: xylen Value: 260 mg/kg/dag
DNEL	Group: Consumer Exposure route: Inhalation Exposure frequency: Long term (repeated) Critical Component: xylen Type of effect: Systemic effect

	Value: 65,3 mg/kg/dag
DNEL	Group: Consumer Exposure route: Dermal Exposure frequency: Long term (repeated) Critical Component: xylen Type of effect: Systemic effect Value: 1872 mg/kg/dag
DNEL	Group: Consumer Exposure route: Oral Exposure frequency: Long term (repeated) Critical Component: xylen Type of effect: Systemic effect Value: 12,5 mg/kg/dag
Exposure guidelines	Country of origin: Sverige Limit value type: NGV 200 mg/m3 OEL Short Term Value: 450 mg/m3 Source: Nationella hygieniska gränsvärden, AFS 2005:17
Other Information	Ovanstående NGV resp. KTV gäller både xylen och etylbenzen

8.2. Exposure controls

Occupational exposure limits	Provide adequate ventilation. Observe Occupational Exposure Limits and minimise the risk of inhalation of vapours. Protective gloves and goggles are recommended. Provide eyewash, quick drench.

Safety signs

Respiratory protection

Respiratory protection	Respiratory protection must be used if air contamination exceeds acceptable level. Use respiratory equipment with gas filter, type A2.

Hand protection

Hand protection	Use protective gloves. Chemical resistant gloves required for prolonged or repeated contact. Gloves of nitrile rubber, PVA or Viton are recommended.

Eye / face protection

Eye protection	Use safety goggles or face shield in case of splash risk.

Skin protection

Skin protection (except hands)	Wear appropriate clothing to prevent any possibility of skin contact.

Hygiene / Environmental

Specific hygiene measures	Wash hands after contact.

SECTION 9: Physical and chemical properties

9.1. Information on basic physical and chemical properties

Physical state	Fluid.
Colour	Colourless.
Odour	Aromatic.
Comments, pH (as supplied)	Not relevant.
Melting point/melting range	Value: < -48 °C
Boiling point / boiling range	Value: 136-145 °C
Flash point	Value: 27 °C
Evaporation rate	Value: 13,5
Explosion limit	Value: 1-7,1 %
Vapour pressure	Value: 1 kPa Test temperature: 20 °C

Vapour density	Value: 3,7
Specific gravity	Value: 0,870 kg/m3 Test temperature: 20 °C
Solubility description	Soluble in: Organic solvents. Not soluble in water.
Partition coefficient: n-octanol/water	Value: 3,15
Spontaneous combustability	Value: > 432-530 °C
Viscosity	Value: < 0,90 mPas Method of testing: Kinematisk Test temperature: 25 °C

9.2. Other information

SECTION 10: Stability and reactivity

10.1. Reactivity

Reactivity	Heating may cause a fire.

10.2. Chemical stability

Stability	Stable under the prescribed storage conditions.

10.3. Possibility of hazardous reactions

Possibility of hazardous reactions	Not known.

10.4. Conditions to avoid

Conditions to avoid	Avoid heat, flames and other sources of ignition.

10.5. Incompatible materials

Materials to avoid	Avoid contact with oxidising agents (e.g. nitric acid, peroxides and chromates). Strong acids.

10.6. Hazardous decomposition products

Hazardous decomposition products	Fire creates: Carbon monoxide (CO). Carbon dioxide (CO2).

SECTION 11: Toxicological information

11.1. Information on toxicological effects

Toxicological Information:

Other toxicological data	Acute Toxicity (Oral LD50): mg/kg (oral rat) > 2000 Acute Toxicity (Inhalation LC50): mg/l (vapours) (4h) > 20 Acute Toxicity (Dermal LD50): mg/kg Rabbit > 2000

Toxicological data for substances

Potential acute effects

Inhalation	In high concentrations, vapours are narcotic and may cause headache, fatigue, dizziness and nausea. Icke klassificerad som aspirationstoxisk (Not classified as asp. tox.)
Skin contact	Prolonged or frequent contact may cause redness, itching, eczema and skin cracking. Defats the skin.
Eye contact	May irritate and cause redness and pain.
Ingestion	Ingestion of large amounts may cause unconsciousness. However, ingestion may cause nausea, headache, dizziness and intoxication. Ingestion may cause irritation of the gastrointestinal tract, vomiting and diarrhoea. May cause irritation to the mouth and throat.

Delayed effects / repeated exposure

Sensitisation	Not known.
Chronic effects	None known.

Carcinogenic, Mutagenic or Reprotoxic

Carcinogenicity	None.
Mutagenicity	Not known.
Teratogenic properties	Suspected of damaging the unborn child

Reproductive toxicity	Not known.

SECTION 12: Ecological information

12.1. Toxicity

Acute aquatic, fish	Value: 2 mg/l Method of testing: LC50 Fish, species: Roccus saxatilis Duration: 96h
Acute aquatic, algae	Value: > 3,2 mg/l Method of testing: IC50 Algae, species: Selenastrum Capricornum Duration: 72h
Acute aquatic, Daphnia	Value: 8,5 mg/l Method of testing: EC50 Daphnia, species: Daphnia magna Duration: 48h

12.2. Persistence and degradability

Persistence and degradability description	Lättnedbrytbar av biologiska organismer.
Chemical oxygen demand (COD)	Value: 5 Method of testing: COD
Biological oxygen demand (BOD)	Value: 0,55 Method of testing: BOD

12.3. Bioaccumulative potential

Bioaccumulative potential	Will not bio-accumulate.
Bioconcentration factor (BCF)	Value: 22 Method of testing: BCF

12.4. Mobility in soil

Mobility	The product is insoluble in water and will spread on the water surface.

12.5. Results of PBT and vPvB assessment

PBT assessment results	This substance is not classified as PBT or vPvB.

12.6. Other adverse effects

Other adverse effects / Remarks	None known.

SECTION 13: Disposal considerations

13.1. Waste treatment methods

Specify the appropriate methods of disposal	Confirm disposal procedures with environmental engineer and local regulations. Absorb in vermiculite or dry sand and dispose of at a licenced hazardous waste collection point. Liquid components can be disposed of by incineration.
Product classified as hazardous waste	Yes
Packaging classified as hazardous waste	Yes

SECTION 14: Transport information

14.1. UN number

ADR	1307
RID	1307
IMDG	1307
ICAO/IATA	1307

14.2. UN proper shipping name

ADR	XYLENES

RID	XYLENES
IMDG	XYLENES
ICAO/IATA	XYLENES

14.3. Transport hazard class(es)

ADR	3
Hazard no.	30
RID	3
ADN	33
IMDG	3
ICAO/IATA	3

14.4. Packing group

ADR	III
RID	III
IMDG	III
ICAO/IATA	III

14.5. Environmental hazards

Comment	Not relevant.

14.6. Special precautions for user

EmS	F-E, S-D

14.7. Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code

SECTION 15: Regulatory information

EC no.	215-535-7

15.1. Safety, health and environmental regulations/legislation specific for the substance or mixture

Other Label Information	Regulation (EC) No 1272/2008 of the European Parliament and of the Council of 16 December 2008 on classification, labelling and packaging of substances and mixtures, amending and repealing Directives 67/548/EEC and 1999/45/EC, and amending Regulation (EC) No 1907/2006 with amendments.
Legislation and regulations	Dangerous Substance Directive 67/548/EEC. The Chemicals (Hazard Information and Packaging for Supply) Regulations 2009 (S.I 2009 No. 716). The List of Wastes (England) (Amendment) Regulations 2005. (SI 2005 No. 895). Avfallsförordningen (2011:927).

15.2. Chemical safety assessment

SECTION 16: Other information

Hazard symbol

R-phrases	R10 Flammable. R38 Irritating to skin. R20/22 Harmful by inhalation and if swallowed. R38 Irritating to skin.
S-phrases	S7 Keep container tightly closed. S16 Keep away from sources of ignition - No smoking.
Classification according to Regulation (EC) No 1272/2008 [CLP/GHS]	Flam. Liq. 3; H226; Acute tox. 4; H312; Skin Irrit. 2; H315;

	Acute tox. 4; H332;
List of relevant R-phrases (under headings 2 and 3).	R38 Irritating to skin. R11 Highly flammable. R10 Flammable. R20/21 Harmful by inhalation and in contact with skin. R20 Harmful by inhalation.
List of relevant H-phrases (Section 2 and 3).	H332 Harmful if inhaled. H312 Harmful in contact with skin. H225 Highly flammable liquid and vapour. H226 Flammable liquid and vapour. H315 Causes skin irritation.
Responsible for safety data sheet	Fred Holmberg & Co AB

SAFETY DATA SHEET

Version 4.10
Revision Date 05/27/2016
Print Date 01/23/2017

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	*trans*-1,2-Dichloroethene
Product Number	:	48527
Brand	:	Supelco
Index-No.	:	602-026-00-3
CAS-No.	:	156-60-5

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Synthesis of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	+1-703-527-3887 (CHEMTREC)

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Flammable liquids (Category 2), H225
Acute toxicity, Inhalation (Category 4), H332
Acute aquatic toxicity (Category 3), H402
Chronic aquatic toxicity (Category 3), H412

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word: Danger

Hazard statement(s)

H225	Highly flammable liquid and vapour.
H332	Harmful if inhaled.
H412	Harmful to aquatic life with long lasting effects.

Precautionary statement(s)

P210	Keep away from heat/sparks/open flames/hot surfaces. No smoking.
P233	Keep container tightly closed.
P240	Ground/bond container and receiving equipment.
P241	Use explosion-proof electrical/ ventilating/ lighting/ equipment.
P242	Use only non-sparking tools.

P243	Take precautionary measures against static discharge.
P261	Avoid breathing dust/ fume/ gas/ mist/ vapours/ spray.
P271	Use only outdoors or in a well-ventilated area.
P273	Avoid release to the environment.
P280	Wear protective gloves/ eye protection/ face protection.
P303 + P361 + P353	IF ON SKIN (or hair): Remove/ Take off immediately all contaminated clothing. Rinse skin with water/ shower.
P304 + P340 + P312	IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing. Call a POISON CENTER or doctor/ physician if you feel unwell.
P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam for extinction.
P403 + P235	Store in a well-ventilated place. Keep cool.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Synonyms : *trans*-1,2-Dichloroethene
trans-1,2-Dichloroethylene
trans-Acetylene dichloride

Formula : $C_2H_2Cl_2$
Molecular weight : 96.94 g/mol
CAS-No. : 156-60-5
EC-No. : 205-860-2
Index-No. : 602-026-00-3

Hazardous components

Component	Classification	Concentration
trans-Dichloroethylene		
	Flam. Liq. 2; Acute Tox. 4; Aquatic Acute 3; Aquatic Chronic 3; H225, H332, H412	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Wash off with soap and plenty of water. Consult a physician.

In case of eye contact
Flush eyes with water as a precaution.

If swallowed
Do NOT induce vomiting. Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed

The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed

No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture
No data available

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
Use water spray to cool unopened containers.

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Use personal protective equipment. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Remove all sources of ignition. Evacuate personnel to safe areas. Beware of vapours accumulating to form explosive concentrations. Vapours can accumulate in low areas.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

6.3 Methods and materials for containment and cleaning up
Contain spillage, and then collect with an electrically protected vacuum cleaner or by wet-brushing and place in container for disposal according to local regulations (see section 13).

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid contact with skin and eyes. Avoid inhalation of vapour or mist.
Use explosion-proof equipment.Keep away from sources of ignition - No smoking.Take measures to prevent the build up of electrostatic charge.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place. Containers which are opened must be carefully resealed and kept upright to prevent leakage.

Recommended storage temperature 2 - 8 °C

Light sensitive. Air and moisture sensitive. Refrigerate before opening.
Storage class (TRGS 510): Flammable liquids

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
trans-Dichloroethylene	156-60-5	TWA	200.000000 ppm	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Central Nervous System impairment Eye irritation		

		TWA	200.000000 ppm	USA. ACGIH Threshold Limit Values (TLV)
		Central Nervous System impairment Eye irritation		
		TWA	200 ppm	USA. ACGIH Threshold Limit Values (TLV)
		Central Nervous System impairment Eye irritation		

8.2 Exposure controls

Appropriate engineering controls
Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection
Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Body Protection
Complete suit protecting against chemicals, Flame retardant antistatic protective clothing., The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face respirator with multi-purpose combination (US) or type AXBEK (EN 14387) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: liquid, clear Colour: light yellow
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: -50 °C (-58 °F) - lit.
f)	Initial boiling point and boiling range	48 °C (118 °F) - lit.
g)	Flash point	6.0 °C (42.8 °F) - closed cup
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or	Upper explosion limit: 12.8 %(V) Lower explosion limit: 9.7 %(V)

	explosive limits	
k)	Vapour pressure	No data available
l)	Vapour density	No data available
m)	Relative density	1.257 g/cm3 at 25 °C (77 °F)
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	No data available
p)	Auto-ignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information
No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions
Vapours may form explosive mixture with air.

10.4 Conditions to avoid
Heat, flames and sparks.

10.5 Incompatible materials
Oxidizing agents, Bases

10.6 Hazardous decomposition products
Hazardous decomposition products formed under fire conditions. - Carbon oxides, Hydrogen chloride gas
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - 1,235 mg/kg

LD50 Oral - Mouse - 2,122 mg/kg
Remarks: Behavioral:Altered sleep time (including change in righting reflex). Behavioral:Somnolence (general depressed activity). Behavioral:Ataxia.

LC50 Inhalation - Rat - 24100 ppm
Remarks: Behavioral:Somnolence (general depressed activity).

LD50 Dermal - Rabbit - > 5,000 mg/kg
Remarks: Prolonged skin contact may cause skin irritation and/or dermatitis. Nutritional and Gross Metabolic:Weight loss or decreased weight gain.

No data available

Skin corrosion/irritation
Skin - Rabbit
Result: Skin irritation - 24 h

Serious eye damage/eye irritation
Eyes - Rabbit
Result: Eye irritation

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

IARC: No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

NTP: No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
No data available

No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: Not available

prolonged or repeated exposure can cause:, narcosis, To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

Kidney -

12. ECOLOGICAL INFORMATION

12.1 Toxicity

Toxicity to daphnia and other aquatic invertebrates	EC50 - Daphnia magna (Water flea) - 220.00 mg/l - 48 h

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.
Harmful to aquatic life with long lasting effects.

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Burn in a chemical incinerator equipped with an afterburner and scrubber but exert extra care in igniting as this material is highly flammable. Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 1150 Class: 3 Packing group: II
Proper shipping name: 1,2-Dichloroethylene
Reportable Quantity (RQ): 1000 lbs

Poison Inhalation Hazard: No

IMDG
UN number: 1150 Class: 3 Packing group: II EMS-No: F-E, S-D
Proper shipping name: 1,2-DICHLOROETHYLENE

IATA
UN number: 1150 Class: 3 Packing group: II
Proper shipping name: 1,2-Dichloroethylene

15. REGULATORY INFORMATION

SARA 302 Components
No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components
This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

SARA 311/312 Hazards
Fire Hazard

Massachusetts Right To Know Components

Preparation Information

Sigma-Aldrich Corporation
Product Safety – Americas Region
1-800-521-8956

Version: 4.10 Revision Date: 05/27/2016 Print Date: 01/23/2017

SAFETY DATA SHEET

Version 4.6
Revision Date 03/02/2015
Print Date 02/18/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	Trichloroethylene
Product Number	:	251402
Brand	:	Sigma-Aldrich
Index-No.	:	602-027-00-9
CAS-No.	:	79-01-6

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Manufacture of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Skin irritation (Category 2), H315
Eye irritation (Category 2A), H319
Germ cell mutagenicity (Category 2), H341
Carcinogenicity (Category 1B), H350
Specific target organ toxicity - single exposure (Category 3), Central nervous system, H336
Acute aquatic toxicity (Category 3), H402
Chronic aquatic toxicity (Category 3), H412

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word Danger

Hazard statement(s)

H315	Causes skin irritation.
H319	Causes serious eye irritation.
H336	May cause drowsiness or dizziness.
H341	Suspected of causing genetic defects.
H350	May cause cancer.
H412	Harmful to aquatic life with long lasting effects.

Precautionary statement(s)

P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and understood.
P261	Avoid breathing dust/ fume/ gas/ mist/ vapours/ spray.
P264	Wash skin thoroughly after handling.
P271	Use only outdoors or in a well-ventilated area.
P273	Avoid release to the environment.
P280	Wear eye protection/ face protection.
P280	Wear protective gloves.
P281	Use personal protective equipment as required.
P302 + P352	IF ON SKIN: Wash with plenty of soap and water.
P304 + P340 + P312	IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing. Call a POISON CENTER or doctor/ physician if you feel unwell.
P305 + P351 + P338	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.
P332 + P313	If skin irritation occurs: Get medical advice/ attention.
P337 + P313	If eye irritation persists: Get medical advice/ attention.
P362	Take off contaminated clothing and wash before reuse.
P403 + P233	Store in a well-ventilated place. Keep container tightly closed.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Synonyms	:	TCE Trichloroethene
Formula	:	C_2HCl_3
Molecular weight	:	131.39 g/mol
CAS-No.	:	79-01-6
EC-No.	:	201-167-4
Index-No.	:	602-027-00-9

Hazardous components

Component	Classification	Concentration
Trichloroethylene Included in the Candidate List of Substances of Very High Concern (SVHC) according to Regulation (EC) No. 1907/2006 (REACH)		
	Skin Irrit. 2; Eye Irrit. 2A; Muta. 2; Carc. 1B; STOT SE 3; Aquatic Acute 3; Aquatic Chronic 3; H315, H319, H336, H341, H350, H412	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Wash off with soap and plenty of water. Consult a physician.

In case of eye contact
Rinse thoroughly with plenty of water for at least 15 minutes and consult a physician.

If swallowed
Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture
Carbon oxides, Hydrogen chloride gas

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
No data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Use personal protective equipment. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

6.3 Methods and materials for containment and cleaning up
Soak up with inert absorbent material and dispose of as hazardous waste. Keep in suitable, closed containers for disposal.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid contact with skin and eyes. Avoid inhalation of vapour or mist.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place. Containers which are opened must be carefully resealed and kept upright to prevent leakage.

Light sensitive. Handle and store under inert gas.
Storage class (TRGS 510): Non-combustible, acute toxic Cat.3 / toxic hazardous materials or hazardous materials causing chronic effects

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
Trichloroethylene	79-01-6	TWA	10.000000 ppm	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Central Nervous System impairment cognitive decrement Renal toxicity Substances for which there is a Biological Exposure Index or Indices (see BEI® section) Suspected human carcinogen		
		STEL	25.000000 ppm	USA. ACGIH Threshold Limit Values (TLV)
		Central Nervous System impairment cognitive decrement Renal toxicity Substances for which there is a Biological Exposure Index or Indices (see BEI® section) Suspected human carcinogen		
		Potential Occupational Carcinogen See Appendix C See Appendix A		
		See Table Z-2		
		TWA	100.000000 ppm	USA. Occupational Exposure Limits (OSHA) - Table Z-2
		Z37.19-1967		
		CEIL	200.000000 ppm	USA. Occupational Exposure Limits (OSHA) - Table Z-2
		Z37.19-1967		
		Peak	300.000000 ppm	USA. Occupational Exposure Limits (OSHA) - Table Z-2
		Z37.19-1967		

Biological occupational exposure limits

Component	CAS-No.	Parameters	Value	Biological specimen	Basis
Trichloroethylene	79-01-6	Trichloroacetic acid	15.0000 mg/l	Urine	ACGIH - Biological Exposure Indices (BEI)
	Remarks	End of shift at end of workweek			
		Trichloroethanol	0.5000 mg/l	In blood	ACGIH - Biological Exposure Indices (BEI)
		End of shift at end of workweek			
		Trichloroethylene		In blood	ACGIH - Biological Exposure Indices (BEI)
		End of shift at end of workweek			
		Trichloroethylene		In end-exhaled air	ACGIH - Biological Exposure Indices (BEI)
		End of shift at end of workweek			

8.2 Exposure controls

Appropriate engineering controls

Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection
Safety glasses with side-shields conforming to EN166 Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Fluorinated rubber
Minimum layer thickness: 0.7 mm
Break through time: 480 min
Material tested:Vitoject® (KCL 890 / Aldrich Z677698, Size M)

Splash contact
Material: Fluorinated rubber
Minimum layer thickness: 0.7 mm
Break through time: 480 min
Material tested:Vitoject® (KCL 890 / Aldrich Z677698, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Complete suit protecting against chemicals, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face respirator with multi-purpose combination (US) or type ABEK (EN 14387) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: liquid, clear Colour: colourless
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: -84.8 °C (-120.6 °F) - lit.
f)	Initial boiling point and boiling range	86.7 °C (188.1 °F) - lit.
g)	Flash point	No data available
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower	Upper explosion limit: 10.5 %(V)

	flammability or explosive limits	Lower explosion limit: 8 %(V)
k)	Vapour pressure	81.3 hPa (61.0 mmHg) at 20.0 °C (68.0 °F)
l)	Vapour density	No data available
m)	Relative density	1.463 g/mL at 25 °C (77 °F)
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	log Pow: 2.29log Pow: 5
p)	Auto-ignition temperature	410.0 °C (770.0 °F)
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information
No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions
No data available

10.4 Conditions to avoid
No data available

10.5 Incompatible materials
Oxidizing agents, Strong bases, Magnesium

10.6 Hazardous decomposition products
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - 4,920 mg/kg

LC50 Inhalation - Mouse - 4 h - 8450 ppm

LD50 Dermal - Rabbit - > 20,000 mg/kg

No data available

Skin corrosion/irritation
Skin - Rabbit
Result: Severe skin irritation - 24 h

Serious eye damage/eye irritation
Eyes - Rabbit
Result: Eye irritation - 24 h

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
Laboratory experiments have shown mutagenic effects.
In vitro tests showed mutagenic effects

Carcinogenicity

This product is or contains a component that has been reported to be probably carcinogenic based on its IARC, OSHA, ACGIH, NTP, or EPA classification.

Possible human carcinogen

IARC:	1 - Group 1: Carcinogenic to humans (Trichloroethylene)
NTP:	Reasonably anticipated to be a human carcinogen (Trichloroethylene)
OSHA:	No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
No data available

No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: KX4550000

burning sensation, Cough, wheezing, laryngitis, Shortness of breath, Headache, Nausea, Vomiting, Exposure to and/or consumption of alcohol may increase toxic effects., Gastrointestinal disturbance, Kidney injury may occur., narcosis
To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

12. ECOLOGICAL INFORMATION

12.1 Toxicity

Toxicity to fish	LC50 - Pimephales promelas (fathead minnow) - 41 mg/l - 96.0 h
	LOEC - other fish - 11 mg/l - 10.0 d
	NOEC - Oryzias latipes - 40 mg/l - 10.0 d
Toxicity to daphnia and other aquatic invertebrates	EC50 - Daphnia magna (Water flea) - 18.00 mg/l - 48 h
Toxicity to algae	IC50 - Pseudokirchneriella subcapitata (green algae) - 175.00 mg/l - 96 h

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
Does not bioaccumulate.

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.
Harmful to aquatic life with long lasting effects.

An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.

Harmful to aquatic organisms, may cause long-term adverse effects in the aquatic environment.

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 1710 Class: 6.1 Packing group: III
Proper shipping name: Trichloroethylene
Reportable Quantity (RQ): 100 lbs

Poison Inhalation Hazard: No

IMDG
UN number: 1710 Class: 6.1 Packing group: III EMS-No: F-A, S-A
Proper shipping name: TRICHLOROETHYLENE

IATA
UN number: 1710 Class: 6.1 Packing group: III
Proper shipping name: Trichloroethylene

15. REGULATORY INFORMATION

SARA 302 Components
No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components
The following components are subject to reporting levels established by SARA Title III, Section 313:

	CAS-No.	Revision Date
Trichloroethylene	79-01-6	2007-07-01

SARA 311/312 Hazards
Acute Health Hazard, Chronic Health Hazard

Massachusetts Right To Know Components

	CAS-No.	Revision Date
Trichloroethylene	79-01-6	2007-07-01

Pennsylvania Right To Know Components

	CAS-No.	Revision Date
Trichloroethylene	79-01-6	2007-07-01

New Jersey Right To Know Components

	CAS-No.	Revision Date
Trichloroethylene	79-01-6	2007-07-01

California Prop. 65 Components

	CAS-No.	Revision Date
WARNING! This product contains a chemical known to the State of California to cause cancer. Trichloroethylene	79-01-6	2011-09-01
WARNING: This product contains a chemical known to the State of California to cause birth defects or other reproductive harm.	79-01-6	2011-09-01

Trichloroethylene

16. OTHER INFORMATION

Full text of H-Statements referred to under sections 2 and 3.

Aquatic Acute	Acute aquatic toxicity
Aquatic Chronic	Chronic aquatic toxicity
Carc.	Carcinogenicity
Eye Irrit.	Eye irritation
H315	Causes skin irritation.
H319	Causes serious eye irritation.
H336	May cause drowsiness or dizziness.
H341	Suspected of causing genetic defects.
H350	May cause cancer.
H402	Harmful to aquatic life.

HMIS Rating

Health hazard:	2
Chronic Health Hazard:	*
Flammability:	0
Physical Hazard	0

NFPA Rating

Health hazard:	2
Fire Hazard:	0
Reactivity Hazard:	0

Signal word Danger

Hazard statements

H314 Causes severe skin burns and eye damage.
H335 May cause respiratory irritation.
H402 Harmful to aquatic life.

CHROMIUM HARD,TRIVALENT

Precautionary statements

P260 Do not breathe vapor/ spray.
P280 Wear protective gloves/ protective clothing/ eye protection/ face protection.
P304+P340 If inhaled: Remove person to fresh air and keep comfortable for breathing.
P305+P351+P338 If in eyes: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P363 Wash contaminated clothing before reuse.
P403+P233 Store in a well-ventilated place. Keep container tightly closed.
P501 Dispose of contents/ container in accordance with national regulations.
P264 Wash skin thoroughly after handling.
P270 Do not eat, drink or smoke when using this product.
P284 [In case of inadequate ventilation] wear respiratory protection.
P301+P310 If swallowed: Immediately call a poison center/ doctor.
P302+P352 If on skin: Wash with plenty of water.

Contains AMMONIUM FORMATE, CHROMIUM (III) SULPHATE, AMMONIA ...%

Other hazards

This product does not contain any substances classified as PBT or vPvB.

3. Composition/information on ingredients

Mixtures

AMMONIUM FORMATE **25-30%**

CAS number: 540-69-2

Classification
Skin Irrit. 2 - H315
Eye Irrit. 2 - H319

Classification Acute Tox. 4 - H312	

The full text for all hazard statements is displayed in Section 16.

4. First-aid measures

Description of first aid measures

Inhalation Move affected person to fresh air at once. Get medical attention.

Ingestion Get medical attention immediately. Do not induce vomiting.

Skin Contact Remove contaminated clothing immediately and wash skin with soap and water. Continue to rinse for at least 15 minutes and get medical attention.

Eye contact Remove affected person from source of contamination. Rinse immediately with plenty of water. Continue to rinse for at least 15 minutes and get medical attention.

Most important symptoms and effects, both acute and delayed

Inhalation Coughing, chest tightness, feeling of chest pressure.

Ingestion May cause chemical burns in mouth and throat. May cause stomach pain or vomiting.

Skin contact May cause serious chemical burns to the skin.

Eye contact Causes severe burns. May cause serious eye damage.

Indication of immediate medical attention and special treatment needed

Notes for the doctor No specific recommendations.

5. Fire-fighting measures

Extinguishing media

Suitable extinguishing media The product is not flammable. Use fire-extinguishing media suitable for the surrounding fire.

Special hazards arising from the substance or mixture

CHROMIUM HARD,TRIVALENT

Specific hazards Corrosive gases or vapors.

Advice for firefighters

Protective actions during firefighting Wear positive-pressure self-contained breathing apparatus (SCBA) and appropriate protective clothing.

Special protective equipment for firefighters Use protective equipment appropriate for surrounding materials.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures

Personal precautions Follow precautions for safe handling described in this safety data sheet. Avoid inhalation of vapors. Provide adequate general and local exhaust ventilation.

Environmental precautions

Environmental precautions Do not discharge into drains or watercourses or onto the ground. Inform the relevant authorities if environmental pollution occurs (sewers, waterways, soil or air).

Methods and material for containment and cleaning up

Methods for cleaning up Wear suitable protective equipment, including gloves, goggles/face shield, respirator, boots, clothing or apron, as appropriate. Flush contaminated area with plenty of water. Avoid the spillage or runoff entering drains, sewers or watercourses. Collect and dispose of spillage as indicated in Section 13. Wash thoroughly after dealing with a spillage.

Reference to other sections Wear protective clothing as described in Section 8 of this safety data sheet. See Section 11 for additional information on health hazards. See Section 12 for additional information on ecological hazards. For waste disposal, see Section 13.

7. Handling and storage

Precautions for safe handling

Usage precautions Avoid spilling. Avoid contact with skin and eyes. Avoid inhalation of vapors and spray/mists. Provide adequate general and local exhaust ventilation.

Conditions for safe storage, including any incompatibilities

Storage precautions Store in tightly-closed, original container in a dry, cool and well-ventilated place. Protect from freezing and direct sunlight.

Storage class Corrosive storage.

Specific end uses(s)

Specific end use(s) The identified uses for this product are detailed in Section 1.

8. Exposure controls/Personal protection

Exposure controls

Protective equipment

Appropriate engineering controls As this product contains ingredients with exposure limits, process enclosures, local exhaust ventilation or other engineering controls should be used to keep worker exposure below any statutory or recommended limits, if use generates dust, fumes, gas, vapor or mist.

Eye/face protection Tight-fitting safety glasses.

CHROMIUM HARD,TRIVALENT

Hand protection	It is recommended that chemical-resistant, impervious gloves are worn. Considering the data specified by the glove manufacturer, check during use that the gloves are retaining their protective properties and change them as soon as any deterioration is detected. It is recommended that gloves are made of the following material: Nitrile rubber.
Other skin and body protection	Appropriate footwear and additional protective clothing complying with an approved standard should be worn if a risk assessment indicates skin contamination is possible.
Hygiene measures	Do not eat, drink or smoke when using this product. Wash at the end of each work shift and before eating, smoking and using the toilet.
Respiratory protection	If ventilation is inadequate, suitable respiratory protection must be worn. Respiratory protection must be used if the airborne contamination exceeds the recommended occupational exposure limit.

9. Physical and chemical properties

Information on basic physical and chemical properties

Appearance	Liquid.
Color	Dark. Blue.
Odor	Acidic.
pH	pH (concentrated solution): 6.0-7.0
Initial boiling point and range	100°C/212°F @
Relative density	1.150-1.180
Other information	Not available.

10. Stability and reactivity

Reactivity	There are no known reactivity hazards associated with this product.
Stability	Stable at normal ambient temperatures and when used as recommended.
Possibility of hazardous reactions	Under normal conditions of storage and use, no hazardous reactions will occur.
Conditions to avoid	Avoid excessive heat for prolonged periods of time.
Materials to avoid	None known.
Hazardous decomposition products	None at ambient temperatures.

11. Toxicological information

Information on toxicological effects

Acute toxicity - oral

ATE oral (mg/kg)	4,284.49

Acute toxicity - dermal

ATE dermal (mg/kg)	19,400.35

Acute toxicity - inhalation

ATE inhalation (vapours mg/l)	194.0

CHROMIUM HARD,TRIVALENT

Inhalation	Vapors irritate the respiratory system.
Ingestion	Causes severe burns. May cause chemical burns in mouth, esophagus and stomach.
Skin Contact	May cause serious chemical burns to the skin.
Eye contact	Causes serious eye damage. Immediate first aid is imperative.
Acute and chronic health hazards	May cause burns in mucous membranes, throat, esophagus and stomach.
Route of exposure	Ingestion Inhalation Skin and/or eye contact

Toxicological information on ingredients.

AMMONIUM FORMATE

Acute toxicity - oral

Acute toxicity oral (LD_{50} mg/kg)	2,250.0

Acute toxicity oral (LD_{50} mg/kg)	3,500.0
Species	Rat
ATE oral (mg/kg)	3,500.0

Acute toxicity - dermal

Acute toxicity dermal (LD_{50} mg/kg)	2,000.0
Species	Rabbit
ATE dermal (mg/kg)	2,000.0

12. Ecological information

Ecotoxicity The product contains a substance which may have hazardous effects on the environment.

Toxicity No data available.

Ecological information on ingredients.

Potassium Sulfate

Acute aquatic toxicity

Acute toxicity - fish LC_{50}, 96 hour: 680 mg/l, Pimephales promelas (Fat-head Minnow)

AMMONIA ...%

Acute aquatic toxicity

$LE(C)_{50}$	0.1 < L(E)C50 ≤ 1
M factor (Acute)	1
Acute toxicity - fish	LC_{50}, 96 hours: 0.53 mg/l, Freshwater fish LC_{50}, 96 hours: 0.75 -3.4 mg/l, Freshwater fish LC_{50}, 96 hours: 8.2 mg/l, Freshwater fish
Acute toxicity - aquatic invertebrates	EC_{50}, 48 hours: 0.66 mg/l, Daphnia magna

SODIUM BROMIDE

Acute aquatic toxicity

Acute toxicity - fish	NOEC, 96 hour: 7800 mg/l, Oryzias latipes (Red killifish) LC_{50}, 96 hour: 160,000 mg/l, Poecilia reticulata (Guppy)
Acute toxicity - aquatic invertebrates	NOEC, 48 hour: 7800 mg/l, Daphnia magna EC_{50}, 48 hours: 5800 mg/l, Daphnia magna

Persistence and degradability

Persistence and degradability No data available.

Bioaccumulative potential

Bio-Accumulative Potential The product does not contain any substances expected to be bioaccumulating.

Mobility in soil

Mobility The product is soluble in water.

CHROMIUM HARD,TRIVALENT

Other adverse effects

Other adverse effects Not determined.

13. Disposal considerations

Waste treatment methods

General information Disposal of this product, process solutions, residues and by-products should at all times comply with the requirements of environmental protection and waste disposal legislation and any local authority requirements.

Disposal methods Dispose of waste to licensed waste disposal site in accordance with the requirements of the local Waste Disposal Authority.

14. Transport information

General The product is not covered by international regulations on the transport of dangerous goods (IMDG, IATA, DOT).

UN Number

UN No. (International) Not applicable.

UN proper shipping name

Proper shipping name (International) Not applicable.

Proper shipping name (DOT) NOT RESTRICTED LIQUID

Transport hazard class(es)

Transport Labels (International) No transport warning sign required.

Packing group

Packing group (International) Not applicable.

Environmental hazards

Environmentally Hazardous Substance
No.

Special precautions for user

Not applicable.

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code Not applicable.

15. Regulatory information

National regulations The customer is advised to check if there are specific local or national regulations specifically applicable to the chemicals contained in the product. The hazards statement for this product is in accordance with international regulations, always observing the most stringent requirements.

US Federal Regulations

SARA Section 302 Extremely Hazardous Substances Tier II Threshold Planning Quantities
Exempt.

CHROMIUM HARD,TRIVALENT

CERCLA/Superfund, Hazardous Substances/Reportable Quantities (EPA)

Revision date	8/10/2018
Revision	3

CHROMIUM HARD,TRIVALENT

Hazard statements in full	H302 Harmful if swallowed. H312 Harmful in contact with skin. H314 Causes severe skin burns and eye damage. H315 Causes skin irritation. H318 Causes serious eye damage. H319 Causes serious eye irritation. H332 Harmful if inhaled. H335 May cause respiratory irritation. H400 Very toxic to aquatic life. H402 Harmful to aquatic life.
NFPA - health hazard	Extremely hazardous, serious injury. (3)
NFPA - flammability hazard	Will not burn. (0)
NFPA - instability hazard	Normally stable. (0)

The Information in this data sheet is believed to be correct but neither we nor our employees or agents give any warranty or make any representation to the accuracy thereof and accept no liability for any loss, injury or damage which may result in it's use. The sole purpose of this data sheet is to provide guidance on the safe handling and use of the products to which it relates. It does not form part of any product specification nor part of any contract. It is not practical for the guidance and information in this data sheet to cover every conceivable application of a product and as we may not be aware of the use to which the products covered by this data sheet are to be put it remains the responsibility of the user to conduct it's own tests and to satisy itself as to the suitability of the product.

SAFETY DATA SHEET

Version 5.8
Revision Date 03/13/2015
Print Date 01/29/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	Vanadium(V) oxide
Product Number	:	204854
Brand	:	Aldrich
Index-No.	:	023-001-00-8
CAS-No.	:	1314-62-1

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Manufacture of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Acute toxicity, Oral (Category 4), H302
Acute toxicity, Inhalation (Category 4), H332
Serious eye damage (Category 1), H318
Germ cell mutagenicity (Category 2), H341
Reproductive toxicity (Category 2), H361
Specific target organ toxicity - single exposure (Category 3), Respiratory system, H335
Specific target organ toxicity - repeated exposure (Category 1), H372
Acute aquatic toxicity (Category 2), H401
Chronic aquatic toxicity (Category 2), H411

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word Danger

Hazard statement(s)

H302 + H332	Harmful if swallowed or if inhaled
H318	Causes serious eye damage.
H335	May cause respiratory irritation.
H341	Suspected of causing genetic defects.
H361	Suspected of damaging fertility or the unborn child.
H372	Causes damage to organs through prolonged or repeated exposure.

H411	Toxic to aquatic life with long lasting effects.

Precautionary statement(s)

P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and understood.
P260	Do not breathe dust/ fume/ gas/ mist/ vapours/ spray.
P264	Wash skin thoroughly after handling.
P270	Do not eat, drink or smoke when using this product.
P271	Use only outdoors or in a well-ventilated area.
P273	Avoid release to the environment.
P280	Wear protective gloves/ protective clothing/ eye protection/ face protection.
P301 + P312 + P330	IF SWALLOWED: Call a POISON CENTER or doctor/ physician if you feel unwell. Rinse mouth.
P304 + P340 + P312	IF INHALED: Remove person to fresh air and keep comfortable for breathing. Call a POISON CENTER or doctor/ physician if you feel unwell.
P305 + P351 + P338 + P310	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER or doctor/ physician.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.
P391	Collect spillage.
P403 + P233	Store in a well-ventilated place. Keep container tightly closed.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Formula	:	O_5V_2
Molecular weight	:	181.88 g/mol
CAS-No.	:	1314-62-1
EC-No.	:	215-239-8
Index-No.	:	023-001-00-8

Hazardous components

Component	Classification	Concentration
Vanadium pentoxide		
	Acute Tox. 4; Eye Dam. 1; Muta. 2; Repr. 2; STOT SE 3; STOT RE 1; Aquatic Acute 2; Aquatic Chronic 2; H302 + H332, H318, H335, H341, H361, H372, H411	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Wash off with soap and plenty of water. Take victim immediately to hospital. Consult a physician.

In case of eye contact
Rinse thoroughly with plenty of water for at least 15 minutes and consult a physician.

If swallowed
Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture
Vanadium/vanadium oxides

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
No data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Use personal protective equipment. Avoid dust formation. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

6.3 Methods and materials for containment and cleaning up
Pick up and arrange disposal without creating dust. Sweep up and shovel. Keep in suitable, closed containers for disposal.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid contact with skin and eyes. Avoid formation of dust and aerosols.Further processing of solid materials may result in the formation of combustible dusts. The potential for combustible dust formation should be taken into consideration before additional processing occurs.
Provide appropriate exhaust ventilation at places where dust is formed.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.
Storage class (TRGS 510): Non-combustible, acute toxic Cat.3 / toxic hazardous materials or hazardous materials causing chronic effects

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
Vanadium pentoxide	1314-62-1	C	0.100000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		C	0.500000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
	Remarks	Ceiling limit is to be determined from breathing-zone air samples.		
		TWA	0.050000 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Upper Respiratory Tract irritation Lower Respiratory Tract irritation Substances for which there is a Biological Exposure Index or Indices (see BEI® section) Confirmed animal carcinogen with unknown relevance to humans		
		TWA	0.05 mg/m3	USA. ACGIH Threshold Limit Values (TLV)
		Upper Respiratory Tract irritation Lower Respiratory Tract irritation Substances for which there is a Biological Exposure Index or Indices (see BEI® section) Confirmed animal carcinogen with unknown relevance to humans		
		C	0.050000 mg/m3	USA. NIOSH Recommended Exposure Limits
		15 minute ceiling value		
		C	0.050000 mg/m3	USA. NIOSH Recommended Exposure Limits
		15 minute ceiling value		
		C	0.100000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		Ceiling limit is to be determined from breathing-zone air samples.		
		C	0.500000 mg/m3	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		Ceiling limit is to be determined from breathing-zone air samples.		
		C	0.050000 mg/m3	USA. NIOSH Recommended Exposure Limits
		15 minute ceiling value		
		C	0.050000 mg/m3	USA. NIOSH Recommended Exposure Limits
		15 minute ceiling value		
		C	0.050000 mg/m3	USA. NIOSH Recommended Exposure Limits
		15 minute ceiling value		
		C	0.050000 mg/m3	USA. NIOSH Recommended Exposure Limits
		15 minute ceiling value		

Biological occupational exposure limits

Component	CAS-No.	Parameters	Value	Biological specimen	Basis
Vanadium pentoxide	1314-62-1	Vanadium	0.0500 mg/g	In urine	
	Remarks	End of shift at end of workweek			

8.2 Exposure controls

Appropriate engineering controls
Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection
Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Complete suit protecting against chemicals, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face particle respirator type N100 (US) or type P3 (EN 143) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: solid
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: 690 °C (1,274 °F) - lit.
f)	Initial boiling point and boiling range	No data available
g)	Flash point	Not applicable

h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or explosive limits	No data available
k)	Vapour pressure	No data available
l)	Vapour density	No data available
m)	Relative density	3.35 g/mL at 25 °C (77 °F)
n)	Water solubility	904 g/l at 20 °C (68 °F) - OECD Test Guideline 105
o)	Partition coefficient: n-octanol/water	No data available
p)	Auto-ignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	The substance or mixture is not classified as oxidizing.

9.2 Other safety information

Solubility in other solvents	Ethanol - insoluble

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions
No data available

10.4 Conditions to avoid
No data available

10.5 Incompatible materials
Strong acids

10.6 Hazardous decomposition products
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
Harmful if swallowed. Classified according to Regulation (EU) 1272/2008, Annex VI (Table 3.1/3.2)

LC50 Inhalation - Rat - female - 4 h - 2.21 mg/l
(OECD Test Guideline 403)

LC50 Dermal - Rat - > 2,500 mg/kg
(OECD Test Guideline 402)

No data available

Skin corrosion/irritation
Skin - in vitro assay
Result: No skin irritation

Serious eye damage/eye irritation
Eyes - Rabbit
Result: Risk of serious damage to eyes.
(OECD Test Guideline 405)

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
Laboratory experiments have shown mutagenic effects.
In vitro tests showed mutagenic effects

Carcinogenicity

No data available

IARC:	2B - Group 2B: Possibly carcinogenic to humans (Vanadium pentoxide)
NTP:	No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.
OSHA:	No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
Possible risk of congenital malformation in the fetus.
Suspected human reproductive toxicant

No data available

Specific target organ toxicity - single exposure
May cause respiratory irritation.
Classified according to Regulation (EU) 1272/2008, Annex VI (Table 3.1/3.2)

Specific target organ toxicity - repeated exposure
Causes damage to organs through prolonged or repeated exposure.

Aspiration hazard
No data available

Additional Information
RTECS: Not available

To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

Stomach - Irregularities - Based on Human Evidence
Stomach - Irregularities - Based on Human Evidence

12. ECOLOGICAL INFORMATION

12.1 Toxicity

Toxicity to fish	LC50 - Oncorhynchus mykiss (rainbow trout) - 5.2 mg/l - 96.0 h
Toxicity to daphnia and other aquatic invertebrates	LC50 - Daphnia magna (Water flea) - 1.52 mg/l - 48 h

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
Toxic to aquatic life with long lasting effects.
An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 2862 Class: 6.1 Packing group: III
Proper shipping name: Vanadium pentoxide
Reportable Quantity (RQ): 1000 lbs

Poison Inhalation Hazard: No

IMDG
UN number: 2862 Class: 6.1 Packing group: III EMS-No: F-A, S-A
Proper shipping name: VANADIUM PENTOXIDE
Marine pollutant:yes
IATA
UN number: 2862 Class: 6.1 Packing group: III
Proper shipping name: Vanadium pentoxide

15. REGULATORY INFORMATION

SARA 302 Components
The following components are subject to reporting levels established by SARA Title III, Section 302:

	CAS-No.	Revision Date
Vanadium pentoxide	1314-62-1	2007-07-01

SARA 313 Components

	CAS-No.	Revision Date
Vanadium pentoxide	1314-62-1	2007-07-01

The following components are subject to reporting levels established by SARA Title III, Section 313:

	CAS-No.	Revision Date
Vanadium pentoxide	1314-62-1	2007-07-01

SARA 311/312 Hazards
Acute Health Hazard, Chronic Health Hazard

Massachusetts Right To Know Components

	CAS-No.	Revision Date
Vanadium pentoxide	1314-62-1	2007-07-01

Pennsylvania Right To Know Components

	CAS-No.	Revision Date
Vanadium pentoxide	1314-62-1	2007-07-01

New Jersey Right To Know Components

	CAS-No.	Revision Date
Vanadium pentoxide	1314-62-1	2007-07-01

California Prop. 65 Components

WARNING! This product contains a chemical known to the State of California to cause cancer.	CAS-No.	Revision Date
Vanadium pentoxide	1314-62-1	2007-09-28

16. OTHER INFORMATION

Full text of H-Statements referred to under sections 2 and 3.

Acute Tox.	Acute toxicity
Aquatic Acute	Acute aquatic toxicity
Aquatic Chronic	Chronic aquatic toxicity
Eye Dam.	Serious eye damage
H302	Harmful if swallowed.
H302 + H332	Harmful if swallowed or if inhaled
H318	Causes serious eye damage.
H332	Harmful if inhaled.
H335	May cause respiratory irritation.
H341	Suspected of causing genetic defects.
H361	Suspected of damaging fertility or the unborn child.
H372	Causes damage to organs through prolonged or repeated exposure.
H401	Toxic to aquatic life.

HMIS Rating

Health hazard:	4
Chronic Health Hazard:	*
Flammability:	0
Physical Hazard	0

NFPA Rating

Health hazard:	3
Fire Hazard:	0
Reactivity Hazard:	0

SAFETY DATA SHEET

Version 3.11
Revision Date 12/01/2015
Print Date 02/18/2016

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name	:	Vinyl chloride
Product Number	:	387622
Brand	:	Aldrich
Index-No.	:	602-023-00-7
CAS-No.	:	75-01-4

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	:	Laboratory chemicals, Synthesis of substances

1.3 Details of the supplier of the safety data sheet

Company	:	Sigma-Aldrich 3050 Spruce Street SAINT LOUIS MO 63103 USA
Telephone	:	+1 800-325-5832
Fax	:	+1 800-325-5052

1.4 Emergency telephone number

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Flammable gases (Category 1), H220
Gases under pressure (Liquefied gas), H280
Carcinogenicity (Category 1A), H350

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word: Danger

Hazard statement(s)

H220	Extremely flammable gas.
H280	Contains gas under pressure; may explode if heated.
H350	May cause cancer.

Precautionary statement(s)

P201	Obtain special instructions before use.
P202	Do not handle until all safety precautions have been read and understood.
P210	Keep away from heat/sparks/open flames/hot surfaces. No smoking.
P281	Use personal protective equipment as required.
P308 + P313	IF exposed or concerned: Get medical advice/ attention.

P377	Leaking gas fire: Do not extinguish, unless leak can be stopped safely.
P381	Eliminate all ignition sources if safe to do so.
P405	Store locked up.
P410 + P403	Protect from sunlight. Store in a well-ventilated place.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS
May form explosive peroxides.

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Synonyms	:	Chloroethylene
Formula	:	C_2H_3Cl
Molecular weight	:	62.50 g/mol
CAS-No.	:	75-01-4
EC-No.	:	200-831-0
Index-No.	:	602-023-00-7

Hazardous components

Component	Classification	Concentration
Vinyl chloride		
	Flam. Gas 1; Press. Gas Liquefied gas; Carc. 1A; SA ; H220, H280, H350,	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Wash off with soap and plenty of water. Consult a physician.

In case of eye contact
Flush eyes with water as a precaution.

If swallowed
Do NOT induce vomiting. Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture
Carbon oxides, Hydrogen chloride gas

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
Use water spray to cool unopened containers.

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Use personal protective equipment. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Remove all sources of ignition. Evacuate personnel to safe areas. Beware of vapours accumulating to form explosive concentrations. Vapours can accumulate in low areas.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains.

6.3 Methods and materials for containment and cleaning up
Clean up promptly by sweeping or vacuum.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid inhalation of vapour or mist.
Use explosion-proof equipment.Keep away from sources of ignition - No smoking.Take measures to prevent the build up of electrostatic charge.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.

Contents under pressure. Light sensitive.

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters

Component	CAS-No.	Value	Control parameters	Basis
Vinyl chloride	75-01-4	TWA	1 ppm	USA. OSHA - TABLE Z-1 Limits for Air Contaminants - 1910.1000
		TWA	1 ppm	USA. ACGIH Threshold Limit Values (TLV)
	Remarks	Liver damage Lung cancer Confirmed human carcinogen		
		STEL	5 ppm	USA. OSHA - TABLE Z-1 Limits for Air Contaminants - 1910.1000
		TWA	1 ppm	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		STEL	5 ppm	USA. Occupational Exposure Limits (OSHA) - Table Z-1 Limits for Air Contaminants
		See 1910.1017		
		Potential Occupational Carcinogen See Appendix A		

8.2 Exposure controls

Appropriate engineering controls
Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection
Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Splash contact
Material: Fluorinated rubber
Minimum layer thickness: 0.7 mm
Break through time: 120 min
Material tested:Vitoject® (KCL 890 / Aldrich Z677698, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Complete suit protecting against chemicals, Flame retardant antistatic protective clothing., The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face respirator with multi-purpose combination (US) or type AXBEK (EN 14387) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: Liquefied gas
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: -153.8 °C (-244.8 °F) - lit.
f)	Initial boiling point and boiling range	-13.4 °C (7.9 °F) - lit.
g)	Flash point	-61.0 °C (-77.8 °F) - closed cup
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	No data available
j)	Upper/lower flammability or	Upper explosion limit: 33 %(V) Lower explosion limit: 3.6 %(V)

	explosive limits	
k)	Vapour pressure	No data available
l)	Vapour density	No data available
m)	Relative density	0.911 g/cm3 at 25 °C (77 °F)
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	No data available
p)	Auto-ignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information
No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.
Contains the following stabiliser(s):
Hydroquinone (>=0 - <=0.0001 %)
Phenol (>=0 - <=0.01 %)

10.3 Possibility of hazardous reactions
No data available

10.4 Conditions to avoid
Heat, flames and sparks. Extremes of temperature and direct sunlight.

10.5 Incompatible materials
Chemically active metals, Copper

10.6 Hazardous decomposition products
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
No data available

LC50 Inhalation - Rat - 0.3 h - 180000 ppm
Remarks: Behavioral:Tremor. Behavioral:Convulsions or effect on seizure threshold. Respiratory disorder

Dermal: No data available

No data available

Skin corrosion/irritation
No data available

Serious eye damage/eye irritation
No data available

Respiratory or skin sensitisation
No data available

Germ cell mutagenicity
No data available

Carcinogenicity

This is or contains a component that has been reported to be carcinogenic based on its IARC, OSHA, ACGIH, NTP, or EPA classification.

Human carcinogen.

IARC:	1 - Group 1: Carcinogenic to humans (Vinyl chloride)
NTP:	Known to be human carcinogen (Vinyl chloride)
OSHA:	OSHA specifically regulated carcinogen (Vinyl chloride)

Reproductive toxicity
No data available

Overexposure may cause reproductive disorder(s) based on tests with laboratory animals.

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: KU9625000

burning sensation, Cough, wheezing, laryngitis, Shortness of breath, Headache, Nausea, Vomiting, To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

Central nervous system -
Stomach - Irregularities - Based on Human Evidence (Phenol)
Liver - Irregularities - Based on Human Evidence

12. ECOLOGICAL INFORMATION

12.1 Toxicity
No data available

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects

No data available

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Burn in a chemical incinerator equipped with an afterburner and scrubber but exert extra care in igniting as this material is highly flammable. Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 1086 Class: 2.1
Proper shipping name: Vinyl chloride, stabilized
Reportable Quantity (RQ): 1 lbs

Poison Inhalation Hazard: No

IMDG
UN number: 1086 Class: 2.1 EMS-No: F-D, S-U
Proper shipping name: VINYL CHLORIDE, STABILIZED

IATA
UN number: 1086 Class: 2.1
Proper shipping name: Vinyl chloride, stabilized
IATA Passenger: Not permitted for transport

15. REGULATORY INFORMATION

SARA 302 Components
The following components are subject to reporting levels established by SARA Title III, Section 302:

	CAS-No.	Revision Date
Phenol	108-95-2	2007-07-01
Hydroquinone	123-31-9	2007-07-01

SARA 313 Components
The following components are subject to reporting levels established by SARA Title III, Section 313:

	CAS-No.	Revision Date
Vinyl chloride	75-01-4	2007-07-01

SAFETY DATA SHEET

Creation Date 22-Sep-2009 **Revision Date** 25-Apr-2019 **Revision Number** 6

1. Identification

Product Name **Vinylidene chloride, stabilized**

Cat No. : **AC172290000; AC172290010; AC172290025; AC172290250**

CAS-No 75-35-4
Synonyms 1,1-Dichloroethylene

Recommended Use Laboratory chemicals.
Uses advised against Food, drug, pesticide or biocidal product use.

Details of the supplier of the safety data sheet

Company

Fisher Scientific
One Reagent Lane
Fair Lawn, NJ 07410
Tel: (201) 796-7100

Acros Organics
One Reagent Lane
Fair Lawn, NJ 07410

Emergency Telephone Number
For information **US** call: 001-800-ACROS-01 / **Europe** call: +32 14 57 52 11
Emergency Number **US:**001-201-796-7100 / **Europe:** +32 14 57 52 99
CHEMTREC Tel. No.**US:**001-800-424-9300 / **Europe:**001-703-527-3887

2. Hazard(s) identification

Classification
This chemical is considered hazardous by the 2012 OSHA Hazard Communication Standard (29 CFR 1910.1200)

Flammable liquids	Category 1
Acute oral toxicity	Category 4
Acute Inhalation Toxicity - Vapors	Category 4
Serious Eye Damage/Eye Irritation	Category 2
Carcinogenicity	Category 2
Specific target organ toxicity - (repeated exposure)	Category 2
Target Organs - Nasal Cavities, Liver.	

Label Elements

Signal Word
Danger

Hazard Statements
Extremely flammable liquid and vapor
Causes serious eye irritation

Suspected of causing cancer
May cause damage to organs through prolonged or repeated exposure
Harmful if swallowed or if inhaled

Precautionary Statements
Prevention
Obtain special instructions before use
Do not handle until all safety precautions have been read and understood
Use personal protective equipment as required
Wash face, hands and any exposed skin thoroughly after handling
Do not eat, drink or smoke when using this product
Use only outdoors or in a well-ventilated area
Wear eye/face protection
Do not breathe dust/fume/gas/mist/vapors/spray
Keep away from heat/sparks/open flames/hot surfaces. - No smoking
Keep container tightly closed
Ground/bond container and receiving equipment
Use explosion-proof electrical/ventilating/lighting/equipment
Use only non-sparking tools
Take precautionary measures against static discharge
Response
IF exposed or concerned: Get medical attention/advice
Inhalation
IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing
Skin
IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water/shower
Eyes
IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing
If eye irritation persists: Get medical advice/attention
Ingestion
IF SWALLOWED: Call a POISON CENTER or doctor/physician if you feel unwell
Rinse mouth
Fire
In case of fire: Use CO_2, dry chemical, or foam for extinction
Storage
Store locked up
Store in a well-ventilated place. Keep cool
Disposal
Dispose of contents/container to an approved waste disposal plant
Hazards not otherwise classified (HNOC)
Toxic to aquatic life with long lasting effects
WARNING. Cancer - https://www.p65warnings.ca.gov/.

3. Composition/Information on Ingredients

Component	CAS-No	Weight %
Vinylidene chloride	75-35-4	>95
4-Methoxyphenol	150-76-5	0.02

4. First-aid measures

Eye Contact Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Get medical attention.

Skin Contact Wash off immediately with plenty of water for at least 15 minutes. Get medical attention.

Inhalation Remove to fresh air. If breathing is difficult, give oxygen. Get medical attention.

Ingestion Do NOT induce vomiting. Get medical attention.

Most important symptoms and effects Difficulty in breathing. . Inhalation of high vapor concentrations may cause symptoms like headache, dizziness, tiredness, nausea and vomiting

Notes to Physician Treat symptomatically

5. Fire-fighting measures

Suitable Extinguishing Media Water spray. Carbon dioxide (CO_2). Dry chemical. Water mist may be used to cool closed containers. Chemical foam. Water mist may be used to cool closed containers.

Unsuitable Extinguishing Media No information available

Flash Point -25 °C / -13 °F

Method - No information available

Autoignition Temperature 520 °C / 968 °F

Explosion Limits
- **Upper** 16.5%
- **Lower** 8.4%
- **Sensitivity to Mechanical Impact** No information available
- **Sensitivity to Static Discharge** No information available

Specific Hazards Arising from the Chemical
Extremely flammable. Vapors may travel to source of ignition and flash back. Vapors may form explosive mixture with air. Containers may explode when heated. Vapors may form explosive mixtures with air.

Hazardous Combustion Products
Carbon monoxide (CO). Carbon dioxide (CO_2). Formaldehyde. peroxides. Hydrogen chloride gas.

Protective Equipment and Precautions for Firefighters
Vapors are heavier than air and may spread along floors. As in any fire, wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH (approved or equivalent) and full protective gear.

NFPA

Health	Flammability	Instability	Physical hazards
2	4	1	N/A

6. Accidental release measures

Personal Precautions Remove all sources of ignition. Take precautionary measures against static discharges.

Environmental Precautions Do not flush into surface water or sanitary sewer system. See Section 12 for additional Ecological Information. Avoid release to the environment. Collect spillage.

Methods for Containment and Clean Up Soak up with inert absorbent material (e.g. sand, silica gel, acid binder, universal binder, sawdust). Keep in suitable, closed containers for disposal. Remove all sources of ignition. Use spark-proof tools and explosion-proof equipment. Do not let this chemical enter the environment.

7. Handling and storage

Handling

Ensure adequate ventilation. Wear personal protective equipment/face protection. Avoid contact with skin and eyes. Take precautionary measures against static discharges. Do not ingest. If swallowed then seek immediate medical assistance. Handle product only in closed system or provide appropriate exhaust ventilation. Use spark-proof tools and explosion-proof equipment. Use only non-sparking tools. Do not subject to grinding/shock/friction. Avoid breathing dust/fume/gas/mist/vapors/spray. Keep away from open flames, hot surfaces and sources of ignition. To avoid ignition of vapors by static electricity discharge, all metal parts of the equipment must be grounded.

Storage

Refrigerator/flammables. Keep away from heat, sparks and flame. Protect from light. May form explosive peroxides on prolonged storage. Keep under nitrogen. Keep containers tightly closed in a dry, cool and well-ventilated place.

8. Exposure controls / personal protection

Exposure Guidelines

Component	ACGIH TLV	OSHA PEL	NIOSH IDLH	Mexico OEL (TWA)
Vinylidene chloride	TWA: 5 ppm	(Vacated) TWA: 1 ppm (Vacated) TWA: 4 mg/m³		TWA: 5 ppm
4-Methoxyphenol	TWA: 5 mg/m³	(Vacated) TWA: 5 mg/m³	TWA: 5 mg/m³	TWA: 5 mg/m³

Legend

ACGIH - American Conference of Governmental Industrial Hygienists
OSHA - Occupational Safety and Health Administration
NIOSH IDLH: NIOSH - National Institute for Occupational Safety and Health

Engineering Measures

Use explosion-proof electrical/ventilating/lighting/equipment. Ensure adequate ventilation, especially in confined areas. Ensure that eyewash stations and safety showers are close to the workstation location.

Personal Protective Equipment

Eye/face Protection

Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133 or European Standard EN166.

Skin and body protection

Wear appropriate protective gloves and clothing to prevent skin exposure.

Respiratory Protection

Follow the OSHA respirator regulations found in 29 CFR 1910.134 or European Standard EN 149. Use a NIOSH/MSHA or European Standard EN 149 approved respirator if exposure limits are exceeded or if irritation or other symptoms are experienced.

Hygiene Measures

Handle in accordance with good industrial hygiene and safety practice.

9. Physical and chemical properties

Physical State	Liquid
Appearance	Colorless
Odor	aromatic
Odor Threshold	No information available
pH	7 2.5 g/l aq.sol
Melting Point/Range	-122 °C / -187.6 °F
Boiling Point/Range	31.2 - 32 °C / 88.2 - 89.6 °F @ 760 mmHg
Flash Point	-25 °C / -13 °F
Evaporation Rate	No information available
Flammability (solid,gas)	Not applicable
Flammability or explosive limits	

Upper	16.5%
Lower	8.4%
Vapor Pressure	665 mbar @ 20 °C
Vapor Density	3.4 (Air = 1.0)
Specific Gravity	1.218
Solubility	No information available
Partition coefficient; n-octanol/water	No data available
Autoignition Temperature	520 °C / 968 °F
Decomposition Temperature	No information available
Viscosity	.377 mPa.s at 15 °C
Molecular Formula	C2 H2 Cl2
Molecular Weight	96.94

10. Stability and reactivity

Reactive Hazard None known, based on information available

Stability May form explosive peroxides. Hazardous polymerization may occur upon depletion of inhibitor. Moisture sensitive. Air sensitive. Light sensitive.

Conditions to Avoid Keep away from open flames, hot surfaces and sources of ignition. Excess heat. Exposure to air. Exposure to light. Incompatible products. Exposure to moist air or water.

Incompatible Materials Strong oxidizing agents, Strong bases, Finely powdered metals, oxygen, Peroxides, Metals, copper, Finely powdered metals, Acids

Hazardous Decomposition Products Carbon monoxide (CO), Carbon dioxide (CO_2), Formaldehyde, peroxides, Hydrogen chloride gas

Hazardous Polymerization Hazardous polymerization may occur.

Hazardous Reactions None under normal processing.

11. Toxicological information

Acute Toxicity

Product Information

Oral LD50 Category 4. ATE = 300 - 2000 mg/kg.

Vapor LC50 Category 4. ATE = 10 - 20 mg/l.

Component Information

Component	LD50 Oral	LD50 Dermal	LC50 Inhalation
Vinylidene chloride	LD50 = 1500 mg/kg (Rat) LD50 = 200 mg/kg (Rat)	Not listed	LC50 = 1.66 mg/L (Rat) 4 h LC50 = 6350 ppm (Rat) 4 h
4-Methoxyphenol	1600 mg/kg (Rat)	LD50 > 2000 mg/kg (Rabbit)	Not listed

Toxicologically Synergistic Products No information available

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Irritation May cause skin, eye, and respiratory tract irritation

Sensitization No information available

Carcinogenicity Limited evidence of a carcinogenic effect. The table below indicates whether each agency has listed any ingredient as a carcinogen.

Component	CAS-No	IARC	NTP	ACGIH	OSHA	Mexico
Vinylidene chloride	75-35-4	Group 2B	Not listed	Not listed	X	Not listed
4-Methoxyphenol	150-76-5	Not listed	Not listed	Not listed	Not listed	Not listed

Mutagenic Effects Ames test: positive.

Reproductive Effects No information available.

Developmental Effects No information available.

Teratogenicity No information available.

STOT - single exposure None known
STOT - repeated exposure Nasal Cavities Liver

Aspiration hazard No information available

Symptoms / effects,both acute and delayed Inhalation of high vapor concentrations may cause symptoms like headache, dizziness, tiredness, nausea and vomiting

Endocrine Disruptor Information No information available

Other Adverse Effects The toxicological properties have not been fully investigated. See actual entry in RTECS for complete information.

12. Ecological information

Ecotoxicity

The product contains following substances which are hazardous for the environment. Toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment.

Component	Freshwater Algae	Freshwater Fish	Microtox	Water Flea
Vinylidene chloride	Not listed	LC50: 161 - 179 mg/L, 96h static (Pimephales promelas) LC50: 57 - 91 mg/L, 96h static (Lepomis macrochirus) LC50: 85 - 117 mg/L, 96h flow-through (Pimephales promelas)	EC50 > 2000 mg/L 17 h	LC50: 62 - 110 mg/L, 48h Static (Daphnia magna) LC50: 9.0 - 14.0 mg/L, 48h Static (Daphnia magna)
4-Methoxyphenol	Not listed	LC50: = 28.5 mg/L, 96h flow-through (Oncorhynchus mykiss) LC50: = 84.3 mg/L, 96h flow-through (Pimephales promelas)	EC50 = 3.66 mg/L 5 min EC50 = 4.30 mg/L 15 min EC50 = 4.61 mg/L 30 min	Not listed

Persistence and Degradability No information available

Bioaccumulation/ Accumulation No information available.

Mobility Will likely be mobile in the environment due to its volatility.

Component	log Pow
Vinylidene chloride	2.02
4-Methoxyphenol	1.3

13. Disposal considerations

Waste Disposal Methods Chemical waste generators must determine whether a discarded chemical is classified as a hazardous waste. Chemical waste generators must also consult local, regional, and national hazardous waste regulations to ensure complete and accurate classification.

Component	RCRA - U Series Wastes	RCRA - P Series Wastes
Vinylidene chloride - 75-35-4	U078	-

Emergency Phone #	:	(314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Self-heating substances and mixtures (Category 1), H251
Substances and mixtures, which in contact with water, emit flammable gases (Category 1), H260
Acute aquatic toxicity (Category 1), H400
Chronic aquatic toxicity (Category 1), H410

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word	Danger
Hazard statement(s)	
H251	Self-heating: may catch fire.
H260	In contact with water releases flammable gases which may ignite spontaneously.
H410	Very toxic to aquatic life with long lasting effects.
Precautionary statement(s)	
P223	Do not allow contact with water.
P231 + P232	Handle under inert gas. Protect from moisture.
P235 + P410	Keep cool. Protect from sunlight.
P273	Avoid release to the environment.

P280	Wear protective gloves/ eye protection/ face protection.
P335 + P334	Brush off loose particles from skin. Immerse in cool water/ wrap in wet bandages.
P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam to extinguish.
P391	Collect spillage.
P402 + P404	Store in a dry place. Store in a closed container.
P407	Maintain air gap between stacks/ pallets.
P413	Store bulk masses greater than .? kg/ .? lbs at temperatures not exceeding .? °C/ .? °F.
P420	Store away from other materials.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS

Combustible dust

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.1 Substances

Formula	:	Zn
Molecular weight	:	65.39 g/mol
CAS-No.	:	7440-66-6
EC-No.	:	231-175-3
Index-No.	:	030-001-00-1

Hazardous components

Component	Classification	Concentration
Zinc powder (pyrophoric)		
	Self-heat. 1; Water-react. 1; Aquatic Acute 1; Aquatic Chronic 1; H251, H260, H410	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice

Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled

If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact

Wash off with soap and plenty of water. Consult a physician.

In case of eye contact

Flush eyes with water as a precaution.

If swallowed

Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed

The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed

No data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media

Dry powder

5.2 Special hazards arising from the substance or mixture
Zinc/zinc oxides

5.3 Advice for firefighters
Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Further information
No data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Avoid dust formation. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas.
For personal protection see section 8.

6.2 Environmental precautions
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

6.3 Methods and materials for containment and cleaning up
Sweep up and shovel. Contain spillage, and then collect with an electrically protected vacuum cleaner or by wet-brushing and place in container for disposal according to local regulations (see section 13). Do not flush with water. Keep in suitable, closed containers for disposal. Contain spillage, pick up with an electrically protected vacuum cleaner or by wet-brushing and transfer to a container for disposal according to local regulations (see section 13).

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Further processing of solid materials may result in the formation of combustible dusts. The potential for combustible dust formation should be taken into consideration before additional processing occurs.
Provide appropriate exhaust ventilation at places where dust is formed.Keep away from sources of ignition - No smoking.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.
Never allow product to get in contact with water during storage.

Keep in a dry place.
Storage class (TRGS 510): Pyrophoric and self-heating hazardous materials

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters
Contains no substances with occupational exposure limit values.

8.2 Exposure controls

Appropriate engineering controls
Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection
Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Protective gloves against thermal risks

Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:Dermatril® (KCL 740 / Aldrich Z677272, Size M)

data source: KCL GmbH, D-36124 Eichenzell, phone +49 (0)6659 87300, e-mail sales@kcl.de, test method: EN374
If used in solution, or mixed with other substances, and under conditions which differ from EN 374, contact the supplier of the CE approved gloves. This recommendation is advisory only and must be evaluated by an industrial hygienist and safety officer familiar with the specific situation of anticipated use by our customers. It should not be construed as offering an approval for any specific use scenario.

Body Protection
Flame retardant protective clothing, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
Where risk assessment shows air-purifying respirators are appropriate use a full-face particle respirator type N100 (US) or type P3 (EN 143) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: powder Colour: grey
b)	Odour	No data available
c)	Odour Threshold	No data available
d)	pH	No data available
e)	Melting point/freezing point	Melting point/range: 420 °C (788 °F) - lit.
f)	Initial boiling point and boiling range	907 °C (1,665 °F) - lit.
g)	Flash point	No data available
h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	May form combustible dust concentrations in air
j)	Upper/lower flammability or explosive limits	No data available
k)	Vapour pressure	1 hPa (1 mmHg) at 487 °C (909 °F)

l)	Vapour density	No data available
m)	Relative density	7.133 g/mL at 25 °C (77 °F)
n)	Water solubility	No data available
o)	Partition coefficient: n-octanol/water	log Pow: 5
p)	Auto-ignition temperature	The substance or mixture is classified as self heating with the category 1.
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	No data available

9.2 Other safety information
No data available

10. STABILITY AND REACTIVITY

10.1 Reactivity
No data available

10.2 Chemical stability
Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions
Reacts violently with water.

10.4 Conditions to avoid
Exposure to moisture

10.5 Incompatible materials
Strong acids and oxidizing agents

10.6 Hazardous decomposition products
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
No data available

Inhalation: No data available

Dermal: No data available

No data available

Skin corrosion/irritation
No data available

Serious eye damage/eye irritation
No data available

Respiratory or skin sensitisation
Did not cause sensitisation on laboratory animals.

Germ cell mutagenicity
No data available

Carcinogenicity

IARC: No component of this product present at levels greater than or equal to 0.1% is identified as

probable, possible or confirmed human carcinogen by IARC.

ACGIH: No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by ACGIH.

NTP: No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
No data available

No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

Additional Information
RTECS: ZG8600000

chills, dry throat, sweet taste, Fever, Cough, Nausea, Vomiting, Weakness
To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

12. ECOLOGICAL INFORMATION

12.1 Toxicity

Toxicity to fish	LC50 - Cyprinus carpio (Carp) - 450.0 µg/l - 96.0 h
Toxicity to daphnia and other aquatic invertebrates	LC50 - Daphnia magna (Water flea) - 0.068 mg/l - 48 h
	mortality NOEC - Daphnia (water flea) - 0.101 - 0.14 mg/l - 7 d

12.2 Persistence and degradability

12.3 Bioaccumulative potential

Bioaccumulation	Algae - 7 d at 16 °C - 5 µg/l Bioconcentration factor (BCF): 466

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.
Very toxic to aquatic life.

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Contact a licensed professional waste disposal service to dispose of this material. Burn in a chemical incinerator equipped with an afterburner and scrubber but exert extra care in igniting as this material is highly flammable. Offer surplus and non-recyclable solutions to a licensed disposal company.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
UN number: 1436 Class: 4.3 (4.2) Packing group: II
Proper shipping name: Zinc powder
Reportable Quantity (RQ): 1000 lbs

Poison Inhalation Hazard: No

IMDG
UN number: 1436 Class: 4.3 (4.2) Packing group: II EMS-No: F-G, S-O
Proper shipping name: ZINC POWDER
Marine pollutant:yes
IATA
UN number: 1436 Class: 4.3 (4.2) Packing group: II
Proper shipping name: Zinc powder

15. REGULATORY INFORMATION

SARA 302 Components
No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components
The following components are subject to reporting levels established by SARA Title III, Section 313:

	CAS-No.	Revision Date
Zinc powder (pyrophoric)	7440-66-6	1993-04-24

SARA 311/312 Hazards
Reactivity Hazard

Massachusetts Right To Know Components

	CAS-No.	Revision Date
Zinc powder (pyrophoric)	7440-66-6	1993-04-24

Pennsylvania Right To Know Components

	CAS-No.	Revision Date
Zinc powder (pyrophoric)	7440-66-6	1993-04-24

New Jersey Right To Know Components

	CAS-No.	Revision Date
Zinc powder (pyrophoric)	7440-66-6	1993-04-24

California Prop. 65 Components
This product does not contain any chemicals known to State of California to cause cancer, birth defects, or any other reproductive harm.

16. OTHER INFORMATION

Full text of H-Statements referred to under sections 2 and 3.

Aquatic Acute	Acute aquatic toxicity
Aquatic Chronic	Chronic aquatic toxicity
H251	Self-heating: may catch fire.
H260	In contact with water releases flammable gases which may ignite spontaneously.
H400	Very toxic to aquatic life.
H410	Very toxic to aquatic life with long lasting effects.
Self-heat.	Self-heating substances and mixtures

HMIS Rating
Health hazard: 0

Chronic Health Hazard:	
Flammability:	3
Physical Hazard	1

NFPA Rating

Health hazard:	0
Fire Hazard:	3
Reactivity Hazard:	1
Special hazard.I:	W

Version: 4.9 Revision Date: 08/24/2015 Print Date: 02/07/2016

SAFETY DATA SHEET

Version 6.7
Revision Date 08/05/2024
Print Date 08/06/2024

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifiers

Product name : Sodium nitrate

Product Number : S5506
Brand : SIGALD
CAS-No. : 7631-99-4

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Laboratory chemicals, Synthesis of substances

Uses advised against : The product is being supplied under the TSCA R&D Exemption (40 CFR Section 720.36). It is the recipient's responsibility to comply with the requirements of the R&D exemption. The product may not be used for a non-exempt commercial purpose under TSCA unless appropriate consent is granted in writing by MilliporeSigma.

1.3 Details of the supplier of the safety data sheet

Company : Sigma-Aldrich Inc.
3050 SPRUCE ST
ST. LOUIS MO 63103
UNITED STATES

Telephone : +1 314 771-5765
Fax : +1 800 325-5052

1.4 Emergency telephone

Emergency Phone # : 800-424-9300 CHEMTREC (USA) +1-703-527-3887 CHEMTREC (International) 24 Hours/day; 7 Days/week

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)

Oxidizing solids (Category 3), H272
Eye irritation (Category 2A), H319

For the full text of the H-Statements mentioned in this Section, see Section 16.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal Word: Warning

Hazard Statements

H272	May intensify fire; oxidizer.
H319	Causes serious eye irritation.

Precautionary Statements

P210	Keep away from heat.
P220	Keep/Store away from clothing/ combustible materials.
P221	Take any precaution to avoid mixing with combustibles.
P264	Wash skin thoroughly after handling.
P280	Wear protective gloves/ eye protection/ face protection.
P305 + P351 + P338	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P337 + P313	If eye irritation persists: Get medical advice/ attention.
P370 + P378	In case of fire: Use dry sand, dry chemical or alcohol-resistant foam to extinguish.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

SECTION 3: Composition/information on ingredients

3.1 Substances

Formula	:	$NNaO_3$
Molecular weight	:	84.99 g/mol
CAS-No.	:	7631-99-4
EC-No.	:	231-554-3

Component	Classification	Concentration
sodium nitrate		
	Ox. Sol. 3; Eye Irrit. 2A; H272, H319	<= 100 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

SECTION 4: First aid measures

4.1 Description of first-aid measures

No data available

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
No data available

SECTION 5: Firefighting measures

5.1 Extinguishing media
No data available

5.2 Special hazards arising from the substance or mixture
Nitrogen oxides (NOx)
Sodium oxides
Not combustible.

5.3 Advice for firefighters
No data available

5.4 Further information
No data available

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures
For personal protection see section 8.

6.2 Environmental precautions
No data available

6.3 Methods and materials for containment and cleaning up
No data available

6.4 Reference to other sections
For disposal see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
No data available

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Ingredients with workplace control parameters
Contains no substances with occupational exposure limit values.

8.2 Exposure controls

Personal protective equipment

Skin protection
This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Full contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:KCL 741 Dermatril® L

This recommendation applies only to the product stated in the safety data sheet, supplied by us and for the designated use. When dissolving in or mixing with other substances and under conditions deviating from those stated in EN 16523-1 please contact the supplier of CE-approved gloves (e.g. KCL GmbH, D-36124 Eichenzell, Internet: www.kcl.de).
Splash contact
Material: Nitrile rubber
Minimum layer thickness: 0.11 mm
Break through time: 480 min
Material tested:KCL 741 Dermatril® L

Control of environmental exposure
Prevent product from entering drains.

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: solid
b)	Odor	odorless
c)	Odor Threshold	Not applicable
d)	pH	5.5 - 8.0 at 50 g/l at 20 °C (68 °F)
e)	Melting point/freezing point	Melting point: 308 °C (586 °F)
f)	Initial boiling point and boiling range	380 °C 716 °F
g)	Flash point	()Not applicable

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

h)	Evaporation rate	No data available
i)	Flammability (solid, gas)	The product is not flammable.
j)	Upper/lower flammability or explosive limits	No data available
k)	Vapor pressure	No data available
l)	Vapor density	Not applicable
m)	Density	2.26 g/cm3 at 20 °C (68 °F)
	Relative density	No data available
n)	Water solubility	874 g/l at 20 °C (68 °F) - soluble
o)	Partition coefficient: n-octanol/water	Not applicable for inorganic substances
p)	Autoignition temperature	No data available
q)	Decomposition temperature	No data available
r)	Viscosity	No data available
s)	Explosive properties	No data available
t)	Oxidizing properties	The substance or mixture is classified as oxidizing with the category 3.

9.2 Other safety information

Relative vapor density	Not applicable

SECTION 10: Stability and reactivity

10.1 Reactivity

No data available

10.2 Chemical stability

No data available

10.3 Possibility of hazardous reactions

Risk of explosion with:
Powdered metals
aluminium oxide
boron phosphide
Cyanides
Acetic anhydride
sodium phosphite
sodium thiosulphate
performic acid

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

sulfur
Polyvinyl chloride
Risk of ignition or formation of inflammable gases or vapours with:
Risk of explosion with:
organic combustible substances
oxidisable substances
carbon
Arsenic oxides

10.4 Conditions to avoid

Fusion of mixtures of metal cyanides, including lead thiocyanate, with metal chlorates, perchlorates, nitrates or nitrites causes a violent explosion. Addition of one solid component (even as a residue in small amount) to another molten component is also highly dangerous. Heat.

10.5 Incompatible materials

No data available

10.6 Hazardous decomposition products

In the event of fire: see section 5

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity
LD50 Oral - Rat - male and female - 3,430 mg/kg
(OECD Test Guideline 401)
Symptoms: Irritation of mucous membranes, Nausea, Vomiting, Diarrhea
Symptoms: Possible damages:, mucosal irritations
LD50 Dermal - Rat - male and female - > 5,000 mg/kg
(OECD Test Guideline 402)

Skin corrosion/irritation
Skin - Rabbit
Result: No skin irritation - 4 h
(OECD Test Guideline 404)
Remarks: The value is given in analogy to the following substances: Ammonium nitrate

Serious eye damage/eye irritation
Eyes - Rabbit
Result: irritating
(OECD Test Guideline 405)

Respiratory or skin sensitization
Local lymph node assay (LLNA) - Mouse
Result: negative
(OECD Test Guideline 429)

Germ cell mutagenicity
Test Type: Mutagenicity (mammal cell test): chromosome aberration.
Test system: Human lymphocytes
Metabolic activation: with and without metabolic activation

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Method: OECD Test Guideline 473
Result: negative
Test Type: Mutagenicity (mammal cell test): chromosome aberration.
Test system: Chinese hamster fibroblasts
Metabolic activation: without metabolic activation
Result: positive
Remarks: (ECHA)
Test Type: Ames test
Test system: Salmonella typhimurium
Metabolic activation: with and without metabolic activation
Method: OECD Test Guideline 471
Result: negative

Carcinogenicity

IARC: No ingredient of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

NTP: No ingredient of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is on OSHA's list of regulated carcinogens.

Reproductive toxicity
No data available

Specific target organ toxicity - single exposure
No data available

Specific target organ toxicity - repeated exposure
No data available

Aspiration hazard
No data available

11.2 Additional Information

Repeated dose toxicity - Rat - male and female - Oral - 28 d - NOAEL (No observed adverse effect level) - >= 1,500 mg/kg
Remarks: The value is given in analogy to the following substances: potassium nitrate

RTECS: WC5600000
Absorption into the body leads to the formation of methemoglobin which in sufficient concentration causes cyanosis. Onset may be delayed 2 to 4 hours or longer.
To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

After absorption of large quantities:

Methaemoglobinaemia with headache, cardiac arrhythmia, drop in blood pressure, dyspnoea, and spasms, key symptom: cyanosis (blue colouration of the blood).

The following applies to nitrites/nitrates in general: methaemoglobinaemia after the uptake of large quantities.

Other dangerous properties can not be excluded.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Handle in accordance with good industrial hygiene and safety practice.

SECTION 12: Ecological information

12.1 Toxicity

No data available

Toxicity to daphnia and other aquatic invertebrates	EC50 - Daphnia magna (Water flea) - 3,581 mg/l - 48 h Remarks: (IUCLID)
Toxicity to bacteria	static test EC50 - activated sludge - > 1,000 mg/l - 3 h (OECD Test Guideline 209)

12.2 Persistence and degradability

The methods for determining the biological degradability are not applicable to inorganic substances.

12.3 Bioaccumulative potential

No data available

12.4 Mobility in soil

No data available

12.5 Results of PBT and vPvB assessment

PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Endocrine disrupting properties

No data available

12.7 Other adverse effects

No data available

SECTION 13: Disposal considerations

13.1 Waste treatment methods

No data available

SECTION 14: Transport information

DOT (US)

UN number: 1498 Class: 5.1 Packing group: III

Proper shipping name: Sodium nitrate

Reportable Quantity (RQ):

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

Poison Inhalation Hazard: No

IMDG
UN number: 1498 Class: 5.1 Packing group: III EMS-No: F-A, S-Q
Proper shipping name: SODIUM NITRATE

IATA
UN number: 1498 Class: 5.1 Packing group: III
Proper shipping name: Sodium nitrate

SECTION 15: Regulatory information

CERCLA Reportable Quantity

This material does not contain any components with a CERCLA RQ.

SARA 304 Extremely Hazardous Substances Reportable Quantity

This material does not contain any components with a section 304 EHS RQ.

SARA 302 Extremely Hazardous Substances Threshold Planning Quantity

This material does not contain any components with a section 302 EHS TPQ.

SARA 311/312 Hazards : Reactivity Hazard

SARA 313 : The following components are subject to reporting levels established by SARA Title III, Section 313:

sodium nitrate 7631-99-4 >= 90 - <= 100 %

US State Regulations

Massachusetts Right To Know

sodium nitrate 7631-99-4

Pennsylvania Right To Know

sodium nitrate 7631-99-4

Maine Chemicals of High Concern

Product does not contain any listed chemicals

Vermont Chemicals of High Concern

Product does not contain any listed chemicals

Washington Chemicals of High Concern

Product does not contain any listed chemicals

The ingredients of this product are reported in the following inventories:

TSCA : All substances listed as active on the TSCA inventory

TSCA list

No substances are subject to a Significant New Use Rule.

The life science business of Merck KGaA, Darmstadt, Germany
operates as MilliporeSigma in the US and Canada

No substances are subject to TSCA 12(b) export notification requirements.

SECTION 16: Other information

The branding on the header and/or footer of this document may temporarily not visually match the product purchased as we transition our branding. However, all of the information in the document regarding the product remains unchanged and matches the product ordered. For further information please contact mlsbranding@sial.com.

JOBSITE SAFETY INSPECTION CHECKLIST

Jobsite Safety Inspection Checklist

Date: _____ **Inspected By:** _____

Location: _____ **Project #:** _____

Check one of the following: **A:** Acceptable **NA**: Not Applicable **D**: Deficiency

	A	NA	D	Remark
1. HASP available onsite for inspection?				
2. Health & Safety Compliance agreement (in HASP) appropriately signed by Langan employees and contractors?				
3. Hospital route map with directions posted on site?				
4. Emergency Notification List posted on site?				
5. First Aid kit available and properly stocked?				
6. Personnel trained in CPR/First Aid on site?				
7. MSDSs readily available, and all workers knowledgeable about the specific chemicals and compounds to which they may be exposed?				
8 Appropriate PPE being worn by Langan employees and contractors?				
9. Project site safe practices ("Standing Orders") posted?				
10. Project staff have 40-hr./8-hr./Supervisor HAZWOPER training?				
11. Project staff medically cleared to work in hazardous waste sites and fit-tested to wear respirators, if needed?				
12. Respiratory protection readily available?				
13. Health & Safety Incident Report forms available?				
14. Air monitoring instruments calibrated daily, and results recorded on the Daily Instrument Calibration check sheet?				
15. Air monitoring readings recorded on the air monitoring data sheet/field logbook?				
16. Subcontract workers have received 40-hr./8-hr./Spvsr. HAZWOPER training, as appropriate?				
17. Subcontract workers medically cleared to work on site, and fit-tested for respirator wear?				
18. Subcontract workers have respirators readily available?				
19. Mark outs of underground utilities done prior to initiating any subsurface activities?				
20. Decontamination procedures being followed as outlined in HASP?				
21. Are tools in good condition and properly used?				
22. Drilling performed in areas free from underground objects including utilities?				

23. Adequate size/type fire extinguisher supplied?				
24. Equipment at least 20 feet from overhead powerlines?				
25. Evidence that drilling operator is responsible for the safety of his rig.				
26. Trench sides shored, layer back, or boxed?				
27. Underground utilities located, and authorities contacted before digging?				
28. Ladders in trench (25-foot spacing)?				
29. Excavated material placed more than 2 feet away from excavation edge?				
30. Public protected from exposure to open excavation?				
31. People entering the excavation regarding it as a permit-required confined space and following appropriate procedures?				
32. Confined space entry permit is completed and posted?				
33. All persons knowledgeable about the conditions and characteristics of the confined space?				
34. All persons engaged in confined space operations have been trained in safe entry and rescue (non-entry)?				
35. Full body harnesses, lifelines, and hoisting apparatus available for rescue needs?				
36. Attendant and/or supervisor certified in basic first aid and CPR?				
37. Confined space atmosphere checked before entry and continuously while the work is going on?				
38. Results of confined space atmosphere testing recorded?				
39. Evidence of coordination with off-site rescue services to perform entry rescue, if needed?				
40. Are extension cords rated for this work being used and are they properly maintained?				
41. Are GFCIs provided and being used?

JOB SAFETY ANALYSIS FORM

LANGAN	Job Safety Analysis (JSA) Health and Safety
JSA TITLE: **JSA NUMBER:**	**DATE CREATED:** **CREATED BY**: **REVISION DATE:** **REVISED BY:**

Langan employees must review and revise the Job Safety Analysis (JSA) as needed to address the any site-specific hazards not identified. Employees must provide their signatures on the last page of the JSA indicating they have review the JSA and are aware the potential hazards associated with this work and will follow the provided preventive or corrective measures.

PERSONAL PROTECTIVE EQUIPMENT REQUIRED: (PPE): ■ Required ☒ As Needed		
☐ Steel-toed boots	☐ Nitrile gloves	☐ Dermal Protection (Specify)
☐ Long-sleeved shirt	☐ Leather/ Cut-resistant gloves	☐ High visibility vest/clothing
☐ Safety glasses	☐ Face Shield	☐ Hard hat
ADDITIONAL PERSONAL PROTECTIVE EQUIPMENT NEEDED (Provide specific type(s) or descriptions)		
☐ Air Monitoring:	☐ Respirators:	☐ Other:
☐ Dermal Protection:	☐ Cartridges:	☐ Other:

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE OR CORRECTIVE ACTION
1.	1. 2.	1a. 1b. 2a. 2b.
2.	1.	1
Additional items identified in the field.		
Additional Items.		

If additional items are identified during daily work activities, please notify all relevant personnel about the change and document on this JSA.

LANGAN	Job Safety Analysis (JSA) Health and Safety
JSA Title: COVID-19 Awareness – Site Work **JSA Number: JSA046-00**	
A Job Safety Analysis (JSA) must identify all job steps required to complete the task, the potential hazards employees could be exposed to while performing the job step and the preventative/corrective actions required to reduce/mitigate the identified potential hazards. Employees must certify that they have either prepared the JSA or have reviewed the JSA and are aware of the potential hazards associated with this task and will follow the provided preventive/corrective actions. Prior to the start of any work "TAKE 5" and conduct a Last-Minute Risk Assessment.	

PERSONAL PROTECTIVE EQUIPMENT (Required or to be worn as needed):				
☒ Safety Boots	☐ Long Sleeves	☐ Safety Vest (Class 2)	☐ Hard Hat	☐ Hearing Protection
☐ Safety Glasses	☐ Safety Goggles	☐ Face Shield	☐ Nitrile Gloves	☐ PVC Gloves
☐ Leather Gloves	☐ Cut Resist. Gloves	☐ Fall Protection	☐ Fire Resistant Clothing	☐ Rubber Boots
☐ Insect/Animal Repellent	☐ Ivy Blocker/Cleaner	☐ Traffic Cones/Signs	☐ Life Vest/Jacket	
☒ Other: Alcohol-based hand sanitizer, disinfectant wipes/spray				

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
1. All Activities	1. Transmittal/exposure of COVID-19	1. Ask yourself and your managers – is this work essential? Can this be done remotely? 2. Stay home if sick or showing symptoms of COVID-19 (e.g., fever, cough, etc.). 3. Carry nitrile gloves, alcohol-based hand sanitizer, face coverings and disinfectant wipes/spray during field work. 4. Check federal, state, and/or local travel restrictions **prior** to travel. Many states, counties, and cities are passing strict "shelter-in-place" or business restrictions in response to COVID-19. 5. Immediately notify Beverly Williams or Rory Johnston (Supervisor if employee chooses) if you display symptoms of COVID-19. Symptoms include fever (over 100.4 F), cough, and shortness of breath. 6. Notify Beverly Williams or Rory Johnston, Supervisor and Coronavirus Task Force if you had close contact with an individual who tested positive or displayed symptoms of COVID-19. 7. Do not touch your face, to the extent possible. 8. Wear face coverings when around other worker to minimize spread of COVID-19. (May be required in certain states or locations.)

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
		9. Practice social distancing, maintaining at least 6 feet of distance between yourself and others. Avoid gatherings of more than 10 people. Limit, to the extent possible, contact with public items/objects. 10. Clean your hands frequently with soap and water for at least 20 seconds especially after you have been in a public place, or after blowing your nose, coughing, sneezing, or using the rest room. 11. If soap and water are not readily available, use a hand sanitizer that contains at least 60% alcohol. Cover all surfaces of your hands and rub them together until they feel dry. 12. Cover your mouth and nose with a tissue when you cough or sneeze or use the inside of your elbow. 13. Clean and disinfect frequently touched surfaces daily, for example, cell phones, computer equipment, headsets, tables, doorknobs, light switches, countertops, handles, desks, toilets, faucets, and sinks.
2. Travel to Jobsite	1. Transmittal/exposure of COVID-19 between passengers 2. Transmittal/exposure of COVID-19 from previous occupants (rental and fleet vehicles) 3. Transmittal/exposure of COVID-19 while refueling	1. Limit the number of occupants to each vehicle to 2 people. Employees should sit as far away from each other as possible. 2. Disinfect high “hand-traffic” areas of the vehicle: Door handles, steering wheel, turn signal and control rods, dashboard controls, seatbelts, armrests, etc. To the extent possible, do not use recycled air for heat/AC and travel with the windows open. 3. Use hand sanitizer before and after pumping gas and only return to the inside of the vehicle after refueling is complete. 4. Wear nitrile gloves if available or disinfect the keypad, pump handle, and fuel grade button prior to use. 5. Recommend face coverings are worn to minimize spread of COVID-19.
3. Conduct Tailgate Safety Meeting & Complete H&S Paperwork	1. Transmittal/exposure of COVID-19 between meeting participants	1. Practice social distancing, maintaining at least 6 feet of distance between yourself and others. 2. Recommend face coverings are worn when around other workers to minimize spread of COVID-19, 3. Hold meetings outside and keep in mind wind direction. To the extent possible, remain crosswind from other people. 4. Designate a single person to maintain sign-in sheets/permits throughout the day to limit the passing of pens/clipboards between people. 5. Each person should complete their own JSA, even if they are completing similar tasks as others in order to limit the passing of paper/pens/clipboards between people. 6. Include COVID-19 topics and prevention measures in safety meetings.
4. Conduct Site Work	1. Transmittal/exposure of COVID-19 between site workers and public.	1. Practice social distancing maintaining 6 feet of distance between yourself and others. 2. Recommend face coverings are worn when around other workers to minimize spread of COVID-19, 3. To the extent possible, do not interact with the public. If it is necessary, politely explain you are practicing social distance and request they stay at least 6 feet away and they do not attempt to pass objects to you. 4. Wear nitrile gloves during site work underneath the appropriate gloves for your task. Utilize appropriate decontamination procedures, securely bag all waste (including nitrile gloves) generated during site work and dispose of.

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
		5. Do not share tools. Each person should be equipped with the tools to complete their task or tasks should be divided to remove the need to share tools. If tools must be shared, surfaces should be disinfected. 6. Clean and disinfect surfaces of rental tools and equipment upon receipt. To the extent possible rent equipment from Langan's internal equipment reservation center, where cleaning/disinfecting procedures can be verified.
5. Use of Construction Trailers	1. Transmittal/exposure of COVID-19 between site workers and others.	1. Avoid use of shared trailers, if possible. Minimize trailer use to essential personnel. 2. Practice social distancing; maintaining 6 feet of distance between yourself and others in trailer. 3. Clean and disinfect areas including desks, phones, chairs, and other common areas, before and after use.
6. Purchasing Food from a Restaurant	1. Transmittal/exposure of COVID-19 from other customers, staff, surfaces.	1. To the extent possible, bring your own food. 2. If you must visit a restaurant, call ahead for take-out or "contactless delivery." Do not dine in. When picking up food, follow guidelines for Job Step #8: Purchasing Supplies at Retail/Shipping Centers. 3. Wash hands before and after eating.
7. Smoking Cigarettes	1. Transmittal/exposure of COVID-19 by touching mouth with hands	1. Cigarette smokers are at greater risk of complications arising from COVID-19. Nicotine patches/lozenges/gum, smoking cessation programs, and prescription medications may aid in "kicking the habit" if you decide to quit. 2. Wash hands thoroughly before and after smoking. 3. Discard cigarette butts properly. Do not light cigarettes from others and do not give cigarettes to others.
8. Hotel Stay	1. Transmittal/exposure of COVID-19 from previous occupants, hotel staff, common areas.	1. Verify the hotel chain/brand has modified cleaning procedures to reflect risk of COVID-19. Most hotel companies have issued statements on their websites and in email blasts reflecting these new procedures. 2. Use the front door, and not peripheral entrances. Front doors of hotels are usually automatic. 3. Request ground floor room to avoid elevator use and a room that has not be utilized in 48-72 hours. 4. If elevator use is required, do not directly touch elevator buttons with your hands. Do not ride elevators with other people, to the extent possible. 5. Bring disinfecting wipes or sanitizing spray. Upon arrival, disinfect high "hand-traffic" areas of the hotel room: Door handles, light switches, shower/sink faucet handles, TV remote, curtain/blind handles. Clean these surfaces daily. 6. Place the "Do Not Disturb" Sign on your door to prevent people (housekeeping) from entering your room. 7. Avoid common spaces and hotel sponsored events where crowds will be present. 8. Confirm hotel cleaning procedures have been modified to address COVID-19. Confirm no COVID-19 cases have occurred in hotel
9. Purchasing Supplies at Retail/Shipping Centers	1. Transmittal/exposure of COVID-19 from other customers, staff, surfaces.	1. Plan your travel to limit the need to visit retail/shipping centers. 2. Practice social distancing, maintaining at least 6 feet of distance between yourself and others. If the store is too crowded/small, consider visiting another store or returning at a different time. 3. Avoid high "hand-traffic" items/areas like door handles (i.e. use your shoulder, hip/butt, or open with a disposable napkin/paper towel), credit cards terminals (i.e. use Apple/Android pay if available), shopping carts/baskets (i.e. bring your own shopping

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
		bags), counter tops (i.e. ask clerk if you can hold the items while they are scanned) and bulk/buffet items (i.e. just avoid them). 4. Disinfect your hands before and after visiting a retail/shipping center.

PERSONAL PROTECTIVE EQUIPMENT (Required or to be worn as needed):				
☒ Safety Shoes	☒ Long Sleeves	☒ Safety Vest (Class 2)	☒ Hard Hat	☐ Hearing Protection
☒ Safety Glasses	☐ Safety Goggles	☐ Face Shield	☒ Nitrile Gloves	☐ PVC Gloves
☐ Leather Gloves	☐ Cut Resist. Gloves	☐ Fall Protection	☒ Fire Resistant Clothing	☐ Rubber Boots
☒ Insect/Animal Repellent	☒ Ivy Blocker/Cleaner	☐ Traffic Cones/Signs	☐ Life Vest/Jacket	
☒ Other: Tyvek Sleeves				

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
1. Drive to sample location	1. Rough/Off Road terrain	1. Pay attention to road conditions such as road erosion, unprotected embankments, and soft road conditions.
2. Sample Collection (Walking)	1. Slip/Trips/Falls 2. Back strains 3. Wildlife (Insects, Stray animals, rodents) 4. Poisonous vegetation	1. Minimize distance to sample area/ Plan route and check surface prior to carrying heavy equipment/ Locate safest access point/ Follow good housekeeping procedures/ Mark significant below grade hazards (holes, trenches) with spray paint or cones/ Wear foot protection with ankle support and gripping soles. 2. Use proper lifting techniques/ Use wheeled transport/ Obtain assistance where and when needed/ Consider load weight when evaluating what is safe and unsafe to carry. 3. Be aware of surroundings for the presence of wildlife. Do not approach stray animals. Carry and use animal repellant when needed/ Use bug spray when needed. 4. Keep skin covered/ Identify and avoid poisonous vegetation/ Clean areas after contact with suspected vegetation.
3. Sample Collection (Water)	1. Drowning Hazards 2. Chemical burns (when adding acid preservative to sample) 3. Back Strains 4. Ergonomic issues 5. Slip/Trips/Falls	1. Use buddy system/ Wear flotation vest if water is deeper than 2 feet or swift moving/ Select working area with stable footing. Do not attempt to cross or stand in swift moving water. 2. Wear proper PPE (Nitrile gloves, Tyvek Sleeves) 3. Use proper lifting techniques/ Use wheeled transport/ Obtain assistance where and when needed/ Consider load weight when evaluating what is safe or unsafe to carry. 4. When possible, avoid bending over for long periods of time/ Use a small stool for sitting or knee pad for kneeling.

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
		5. Minimize distance to sample area/ Plan route and check surface prior to carrying heavy equipment/ Locate safest access point/ Follow good housekeeping procedures/ Mark significant below grade hazards (holes, trenches) with spray paint or cones/ Wear foot protection with ankle support and gripping soles/ Avoid standing water or slippery terrain.
4. All activities	1. Slips/ Trips/ Falls 2. Hand injuries, cuts, or lacerations during manual handling of materials 3. Foot injuries 4. Back injuries 5. Traffic 6. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.) 7. High Noise levels 8. Overhead hazards 9. Heat Stress/ Cold Stress 10. Eye Injuries	1. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards 2. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves 3. Wear Langan approved safety shoes 4. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible 5. Wear high visibility clothing & vest / Use cones or signs to designate work area 6. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed 7. Wear hearing protection 8. Wear hard hat / Avoid areas where overhead hazards exist. 9. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress 10. Wear safety glasses

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
5. Transport equipment to work area	2. Back/strain 3. Slip/Trip/Falls 4. Traffic 5. Cuts/abrasions/contusions from equipment 6. Accidents due to vehicle operations	1. Use proper lifting techniques/Use wheeled transport 2. Minimize distance to work area/unobstructed path to work area/follow good housekeeping procedures 3. Wear proper PPE (high visibility vest or clothing) 4. Wear proper PPE (leather gloves, long sleeves, Langan approved safety shoes) 5. Observe posted speed limits/ Wear seat belts at all times
6. Traffic	1. Hit by moving vehicle	1. Use traffic cones and signage/ Use High visibility traffic vests and clothing/ Caution tape when working near active roadways.
7. Field Work (drilling, resistivity testing, and inspection)	1. Biological Hazards: insects, rats, snakes, poisonous plants, and other animals 2. Heat stress/injuries 3. Cold Stress/injuries 4. High Energy Transmission Lines 5. Underground Utilities 6. Electrical (soil resistivity testing)	1. Inspect work area to identify biological hazards. Wear light colored long sleeve shirt and long pants/ Use insect repellant as necessary/ Beware of tall grass, bushes, woods, and other areas where ticks may live/ Avoid leaving garbage on site to prevent attracting animals/ Identify and avoid contact with poisonous plants/Beware of rats, snakes, or stray animals. 2. Wear proper clothing (light colored)/ drink plenty of water/ take regular breaks/use sun block. 3. Wear proper clothing/ dress in layers/ take regular breaks. 4. Avoid direct contact with high energy transmission lines/ position equipment at least 15 feet or as required by PSE&G from the transmission lines/ wear proper PPE (dielectric overshoes 15 kV minimum rating).

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
		5. Call one-call service before performing intrusive field work/ Review utility mark-outs and available utility drawings (with respect to proposed work locations)/ Follow Underground Utility Guidelines 6. See AGI Sting R1 operating manual for specific concerns during operating instrument
8. All activities	1. Slips/ Trips/ Falls 2. Hand injuries, cuts, or lacerations during manual handling of materials 3. Foot injuries 4. Back injuries 5. Traffic 6. Job Safety Analysis (JSA)
Health and Safety

JSA Title: **55-gallon Drum Sampling**
JSA Number: **JSA043-01**

A Job Safety Analysis (JSA) must identify all job steps required to complete the task, the potential hazards employees could be exposed to while performing the job step and the preventative/corrective actions required to reduce/mitigate the identified potential hazards. Employees must certify that they have either prepared the JSA or have reviewed the JSA and are aware of the potential hazards associated with this task and will follow the provided preventive/corrective actions. Prior to the start of any work "TAKE 5" and conduct a Last-Minute Risk Assessment.

S – ***Stop,*** *what has changed?*
T – ***Think*** *about the task*
E – ***Evaluate*** *potential hazards*
P – ***Plan*** *safe approach*
S - ***Start*** *task /* ***Stop*** *& regroup*

PERSONAL PROTECTIVE EQUIPMENT (Required or to be worn as needed):				
☒ Safety Shoes	☒ Long Sleeves	☒ Safety Vest (Class 2)	☒ Hard Hat	☐ Hearing Protection
☒ Safety Glasses	☒ Safety Goggles	☒ Face Shield	☒ Nitrile Gloves	☒ PVC Gloves
☒ Leather Gloves	☐ Cut Resist. Gloves	☐ Fall Protection	☐ Fire Resistant Clothing	☐ Rubber Boots
☐ Insect/Animal Repellent	☐ Ivy Blocker/Cleaner	☐ Traffic Cones/Signs	☐ Life Vest/Jacket	
☒ Other: All Drums are required to be labeled. Langan employees do not open or move undocumented drums or unlabeled drums without proper project manager authorization.				

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
20.Unpack/Transport equipment to work area.	16.Back Strains 17.Slip/Trips/Falls 18.Cuts/Abrasions from equipment 4. Contusions from dropped equipment	10. Use proper lifting techniques/Use wheeled transport. 11. Minimize distance to work area/Unobstructed path to work area/follow good housekeeping procedures. Mark slip/trip/fall hazards with orange safety cones. 12. Wear proper PPE (leather gloves, long sleeves). 4. Wear proper PPE (Langan approved safety shoes).
21.Open Drums	1. Hand Injuries, cuts or lacerations when untightening drum locking bolt, removing drum lid strap, or removing lid. 2. Pressure from drums.	1. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves. Use non-metallic mallet and non-sparking tools/wrenches. 2. Open drum slowly to relieve pressure. Wear proper PPE: face shield and goggles; correct gloves; and over garments.
22.Collecting Soil/Fluid Sample	8. Irritation to eye from vapor, soil dust, or splashing. 9. Irritation to exposed skin	6. Wear proper eye protection including safety glasses/ face shield/googles and when necessary, splash guard. If dust or vapor phase is present, wear appropriate safety breathing gear (1/2 mask or full face mask with correct filter) 7. Wear proper skin protection including nitrile gloves.
23.Closing Drums	1. Hand Injuries, cuts or lacerations when untightening drum locking bolt, removing drum lid strap, or removing lid.	7. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves. Use non-metallic mallet and non-sparking tools/wrenches.

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
24.Moving Drums	2. Hand Injuries, cuts or lacerations when untightening drum locking bolt, removing drum lid strap, or removing lid. 3. Back Strains	2. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves. Use non-metallic mallet and non-sparking tools/wrenches. 3. Use proper lifting techniques/Use wheeled transport.
25. All activities	31. Slips/ Trips/ Falls 32. Hand injuries, cuts, or lacerations during manual handling of materials 33. Foot injuries 34. Back injuries 35. Traffic 36. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.) 37. High Noise levels 38. Overhead hazards 39. Heat Stress/ Cold Stress 40. Eye Injuries	37. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards. 38. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves. 39. Wear Langan approved safety shoes. 40. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible. 41. Wear high visibility clothing & vest / Use cones or signs to designate work area. 42. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed. 43. Wear hearing protection 44. Wear hard hat / Avoid areas where overhead hazards exist. 45. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress. 46. ☒ Other: Half-face respirator, dust cartridges, PID (if applicable)				

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
26.Move equipment to work site	19.Back strain when lifting equipment. 20.Slips/ Trips/ Falls while moving equipment. 21.Traffic (if applicable) 22.Pinched fingers or running over toes during GeoProbe set-up. 23.Overturn drilling rig while transporting to loading dock on flat-bed tow truck	13. Use proper lifting technique (use legs for bending and lifting and not the back)/ Use wheeled transport for heavy equipment / Get assistance when handling loads greater than 50 lbs. / Minimize distance to vehicle 14. Use proper lifting technique (use legs for bending and lifting and not the back) / Use wheeled transport for heavy equipment / Get assistance when handling loads greater than 50 lbs. / Minimize distance to vehicle / Have unobstructed path to vehicle or collection point / Do not lift/walk with boxes that are heavy/difficult to lift 15. Wear high visibility safety vests or clothing / Exercise caution 16. Wear proper PPE (cut-resistant gloves) / Stay alert, be aware of geoprobe rig at all times 17. Drill rig should be parked in center of flat-bed tow truck / Emergency brake shall be used at all times during transport on the flat-bed truck/ All unnecessary personnel should stay away from the flat-bed truck during moving activities
27.Calibration of monitoring equipment	10.Skin or eye contact with calibration chemicals 11.Pinch fingers in monitoring equipment	8. Wear proper PPE (safety glasses/ goggles) 9. Wear proper PPE (leather gloves)
28.Set-up GeoProbe rig	10. Geoprobe rig movement	8. All field personnel should stay clear of the GeoProbe rig while moving / Use a spotter when backing up the GeoProbe
29.Advance GeoProbe rods below ground surface to desired depth	4. Underground utilities 5. High noise levels	4. Clean all subsurface soil borings to a minimum of 5 feet below grade. 5. Wear proper PPE (hearing protection)
30. Remove and open acetate liner.	41. Pinched fingers while removing macrocore.	1. Wear proper PPE (nitrile gloves, cut-resistant or leather gloves 2. Wear proper PPE (cut-resistant or leather gloves)

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
5. Remove and open acetate liner (cont'd)	42. Cuts/lacerations when cutting acetate liner open. 43. Exposure to hazardous vapors 44. Skin contacts with contaminated soil	3. Do not place face over acetate liner when opening / Monitor hazardous vapors in air with PID / Upgrade PPE as necessary based on levels contained in the Health and Safety Plan 4. Wear proper PPE (nitrile gloves)
31. Sample Collections a) Monitor parameters. b) Prepare sample containers and labels	1. Contact with potentially contaminated soil. 2. Lacerations from broken sample bottles 3. Back strain while transporting full coolers. 4. Internal exposure to contaminants and metals through inhalation of dust 5. Slips/ Trips/ Falls	1. Use monitoring devices / Wear proper PPE (safety glasses, nitrile gloves) 2. Do not over-tighten bottle caps / Handle bottles safely to prevent breakage. 6. Use proper lifting techniques / Do not lift heavy loads without assistance. 7. Avoid creating dust / If necessary, wear a half mask respirator with applicable dust cartridge / Inspect respirator for damage and cleanliness prior to use / Clean respirator after each use and store in a clean, secure location. 8. Be alert / Follow good housekeeping procedures
32. Remove excess soil from acetate liner and place in 55-gallon drum (IF NOT PERFORMED BY LANGAN, REMOVE!)	1. Cuts/lacerations from acetate liner 2. Pinched fingers/hand while opening/closing drum. 3. Skin contacts with contaminated soil 4. Soil debris in eyes	1. Wear proper PPE (cut-resistant or leather gloves) 2. Wear proper PPE (cut-resistant or leather gloves) 3. Wear proper PPE (nitrile gloves) 4. Wear proper PPE (safety glasses)

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
8. Transport drums to central staging location (IF NOT PERFORMED BY LANGAN, REMOVE!)	1. Back, arm or shoulder strain from moving drums. 2. Pinch fingers/hand in drum cart when moving drums. 3. Pinch fingers/hand when operating lift-gate on vehicle. 4. Contact with potentially contaminated groundwater when moving improperly sealed drums. 5. Slips when moving drums. 6. Drop drum on feet/toes	47. Use drum cart for moving drums / Use proper lifting techniques / Do not lift heavy loads without assistance. 48. Wear proper PPE (cut-resistant or leather gloves) 49. Wear proper PPE (cut-resistant or leather gloves) 50. Wear proper PPE (nitrile gloves underneath work gloves) 51. Follow good housekeeping procedures / Ensure route to move drum and storage space is free from obstructions. 52. Wear proper PPE (safety shoes) / Work in a safe manner to prevent dropped drum
9. All activities 9. All activities (cont'd)	1. Slips/ Trips/ Falls 2. Hand injuries, cuts, or lacerations during manual handling of materials 3. Foot injuries 4. Back injuries 5. Traffic 6. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.) 7. High Noise levels 8. Overhead hazards 9. Heat Stress/ Cold Stress 10. Eye Injuries	1. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards. 2. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves. 3. Wear Langan approved safety shoes. 4. PERSONAL PROTECTIVE EQUIPMENT (Required or to be worn as needed):				
☒ Safety Shoes	☒ Long Sleeves	☒ Safety Vest (Class 2)	☒ Hard Hat	☒ Hearing Protection
☒ Safety Glasses	☐ Safety Goggles	☐ Face Shield	☒ Nitrile Gloves	☐ PVC Gloves
☒ Leather Gloves	☐ Cut Resist. Gloves	☒ Fall Protection	☐ Fire Resistant Clothing	☐ Rubber Boots
☐ Insect/Animal Repellent	☐ Ivy Blocker/Cleaner	☐ Traffic Cones/Signs	☐ Life Vest/Jacket	
☒ Other: Tyvek sleeves, Dermal Protection, PID				

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
36. Transport equipment to work area	1. Back Strain 2. Slips/ Trips/ Falls 3. Traffic 4. Cuts/abrasions from equipment 5. Contusions from dropped equipment	1. Use proper lifting techniques / Use wheeled transport. 2. Minimize distance to work area / Have unobstructed path to work area / Follow good housekeeping procedures. 3. Wear proper PPE (high visibility vest or clothing) 4. Wear proper PPE (leather gloves, long sleeves) 5. Wear proper PPE (safety shoes)
37. Remove well cover	18. Scrape knuckles/hand 19. Strain wrist/bruise palm 20. Pinch fingers or hand	3. Wear proper PPE (leather gloves) 4. Using a hammer, tap the end of the wrench to loosen grip of bolts. 5. Wear proper PPE (leather gloves)
38. Remove well cap and lock	11. Well can pops from pressure. 12. Exposure to hazardous substances through inhalation or dermal exposure 13. Scrape knuckles/hand 14. Strain write/bruise palm	5. Remove cap slowly to relieve pressure / Do not place face over well when opening / Wear proper PPE (safety glasses) 6. Use direct air monitoring/reading instrument (i.e., PID) / Be familiar with and follow actions prescribed in the HASP / Wear proper PPE (nitrile gloves) 7. Wear proper PPE (leather gloves) 8. Using hammer, tap the end of the wrench to loosen grip
39. Measure head-space vapor levels	1. Exposure to hazardous substances through inhalation	1. Do not place face over well when collecting measurement
40. Remove dedicated tubing (if necessary)	1. Exposure to hazardous substances through inhalation or dermal exposure 2. Tubing swings around after removal	1. Wear proper PPE (nitrile gloves, Tyvek sleeves) 2. Wear proper PPE (safety glasses)
41. Set-up plastic sheeting for work site around the well	1. Lacerations when cutting plastic sheeting.	1. Use scissors to cut plastic sheeting / Cut motions should always be away from body and body parts

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
42. Measure depth to water	1. Exposure to hazardous substances through inhalation or dermal exposure 2. Pinch fingers or hand in water level instrument	1. Wear proper PPE (nitrile gloves) 2. Wear proper PPE (leather gloves)
43. Calibrate monitoring equipment	1. Skin or eye contact with calibration chemicals 2. Pinch fingers or hand in monitoring equipment	1. Wear proper PPE (safety glasses, nitrile gloves) 2. Wear proper PPE (leather gloves) / Avoid pinch points
44. Install sampling pump in well	1. Hand injuries during installation of pump 2. Lacerations when cutting tubing. 3. Back strain during installation of pump 4. Physical hazards associated with manual lifting of heavy equipment. 5. Back strain from starting generator. 6. Burns from hot exhaust from generator. 7. Electrical shock from improper use of generator and pump 8. Contaminated water spray from loose connections	1. Wear proper PPE (leather gloves, nitrile gloves) 2. Use safety tubing cutter. 3. Use proper lifting techniques. 4. Use proper lifting techniques / Use wheeled transport for heavy equipment. 5. Use arm when starting generator / Do not over-strain if generator does not start. 6. Do not touch generator near exhaust / Use proper handle to carry / Allow generator to cool down before moving. 7. Properly plug in pump to generator / Do not allow the pump or generator to contact water / Check for breaks in the cord. 8. Check all tubing connections to ensure they are tight and secure

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
10. Purge water	1. Contact with potentially contaminated groundwater. 2. Back strain from lifting buckets of water 3. Tripping potential on sample discharge lines and pump electric lines	1. Wear proper PPE (safety glasses, nitrile gloves) 2. Use proper lifting techniques / Use wheeled transport. 3. Organize discharge of electric line to keep out of way as much as possible / Mark potential tripping hazards with caution tape or safety cones
11. Sample water collection	1. Contact with potentially contaminated groundwater through dermal exposure. 2. Contact with and burns from acid used for sample preservation. 3. Tripping potential on sample discharge lines and pump electric lines 4. Lacerations from broken sample bottles 5. Back strain when transporting coolers full of collected samples. 6. Slips/ Trips/ Falls	1. Wear proper PPE (safety glasses, nitrile gloves) 2. Wear proper PPE (safety glasses, nitrile gloves) / Ensure sample bottle lids are secure before use and after sample collection. 3. Organize line to keep out of the way as much as possible / Mark potential tripping hazards with caution tape or safety cones. 4. Do not over-tighten bottle caps / Handle bottles safely to prevent breakage / Wrap glass bottles in bubble wrap, if possible 5. Use proper lifting techniques / Use wheeled transport / Seek assistance if coolers weight exceeds 50lbs. / Minimize distance to vehicle. 6. Have unobstructed path to vehicle or collection point / Follow good housekeeping procedures / Do not lift/walk with coolers that are too heavy/difficult to lift
12. Remove pump and pack up equipment	1. Back strain when removing pump or lifting heavy equipment	1. Use proper lifting technique / Use wheeled transport for heavy equipment
13. Replace well cap and lock	1. Scrape fingers/hand 2. Strain wrist/bruise palm	1. Wear proper PPE (leather gloves) 2. Using hammer, tap the end of the well cap to tighten grip
14. Replace well cover	1. Scrape knuckles/hand 2. Strain write/bruise palm. 3. Pinch fingers or hand	1. Wear proper PPE (leather gloves) 2. Using hammer, tap the end of the wrench to tighten the grip of the bolts. 3. Wear proper PPE (leather gloves)
15. Transport drums to disposal staging location	1. Back, arm or shoulder strain from moving drums. 2. Pinch hazard 3. Contact with potentially contaminated groundwater when moving improperly sealed drums. 4. Slips/ Trips/ Falls when moving drum. 5. Drop drum on feet/toes	1. Use drum cart for moving drums / Use proper lifting techniques / Obtain assistance, if needed 2. Wear proper PPE (leather gloves) 3. Wear proper PPE (nitrile gloves under leather gloves) / Properly seal drum to prevent leak. 4. Ensure route to move drum to storage space is dry and free from obstructions. 5. Wear proper PPE (safety shoes)
16. Place used PPE in designated disposal drum	1. Pressure build-up inside drum 2. Pinch hazard	1. Remove cap from bung hole in drum to relieve pressure. 2. Wear proper PPE (leather gloves)
17. Decontaminate equipment	1. Splashing water/soap from decontamination 2. Contact with potentially contaminated groundwater through dermal exposure. 3. Electrical shock from broken electric cords	1. Wear proper PPE (safety glasses) 2. Wear proper PPE (safety glasses, dermal protection) 3. Properly plug in pump to generator / Do not allow the pump or generator to contact water / Check for breaks in the cord
18. All activities	55. Slips/ Trips/ Falls 56. Hand injuries, cuts, or lacerations during manual handling of materials 57. Foot injuries 58. Back injuries 59. Traffic 60. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.)	63. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards. 64. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves. 65. Wear Langan approved safety shoes.

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
	61. High Noise levels 62. Overhead hazards 63. Heat Stress/ Cold Stress 64. Eye Injuries	66. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible. 67. Wear high visibility clothing & vest / Use cones or signs to designate work area. 68. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed. 69. Wear hearing protection 70. Wear hard hat / Avoid areas where overhead hazards exist. 71. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress. 72. Wear safety glasses

46.Calibration of monitoring equipment	21.Skin or eye contact with calibration chemicals 22.Pinch fingers in monitoring equipment	16. Wear proper PPE (safety glasses/ goggles) 17. Wear proper PPE (leather gloves)
18. Set-up GeoProbe rig	15. Geoprobe rig movement	9. All field personnel should stay clear of the GeoProbe rig while moving / Use a spotter when backing up the GeoProbe
19. Advance GeoProbe rods below ground surface to desired depth	6. Underground utilities 7. High noise levels	9. Clean all subsurface soil borings to a minimum of 5 feet below grade. 10. Wear proper PPE (hearing protection)

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
20. Remove and open acetate liner. 5. Remove and open acetate liner (cont'd)	65. Pinched fingers while removing macrocore. 66. Cuts/lacerations when cutting acetate liner open. 67. Exposure to hazardous vapors 68. Skin contacts with contaminated soil	5. Wear proper PPE (nitrile gloves, cut-resistant or leather gloves 6. Wear proper PPE (cut-resistant or leather gloves) 7. Do not place face over acetate liner when opening / Monitor hazardous vapors in air with PID / Upgrade PPE as necessary based on levels contained in the Health and Safety Plan 8. Wear proper PPE (nitrile gloves)
6. Remove excess soil from acetate liner and place in 55-gallon drum (IF NOT PERFORMED BY LANGAN, REMOVE!)	5. Cuts/lacerations from acetate liner 6. Pinched fingers/hand while opening/closing drum. 7. Skin contacts with contaminated soil 8. Soil debris in eyes	5. Wear proper PPE (cut-resistant or leather gloves) 6. Wear proper PPE (cut-resistant or leather gloves) 7. Wear proper PPE (nitrile gloves) 8. Wear proper PPE (safety glasses)
7. Attach hollow-stem augers to the GeoProbe rig; Advance augers and attach. additional augers until desired depth is reached	1. Strain wrist/bruise palm 2. Pinched fingers 3. Back Strain 4. Clothing entanglement 5. Carbon monoxide poisoning 6. Bruise toes/foot 7. High noise levels 8. Skin contacts with contaminated soil	1. Wear proper PPE (cut-resistant or leather gloves) 2. Wear proper PPE (cut-resistant or leather gloves) 3. Use proper lifting techniques. 4. Wear proper work attire(no loose clothing/strings) 5. Properly ventilate work area 6. Wear proper PPE (safety shoes) 7. Wear proper PPE (hearing protection) 8. Wear proper PPE (Tyvek sleeves, nitrile gloves)
8. Install monitoring well	1. Pinched fingers 2. Lacerations/abrasions 3. Back Strain	1. Wear proper PPE (cut-resistant or leather gloves) 2. Wear proper PPE (cut-resistant or leather gloves) 3. Use proper lifting techniques
9. Tremie-grout annulus space above bentonite seal	1. Back strain 2. Pinched fingers	1. Use proper lifting techniques. 2. Wear proper PPE (cut-resistant or leather gloves)
10. Install flush-mount monitoring well pad	1. Splashed concrete. 2. Pinched fingers 3. Cuts/lacerations	1. Wear proper PPE (safety glasses) 2. Wear proper PPE (cut-resistant or leather gloves) 3. Wear proper PPE (cut-resistant or leather gloves)
11. Decontaminate equipment	1. Splashing water/soap 2. Contact with potentially contaminated groundwater/soil through dermal exposure. 3. Electrical shock from broken electric cords	1. Wear proper PPE (safety glasses) 2. Wear proper PPE (safety glasses, dermal protection) 3. Properly plug in pump to generator / Do not allow the pump or generator to contact water / Check for breaks in the cord
12. Transport drums to central staging location (IF NOT PERFORMED BY LANGAN, REMOVE!)	7. Back, arm or shoulder strain from moving drums. 8. Pinch fingers/hand in drum cart when moving drums. 9. Pinch fingers/hand when operating lift-gate on vehicle. 10. Contact with potentially contaminated groundwater when moving improperly sealed drums. 11. Slips when moving drums. 12. Drop drum on feet/toes	73. Use drum cart for moving drums / Use proper lifting techniques / Do not lift heavy loads without assistance. 74. Wear proper PPE (cut-resistant or leather gloves) 75. Wear proper PPE (cut-resistant or leather gloves) 76. Wear proper PPE (nitrile gloves underneath work gloves) 77. Follow good housekeeping procedures / Ensure route to move drum and storage space is free from obstructions. 78. Wear proper PPE (safety shoes) / Work in a safe manner to prevent dropped drum

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
13. All activities 13. All activities (cont'd)	11. Slips/ Trips/ Falls 12. Hand injuries, cuts, or lacerations during manual handling of materials 13. Foot injuries 14. Back injuries 15. Traffic 16. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.) 17. High Noise levels 18. Overhead hazards 19. Heat Stress/ Cold Stress 20. Eye Injuries	11. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards. 12. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves. 13. Wear Langan approved safety shoes. 14. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible. 15. Wear high visibility clothing & vest / Use cones or signs to designate work area. 16. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed. 17. Wear hearing protection 18. Wear hard hat / Avoid areas where overhead hazards exist. 19. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress. 20. Wear safety glasses

Job Safety Analysis (JSA)
Health and Safety

JSA Title: **Monitoring Well Development**
JSA Number: **JSA026-01**

A Job Safety Analysis (JSA) must identify all job steps required to complete the task, the potential hazards employees could be exposed to while performing the job step and the preventative/corrective actions required to reduce/mitigate the identified potential hazards. Employees must certify that they have either prepared the JSA or have reviewed the JSA and are aware of the potential hazards associated with this task and will follow the provided preventive/corrective actions. Prior to the start of any work "TAKE 5" and conduct a Last-Minute Risk Assessment.

S – ***Stop,*** *what has changed?*
T – ***Think*** *about the task*
E – ***Evaluate*** *potential hazards*
P – ***Plan*** *safe approach*
S - ***Start*** *task /* ***Stop*** *& regroup*

PERSONAL PROTECTIVE EQUIPMENT (Required or to be worn as needed):				
☒ Safety Shoes	☒ Long Sleeves	☒ Safety Vest (Class 2)	☒ Hard Hat	☐ Hearing Protection
☒ Safety Glasses	☐ Safety Goggles	☒ Face Shield	☒ Nitrile Gloves	☐ PVC Gloves
☒ Leather Gloves	☒ Cut Resist. Gloves	☐ Fall Protection	☐ Fire Resistant Clothing	☐ Rubber Boots
☐ Insect/Animal Repellent	☐ Ivy Blocker/Cleaner	☐ Traffic Cones/Signs	☐ Life Vest/Jacket	
☒ Other: Tyvek Sleeves				

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
47.Transport equipment to work area	33.Back Strains 34.Slips/Trips/Falls 35.Traffic 36.Cuts/Abrasions/Contusions from equipment	27. Use proper lifting techniques/ Use wheeled transport/ use buddy system when lifting equipment. 28. Minimize distance from work area/ unobstructed path to collection points and vehicle/ Follow good housekeeping procedures. 29. Wear high-visibility vest or clothing/Exercise caution/ Use traffic cones or signage if needed. 30. Wear proper PPE (leather gloves, long sleeves, Langan approved safety shoes).
48.Measure depth of water	23.Exposure to hazardous substances 24.Pinched fingers	21. Wear proper PPE (Nitrile gloves, Safety glasses/Face shield). 22. Wear proper PPE (cut-resistant gloves).
49.Install Tremie pipe in the monitoring well and connect to water source.	16. Hand injuries during installation (pinched fingers/hands). 17. Back strain from holding Tremie pipe. 18. High pressure water spray.	10. Wear proper PPE (Nitrile gloves/cut-resistant gloves). 11. Use proper lifting techniques/ Use two personnel when lowering pump greater than 80 feet. 12. Ensure all those connections are tight and secure/ Use proper PPE (face shield and safety glasses).
50.Install pump in to well. a. Connect pump to sample tubing. b. Lower pump to desired depth in well. c. Connect sample tubing to flow cell. d. Connect pump to power source	8. Hand injuries during pump installation and sample tubing cutting. 9. Back strain 10. Electric shock 11. Exhaust gases from generator 12. Burns from hot equipment	11. Wear proper PPE when installing pump and cutting sample tubing (Nitrile and cut-resistant gloves)/ Use tubing cutter. 12. Proper lifting techniques/ Two personnel when installing pump at depths greater than 80 feet/ Use buddy when lifting heavy loads (pump, generator)/Use wheeled transport. 13. Ensure equipment is (LO/TO: locked out/tagged out) prior to preforming any electrical connections/ Inspect wires for frays or cuts/Ensure generator is properly grounded prior to starting.

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
(generator) e. Turn on power source (generator)		14. Position generator so that exhaust is flowing away from work area. 15. Do not touch exhaust or any hot part of generator/ Allow equipment time to cool down prior to carrying/ Use proper PPE (long sleeves, leather gloves)
51. Develop monitoring well. a. Jet water into well using Tremie pipe. b. Turn pump on and adjust to desired flow rate. c. Surge pump up and down well to remove sediment from screen. d. Containerize all purge water from well.	69. Hand injuries 70. Face injuries 71. Contaminated spray from water	79. Wear proper PPE (cut-resistant gloves and nitrile gloves). 80. Wear proper PPE (face shield and safety glasses)/do not stand over well opening. 81. Wear proper PPE (Face shield and safety goggles)/Tyvek over garments/ Ensure all connections are secure and tight/ Tubing outlet is contained in an overflow container.
52. Drum staging area.	1. Back, Arm, and shoulder strain. 2. Pinch points 3. Cross contamination 4. Slip/Trips/Falls	1. Use proper lifting techniques/ Use drum carts when moving drums/ use buddy system for moving of drums if needed/Move drums shortest distance needed. 2. Keep fingers and feet away from pinch points/ Use proper PPE (cut-resistant gloves, Langan approved safety shoes) 3. Use proper PPE (Nitrile gloves, Tyvek sleeves) 4. Ensure pathway is clear prior to moving equipment/ Mark all hazards/ Use additional person as a spotter if needed.
53. Equipment pack-up	1. Back Strains 2. Slips/Trips/Falls 3. Traffic 4. Cuts/Abrasions/Contusions from equipment.	1. Use proper lifting techniques/ Use wheeled transport/ use buddy system when lifting equipment. 2. Minimize distance from work area/ Unobstructed path to collection points and vehicle/ Follow good housekeeping procedures. 3. Wear high-visibility vest or clothing/Exercise caution/ Use traffic cones or signage if needed. 82. Wear proper PPE (leather gloves, long sleeves, Langan approved safety shoes).
54. All activities	1. Slips/ Trips/ Falls 2. Hand injuries, cuts, or lacerations during manual handling of materials 3. Foot injuries 72. Back injuries 73. Traffic 74. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.) 75. High Noise levels 76. Overhead hazards 77. Heat Stress/ Cold Stress 78. Eye Injuries	1. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards 2. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves 3. Wear Langan approved safety shoes 4. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible 5. Wear high visibility clothing & vest / Use cones or signs to designate work area 6. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed 7. Wear hearing protection 8. Wear hard hat / Avoid areas where overhead hazards exist. 9. Wear proper attire for weather conditions (sunscreen or protective clothing

☒ Leather Gloves	☐ Cut Resist. Gloves	☐ Fall Protection	☒ Fire Resistant Clothing	☐ Rubber Boots
☐ Insect/Animal Repellent	☐ Ivy Blocker/Cleaner	☒ Traffic Cones/Signs	☐ Life Vest/Jacket	
☒ Other: Tyvek sleeves, Dermal Protection, PID, absorbent pads				

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
55. Transport equipment to work area	6. Back Strain 7. Slips/ Trips/ Falls 8. Traffic 9. Cuts/abrasions from equipment 10. Contusions from dropped equipment	6. Use proper lifting techniques / Use wheeled transport. 7. Minimize distance to work area / Have unobstructed path to work area / Follow good housekeeping procedures. 8. Wear proper PPE (high visibility vest or clothing) 9. Wear proper PPE (leather gloves, long sleeves) 10. Wear proper PPE (safety shoes)
56. Remove well cover	25. Scrape knuckles/hand 26. Strain wrist/bruise plan 27. Pinch fingers or hand	6. Wear proper PPE (leather gloves) 7. Using a hammer, tap the end of the wrench to loosen grip of bolts. 8. Wear proper PPE (leather gloves)
57. Remove well cap and lock	19. Well can pops from pressure. 20. Exposure to hazardous substances through inhalation or dermal exposure 21. Scrape knuckles/hand 22. Pinch points 23. Strain write/bruise palm	9. Remove cap slowly to relieve pressure / Do not place face over well when opening / Wear proper PPE (safety glasses, face shield, hand protection) 10. Use direct air monitoring/reading instrument (i.e., PID) / Be familiar with and follow actions prescribed in the HASP / Wear proper PPE (nitrile gloves) 11. Wear proper PPE (leather gloves) 12. Using hammer, tap the end of the wrench to loosen grip
58. Measure head-space vapor levels	2. Exposure to hazardous substances through inhalation	2. Do not place face over well when collecting measurement
59. Set-up plastic sheeting/absorbent pads	2. Lacerations when cutting plastic sheeting/absorbent pads.	2. Use scissors to cut plastic sheeting/absorbent pads / Cut motions should always be away from body and body parts

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
for work site around the well		
60. Lower Bailer sleeve into well	7. Repetitive motion injury (pulled arm/back muscles) 8. Dehydration	7. Take breaks while lowering bailer into well/ Use a mechanical device to lower bailer into well/ Rotate employees (take turns conducting the manual labor portion) 8. Take breaks and drink water.

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
7. Purge/Sample water/product collection	1. Contact with potentially contaminated groundwater or product through dermal exposure 2. Contact with and burns from acid used for sample preservation 9. Tripping potential on sampling lanyard 10. Lacerations from broken sample bottles 11. Back strain when transporting coolers full of collected samples. 12. Slips/ Trips/ Falls	1. Wear proper PPE (safety glasses, nitrile gloves, safety shield, Tyvek) 2. Ensure sample bottle lids are secure before use and after sample collection 3. Organize lanyard to keep out of the way as much as possible / Mark potential tripping hazards with caution tape or safety cones 9. Do not over-tighten bottle caps / Handle bottles safely to prevent breakage / Wrap glass bottles in bubble wrap, if possible 10. Use proper lifting techniques / Use wheeled transport / Seek assistance if coolers weight exceeds 50lbs. / Minimize distance to vehicle. 11. Have unobstructed path to vehicle or collection point / Follow good housekeeping procedures / Do not lift/walk with coolers that are too heavy/difficult to lift
8. Retrieval of bailer	9. Repetitive motion injury (pulled arm/back muscles) 10. Dehydration	9. Take breaks while retrieving bailer out of the well/ Use a mechanical device to raise bailer out of well/ Rotate employees (take turns conducting the manual labor portion) 10. Take breaks and drink water.
9. Pack-up equipment	2. Back strain when removing or lifting heavy equipment	2. Use proper lifting technique / Use wheeled transport for heavy equipment
10. Replace well cap and lock	3. Scrape fingers/hand 4. Strain wrist/bruise palm	3. Wear proper PPE (leather gloves) 4. Using hammer, tap the end of the well cap to tighten grip
11. Replace well cover	4. Scrape knuckles/hand 5. Strain write/bruise palm. 6. Pinch fingers or hand	4. Wear proper PPE (leather gloves) 5. Using hammer, tap the end of the wrench to tighten the grip of the bolts. 6. Wear proper PPE (leather gloves)
12. Place used PPE in designated disposal drum	3. Pressure build-up inside drum 4. Pinch hazard	3. Remove cap from bung hole in drum to relieve pressure. 4. Wear proper PPE (leather gloves) 5. Product drums may require additional spill protection/electrical grounding, check local regulations
13. Decontaminate equipment	4. Splashing water/soap from decontamination 5. Contact with potentially contaminated groundwater through dermal exposure.	4. Wear proper PPE (safety glasses) 5. Wear proper PPE (safety glasses, dermal protection)

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
14. All activities	79. Slips/ Trips/ Falls 80. Hand injuries, cuts, or lacerations during manual handling of materials 81. Foot injuries 82. Back injuries 83. Traffic 84. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.) 85. High Noise levels 86. Overhead hazards 87. Heat Stress/ Cold Stress 88. Eye Injuries	83. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards. 84. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves. 85. Wear Langan approved safety shoes. 86. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible. 87. Wear high visibility clothing & vest / Use cones or signs to designate work area. 88. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed. 89. Wear hearing protection 90. Wear hard hat / Avoid areas where overhead hazards exist. 91. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress. 92. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible. 106. Wear high visibility clothing & vest / Use cones or signs to designate work area. 107. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed. 108. Wear hearing protection 109. Wear hard hat / Avoid areas where overhead hazards exist. 110. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress. 111. Wear safety glasses

Job Safety Analysis (JSA)
Health and Safety

JSA Title: **Hammer Drill**
JSA Number: **JSA049**

A Job Safety Analysis (JSA) must identify all job steps required to complete the task, the potential hazards employees could be exposed to while performing the job step and the preventative/corrective actions required to reduce/mitigate the identified potential hazards. Employees must certify that they have either prepared the JSA or have reviewed the JSA and are aware of the potential hazards associated with this task and will follow the provided preventive/corrective actions. Prior to the start of any work "TAKE 5" and conduct a Last-Minute Risk Assessment.

S – ***Stop,*** *what has changed?*
T – ***Think*** *about the task*
E – ***Evaluate*** *potential hazards*
P – ***Plan*** *safe approach*
S - ***Start*** *task /* ***Stop*** *& regroup*

PERSONAL PROTECTIVE EQUIPMENT (Required or to be worn as needed):				
☒ Safety Shoes	☒ Long Sleeves	☒ Safety Vest (Class 2)	☒ Hard Hat	☒ Hearing Protection
☒ Safety Glasses	☐ Safety Goggles	☒ Face Shield	☒ Nitrile Gloves	☐ PVC Gloves
☒ Leather Gloves	☐ Cut Resist. Gloves	☐ Fall Protection	☐ Fire Resistant Clothing	☐ Rubber Boots
☐ Insect/Animal Repellent	☐ Ivy Blocker/Cleaner	☒ Traffic Cones/Signs	☐ Life Vest/Jacket	
☐ Other:				

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
77.Transport equipment to work area	43.Back Strain 44.Slips/ Trips/ Falls 45.Traffic 46.Cuts/abrasions from equipment 47.Contusions from dropped equipment	8. Use proper lifting techniques / Use wheeled transport. 9. Minimize distance to work area / Have unobstructed path to work area / Follow good housekeeping procedures. 10. Wear proper PPE (high visibility vest or clothing) 11. Wear proper PPE (leather gloves, long sleeves) 12. Wear proper PPE (safety shoes)
78.Electrical Connection	30.Inspect electrical cord to drill. 31.Inspect hammer drill. 32.Inspect extension cord. 33.Test GFCI	10. Check the plug, ensure all connections are in place, check cord for frayed sections. If plug or cord are worn, do not use equipment until repaired. 11. Inspect chuck for proper grasping and holding of bit, check that plastic housing is not cracked or missing pieces. Do not use if chuck does not work properly or housing is compromised. 12. Inspect extension cord, if worn or stripped pull from service and replace 13. Test GFCI, replace if GFCI fails
79.Drill Bit	1. Inspect drill bit	1. Replace if worn. 2. Wear proper PPE (leather gloves) when installing and removing drill bit. 3. Ensure equipment is unplugged from electrical power when removing and installing drill bit.
80.Use of Hammer Drill	1. Hazards associated with using hammer drill, flying objects, heavy equipment, ground level hazards and dust. 2. Slips/ Trips/ Falls 3. Hazards associated drilling into concrete slab	1. Maintain a safe distance from other site operations / Wear proper PPE (hard hat, safety glasses, safety shoes, safety vest, ear protection and leather gloves) 2. Be aware of potential trip hazards / Follow good housekeeping procedures / Mark extension cord pathway with safety cones. 3. Do not push hammer drill during use.

1 Purpose and Scope

1.1 Document Overview

New York City Department of Parks and Recreation (DPR) is submitting this Supplemental Engineering Report ("the Report") in support of its updated application package for the Ferry Point Park East 6NYCRR Part 360 Solid Waste Management Permit ("the 2005 Permit"), No. 2-6006-00014/00013.

This Report presents the studies, modeling, investigations, and design work that were performed to resolve outstanding comments that have been received by DPR since the April 8, 2009, Notice of Incomplete Application and the November 25, 2009, permit application submittal to the New York State Department of Environmental Conservation (NYSDEC).

This Report and the supporting documentation provide sufficient data and analysis to demonstrate how outstanding comments and requests have been addressed and complete the permit application.

1.2 Document Organization

This report is organized as follows:

- Section 2 – Presents the history and scope of the project, and past permitting benchmark dates,
- Section 3 – Provides construction status and a permit compliance summary,
- Section 4 – Discusses each previously unresolved NYSDEC issue,
- Appendices – Provide supporting documentation for the additional studies, modeling, and investigations for the Site that were completed at the request of NYSDEC.

2 Introduction

2.1 Project History

Ferry Point Park East in the Bronx (the "Site") is a former landfill that is bounded by the Bronx-Whitestone Bridge and Hutchinson River Parkway to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south.

In the late 1990s, the New York City Department of Parks & Recreation (DPR) entered into a license agreement with Ferry Point Partners, LLC (FPP) to develop, construct, and operate a new public recreation facility (the "Project") at the Site. The new facility would include a golf course, a Community Park, a waterfront park, and related facilities. At that time all required reviews for the Project were completed under the City Environmental Quality Review (CEQR), State Environmental Quality Review Act (SEQRA), and the City's Uniform Land Use Review Procedure (ULURP).

On July 17, 2000, NYSDEC issued a Part 360 Solid Waste Management Permit (No. 2-6006-00014-000110) (the "2000 Permit") jointly to FPP and DPR (collectively, the "Historic Permittee") for a non-specific "facility" under Part 360-1.9(b) at the Site. The 2000 Permit allowed the Historic Permittee to import and place a total of 1,000,000 cubic yards (CY) of fill necessary to construct the golf course on the Site. In February 2002 and November 2005, the Part 360 Permit was modified to allow additional fill volume and changes in design features. On November 18, 2005, NYSDEC issued the modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013) to place a total of 2,543,729 CY of in-place fill on the Site. This action was followed by a December 27, 2005, revision (No. 2-6006-00014/00013) that amended the total in-place fill volume to 2,370,000 CY (the "2005 Permit").

In 2007, DPR terminated the license agreement with FPP and took over Site development responsibilities, including redevelopment of the Community Park and construction of the waterfront park and golf course portions of the Site.

2.2 Project Scope

Consistent with the 2005 Permit, the project scope includes the construction of three major elements (a golf course, Community Park, and waterfront park) over the 222-acre Site (see Figure 2-1) as follows:

- An 18-hole golf course with practice facility, driving range, clubhouse, maintenance facility, irrigation lake, stormwater retention ponds, and a parking lot (192.5 acres);
- A passive recreation waterfront park with walkways and a comfort station (19.5 acres); and
- A Community Park with baseball fields, basketball court, walkways, comfort station, and landscaped stormwater retention area (10 acres).

2.3 Permitting Benchmarks

The following bullets chronicle significant permit-related correspondence and actions since the 2005 Permit was issued:

- **July 25, 2008:** A permit renewal application package to the 2005 Permit was submitted by DPR. This submittal requested a modification of the 2005 Permit to allow the use of dredge and processed dredge material (PDM) as fill and the barge delivery of such fill material to the Site.
- **October 24, 2008:** NYSDEC issued a Notice of Incomplete Application and comments to the July 25, 2008 submittal.
- **December 2, 2008:** NYSDEC issued a letter to advise DPR that the 2005 Part 360 Permit (with the corresponding November 30, 2008, expiration date) remains in full force and effect until NYSDEC approves the permit renewal application, as per Section 401(2) of the State Administrative Procedure Act (SAPA). See Appendix A for a copy of the SAPA letter.
- **December 26, 2008:** A response to NYSDEC's comments of October 24, 2008 was submitted by DPR with a supplemental permit application package to the 2005 Permit.
- **April 8, 2009:** NYSDEC issued comments to the December 26, 2008, permit application submittal.
- **April 9, 2009:** DPR withdrew its request for a permit modification to allow the use of PDM as fill.
- **November 25, 2009:** A response to NYSDEC's comments of April 8, 2009, was submitted by DPR with a second supplemental permit application package to the 2005 Permit. This submittal withdrew the request to allow the use of dredge material and PDM as fill and the barge delivery of such fill material

to the Site. This submittal also proposed a design modification for a Site-wide active landfill gas control system. The 2005 Permit included passive venting systems for the Site, with active systems proposed only in enclosed structures.

- **June 25, 2010:** NYSDEC issued a Notice of Incomplete Application and comments on the November 25, 2009, permit application submittal.

- **August 6, 2010:** NYSDEC issued additional comments on the November 25, 2009, permit application submittal.

- **September 29, 2010:** A response to NYSDEC's comments of June 25 and August 6, 2010, was submitted by DPR with a third supplemental permit application package for the 2005 Permit. This submittal withdrew the proposed design modification of a Site-wide active landfill gas control system and proposed a system consistent with the 2005 Permit.

- **October 7, 2010:** A supplemental response to NYSDEC's comments of June 25 and August 6, 2010, was submitted by DPR to accompany the September 29, 2010, permit renewal application submittal.

Figure 2-1 Ferry Point Park Site Layout

3 Project Status

3.1 Construction Status

Construction activities are proceeding with the following scheduled milestones.

Community Park

- **As of December 31, 2011:** Stormwater retention pond, passive landfill gas (LFG) vents, and recreation facilities were complete.
- **December 31, 2014:** Comfort station completion is anticipated.

Golf Course

- **As of May 17, 2012:** Construction of the golf course is 73% complete.
- **December 31, 2014:** Golf course completion is anticipated, and opens with a temporary clubhouse.
- **December 31, 2017:** Completion of the permanent clubhouse is anticipated.

Waterfront Park

- **November 30, 2012:** Final design completion is anticipated.
- **December 31, 2015:** Construction completion is anticipated.

3.2 Permit Compliance Monitoring and Reporting since November 18, 2005

In accordance with the 2005 Permit and as required under Special Condition 25, an Independent Environmental Monitor (IEM) has been retained by the Permittee (DPR) to provide environmental oversight of all activities authorized by the permit. The 2005 Permit states that the IEM may be an individual or engineering firm, and must be or provide a New York State-licensed professional engineer. The firm of Woodard & Curran is currently performing the IEM responsibilities for the project.

The IEM monitoring is conducted daily and reported to NYSDEC on a bi-weekly basis. These reports are available at the DPR Bronx Borough Headquarters (Ranaqua) document repository and are part of the public record. The address of the repository is 1 Bronx River Parkway, Bronx, NY 10462; telephone: (718) 430-1800. As these reports continue to be issued, DPR responds to and resolves issues as they develop. An email received from NYSDEC on Thursday, May 24, 2012 (see Appendix B), verified that there is "*no outstanding enforcement action*" for the Site.

4 Supplemental Engineering Work

4.1 Fill Volumes

DPR is conforming to the fill volume conditions of the 2005 Permit. Under Special Condition No. 9, a total of 2,370,000 CY of in-place fill is allowed to be imported to the Site by truck: 2,120,000 CY of shaping fill material is being imported and placed on-site for the base layer, and approximately, 250,000 CY of cover fill material is being imported to be placed on top of the base layer. The imported fill materials are being used to attain the final design grades and contours of the golf course.

In accordance with Special Condition No. 10 of the 2005 Permit, imported fill brought to the Site is tracked according to "in-truck" volumes and reported by the Site's IEM to NYSDEC. A compaction factor is used to calculate the difference between the volume of in-truck fill and the volume of compacted in-place fill that achieves the design grades and contours of the Site. A compaction factor of 41.7% is being used in the IEM reports to calculate the in-place fill volume.

As of April 20, 2012, the IEM reported that a total of 1,525,436 CY of in-place fill volume has been reported at the Site since October 18, 2002. This volume includes 1,450,858 CY of in-place shaping material and 74,578 CY of in-place cover material.

During 2010, fill material from one particular source was brought on-site and placed in seven different stockpiles. The material was believed to be in conformance with permit conditions. However, it was found that the material did not meet the requirements of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. On January 10, 2011, DPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to this fill material. In accordance with the Consent Order, NYSDEC and DPR "*agreed … the material specified in this Order as shaping material on this Site, provided that it is covered by asphalt*." The IEM reported that 64,230 CY of in-truck volume was designated as shaping material under this Order. This fill material was covered by asphalt in 2012.

4.2 Fill Material Chemical Criteria

In light of evolving soil criteria and standards for public use, NYSDEC has provided comments and other clarifications to DPR with respect to the chemical parameters for each soil layer. DPR has complied with the 2005 Permit require-

ments and the additional clarifications provided by NYSDEC, which has been verified by the IEM.

This section reviews DPR's compliance with the 2005 Permit conditions and NYSDEC clarifications. In addition, it provides responses to NYSDEC comments related to imported fill material.

4.2.1 Fill Material Characterization

As required under the 2005 Permit, all fill material imported to the Site is analyzed for the chemical contaminants identified in Special Conditions 15(a) through 15(d). The additional criteria set forth in NYSDEC correspondence since the 2005 Permit, described below must also be met. Only those soils that satisfy the requirements of these criteria are allowed to be used on the Site.

4.2.1.1 Shaping Layer Chemical Criteria

Fill material imported to the Site and used for the shaping layer is analyzed for the following parameters, per Special Condition 15(c) of the 2005 Permit:

"The shaping layer must meet the following chemical limits:

i. *Total carcinogenic SVOC levels must be less than 3ppm if any one of the carcinogenic SVOCs exceed Technical and Administrative Guidance Memorandum (TAGM) 4046. The following are the list of carcinogenic SVOCs that are subject to this 3ppm limit: Benzo(a)pyrene, Dibenzo(a,h) anthracene, Benzo(a)anthracene, Benzo(b)fluoranthene, Indeno(1,2,3-cd)pyrene, Benzo(k)fluoranthene, and Chrysene.*
ii. *Total SVOCs must be less than 500ppm*
iii. *Metals*
    - *Arsenic less than 28ppm;*
    - *Barium less than 2,000ppm;*
    - *Cadmium less than 20ppm;*
    - *Chromium less than 1,000ppm;*
    - *Copper less than 1,000ppm;*
    - *Lead less than 400ppm;*
    - *Mercury less than 0.57ppm;*
    - *Selenium less than 11ppm;*
    - *Silver less than 100ppm*
iv. *Asbestos for all layers must be 0.5% or less*
v. *Total sulfur for all layers must be 0.5% or less*
vi. *Total PCBs less than 10ppm*
vii. *Total Pesticides less than 10ppm*
viii. *VOCs (all individual analytes less than TAGM 4046)"*

In a letter dated October 25, 2006 (see Appendix C.1), NYSDEC provided a clarification of Special Condition 15(c)(i) adding that a carcinogenic SVOC limit of 10 ppm or lower is allowable from individual fill material sources, provided that a weighted average of equal or less than 3 ppm is achieved by the end of the permit.

A formula for the weighted average was included in the correspondence for use by the IEM.

4.2.1.2 Cover Layer Chemical Criteria

Fill material imported to the Site and used for the cover layer is subject to the following requirements, per Special Condition 15(b) of the 2005 Permit:

"In order for topsoil material to be used on Site for the cover layer, it must be sampled prior to acceptance and after the importation of each additional 2,000 cubic yards (in truck volumes). Each soil sample is to be analyzed for the entire analyte list in the NYSDEC Technical and Administrative Guidance Memorandum (TAGM) 4046, total volatile organic compounds (VOCs), total semi-volatile organic compounds (SVOCs), pesticides and herbicides, polychlorinated biphenyls (PCBs), and metals (including Resource Conservation and Recovery Act (RCRA) metals)."

As required by the 2005 Permit, the cover layer must meet the following chemical limits:

- TAGM 4046 Table 1 – Volatile Organic Compounds (VOCs)
- TAGM 4046 Table 2 – Semi-Volatile Organic Compounds (SVOCs)
- TAGM 4046 Table 3 – Pesticides/Herbicides and Polychlorinated Biphenyls (PCBs)
- TAGM 4046 Table 4 – Metals
- Total Asbestos 0.5% or less
- Total Sulfur 0.5% or less

The following additional criteria were directed in NYSDEC correspondence since the 2005 Permit. DPR has been following NYSDEC's directives since receipt of each one.

- **April 30, 2009** – Directs DPR not to accept or place on the Site any cover layer materials with arsenic concentrations greater than 16 ppm or lead concentrations greater than 400 ppm.
- **July 28, 2009** – Provides a table to DPR listing modified heavy metal chemical limits for the cover layer at the Site.
- **September 25, 2009** - Revises and clarifies the chromium chemical limits for the cover layer previously presented in the July 28, 2009, letter.

A complete list of the 2005 Permit criteria is provided along with the additional criteria correspondence in Appendix C.2.

4.2.1.3 Demarcation Layer Requirements

Special Condition 15(d) of the 2005 Permit requires the following:

"The final placement (including top soil), location, thickness, and detailed chemical limits of the final cover layers on the Site, including the community park and waterfront park, are subject to the specifications, directions and requirements determined by the NYS Department of Health (NYSDOH) to be applicable. It is the responsibility of the Permittees to obtain a written determination from NYSDOH. The Permittees must provide the Department with a copy of NYSDOH's determination. No cover layer material may be placed on the Site, until the Department acknowledges receipt of NYSDOH's determination."

As required by Special Condition 15(d), DPR obtained such written determination from NYSDOH in a letter dated, August 2, 2006 (see Appendix C.3).

In accordance with this communication, two different recreational classifications, active and passive, were proposed by DPR for incorporation into the overall design compliance objectives for the Site. This letter also included that a *"demarcation barrier be used to divide the final cover fill from the existing landfill capping material."* The demarcation barrier (layer) at Ferry Point Park East provides a visual warning that will be easily recognizable during future excavation work beneath the cover layer. (Refer to Section 4.2.1.4 for further discussion of the demarcation layer.)

In a letter dated July 9, 2009 (see Appendix C.3), DPR requested a further review of the heavy metal chemical criteria for the cover layer at Ferry Point Park East. A response received from NYSDEC on July 28, 2009, provided additional clarification regarding what are considered active and passive recreational areas. As per this letter:

Active Recreation – *"…all other areas that are not covered with a building or other impermeable cover system… are deemed active recreational areas."*

In compliance with this active recreational determination, DPR installed 2 feet of cover material and a demarcation layer throughout the Community Park.

Passive Recreation – *"…the golf course is deemed a "passive recreational area" and is required to have a one foot thick cover layer over a demarcation layer."*

Following this directive, DPR requested clarification from NYSDEC regarding the demarcation layer requirement for the extent of the golf course. The request for clarification was based on the need for further specificity regarding the use of a demarcation layer on the golf course.

In response, NYSDEC and NYSDOH reviewed a summary of the analytical data for all the shaping material imported to the Site to date. Upon review of the data set, confirmatory analytical sampling of the in-place shaping material was requested by NYSDEC and NYSDOH. DPR conducted test-pit sampling and analysis under an approved work plan and submitted the data to NYSDEC on February 16, 2011.

In their letter dated March 9, 2011, NYSDEC stated that "*NYSDOH reviewed the shaping layer test pit data and determined that it confirmed existing shaping layer data.*" NYSDEC and NYSDOH agreed that a demarcation layer would not be required at areas of the golf course having a fill thickness of 5 or more feet of combined shaping and cover layer materials. Communications related to this determination are provided in Appendix C.3.

4.2.1.4 Demarcation Layer Plan

At the Ferry Point East Site, "demarcation layer" means a brightly colored, permeable plastic material placed beneath the Site's final cover layer that is easily recognizable during an excavation. The request was made for the protection of Site workers during any future excavation work beneath the cover layer.

The demarcation layer plan was based on a comparison of final design grades and the top of waste elevations extrapolated from soil boring data. Appendix C.4 provides the Demarcation Layer Plan for the Site. Field verification that demarcation requirements are being met is performed continuously and routinely reported by the IEM to confirm permit compliance.

4.2.2 Dioxin and Furan Analytical Methods

In a letter dated May 26, 2011 (see Appendix C.5), DPR requested confirmation that the use of United States Environmental Protection Agency (EPA) Analytical Method 625/8270 is an acceptable alternative method for the analysis of dioxin and furan constituents. On April 12, 2011, NYSDEC provided verbal confirmation to DPR that this method may be used. Accordingly, EPA Analytical Method 625/8270 is now being used where appropriate for the analysis of dioxin and furan constituents on sources of incoming fill material.

4.3 Final Cover Material Physical Characteristics

In accordance with the 2005 Permit, and as written in the June 30, 2005, Engineering Report (TRC 2005), *"The upper portion of the cover layer will consist of topsoil and/or sand capping material in accordance with the Nicklaus Design Technical Specifications (see 2005 Fill Report) to support the growth of the golf course turf and the grassed areas of the adjacent parks*."

Special Condition 16 states that "*the major components (greens, contours, heights, and topsoil) shall meet the Nicklaus Design Technical Specification, as noted in … the 2005 Engineering Report.*

The golf course construction specifications are consistent with these regulatory requirements.

4.3.1 Site-wide Water Balance Model

In their August 6, 2010, letter of additional comments to the November 25, 2009, permit application submittal, NYSDEC requested DPR *"demonstrate that the soil to be used at the site as final cover material — not necessarily as the uppermost planting material — will have a sufficiently low coefficient of permeability and percentage of organic material to minimize the infiltration of water into the lower layers of material to the greatest extent practicable."*

In response to this request, DPR performed a site-wide water balance to predict post-construction infiltration rates. The EPA's Hydrologic Evaluation of Landfill Performance (HELP) computer model was used for this purpose.

As requested by NYSDEC, DPR used a modeling scenario that compared a typical one-foot thick soil landfill cover with the proposed Site cover material as designed.

Model results were presented to NYSDEC in a May 13, 2011, Memorandum (see Appendix D.1). The water balance accounted for impermeable areas of the Site, irrigation of the golf course, drainage system stormwater capture, and the lining of on-site ponds (for a specific discussion of Site ponds, see Section 4.3.1.2). Using a cover soil permeability of 14 inches per hour, the model results indicated that post-construction conditions would result in a reduction in the infiltration rate over the entire Site by approximately 9,700 gallons per day. This estimate effectively showed there will be a lower volume of water infiltrating through the surface of the Site following completion of construction.

A subsequent water balance memorandum was submitted by DPR to NYSDEC on August 10, 2011 (see Appendix D.2). These water balance results indicated that a higher cover soil permeability of 30 inches per hour would also result in a lower volume of water infiltrating through the surface of the Site following completion of construction. Prior to approving this subsequent request to use a cover soil permeability of 30 inches per hour, NYSDEC asked that DPR review and verify the adequacy of the Site's drainage capacity. The purpose of this review was to determine whether the Site's drainage system as designed would be adequate if lined ponds and a cover soil permeability of 30 inches per hour were incorporated into the Site design. A description of the pond liners and drainage capacity review are provided in Sections 4.3.1.2 and 4.3.1.3.

Based on the model results and the drainage capacity review discussed in Section 4.3.1.3, NYSDEC approved a maximum permeability of 30 inches per hour for cover material used at the Site. As cover material is imported to the Site, it is sampled and tested to confirm it meets the water balance (permeability) requirements approved by NYSDEC. The results of the permeability testing are provided in bi-weekly IEM reports.

In a letter dated January 26, 2012 (see Appendix D.3), NYSDEC clarified that the average percolation rate from all samples collected within one cover material stockpile can be used as the representative percolation rate of that stockpile. The average percolation rate *"is justified because the loading, unloading, transporting, stockpiling, and spreading of the cover material will provide a homogenous mixture of the sand"* (material) from the stockpile. *"…the sand will be tested every 2,000 CY per the permit requirements moving forward."*

4.3.1.1 Pond Liner Designs

A single irrigation pond has already been constructed at the Site. The purpose of this pond is to collect and store stormwater runoff and reuse it later for irrigation and maintenance of the golf course vegetative cover. This pond is fully lined to maximize the retention of irrigation water. The irrigation pond design documents were included in the November 25, 2009, permit application package.

In addition, there are five smaller water quality ponds designed to provide active stormwater retention and limit the off-site migration of sediment. The geometry and grading (engineering design) of these ponds were also provided in the November 25, 2009, permit application package.

DPR considered various methods to meet NYSDEC's request of August 6, 2010, to minimize the infiltration of water through *"the lower layers of material to the maximum extent possible."* Based on this consideration, DPR is implementing a recommendation contained in the November 16, 2010, memorandum (see Appendix D.1) to line the five on-site water quality ponds to limit water exfiltration.

Supplemental drawings and specifications for the lining of these ponds are provided in Appendix D.4. The pond liner designs are consistent with the previously approved geometry and grading (engineering design) presented in the November 25, 2009, permit application package.

4.3.1.2 Drainage Capacity Review

Following submittal of the Site-wide water balance and the decision to line the water quality ponds, a review of the Site's existing Stormwater Pollution Prevention Plan (SWPPP) (TRC 2009c) was performed by DPR.

NYSDEC requested this review to determine whether additional flow into the Site's drainage system (as a result of lining the water quality ponds and the higher permeability cover soil) would exceed the storm drainage system capacity.

The review indicated that additional flow to the drainage system would not exceed the previously permitted design discharge rates in the SWPPP. The review also concluded that the system's drainage capacity is adequate. The technical memorandum summarizing the drainage review was submitted to NYSDEC on October 18, 2011 (see Appendix D.5). In an October 21, 2011, email response (see Appendix D.5), NYSDEC indicated that they *"…conditionally approve cover*

material at the FPP [Ferry Point Park] golf course having permeability up to 30 inches per hour."

The conditional approval was based on a request for DPR to *"submit for approval an amendment to the Stormwater Pollution Prevention Plan (SWPPP) dated November 13, 2009, with plans and computations that reflect the partial lining of the stormwater basins."* DPR provided this in a technical memorandum to NYSDEC dated November 16, 2011 (see Appendix D.6, pond liner design in Appendix D.4). The memorandum presented a formal submittal of the pond liner design to NYSDEC and included excerpts of calculations from the November 13, 2009, SWPPP. This memorandum showed that the original calculations in the 2009 SWPPP remain adequate since they included conditions for lined ponds. An email approval of "*DPR's SWPPP Amendment"* was given by NYSDEC on December 2, 2011 (see Appendix D.6).

4.4 Landfill Gas Management

The Site's Landfill Gas (LFG) Management system is designed to prevent harmful effects on workers or recreational users of the Site. Therefore, and as requested by NYSDEC in their August 6, 2010, comments, landfill gas data gathered for the Site in 2009 and 2010 were used to model surface methane emissions, LFG generation rates, and the emissions of hazardous air pollutants (HAPs) across the Site. The data were also used to conduct a health impact analysis for users of the Site. Supporting documents on LFG evaluations and design are included in Appendices E and F of this report.

4.4.1 LFG Emission Generation Rates, Hazardous Air Pollutant Concentrations, and Health Impacts Analysis

LFG generation rates for the Site were first estimated in 1999 (AKRF 1999) using the EPA's 1995 "Compilation of Air Pollutant Emission Factors." The generation rates were estimated using a newer mathematical model in 2010, EPA's LandGEM model Version 3.02 (see Appendix E.1). The 2010 LandGEM model results predicted LFG generation rates similar to those of the 1999 modeling. The 1999 and 2010 analyses both indicate that LFG emissions and generation rates are consistent with a municipal solid waste landfill of the age of the Ferry Point Site.

The 2010 analyses also predicted the emissions of HAPs and other air pollutants from the Ferry Point Site. The results predicted that pollutant concentrations in the breathing zones are well below the applicable annual guideline concentrations (AGCs) and short-term guideline concentrations (SGCs). This indicates that there are no expected health impacts on users of the golf course due to these emissions.

The results of these efforts are presented in the Ferry Point Landfill Gas Report (EEEPC 2010, Appendix E.1). A supplemental letter of December 17, 2010, presented in Appendix E.2, provided follow-up responses to NYSDEC comments on the Landfill Gas Report.

In response to an additional comment from NYSDEC received on August 6, 2010, DPR performed emissions monitoring at 12 passive vertical vents installed at Community Park. This monitoring was performed in June 2011.

The monitoring results were used to calculate the emission rates of LFG constituents from the passive vents. Hourly and annual emission rates were predicted. In a July 1, 2011, email, the NYSDEC review of these results concluded that *"there is no ambient air impacts due to the emissions from the twelve vents at the Community Park… which poses no health impact to the public using the park."* Therefore, DPR concludes that no further monitoring is necessary beyond routine maintenance of the 12 passive vents.

Appendix E.3 contains the sampling and analysis report for vent monitoring at Community Park, and the July 1, 2011, email from NYSDEC.

4.4.2 LFG Management System

4.4.2.1 Sitewide Passive Venting System

The LFG management system as redesigned for the Site (since the November 25, 2009, permit application submittal) is an update of prior conceptual passive LFG designs and includes a passive system for the venting of LFG in all areas not covered by enclosed facilities. The primary goals for the design of the Site's LFG management system are to provide safe operating conditions and protect human health.

The proposed passive system is consistent with the plans presented in the 1999 EAS (AKRF 1999), the 2002 Technical Environmental Assessment (AKRF 2002), and the 2005 Engineering Reports (TRC 2005a, b) and was approved under the 2005 Part 360 Permit. It deviates from the 2009 permit renewal application prepared by TRC Engineers (TRC), which recommended an active system. An active system uses blowers or fans to extract gas through vents from the landfills subsurface, whereas a passive system uses vents without blowers or fans. Supplemental Site investigations and extraction testing performed by TRC Engineers at the Site in 2009 and 2010 were reviewed by Walsh Environmental Scientists and Engineers, LLC (Walsh) in 2010. Emissions modeling was also performed by EEEPC in 2010, as discussed in Section 4.4.1.

Based on these evaluations and modeling of Site conditions, a Landfill Gas Management Plan (LFGMP) was prepared (see Appendix F.1). The plan concluded that a passive venting system is sufficient to achieve safe operating conditions for users and workers of the golf course and parks. A description and details of the Site's LFG management system are presented in the LFGMP. The LFG management system as currently designed is consistent with the proposed venting system described in the 2005 Permit.

4.4.2.2 LFG Management of Irrigation Lake and Water Quality Ponds

As described in Section 4.3.1.2, the design of the golf course includes one lake to be used for the collection and storage of rain water for irrigation, and five smaller

water quality ponds to provide active stormwater retention and limit the off-site migration of sediment. Design of the irrigation lake and water quality ponds includes the installation of impermeable liners to prevent exfiltration. The liner component impedes surface venting of LFG from the underlying soils.

The lined irrigation lake has been constructed in the northwestern area of the golf course. A gas transmission layer was constructed underneath the liner and is connected to perforated piping around the perimeter of the lake as shown on Contract Drawings H2.1, H2.2, and H2.13, which were submitted with the November 25, 2009, permit application. This perforated pipe will be used for the passive venting of LFG from beneath the liner of the irrigation lake.

Passive venting has been included in the design of all water quality ponds at the Site. Passive venting of the ponds includes a permeable gravel layer and perforated collection piping from areas underneath the ponds and exiting the top of vent stack above the breathing zone. Engineering drawings and technical specifications for the water quality pond liners and passive venting design are provided in Appendix D.5.

4.4.2.3 LFG Management for Enclosed Structures

Due to its potentially explosive nature, LFG shall not be allowed to accumulate within any enclosed structure at the Site. To protect the occupants, an underslab vent system for each enclosed building shall be installed and continuously operated.

The LFGMP (see Appendix F.1) describes the active sub-slab depressurization systems (SSDS) that have been designed for the underslab of each enclosed building at the Site. These systems will have continuous explosive gas monitoring with local and remote alarm capabilities. The SSDS engineering drawings for the golf course facilities (maintenance building and comfort station) are provided in Appendix F.3. The Community Park comfort station design was provided in the November 25, 2009, permit application. The Waterfront Park comfort station has not been designed.

Maintenance of the SSDS and their monitoring equipment will be performed in accordance with the operations, monitoring, and maintenance (OM&M) program for the Site's Landfill Gas management system (see Section 4.4.4).

The design of any additional structures at the Site will be completed in accordance with New York City Department of Buildings requirements. The need for LFG mitigation systems for any future Site structures will be evaluated as part of their design.

4.4.2.4 LFG Venting for Subsurface Utilities

Low-permeability soil/bentonite collars ("soil collars") will be installed for all utility trenches that contain permeable bedding in order to prevent the migration of LFG into enclosed buildings at the Site. The soil collars will be installed

around the water and sewer pipelines, within the trenches at the subsurface location where the pipeline crosses above the building foundation (the building line). Each soil collar will be passively vented as described in the LFGMP (see Appendix F.1) and as shown on the engineering design drawings in Appendix F.2.

Similarly, conduit seals will be used for electrical conduits that are installed in trenches using permeable bedding materials. The conduit seals will be installed at the building lines.

Other utility LFG controls include the underslab passive venting for the aboveground double-check valve (DCV) enclosure. The DCV enclosure is for the potable water supply line as it enters the golf course site. Detailed design drawings for the venting the DCV enclosures are provided in Appendix F.4.

The need for LFG venting for any future Site subsurface vaults will be evaluated as part of their design.

4.4.3 Landfill Gas Management Operations, Monitoring & Maintenance Program

The NYCRR Part 360 "Solid Waste Management Facilities" regulations, Section 2.17(f) concerning LFG, were used as guidance in developing the Site's LFG monitoring program. In accordance with this section: (1) the concentration of explosive gases must not exceed 25% of the lower explosive limit (LEL) in on-site and off-site structures; and (2) the concentration of explosive gases must not exceed the LEL at the property boundary.

Because of the planned future uses of the site as a golf course, banquet facility, and public park, the LFG monitoring plan provides a comprehensive program for future monitoring and maintenance at the Site, with specific contingency actions. Continuous LFG monitoring with local and remote alarm capabilities will occur in all enclosed Site buildings for the protection of occupants.

The LFG monitoring and maintenance (M&M) supervisor will be assigned responsibility for overseeing all Site LFG M&M activities, and will serve as the primary point of contact for DPR. The LFG M&M supervisor will be a DPR employee with the responsibility and authority to direct all OM&M work activities and maintain the necessary monitoring personnel for the required M&M activities.

OM&M for the Site's LFG management system will take place on an ongoing, routine schedule, with additional inspections to address maintenance concerns and potential alarm call-outs and to provide contingency monitoring and actions as needed. The OM&M plan for the Site is presented in Section 6 of the LFGMP (see Appendix F.1). This plan has also been incorporated by reference into the Post-Construction Custodial Plan (see Appendix I) for the Site.

4.5 Groundwater Characterization

Municipal solid waste (MSW) filling operations ceased at the Site in the 1960s, prior to the implementation of the comprehensive environmental regulations now in place, and a formal groundwater sampling program was not required at that time. Information on groundwater quality at a former landfill site such as Ferry Point Park East can be used to help evaluate existing groundwater conditions.

For the 2005 Permit application, the Site's history was reviewed and a geotechnical investigation was performed to evaluate the potential for adverse impacts on the Site's groundwater due to the placement of fill during construction of the golf course and parks.

A summary provided in the 2005 Engineering Report concluded *"that the placement of fill would not have an adverse impact on pre-development groundwater conditions at the site and that the proposed golf course construction would not result in an increased flow of contamination into the river through groundwater flow."* (TRC 2005a).

In their comments of June 25, 2010, NYSDEC asked DPR whether any new information was available regarding groundwater conditions at the Site, and if any new, relevant information was available, to verify the conclusions of the geotechnical portion of the 2005 Engineering Report (TRC 2005a).

Following several discussions with DPR, and because no prior sampling had been required, NYSDEC requested that DPR undertake a groundwater sampling program and develop a reference point for background water quality conditions at the Site.

To comply with this request, DPR prepared written field procedures for new well installations, well development, and groundwater sampling (see Appendix G.1). The field procedures were submitted to, and approved by, NYSDEC prior to the start of the work effort. Prior to installation, the locations of the monitoring wells were approved by NYSDEC during a meeting held with DPR on September 22, 2011.

In February 2012, eleven new groundwater monitoring wells were installed across the Site to obtain information on current groundwater conditions. Design documents for the groundwater monitoring wells are included in Appendix G.2. An initial sampling event was completed in February 2012 and included the testing activities described below.

- **Groundwater Elevation Measurements:** Water depths were measured at the 11 groundwater monitoring wells. Two measurements were taken from each well within one hour each of high and low tides, starting at the shoreline and moving inland.

- **Elutriate Testing:** One soil core sample per well was collected during well installation in order to perform elutriate analysis. Samples were selected from shaping material zones based on visual observation of the soil cores.

- **Groundwater Testing:** Groundwater samples were collected at each of the 11 wells and shipped for laboratory analysis.

- **Hydraulic Conductivity Testing:** In situ slug testing for hydraulic conductivity was completed at each of the 11 groundwater monitoring wells.

The initial groundwater monitoring data from February 2012 was submitted to NYSEC by email on March 28, 2012. This data is included in the report for the initial groundwater monitoring event (see Appendix G.5). At that time, DPR requested direction from NYSDEC concerning procedures for future sampling events. That is, should future sample collection be modified due to the high turbidity (>1,000 nephelometric turbidity units [NTUs]) observed in the initial samples.

A call was held with NYSDEC on May 8, 2012, to discuss the initial data and provide guidance on future monitoring (see Appendix G.3 for call minutes. Also during this call, NYSDEC directed DPR to perform inorganic analyses on both filtered and unfiltered samples collected during the next sampling event. If the next round of results is found to be in expected ranges, then future sampling events will utilize only filtered samples for inorganic analyses.

NYSDEC provided DPR with requirements for future groundwater monitoring in their FPP Groundwater Characterization/Monitoring Objective, on May 8, 2012 (see Appendix G.4). DPR will implement the groundwater monitoring program in accordance with the schedule and monitoring parameters requested by NYSDEC.

The schedule includes two additional quarterly sampling events, followed by approximately three semi-annual events (through completion of construction) and three post-construction annual sampling events. After the third annual sampling event, DPR may request to reduce the sampling frequency or cease the groundwater sampling program at the Site. Table 4-1 provides a schedule of the monitoring events that will be performed to complete this program and the parameters that will be analyzed for during each event.

Post-construction groundwater monitoring and groundwater monitoring well maintenance requirements are incorporated into the Post-Construction Custodial Care Plan for the Site (see Appendix I).

Table 4-1 Groundwater Monitoring Program Schedule

Sampling Frequency	Approximate Dates of Sampling Events	Parameters
Quarterly	May 2012	6 NYCRR Subpart Part 360-2.11 Baseline Parameters; analysis for inorganic parameters on both filtered and unfiltered samples.
Quarterly	August 2012	6 NYCRR Subpart Part 360-2.11 Baseline Parameters; analysis for inorganic parameters on filtered samples only.
Bi-Annually (2x/year)	March 2013 September 2013 March 2014	6 NYCRR Subpart Part 360-2.11 Baseline Parameters; analysis for inorganic parameters on filtered samples only.
Annually	September 2014[1] September 2015 September 2016	6 NYCRR Subpart Part 360-2.11 Routine Parameters; analysis for inorganic parameters on filtered samples only.

Notes:
1. It is currently anticipated that golf course operations will begin in the fall of 2014, and that this event will be become the first of the three required annual sampling events.

4.6 Settlement Monitoring

4.6.1 Impacts on Short- and Long-Term Settlement Monitoring

Special Conditions 7 and 8 of the 2005 Permit set forth settlement monitoring requirements related to the placement of fill material across the Site. Monitoring must also conform to the recommendations provided in the Settlement Evaluation and Long-Term Monitoring Plan prepared by Langan Engineering and Environmental Services, Inc. (Langan 2005).

Short-Term Settlement Monitoring

The short-term settlement monitoring program began in December 2002 with the bi-weekly monitoring of seven test fills and six settlement plates located throughout the Site. Test fills consist of an engineered soil fill ranging from 10 to18 feet deep, generally located on-site in areas where significant thicknesses of fill are required. Settlement plates consist of a subsurface plate beneath a casing and a flush-mount monitoring access port, similar to a monitoring well. Settlement plates that are part of the short-term settlement monitoring program were generally located in areas of the site already at or close to final grade.

In their report, Langan recommended the following adjustments be made to the monitoring program during construction:

- Test fills that obstruct construction activities should be replaced with a settlement plate to be monitored near the location of the test fill.
- Settlement plates that need to be moved for construction purposes should be relocated to the same general area and monitored until long-term monitoring points have been installed.

Short-term settlement monitoring continues to be performed bi-weekly at the Site. Monitoring at several points has now been discontinued due to interference with ongoing construction. In an email correspondence dated May 1, 2012 (see Appendix H), NYSDEC informed DPR that these short-term monitoring locations do not need to be replaced as long as construction at the Site progresses.

As construction is concluded in each area of the Site, long-term monitoring plates will be installed as described below.

Long-Term Settlement Monitoring

The revised Settlement Plate Locations Plan and a sketch that shows the additional monitoring point between golf course holes 6 and 7 (Appendix H) were approved by NYSDEC in an email dated May 1, 2012. The long-term settlement monitoring points will be installed as construction is concluded in each area. Upon installation, the long-term settlement plates will be monitored in accordance with the criteria set forth in Special Condition 8 of the 2005 Permit.

4.7 Post-Construction Custodial Care Plan

The Ferry Point Park East Post-Construction Custodial Care Plan (FPCCCP) has been prepared to meet the relevant requirements of NYDEC Part 360 Permit No 2-6006-00014/00013-0 (hereafter referred to as the "Permit") and all other applicable conditions as agreed upon between NYSDEC and DPR. This document provides for the post-construction custodial care requirements as they relate to the systems and components installed as part of Site-wide development specific to Ferry Point Park East. The Post-Construction Custodial Care Plan is provided in Appendix I.

As specified in Special Condition 39 of the 2005 Part 360 Permit, as built drawings and a written post-construction certification report for NYSDEC review and approval and certification by the IEM shall be prepared within 60 days of completion of the filling operation on the Site and construction of the earthwork portion of the Project. Therefore, no as-built drawings or post-construction certification report has been provided in this FPCCCP.

The scope of the FPCCCP is to provide the current monitoring and maintenance plans and descriptions for the components and systems within Ferry Point Park East as they will exist following the conclusion of construction at the Site. For each component or system, a brief overview is included within the scope of this document. In addition, an emergency personnel contact list is provided in the Site's Health and Safety Plan, which is referenced in the Post-Construction Custodial Care Plan.

1 Introduction

Ferry Point Park in the Bronx (the Site) is a former landfill that is bounded by the Bronx Whitestone Bridge and Hutchinson River Parkway to the west, Balcom, Miles, and Emerson avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south.

New York City Department of Parks (DPR) has initiated development of a community park, waterfront park, and a golf course on the Site. The boundaries of these portions on the Site are presented in Figure 1-1.

Ecology and Environment Engineering, P.C. (EEEPC) has prepared this Landfill Gas Management Plan (LFGMP) to evaluate landfill gas (LFG) conditions at the Site and to describe the systems proposed for long term LFG control at the Site.

The Ferry Point landfill ceased municipal waste (MSW) landfill operations in the 1960s, and has been closed for approximately 50 years. Over 12 years of LFG monitoring data is available for the Site, dating from 1999. Several field investigations and two gas emissions models have also been completed for the Site. This extensive supply of data forms the basis for the LFG management and monitoring methods proposed in this document.

1.1 Purpose and Scope

Environmental compliance for site development is being conducted in accordance with a November 2005 New York State Department of Environmental Conservation (NYSDEC) modified Part 360 Solid Waste Management Permit, for which DPR is the current permit holder.

The proposed LFG management and monitoring approach presented in this document will be incorporated into the Part 360 permit renewal application for the Site. A review of available documentation of previous activities relating to LFG monitoring, investigation, and control at the Site was performed and is presented as a preface to the design component of this plan.

The LFG design presented in this LFGMP supplements prior site conceptual LFG designs and proposes a Site-wide passive system for the venting of LFG in all areas not covered by enclosed facilities. The primary goal for the Site's LFG management has always been to ensure safe conditions and the protection of human health.

The proposed passive system is consistent with the plans presented in the 1999 EAS (AKRF 1999), the 2002 Technical Environmental Assessment (AKRF 2002), and the 2005 Engineering Reports (TRC 2005a, b), and approved under the current Part 360 Permit. It deviates from the 2009 permit renewal application prepared by TRC Engineers (TRC), which recommended an active system. A review of TRC Site investigations and extraction testing by Walsh Environmental Scientists and Engineers, LLC (Walsh) and emissions modeling performed by EEEPC in 2010 was used to conclude that a passive system is sufficient to achieve safe conditions for golf course users or workers.

Existing and proposed LFG control systems are listed in Table 1-1.

Table 1-1 Existing and Proposed Landfill Gas Control Systems at the Site

Control System and Location	Type	Concept Included in 2005 Permit	To be Included in Renewed Permit?
Golf Course			
Irrigation Lake Venting System	Passive[1]	Yes	Yes
Water Quality Ponds Venting System	Passive	No	Yes
Sub-slab depressurization systems 1) One 12,000-square-foot maintenance facility 2) One 800-square-foot comfort station on the eastern area of the Site; and 3) One approximately 15,000-square-foot combined golf course, clubhouse, and banquet facility (not yet designed (NYD))	 Active Active NYD	 Yes Yes Yes	 Yes Yes NYD
LFG passive venting for subsurface utility lines that enter enclosed facilities or travel offsite	Passive	Yes	Yes
Perimeter Vent Trench	Passive	Yes	Yes
Individual LFG Vents[2]	Passive	Yes	Yes
Community Park			
Perimeter Vent Trench Along Eastern Perimeter – buried trench with individual LFG Vents along its length.	Passive	Yes	Yes
12 Individual LFG Vents	Passive	Yes	Yes
Sub-slab depressurization system for one 800-square-foot comfort station	Active	Yes	Yes
Water Quality Ponds Venting	Passive	Yes	Yes
Individual LFG Vents	Passive	Yes	Yes

Table 1-1 Existing and Proposed Landfill Gas Control Systems at the Site

Waterfront Park			
Sub-slab depressurization system for one comfort station (not yet designed)	NYD	Yes	NYD

Notes:

1. The Irrigation Lake venting system infrastructure allows for the connection of an active blower system as a potential contingency action. Section 6 discusses the conditions under which contingency actions may be taken.
2. See Section 5 for discussion of passive venting design and Appendix A for layout and details of passive gas vents.
3. NYD denotes "Not Yet Designed".

1.2 Document Organization

The remainder of this document is divided into four sections. The purpose of each section of this LFGMP is as follows:

- Section 2 - Landfill Gas Generation and Movement: Discusses gas generation rates and primary gas migratory pathways within landfills.
- Section 3 - Background: Discusses Site setting and project history, proposed facilities, sampling and monitoring data, and the evolution of the LFG collection system design.
- Section 4 - Evaluation of Existing Landfill Gas Data and LFG Exposure Assessment: Presents a Site conceptual model that includes an outline of the vertical and lateral extent of the LFG within the interior of the Site and at and along the Site perimeter, and an assessment of the risk from exposure to LFG both on site and at the Site perimeter. Provides a collective review of the data and draws conclusions on current and future site LFG conditions.
- Section 5 - Landfill Gas Management Approach: Discusses the basis for the proposed design. Provides design details of the proposed final LFG collection system.

2 Landfill Gas Generation and Movement

2.1 Landfill Gas Generation

LFG is generated in a landfill when bacteria in the landfill waste use anaerobic processes to break down organic material. LFG is composed primarily of methane and carbon dioxide. LFG also contains small amounts of nitrogen, oxygen, water vapor, sulfur, hydrogen, and other non-methane organic compounds (NMOCs). NMOCs comprise less than 1% of LFG and include ethane, propane, butanes, pentanes, and other carbon compounds.

The specific components and quantity of LFG depend on a number of factors, which include but are not limited to the following:

- Waste composition;
- Age of refuse;
- Moisture content; and
- Temperature.

2.1.1 Methane Generation

Methane concentrations in landfills can vary according to the season, with low concentrations of methane and high concentrations of carbon dioxide in the summer.

2.2 Landfill Gas Migration Pathways

Migration of LFG in the subsurface is influenced by several site-specific factors such as pressure and diffusion gradients, subsurface lithology and soil stratigraphy, and groundwater levels. The factors affecting LFG migration are discussed below.

2.2.1 Diffusion

LFG does not build up in a landfill in a uniform manner. As it builds up in the subsurface, it moves from areas of high concentration to areas of lower concentrations. Since gas concentrations are higher within the landfill than outside the landfill, LFG will tend to diffuse, or spread, to surrounding areas.

2.2.2 Pressure Gradient

Pressure gradients enable LFG to move both vertically and horizontally within a landfill. This is the primary way LFG moves within the subsurface. As gas continues to be generated, the pressure increases and LFG moves to areas of lower pressure. If there is a confining, or less permeable, layer in place above the MSW layer, LFG will move laterally toward an area of lower pressure.

If no confining layer is present, LFG will migrate vertically to the surface, where it exits the landfill surface into the atmosphere. This occurs when the LFG subsurface pressure is higher than barometric pressure. Diffusion of LFG into the atmosphere results in a rapid reduction to negligible and safe levels once it reaches the landfill surface.

2.3 Vertical Landfill Gas Migration

The methane component of LFG is lighter than air. As a result, LFG will travel upward if the permeability of the overlying material is equal or higher than that of the surrounding material

Groundwater level is another factor that influences vertical migration: as the water table rises into an area of the landfill, it forces the LFG upward.

2.4 Horizontal Landfill Gas Migration

LFG can migrate horizontally through both natural pathways (fractured rock and porous soil) and man-made pathways (e.g., porous pipe bedding materials, utility pipes and conduits, sand or gravel layers). Layers of low-permeability material that overlie LFG-producing waste material can significantly reduce surface emissions but increase the likelihood for horizontal migration.

3 Background

3.1 Site Setting and Project History

3.1.1 Setting

The Site, a former landfill, is located in the Bronx next to the Whitestone Bridge and is bounded by the Hutchinson River Parkway to the west; Balcom, Miles, and Emerson Avenues to the east; Schley Avenue and Saint Raymond's Cemetery to the north; and the East River to the south (see Figure 3-1). The original parcel of 171 acres was first acquired by New York City in 1937, and two additional parcels totaling 243 acres were acquired by the City in 1948. From 1951 into the 1960s, the New York City Department of Sanitation (DSNY) used the Ferry Point property as a municipal waste importation site (DPR 2007). Figure 3-1 shows the approximate fill progression at the Site. Landfill operations ceased in the 1960s. Upon closing, the landfill was capped with a soil cover of varying thickness across the site.

A summary of the results from previous investigations is presented in the 2005 Engineering Report (TRC 2005a, b). A bibliography of documents reviewed is provided in Section 6 of this LFGMP.

3.1.2 Project History

In the late 1990s, the DPR entered into an agreement with Ferry Point Partners, LLC (FPP) to develop, construct, and operate a new public recreation facility, including a golf course, community park, waterfront park, and related facilities that would encompass 222 acres of the Site. At that time, all required reviews for the Project were completed under the City Environmental Quality Review (CEQR), the State Environmental Quality Review Act (SEQRA), and the City's Uniform Land Use Review Procedure (ULURP).

In July 2000, NYSDEC issued a Part 360 Solid Waste Management Permit (NYSDEC No. 2-6006-00014-000110; Part 360 Permit) jointly to the FPP and the DPR (collectively, the "Historic Permittee") for a non-specific "facility" under Part 360-1.9(b) at the Site. This permit allowed the import and placement of a total of 1,000,000 cubic yards (cy) of fill necessary to construct the golf course. In February 2002 and November 2005, the Part 360 Permit was modified to accommodate additional golf course design features and changes in the design approach. In November 2005, NYSDEC issued a modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013) to place a total of 2,370,000 cy of in-place fill on the Site (NYSDEC 2005).

In 2007, the DPR terminated its license agreement with the FPP. Since that time, the DPR has taken over the site development responsibilities and has initiated re-development of the community park, waterfront park, and golf course portions of the Site.

3.2 Current Project Plans

3.2.1 Overview

The project includes the development of public recreational facilities (waterfront and community parks) on 29.5 acres, a comprehensive golf facility on 192.5 acres, and a fine-dining/banquet facility incorporated into the golf course club-house facilities.

3.2.2 Cover Soil

As per the 2005 Part 360 Permit, 423,729 cy of uncontaminated soil were approved for use in the cover layer. The final cover/topsoil layer will consist of uncontaminated soil materials, which meet background levels approved by NYSDEC and will be imported from non-industrial sites. (For cover layer fill specifications see Section 2.1.2 of the 2005 Fill Report Volume 2, Exhibit C [TRC 2005b]).

Major components of the cover layer will be constructed to meet the Nicklaus Design Technical Specification as noted in Exhibit C of the June 30, 2005, Engineering Report (TRC 2005a), and summarized here as follows:

- Greens mix imported to the site shall be tested per the specified material testing requirements. Fertilizer and soil amendments may be applied on the greens mix after spreading and grassed; and

- Topsoil imported shall be free of rock and debris greater than three-quarters of an inch. Soil amendments, fertilizer applications, and seed may be applied to tee, fairway, and rough areas.

A NYSDEC letter from July 28, 2009 (NYSDEC 2009) notes that a minimum thickness of 2 feet of cover layer material is required for all active recreation areas that are not covered with a building or other acceptable impermeable cover and at least 1 foot of cover layer material is required for passive recreation areas.

The 2005 permit requires that “the major components (greens, contours, heights and topsoil) of the cover layer shall meet the Nicklaus Design Technical Specification, as noted in Exhibit C of the June 30, 2005 Engineering Report.” In accordance with the Nicklaus Technical Design Specifications, the Permit allows amendments to the topsoil and/or sand capping. Because imported material may not be readily available, sand capping may be used as an alternative to topsoil on portions of the course.

3.2.3 Buildings

The following buildings are proposed for the golf course portion of the Site:

- Two 220-square-foot, open-air rain shelters located on the western and northern portions of the site
- One 12,000-square-foot maintenance facility on the western portion of the site
- One 800-square-foot comfort station on the eastern area of the site
- One approximately 15,000-square-foot combined clubhouse and banquet facility on the southwest portion of the site.

The following is proposed for the community park:

- One 800-square-foot comfort station near the center of the park.

The following is proposed for the waterfront park:

- One comfort station on the western area of the park.

3.2.4 Utilities

An extensive storm sewer system will be installed throughout the golf course. Storm water will be drained from the golf course and directed to on-site water quality ponds located within the golf course or to New York City Department of Environmental Protection (NYCDEP) combined sewer systems. Excess water beyond the storage capacity of the ponds will also be directed from the water quality ponds to the NYCDEP sewer system.

The main drainage line for the golf course surface catchment system will be set at a depth of approximately 3 to 4 feet below ground surface (BGS). Lateral branches to the fairways will intersect the main line at this elevation and will be graded to the fairways with a final depth of 1.5 to 2 feet. A fairway "herring-bone"-shaped surface drainage system will tie into these lateral branches and into the main site storm drainage line.

The drainage master plan is presented in the NYCDEP Master Plan (Drawing X.126-808M of the Golf Course Contract Drawings).

A sanitary sewer is to be installed along the south, west, and north perimeter of the golf course and cross into the golf course at hole 18 and to the comfort station on the eastern area of the site. Other on-site subsurface utilities include water main, electric, telephone, and gas. These utilities will service buildings and run along the western and northern perimeter of the Site as well as to the comfort station on the eastern area of the Site. Subsurface electric utilities are also to be installed throughout the practice area. Irrigation lines will be installed throughout the golf course fairways, greens, and tees.

Existing utilities at the Site include the Emerson Avenue Box Culvert and an abandoned passive methane-venting system. The box culvert runs along the Emerson Avenue alignment through the middle of the golf course. The methane-venting system was installed at the northeast portion of the site, east of the Emerson Avenue Box Culvert, in 1986. The system contained a series of collection lines that allowed LFG to travel through one main vent. Attempts to locate this system were unsuccessful, and the system's structural integrity or viability cannot be ascertained. Therefore, the existing system will not be incorporated into the currently proposed LFG venting system (see Section 3.3.2).

3.3 History and Evolution of the System

EEEPC reviewed site documents and reports generated since 1999 to develop an understanding of previous monitoring and control of LFG at the Site. A list of the documents reviewed for this LFGMP is presented in Section 6.

3.3.1 1999 Activities and Landfill Gas Control Systems

As described in the Hazardous Materials section of the 1999 Environmental Assessment Statement (EAS), Allee, King, Rosen, & Fleming, Inc. (AKRF) evaluated LFG at the Site (AKRF 1999). Both ambient air and subsurface borings were monitored. This investigation and recommended control systems are discussed below.

Although AKRF produced the 1999 EAS report and performed several gas monitoring studies for the project, TRC wrote the Hazardous Materials section of the report and incorporated AKRF investigations into their text. TRC analyzed methane emissions rate as part of this work.

Landfill Gas Monitoring

AKRF surveyed for soil gas in April 1999 to characterize LFG occurrence and assess the potential for adverse effects of methane gas on the golf course facilities. Thirty-one borings were measured for percentages of methane, carbon dioxide, and oxygen at depths of 2 to 3 feet below the landfill surface. Ambient air was monitored in the immediate vicinity of the survey points. Methane was not detected in the ambient air, even when measurements were taken at the surface immediately adjacent to the soil gas survey points. Readings below the landfill surface ranged from non-detect to 76% methane by volume and were described as being "not atypical of a landfill this size and age."

Landfill Gas Emission Rates

The 1999 EAS describes TRC's analysis of methane generation, which was used to determine sub-slab venting requirements under on-site buildings. Using the United States Environmental Protection Agency's (EPA's) "Compilation of Air Pollutant Emission Factors" (EPA 1995), TRC calculated a methane gas generation rate that considered the age of the waste, the rate and amount at which waste had been accepted over the lifetime of the landfill, and several constant factors for methane generation potential and rate constant based on Site conditions.

The calculations yielded a Site methane gas generation rate of 0.00004 cubic feet per minute (cfm) of methane per square foot, or about 2 cfm per acre of surface area. TRC determined that the maximum allowable gas concentration in the air beneath a structure was 1% or less of methane in air (less than 20% lower explosive level [LEL]).

Using the above generation rate and a safety factor of 2, a minimum venting rate of 0.008 cfm of air per square foot of sub-slab was determined (0.00004 cfm methane generation rate/ [1% allowable concentration/2])(see Section 4.1.6 for a comparison of this estimate with the LandGEM modeling results.

Based on the estimated methane emission rate and venting calculation, TRC recommended installing active venting systems beneath the planned Site structures. The 1999 report did not recommend LFG venting systems in open space areas, except for specific turf grass areas.

The movement of methane through turf grass and the vegetative soil layer was anticipated by TRC to have limited and isolated impacts. If needed, based on future evaluations, TRC suggested that an impermeable barrier with a permeable gas-venting layer could be constructed below selected areas of the course ensure turf health. This was to be determined on a hole-by-hole basis during the final project design phase.

1999 Conceptual Proposal for LFG Control Systems

The 1999 EAS recommended the following features for the LFG control system:

- LFG interception and venting systems would be below buildings and, in the area of built structures, direct LFG away from buildings to designated release points. Several venting systems were considered for further evaluation, including passive vents, continuous mechanical venting, or intermittent mechanical venting controlled by a methane monitor.

- Ponds to collect and store water on-site were to be constructed with impermeable membrane liner systems to prevent water leaks and a gas-venting layer for passive gas collection and venting.

- Soil plugs and conduit seals for underground utilities and drainage features would be constructed.

3.3.2 2001 through 2004 Activities at and around the Perimeter Vent Trench

Landfill Gas Control Systems

The LFG perimeter vent trench was the primary gas-management structure proposed and constructed in 2001. No additional changes were proposed to the 1999 conceptual LFG control systems (described above in Section 3.3.1) during this

time. The LFG perimeter vent trench was installed in order to prevent the migration of LFG off-site. TRC designed and oversaw the installation of the trench and provided certified drawings to NYSDEC for each stage for approval (AKRF 2002).

The LFG vent trench was constructed along the eastern and part of the northern Site perimeter from May 2001 to December 2001 (see Figure 3-2). The purpose of the trench was to allow passive gas venting and provide a physical gas barrier between the Site and adjacent residential neighborhoods. The passive vent trench extends from the water's edge near the foot of Emerson Avenue, along the length of the Balcolm Avenue Site boundary and continues approximately 1,050 feet west past the intersection of Schley and Buttrick avenues.

Landfill Gas Monitoring

Off-site Monitoring Study. Starting in March 2001, AKRF sampled off-site soils to evaluate off-site LFG migration. The results were reported in the February 2002 AKRF Methane Monitoring Study (Attachment A of the 2002 Technical EAS [AKRF 2002]), and included the following findings:

- Perimeter monitoring performed by Emteque Corporation indicated that methane outside the vent trench was below the LEL since November 2001. However, MW-0, located at the corner of Schley and Buttrick avenues in the former Baxter Creek, showed no change after the vent trench was installed and ranged from 10% to 20% methane by volume. AKRF concluded that the source of methane in this area was off-site.

- Elevated levels were noted on Buttrick Avenue between Randall and Schley Avenues. Specifically, three monitoring points along Buttrick Avenue (300 to 400 feet north of the Site) had elevated levels of methane in the soil ranging from 10% to 50% methane by volume. AKRF also reported that installation of the LFG vent trench had not impacted these readings and presented two explanations:

  1. Elevated methane levels were located over former Baxter Creek, a marshy area filled in before 1954. The plants and organic sediments could have produced methane when covered with fill and subsequent laboratory test results indicated that soils were rich in organic material.

  2. Garbage was found in two test pits along Buttrick Avenue and outside of the Site.

  Considering these factors and the fact that no methane was detected in the ambient air above the trench, AKRF concluded that methane detected on Buttrick Avenue was due to an off-site source.

SOURCE: Ecology and Environment Engineering, P.C. 2011

Figure 3-2 Monitoring Locations

TRC reported results for biweekly monitoring of methane in perimeter wells and off-site, semi-permanent monitoring points and measuring depth to groundwater in the piezometer network starting in February 2002 (TRC 2002). Locations of sampling points included in the monitoring program are shown in Figure 3-2. A discussion of the results of the off-site monitoring is presented in Section 4 of this LFGMP.

Perimeter Monitoring Wells. At NYSDEC's direction, FPP installed perimeter LFG monitoring wells MW-0 through MW-18 (not including MW-13) at approximately 250-foot intervals along the eastern border of the Site, adjacent to a residential neighborhood (AKRF 2002). In accordance with the Part 360 Permit, these wells were monitored biweekly and continue to be included in the LFG monitoring program.

Part 360 Permit Modification Application

In February 2002, TRC submitted a permit modification application to supplement the April 2000 Engineering Report prepared for the original Part 360 Permit application. TRC indicated in this document that the LFG control systems presented in the 2000 Engineering Report would be implemented. The following items were discussed.

Piezometer Installation and Monitoring. Details regarding installation and monitoring of piezometers were presented in this report. Twenty-five piezometers (PZ-01 through PZ-25) were installed at approximate 300-foot intervals along the trench, adjacent to Miles Avenue. The piezometers were installed to monitor groundwater elevations relative to the vent trench depth.

Monitoring was proposed to begin one week after the piezometers were installed and every month thereafter until six months after all fill had been placed on the Site. The piezometers were to be inspected every month.

LFG Perimeter Vent Trench. The vent trench was reported to be operating and forming a physical barrier to prevent methane from migrating off-site. The Permit application indicated that the trench was designed to operate passively. The trench was on a biweekly inspection schedule.

1986 Passive Ventilation System. In a response to NYSDEC comments on the February 2002 permit modification application, dated July 2, 2002, TRC indicated that FPP planned a visual and test pit program to evaluate the systems around the 1986 passive-venting system outflow vent location. If the outflow vent could be located and nearby piping from the collection wells to the outflow vent were found to be functioning (i.e., conveying methane), the passive venting system would remain in place and FPP would construct and maintain a new outflow vent "at a nearby location removed from the primary golf course features." It is also stated in this response that MW-19 was installed separately by FPP and is not the outlet vent of the 1986 system. In follow-up correspondence with NYSDEC, dated February 10, 2003, TRC discussed their field investigations to locate the his-

toric venting system (TRC 2003a). Test pits and visual investigations were unsuccessful in locating the historic venting system. TRC recommended that if this system were uncovered during the upcoming construction activities, it should be preserved. (To date, the historic venting system has not been uncovered and, therefore, will not be included in the proposed LFG venting design).

3.3.3 2005 Activities and Landfill Gas Control Systems

Consistent with information presented in the 1999 EAS, the 2005 Engineering Report indicated that because of the age of the waste materials at the Site, which was approaching 40 to 50 years, the LFG generation rate is declining (TRC 2005a,b). Conceptual design of the LFG control system was also to remain similar to that proposed in 1999, noting that building slab areas would contain active venting systems, and the golf course and utilities would contain passive systems where necessary.

A number of monitoring activities were included in this report, along with a revised description of the LFG control system.

Landfill Gas Monitoring

Monitoring Wells. The 2005 Engineering Report (TRC 2005 a) provided the following information on monitoring wells:

- TRC continued to monitor all perimeter gas monitoring wells and off-site gas monitoring points biweekly for methane and oxygen per the 2002 Permit. Monitoring points were repaired and maintained as needed

- Elevated levels continued to be found in three monitoring points on Buttrick Avenue between Randall and Schley Avenues after construction of the vent trench, thus suggesting the presence of an off-site methane source.

- From October 2002 to February 2005, two off-site semi-permanent monitoring points (9 and 10) along Buttrick Avenue exceeded 25% of the LEL. Additionally, MW-0, located near the trench and within the Ferry Point Park property, routinely showed elevated levels.

Piezometers and Piezometer Monitoring

Groundwater was monitored every month at the piezometers as per the 2002 Permit requirements. TRC generated a construction-phase Response Action Plan to define response to conditions where groundwater in one or more groundwater level-monitoring piezometer was beneath the base of the trench elevation.

Landfill Gas Control Systems

The 2005 Engineering Report proposed the following components of the LFG control system, which were consistent with, but more detailed than those described in the 1999 EAS.

- Sub-slab venting components were primarily described as active systems beneath buildings and on-site structures. Several venting systems were recommended for further evaluation and the design was to be finalized based on building structure and location.

- The irrigation lake and ponds were proposed to have impermeable membrane liner systems with a gas-venting layer for passive gas collection and venting.

- Underground site utilities were proposed to have soil plugs and conduit seals for piping and conduits.

- The movement of methane through turf grass and the vegetative soil layer was anticipated to have limited and isolated impacts. If specific greens required venting for the maintenance of turf health, an impermeable barrier with a permeable gas venting layer was recommended beneath the vegetative soil.

- The 2005 Engineering Report did not propose LFG venting systems in open space areas, except for specific turf grass areas as described above.

3.3.4 Post-2005 Monitoring at and around the Perimeter Vent Trench

Landfill Gas Monitoring

Methane Monitoring. Permanent monitoring wells and semi-permanent points have been monitored biweekly in accordance with the 2005 Permit. Since issuance of the 2005 Permit, several exceedences have occurred at MW-0, with sporadic exceedences at MW-14 and E3R.

Piezometers and Piezometer Monitoring

Monthly monitoring of groundwater depth was completed in each piezometer in accordance with Special Condition 30 of the 2005 Permit. Sustained, low groundwater levels have not been observed since 2005.

Vent Trench

Routine inspections and maintenance ensured continued vent trench functionality. A review of historic vent trench data by TRC (TRC 2009a) concluded that the LFG vent trench was providing an effective perimeter control based on the following:

- In the year following installation of the vent trench, methane levels near the trench decreased significantly in most monitoring wells.

- Methane levels generally increased in 2005, likely due to installation of new monitoring points and repaired wells.

3.3.5 2007 through 2009 Activities

Methane Monitoring Reports (2007 through 2009)

Monthly methane monitoring reports were prepared by TRC from 2007 through September 2009. The monitoring routine included noting weather conditions; measuring methane and oxygen levels from both on-site methane monitoring wells and off-site semi-permanent methane monitoring points; and measuring groundwater levels in piezometers adjacent to the vent trench.

Pre-Extraction Pilot Test Subsurface Investigation (2008/2009)

In 2008 and 2009, TRC performed a subsurface investigation through the installation of borings and LFG probes and tested for soil gas with slam bars (sampling rods with slotted points) in order to supplement existing site data and assess the current nature and extent of LFG at the Ferry Point site (TRC 2009c).

Data obtained from TRC's investigation include:

- MSW thickness ranged from 4 to 47 feet. Saturated MSW thickness ranged from 0 to 24 feet.
- Methane gas concentrations observed in 16 of the western perimeter slam bar monitoring locations were less than the 25% LEL regulatory level for landfill gas control in on- and off-site structures, and less than the 100% LEL regulatory level at or beyond the property boundary (New York Code of Rules and Regulations [NYCRR]360-2.15(e) and.360-2.15(k)(4)).
- Combustible gas concentrations observed in the shallow slam bar monitoring locations were lower than those present in the deeper soil borings. Only one slam bar monitoring point exceeded 0.5% methane by volume.
- In 39 of 54 borings within the golf course interior, combustible gas was measured at 25% LEL or higher.
- Permeability field testing revealed that the average permeability of the existing shaping layer material was on the order of 10^{-5} inches per second (in/sec). Non-domestic MSW (typically soil with some construction and demolition debris) and domestic MSW had average permeabilities of 10^{-2} in/sec and 10^{-3} in/sec, respectively.

Extraction Pilot Test

TRC performed an extraction pilot test in 2009 with the intention of gaining a better understanding of on-site gas generation. NYSDEC's Air Guide 1 air toxics assessment procedure was used as the testing protocol and a comparison of emissions from the test to short-term guideline concentrations (SGCs) was made to confirm that SGCs were not exceeded. Details of the pilot extraction test are included in the Pre-Design Landfill Gas Investigation Scope of Work (SOW) and

the Amendment to Volume No. 1 of the Permit application dated November 25, 2009 (TRC 2009a).

Data from the test reported by TRC include the following:

- During static conditions, pressures measured in the LFG were less than 0.02 to 0.08 inches of water column (in-wc) gauge.
- During passive venting of the extraction well, monitoring probes showed positive pressure readings from 0.04 to 0.30 in-wc gauge.
- LFG samples collected from the extraction well produced methane concentrations of approximately 61% by volume. Methane concentrations measured with pressure probes exceeded LELs at several locations.
- Data from the active blower test were as follows:
  - An 85 standard cubic feet per minute flow rate was shown capable of evacuating pore volume and creating negative pressure over a 150 foot test radius.
  - Atmospheric infiltration was noted in several probes when the induced pressure vacuum was increased to 14 to 16 in-wc.

Shortcomings of the pilot test performed by TRC have been evaluated by EEEPC and are discussed in Section 4.2.1.1.

Landfill Gas Control Systems

Based on TRC's interpretation of the 2009 subsurface investigation and extraction pilot tests, they proposed a low-flow active LFG control system for "the golf course area of the site". The rationale for this design was that passive venting was not expected to achieve safe levels of methane in the subsurface in time for the anticipated opening of the golf course. The proposal for active systems for sub-slab venting was similar to those previously proposed by TRC in the 2005 Engineering Report (2005a). The irrigation pond venting system was proposed for incorporation into the active system.

However, the TRC report did state that operating an active LFG extraction at high flow rates could cause dangerous atmospheric infiltration, pulling air underground from the surface and potentially causing underground fires or explosions.

In this report, TRC proposed the following system components:

- Vertical LFG collection wells, screened in the MSW layer, would consist of horizontal collection systems, including perforated collection pipes placed underneath an impermeable liner below the green and tee areas and the clubhouse parking lot asphalt; horizontal collection pits/pipes under the comfort station and maintenance facility; and gas venting geocomposite and perforated collection pipe system associated with the lined irrigation pond.

- Forty control zones of extraction wells and green and tee horizontal collection piping would be established, divided to accommodate Site conditions (topography and "other features such as the box culvert") and to allow "flexible operations." Wells and piping in each zone would be connected through a network of header pipes to a vent flare with an in-line fan. Flexible operation would be enabled by a blanked flange in each vent point. Subsurface collection piping network would be incorporated into the irrigation pond and parking lot with piping connected to a central discharge location. Sub-slab active depressurization systems would be installed for the comfort station and maintenance facility and would include automated methane monitoring and alarm systems.

- A probe network for monitoring LFG control system performance and LFG across the Site and along the boundary would be installed.

4 Evaluation of Existing LFG Data and LFG Exposure Assessment

Based on the 2008/2009 TRC investigations and proposal for a Site-wide active LFG extraction systems for all open space areas of the site, it was decided that a re-evaluation of LFG data be performed to ensure the appropriate mitigation systems were selected. An exposure assessment and additional emissions modeling effort was also undertaken to provide additional Site data.

4.1 Additional Data Collection

The following data was gathered through monitoring, investigations, and computer modeling to provide additional information regarding LFG conditions at the Site.

4.1.1 Methane Monitoring Reports (2009 through present)

Monthly methane monitoring reports are prepared by American Environmental Services, Inc. (AES). From October 2009 to May 17 2012, AES monitored:

- Ambient weather conditions
- Methane, oxygen, hydrogen sulfide, and carbon monoxide levels in on-site methane monitoring wells, perimeter methane monitoring wells, and off-site semi-permanent methane monitoring points
- Groundwater levels in piezometers adjacent to the vent trench

As of May 23, 2012, AES began monitoring the expanded parameters requested by NYSDEC in their January 3, 2011 letter. The following parameters are now being monitoring in addition to those above:

- Well pressure
- Well temperature
- Ambient relative humidity

4.1.2 Walsh Review of Site Investigations (2010)

Walsh reviewed TRC's subsurface investigation and extraction test in May and August of 2010 (Walsh 2010a, b). The review reported that the results of the TRC testing were consistent and expected based on the age and character of the landfill. Due to low pressure readings throughout the Site and methane levels below the LEL in most shallow monitoring points, Walsh concluded that a site-wide

active venting system would not be necessary to achieve safe conditions for golf course users or workers.

Based on the Walsh reviews and as requested by NYSDEC (NYSDEC 2010), TRC completed a flux box sampling in October 2010 in order to more accurately determine surface methane emission rates at the Site. The results of the flux box sampling were reported by TRC as an insert to the Supplement to the 2009 Engineering Report.

4.1.3 TRC Flux Box Testing (2010)

The TRC flux box and ambient air sampling event in October 2010, in accordance with the sampling plan submitted to NYSDEC, is included as Appendix B of EEEPC's November 2010 Landfill Gas Report. A flux box is a container of known volume which is used at the surface of the landfill for the measurement of LFG emissions and concentrations. A total of 30 test locations were sampled: 19 in the area of the golf course and associated facilities, three each in the waterfront and community parks, and five at the LFG vent trench. Results of this sampling were as follows:

- Methane was not detected in any of the flux box samples.
- No sulfur compounds were detected above the detection limit in any flux box or ambient air sample.
- Five compounds were found at concentrations higher than the NYSDEC Annual Guideline Concentrations (AGCs): benzene, carbon tetrachloride, methylene chloride, tetrachloroethylene, and trichloroethylene. Due to the concentrations found in the ambient air samples, it was concluded that these compounds were likely from off-site urban environment sources. Three of the five compounds warranted further evaluation using the NYSDEC Area Source Method. The results indicated on-site annual impacts would be less than 1.5% of the AGC, and off-site impacts less than 0.25% of the AGC for tetrachloroethylene, trichloroethylene, and methylene chloride.

4.1.4 Community Park Vent Monitoring (2011)

In June 2011, EEEPC conducted a monitoring event of the twelve (12) passive LFG vents previously installed at Community Park (EEEPC 2011b). Vent testing was used to identify and quantify the emission rates of LFG constituents from the vents. Air samples were collected from each vent and analyzed to determine the concentration of methane, carbon dioxide (CO_2), oxygen (O_2), nitrogen (N_2), volatile organic compounds (VOCs), and sulfur compounds. The LFG flow rate for each vent pipe was also measured.

The field data and analytical results were used to estimate hourly and annual emission rates of chemical constituents from the LFG vents. Modeled ambient air concentrations resulting from the estimated emission rates were found to be below NYSDEC short-term and annual guideline concentrations (SGCs/AGCs).

4.1.5 LFG Fingerprinting Investigation (2011)

In an effort to supplement existing data regarding the source of offsite methane detections in the vicinity of Buttrick/Schley avenues, EEEPC conducted an investigation in June 2011, in accordance with a May 2011 Fingerprinting Protocol (EEEPC 2011b).

The following wells/probes were included in the investigation:

- Offsite monitoring points 9 and 10, located on Buttrick Avenue between Randall and Schley avenues;
- Perimeter monitoring well, MW-0, located in the vicinity of Buttrick Avenue; and
- Onsite monitoring wells MW-13 and MW-19.

The fingerprinting protocol recommended that methane measurement be conducted in interior monitoring well MW-4R. However, this well was previously decommissioned and as a result, measurement was conducted in well, MW-13, which is also an onsite monitoring well.

Each location was purged according to procedures outlined in the protocol and then monitored for methane concentration. None of the locations yielded methane concentrations sufficient for isotopic gas analysis, a minimum of 1% methane by volume. As a result, LFG samples could not be collected for isotopic fingerprinting analyses.

4.1.6 Landfill Gas Generation Modeling

Using LandGEM Model Version 3.02, EEEPC (2010) modeled emission rates for the Site in order to compare to the flux box sampling and previous emission rates estimated by TRC in 1999.

The LandGEM model generates emission estimates during landfill operation and for the years following closure. For use in the model, the waste acceptance rate at the site and the years of waste acceptance were based on site characteristics and historical data. Conservative Clean Air Act (CAA) municipal solid waste landfill defaults were used for the remaining input parameters.

- Years of waste acceptance: 1940 to 1959
- Annual waste acceptance rate: 319,566 megagrams per year (Mg/yr) assumed to be equal from 1940 to 1959
- Methane generation rate: 0.05 yr^{-1}

- Potential methane generation capacity: 170 cubic meters per megagram (m^3/Mg)

- Methane content: 50% by volume.

LandGEM generated the following results, predicting methane emissions from the start of waste acceptance in 1940 through the year 2040:

- The 1999 model year emissions rate was calculated to be 3,268 Mg/yr, equivalent to 0.00003 cfm per square foot (SF) a rate similar to the 1999 TRC estimate of 0.00004 cfm/SF calculated using EPA Method AP-42.

- For the model year 2010, the results yielded a methane emission rate of 1,885 Mg/yr, or 2,078 tons per year (tons/yr) in 2010. This is equivalent to an emission rate of 0.00002 cfm/SF or slightly less than 1 cfm/acre.

- LandGEM also projected methane generation calculations up to 30 years into the future, projecting that by 2040 emissions would be reduced to 25% of current day emissions (420 Mg/yr, approximately 0.000005 cfm/SF). Overall, methane generation shows a consistent decrease over time.

- The emission rate projected by LandGEM in 2010 is just a fraction of the peak estimated emission rate of 22,970 Mg/yr (0.00023 cfm/SF), predicted for the year 1960.

Like other landfill sites, the rate of LFG production at the Site is affected by waste composition, waste volume, moisture content, age, and landfill geometry. Field measurements have shown that the LFG produced at the Site predominantly contains methane and carbon dioxide, with small amounts of nitrogen, oxygen, water vapor, sulfur, and other contaminants. Some NMOCs, which can also be classified as hazardous air pollutants (HAPs) were reported at much lower quantities.

Section 4.2 presents an assessment of the lateral and vertical extents of LFG within the MSW and the current shaping layers, both in the interior and at and around the perimeter of the Site. Figures 4-1 and 4-2 are conceptual cross sections illustrating the lateral and vertical extents of methane at the Site. Figure 4-3 shows methane concentrations in samples collected within the Site interior, along the Site perimeter, and at off-site locations.

Also included is an assessment of the risk of exposure to LFG both on and at the perimeter of the Site. The exposure assessment includes a comparison of LFG concentrations to applicable New York Codes, Rules, and Regulations (NYCRR) Part 360 standards.

Notes: 1. Data are from the TRC 2009 Supplemental Landfill Gas Investigation, the TRC 2009 Pre-Extraction Pilot Test Subsurface Investigation, and the TRC 2010 Emissions and Air Quality Testing.
2. Color coding for monitoring wells and methane survey points based on data from a 2 year period between January 2009 and January 2011. Color coded as yellow if 2 or more meausurements equal or exceed 25% LEL and as red if 2 or more measurements equal or exceed LEL.

4.2 Evaluation of LFG Data

4.2.1 Occurrence of LFG in the MSW Layer

4.2.1.1 Site Interior

Historical LFG Operations Monitoring Data

Since 2000, field methane measurements have been collected from two interior gas wells; MW-4/4R and MW-19 (see Figure 4-4, which shows temporal trends for these monitoring points from 2000 to 2011). Between 2008 and 2010 these measured concentrations had declined from 100% of LEL to non-detect levels.

Due to concerns raised by NYSDEC regarding the condition of the wells, DPR submitted a plan to abandon the existing onsite gas wells and install two replacement gas wells within the Site's interior. Concurrently, DPR requested that gas well MW-0 be abandoned and a replacement gas well installed within the Site's interior. This request was made due to a suspected off-site source(s) of methane in the vicinity of this location (AKRF 2002; TRC 2005a, 2009a). Monitoring at the approved replacement locations began in February 2012. Measured methane concentrations in the three interior replacement gas wells (see Appendix C), is consistent with LFG data from samples collected within the MSW layer at the Site between 2008 and 2009, which indicated methane concentrations above the LEL.

Figure 4-4 Temporal Trends in Methane Concentrations at Site Interior Wells, 2000 to 2011

Recent LFG Investigation Data

Pre-Extraction Subsurface Investigation. Methane concentrations were measured by TRC at on-site borings in 2008 and 2009 (see Figure 3-2 for boring locations).

Methane was measured at concentrations exceeding 25% LEL in 82 of 135 samples and exceeding the LEL in 73 of 135 samples within the MSW layer. Mean and median of the measured methane concentrations were both greater than the LEL. Methane concentrations exceeding 25% LEL were measured in approximately two-thirds of the samples collected from the MSW layer, which supports the premise that methane is not present in specific areas but appears to exist in the MSW layer throughout the interior of the Site. However, measured data in the shaping layer, overlying the MSW layer, and at the surface indicates that concentrations decline rapidly as gas migrates upward toward the surface (see Sections 4.2.2 and 4.2.3).

LFG Extraction Test. TRC utilized EPA Method 2E in their 2009 extraction testing. EPA Method 2E was historically used to determine LFG flow (EPA 2000). This method states that the purpose of short-term testing is to determine the "maximum vacuum that can be applied to wells without infiltration of ambient air into the landfill." In 2003, an article in the *Journal of Air & Waste Management* (Walter 2003) discussed fatal flaws that existed with this method for measuring landfill gas generation rates. In addition, TRC's extraction pilot test diverged from the recommended EPA method, which identifies ambient air intrusion by percent volume of nitrogen. TRC identified ambient air intrusion by percent volume of oxygen. TRC determined the radius of influence based on differential pressures at the surrounding test wells, yet EPA Method 2E specifies determining the radius of influence based on absolute pressures under static and active extraction conditions.

More importantly, because of the atmospheric intrusion noted during the extraction test, the LFG extraction rate used by TRC during the pilot testing would be significantly higher than the actual LFG generation rates within the area of the pilot test. If LFG generation rates for the entire Site are based on the pilot test results, the resulting estimate would grossly over-estimate actual LFG generation.

4.2.1.2 Site Perimeter

Historical LFG Operations Monitoring Data

Since 2000, biweekly field methane measurements have been collected from wells located next to the passive vent trench along the perimeter of the Site (see Figure 3-2). Measured methane concentrations have declined from more than 100% of LEL to non-detect levels with a few exceptions (see Figure 4-5 for temporal trends in selected perimeter wells from 2000 to 2011). This significant decline in methane concentrations in perimeter wells demonstrates the effectiveness of the perimeter trench in venting LFG, along with an overall decline in LFG gen-

eration. However, a number of monitoring locations were missing valves during this time, which may have impacted the data collected.

A suspected offsite source of methane in the vicinity of MW-0 located close to the intersection of Buttrick and Schley Avenues, outside the northeastern corner of the Site) was attributed to elevated methane readings at this location (see Section 4.2.1.3 for further discussion). MW-0 has now been abandoned and relocated within the Site's interior as discussed in Section 4.2.1.1 above.

Gas Monitoring Well Repairs

During their routine inspections of the Site, the IEM noted out that many of the perimeter monitoring wells were missing valves and caps, or otherwise needed repair. DPR performed an inspection of all perimeter wells, and performed the necessary repairs, or installed replacement wells as necessary to bring them into compliance with the current Part 360 Permit.

Monitoring following the repairs began in February 2012 (see Figure 4-6 for temporal trends in selected perimeter wells. The new bi-weekly data from the site perimeter wells shows that methane concentrations remained consistent with concentrations measured at these wells between 2008 and 2011 (see Appendix C for methane monitoring data).

Figure 4-5 Temporal Trends in Methane Concentrations in Site Perimeter Wells, 2000 to 2011

Figure 4-6 Temporal Trends in Methane Concentrations in Site Perimeter Wells, Biweekly Sampling Events 2012

The TRC 2008 and 2009 investigations (TRC 2009c) did not measure methane in the MSW along the site perimeter.

Recent Community Park Vent Data

Sampling was performed at 12 vents within Community Park in June 2011, using the procedures established in the *Landfill Gas Vents Sampling and Analysis Protocol*,(EEEPC 2011c). The protocol summarized the procedures used to identify and estimate the emission rates of air pollutants as well as procedures to conduct an air quality model analysis to identify and compare potential impacts associated with these emissions. The protocol was approved as noted by NYSDEC on March 30, 2011. The June 2011 data reported no measurable gas flow in the Community Park vents. The presence of methane was detected in only 3 of the 12 vents sampled, with detections in the three vents ranging from 1.5 to 7.3% by volume (7.5% LEL to >100%LEL). In the 9 remaining vents, concentrations were below laboratory reporting limits (EEEPC 2011b).

4.2.1.3 Off-site Areas on Schley, Buttrick, Balcom, and Emerson Avenues

Historical LFG Operations Monitoring Data

Since the early 2000s, field methane measurements have been collected from probes, located on Schley, Buttrick, Balcom, Miles, and Emerson avenues (see Figure 3-2). Measured methane concentrations have been lower than the LEL in

the Schley, Balcom, Miles, and Emerson Avenue probes since 2002, indicating absence of significant methane at these off-site locations.

Methane concentrations in the probes on Buttrick Avenue, however, have been higher than the LEL in several probes (see Figures 4-7 and 4-8). The presence of elevated methane levels in these probes indicates an off-site source of methane, separate from landfill activities at the Site. This is further discussed below under the heading "Gas Monitoring Well Repairs."

Figure 4-7 Temporal Trends in Methane Concentrations in Off-site Probes on Buttrick Avenue, 2000 to 2011

Gas Monitoring Well Repairs

As discussed in Section 4.2.1.2, off-site monitoring locations were also subject to repairs based on the IEM's routine inspections. DPR has performed the necessary repairs, or installed replacement wells as appropriate for the majority of monitoring locations.

Monitoring following these repairs began in February 2012 (see Figure 4-8). The new bi-weekly data showed that methane concentrations remained consistent with concentrations measured at these wells between 2008 and 2011.

Figure 4-8 Temporal Trends in Methane Concentrations in Off-site Probes on Buttrick Avenue, Biweekly Sampling Events 2012

The following findings from previous investigations/LFG monitoring provide evidence for the presence of an offsite source of methane in the Buttrick Avenue area:

1. The February 2002 AKRF Methane Monitoring Study in which two test pits were excavated in areas of elevated methane detections along Buttrick Avenue in September 2001 identified presence of garbage at this location.
   a. According to the report: "*Garbage was identified in the material excavated and included wood, paper, cloth, metal cans, plastic bottles, glass, ceramic, asphalt, foam, and shoe soles*".

2. The 2002 AKRF study also confirmed the presence of soils rich in organic material, consistent with the reported presence of historic marshlands in this area.
   a. To confirm the presence of historic marshlands, soil samples from the excavations from the test pits in this area were sent for laboratory analysis and AKRF reported that "the laboratory results indicate the soils are rich in organic material". These results support the presence of a former marsh, which was likely to contain organic-rich sediments.

3. During the sampling conducted following the installation of the perimeter vent trench, AKRF concluded the following in their 2002 study:
   a. *"because there has been little change in the elevated methane levels on Buttrick Avenue since the installation of the landfill gas venting trench, garbage and organic rich materials were found in the test pits excavated*

in this area, and the area is located over a filled marshy area, the source of methane on Buttrick Avenue is offsite".

4. Further, as discussed in the TRC 2005 and 2009 engineering reports (TRC 2005a, 2009a), this area was a former tidal marsh subject to potential filling with MSW prior to 1945. According to TRC, organic-rich marsh deposits and fill possibly containing MSW are the likely sources of methane in this area. (Figure 3-1 shows the approximate MSW fill progression at the Site and surrounding historic waterbodies and marshlands.)

In the TRC 2008 and 2009 investigations (TRC 2009c), samples for methane measurement were not collected at off-site locations.

4.2.2 Occurrence of LFG in the Shaping Layer

4.2.2.1 Site Interior

Methane concentrations were measured by TRC in the shaping layer at on-site borings drilled in 2008 and 2009 (see Figure 3-2). Samples were collected from within the top 2 feet of the shaping layer and from 2 to 6 feet BGS, also within the shaping layer (TRC 2009c).

Methane concentrations observed in the shaping layer were lower than those in the underlying MSW layer (see Figure 4-3). More importantly, methane concentrations attenuated from the bottom to the top of the shaping layer; concentrations in the top 2 feet are significantly lower than those measured from 2 to 6 feet BGS.

The mean and median values for samples within the top 2 feet of shaping layer were 17.84% LEL and 0.0% LEL, respectively. Samples collected between 2 and 6 feet BGS resulted in a mean and median of 100% LEL and 60% LEL, respectively.

4.2.2.2 Site Perimeter

During the 2008 and 2009 investigation, TRC measured methane concentrations in the shaping layer in shallow, temporary monitoring points installed along the western perimeter of the Site (see Figure 3-2). Samples were collected from within the top 2 feet of shaping material (TRC 2009c).

The mean and median values of methane concentrations in these samples were 1.6% LEL and 2% LEL, respectively. The absence of methane concentrations above the LEL in these perimeter monitoring points demonstrates the rapid attenuation that occurs in the westward direction. These findings indicate that mitigation measures are not deemed necessary along the western perimeter of the Site.

4.2.3 Occurrence of LFG at the Surface

At 30 locations, flux box and ambient air testing was conducted by TRC in 2010, for field measurements of methane and laboratory analysis of VOCs (see Figure 3-2). Monitoring and analysis was performed using the procedures established in the "Flux Chamber Testing Program Work Plan", included as Appendix B to the

Ferry Point Landfill Gas Report (EEEPC 2010). The work plan summarized the flux chamber sampling and analysis techniques that would be used to determine surface emission rates from the landfill. The results of the analysis were used to develop total hourly and annual emission rates. These rates were used for the analysis of potential impacts to on site and off site receptors for methane and hazardous air pollutants (HAPs).

Methane was not detected in field measurements in any of the sampling locations (EEEPC 2010). The absence of methane in the flux box samples demonstrates a rapid attenuation of methane occurring in the upward direction from the MSW layer through the shaping layer and to the surface. It provides further evidence that methane is not present at measurable rates at the surface of the Site.

Low levels of select VOCs were reported in some flux box samples. However, the concentrations were either below NYSDEC acceptable standards or similar to background concentrations reported in ambient air samples (EEEPC 2010).

4.3 LFG Emission Rates

4.3.1 Methane Emission Rates

The surface emission rate of methane at the Site was estimated using LandGEM Version 3.02 (EEEPC 2010 [see Appendix B]). Because the LandGEM model is intended to be used to design gas collection systems, it typically overpredicts LFG generation. CAA defaults were used in the model, which also yields conservative emission estimates.

As discussed in Section 4.1.6 the LandGEM model estimated a 2010 methane emission rate of 1,885 Mg/yr (or 2,078 tons/yr). This corresponds to an average hourly emission rate of 0.237 tons/hr (based on 24 hours/day and 365 days/year). The model predicts substantial reductions in each subsequent year, ranging from a predicted rate of 2,078 tons/yr in 2010 to a rate of 463 tons/yr in 2040. This represents an approximate 75% decrease in methane production over time.

For comparison, in 1999, TRC estimated a methane emission rate of 0.00004 cfm/SF, calculated using the EPA Method AP-42. The LandGEM modeling performed in 2010 calculated 1999 model year emissions rate equivalent to 0.00003 cfm/SF, which is nearly the same value as the TRC AP-42 estimate.

4.3.2 HAP and Other VOC Emission Rates

Flux Box Measurements

The emission rates of HAPs and other reported VOCs in the LFG from the Site were estimated using the average concentration of each compound in the flux box samples. The average concentration was calculated only from samples with compound concentrations over the detection limit. This methodology produces a very conservative (i.e., biased high) emission rate as it ignores samples with results below detection limits. The assumptions and the approach used to model the

emission rate are presented in EEEPC's Landfill Gas Report, Ferry Point (November 2010).

NYSDEC's guidelines for estimating annual impacts, when applied to the calculated emission rates, resulted in ambient air concentrations below NYSDEC's acceptable thresholds (EEEPC 2010).

Community Park Vent Measurements

The emission rates of VOCs and sulfur compounds in the community park vents were estimated by multiplying an assumed vent flow rate (1 cm^3/sec was used because no measurable flow was observed) and reported concentration of each constituent. Emission rates were below levels that would result in an adverse impact to public receptors in the vicinity of the vents (EEEPC 2011b).

4.4 Exposure Assessment

4.4.1 Criteria

Methane

NYCRR Part 360 criteria, which requires that combustible gas concentrations not exceed 25% of the LEL in structures on-site and off-site and not exceed the LEL at or beyond the Site boundary, were used for comparison with methane concentrations measured within and along the perimeter of the Site.

HAPs and Other VOCs

NYSDEC SGCs and AGCs are screening-level values used to determine the appropriate environmental rating of air pollutant emissions. SGCs are chosen to protect the general population from adverse acute one-hour exposures; AGCs are chosen to protect against adverse chronic exposure and are based upon the most conservative carcinogenic or non-carcinogenic annual exposure limit. SGCs and AGCs are used to assess impacts on ambient air caused by an emission source.

4.4.2 Comparison of Flux Box & Community Park Testing Results with Exposure Criteria

Methane

Methane was not detected in the flux box samples collected within the interior of the Site, indicating that methane is not emitted at the ground surface at measurable rates. Absence of methane at the surface indicates that NYCRR Part 360 criteria are met.

Also both mean and median concentrations of methane in the top 2 feet of the shaping layer within the interior of the Site did not exceed 25% LEL, as would be required by NYCRR Part 360 for on and off-site structures.

Methane concentrations in the perimeter wells, except in MW-0, located along the existing vent trench, abutting Emerson, Miles, Balcom, and Schley avenues were below the LEL, as required by NYCRR Part 360. Methane concentrations were

also below the NYCRR Part 360 criteria for samples collected along the western perimeter.

Methane concentrations in the probes on Buttrick Avenue, located close to MW-0, have been higher than 100% LEL. As discussed in Section 4.2.1.3, the presence of elevated methane levels in these probes along with the nearby organic-rich marshland and pre-1945 use of the area for MSW fill indicates an off-site source of methane that likely contributes to elevated levels at MW-0.

VOCs

Flux Box Measurements. Of the four VOCs detected in flux box samples in the 2009 TRC investigation, benzene was reported below the concentrations found in the ambient samples, which are representative of background concentrations. Three other VOCs— methylene chloride, trichloroethylene, and tetrachloroethylene—concentrations in flux box samples were roughly equivalent to and/or slightly greater than those in the ambient samples (EEEPC 2010). Potential impacts on ambient air as a result of emission of these VOCs at the Site were assessed by EEEPC, and the results indicated no exceedences of NYSDEC standards (EEEPC 2010).

Carbon tetrachloride was detected in an ambient sample but not in the flux box sample. Because of its reported widespread use in operations within urban areas and its absence in Site flux box samples, the Site is not considered to be a source of carbon tetrachloride in ambient air.

Community Park Vent Measurements. Recent testing indicates that the VOC emissions from the 12 community park vents would result in ambient air concentrations that are well below NYSDEC standards, indicating an absence of impacts above public exposure thresholds in the vicinity of the vents (EEEPC 2011b).

In an email dated July 1, 2011, NYSDEC confirmed their acceptance of these tests and indicated that emissions from the vents pose no health impact to the public using the park.

4.5 Conclusions

The following conclusions were drawn from the evaluation of the LFG data collected and modeling conducted to date at the Site:

- The reported data indicates the presence of methane within the MSW, as expected from a landfill of its age. Methane levels at the surface were below regulatory limits for structures within the interior of the Site (below 25% LEL). Methane levels in the subsurface were below regulatory limits at the perimeter of the Site (below LEL).

- At the current landfill surface, concentrations of other LFG compounds, primarily VOCs, were either below their acceptable thresholds or similar to background levels measured in ambient air samples.

- Modeled ambient air concentrations using VOC concentrations reported in the flux box samples demonstrated no reportable impact of VOCs on ambient air at the Site.

- The LandGEM model, which predicts a conservative estimate of LFG generation rates, shows that methane emissions from Ferry Point do not contribute significantly to greenhouse gas (GHG) emissions. The estimated 2010 annual methane emissions from Ferry Point are approximately 0.048 million tons of CO_2-equivalent emissions.

- No measurable LFG flow was measured in recently tested Community Park Vents.

- Recent testing of the vents at the Community Park indicate that emissions for VOCs and sulfur compounds from the LFG vents that would cause short-term and annual impacts that are well below the SGCs and AGCs. The impacts are several orders of magnitude less than these guideline concentrations, which is indicative of the limited emissions from the LFG that is present in the subsurface.

- Subsurface MSW and historic marshlands in the Buttrick Avenue area have been identified as the likely offsite source(s) of elevated methane measurements in LFG probes in this area.

LFG does not exceed regulatory and health-based thresholds at the surface, which indicates that LFG generation within the waste occurs at low levels, consistent with the age of the landfill. Therefore, active LFG extraction systems at the Site are not warranted.

However, methane concentrations exceeded the LEL in 73 out of 135 samples collected within the subsurface MSW layer during the 2008/2009 TRC subsurface investigation. Therefore, passive venting systems are proposed for the open areas of the Site. Active depressurization systems are recommended to be placed under building footprints to minimize the potential for LFG to collect underneath structures.

5 Landfill Gas Management Approach

5.1 Summary of LFG Data and Planned LFG Control Measures

5.1.1 Summary of Data

Site Interior

The MSW layer in the interior of the golf course and community park portions of the Site ranges from 4 feet thick to 47 feet. Concentrations of methane, the primary component of LFG, are elevated in the MSW layer, with both mean and median concentrations above the LEL. However, as the LFG migrates upward toward the ground surface through the shaping layer, methane concentrations decline rapidly. Concentrations in samples collected at the surface in flux boxes were below the instrument's detection.

Site Perimeter

Along the northern and eastern perimeters of the Site, where the perimeter vent trench is located, methane concentrations have declined significantly. As described in Section 3.3.4, groundwater levels measured during biweekly piezometer monitoring events have been observed to be above the vent trench bottom depth since 2005. This demonstrates the effectiveness of the vent trench in controlling the migration of LFG in this area. Along the western perimeter of the Site, methane concentrations in the upper section of the shaping layer are below the LEL, thus precluding the need for placing LFG control measures in this area.

5.1.2 Planned LFG Control Measures

A description of the planned LFG control measures is included below and the type of LFG control measures to be installed for each Site feature is presented in Table 1-1 (see Figure 5-1 for a conceptual layout of the LFG control measures).

Site Interior

Methane generation, as shown in the 2010 LandGEM modeling, is currently estimated at approximately 1 cfm/acre or less, a very low rate that correlates well with the 1999 TRC AP-42 modeling. Elevated levels of subsurface methane are expected to decrease over time and, as described in Section 2, methane that exits the landfill via the permeable soil cover into the open atmosphere will quickly diffuse to negligible levels. Moreover, elevated subsurface levels do not result in

unsafe levels at the landfill's surface, as demonstrated by the lack of methane detection in the flux box measurements taken by TRC in October 2010.

In order to provide adequate ventilation to enclosed structures at the site, the migration of LFG into occupied structures or structures where there is an ignition source (such as electrical connections) needs to be prevented or minimized (to at or below the regulatory-prescribed levels). Thus, all on-site buildings will have an active sub-slab depressurization (SSD) system (see Section 5.3).

Although the data do not indicate the need for LFG control within the site interior (other than within enclosed structures), methane concentrations exceeded the LEL in 73 out of 135 samples within the MSW layer during the 2008/2009 TRC subsurface investigation. Hence, a passive venting system consisting of venting wells screened across the MSW layer will be installed as a precautionary measure (see Figure 5-1 and Appendix A for a layout of the venting system, and Section 5.2 for a design description). Figure 5-1 currently shows the location of passive vent wells within the golf course portion of the Site.

Also, methane was not present in the upper section of the shaping layer above the NYCRR Part 360 limit (25% LEL) for on-site structures. During the recent 2008/2009 TRC investigations, less than 10% of samples collected in the upper 2 feet of the Site subsurface were reported to have concentrations exceeding this limit. None of these sample locations, where methane was reported above the 25% LEL, were below the planned footprint of proposed onsite structures. Conservatively, an SSD system is proposed for installation underneath the footprints of the structures as a precautionary measure to allow the LFG to be directed to and vented at the rooftops. This design will mitigate the threat of exposure to building occupants and preclude explosive conditions. Refer to Figure 5-1 for locations of the planned buildings where a SSD system is planned and Section 5.3 for a design description.

Risk management measures to control LFG under subsurface features, including utility corridors, ponds, and lakes in the interior of the Site are described in Section 5.4.

Site Perimeter

Because passive venting has been effective in reducing methane concentrations along the eastern and northern perimeters of the Site, the existing vent trench will continue to operate in accordance with the existing program requirements outlined in the Part 360 permit (see Figure 5-1).

LFG control along the western perimeter of the Site, where methane concentrations are below the LEL is not planned The East River will provide an effective block to off-site migration of LFG on the south side of the Site.

Figure 5-1 Layout of LFG Control Measures

5.2 Passive Vent Well System Design

5.2.1 System Description

EEEPC has prepared a layout of the vertical passive gas vent wells for the golf course (see Figure 5-1 and Appendix A). The number of vent wells and their locations were selected to maximize the LFG removal efficiency while avoiding the golf course playing area using the following criteria, in order of priority:

- Vent wells were first located in areas exhibiting high historical subsurface and shaping layer LFG concentrations (see Figure 4-3).
- The locations were further biased toward areas exhibiting larger waste thicknesses because these areas could generate more LFG.
- The locations were then biased toward areas of higher shaping layer thickness and higher top of MSW elevations because these areas will influence LFG pressure build-up and/or lateral migration of LFG.
- The locations were selected to avoid subsurface utilities and playing areas of the golf course.
- The Site includes a network of vertical vent trenches along the northern and eastern boundaries that capture and release any LFG that laterally migrates towards these Site boundaries.
- The Site design includes a porous sand layer that will diffuse any LFG releasing from any preferential pathway in the shaping layer.
- Subsurface utilities that travel off-site or into/out of occupied structures will have soil/bentonite collars and additional passive vents installed (see Section 5.4).
- Water quality ponds will be lined up to their permanent pool elevations with a low permeability low density polyethylene (LDPE) liner and include passive vent systems. Ponds to be lined and passively vented include: K, L, M, P1, P2, and the irrigation lake. Pond P2 will be lined for its entire volume due to the presence of MSW encountered during excavation.
- The three enclosed buildings (maintenance facility, comfort station, and clubhouse/banquet facility) on the golf course will have active SSD systems with additional venting installed. The maintenance facility and comfort station are shown on the engineering drawings S-202.00, C-221.00/C-222.00, and C-321.00/C-322.00, respectively prepared for the DPR under Contract X.126-209M (TRC 2009b). Community and waterfront parks will have one comfort station each which will also be designed with active SSD systems. The community park is shown on the engineering drawings prepared for the DPR under Contract X.126-208M (TRC 2008), which were also included in the November 2009 Permit Application (TRC 2009a).

Twenty-five stand-alone vertical passive vents and 12 passive vents installed into utility pipe bedding material are planned for the site. There are approximately 190 acres not covered by ponds or buildings, which are vented separately. This equates to a frequency of one vent per 5 acres. It is anticipated that this same venting frequency will be applied to the waterfront park. The community park already has 12 passive vent wells installed, which is a greater frequency than one vent per 5 acres. The community park passive vent design is shown on Drawings H-1.1 through H-1.7 (submitted under separate cover). These drawings show that the stand-alone vertical vents facilitate venting through the aspirometric cowl. The drawings also show a sample port on the side of each vent stack that will facilitate the monitoring of the vented gases.

Passive venting, combined with an LFG generation rate that is more than 50 years past its maximum, the vertical vent trenches and those vents incorporated into utilities, SSD systems, and the pond liner systems will more than adequately vent the LFG such that all emissions and health and safety requirements are met.

These vents will work predominantly via a pressure gradient. The vertical vents will be screened for the entire thickness of the MSW layer and extend to below the lowest known water table. When the LFG pressure in the subsurface is higher than the atmospheric pressure, LFG will be conveyed towards the vent and released through the top of the vent. During periods of equal subsurface and vent pipe pressure, a smaller amount of LFG will be released via diffusion as the subsurface gas concentrations in or near the vent pipe seek to equalize with the atmospheric concentrations. Radii of Influence (ROIs) are calculated for active venting systems and do not apply to the performance of passive venting systems. Therefore, no ROI calculations can be made for the passive vents as the pressure gradient in the subsurface will convey LFG to the passive vents.

5.3 Sub-Slab Depressurization Systems for Building Structures

SSD systems will be installed for all enclosed buildings at the site. This includes the maintenance building, clubhouse/banquet facility, and comfort station at the golf course; and one comfort station each at community and waterfront parks.

The SSD systems will be designed to capture and actively vent LFG from beneath each building foundation. Vent piping will be installed to penetrate the foundation slabs at each building, and travel up through the roof via a suction fan to discharge accumulated LFG to the atmosphere.

At each building, an impermeable geotextile liner will be placed directly on top of a 12-inch thick gas permeable aggregate sub-base layer, beneath the entire building's floor slab. Sub-slab depressurization pit(s) will be installed in the aggregate layer. A six-inch diameter vertical riser pipe will extend from the SSD pit(s) through the building to the roof, where a suction fan shall be installed to actively vent LFG.

Sub-slab LFG concentrations will be monitored through monitoring points installed through the floor slabs of each building. Indoor air combustible gas levels will be monitored via combustible gas indicators installed throughout the buildings.

5.4 LFG Control in Subsurface Features

LFG Control in Utility Corridors

All site utilities will be installed within the subsurface. Low-permeability soil/bentonite collars will be installed in utility corridors containing permeable pipe bedding materials at the building line into structures and where the utilities travel off-site. This will be done to prevent LFG from migrating laterally within pipe bedding and into buildings or off-site. These utilities are predominantly water and sanitary sewer lines but will include other utilities if they were installed with permeable pipe bedding material and they either enter a building or extend off-site.

Where such utilities are routed off-site through a perimeter vent trench, the soil collar will be installed immediately adjacent to the off-site side of the vent trench, thus allowing any gas traveling through the pipe bedding to be vented to the atmosphere through the vent trench. In locations where these utilities are not routed through a vent trench, a vertical passive vent will be installed immediately on the landfill side of the soil collar. In locations where these utilities travel into a building, the soil collar will be at the building line and a passive vent will be installed to vent the pipe bedding to the roof of the building.

Other utility LFG controls include air vents on vault and manhole covers and conduit seals and electrical connection.

Locations and details of the soil/bentonite collars and vent locations are shown on the Design Drawings prepared for the DPR under Contract X.126-208M (EEEPC 2012). The Design Drawings also include a detail of the conduit seals.

LFG Control Underneath Ponds/Lakes

An irrigation lake with a geomembrane liner has been constructed in the northwestern area of the golf course. The liner is an impediment to the surface venting of LFG. A gas transmission layer has been installed underneath the geomembrane liner and is connected to perforated piping around the perimeter of the lake as shown on TRC's Contract Drawings H2.1, H2.2, and H2.13 of Contract X.126-109M (TRC 2009c). This perforated pipe enables the passive venting of LFG from beneath the liner. This venting system could be activated should contingency actions be needed as described below.

Should perimeter LFG monitoring data indicate the off-site migration of methane, this venting system allows for the contingency connection of an active blower. Section 6.3.4.1 discusses the conditions for this potential contingency action.

Water quality ponds will be lined with a low permeability liner up to their permanent pool elevation. The low permeability LDPE liner will include passive venting. Ponds to be lined and passively vented include: K, L, M, P1, P2, and the irrigation lake. Pond P2 will be lined for its entire volume due to the presence of MSW encountered during excavation. The water quality ponds are shown on TRC's Contract Drawings C3.4 through C3.9 of Contract X.126-109M (TRC 2009c) and C-351.00 of Contract X.126-209M (TRC 2009b). The water quality pond liner designs are shown in EEEPC's Supplemental Drawings of Contract X.126-109M (EEEPC 2011a). A geocomposite layer will transfer, via a pressure gradient, any LFG building up pressure beneath the liner to the perimeter trench perforated pipe, where it will be passively vented to the atmosphere. Once the gas reaches the atmosphere, it will diffuse quickly to negligible levels, as described in Section 2.

Additional Risk Management Measures

The venting of enclosed but rarely occupied spaces, such as manholes, will be conducted by following confined space entry protocols, including active ventilation just prior to and during entry. A health and safety plan that addresses confined space ventilation, required air monitoring, and required personal protective equipment will be prepared and provided to NYSDEC.

6 Landfill Gas Maintenance and Monitoring Requirements

6.1 Introduction

Since 2000, DPR has performed bi-weekly LFG monitoring at on-site, perimeter, and off-site monitoring locations in accordance with the Site's 2005 Part 360 Permit (Permit No. 2-6006-00014/00013). Compliance with Part 360-2.17(f) requires methane concentrations at the site boundary to be less than the LEL. However, the 2005 Permit required the Ferry Point site to comply to a more restrictive criteria of 25% LEL as the action level for which additional sampling and reporting was required. The Part 360 renewal application for the site will comply with the regulatory guidance of NYCRR Part 360-2.17(f) for LFG monitoring and reporting, as described below in Section 6.1.1.

The required operations, maintenance, and monitoring (OM&M) actions presented in this document will be incorporated into the Part 360 permit renewal application for the Site.

LFG monitoring is planned using existing LFG probes, and will be conducted in accordance with this Plan. Figure 3-2 shows the location of LFG monitoring probes and piezometers.

6.1.1 Regulatory Guidance

The NYCRR Part 360 "Solid Waste Management Facilities" regulations concerning LFG were used as guidance in developing the OM&M program. The following criteria will be used for the Site:

Part 360-2.17(f):

- Concentration of explosive gases must not exceed 25% LEL in on-site and off-site structures; and
- Concentration of explosive gases must not exceed LEL at the property boundary.

Because of the planned future uses of the site as a golf course, banquet facility, and public park, the LFG monitoring plan provides a comprehensive program for future monitoring and maintenance, with specific contingency actions as needed.

Continuous monitoring for methane will occur in all enclosed buildings at the Site for the protection of occupants.

6.2 Monitoring Activities through Completion of Golf Course Construction

LFG monitoring activities through the completion of construction will continue to comply with the existing 2005 Part 360 permit special conditions, as summarized below. OM&M personnel for the site will remain as-is (AES or other DPR authorized gas monitoring subcontractor) through turnover of the project to post-construction operations.

- Special condition 26: Monthly inspections shall be performed of the gas venting trench to verify the integrity of the trench and mulch cover. The gas venting trench shall be maintained at all times and soil washouts promptly repaired. Mulch cover shall be replaced at a minimum every spring to maintain the effectiveness of the trench.

- Special condition 30: Monthly groundwater elevation gauging shall be performed to measure the depth to groundwater in each piezometer installed at the gas venting trench until completion of construction. If groundwater elevation in an individual piezometer is measured below the base of the vent trench during a single event, DPR will implement a response plan in accordance with special condition 31 of the 2005 permit. This response plan supersedes the requirements outlined in Exhibit I of Volume II of TRC's 2005 Engineering Report.

- Special condition 31: In the event groundwater level in an individual piezometer is measured below the base of the perimeter vent trench, the following actions will be taken:

  1. NYSDEC will be notified within 24 hours of an individual detection of groundwater elevation below the base of the trench.

  2. Frequency of piezometer monitoring will be switched to bi-weekly if two consecutive exceedences of LEL occur at nearby gas probes; or two consecutive groundwater elevation measurements in the piezometer are reported below the trench elevation.

  3. Monitoring will return to its routine frequency when groundwater elevation in the piezometer is reported above the base of the trench for three consecutive bi-weekly measurements; or methane measurements in nearby probes drop below the LEL for three consecutive measurements.

- Special conditions 32 and 34: Bi-weekly monitoring shall be performed for perimeter gas monitoring wells (0, 1A, 1 to 3, 5 to 12, and 14 to 18) and on-site monitoring wells (13 and 19).

If any individual monitoring point has a reading equal to or greater than 100% LEL or three consecutive bi-weekly readings greater than 25% LEL, monitoring will be performed weekly for the individual points with the elevated readings. An individual monitoring point will return to the regular bi-weekly monitoring schedule when three consecutive weekly readings are measured below the 25% LEL.

- Special conditions 36 and 37: Bi-weekly monitoring shall be performed for the off-site gas monitoring network.

  If any individual monitoring point has a reading that equals or greater than 100% LEL, or three consecutive bi-weekly readings greater than 25% LEL, monitoring will be performed weekly for the individual points with elevated readings. An individual monitoring point will return to the regular bi-weekly monitoring schedule when three consecutive weekly readings are measured below 25% LEL.

- As per NYSDEC's January 3, 2011, letter, additional LFG monitoring parameters will be added to the gas probe monitoring program for the remainder of Site construction. These parameters will continue to be monitored post-construction. These parameters include hydrogen sulfides, VOCs, and carbon monoxide, reported in parts per million (ppm); and well temperature and pressure.

6.3 Post-construction Monitoring and Maintenance

The information presented in the post-construction monitoring and maintenance plan is organized as follows:

- Description of OM&M personnel and responsibilities;
- Description of site gas monitoring and maintenance infrastructure, and the activities that will occur for each monitoring and/or maintenance event;
- Schedule of proposed maintenance and monitoring frequency;
- Performance criteria for:
  - Contingency actions,
  - Reduction in maintenance/monitoring,
  - Abandonment of gas venting and monitoring infrastructure; and
- Record keeping and reporting requirements.

Monitoring locations and frequencies are summarized in Table 6-1. O&M forms are included in Appendix D.

6.3.1 OM&M Personnel

New York City Departments of Parks and Recreation

The DPR is responsible for maintaining this OM&M Plan and ensuring that the LFG control systems are operated and maintained.

LFG Monitoring and Maintenance Supervisor

The LFG monitoring and maintenance (LFG M&M) supervisor will be an employee of DPR, oversee all Site LFG monitoring and maintenance activities, and serve as the primary point of contact for DPR for OM&M activities for the Site's LFG control systems. This individual shall be required to have a minimum of 5 years experience with the monitoring and reporting of LFG. The individual will be proficient in operating and maintaining gas monitoring equipment. They will have completed the initial 29 CFR 1910.120 (OSHA 40-hour HAZWOPER) training, and maintain the annual 8-hour refresher training. The LFG M&M supervisor has responsibility and authority to direct all OM&M work activities. The LFG M&M supervisor will maintain the necessary monitoring personnel for the required maintenance and monitoring activities.

LFG O&M Personnel

Each inspection/monitoring event will be performed by up to two personnel, who shall have prior experience with LFG monitoring, and who will be assigned by the LFG M&M supervisor. O&M personnel will be trained in the operation and maintenance of gas monitoring equipment and have completed the initial 29 CFR 1910.120 (OSHA 40-hour HAZWOPER) training, and maintain the annual 8-hour refresher training.

The duties of the LFG operation and maintenance (O&M) personnel include:

- Routine monitoring, maintenance, and inspections as detailed in Section 6.3.2;
- Performing contingency activities as detailed in Section 6.3.4.1; and
- Providing completed LFG O&M forms to the LFG M&M supervisor.

New York State Department of Environmental Conservation

NYSDEC is the regulatory agency under whose oversight maintenance and operation of LFG control systems will be conducted.

6.3.2 LFG Monitoring and Maintenance Infrastructure

6.3.2.1 Perimeter LFG Probes

Perimeter probes are located at approximately 250-foot intervals along the north, east, and southern site boundaries (refer to Figure 6-1 for probe locations and Exhibit H of Volume II of the TRC 2005 Engineering Report for probe completion details).

Routine Monitoring and Maintenance
During each event, OM&M personnel will:

1. Record the following field measurements at each location:
   a. Methane (% by volume and % LEL), O_2 (% by volume), hydrogen sulfides (ppm), VOCs (ppm), and carbon monoxide (CO) (ppm).
   b. Well temperature degrees Fahrenheit (°F) and well pressure pounds per square inch (psi).

2. Observe the probes and surrounding ground surface for damage and settlement, and make repairs as necessary (inspect inner and outer casings, check sample tube for holes or cuts, and make sure it is not kinked, make sure valve is operable, replace bolts, well lid, and check well locks as necessary). A summary of necessary repairs will be included in the Annual Report.

3. Complete a monitoring report following each event.

6.3.2.2 Off-site LFG Monitoring Network
Off-site probes are located along Buttrick, Balcom, Schley, Miles, and Emerson, avenues (see Figure 3-1 for probe locations and AKRF [2002] for probe construction details).

Routine Monitoring and Maintenance
During each event, OM&M personnel will:

1. Record the following field measurements at each location:
   a. Methane (% by volume and % LEL), O_2 (% by volume), hydrogen sulfides (ppm), VOCs (ppm), and CO (ppm).
   b. Well temperature (°F) and well pressure (psi).

2. Observe the probes and surrounding ground surface for damage and settlement and make repairs as necessary (inspect inner and outer casings, replace bolts, well lid, and check well locks). A summary of necessary repairs will be included in the Annual Report.

3. Complete a monitoring report following each event.

6.3.2.3 Piezometers
In 2002, 25 piezometers were installed to evaluate the groundwater elevation relative to the bottom of the passive-vent trench (see Figure 6-1 for piezometer locations and Exhibit I of Volume II of TRC's 2005 Engineering Report for piezometer details).

Routine Monitoring and Maintenance
During each event, OM&M personnel will:

1. Record the following field measurements at each location:

a. Depth to groundwater in the piezometer.

2. Observe the piezometers and surrounding ground surface for damage and settlement and make repairs as necessary (e.g., inspect inner and outer casings, replace bolts, well lid). A summary of necessary repairs will be included in the Annual Report.

3. Complete a monitoring report following each event.

6.3.2.4 Passive Vent Trench

The passive-vent trench is installed along the eastern perimeter of the Site and along a portion of the northern Site perimeter. The passive vent trench will be inspected annually, and maintained by DPR to verify the trench is operating as designed. During each event, OM&M personnel will:

1. Observe the vent trench for soil washouts of the mulch cover or other visible signs of damage.

2. Replace mulch cover for areas noted to have washouts.

3. Remove any woody vegetation that has accumulated in the trench.

4. Restore to grade any areas observed to have settled or eroded.

5. Complete a maintenance report, noting the schedule for any maintenance unable to be completed during the original event.

6.3.2.5 LFG Passive Vents

The passive venting system consists of:

- 25 individual vents within the golf course interior (See Appendix A – Passive Vent Layout and Details – Sheet S-H11.01 and SH11.02 for locations of these vents.)

- 12 passive vents inserted into utility pipe bedding material within golf course interior

- 12 passive vents within the community park.

- Additional passive vents as-needed for site features such as water quality pond liners.

Passive vents are intended to relieve LFG pressure buildup within in the buried waste and prevent offsite gas migration. Data trends observed in onsite probes MW-4R and MW-19 (Appendix C – LFG Monitoring Data - Sheets S-H6.01 and S-H6.02 –Existing Gas Monitoring and Venting Plan) illustrate the behavior of LFG that is anticipated at passive vent locations that are drilled into areas where

LFG is present. Elevated methane levels might be observed for up to several years following installation when decreased methane levels are expected.

The 25 stand-alone passive vents will be monitored for stack height reduction eligibility and decommissioning purposes, as described in Section 6.3.4.3 – Decommissioning of LFG Management Infrastructure. Passive vents will have an access port to facilitate monitoring. Passive vent monitoring will occur during routine vent inspection.

Routine monitoring of perimeter probes is based on the regulatory requirements outlined in Section 6.1, and will continue to detect the potential of off-site gas migration and be used for the recommendation of contingency actions for the Site.

Elevated levels of methane in a vent do not indicate an unsafe surrounding, since the vents are designed to transport LFG from within the landfill to the atmosphere for dispersal. Contingency actions for the stand-alone passive vents are given in Section 6.3.4.

Routine Maintenance and Inspection

During each event, OM&M personnel will:

1. Observe the ground surface around the vents and confirm that the vents are firmly anchored in their original intended position.

2. Observe the vent riser and confirm absence of damage to vent piping.

3. Provide general upkeep, including:
   a. Removing excessive vegetation at and around the vent area,
   b. Repairing any erosion or settlement around the vent riser, and
   c. Repairing any damage to vent risers, as necessary.

4. Monitoring of the 25 stand-alone passive vents within the golf course will be performed to evaluate stack height reduction eligibility. These measurements will be recorded and reported in the maintenance or inspection report.

   Perimeter probe monitoring will be used to determine if methane may be migrating off site. Contingency actions are discussed in Section 6.3.4.1.

   The following parameters will be measured and recorded:

   a. Methane (% by volume and % LEL), O_2 (% by volume), hydrogen sulfides (ppm), VOCs (ppm), and CO (ppm)
   b. Vent temperature (°F).

5. Complete a maintenance report, noting the schedule for any repairs/maintenance unable to be completed during the original event.

6.3.2.6 Sub-Slab Depressurization Systems

SSD systems are proposed for enclosed buildings at the Site. Monitoring requirements for SSD systems are presented in this section. The locations of the enclosed buildings where the SSD systems are to be installed are presented in Figure 3-2, Monitoring Locations. The proposed SSD systems must be approved by both NYSDEC and the New York State Department of Health (NYSDOH) prior to installation. Upon completion of the detailed design of these systems, DPR will provide NYSDEC with the manufacturer's specification sheets for the vapor barrier materials; manufacturers' operation and maintenance manuals for all vapor monitoring and control systems; and sizing calculations for vent fans. Installation and proper functioning of the SSDS shall be certified by a Professional Engineer registered in New York State.

The following buildings will have SSDSs:

- Golf Course Comfort station, as shown on drawings X-002.00 through X-005.00 (TRC 2009b);
- Golf Course Maintenance Facility, as shown on drawings X-001.00 and X-003.00 through X-005.00 (TRC 2009b);
- Community Park Comfort Station, as shown on drawing EV-1 (Whitestone Associates 2009);
- Golf Course Clubhouse (not yet designed); and
- Waterfront Park Comfort Station (not yet designed).

Any new structures at the Site will be designed in accordance with New York City Department of Buildings permitting procedures. The need and extent of LFG mitigation systems for future site structures will be evaluated on a case by case basis.

Routine Maintenance and Inspections

System inspections will be performed on a routine basis for the site's SSD systems. During each event, OM&M personnel will:

1. Perform routine maintenance on the SSD equipment based on manufacturer's manuals, including calibration of the methane gas monitors using standard gasses.

2. Download continuous SSD monitoring data retained by the system controller at each building.

3. Complete maintenance activities indicated by equipment manufacturers of the respective systems.

4. Complete an inspection report, with the following readings:
   a. Sub-slab vacuum readings at the sub-slab monitoring points located within each building,
   b. Vacuum gauge readings located on the suction fan inlet, and

c. Note the schedule for any maintenance unable to be completed during the original event.

Real-Time Monitoring and Contingency Actions for Occupied Structures

Each enclosed facility will have at least one continuous combustible-gas monitor that will transmit real-time methane readings to a system controller. The installed system will be capable of retaining the readings and generating reports that include date, time, and methane concentration.

One air-flow switch will be installed for each suction fan. The switch will detect and transmit low-flow conditions to a system autodialer.

An autodialer system will enable the DPR to be notified remotely based on "early warning" indicators. Early warning levels will be set to allow time for corrective action to be taken before methane levels reach 25% LEL in the enclosed space.

Early warning indicators will identify the following conditions:

- Reduction of system flow rate below what is required for effective operation.
- Detection of methane levels at a sentinel concentration of 10% LEL.

Visible and audible alarms will occur at levels of 25% LEL and above to signal the need for building evacuation. Upon notification of elevated methane levels, the building will be evacuated and ventilated. Building occupants will be allowed to re-enter the enclosed facility only after continuously monitored LEL levels drop below 25% LEL.

If methane readings exceed 25% LEL in an enclosed space, NYSDEC will be notified within 24 hours of the event.

6.3.2.7 Irrigation Lake Venting System

An irrigation lake with a geomembrane liner has been constructed in the northwestern area of the golf course. The liner is an impediment to the surface venting of LFG. A gas transmission layer has been installed underneath the geomembrane liner and is connected to perforated piping around the perimeter of the lake as shown on TRC's Contract Drawings H2.1, H2.2, and H2.13 of Contract X.126-109M. This perforated pipe enables the passive venting of LFG from beneath the liner. This venting system could be activated should contingency actions be needed as described below.

Should perimeter LFG monitoring data indicate the off-site migration of methane, this venting system allows for the contingency connection of an active blower. Section 6.3.4.1 discusses the conditions for this potential contingency action.

6.3.3 LFG Monitoring Schedule

Implementation of the post-construction monitoring plan will collect data necessary to meet the regulatory guidance and to confirm the effectiveness of the installed LFG control measures. The monitoring program will be used to confirm that future LFG conditions are consistent with noted historical trends and LandGEM model projections.

Basis for Proposed Monitoring Schedule

A review of Site data from 2000 to April, 2012 was performed to create the basis for the recommended method of post-construction gas monitoring. The data review included five bi-weekly monitoring events that occurred after the well repairs (including retrofits) were made. LFG design criteria and LandGEM modeling data were also reviewed.

Methane emissions modeling performed by both TRC in 1999 (AKRF 1999) and EEEPC in 2010 projected estimates that were approximately 10% of the peak generation rate, and were higher in concentration than actual field measured emissions obtained through the 2010 flux box sampling event (see Figure 6-1). The flux box sampling event found no reportable surface methane concentrations at any of the 30 on-site test locations.

Figure 6-1 LandGEM Emissions Model Results

Piezometer Measurements

In compliance with the current permit and consistent with Part 360-2.15(f) performance objectives, the DPR has taken groundwater elevation measurements bi-weekly at piezometer locations. The data collected from 2007 through 2010 demonstrates that groundwater elevations in the piezometers have been above the base of the vent trench during the entire period.

6.3.3.1 Proposed Monitoring Frequencies

The monitoring schedule below is proposed as the initial post-construction monitoring plan. Adjustments to monitoring frequencies will be requested of NYSDEC upon meeting the performance criteria thresholds identified in this document. DPR will submit a request with supporting documentation to NYSDEC 30 days prior to the desired date of the proposed change in monitoring. DPR will not change monitoring frequencies until the request has been approved.

All wells that have not been approved for abandonment by NYSDEC, have undergone the repairs necessary to bring them into compliance with the current Part 360 Permit. Data collected from the repaired well locations has been used, with the historic data to recommend the initial monitoring frequencies shown in Table 6-1.

- Perimeter and off-site gas probes that reported detections of methane above 25% LEL in the last five years of monitoring (since 2006) will be monitored quarterly. Inspections and maintenance at these locations will be performed during monitoring events.

- Perimeter and off-site gas probes that reported no detections of methane above 25% LEL in the last five years of monitoring (since 2006) will be monitored annually. Inspections and maintenance at these locations will be performed during monitoring events.

- On-site LFG monitoring probes will not be included in the post-construction monitoring program. Inspections and maintenance at these locations will be performed annually.

- Piezometers locations will be monitored and inspected monthly.

- The 25 stand-alone passive vents within the golf course boundary will be inspected approximately one month after completion of installation of all vents. Inspections will occur quarterly for the first year following installation, and continue annually thereafter. NYSDEC reserves the right to require an inspection frequency other than annual after the first year. Inspections of passive vents include LFG monitoring as described in Section 6.3.2.5.

- The remaining passive venting infrastructure, including the passive vent trench, and vents for Community Park, water quality ponds, and utility soil collar vents will be inspected annually.

- Monitoring in enclosed structures will be conducted using combustible gas monitors that will record real-time methane concentrations. System alarms will be monitored and maintained inside these structures. Inspections and maintenance of sub-slab depressurization systems at enclosed structures will be performed quarterly.

Monitoring will continue at the frequency outlined in this Plan until: 1) the DPR provides NYSDEC a formal request to change the monitoring frequencies along with supporting documentation and 2) the request is approved by NYSDEC. Additional inspections of passive venting infrastructure may occur upon the implementation of contingency activities, as discussed in Section 6.3.4.1.

Notes:
1. Locations selected for annual monitoring - No detections of methane above 25% LEL since January 2006.
2. Locations selected for quarterly monitoring - At least one detection of methane above 25% LEL since January 2006.
3. On-site wells will not be included in post-construction monitoring.
4. Off-site probe locations selected for abandonment based on proximity to other monitoring points.

6.3.4 Gas Monitoring Performance Criteria

6.3.4.1 Contingency Actions for LFG Monitoring Wells and Gas Management Infrastructure

The following contingency actions are recommended for post-construction site operations for LFG monitoring wells and gas management infrastructure:

- NYCDPR will provide verbal and electronic notification within 24 hours of an individual LFG measurement exceeding the criteria established in the Part 360 Permit to FDNY, NYCHA, NYSDEC, and NYCDOHMH, according to the following guidelines:
  - NYSDEC & FDNY – Will be notified for all post-construction monitoring events and contingency action events where an exceedance is observed.
  - NYCHA & NYCDOHMH – Will be notified for post-construction monitoring and contingency action events where an exceedance is observed within an enclosed building, or at a perimeter or offsite monitoring location. Enclosed buildings are defined as those buildings within the site that have sub-slab depressurization systems: golf course maintenance building, clubhouse, comfort station/snack bar and community park comfort station.
  - All monitoring, maintenance, and contingency actions will be documented and kept at the NYCDPR Bronx Borough Office (Ranaqua), Bronx Park, Bronx, New York.

- If two consecutive measurements above 100% LEL occur at any perimeter gas monitoring probe, or at an offsite gas monitoring probe located on Emerson, Miles, or Balcolm avenues, a monitoring and maintenance event will be performed within seven days following the second consecutive measurement and consist of the following:
  1. Inspection and maintenance of the perimeter vent trench within 100 feet on either side of the individual probe location.
  2. Water level gauging at the two nearest piezometers to the individual probe location.
  3. Inspection of any additional passive venting infrastructure located within a 100-foot radius of the individual probe location for damage and overgrowth.
  4. Follow up monitoring for all parameters at the individual probe location two weeks after completion of the items above.

  If contingency maintenance reveals a potential cause for the elevated methane measurements (e.g., vent trench clogged and water levels below trench), this will be reported to NYSDEC and routine monitoring frequency will resume once maintenance is complete, and follow-up monitoring indicates levels have dropped.

  If monitoring following contingency maintenance indicates that methane levels remain above 100% LEL, the following actions will be completed and reported to NYSDEC within 45 days of completion of initial contingency maintenance:
  1. Review of recent elevated detections at nearby monitoring locations.
  2. Evaluation of methane levels at the property boundary and off-site, if necessary.
  3. Evaluation of potential outside causes of elevated methane (i.e., mulching/composting activities nearby).
  4. Evaluation of potential Site disturbances (i.e., excavation or construction) that may have resulted in the movement of subsurface methane.
  5. A proposed plan for the mitigation of elevated methane, which includes:
     a. Mitigation of outside causes of elevated methane, if identified.
     b. LFG monitoring in the vicinity of site work to determine impacts resulting from site activities.
     c. Inspection and maintenance of passive vent trench.
     d. Follow-up monitoring to confirm methane levels following completion of contingency actions.
  6. Evaluation for the potential installation of additional venting infrastructure may be considered if the contingency actions above are shown to be ineffective. These include:
     a. Installation of additional individual passive vents, and
     b. Installation of active blower system for the irrigation lake;

- Off-site probes on Buttrick and Schley avenues are believed to be located near an off-site source of methane. In addition, perimeter gas probes exist on

Schley Avenue which will indicate the presence of methane at the Site boundary. Therefore, elevated methane measurements at off-site probes located on Buttrick and Schley avenues will not require contingency actions.

- For the twenty-five stand-alone passive vents at the golf course:

If the routine vent inspections indicate that any stand-alone passive vent is not functioning as designed, DPR will:

1. Perform a 25-foot radius scan using the LFG monitoring instrument around that vent to confirm safe conditions in the breathing zone.

2. Prepare a specific work plan to evaluate conditions at that vent and recommend contingency actions.

6.3.4.2 Performance Criteria for Reduction of LFG Monitoring

The following performance thresholds will be used as guidance reductions in monitoring frequency. When the data thresholds assigned show that site conditions are acceptable for such reductions, DPR will provide NYSDEC with the supporting documentation and a request to change the monitoring frequency, for NYSDEC review and approval.. These thresholds apply to the post-construction period only.

For perimeter, on-site and off-site probes initially subject to quarterly monitoring:

- Following three consecutive years of quarterly methane measurements below 25% LEL at an individual location, DPR will request that monitoring at that location will be reduced to annually.

- Following two additional consecutive years of annual methane measurements below 25% LEL at an individual location, DPR will request that monitoring at that location will be discontinued and decommissioned. Discontinued gas monitoring locations may be selected for decommissioning upon approval by NYDEC.

For perimeter, on-site and off-site probes initially subject to annual monitoring:

- Following five consecutive years of annual methane measurements below 25% LEL at an individual location, DPR will request that monitoring at that location will be discontinued. Discontinued gas monitoring locations may be selected for decommissioning upon approval by NYSDEC.

For piezometers (all subject to annual monitoring):

- Following five years of annual groundwater measurements above the base elevation of the perimeter vent trench at an individual location, DPR will request that monitoring at that location will be discontinued. Discontinued pie-

zometer locations may be selected for decommissioning upon approval by NYSDEC.

6.3.4.3 Decommissioning of LFG Management Infrastructure

LFG monitoring and mitigation systems will be evaluated for phase-out and decommissioning as described in the sections below. DPR will submit a request with supporting documentation to NYSDEC 30 days prior to the desired date of decommissioning of any LFG mitigation infrastructure. Decommissioning of LFG management infrastructure will not occur until after the request has been approved by NYSDEC.

Perimeter, On-Site and Off-site Monitoring Probes

Decommissioning of perimeter, on-site and off-site gas probes will be requested when an individual location has met the criteria for removal from the monitoring program.

Off-site Probes in Buttrick/Schley Avenue (North and South) Areas:

Persistent methane detections in probes, located on Buttrick/Schley Avenue areas are attributed to a source separate from a landfill. The DPR has performed desktop and field evaluations to determine the source of the methane measurements.

1. Historic mapping shows the previous presence of marshlands, which are a likely contributor to elevated subsurface methane.

2. Following installation of the landfill gas perimeter vent trench, no significant changes in the elevated methane levels on Buttrick Avenue were observed.

3. LFG fingerprint testing for selected wells on Buttrick Avenue was attempted in June 2011. Monitoring following well purging observed methane levels too low on this occasion to obtain sufficient samples for laboratory analysis.

Due to these considerations, decommissioning of these probes may be requested of NYSDEC prior to meeting the criteria established in this document.

Piezometers

Monitoring of perimeter piezometer locations within the LFG vent trench will continue while LFG monitoring continues at perimeter gas monitoring locations. Once data shows that all perimeter gas monitoring locations have met the criteria for removal from the monitoring program, monitoring of the piezometers will also be discontinued, and piezometer locations will be abandoned in place, pending approval by NYSDEC.

Passive Vent Trench

Maintenance of the passive vent trench will continue while LFG monitoring continues at perimeter gas monitoring locations. Once data shows that all perimeter gas monitoring locations have met the criteria for removal from the monitoring

program, inspections of the vent trench and its use as a passive gas mitigation method will be discontinued, pending approval by NYSDEC.

Passive Venting Systems

The 12 community park vents will remain in place after LFG monitoring and mitigation activities cease, due to their incorporation into park facilities. Once it is determined that on-site and perimeter monitoring can be discontinued, inspections of these vents and their use as a passive gas mitigation method will be discontinued, pending approval by NYSDEC.

Passive vents associated with utilities, structures, and ponds may be selected for decommissioning on site, pending approval by NYSDEC.

The 25 stand-alone passive vents within the golf course boundary will be monitored for stack height reduction eligibility only during annual inspection events. The stand-alone passive vents are designed with a sampling port to facilitate monitoring. Vents will be eligible for a stack height reduction according to the following:

- Following five years of methane detections reported below the LEL at an individual vent location, vent height will be reduced to 6 inches above ground surface. Reduced height vents will continue to remain in service and be fitted with an appropriate cover to allow venting and protect from damage or foreign objects.

The 25 stand-alone passive vents within the golf course boundary may be selected for decommissioning, pending approval by NYSDEC. Once on site and perimeter monitoring locations have shown compliance with the criteria for removal from the monitoring program, inspections of the vents and their use as a passive gas mitigation method will be discontinued.

DPR will submit a request with supporting documentation to NYSDEC 30 days prior to the planned date to decommission of any passive venting locations. DPR will not take action until the request has been approved by NYSDEC.

SSD Systems

Once it is determined that all of the 25 stand-alone onsite passive vents have been decommissioned based on the decommissioning guidelines provided in this document and upon approval by NYSDEC, SSD systems will be phased out of active operations. At this time the SSD systems will be retrofitted to enable passive venting. Continuous methane monitors and alarms will remain in place inside each building, and be maintained until approval to discontinue continuous monitoring is granted by NYSDEC.

6.4 Record-Keeping and Reporting

6.4.1 Record-Keeping

All project documents, maintenance, and monitoring records will be held at the NYCDPR Bronx Borough Office (Ranaqua), Bronx Park, Bronx, New York. An additional copy of the LFG OM&M plan will be maintained at the Site's Maintenance Facility office. Project documents held by the DPR will include:

- Construction Specifications;
- Record Drawings;
- Ferry Point Landfill Gas Management Plan;
- Ferry Point Landfill Gas Operations, Maintenance, and Monitoring Plan; and
- Equipment Manufacturers Operations and Maintenance Documents and Specifications.

Monitoring personnel will be required to fill out the forms enclosed in Appendix D upon completion of the respective Site activity. Completed forms will be kept on-site for a minimum of one year and retained by the DPR thereafter. These documents will be provided to NYSDEC as part of the Annual Report.

6.4.2 Contingency Reporting

LFG Monitoring Locations

- NYSDEC will be notified within 24 hours if methane is detected above the LEL during monitoring activities.
- NYSDEC will be notified within 24 hours when methane detections indicate contingency actions are necessary.
- NYSDEC will be notified within seven days following completion of contingency actions.
- The DPR will prepare and submit a follow-up report to NYSDEC upon completion of contingency actions.

Piezometer Monitoring Locations

- NYSDEC will be notified within 24 hours if groundwater elevation is detected below the base of the passive-vent trench during monitoring activities.

Sub-slab Depressurization Systems

- NYSDEC will be notified within 24 hours if methane levels are reported above 25% LEL.

6.4.3 Annual Reporting

The DPR will prepare and submit an Annual Report to NYSDEC describing monitoring activities each year. Observation, repair, and monitoring reports will be included as appendices to the annual report. Annual reports will be submitted until the phase-out and decommissioning of all LFG-control systems and monitoring locations has occurred. The annual report will be submitted to NYSDEC by March 31 of the year following the monitoring period.

TABLE OF CONTENTS

SECTION **PAGE NO.**

1 Introduction 6

1.1 Purpose 6

1.2 Report Organization 6

1.3 Background Information 7

1.3.1 Project Scope 7

1.3.2 Project Site 7

1.3.3 Key Agencies 9

1.3.4 Independent Environmental Monitor 10

1.3.5 Project and Part 360 Permitting History 10

1.3.6 Construction Drawings 19

2 Part 360 Permit 20

2.1 Part 360 Permits and Modifications 20

2.2 Reference Documents 20

2.3 Non-Conformance Issues 20

2.4 Operational Upsets, Emergencies, and Unusual Circumstances 20

2.4.1 Security breaches, Unauthorized Entries, Injuries, Fires, Theft, Vandalism, etc. 20

2.5 Reporting 22

2.5.1 Daily Observation Reports (DOR) 22

2.5.2 Fill Management Reports (FMR) 22

2.5.3 Quarterly Reports 22

2.6 Authorized Fill Volumes 23

3 Fill Importation QA/QC Program 25

3.1 Source Site Reviews 25

3.1.1 Shaping Layer Material 28

3.1.1.1 PS-310 (942 62nd Street, Brooklyn, NY) 30

3.1.1.2 PSAC 30

3.1.1.3 Barclays Arena (620 Atlantic Avenue, Brooklyn, NY) 30

3.1.1.4 JFK Jet Blue/Delta Runway (Jamaica, NY) 31

3.1.1.5 Columbia University 31

3.1.1.6 Long Island Jewish Center (270-05 76th Avenue, New Hyde Park, NY) 31

3.1.1.7 Highbridge Terrace (220 West 167th Street/Sedgewick Avenue, Bronx, NY) 31
3.1.1.8 Astoria (27-07 23rd Avenue, Queens, NY) 32
3.1.1.9 Eastside Access (Queens Street and Jackson Avenue, Queens, NY) 32
3.1.1.10 Kew Gardens (Van Wyck Expressway between Grand Central Avenue and 86th Avenue, Queens, NY) 34
3.1.1.11 PS-285 (1065 Martin Luther King Boulevard, Bronx, NY) 37
3.1.1.12 Flushing Hotel (133-63 Roosevelt Avenue/39-20 Prince Street, Queens, NY) 37
3.1.1.13 2nd Avenue (2nd Avenue and 94th Street, New York, NY) 38
3.1.1.14 2nd Avenue (2nd Avenue and 72nd Street, New York, NY) 39
3.1.1.15 Alexander Hamilton Bridge (Bronx, NY) 39
3.1.1.16 Throgg's Neck/Target/USPS (815 Hutchinson River Parkway, Bronx, NY) 40
3.1.1.17 PS-287 (110-10 Northern Boulevard, Queens, NY) 41
3.1.1.18 City Point Brooklyn (1 DeKalb Avenue, Brooklyn, NY) 42
3.1.1.19 400 Park Avenue South (New York, NY) 43
3.1.1.20 Union Street (43-31 Union Street, Flushing, NY) 43
3.1.1.21 Mount Vernon Recycling Corp. (113 Edison Avenue, Mount Vernon, NY) 43
3.1.1.22 228th Street (Rosedale, NY) 43
3.1.1.23 Evergreen Recycling/Tully Environmental (Willets Point Boulevard, Corona, NY) 44
3.1.1.24 Waterpointe-Whitestone 44
3.1.1.25 Don Carlo Environmental/Brooklyn (1247 38th Street, Brooklyn, NY) 44
3.1.1.26 Castle Hill Recycling (1000 Zerega Avenue, Bronx, NY) 45
3.1.1.27 Springfield Gardens 45
3.1.1.28 Calvert Vaux (Brooklyn, NY) 45
3.1.1.29 160 Myrtle Avenue (Brooklyn, NY) 45
3.1.1.30 215 E. 68th Street (New York, NY) 46
3.1.1.31 DEP Valhalla (10 Walker Road, Valhalla, NY) 46
3.1.1.32 Tilcon (Bronx) (980 East 149th Street, Bronx, NY) 46
3.1.1.33 NY Recycling (475 Exterior Street, Bronx, NY) 47
3.1.1.34 Little Bay (Queens, NY) 48
3.1.2 Cover Layer Material 49
3.1.2.1 Bloomingburg (C.M. & Sons Trucking Site, 680 Bloomingburg Road, Bloomingburg, NY) 50

3.1.2.2 Ranco Sand (115 South Street, Manorville, NY) [LAWS] 52
3.1.2.2.1 Ranco Sand (115 South Street, Manorville, NY) [MFM] 56
3.1.2.2.2 Ranco Sand (115 South Street, Manorville, NY) [Triton] 57
3.1.2.3 East Coast Mines (Lewis Road near Route 104, East Quogue, NY) 57
3.1.2.4 Amboy Aggregates (415 Main Street, South Amboy, NJ) 61
3.1.2.5 Long Island Compost/Great Gardens (445 Horseblock Road, Yaphank, NY) 61
3.2 On-Site Fill Importation Inspections 62
3.2.1 Process 62
3.2.2 Trucking Manifests 63
3.2.3 Rejected Trucks & Materials (JFK Consent Order Material & Misc. Debris) 63
3.3 Fill Tracking 64
3.4 Total Carcinogenic Semi-Volatile Organic Compound Tracking 68
4 Construction 68
4.1 General Construction 68
4.1.1 Community Park 68
4.1.2 Golf Course 69
4.1.3 Waterfront Park 69
4.2 Environmental Controls/Construction 70
4.2.1 Wells (Landfill gas, groundwater and water balance analysis) 70
4.2.2 Liners 73
4.2.3 Gas Venting 74
4.2.3.1 Active 74
4.2.3.2 Passive 74
4.2.4 Vent Trench 75
4.2.5 Landfill Cap 77
4.2.6 Environmental Controls On-Site Structures 77
4.3 Municipal Solid Waste (MSW) 78
4.3.1 Manifests 79
4.4 Earthwork/Fill Placement 79
4.4.1 Shaping Layer Material 80
4.4.2 Demarcation Layer 81
4.4.3 Cover Layer Material 82

4.4.4 Greens and Tees Mix, Bunker Sand 84
4.4.5 Topsoil 85
4.5 Meetings 85
4.6 As-Built Survey, Record Drawings, Deviations from Approved Design Plans 85
5 Environmental Monitoring 88
5.1 SWPPP 88
5.2 Landfill and Off-Site Gas Monitoring 89
5.2.1 Bi-Weekly 100
5.2.2 Special Conditions 101
5.3 Piezometer Monitoring 101
5.4 Settlement Plate Monitoring 101
5.4.1 Short Term 104
5.4.2 Long Term 106
5.5 Groundwater Monitoring 108
5.6 Deed Restriction 113
5.7 Post Construction Monitoring 113
5.7.1 Golf Course Operations 114

1 Introduction

1.1 Purpose

This Final Construction Certification Report for the Ferry Point Park Golf Course is submitted to the New York State Department of Environmental Conservation upon completion of the construction of Ferry Point Park East, a solid waste management facility, which includes the resultant information prepared in accordance with 6NYCRR Part 360 of the New York State Solid Waste Management Program.

This report is to certify that the construction of Ferry Point Park East has been completed in accordance with the 6NYCRR Part 360 and the Ferry Point Park Part 360 permits. Therefore, this report will present in great detail each specific approved component of the project – what was approved, what was actually constructed initially (with pictures), the changes that were made, and the final status and design as of the date of this report (with pictures).

1.2 Report Organization

This report has been generated to provide a written post-construction certification report to comply with the requirements of the Project's Part 360 Permits. The narrative and supporting information provided in this report have been organized such that any individual, especially those not familiar with the project, can gain a concise understanding of the history of improvements at the Site. As such, the report has been organized into the following sections:

- This report begins with this introductory chapter (Section 1) which briefly describes the purpose and scope of the project, provides details pertaining to the Site background including a Site description, key agencies involved, and Project and permitting history.

- Section 2 describes the Part 360 Permits and modifications, Permit reference documents, non-conformance issues, operational upsets, emergencies, and unusual circumstances, and reporting completed associated with the Project.

- Section 3 details the fill importation QA/QC program, specifically source site reviews for shaping layer and cover layer material, on-site fill importation inspection, trucking manifests, rejected trucks and materials, fill tracking, and total carcinogenic semi-volatile organic compound tracking.

- Section 4 provides details related to construction activities on-site including construction of the Community Park and the Golf Course, status of the Waterfront Park, environmental controls such as landfill gas wells, groundwater wells, liners, gas venting systems, vent trench, landfill cap, municipal solid waste handling, earthwork and fill placement, demarcation layer, miscellaneous golf course materials such as greens and tees mix, construction progress meetings, and deviations from the approved design plans and/or Permit requirements with as-built surveys.

- Section 5 details the environmental monitoring completed during the Project including Stormwater Pollution Prevention Plan (SWPPP), landfill gas, piezometer, settlement plate, and groundwater monitoring as well as information related to the deed restriction and post construction monitoring requirements at the Site.

- Section 6 provides a summary of the report.

- Report certification is provided in Section 7.

1.3 Background Information

1.3.1 Project Scope

Ferry Point Park in the Bronx (the "Site") is a former landfill covering 222 acres that is bounded by the Bronx-Whitestone Bridge and Hutchinson River Parkway to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south (See Figure 1-1 Ferry Point Park Project Area Map). The project was originally managed under Ferry Point Partners, LLC and was taken over solely by the City of New York Department of Parks and Recreation in October 2007.

The original project scope (the "Project") included the construction of three main elements including a golf course, a community park, and a waterfront park over the 222-acre Site (see Figure 2-1 Ferry Point Park Site Layout) as follows:

1. An 18-hole golf course with practice facility, driving range, clubhouse, maintenance facility, irrigation lake, stormwater retention ponds, and a parking lot (192.5 acres);
2. A passive recreation waterfront park with walkways and a comfort station (19.5 acres); and
3. A community park with baseball fields, basketball court, walkways, comfort station, and landscaped stormwater retention area (10 acres).

1.3.2 Project Site

The origins of the site for purposes of presenting a description of the site and surrounding area for this report extend back to the early 1900's. At that time an available 1900 map of the Bronx (Figure 2-2) showed the western edge of the site which now contains the expressway and Whitestone Bridge was a long narrow peninsula extending out to the same area that the northern landing of the Whitestone Bridge now extends to. Immediately east of this peninsula was a large open bay which is the area that the Ferry Point Golf Course is located within. Further to the northeast of this bay and well inland and beyond the current golf course was the Baxter Creek that drained into the bay. The eastern landfall of this embayment area is a larger peninsula that contains roadways and what appears to be residential development. The road patterns do not resemble the roadways that currently exist in that area and appear to have been changed.

A 1938 aerial photo (Figure 2-3) showing the construction of the Whitestone Bridge shows the Bay, mooring, residential area and land to the west to be virtually the same as shown in the 1900 map (Fig. 2-2). The significant change is in the widening of the western peninsula where the expressway was being constructed leading to the bridge ramps. The widening was not significant at this time but a rectangular area in the extreme northwest corner of what is now the site does appear to be filled and graded possible for bridge and expressway construction staging or support. Areas of filling can be readily identified by the contrasting lighter color typically indicative of sandy dredge sand placement. Other areas along the shoreline can be seen as containing a lighter colored band of fill material and this includes much of the new Ferry Point Park located west of the Whitestone Bridge. Much of the park area was filled, graded and completed by 1938. Bulkheads were constructed with linear components to present a smooth shoreline but one that does not appear to contain a beach where water diminishes in depth to 0. Photos of the eastern area of the bay where mooring and docks can be seen showing large vessels moored against the shore. This would indicate the water has significant depth all of the way to the center of the bay.

Aerial photographs from the 1950's (Figure 2-4) show a drastic change in the area currently referred to as the site. Large expansion of the filling that was evident in 1938-39 up in the northeast corner can be clearly seen. The filling extends well into the bay and it appears that a connective bridge was constructed from the eastern shore to the fill area. It is difficult to discern if this is a usable structure for crossing or if it had some other purpose. The filling operation appears from the photo to consist of the same light colored material that was placed in the Ferry point Park and from photos showing a large number of barges in the water filled with material of the same light color. There is no specific logs and documentation that presents the specific origin and consistency of the material but from the prior aerials showing filling and this large expansion, it appears to be of a similar origin which would be dredge sand. In the 1951 aerial, no specific municipal solid waste dumping and disposal can be seen but the records indicate the landfill operated from this approximate time period. So it can be assumed that municipal solid waste was dumped within the site area very soon after that. The filling shown in the aerial may very well have been the initial construction of the upper portion of the landfill with the tidal gate or bridge closing in the upper bay area. Additional aerials of the landfilling were not identified and more recent aerials document the completion of filling as well as the more recent golf course construction.
What can be discerned from this compilation of photos is that the landfill was located on area that may have been completely filled open water as well as some area that was previously reclaimed land with dredge material.

The Site operated as a landfill from before 1951 to the 1960's. The landfill reportedly accepted municipal solid waste during its operating period and was closed and covered in the mid-1960's, with additional closure operations conducted more recently in the 1980's. Prior Site use was determined from historic aerial photographs from 1951 thru 1991. The aerial photographs span practically the entire operational period of the prior landfill, from its initial operations to the present, and provides substantial information about the Site's development.

1.3.3 Key Agencies

The following were the key agencies associated with the project providing oversight, administration, design, construction, and monitoring services. The following is not intended to be an exhaustive list of involved entities related to the Project. A more extensive list of project participants is included in Appendix 18.

Primary Regulatory Agency:
New York State Department of Environmental Conservation Region 2 ("NYSDEC")

Project Permittee (Prior to October 2007):
Ferry Point Partners, LLC ("FPP")
City of New York Department of Parks and Recreation ("NYCDPR")

Project Permittee (Post October 2007):
City of New York Department of Parks and Recreation ("NYCDPR")

Primary Design, Engineering, Construction, and Monitoring Consultants:
Sanford Golf Design ("Sanford")
Nicklaus Design ("Nicklaus")
TRC Companies, Inc. ("TRC")
Langan Engineering & Environmental Services, Inc. ("Langan")
Ecology and Environment, Inc. ("E&E")
KS Engineers PC ("KSE")
Wesler Cohen Associates ("WCA")
The Pignato Group ("TPG")
Thomas Balsley Associates ("TBA")
Green Bases, Inc. ("GBI")

Independent Environmental Monitor ("IEM"):
ARCADIS/Geraghty & Miller (July 2000 – December 2000)
Gannett Fleming (December 2000 – October 24, 2010)
Woodard & Curran ("WC") (October 25, 2010 – Project Completion)

General Contractor:
Golf Course and Community Park: LAWS Construction Corp. ("LAWS")
Community Park Comfort Station: TJM Construction Corp. / Long Island Concrete, Inc.
Golf Course Maintenance Building, Rain Shelter, Comfort Station: Triton Structural Concrete, Inc.
Golf Course Cover Layer Material Importation: MFM Contracting Corp.

Golf Course Concessionaire/Operator:
The Trump Organization ("Trump")

1.3.4 Independent Environmental Monitor

The requirement for an Independent Environmental Monitor ("IEM") on this project was associated with an increased level of monitoring exceeding normal review and oversight practices of the NYSDEC in order to protect public health and the environment. The increased level of review and oversight for this Project was mainly associated with the extensive effort required for evaluation of fill material sources, source site testing and inspection, importation of the fill material, extensive earthwork, and environmental monitoring required at the 222-acre Site.

In accordance with Special Condition 24 of the 2014 Permit, NYCDPR was responsible to retain an IEM, accountable to the NYSDEC, to provide environmental oversight of all activities authorized under the Permit including but not limited to the quantification, importation and placement of fill, and the monitoring of the Site. Particular activities performed by the IEM for this Project included the following:

- Report deviations from or non-compliance with permitted activities to the NYSDEC;
- Evaluate and inspect fill sources;
- Witness source site investigation, sampling, and compare lab test results to Permit requirements;
- Visual and Photo-Ionization Detector (PID) inspection of imported fill materials to the Site;
- Monitor offloading of all trucks and reject unacceptable materials from being dumped on the Site and used for construction;
- Monitor environmental sampling on the Site (i.e. landfill gas, piezometer, groundwater, settlement, etc.);
- Monitor all aspects of fill operations on the Site, particularly the installation of minimum thickness of shaping layer and cover layer materials as well as demarcation layer installation; and
- Complete and submit to the NYSDEC Daily Observation Reports, bi-weekly Fill Management Reports, and Quarterly Reports related to Project activities.

The selection, continued retention, discharge, or replacement of the IEM was subject to the approval of the NYSDEC, at its sole discretion.

1.3.5 Project and Part 360 Permitting History

The following represents an overview of project and permitting history outlining key events associated with the Project. For more detailed and additional supporting information, reference the updated Permit Modification application package titled "Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East", dated May 31, 2012 and subsequently revised on August 31, 2012, June 20, 2013, and October 15, 2013 ("2013 Engineering Report") included in Appendix 20.

In May 1997, a Request for Proposals was released for the development of the Site. In May of 1998 Ferry Point Partners, LLC ("FPP") was selected as the developer and in the late May 2000, the City of New York Department of Parks and Recreation ("NYCDPR") initially entered into a license agreement with FPP to develop, construct, and operate the new recreation facility. The facility included a Jack Nicklaus signature golf course, a community park, a waterfront park, and related facilities (the "Project"). At that time, all required reviews for the Project were completed under the City Environmental Quality Review (CEQR),

State Environmental Quality Review Act (SEQRA), and New York City's Uniform Land Use Review Procedure (ULURP).

On July 17, 2000, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-00014-00011) (the "2000 Permit") jointly to NYCDPR and FPP (the "Permittee"), for a non-specific "facility" under Part 360-1.9(b) at the Site (see Appendix 1 for a copy of the permit). This permit allowed the Permittee to import and place fill necessary to construct the Project. This permit allowed for 1,000,000 cubic yards of fill material (in-place volume) to be imported and placed on the Site. The Permittee prepared an Engineering Report, dated April 11, 2000 and a Report on Fill Management Operations & Maintenance, dated May 16, 2000 as part of the permit application.

After the receipt of the original Part 360 Permit in July 2000, FPP entered into a contract with LAWS Construction Company, Inc. (the "Contractor") to construct the golf course, parks and other features of the Project, and to identify, secure and import the off-site fill material to be used to meet the design elevations of the grading plans referenced in the 2000 Permit.

Initially ARCADIS/Geraghty & Miller, Inc. was retained as the IEM. ARCADIS/Geraghty & Miller, Inc. was retained as the IEM for a period from July 2000 to December 2000 and was replaced as the IEM by Gannett Fleming Engineers and Architects, P.C. in December 2000.

FPP began importing fill to the Site in August 2000 and continued, with some interruptions, until January 2002 when fill deliveries were halted pending the modification of the 2000 Permit.

On January 10, 2001, the NYSDEC issued a letter addressing quality control protocol for potential sources of material from sites that previously experienced backfilling with soil, but not with waste materials, for the use in the shaping layer.

On May 21, 2001, the NYSDEC issued a Fill Procurement Protocol letter addressing acceptance of uncontaminated, unprocessed construction and demolition debris ("C&D") from registered C&D processing facilities.

On May 24, 2001, the NYSDEC issued a Fill Procurement Protocol letter addressing paragraph b in the May 21, 2001 letter and clarifying the definition of processed material.

From May to December 2001, based on the results of the Site perimeter methane gas monitoring, the NYSDEC required the construction of a landfill gas passive vent trench along most stretches of the Site perimeter from the water's edge near the foot of Emerson Avenue, along the entire length of the Site boundary with Balcom Avenue, and along Schley Avenue and continuing approximately 1,050 feet to the west past the intersection of Schley Avenue and Buttrick Avenue. In total, approximately 5,350 feet of passive vent trench was constructed (see Section B.3.a of Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx,

NY, Engineering Report, dated June 30, 2005 (revised) for additional information). Additional discussion related to the vent trench construction is included in Sections 4.2.4 and 4.6 of this report.

In February 2002, the Permittee requested a modification to the 2000 Permit to increase the volume of in-place fill to approximately 1,550,000 cubic yards and changes in design features. The Permittee prepared a Supplement to the Engineering Report, dated February 11, 2002 and a Response to Request for the Additional Information, dated July 2, 2002 as part of the permit modification.

On October 18, 2002, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-0014-00013) (the "2002 Permit") to allow the Permittee to place 1,522,300 cubic yards of in-place fill on the Site (see Appendix 1 for a copy of the permit modification). Prior to October 18, 2002, 446,500 cubic yards of shaping material had been imported to the Site.

After the NYSDEC issued the 2002 Permit in October 2002, FPP resumed importing fill to the Site. The importation of fill to the Site was performed in accordance with the 2000 Permit, the 2002 Permit, the 2000 Fill Report and the Fill Procurement Protocol per the NYSDEC letters dated January 10, 2002, May 21, 2001 and May 24, 2001.

On December 10, 2002, NYCDPR submitted the Response Action Plan ("RAP") as required by Special Condition 31 of the 2002 Permit. A copy of the RAP is included in Appendix 19.

On March 10, 2003, NYCDPR submitted a proposal to the NYSDEC to repair and replace methane monitoring system components. A copy of the proposal is included in Appendix 19.

In response to NYCDPR's March 10, 2003 request to repair and replace methane monitoring system components, the NYSDEC approved replacement of 34, 25-foot spaced, semi-permanent monitoring wells with eighteen, 50-foot spaced, monitoring wells along Miles and Emerson Avenues, in accordance with Special Condition #37 of the 2002 Permit, on March 17, 2003. Installation of the replacement monitoring wells was completed in May 2003.

On November 18, 2003, the NYSDEC approved the Work Plan for the Final Consent Order, Case No. R2-20030724-187, dated November 18, 2003. This provided for the placement on Site of the solid waste material excavated during the construction of the gas venting trench, the size reduction of concrete on Site, and the processing and composting of existing wood on Site. The solid waste material was moved and placed in January 2004 and the processing and composting of the wood was completed in the spring of 2004. A copy of the approval is included in Appendix 19.

On January 12, 2004, the NYSDEC transmitted a copy of the executed Order on Consent No. R2-20030724-187 to NYCDPR. A copy of the fully executed consent order is included in Appendix 19.

On November 1, 2004, the NYSDEC approved the revised truck compaction factor of 42.4% based on the October 10, 2003 30% aerial topographic survey as was required per the 2002 Permit.

On December 7, 2004, the NYSDEC approved the revised truck compaction factor of 41% based on the July 17, 2004 60% aerial topographic survey as was required per the 2002 Permit.

In May 2005, the Permittee requested a modification to the permit to increase the volume of in-place fill to approximately 2,370,000 cubic yards among other items in order to reshape the Golf Course related to a revised design by the golf course architect. The Permittee prepared Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associated dated June 30, 2005 (revised) and Volume #2, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associated dated June 30, 2005 (collectively known as the "2005 Engineering Report"). A copy of the 2005 Engineering Report is included in Appendix 20.

On August 2, 2005, NYCDPR responded to NYSDEC comments on the previously submitted June 30, 2005 Permit Modification and Engineering Report. A copy of the comment response is included in Appendix 19.

On November 18, 2005, the NYSDEC issued the modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013) to place a total of 2,543,729 cubic yards of in-place fill on the Site (see Appendix 1 for a copy of the permit modification). This action was followed by a December 27, 2005, revision (No. 2-6006-00014/00013) that amended the total in-place fill volume to 2,370,000 cubic yards (the "2005 Permit").

On April 4, 2006, NYCDPR submitted a request for a determination related to cover layer material chemical criteria to the NYSDOH. On August 2, 2006, the NYSDOH provided written determination related to fill material chemical criteria required under Permit Special Condition 15(d) of the 2005 Permit. The submission and response are included in Appendix 19.

On October 25, 2006, the NYSDEC authorized the importation of shaping layer material from otherwise allowable sites with a total carcinogenic SVOC level in exceedance of the site limit, but 10 ppm or lower provided that a weighted average equal to or less than 3 ppm would be achieved by the end of each quarter of each year. A copy of the correspondence is included in Appendix C.1 of the 2013 Engineering Report (Appendix 20).

On October 26, 2007, the NYCDPR terminated the license agreement with Ferry Point Partners, LLC and took over site development activities. Ferry Point Partners, LLC was no longer involved with the Project or a Permittee.

On February 29, 2008, FPP submitted an application to the NYSDEC to transfer the Part 360 Permit solely to NYCDPR.

On July 25, 2008, a permit renewal application package to the 2005 Permit was submitted by NYCDPR. This submittal requested a modification of the 2005 Permit to allow the use of dredge and processed dredge material (PDM) as fill and the barge delivery of such fill material to the Site.

On August 12, 2008, the NYSDEC notified NYCDPR and FPP that the Part 360 Permit had been transferred to NYCDPR.

On October 24, 2008, the NYSDEC issued a Notice of Incomplete Application and comments to the July 25, 2008 submittal.

On December 2, 2008, the NYSDEC issued a letter to advise NYCDPR that the 2005 Part 360 Permit (with the corresponding November 30, 2008, expiration date) remained in full force and effect until NYSDEC approved the permit renewal application, as per Section 401(2) of the State Administrative Procedure Act (SAPA). See Appendix A of the 2013 Engineering Report (Appendix 20) for a copy of the SAPA letter.

On December 26, 2008, a response to NYSDEC's comments of October 24, 2008 was submitted by NYCDPR with a supplemental permit application package to the 2005 Permit.

On April 8, 2009, the NYSDEC issued comments to the December 26, 2008, permit application submittal. A copy of the comment letter is included in Appendix 19.

On April 9, 2009, the NYCDPR withdrew its request for a permit modification to allow the use of Processed Dredged Material ("PDM") as fill.

On April 30, 2009, the NYSDEC directed NYCDPR to not accept or place on the Site any cover layer materials with arsenic concentrations greater than 16 ppm or lead concentrations greater than 400 ppm. A copy of the correspondence is included in Appendix C.2 of the 2013 Engineering Report (Appendix 20).

On July 9, 2009, NYCDPR submitted proposed cover layer material chemical criteria to NYSDEC for review and approval. A copy of the correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

On July 28, 2009, the NYSDEC notified NYCDPR that cover material is divided between two classifications: Active (suitable for use in Active or Passive Recreation areas), and Passive (suitable for use in Passive Recreation areas only). NYSDEC provided a table to NYCDPR listing modified heavy metal chemical limits for the cover layer at the Site. A copy of the correspondence is included in Appendix C.2 of the 2013 Engineering Report (Appendix 20).

On September 18, 2009, NYCDPR submitted rationale for a revised shaping layer correction factor based on the latest survey and fill imports volumes at that time. A December 11, 2012 letter evaluating the September 18, 2009 submittal was also submitted to the NYSDEC. The submissions are included in Appendix 19.

On September 25, 2009, the NYSDEC revised and clarified the chromium chemical limits for the cover layer previously presented in the July 28, 2009 correspondence. A copy of the correspondence is included in Appendix C.2 of the 2013 Engineering Report (Appendix 20).

On November 25, 2009, a response to NYSDEC's comments of April 8, 2009, was submitted by NYCDPR with a second supplemental permit application package to the 2005 Permit. This submittal withdrew the request to allow the use of dredge material and PDM as fill and the barge delivery of such fill material to the Site. This submittal also proposed a design modification for a Site-wide active landfill gas control system. The 2005 Permit included passive venting systems for the Site, with active systems proposed only in enclosed structures. The November 25, 2009 permit renewal application is included in Appendix 20.

On June 25, 2010, the NYSDEC issued a Notice of Incomplete Application and comments on the November 25, 2009, permit application submittal. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On August 6, 2010, the NYSDEC issued additional comments on the November 25, 2009, permit application submittal. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On September 29, 2010, a response to NYSDEC's comments of June 25 and August 6, 2010, was submitted by NYCDPR with a third supplemental permit application package for the 2005 Permit. This submittal withdrew the proposed design modification of a Site-wide active landfill gas control system and proposed a system consistent with the 2005 Permit. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On October 7, 2010, a supplemental response to NYSDEC's comments of June 25 and August 6, 2010, was submitted by NYCDPR to accompany the September 29, 2010, permit renewal application submittal. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On October 25, 2010, Woodard & Curran replaced Gannett Fleming, assuming the duties of the IEM for the Project.

On December 17, 2010, NYCDPR submitted supplemental information to the NYSDEC related to the Landfill Gas Report originally submitted to the NYSDEC on November 16, 2010 to address requests from the NYSDEC from a December 2, 2010 meeting. The November 2010 Landfill Gas Report and the December 17, 2010 supplemental information are included in Appendix E of the 2013 Engineering Report (Appendix 20).

On January 3, 2011, the NYSDEC issued a letter directing NYCDPR to collect and provide additional landfill gas data to better elucidate the subsurface conditions at a frequency described in the 2005 Permit. The letter requested that NYCDPR expand the landfill gas monitoring to include concentrations of hydrogen

sulfide, volatile organic compounds, and carbon monoxide, well temperature, and well pressure. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On January 10, 2011, NYCDPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to fill material imported to the Site that violated the Permit. During 2010, fill material was brought on-site and placed in seven different stockpiles. The material was believed to be in conformance with Permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. Under the terms of the consent order, the material was allowed to remain on-site under controlled conditions. The material was used to construct the base of the clubhouse and maintenance facility parking lots. Additional details are included in the Order on Consent, which is included in as Appendix I of the 2013 Engineering Report (Appendix 20).

On January 12, 2011, NYSDEC issued a response to NYCDPR's Request for Explanation of NYSDEC Request for Expansion of Ferry Point Park Landfill Gas Monitoring Parameters. Additional parameters included collecting data for hydrogen sulfide, volatile organic compounds and carbon monoxide, well temperature and well pressure. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On February 16, 2011, NYCDPR submitted test pit analytical data to NYSDEC for review related to demarcation layer installation requirements. A copy of the correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

On March 9, 2011, the NYSDEC issued a response to NYCDPR's February 16, 2011 correspondence requiring demarcation layer to be installed on the Site only in areas where there was less than five feet of shaping and cover layer materials. A copy of the correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

On May 13, 2011, NYCDPR issued a memorandum to the NYSDEC presenting the results of a site-wide water balance based on a cover layer material permeability of 14 inches per hour, which indicated that there would be a reduction in the infiltration rate over the entire Site. A copy of the correspondence, which includes additional details on the topic, is included in Appendix D.1 of the 2013 Engineering Report (Appendix 20).

On May 26, 2011, NYCDPR requested confirmation from the NYSDEC that the use of USEPA Analytical Method 625/8270 was an acceptable alternative method for the analysis of dioxin and furan constituents. The NYSDEC provided verbal confirmation that this was an acceptable method to be used. A copy of the correspondence is included in Appendix C.5 of the 2013 Engineering Report (Appendix 20).

NYCDPR issued a June 2011 report to the NYSDEC regarding sampling and analysis of landfill gas vents at the Community Park. A copy of the report, which includes further details of this sampling and analysis, is included in Appendix E.3 of the 2013 Engineering Report (Appendix 20). On July 1, 2011, the NYSDEC concluded that there were no ambient air impacts due to the landfill gas emissions from the twelve vents

located in the Community Park and that no further monitoring was necessary beyond routine maintenance.

On August 10, 2011, NYCDPR issued a subsequent water balance memorandum indicating that a higher cover layer material permeability of 30 inches per hour would also result in a lower volume of water infiltrating through the surface of the Site after completion of construction. Section 4.2.1 includes the description relating to the site permeability modifications. Additional details related to the water balance are included in Appendix D.2 of the 2013 Engineering Report (Appendix 20).

On September 19, 2011, NYCDPR prepared technical memorandum Field Sampling Procedures for Ferry Point Site related to groundwater characterization. The memorandum is included in Appendix G of the 2013 Engineering Report (Appendix 20).

On October 18, 2011, NYCDPR submitted a technical drainage review memorandum to the NYSDEC for review regarding the final cover material and site wide water balance. A copy of the correspondence is included in Appendix D.5 of the 2013 Engineering Report (Appendix 20).

On October 21, 2011, the NYSDEC provided a response to NYCDPR's October 18, 2001 technical drainage review memorandum including a conditional approval allowing cover layer material to have a percolation rate of up to 30 inches per hour. The condition was that NYCDPR was required to submit for approval an amendment to the Stormwater Pollution Prevention Plan (SWPPP) including plans and computations that reflect the partial lining of stormwater basins. A copy of the correspondence is included in Appendix D.5 of the 2013 Engineering Report (Appendix 20).

On November 16, 2011, NYCDPR provided NYSDEC with a technical memorandum addressing the conditions included in the October 21, 2011 conditional approval for the cover layer material percolation rate. A copy of the correspondence is included in Appendix D.6 of the 2013 Engineering Report (Appendix 20).

On December 2, 2011, the NYSDEC provided an approval for NYCDPR's SWPPP amendment via email. A copy of the correspondence is included in Appendix D.6 of the 2013 Engineering Report (Appendix 20).

On January 26, 2012, the NYSDEC clarified that the average percolation rate from all samples collected within one cover layer material stockpile could be used as the representative percolation rate of that stockpile due to the mixing that occurred during loading, unloading, transport, stockpiling, and spreading of the material. A copy of the correspondence is included in Appendix 19.

On March 28, 2012, NYCDPR submitted to the NYSDEC initial groundwater monitoring data from the installation of 11 new monitoring wells installed and sampled in February 2012. NYCDPR requested additional direction from the NYSDEC concerning procedures for future sampling events.

On May 1, 2012, the NYSDEC acknowledged that settlement plate monitoring at several points has been discontinued due to interference with ongoing construction, and informed NYCDPR that the short-term monitoring locations did not need to be replaced as long as construction at the Site progressed and the long-term plates were installed as construction was completed. A copy of the correspondence is included in Appendix H of the 2013 Engineering Report (Appendix 20).

On May 8, 2012, a conference call was held between NYCDPR and the NYSDEC to discuss the initial groundwater monitoring data submitted on March 28, 2012 and to discuss guidance for future groundwater monitoring. The NYSDEC provided NYCDPR with requirements for future groundwater monitoring in their May 8, 2012 Ferry Point Park Groundwater Characterization/Monitoring Objective. Meeting minutes are included in Appendix G of the 2013 Engineering Report (Appendix 20).

On May 24, 2012, the NYSDEC verified via email that there were no outstanding enforcement actions for the Site. A copy of the correspondence is included in Appendix B of the 2013 Engineering Report (Appendix 20).

In May 2012, the Permittee requested a modification to the Permit presenting studies, modeling, investigations, and design work that were performed to resolve outstanding comments that were received by the Permittee after the April 8, 2009 Notice of Incomplete Application and the November 25, 2009 permit application to the NYSDEC. NYCDPR submitted the initial version of the Supplemental Engineering Report dated May 31, 2012.

On June 8, 2012, the NYSDEC confirmed that the sand material used for the tees, greens, and sand traps (bunkers) should not be counted towards the Permit stated allowable cover soil maximum of 250,000 cubic yards. Based on information provided to the IEM by NYCDPR, NYCDPR's consultants have estimated the required sand material volumes as follows: Tees and Greens (24,705 cubic yards), Driving Range Tee (3,025 cubic yards), and bunkers (6,076 cubic yards). Since these values were estimated and calculated by NYCDPR's consultants, it shall be noted that actual installed volumes may fluctuate from the volumes identified above. Information is from an email from Joe Voss to Faisal Choudhury on June 13, 2012. A copy of the correspondence is included in Appendix 19.

On January 23, 2013, NYCDPR submitted the rationale for increasing the amount of cover layer material that could be imported to the Site under the Permit. A copy of the correspondence is included in Appendix 19.

On February 1, 2013, The NYSDEC issued an amendment to the 2005 Permit (last modified October 17, 2012) authorizing the Permittee to import a total of 2,514,000 cubic yards of in-place fill totaling approximately 2,120,000 cubic yards of shaping layer material and approximately 394,000 cubic yards of cover layer material. A copy of the amendment is included in Appendix 1.

On April 26, 2013, the NYSDEC notified NYCDPR that the compaction factor for cover layer material was revised to 18%, approving NYCDPR's revised April 8, 2013 submittal. A copy of the approval letter and submittal are included in Appendix 19.

On October 15, 2013, NYCDPR submitted the final version of the "2013 Engineering Report", entitled Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, NY dated May 31, 2012 (Revised August 31, 2012, October 15, 2013) to address concerns raised by the NYSDEC since the Notice of Incomplete Application of November 25, 2009 to modify the 2005 Permit. The 2013 Engineering Report is attached in Appendix 20.

On April, 17, 2014, the NYSDEC confirmed via email that a minor exceedance of the cover layer in-place volume as included in the Permit is acceptable considering no additional shaping material will need to be imported and that the exceedance could be addressed via as-built drawings and in the final construction certification report. A copy of the email is included in Appendix 19.

On May 21, 2014, the NYSDEC issued the modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013 (SW)) and Tidal Wetlands Permit (No. 2-6006-00014/00016 (TW)) (the "2014 Permit"). See Appendix 1 for a copy of the permit.

On October 29, 2014, the NYSDEC issued an amendment to Special Condition 24 of the 2014 Permit stating that during fill delivery and earthwork, NYCDPR should submit quarterly reports to the NYSDEC summarizing all Site activities set forth in the Permit. Each report should provide details of all rejected fill material, quantify the amount of material imported to the Site using truck volumes, and the results of all on-site monitoring for that period. All fill tracking, earthwork activities, landfill gas monitoring, and associated reporting requirements typically contained within each Fill Management Report would be addressed by Quarterly Reports moving forward and Fill Management Reports would no longer be issued. FMRs were no longer being issued due to a significant reduction in fill importation and earthwork activities at the Site. A copy of the letter is included in Appendix 1.

For a detailed history of site operations and activities prior to June 30, 2005, see Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associated dated June 30, 2005 (revised) which is attached in Appendix 20.

1.3.6 Construction Drawings

The project included a substantial number of different construction drawings associated with the Project. Construction drawings are included in Appendix 4.

2 Part 360 Permit

2.1 Part 360 Permits and Modifications

The following is a list of the permits and modifications issued for this Project:

On July 17, 2000, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-00014-00011) (the "2000 Permit").

On October 18, 2002, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-0014-00013) (the "2002 Permit").

On November 18, 2005, the NYSDEC issued a modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013), followed by a December 27, 2005 revision (the "2005 Permit").

On May 21, 2014, the NYSDEC issued a modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013 (SW)) and a Tidal Wetlands Permit (No. 2-6006-00014/00016 (TW)) (the "2014 Permit").

Note that a separate SPDES General Permit for Stormwater Discharges from Construction Activity (GP-08-001) was obtained for the Project and the Acknowledgement of Notice of Intent is dated May 12, 2009 (Permit Identification No. NYR10R112).

Copies of the aforementioned permits and modifications are included in Appendix 1.

2.2 Reference Documents

Refer to Appendix 2 for a list of Permit reference documents. These documents support the original Permit and/or provide basis for subsequent permits renewals and modifications.

2.3 Non-Conformance Issues

In accordance with Special Condition 24, the IEM reported on Permit related non-conformance issues during the duration of construction at the Site. A complete list of all non-conformance issues observed and corrective actions taken during the Project is included in Appendix 3.

2.4 Operational Upsets, Emergencies, and Unusual Circumstances

2.4.1 Security breaches, Unauthorized Entries, Injuries, Fires, Theft, Vandalism, etc.

The following information was gathered from TRC, NYCDPR's design and construction consultant:

In July/August of 2013, a CBS film crew received authorization from the Agency to scout and film areas within the Ferry Point Golf Course proper. There were no known issues with those activities.

TRC did not have specific detailed reports for thefts or vandalism that occurred on the Site. To the best of their knowledge, there were two incidents of vandalism to contractor equipment (broken glass

windows and spray painted vehicles), and a few incidents when the perimeter fence was damaged (bent/scratched vertical bars). Landfill gas vent caps were damaged, but there was no evidence of vandalism; the vent caps may have been damaged by lawn mowers or other equipment running over them.

There were no known major fires or injuries during the construction time period.

The only unusual event was the discovery of the body of a construction worker who had fallen from the Throggs Neck Bridge and washed up at the Waterfront Park. For several days there was police presence and other related activity. However, that event was not related to the work at the golf course nor did it delay or adversely affect the progress of the project.

As reported by the IEM:

On the evening of August 18, 2011, the Site was broken into by unknown persons. LAWS equipment storage containers were forced open and various tools and copper piping was stolen. The trespassers appeared to have entered the Site at the back entrance to the golf course along Balcom Avenue. The fence was observed cut open in that area.

Upon arrival at the Site on August 26, 2011, IEM staff observed that the IEM trailer had been broken into by unidentified persons. On-site security and LAWS representatives were notified as well as the local police (by LAWS). Two digital cameras were stolen from the IEM trailer.

On June 25, 2012, the IEM witnessed a trailer of imported fill material slide off its frame during dumping activities. No injuries were reported.

On October 31 and November 1, 2012, IEM staff performed on-site inspections to assess damage caused by Hurricane Sandy. IEM staff observed many areas around the Site where restoration work needs to be performed on the vent trench, silt fence repair, site security fence repair, and garbage/debris removal. The southern site boundary was observed to have significant damage and washout. The entire south end of the Site was open without protection and it was filled with debris from the storm.

On October 25, 2012, the IEM witnessed both a truck and a trailer roll over onto their side during dumping activities. No injuries were reported.

Various Permit non-conformance issues were observed related to unsatisfactory security at the Site beginning with non-conformance issue 12 on October 1, 2003 where security fence and other controls were not properly maintained on-site allowing for unauthorized entry to the Site. Site security, control, and unauthorized access were the subject of non-conformance issues 15, 72, 90, 93, 97, 98, 122, and 127. Ultimately, all of these non-conformance issues were resolved and closed out during construction on an ongoing/as-needed basis.

There was a presence of coyotes at the Site as tracked and studied as part of the Gotham Coyote Project. The work was conducted under NYCDPR permits and information was released to NYCDPR for informational purposes. Coyotes were initially monitored by game camera in Ferry Point Park beginning in January 2012 through 2013. Coyote monitoring did not occur at the Site in 2014.

2.5 Reporting

The IEM was responsible for reporting to the NYSDEC related to Permit activities and compliance for the Project in accordance with Special Condition 24 of the 2014 Permit. The IEM prepared and submitted to the NYSDEC Daily Observation Reports ("DOR"), bi-weekly Fill Management Reports ("FMR"), and Quarterly Reports ("QR"). These reports are attached as appendices to this report and available at the NYCDPR Bronx Borough Headquarters (Ranaqua) document repository and are part of the public record. The address of the repository is 1 Bronx River Parkway, Bronx, NY 10462, telephone: (718) 430-1800.

2.5.1 Daily Observation Reports (DOR)

The IEM reported to the NYSDEC on a daily basis on the following information: weather conditions, municipal solid waste material removal from the site, fill materials imported to the site, detailed notes of construction activities, and non-conformance issues related to the Permit conditions.

DORs are attached in Appendix 5 beginning on October 25, 2010. Daily site activity observations for the time period prior to October 25, 2010 are summarized in the IEM's Fill Management Reports.

2.5.2 Fill Management Reports (FMR)

The IEM prepared Fill Management Reports (FMRs) that were submitted to the NYSDEC on a bi-weekly basis. Generally, the FMRs contained the following information and data: a project summary including an overview of site activities, Permit non-conformance issues, fill source site review activities and associated data, site testing activities, filling and shaping activities, and environmental monitoring. FMRs contained figures identifying imported material dump locations and any active filling, grading, and shaping areas associated with the landfill cap.

FMRs were discontinued on October 31, 2014 with FMR 346. FMRs were discontinued because the importation of shaping layer and cover layer materials and earthwork activities were significantly reduced in scope and scale on the Site. In a Permit amendment issued to NYCDPR on October 29, 2014, the NYSDEC stated that all fill tracking, earthwork activities, landfill gas monitoring, and associated reporting requirements would be addressed by Quarterly Reports thereafter.

FMRs 1 through 346 are attached in Appendix 6.

2.5.3 Quarterly Reports

The IEM prepared Quarterly Reports (QRs) that were submitted to the NYSDEC on a quarterly basis. Generally, the QRs contained summarized and aggregated information included in FMRs over each quarterly reporting period.

QRs beginning with the 4th Quarter of 2002 through the 1st Quarter of 2015 (with the exception of the 1st Quarter of 2011) are attached in Appendix 7. Observations for site activities for the 1st Quarter of 2011 are included in FMRs 247 through 253.

2.6 Authorized Fill Volumes

On July 17, 2000, the NYSDEC issued 2000 Permit jointly to NYCDPR and FPP to allow for a total of 1,000,000 cubic yards of fill to be imported and placed on the Site including approximately 750,000 cubic yards of in-place shaping layer material and 250,000 cubic yards of in-place cover layer material.

On October 18, 2002, the NYSDEC issued the 2002 Permit to allow a total of 1,522,300 cubic yards of fill (in-place) to be imported and placed on the Site. The fill material was to consist of approximately 1,272,300 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The 2002 Permit also stated that, "approximately 415,000 cubic yards of fill was deposited on the Site prior to the effective date of the Permit and the projection for in-place fill material to complete the project was 1,107,300 cubic yards, consisting of approximately 857,300 cubic yards (in-place volume) of select exempt construction debris for the shaping layer and approximately 250,000 cubic yards (in-place volume) of uncontaminated soil for the cover layer.

In 2003, the golf course architect determined that the tournament quality and signature status of the course could be significantly improved by making the facility a "links" style golf course. The changes to the Project as compared to the work authorized under the 2002 Permit included:

- Increasing the support mounding between golf holes and grading the course in a links style.
- Re-routing of holes 11, 12 and 13 to reverse their direction in order to improve player circulation and playing time.
- Moving Hole 9 to the west of the golf driving range in order to improve the safety zone of the driving range and remove the need for high netting.
- Realigning the centerlines of holes: 10, 16, 17, and 18 to improve the strategic layout and visual experience of the golf course.
- Lowering the elevations of tees 4 and 6. This eliminated the retaining wall proposed at the northeast corner of the Site.
- Adding a golf training area at the north end of the driving range. This required shifting the centerline of Hole 8 slightly north and increasing the support mounding around this area to buffer the adjacent holes.
- Increasing the mounding adjacent to the TBTA toll plaza in order to block noise and adjacent traffic from view.
- Shifting the Site roadway along the east side of the bridge to accommodate a TBTA easement that extends 25 feet east of the bridge. This required changes to the parking lot at the clubhouse and the location of detention/water quality basin and Waterfront Park.
- Eliminating the Boathouse Grill restaurant in the Waterfront Park. A restaurant would be located within the banquet facility. Parking spaces for the banquet facility were increased to

accommodate the restaurant. A restaurant may be constructed within the Waterfront Park in a future phase, based on economic demands.

- Modifying the parking lot for the Waterfront Park. The 120 parking spaces for the Waterfront Park will be located near the Whitestone Bridge approach structure.

These proposed changes to the Project increased the total needed in-place fill volume for the project to 2,370,000 cubic yards to shape the golf course in a links style.

The quantification of the imported fill material was continuously tracked by both truck volume and periodic topographic surveys of in-place volumes. Initially it was assumed that truck volume would be reduced by 25% when compacted into place, but a new correction factor was to be calculated. On November 1, 2004, the NYSDEC approved a revised truck correction factor of 42.4%, which was based upon an October 10, 2003 30% aerial topographic survey, and on December 7, 2004, the NYSDEC approved a revised truck correction factor of 41%, which was based upon a July 17, 2004 60% aerial topographic survey. These recalculations were performed by dividing the actual in-place volume by the total cubic yards of truck volume delivered to the Site as of the date of the survey, as required by the 2002 Permit.

TRC prepared the 2005 Engineering Report, which comprised of Volume #1, Volume #2, and a 26 sheet drawing set entitled, "Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2". The 2005 Engineering Report is included in Appendix 20 and represented the following scope of work:

- An 18 hole golf course with practice area;
- Maintenance Area in the northwest corner of the Site;
- Clubhouse parking lot in the southwest portion of the Site;
- Banquet Facility in the southwest portion of the Site (along Emerson Avenue);
- Community Park;
- Waterfront Park with parking lot; and
- Drawing G-3 and G-4 of "Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2", showed the deviations in grading between the plans approved on October 18, 2002 with the proposed plan.

On November 18, 2005, the NYSDEC issued the 2005 Permit authorizing the importation of a total of 2,370,000 cubic yards of in-place fill material to the Site. The fill material was to consist of approximately 2,120,000 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The correction factor was 41% at that time and could be further modified.

On January 22, 2009, in accordance with Special Condition 10 of the 2005 Permit, TRC submitted a revised truck reduction factor of 40.3%. On September 18, 2009 TRC submitted a truck reduction factor of 43.3% based on a May 10 2009 aerial topographic survey. On February 11, 2010, the NYSDEC approved a truck reduction factor of 41.7% as submitted by the IEM on December 11, 2009 (included in Appendix 19).

The Golf Course layout that NYCDPR moved forward with was modified from what was shown in the 2005 Engineering Report as revised by the 2013 Engineering Report. One major change was the complete removal of the Banquet Facility in the southeast part of the Site. There were also changes in the placement, alignment, and grading of some holes on the Golf Course.

On February 1, 2013, the NYSDEC granted a permit modification to increase the limit of cover material from 250,000 to 394,000 cubic yards with the stipulation that NYCDPR revisit the correction factor for cover layer material. It was determined that the correction factor for the granular cover material (sand) was 18%. This revised the truck volume to 480,488 cubic yards. The correction factor for cover layer material was approved per an April 26, 2013 letter from NYSDEC to NYCDPR as included in Appendix 19.

On May 21, 2014, the NYSDEC issued the 2014 Permit to NYCDPR to allow the import of a total of 2,514,000 cubic yards of in-place fill material including 2,120,000 cubic yards of in-place shaping layer material and 394,000 cubic yards of in-place cover layer material.

3 Fill Importation QA/QC Program

Fill material importation commenced on August 2, 2000 and the last day for fill import was May 5, 2015. The fill importation QA/QC program implemented for the Project based on the Permit and associated reference documents was adhered to. The fill importation consisted of two main components including source site reviews and on-site inspections. A source site review was conducted by the IEM prior to any fill material being imported to the Site and additional visual and photo-ionization detector (PID) inspections were completed by the IEM upon the material entering the Site at the IEM inspection platform and again once the material was dumped at the work or stockpile location on the Site.

3.1 Source Site Reviews

Prior to any shaping layer or cover layer material being imported to the Site, each potential source was thoroughly evaluated by the IEM. An environmental review was performed for all proposed source sites in accordance with Special Condition 24 of the 2014 Permit. The source site review process criteria was specified in the Report on Fill Management, Operations and Maintenance, prepared by TRC on May 16, 2000, and revised June 30, 2005 (Volume #2 of the 2005 Engineering Report). The source site review process was modified over time as compared to the original process outlined in the various engineering reports and permit modification requests. The process generally consisted of the following main components:

1. NYCDPR would notify the IEM of a new potential source site. NYCDPR would provide the IEM with the site name and location as well as any available historical site information and soil environmental analytical results that existed for the potential source site.

2. Once NYCDPR confirmed that they wanted to move forward with pursuing the potential source site, NYCDPR authorized the IEM to retrieve any available site information from Environmental Data Resources, Inc. (EDR) which included environmental and historical land use records for the source site property under evaluation including Sanborn maps, city directories, topographic maps, and aerial photographs. NYCDPR then completed an initial review of the existing site information,

generated a sampling plan, and provided the results of the initial review and sampling plan to the IEM. NYCDPR then authorized the IEM to conduct a desktop review of the existing site information (i.e. EDR), any available soil environmental analytical results, and NYCDPR's sampling plan. The IEM provided NYCDPR with comments related to their review and their sampling plan in consultation with the NYSDEC. Once a final sampling plan was agreed upon, the source site investigation was initiated and executed per the NYCDPR sampling plan with IEM oversight. For source sites with in situ material, test pits were typically completed with additional soil samples inspected, collected, and analyzed in accordance with the Permit requirements. Once all the sampling was completed, the IEM reviewed sample results and the IEM generated a memorandum summarizing the review process and provided recommendations and requirements necessary for NYCDPR to address in order to continue pursuing the potential source site. The recommendations typically included conditions associated with overseeing the excavation, loading, and import of the source site material to the Site in accordance with the Permit. The IEM submitted the memo of recommendations to the NYSDEC for review and comment prior to issuing the final memorandum to NYCDPR. The NYSDEC would provide final comments and approval of the source site with any additional required conditions.

3. If NYCDPR determined that the potential source site was worth pursuing considering site-specific conditions, schedules, etc., they coordinated with the source site operator and IEM on importation schedule and requirements. The IEM provided oversight to confirm that the loading, hauling, and overall import of the approved material was completed in accordance with the memorandum of recommendations, NYSDEC conditions, and the Permit.

4. The IEM provided oversight during export from the approved source sites on an as needed basis and provided oversight at each source site during additional sampling activities if the source site was exporting more than the minimum sampling frequency outlined in the Permit (i.e. 10,000 cubic yards for shaping layer material and 2,000 cubic yards for cover layer material).

If at any time during the review process there were reasons for concern identified by the IEM resulting in the potential source site being classified as a "complex" source site, the NYSDEC became the primary reviewer and made final recommendations related to additional site investigation requirements or approval/rejection of the potential source site with support from the IEM. A complex source site was defined by the presence of an abundance of or particular Recognized Environmental Concerns ("RECs") and the NYSDEC made any decisions related to approval and/or associated conditions for further evaluation or import of the fill material.

A flow chart detailing the source site review process is included as Appendix 21.

Details of source site review and site testing activities are included in the report text and tables of each bi-weekly Fill Management Report issued by the IEM. Source site review supporting information and testing data is included in Appendix 8.

The following is a listing of source site reviews completed by the IEM since October 25, 2010. Since October 25, 2010, Woodard & Curran's first day as the IEM, 42 potential source sites were formally identified as potential fill source options by NYCDPR. Of the 42 potential source sites identified since October 25, 2010, 39 were advanced to at least a preliminary review stage. Potential source sites did not advance to a full source site review for various reasons such as changes in schedule, insufficient material, financial infeasibility, red flags identified with past uses of the source site, etc. Details of each source site review and site testing activities completed by the IEM, prior to any importation to the Site, are included in Sections 3.1.1 and 3.1.2 below.

A total of 15 of the potential source sites evaluated after October 25, 2010 and through project completion resulted in material being imported to the Site during that same time period. It is noted that all of the source site reviews included in Sections 3.1.1 and 3.1.2, are associated with the Golf Course and all cover layer material exposed at the surface within the golf course was imported from the cover layer material source sites included in Section 3.1.2 below. Refer to FMRs 1 through 241 for details related to source site reviews and site testing prior to October 25, 2010, which are included in Appendix 6.

For a list of source sites that imported material to the Site between November 18, 2005 and October 25, 2010, see the table included in Appendix 12. Refer to FMRs in Appendix 6 for source sites and estimated fill material imported to the Site prior to November 18, 2005.

The following were potential source sites that were identified by NYCDPR since October 25, 2010 where a review was not initiated:

1. 10 Byron Place (Larchmont, NY)
2. College Point
3. PS-331 (Tremont Avenue, Bronx, NY)

The following were potential shaping layer source sites that were identified by NYCDPR since October 25, 2010 with some level of source site review being completed. Source sites that resulted in a complete review and the importation of shaping layer material to the Site after October 25, 2010 are identified with bold text.

1. **PS-310 (942 62nd Street, Brooklyn, NY)**
2. PSAC

33. **NY Recycling (475 Exterior Street, Bronx, NY)**
34. Little Bay (Queens, NY)

The following were potential cover layer source sites that were identified by NYCDPR after October 25, 2010 with some level of source site review being completed. Source sites that resulted in complete reviews and the importation of cover layer material to the Site after October 25, 2010 are identified with bold text.

1. **Bloomingburg (C.M. & Sons Trucking Site, 680 Bloomingburg Road, Bloomingburg, NY)**
2. **Ranco Sand (115 South Street, Manorville, NY)**
3. **East Coast Mines (Lewis Road near Route 104, East Quogue, NY)**
4. Amboy Aggregates (415 Main Street, South Amboy, NJ)
5. **Long Island Compost/Great Gardens (445 Horseblock Road, Yaphank, NY)**

3.1.1 Shaping Layer Material

Materials accepted for use as shaping layer on the Site were sampled prior to acceptance and after the import of each additional 10,000 cubic yards as required by Special Condition 14 of the 2014 Permit. For recycling facilities, sampling was conducted after each additional 5,000 cubic yards. As per the November

18, 2005, Permit Modification, each soil sample was analyzed for TCLP VOCs and metals as well as total VOCs, SVOCs, priority pollutant metals, pesticides, PCBs, sulfur, and asbestos.

Fill material imported to the Site and used for the shaping layer was analyzed for the following parameters, per Special Condition 14 of the 2014 Permit. A description of which can be found below as included in Section 4.2.1.1 of the 2013 Engineering Report.

Based on source site reviews and site testing activities, the shaping layer material imported to the Site met the following chemical limits:

Total carcinogenic SVOC levels less than 10 ppm from individual fill material sources, provided that a weighted average of equal or less than 3 ppm for the entire Project. The following are the list of carcinogenic SVOCs that are subject to this 10 ppm limit: Benzo(a)pyrene, Dibenzo(a,h) anthracene, Benzo(a)anthracene, Benzo(b)fluoranthene, Indeno(1,2,3-cd)pyrene, Benzo(k)fluoranthene, and Chrysene.

Total SVOCs less than 500 ppm.

Metals:

- Arsenic less than 28 ppm;
- Barium less than 2,000 ppm;
- Cadmium less than 20 ppm;
- Chromium less than 1,000 ppm;
- Copper less than 1,000 ppm;
- Lead less than 400 ppm;
- Mercury less than 0.57 ppm;
- Selenium less than 11 ppm;
- Silver less than 100 ppm

Asbestos for all layers 0.5% or less
Total sulfur for all layers 0.5% or less
Total PCBs less than 10 ppm
Total Pesticides less than 10 ppm
VOCs (all individual analytes less than TAGM 4046)

In a letter dated October 25, 2006 (included in Appendix C.1 of the 2013 Engineering Report), the NYSDEC provided a clarification adding that a carcinogenic SVOC limit of 10 ppm or lower is allowable from individual fill material sources, provided that a weighted average of equal or less than 3 ppm is achieved by the end of the Permit.

NYCDPR followed the NYSDEC's directives since receipt of each one associated with the importation of shaping layer material to the Site.

Details of the source site reviews and site testing for each potential shaping layer material source site are as follows:

3.1.1.1 PS-310 (942 62nd Street, Brooklyn, NY)

Source site testing analytical results for the PS-310 site were provided to the IEM by NYCDPR in a submittal dated October 6, 2010, and reviewed by the IEM for potential shaping layer material, based on the site visit performed by Gannett Fleming (the previous IEM) on September 21, 2010, and as recommended in their memo dated September 28, 2010. Samples were collected and tested by Analytical Chemists and issued via lab reports dated October 1, 2010. Analytical results were collected from five test pits from both the fill and natural formation soil layers. An exceedance of lead relative to the Site Permit shaping layer material chemical limits was noted in the fill layer within test pit #3. This information was factored into the final memo of recommendations issued by the IEM dated October 26, 2010 regarding the approved locations and depths of shaping layer material from the source site.

The IEM was on-site on November 10, 2010 to visually inspect and confirm that all fill and petroleum impacted fill from Areas of Concern 1 and 2 were removed. The IEM was also on-site on November 12, 2010 to observe the sampling of three additional sample locations of natural formation soil. The IEM submitted a detailed email to the NYSDEC and NYCDPR summarizing the November 12, 2010 site visit. Shaping material analytical results were reviewed for the PS-310 source site for three samples collected on November 12, 2010. All parameters met Permit criteria for import to the Site.

Approximately 5,308.48 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.2 PSAC

Initial site and fill material information was provided to the IEM between October 25 and November 5, 2010 by Gannett Fleming (the previous IEM). No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.3 Barclays Arena (620 Atlantic Avenue, Brooklyn, NY)

Initial site and material information was provided to the IEM by Gannett Fleming (the previous IEM) between October 18 and November 5, 2010. An initial site visit was completed by the IEM to initially inspect site conditions and materials at the source site. The IEM issued a memo of recommendations for the source site on November 16, 2010 based on materials available at that time. Materials were not reviewed further or imported to the Site at that time.

New material became available at this source site and additional data was provided for IEM review between December 18 and December 31, 2010. The review of this additional data and associated information was initiated. The sampling plan from mid-November 2010 was resubmitted to NYCDPR for the new materials being evaluated at Barclays Arena between January 1 and January 14, 2011 as the

original plan still applied to the additional/revised materials being made available. NYCDPR subsequently notified the IEM that the site source manager did not consider the Site as a viable option at that time.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.4 JFK Jet Blue/Delta Runway (Jamaica, NY)

On December 3, 2010, NYCDPR forwarded the IEM initial lab data for this potential source site associated with a Jet Blue/Delta runway at JFK Airport. On December 6, 2010, the IEM visited the potential source site to inspect the material totaling an estimated 7,000 cubic yards. The IEM witnessed evidence of asphalt and slag in the fill material and notified NYCDPR and the NYSDEC that the material was not a viable option for import to the Site. (See section 3.2.3)

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.5 Columbia University

Initial site and material information was provided to the IEM by Gannett Fleming (the previous IEM) between October 25 and November 5, 2010.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.6 Long Island Jewish Center (270-05 76th Avenue, New Hyde Park, NY)

The IEM conducted an initial site visit on November 5, 2010. An email containing the summary of site visit activities and summary of recommendations was provided. The IEM issued a formal memo of recommendations on November 11, 2010.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.7 Highbridge Terrace (220 West 167th Street/Sedgewick Avenue, Bronx, NY)

On January 10, 2011, a formal fill source site review was initiated for the Highbridge Terrace source site. Sanborn Maps, historical topography maps, historical aerial photos, and the EDR and NYSDEC Spill Databases were reviewed. Approximately 5,900 cubic yards of potential fill material was reportedly available. Initial analytical data was provided however, the IEM was informed by NYCDPR that this potential source site was no longer a viable option at the time and further review did not occur.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.8 Astoria (27-07 23rd Avenue, Queens, NY)

A formal fill source site review was conducted for the Astoria source site February 3, 2011 and consisted of the review of historical information and existing source site sampling data and EDR information. The existing sample data was reviewed and some sample results did not meet the Site Permit limits for shaping material. Preliminarily, the site contractor estimated approximately 2,000 cubic yards of potentially approvable material. The initial review was completed and NYCDPR reported that this source site was no longer a viable option and no further action was expected.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.9 Eastside Access (Queens Street and Jackson Avenue, Queens, NY)

A coordination call was held with the IEM, NYCDPR, and the source site contractor on February 8, 2011. The IEM witnessed initial source site sampling as requested by NYCDPR at the Eastside Access source site on February 9, 2011. A total of seven grab sample collections were observed and one discrete VOC sample collection was observed. The existing stockpile was estimated to measure approximately 2,000-4,000 cubic yards based on an approximation of stockpile dimensions by the IEM.

The IEM received a submittal of information from NYCDPR between February 12 and February 25, 2011. The IEM reviewed the material and found the site to be noncompliant with the Site Permit as material could not be segregated and stockpiled at the source site. Per NYSDEC directive, NYCDPR would be coordinating directly with the NYSDEC for further site review. The site was reviewed by the NYSDEC and a site-specific analytical parameter list (for Metals) was approved by the NYSDEC between March 12 and March 25, 2011.

Between March 26 and April 8, 2011, the IEM was notified by the NYSDEC and NYCDPR that this source site had been approved to export fill materials to the Site by the NYSDEC. The IEM discussed the conditions of the approval with the NYSDEC and began witnessing sample collection of the East Side Access crushed stone material and review of lab reports.

The IEM conducted monitoring of shaping layer material sampling and loading at the East Side Access source site for materials exported to the Site. Sampling at this source site generally occurred the day before materials were expected to ship to the Site. Samples were being analyzed for metals, laboratory results were compared to the Site Permit requirements, and no exceedances of shaping material limits were identified.

Between April 2011 and December 2011, the IEM continued monitoring for this source site. The IEM witnessed sample collection of East Side Access crushed stone material every 10,000 cubic yards, reviewed lab reports, and periodically monitored loading of trucks with shaping layer materials for export to the Site as materials were shipped to the Site.

The IEM reviewed the lab results related to the IEM witnessed source site sampling conducted on December 12, 2011 for proposed shaping material at the East Side Access source site and found the sampled material to be unacceptable for import to the Site based on the fact that the detected value for Arsenic was 48.7 ppm. The permit allowable maximum concentration for Arsenic is 28 ppm. The sampled material was determined to be unacceptable for import to the Site as shaping layer material per the Permit.

NYCDPR requested that the material sampled on December 12, 2011 be removed from consideration for import to the Site and requested that a sample be collected for the next available material at the East Side Access source site. The IEM reviewed the lab results dated December 14, 2011 related to the IEM witnessed sampling conducted on December 13, 2011 for the proposed shaping material and found them to be acceptable based on the fact that the RCRA metals results fell below the Permit shaping layer material allowable maximum concentrations and the Permit USEPA referenced testing method was used. It was determined that approved shaping material to be imported to the Site could only originate from the stockpiles witnessed during the December 13, 2011 sampling event. Material previously sampled on December 12, 2011 was not imported to the Site.

NYCDPR and their associated representatives hypothesized that the unacceptable sample results for arsenic may be a result of a change in the rock removal process, which included drilling, blasting, and crushing to generate the shaping layer material. On December 16, 2011, the NYSDEC stated that if the mining technique did not change (i.e. drilling as opposed to blasting) the sampling frequency could remain unchanged on the basis of the number of successful past results. However, in the event of another failure, the sampling frequency would become one sample per 2,000 cubic yards. The IEM proceeded with observing one sample per 2,000 cubic yards based on a change in mining operations as per discussions with the source site operator.

On February 7, 2012, the NYSDEC stated that based on the number of successful test results for the East Side Access material since the December 12, 2011 failure due to high arsenic content, the NYSDEC approved NYCDPR's request for future testing of East Side Access material at a reduced frequency of one sample per 10,000 cubic yards.

On December 18, 2012, Analytical Chemists collected samples from stockpiled East Side Access Source Site shaping material at the Site that had elevated PID readings when scanned during the on-site inspection process upon import and after dumping. The six segregated loads of East Side Access shaping layer material passed the Site Permit criteria for shaping layer material based on sampling conducted at the Site. Sampling consisted of collected samples witnessed by the IEM on December 18, 2012. Therefore, the material remained on-site and was used as shaping layer material.

Approximately 191,293.87 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.10 Kew Gardens (Van Wyck Expressway between Grand Central Avenue and 86th Avenue, Queens, NY)

Initial site and material information was provided to Woodard & Curran by Gannett Fleming (the previous IEM) between October 25 and November 5, 2010.

A formal fill source site review was initiated for the Kew Gardens between November 6 and November 19, 2010 consisting of compiling and reviewing historical maps, photos, EDRs, and spills database and available information from the source site contractor.

A formal fill source site review was continued for the Kew Gardens source site between November 20 and December 3, 2010 and consisted of the review of Sanborn maps, topographic maps, aerial photographs, NYSDEC spills and remediation database, and the City Directory. A Phase II Environmental Site Assessment (ESA) and associated analytical data was reviewed and sample results did not exceed the Permit limits for shaping layer material. Preliminarily, the source site contractor estimated approximately 10,000 to 15,000 cubic yards of potentially approvable material was available.

On February 11, 2011, the IEM issued a memo of recommendations and sampling plan for the Kew Gardens source site.

The IEM conducted fill material source site sampling oversight at the Kew Gardens site on February 17, 2011. Six areas (1, 2, 3, 4, 5, and 9) were assessed by IEM desktop review and a sampling plan was submitted to, and approved by the NYSDEC for potential cover material evaluation. Representatives from the laboratory, NYCDPR, IEM, and the source site operator met prior to the initiation of sampling activities. The source site operator stated that the full extents of Areas 4, 5, and 9 would not be accessible for visual screening and analytical sample collection and soils in Area 9 were being actively loaded for off-site use. NYCDPR requested that source material evaluation proceed for accessible material. Composite grab and discrete VOC soil samples were collected for laboratory composite and analysis from Areas 1, 2, 5, and 9. Area 4 was not accessible for evaluation. Asphalt and other materials non-compliant with the Site Permit were observed on various soil horizons in Area 3, and as such, no samples were collected as the material was no longer considered for import to the Site.

On February 25, 2011, NYCDPR submitted draft analytical data from the Kew Gardens site for IEM review. At the request of NYCDPR, the IEM performed an initial review of the draft analytical data for cover material, understanding that no final determination can be made until the complete and final data package has been submitted, reviewed by the IEM, and approved by the NYSDEC. The initial IEM review identified cadmium in composite samples from Areas 1, 2, 5, and 9 at concentrations that exceed the Site Permit requirements for cover material. NYCDPR was informed and subsequently requested the material be evaluated for shaping layer material. No exceedances of the Site Permit requirements were identified in the draft data submittal. Additional draft data from the Kew Gardens source site was submitted on March 8, 2011. No exceedances of the Site Permit requirements were identified in that draft data submittal.

Final laboratory data was submitted to the IEM for review on March 18, 2011. Laboratory results were compared to the Site Permit requirements and no exceedances of shaping layer material limits were identified. Metals concentrations in the samples did exceed cover layer material limits. Fill material from

the Kew Gardens source site was approved by the NYSDEC for importation to the Site for use as shaping layer material on March 24, 2011.

Per NYCDPR request, the IEM submitted the Kew Gardens EDR files to NYCDPR on July 1, 2011.

Beginning on August 5, 2011, NYCDPR indicated to the IEM that they had renewed interest in considering shaping layer material from Area 17 at the Kew Gardens source site. The IEM provided a list of concerns and items to address in the sampling plan associated with the attempt to obtain approval for this shaping layer material. On August 11, 2011, NYCDPR indicated that the Kew Gardens review was on hold.

On September 19, 2011, IEM representatives were on-site at Area 17 of the Kew Gardens Source Site to perform a visual, physical, and PID inspection of the existing soil via a total of seven test pits excavated from ground surface to approximately 12 feet to 16 feet below the existing ground surface. The first four test pits were excavated to approximately terminal depth. The last three test pits were terminated prior to reaching terminal depth due to instability of the sidewalls as a result of the presence of dry sand material. The test pits were completed consecutively moving from south to north. The area consisted of approximately 10,000 cubic yards of proposed shaping layer material as identified by NYCDPR and the source site contractor. In addition, the IEM witnessed the collection of grab samples for chemical analysis by NYCDPR's laboratory and logged the test pit locations using handheld GPS equipment.

IEM staff observed an initial layer of organics, which contained a slight odor attributable to decomposition and yielded PID results of 0.1 to 0.5 ppm. This material was not approved for use at the Site and this was communicated directly to NYCDPR and the site contractor. The IEM indicated that any potential approval of shaping layer material from Area 17 would require the full removal of the organic layer prior to any loading and shipping of potentially approval soils to the Site, which would need to be confirmed by the IEM.

The soil below the initial organic layer (beginning approximately 0.5’-1.5’ below grade) consisted of brown, silt with some sand and a trace of clay. Cobbles and boulders were also evident throughout the soil profile. No soil staining or odors were observed, and the material encountered below the organic layer was generally consistent in composition. The soil shifted to more of a sand and cobble composition as the test pits progressed towards the north. No asphalt or any other debris was observed in the soil, and the PID scans did not yield any detections.

IEM staff observed the collection of a grab samples at approximately two-foot intervals in each of the seven test pits completed at the Kew Gardens Source Site on September 19, 2011. It was estimated by NYCDPR and the site contractor that approximately 10,000 cubic yards were available from Area 17 of the source site. In addition to the required discrete sampling of VOCs/TCLP VOCs, the lab was instructed by NYCDPR to run three composite samples for the remaining analyses. The composite samples consisted of the grabs from each depth interval. The first two test pits completed represented composite sample #1, the second two test pits represented composite sample #2, and the last three test pits represented composite sample #3.

The IEM completed a preliminary review of shaping layer material originally sampled on September 19, 2011 proposed for import to the Site from Area 17. The IEM required a revised lab report from Analytical Chemists which contained the TCLP VOA and Metals results as well as the dioxin/furan scan using SW 8270. All other lab data was complete and did not exceed any of the Site Permit criteria. Prior to final

approval to import this material to the Site, NYCDPR was required to obtain the NYSDEC's approval to use the alternative dioxin/furan analysis.

NYCDPR received NYSDEC approval to use Method 8270 for analysis of dioxins/furans at this source site on January 3, 2012. The IEM completed a final review of shaping layer material (originally sampled on September 19, 2011) proposed for import to the Site from Area 17 on January 4, 2012. The review of available lab data identified that sampled material does not exceed any of the Site Permit criteria. On January 5, 2012, the IEM inspected the source site and visually confirmed the removal of the top 0.5 feet to 1.5 feet of soil which consisted of an initial layer of organics that were previously considered unacceptable for import to the Site. It was determined that the available shaping layer materials from Area 17 totaling approximately 500 cubic yards of the original estimated 10,000 cubic yards were approved for export to the Site.

The source site operator provided the IEM with a proposed excavation plan on December 5, 2012 for additional materials available at the source site. On December 8, 2012, the IEM notified NYCDPR that the previous desktop review (i.e. EDR, etc.) performed for this source site was still applicable for the latest area proposed for excavation. The IEM was on-site at the Kew Gardens source site on December 14, 2012 to witness test pits and environmental sampling for additional shaping layer materials being considered for import to the Site.

On January 3, 2013, the IEM provided a memo of recommendations to the NYSDEC regarding an additional estimated 7,500 cubic yards of shaping layer material being considered for import to the Site that was sampled on December 14, 2012. On January 4, 2013, the NYSDEC approved the importation of this material to the Site subject to the following conditions. The outer limits and depths of all areas of excavation should be clearly delineated in the field and confirmed by the IEM in the field prior to any excavation, loading, or trucking of approved soils. The approval only applied to the material samples and inspected on December 14, 2012, consisting of what appeared to be native material, free of debris and any traces of organics. The limits beyond test pit #8 consisted of observed unauthorized C&D material mixed into the soil (i.e. metal and glass, etc.), and were not approved for import to the Site. The IEM periodically inspected the excavation and hauling activities at the Kew Gardens Phase II site to perform visual and physical screening of the proposed shaping layer material. Inspection frequency was at the discretion of the IEM and the NYSDEC. The exportation of all material to the Site was conducted in accordance with the current Permit requirements (i.e. trucking manifests, etc.).

On June 5, 2013, the IEM issued a third memo of recommendations dated June 5, 2013 for the Kew Gardens source site. The IEM notified NYCDPR that the latest round of shaping layer material (approximately 5,000 CY) was acceptable for import to the Site due to the fact that the material met the Site Permit requirements. The approval applied to the material sampled and inspected on May 22, 2013, consisting of what appeared to be native material, free of debris and any traces of organics, and as delineated horizontally and vertically on the provided test pit plan. The top portion of unauthorized soil (i.e. RCA, geotextile, organic) was stripped and removed off-site to the depths and locations listed on the provided test pit plan, and this condition was witnessed by the IEM prior to importation to the Site. The importation of all material to the Site was conducted in accordance with the Permit requirements (i.e. trucking manifests, etc.).

Approximately 11,988.51 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.11 PS-285 (1065 Martin Luther King Boulevard, Bronx, NY)

On March 10 and 11, 2011 the IEM was provided with fill source site documentation for the PS-285 source site. The IEM initiated review of the source site materials provided per request of NYCDPR. Site visits to the PS-285 source site by the IEM were completed on March 14, 2011 to observe test pits and on March 25, 2011 to discuss the approval process and submittal requirements. NYCDPR requested the IEM purchase an EDR Report for the site on March 25, 2011.

The IEM witnessed additional test pits and sampling on March 29, 2011. At the time of sampling, certain portions of the source site were not accessible for sampling. Samples were collected from four test pits and composited into two samples. Lab results were provided on March 30, 2011, but were deemed incomplete by the IEM. A revised report was submitted to the IEM addressing the missing parameters, but it did not address the non-compliant dioxin/furan USEPA Test method used to generate the lab report. Final laboratory data was submitted to the IEM for review on April 5, 2011. Laboratory results were compared to the Site Permit requirements and no exceedances of shaping material limits were identified. Additional review by the IEM and the NYSDEC was required to determine if the source site was approved for material importation to the Site. The IEM completed the review of NYCDPR's EDR and desktop review, and issued a memo to the NYSDEC detailing the IEM's review results on April 5, 2011. The NYSDEC provided their review comments on April 7, 2011.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.12 Flushing Hotel (133-63 Roosevelt Avenue/39-20 Prince Street, Queens, NY)

NYCDPR requested that the IEM order and provide the EDR materials to NYCDPR for their review and submission to the IEM. The draft initial submittal was provided to the IEM over the course of several days (April 5, 6, and 7, 2011). The IEM’s review commenced during this timeframe.

The IEM witnessed test pits and sampling at the Flushing Hotel source site on April 8, 2011. Final laboratory data was submitted to the IEM for review on April 19, 2011. Laboratory results were compared to the Site Permit requirements and no exceedances of shaping layer material limits were identified. Additional review by the IEM and the NYSDEC was required to determine if the source site was approved for material importation to the Site.

The IEM conducted a review of NYCDPR's EDR review, as well as a full review of the EDR, and submitted Phase I and Phase II ESA reports. The IEM reviewed the lab results provided on April 19, 2011. The IEM prepared a review document dated April 20, 2011 titled "Flushing Hotel Source Site - Desktop Submittal Review" and submitted it to NYSDEC and NYCDPR. The NYSDEC provided a response on April 21, 2011.

NYCDPR provided the IEM with supplemental historical lab data and two (2) separate Phase II reports on April 26, 2011. The IEM provided additional review comments based on the aforementioned documents to NYCDPR via conference call and email on April 29, 2011. NYCDPR provided a draft submittal response package dated May 5, 2011.

NYCDPR provided the IEM with a final submittal dated May 13, 2011 in response to IEM comments. The IEM reviewed the final submittal and transmitted that submittal to the NYSDEC for review and comment on May 18, 2011. Due to the fact that this was a complex site, final comments regarding acceptance for import to the Site was to be provided by the NYSDEC.

Conditional approval for the export of shaping material from rows 4, 5, and 6 was provided from the NYSDEC on May 27, 2011. The IEM witnessed the first day of test pits on June 3, 2011 as requested by NYCDPR. Five test pits were excavated at the source site to the maximum depth reachable by the heavy equipment available. The IEM witnessed a second day of test pits on June 6, 2011 as requested by NYCDPR. Three additional test pits were excavated to the maximum depth reachable by the heavy equipment available. NYCDPR submitted a revised site review proposal for importing shaping layer material from this source site on June 15, 2011.

A total of eight (8) test pits were excavated at the Flushing Hotel source site on June 3 and June 6, 2011. One composite sample and one discrete VOC sample was collected from each test pit. Lab results were submitted to the IEM on June 10, 2011. The IEM provided preliminary review and comments to NYCDPR regarding the source site review proposal on June 17, 2011.

The IEM submitted the memo of recommendations to the NYSDEC on June 20, 2011. The IEM visited the site on June 21, 2011 to confirm conditions within the memo of recommendations were met or could be achieved. The IEM reported conclusions to the NYSDEC via email on June 21, 2011. The observed site conditions did not allow for the source site to be approved due to the presence of asphalt, objectionable material, and stockpiles that did not allow for the confirmation of soil elevations. The NYSDEC also indicated that as of June 21, 2011, a formal submittal from NYCDPR to NYSDEC had not occurred to date. The IEM's site observations from June 21, 2011, were emailed to NYCDPR on June 23, 2011. NYCDPR submitted a revised site proposal on June 27, 2011. On June 28, 2011, the IEM indicated that items included in NYCDPR's submittal were non-complaint with the current Site Permit requirements, and therefore required approval from the NYSDEC.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.13 2nd Avenue (2nd Avenue and 94th Street, New York, NY)

The IEM witnessed fill material sampling for this potential source site on May 12 (two samples) and May 16, 2011 (one sample) regarding acceptance of crushed rock from NYCMTA's 2nd Avenue Subway construction project at 94th Street in Manhattan. Samples were analyzed for the nine RCRA metals and all passed the Site Permit requirements relative to the nine RCRA metals. One sample on May 12 was collected from material directly out of the hopper after it was deposited into a truck and the other sample was taken from a stockpile. The May 16 sample was also taken from material that came directly out of the hopper and deposited directly into a truck. The NYSDEC performed all associated reviews for this

source site similar to the East Side Access source site due to the nature of the material that was being generated from subway tunnel construction.

The NYSDEC provided approval for this source site to export shaping layer material to the Site. Shaping layer material sampling began on May 26, 2011 and occurred on a continual basis after each consecutive 2,000 cubic yards of material was imported to the Site.

Approximately 86,667.95 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.14 2nd Avenue (2nd Avenue and 72nd Street, New York, NY)

NYSDEC staff reviewed NYCDPR's submittal dated October 28, 2011 regarding acceptance of crushed rock from NYCMTA's 2nd Avenue Subway construction project at 72nd Street in Manhattan which was proposed for import to the Site. NYCDPR's proposal was acceptable to the NYSDEC provided that a composite sample of this material was tested for the proposed analytical parameters and the sample results were obtained (and approved) prior to loading material for export to the Site.

The IEM reviewed the lab results related to the IEM witnessed source site sampling conducted on December 5, 2011 for the proposed shaping layer material at the source site. The IEM identified that the sampled material was unacceptable for import to the Site based on the fact that the detected value for Arsenic was 38.4 ppm. The permit allowable maximum concentration for Arsenic is 28 ppm. The sampled material was determined to be unacceptable for import to the Site as shaping layer material per the Permit. It was determined that no material may be imported from the 2nd Avenue at 72nd Street source site to the Site. The IEM also witnessed that the physical composition of the sampled material was not that of pure stone dust as witnessed previously at the 2nd Avenue (94th Street) and East Side Access source sites. This material had stones as large as 12 inches to 24 inches in size. The IEM was advised that the hopper at the 2nd Avenue at 72nd Street source site used a screen that contained openings that were 24 inches by 20 inches.

On December 5, 2011, NYCDPR requested that the IEM witness one additional sample from the 2nd Avenue at 72nd Street source site. On December 6, 2011 in response to NYCDPR’s request to perform one additional sample, the NYSDEC stated that if re-sampling produced acceptable results, a more stringent sampling frequency would be required for this source (i.e. one sample per 2,000 cubic yards instead of one sample per 10,000 cubic yards). NYCDPR advised the IEM that they were not pursuing material from this source site any further because it did not meet the specified physical properties for the golf course construction.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.15 Alexander Hamilton Bridge (Bronx, NY)

NYCDPR notified the IEM on February 8, 2012 that NYCDPR was interested in the opportunity to obtain potential shaping layer materials from the Alexander Hamilton Bridge source site (originally sampled July

7, 2009) which had been reviewed and approved in the past by the previous IEM. The IEM requested, obtained, and reviewed the previous files for the source site including previous approvals and corresponding lab data. On February 10, 2012, the IEM requested and received the proposed location for the recently considered shaping layer material.

The IEM visited the Alexander Hamilton Bridge source site on February 22, 2012. The IEM visually inspected a stockpile of approximately 3,000 to 5,000 cubic yards of potential shaping layer material from the previously approved source site (as per IEM records from 2009). Upon a visual inspection, it was determined that the material did not meet the Site Permit requirements due to the presence of unauthorized C&D material including asphalt and metal, as well as other miscellaneous debris. Site observations were photo documented. The IEM notified NYCDPR of its observations and NYCDPR determined that they did not want to pursue this source site any further at that time.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.16 Throgg's Neck/Target/USPS (815 Hutchinson River Parkway, Bronx, NY)

On February 28, 2012, NYCDPR requested that the IEM begin the source site review for the Throgg's Neck/Target/USPS source site. The source site was an existing USPS building that was proposed to be redeveloped with a new Target retail building. The anticipated volume of material being considered as potential shaping layer material was reported to be approximately 20,000 cubic yards per information forwarded to the IEM by NYCDPR. The IEM ordered the EDR and provided the EDR information to NYCDPR. The IEM reviewed the Phase I ESA and the Phase II ESA. The IEM completed a review of the EDR on March 9, 2012. NYCDPR provided the IEM with an EDR review memo on March 27, 2012. The IEM provided NYCDPR with some initial comments and NYCDPR submitted a revised EDR review memo on April 2, 2012.

NYCDPR provided the IEM with a proposed sample location plan with proposed depths for source site sampling on April 19, 2012. The IEM provided comments on a revised sampling plan identifying the location and quantity of test pits on April 20, 2012.

The IEM witnessed three of ten proposed test pits and the associated source site sampling at the source site on April 25, 2012. The remaining test pits were completed and witnessed by the IEM on May 11 and May 14, 2012.

The IEM reviewed the lab data (originally dated May 15 and May 24, 2012 and revised May 30, 2012) and no exceedances of shaping layer material limits were identified. The IEM prepared a memo of recommendations and submitted it to the NYSDEC on May 30, 2012. The NYSDEC reviewed the IEM's May 30, 2012 memo of recommendations for the source site. On May 31, 2012, the NYSDEC approved importation of shaping material from this source site to the Site, provided that all recommendations in the memo of recommendations were implemented. The source site commenced trucking shaping layer material to the Site.

The IEM conducted an inspection of the source site on November 6, 2012. The purpose of the inspection was to determine if site conditions warranted allowing the source site to resume importation of shaping layer material to the Site, in light of the nine truck rejections (due to presence of asphalt) that occurred on October 23, 2012 (resulting in ceasing of importation that same day). Based on the IEM inspection and observations, it was determined that importation may resume to the Site. Observations included surface asphalt had been stripped from within the approved limits of excavation between former TP-6 and TP-8, stockpiles of excavated soil from areas outside the approved excavation limits (i.e. cut along Weiner Place) were located outside the approved excavation limits, and no stockpiles of asphalt material or other poor housekeeping practices were observed within the current area in preparation for export to the Site. NYCDPR was notified that all importation must comply with all previous conditions outlined in the source site approval memo of recommendations (i.e. top +/-3 feet of fill was not approved for importation to the Site; this layer was clearly identifiable due to its color and consistency relative to the native approved material).

The IEM was on-site at the source site on February 6, 2013 to complete a source site inspection associated with a request to resume import to the Site. The site was approved to resume importation of shaping layer material on February 6, 2013 based on the IEM's inspection, which confirmed that the material originated from IEM inspected/approved areas, and the fact that the material is the native approved soil, and there are no signs of asphalt or historical fill on-site in the vicinity of the work area. The area inspected was consistent with the approved areas included in the original NYSDEC approval and IEM memo of recommendations.

Approximately 27,262.77 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.17 PS-287 (110-10 Northern Boulevard, Queens, NY)

On March 2, 2012, NYCDPR requested that the IEM begin the source site review for the PS-287 source site. The source site was a former parking facility that was being redeveloped into a new school. The anticipated volume of material being considered as potential shaping layer material was reported to be approximately 7,000 to 9,000 cubic yards per information forwarded to the IEM by NYCDPR. The source site operator expected to remove the top two feet of asphalt and historical fill, as well as a one-foot buffer. The potential shaping layer material that was being considered was what was claimed to be native soils from a depth of approximately 3 feet to 15 feet below grade. NYCDPR and the site operator wanted to proceed with sampling prior to review of the EDR. A sampling plan was provided to the IEM for review. The IEM completed a review of submitted documents including the Phase I ESA, Phase II ESA, and the proposed sampling plan and issued a review memorandum with comments on March 7, 2012. The site operator submitted a revised sampling plan for review by the IEM on March 8, 2012.

The IEM received NYCDPR's initial review of the EDR on March 14, 2012. The IEM completed a review of the EDR and forwarded a copy to NYCDPR on March 16, 2012. On March 16, 2012, the IEM requested that NYCDPR submit a revised EDR review memo incorporating the identified Recognized Environmental Concerns ("RECs") and other site conditions that were not included in the original review memo.

On March 22, 2012, the IEM received sample results for shaping layer source site sampling that occurred on March 15, 2012. The IEM completed an initial review of the sample data and although there were no exceedances relative to the Site Permit limits for the parameters that were analyzed in the lab reports, there were multiple parameters missing from the lab report.

The IEM received a revised lab report for the PS-287 source site on March 28, 2012. The IEM reviewed the revised lab report for the previously missing lab data and confirmed that the tested soil met the Site Permit criteria for shaping layer material. The IEM issued a memo of recommendations for this source site to the NYSDEC on March 28, 2012. The IEM visited the source site on March 30, 2012 and confirmed that all asphalt, historic fill, and areas not being considered for import to the Site were previously removed from the source site to the appropriate depth including the one-foot buffer below the fill layer. The NYSDEC approved the PS-287 source site for shaping layer material and NYCDPR was notified of the approval on April 2, 2012.

Approximately 6,754.8 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.18 City Point Brooklyn (1 DeKalb Avenue, Brooklyn, NY)

The IEM issued a desktop review summary for the City Point Brooklyn source site to the NYSDEC on July 27, 2012. The review included information acquired or provided to the IEM including EDR files, Phase II report, and boring information. The material being considered was approximately 22,000 cubic yards of native material proposed to be used as shaping layer material.

The NYSDEC approved the City Point Brooklyn source site for further investigation (i.e. physical and visual inspection via test pits and sampling) on August 13, 2012 since all environmental samples for the source site were made available to the IEM for review.

The IEM was on-site at the source site on August 31, 2012 to witness site investigation and sampling activities for 8,000 cubic yards of potential shaping layer material.

On September 11, 2012, the IEM received sample results for source site sampling that occurred on August 31, 2012. On September 20, 2012, the IEM issued a Site Investigation Memorandum (dated September 19, 2012) to the NYSDEC for review for the source site related to IEM witnessed activities that occurred at the source site on August 31, 2012.

On September 25, 2012, the NYSDEC notified the IEM that the City Point source site was conditionally approved pending implementation of the recommendations included in the IEM's September 19, 2012 Site Investigation Memorandum and satisfactory responses to NYSDEC questions.

On October 10, 2012, the IEM notified NYCDPR that the City Point Brooklyn source site was approved by the NYSDEC considering implementation of the recommendations included in the IEM's September 19,

2012 Site Investigation Memorandum. The IEM needed to complete a final inspection of the proposed material prior to importation to the Site.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.19 400 Park Avenue South (New York, NY)

The IEM received initial documents associated with this source site beginning on July 3, 2012. The IEM performed an initial review of the submitted documents. The IEM requested a proposed sampling plan on July 11, 2012.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.20 Union Street (43-31 Union Street, Flushing, NY)

On May 15, 2012, NYCDPR submitted a request to the NYSDEC to import shaping layer material from the Union Street source site. On June 11, 2012, the NYSDEC provided NYCDPR with email approval to import up to 30,000 cubic yards of shaping layer material from the Union Street source site based on environmental testing results submitted to the NYSDEC that was not witnessed by the IEM. On June 14, 2012, NYCDPR notified the IEM that they would begin importing, no earlier than June 18, 2012, an estimated 5,000 to 10,000 cubic yards of shaping layer material from this source site to the Site. The material originated from 30 to 55 feet below grade.

Approximately 1,675.69 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.21 Mount Vernon Recycling Corp. (113 Edison Avenue, Mount Vernon, NY)

On November 27, 2012, the IEM notified NYCDPR that the topsoil on-site that originated from the Mount Vernon Recycling Corp. facility was approved as shaping layer material based on previous NYSDEC approval allowing material to be used as shaping material, and the fact that the material passed all Site Permit criteria per IEM witnessed sample collection and a review of the associated analytical reports. The IEM witnessed sampling on October 11 and November 12, 2012. The approval was pending a receipt of all truck tickets/manifests, and confirmation of the volume of on-site soil. The Site Permit requires that this material be covered with a minimum 1-foot thick layer of approved cover soil.

Approximately 3,920.0 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.22 228th Street (Rosedale, NY)

The IEM completed a review of initial lab data dated December 28, 2012 for the 228th Street source site. Of the 12 lab reports that were reviewed, none of the sampled soil exceeded Site Permit levels for the shaping layer parameters that were analyzed in the reports. A significant number of parameters (including some VOCs, SVOCs, pesticides, and metals) were not analyzed and NYCDPR was notified of the review

findings on January 22, 2013. Sample collection for the submitted lab reports was not witnessed by the IEM.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.23 Evergreen Recycling/Tully Environmental (Willets Point Boulevard, Corona, NY)

On January 28, 2013, the IEM notified NYCDPR that an initial review of the lab data provided for the Evergreen Recycling source site (operated by Tully Environmental) was completed. Sampling was not witnessed by the IEM. There were no exceedances relative to the Site Permit criteria for shaping layer material, however there were a significant number of parameters that were not analyzed. The IEM received a Registration Form for a Waste Management Facility (DEC Registration # 41W93) for the source site. The IEM performed a visual inspection of stockpiled material at the source site material on January 30, 2013 and identified asphalt fragments in the source site material. The stockpiled material was not acceptable for import to the Site based on the presence of asphalt.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.24 Waterpointe-Whitestone

On February 1, 2013, the IEM notified NYCDPR that an initial review of the lab data provided for the Waterpointe-Whitestone source site was completed. Sampling was not witnessed by the IEM. There were no exceedances relative to the Site Permit criteria for shaping layer material, however there were a significant number of parameters that were not analyzed.

On March 27, 2013, the NYSDEC informed NYCDPR that shaping layer material from the Waterpointe-Whitestone source site could be imported to the Site if the material meets the required Permit limits and that the NYSDEC review would continue once involved staff was available to complete the review. On April 3, 2013, the IEM forwarded the NYSDEC correspondence regarding previous NYSDEC work plan acceptance for the proposed source site, which was for work occurring as part of a separate project under NYSDEC review.

On April 3, 2013, the NYSDEC confirmed that the Waterpointe-Whitestone source site was not approved as a potential source for shaping layer material.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.25 Don Carlo Environmental/Brooklyn (1247 38th Street, Brooklyn, NY)

On February 1, 2013, the IEM notified NYCDPR that an initial review of the lab data provided for the Don Carlo Environmental/Brooklyn source site was completed. Sampling was not witnessed by the IEM. The results in the submitted report exceeded the levels in the Site Permit for shaping layer material for the

VOC's ethylbenzene (6.9 ppm vs. 5.5 ppm), toluene (2.1 ppm vs. 1.5 ppm), and xylenes (57 ppm vs. 1.2 ppm). There were a significant number of parameters that were not analyzed.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.26 Castle Hill Recycling (1000 Zerega Avenue, Bronx, NY)

On February 11, 2013, NYCDPR provided the IEM with a permit for Castle Hill Recycling (DEC Registration #03-W-94) that was being considered as a potential shaping layer material source site. The IEM was notified that the source site was creating a 2,000 cubic yard stockpile for sampling. Castle Hill Recycling was a NYSDEC registered solid waste management facility.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.27 Springfield Gardens

On February 21, 2013, the IEM completed an initial review of a soil analysis summary documentation (no lab reports) for approximately 2,500 cubic yards of potential shaping layer material at the Springfield Gardens source site as provided by NYCDPR. The IEM did not witness sample collection. The IEM notified NYCDPR that there were several parameters exceeding the Site Permit criteria and multiple required parameters were not analyzed.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.28 Calvert Vaux (Brooklyn, NY)

On February 20, 2013, NYCDPR provided the IEM and NYSDEC with lab data for the Calvert Vaux source site for approximately 500 cubic yards of shaping layer material. On February 22, 2013, the IEM was notified by the NYSDEC that the NYSDEC would be handling the review of this source site.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.29 160 Myrtle Avenue (Brooklyn, NY)

On February 20, 2013, NYCDPR forwarded the IEM initial sample data information for a potential shaping layer material source site located at 160 Myrtle Avenue, Brooklyn, NY. The potential shaping layer materials totaled approximately 40,000 cubic yards. On February 21, 2013, the IEM notified NYCDPR that the initial review of the soil analysis summary documentation (no lab reports) was completed for the information provided to the IEM. The reviewed material had exceedances for lead and mercury relative to the Site Permit criteria.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.30 215 E. 68th Street (New York, NY)

On March 7, 2013, NYCDPR requested that the IEM review initial lab data for approximately 3,000 to 4,000 cubic yards of potential shaping material at 215 E. 68th Street, New York, NY. On March 8, 2013, the IEM notified NYCDPR that there were exceedances for Mercury and total cSVOC's for multiple samples and multiple VOC, SVOC, Pesticide, and TCLP VOC parameters were missing in all samples.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.31 DEP Valhalla (10 Walker Road, Valhalla, NY)

On February 25, 2013, the IEM initiated review of potential shaping material at the DEP Valhalla source site (Catskill and Delaware Water Treatment Facility). On March 1, 2013, the IEM notified the NYSDEC that a review of the initial lab results and site background information was completed. The initial review indicated that there were no exceedances relative to shaping layer material criteria for the hardcopy data, some sample parameters were missing, and there were no records indicating unacceptable background conditions. The IEM notified the NYSDEC that there was a discrepancy in the hardcopy and electronic data and clarification was requested from NYCDPR/NYCDEP. On March 5, 2013, the IEM completed a visual and physical inspection of the potential shaping layer material at the source site. On March 6, 2013, the IEM notified NYCDPR and the NYSDEC that the potential shaping layer material passed all visual and physical inspection requirements and the material passed the Site Permit criteria for shaping layer material (hardcopy data) although not all parameters were tested. In addition, the data provided electronically on CD contained information demonstrating that previous soil investigations identified soil containing elevated levels of lead and mercury that did not pass the Site Permit criteria for shaping layer material. It was communicated to the IEM verbally that the NYCDEP has been handling all impacted soil separate from the stockpiled material that was inspected, and that all impacted soil has been disposed of off-site and tracked accordingly.

On March 13, 2013, the IEM received requested documentation from the source site owner/operator regarding conditions of the existing soil stockpile and removal of contaminated materials at the DEP Valhalla source site. On March 14, 2013, the IEM notified NYCDPR that the IEM must be notified prior to importation of shaping layer material from the DEP Valhalla source site in order to witness initial loading of trucks at the source site.

Approximately 6,631.2 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.32 Tilcon (Bronx) (980 East 149th Street, Bronx, NY)

On April 1, 2013, the IEM received initial lab data and a NYSDEC Registration Form for a Solid Waste Management Facility (NYSDEC Registration #03W39R) for the Tilcon (Bronx) source site. On April 1, 2013, the NYSDEC confirmed that the Tilcon (Bronx) source site had a valid Registration Form for a Solid Waste Management Facility. On April 2, 2013, the IEM notified NYCDPR that a review of the initial lab data was completed and noted that sampled parameters did not exceed Site Permit criteria for shaping layer

material (samples WCA-1 to WCA-6), however the following parameters were not analyzed: TCLP Metals missing for sample WCA-3, WCA-5, and WCA-6, VOC: 1,2,4-trichlorobenzene, methyl ethyl ketone, and tetrachloroethylene in all samples, SVOC: 4-chloro-3-methylphenol, 2-chlorophenol, 4-methylphenol, and naphthalene in all samples, and Pesticides: 2,4 D, dibenzo-p-dioxins, endrin ketone, gamma-bhc, gamma-chlordane, mitotane (2,4 DDD), and parathion. On April 3, 2013, the IEM witnessed sampling of approximately 4,000 cubic yards of the proposed shaping material at the Tilcon (Bronx) source site.

On April 9, 2013, the IEM notified NYCDPR that the Tilcon (Bronx) shaping layer material, totaling approximately 4,000 cubic yards, witnessed by the IEM on April 3, 2013, was acceptable for import to the Site due to the fact that environmental results met the Site Permit requirements. The IEM conducted a visual inspection of material, and the IEM confirmed that the material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.).

Approximately 3,041.8 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.33 NY Recycling (475 Exterior Street, Bronx, NY)

On April 23, 2013, NYCDPR requested that the IEM initiate review of a potential shaping layer material source site named New York Recycling. On April 24, 2013, the IEM verified that the facility's NYSDEC registration was valid and that the submitted analytical results did not reveal any exceedances relative to the Site shaping layer material Permit requirements; however, several parameters were missing including TCLP metals, TCLP VOCs, and four pesticide parameters. NYCDPR was notified that in order to proceed with this potential source site, the IEM will need to complete a site visit to the facility for visual and physical inspection of the material, and witness collection of samples for chemical testing. In addition, NYCDPR would be required to collect a sample of the fines for submittal to the NYSDEC for review. On April 25, 2013, NYCDPR requested that the IEM take a grab sample of the material fines and provide that sample to the NYSDEC as required. On April 30, 2013, the IEM performed a visual, physical, and PID inspection of the material and collected a sample of fines using a No. 35 sieve. The sample was delivered to the NYSDEC on April 30, 2013.

On Friday, May 24, 2013, the IEM notified NYCDPR that Stockpile #1 of NY Recycling shaping layer material (approximately 8,000 CY) was acceptable for import to the Site due to the fact that the source site qualified as a valid NYSDEC registered C&D processing facility, the IEM conducted a visual/physical inspection of the stockpile on April 30, 2013, the IEM confirmed that the stockpiled material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.), all PID readings measured 0 ppm, and the environmental results were acceptable per the Site Permit requirements for IEM witnessed sampling completed on May 21, 2013. In addition, a sample of fines was collected by the IEM and submitted to NYSDEC for visual review, and subsequent approval. Approved shaping material to be trucked to the Site could only originate from the stockpile witnessed during the May 21, 2013 sampling event.

On June 19, 2013, the IEM notified NYCDPR that Stockpile #2 of NY Recycling shaping layer material (approximately 10,000 cubic yards) as witnessed by the IEM on June 11, 2013, was acceptable for import

to the Site. The IEM conducted a visual/physical inspection of stockpile #2 on June 11, 2013, and the IEM confirmed that the stockpiled material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.). The site qualified as a valid NYSDEC registered C&D processing facility and the test results were acceptable per the Site Permit requirements. Approved shaping material to be trucked to the Site could only originate from the stockpile witnessed during the June 11, 2013 sampling event.

On July 16, 2013, the IEM notified NYCDPR that the latest stockpile of shaping layer material (approximately 5,000 cubic yards) from the NY Recycling source site was acceptable for import to the Site. The submitted lab report met all Permit chemical requirements for sample collection witnessed by the IEM on July 11, 2013 and met Permit visual and physical criteria as per inspection by the IEM.

On August 1, 2013, the IEM notified NYCDPR that the latest stockpile of shaping layer material (approximately 5,000 cubic yards) from the NY Recycling source site was acceptable for import to the Site. The submitted lab report met all Permit chemical requirements for sample collection witnessed by the IEM on July 29, 2013 and met Permit visual and physical criteria as per inspection by the IEM.

On October 24, 2013, the IEM notified NYCDPR that the latest 5,000 cubic yard stockpile of NY Recycling shaping layer material as represented by the submitted TAGM lab report and per samples witnessed by the IEM on October 11, 2013, was acceptable for import to the Site. The approval was based on the fact that the source site qualified as a valid NYSDEC registered C&D processing facility and the IEM conducted a visual/physical inspection of the stockpile on October 11, 2013. The IEM confirmed that the stockpiled material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.), and all PID readings registered in at 0 ppm. The test results were acceptable per the Site Permit requirements. Approved shaping material to be trucked to the Site could only originate from the stockpile witnessed during the October 11, 2013 sampling event.

Approximately 26,688.05 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.34 Little Bay (Queens, NY)

On October 16, 2013, the IEM notified NYCDPR of the findings associated with a preliminary review of available data for the Little Bay source site. The IEM reviewed lab data for Stockpiles 1 through 9 (S-1 through S-9). The lab report did not capture all of the parameters required for testing by the Site Permit, and was missing the full TCLP VOC and TCLP Metals analyses, as well as several SVOC, VOC, Pesticide/Herbicide, and PCB parameters. Based on the data presented, at a minimum, the following stockpiles did not pass the Site Permit criteria as shaping layer material: S-1 exceeded for copper, lead, mercury, and total PCBs; S-4 exceeded for mercury; S-5 exceeded for lead and mercury; and S-9 exceeded for mercury and total PCBs.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.2 Cover Layer Material

Materials accepted for use as cover layer on the Site were sampled prior to acceptance and after each additional 2,000 cubic yards. As per the 2005 Permit modification, the parameters for cover layer material included the complete analyte list of TAGM 4046 for total VOCs, total SVOCs, total pesticides and herbicides, total PCBs, total metals, sulfur, and asbestos.

Fill material imported to the Site and used for the cover layer was subject to the following requirements, per Special Condition 14 of the 2014 Permit and Section 4.2.1.2 of the 2013 Engineering Report. A table of the cover layer material chemical acceptance criteria listed below is included in Appendix C.2 of the 2013 Engineering Report.

In order for topsoil material to be used on the Site for the cover layer, it was sampled prior to acceptance and after the importation of each additional 2,000 cubic yards (in truck volumes). Each soil sample was analyzed for the entire analyte list in the NYSDEC Technical and Administrative Guidance Memorandum (TAGM) 4046, total volatile organic compounds (VOCs), total semi-volatile organic compounds (SVOCs), pesticides and herbicides, polychlorinated biphenyls (PCBs), and metals (including Resource Conservation and Recovery Act (RCRA) metals).

Based on source site reviews and site testing activities, the cover layer material imported to the Site met the following chemical limits:

TAGM 4046 Table 1 – Volatile Organic Compounds (VOCs)

TAGM 4046 Table 2 – Semi-Volatile Organic Compounds (SVOCs)

TAGM 4046 Table 3 – Pesticides/Herbicides and Polychlorinated Biphenyls (PCBs)

TAGM 4046 Table 4 – Metals

Total Asbestos 0.5% or less

Total Sulfur 0.5% or less

The following additional criteria were directed in NYSDEC correspondence:

April 30, 2009 – Directed NYCDPR not to accept or place on the Site any cover layer materials with arsenic concentrations greater than 16 ppm or lead concentrations greater than 400 ppm.

July 28, 2009 – Provided a table to NYCDPR listing modified heavy metal chemical limits for the cover layer at the Site.

September 25, 2009 – Revised and clarified the chromium chemical limits for the cover layer previously presented in the July 28, 2009 letter.

NYCDPR followed the NYSDEC's directives since receipt of each one associated with the importation of cover layer material to the Site.

Details of the source site reviews and site testing for each potential cover layer material source site are as follows.

3.1.2.1 Bloomingburg (C.M. & Sons Trucking Site, 680 Bloomingburg Road, Bloomingburg, NY)

NYCDPR requested that the IEM witness fill material sampling for this potential source site on May 9, 2011. The Site is a sand and gravel supply yard. Material was separated into sand and gravel of various sizes and stockpiled. The source site had been importing sand and gravel material from a nearby real estate development under construction. Material being considered for the Site included two stockpiles (SP-1 and SP-2) of a brown, medium to coarse sand. Both stockpiles were from material generated on-site. Each stockpile was approximately 25,000 cubic yards. Prior to sample collection the piles were screened in various locations using a calibrated PID. No detections of VOCs were observed. The material was inspected using a 3/4-inch screen. No prohibited materials were observed in the screened material. The IEM witnessed a total of six samples collected from two separate stockpiles. Per the AES sampling plan, three samples were collected from each stockpile. Each sample consisted of 20 grabs (depths ranging from the surface to three feet into the pile) which were composited. One discrete grab per sample was collected specifically for VOC analysis without being composited.

NYCDPR provided the IEM authorization to commence review of this source site on May 24, 2011. NYCDPR requested this source site review be put on hold on May 27, 2011. It was requested by NYCDPR that the IEM witness sampling for physical parameters on June 1, 2011. NYCDPR provided authorization to the IEM to order the EDR on NYCDPR's behalf on June 8, 2011.

On June 24, 2011, the IEM emailed the final source site review updates to NYCDPR which identified that Sample #2 for SP-1 failed to meet the cover layer material Permit requirements due to an Antimony exceedance. NYCDPR requested that the source site review be put on hold on June 24, 2011. On June 30, 2011, NYCDPR requested that the IEM resume the source site review. The IEM notified NYCDPR that the review was completed on June 24, 2011 and forwarded the original June 24, 2011 review findings/comments to NYCDPR. On July 1, 2011, NYCDPR requested that the IEM provide the EDR files to NYCDPR which were ordered for the site in June. The IEM resubmitted the EDR files to NYCDPR.

On July 8, 2011, NYCDPR submitted a preliminary review of the EDR to the IEM via email. The IEM provided comments to NYCDPR via email. On July 11, 2011, NYCDPR submitted a preliminary site review submittal via email and the IEM provided comments to NYCDPR via email. On July 12, 2011, NYCDPR submitted the site review submittal to the NYSDEC and the IEM via email. On July 12, 2011, the NYSDEC requested that the IEM provide preliminary comments of NYCDPR's submittal and the IEM provided comments to the

NYSDEC via email. On July 15, 2011, the NYSDEC provided comments to the IEM and a request for clarification on NYCDPR's submittal.

The IEM provided NYCDPR a review status update with respect to this source site via phone and email on July 20, 2011. The update contained action items required for NYCDPR to advance the review process. The IEM provided the NYSDEC with an update on the status of NYCDPR submittals for this source site on July 22, 2011 via email. NYCDPR provided the cover layer material permeability testing results to the IEM on July 22, 2011. The IEM consulted with the NYSDEC beginning on July 22, 2011 regarding the permeability results and the IEM notified NYCDPR on July 28, 2011 that the cover soil permeability rate of 1.51 X 10-2 cm/s (21.4 in/hr.) did not meet the NYSDEC maximum allowable permeability of 1 x 10-2 cm/s (14.7 in/hr.). The IEM also requested clarification on NYCDPR's intent on handling the SP-1 Antimony exceedance as identified in lab reports.

NYCDPR requested the analytical lab data from the IEM on August 8, 2011 and indicated that they would be submitting a final proposal to the NYSDEC regarding the request to import cover material from the Bloomingburg source site by addressing outstanding metals and permeability requirements. The IEM forwarded requested lab data to NYCDPR via email on August 8, 2011.

IEM staff visited the Bloomingburg source site to inspect the cover layer material on October 6, 2011 and the existing material appeared to be the same material that the IEM inspected originally in May 2011 with the exception that SP-1 had been removed off-site and was no longer available. The results of the site visit were consistent with what the IEM was told by the site operator earlier on October 6, 2011. The IEM confirmed that the GPS coordinates of the stockpile (SP-2) were consistent with the original location, the soil appeared to be the same color and consistency, and the stockpile had vegetation growing on it, indicative that it had been untouched for an extended period. The IEM witnessed the loading of one truck on October 6, 2011 headed to the Site, which was carrying approximately 26 cubic yards of cover layer material. IEM staff was on-site at Bloomingburg on October 7, 2011 to witness the initial rounds of cover layer material loading.

In general, the NYSDEC allowed up to 16,000 cubic yards of approved cover material (from all cover material source sites) to be stockpiled in the rough of holes 4 and 5 (8,000 cubic yards per hole) prior to satisfying the conditions associated with spreading the cover material on the Site. These conditions included meeting permeability and shaping layer thickness requirements. On October 21, 2011, the NYSDEC provided NYCDPR with a conditional approval to allow NYCDPR to import cover layer material with a permeability of up to 30 inches per hour pending NYCDPR submitting for approval of an amendment to the Stormwater Pollution Prevention Plan (SWPPP). With this permeability approval, NYCDPR was notified that they could spread cover material on-site at their own risk pending shaping layer thickness compliance which occurred at a later time.

Approximately 4,768.0 cubic yards of cover layer material were imported to the Site from this source site.

3.1.2.2 Ranco Sand (115 South Street, Manorville, NY) [LAWS]

On December 2, 2011, the IEM was directed by NYCDPR to order the EDR for the Ranco Sand source site located in Manorville, NY. The IEM visited the Ranco Sand source site on December 8, 2011 to inspect a stockpile of approximately 10,000 to 12,000 cubic yards of proposed cover soil. The soil was inspected and visually appeared to be 100% sand, free of any debris. The material appeared to be native as it was mined from a NYSDEC permitted facility, extending approximately 100 feet below original grade. The stockpile of sand that was inspected was mined from below the water table.

The IEM witnessed the collection of six composite soil samples and six discrete VOC samples, as well as a physical sample to be analyzed for permeability. The IEM logged the location of the perimeter of the stockpile via GPS. The source site owner and NYCDPR were made aware that the stockpile must remain untouched in order for the material to be considered for approval.

NYCDPR/LAWS submitted a copy of a previous NYSDEC mining permit containing the source site's previous permit number (1-4722-00218/00001). LAWS was informed by the source site representative that the source site is operating under a NYSDEC authorized permit extension.

The EDR was ordered on December 9, 2011. The IEM performed a review of the EDR and provided observations and a list of RECs to the NYSDEC. The IEM received the lab data (from the December 8, 2011 sample event) from LAWS on December 19, 2011. The IEM completed review of the lab data on December 19, 2011 and found that the material met the Site Permit criteria for cover layer soil. The IEM reviewed the NYCDPR submittal associated with the EDR for the source site. Based on review of the NYCDPR EDR review memo, site visits, inspections, and data review, the IEM did not have any objections associated with proceeding with this source site. Prior to receiving approval for importation of this cover material to the Site, the NYSDEC needed to receive and review the permeability testing data.

On January 4, 2012, the IEM forwarded the NYSDEC the permeability data for review. On January 9, 2012, the NYSDEC identified that this source site was conditionally approved as a source for cover material based on samples meeting the approved permeability specification at a frequency of one sample per five hundred cubic yards for the initial 2,000 cubic yards (analysis for permeability only). Thereafter, sampling for permeability would be performed at a frequency of one sample per 2,000 cubic yards if the permeability results for the initial 2,000 cubic yards were satisfactory. This conditional approval was based upon information provided by NYCDPR in its January 5, 2012 email and the IEM's January 4, 2012 email to the NYSDEC. Additional permeability sampling witnessed by the IEM was required since only one IEM witnessed sample has occurred (i.e. January 2, 2012). The IEM witnessed permeability testing at the source site on January 10, 2012.

NYCDPR transmitted additional percolation testing results to the NYSDEC on January 26, 2012. The results were for IEM witnessed sampling completed on January 10, 2012 and January 23, 2012. On January 26, 2012, the NYSDEC provided NYCDPR with approval to use the average of twenty permeability test results as representative of the 12,000 cubic yards of stockpiled cover layer material at the source site. This

approval was based on the fact that loading, transporting, stockpiling, and spreading of the material would result in thorough mixing. The initial 12,000 cubic yards were approved for import to the Site.

On February 1, 2012, IEM staff was on-site to observe loading and transportation of cover layer materials from the approved stockpile and completion of trucking manifests. On February 7, 2012, IEM staff notified NYCDPR and NYSDEC that the IEM had reviewed the environmental sample data for the second round of environmental sampling completed on January 30, 2012 for cover soil (i.e. eight composite samples from an approximately 15,000 cubic yard stockpile). Per the results in the lab report transmitted to the IEM, the IEM verified that the material complied with the Site permit criteria for cover layer material. On February 9, 2012, the IEM reviewed the infiltration rate test results for the second stockpile of cover layer material, and all of the sample results met the Site Permit criteria (i.e. less than 29.4 in/hr.). Based on a review of the submitted environmental data and the infiltration testing data, the second stockpile (up to 16,000 cubic yards) was approved for import to the Site since it met all of the Site Permit criteria.

The IEM was on-site at the Ranco Sand source site on February 22, 2012 to witness sampling of a new stockpile of potential cover layer material (stockpile #3). The IEM witnessed the collection of five samples from the stockpile consisting of approximately 10,000 cubic yards of potential cover layer material.

The IEM reviewed the environmental sampling results from the February 22, 2012 sampling event for this source site and found that the sample results fell below the Site Permit limits. The IEM reviewed the percolation test results and found that the percolation rates for stockpile #3 exceeded the established threshold of 29.4 inches/hour. The IEM required a proposal from NYCDPR on an acceptable approach to remedy the percolation rate exceedance.

On March 15, 2012, the NYSDEC notified the IEM that the environmental testing (TAGM) frequency for this source site had been reduced from one sample per 2,000 cubic yards to one sample per 10,000 cubic yards of cover layer material. The percolation testing frequency remained unchanged at one sample per 2,000 cubic yards.

On March 15, 2012, the NYSDEC found NYCDPR's proposed truck loading and mixing protocol acceptable to address elevated percolation rates for the stockpile #3 materials. On March 19, 2012, the IEM informed NYCDPR that stockpile #3 at the Ranco Sand source site had been approved for import as cover layer material based upon the acceptable environmental testing results and the percolation results in conjunction with the required mixing and truck loading protocol. The IEM witnessed the appropriate truck loading protocol of the first round of trucks at the source site on March 16, 2012. Trucks were loaded in an alternating pattern from both stockpile #2 and stockpile #3.

The IEM witnessed source site sampling at this source site on March 30, 2012. The IEM received a lab report on April 5, 2012 containing infiltration testing data for ten samples collected from stockpile #4. The IEM reviewed the infiltration testing data and confirmed that the results met the permeability requirement for cover soil.

The IEM received the environmental (TAGM) lab report on April 6, 2012 for the samples collected for stockpile #4 on March 30, 2012. On April 9, 2012, the IEM confirmed that sample results for stockpile #4 did not exceed any of the Permit criteria for cover material and the material was acceptable for import to the Site.

The IEM received the environmental (TAGM) lab report on May 9, 2012 for the samples collected for stockpile #5 on April 30, 2012. On May 10, 2012, the IEM confirmed that sample results for stockpile #5 did not exceed any of the Permit criteria for cover material and the material was acceptable for import to the Site. The IEM reviewed the infiltration testing data on May 17, 2012 and confirmed that the results met the permeability requirement for cover soil.

The IEM approved Ranco stockpile #5 on May 17, 2012, as the environmental testing results did not exceed any of the Permit criteria for cover layer material. The 20,000 cubic stockpile from Ranco that was tested and witnessed by the IEM met the Site Permit criteria and was acceptable for import to the Site. Infiltration testing was also approved by the IEM. The NYSDEC lowered the frequency of infiltration testing to one infiltration sample per 10,000 cubic yards for this source site on May 11, 2012. Through May 17, 2012, this source site was approved to export 78,000 cubic yards of cover material to the Site.

The IEM was on-site at this source site on June 8, 2012 to witness the collection of samples from stockpile #6. Two samples were collected for environmental and infiltration analysis for the approximate 20,000 cubic yard stockpile. The IEM received infiltration testing data on June 14, 2012. Infiltration test results were reviewed and approved on June 19, 2012. The IEM received environmental testing lab results on June 18, 2012. The environmental testing lab results were reviewed and approved on June 19, 2012. Stockpile #6 (20,000 CY) did not exceed any of the Site Permit criteria for cover layer material and infiltration requirements and was therefore acceptable for import to the Site.

The IEM was on-site at this source site on July 17, 2012 to witness sampling of stockpile #7 consisting of 10,000 cubic yards of cover layer material. On July 26, 2012, the IEM notified NYCDPR and LAWS that the material from stockpile #7 was acceptable for import to the Site based on the fact that the submitted environmental and infiltration lab reports met the Site Permit requirements.

The IEM reviewed the infiltration and environmental lab reports for stockpile #8 of cover layer material (10,000 cubic yards) sampled on August 14, 2012. The IEM notified NYCDPR on August 22, 2012 that the material was approved for import to the Site as both infiltration and environmental results were acceptable per the Site permit requirements.

On September 17, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #9 of cover layer material sampled at this source site on September 7, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

On October 1, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #10 of cover layer material sampled at this source site on September 21, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

On November 7, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #11 of cover layer material sampled at this source site on October 17, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

On December 10, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #12 of cover layer material sampled at this source site on November 16, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

IEM staff was on-site February 1, 2013 at this source site to perform the visual inspection and witness sampling of the cover soil for environmental and infiltration testing associated with stockpile #13 (10,000 cubic yards). The IEM witnessed collection of one environmental sample and one infiltration sample.

On February 19, 2013, the IEM notified NYCDPR that the latest round of cover layer material for this source site was acceptable for import to the Site based on the fact that both the environmental and infiltration results met the Site Permit requirements. The results were for sampling witnessed by the IEM on February 1, 2013 for stockpile #13.

The IEM witnessed sample collection for stockpiles #14 and #15 totaling 20,000 cubic yards worth of proposed cover layer material at this source site on March 19, 2013. Based on review of submitted lab results, the proposed cover layer material was approved for import to the Site as both infiltration and environmental results were acceptable per the Site Permit requirements.

On June 3, 2013, the IEM notified NYCDPR that the latest round of cover layer material for stockpiles #16 and #17 totaling approximately 20,000 cubic yards were acceptable for import to the Site as both infiltration and environmental results met the Site Permit requirements. Submitted infiltration and environmental lab reports were for sampling witnessed by the IEM on May 22, 2013.

On August 5, 2013, the IEM notified NYCDPR that the latest round of cover layer material for stockpile #18 (approximately 10,000 cubic yards) was acceptable for import to the Site. The submitted infiltration and environmental lab reports for sampling witnessed by the IEM on July 26, 2013 met the Site Permit requirements.

On August 29, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #19 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on August 21, 2013.

On September 13, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #20 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on September 6, 2013.

On October 3, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #21 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on September 25, 2013.

On October 28, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #22 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on October 16, 2013.

On November 8, 2013, the IEM notified NYCDPR that the latest cover layer material stockpile #23 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on October 25, 2013.

On November 18, 2013, the IEM notified NYCDPR that the latest cover layer material stockpile #24 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on November 8, 2013.

On March 14, 2014, the IEM notified LAWS and NYCDPR that the cover layer material stockpile #24, originally sampled and witnessed on November 8, 2013 was acceptable for importation. On March 14, 2014, the IEM completed a site visit and performed a visual inspection of the existing stockpile on-site.

3.1.2.2.1 Ranco Sand (115 South Street, Manorville, NY) [MFM]

On July 10, 2012, the IEM received lab results for a 10,000 cubic yard stockpile of cover layer material sampled at the Ranco Sand source site on July 2, 2012 for MFM. On July 11, 2012, the IEM confirmed that the environmental lab testing results did not exceed any of the Site Permit criteria for cover layer material environmental analyses however the stockpile could not be approved for import as infiltration test results were not reviewed and approved.

The NYSDEC approved the infiltration test results on August 21, 2012 for stockpiled cover layer material (10,000 cubic yards) sampled on July 2, 2012. Based on the NYSDEC approval of the infiltration results, the IEM notified NYCDPR on August 22, 2012 that the stockpiled material was approved for import to the Site as both infiltration and environmental results were acceptable per the Site Permit requirements.

3.1.2.2.2 Ranco Sand (115 South Street, Manorville, NY) [Triton]

On June 6, 2013, the IEM notified NYCDPR that the revised environmental lab report for a 5,000 cubic yard stockpile met the Site Permit requirements for IEM witnessed sampling completed on May 31, 2013. On June 7, 2013, the IEM notified NYCDPR that the infiltration testing results did not meet the Site Permit requirements.

On June 24, 2013, the IEM notified NYCDPR that the additional infiltration tests analyzed for a 5,000 cubic yard stockpile did not meet the Site Permit requirements for IEM witnessed sampling completed on May 31, 2013 and it was not approved for import to the Site. On June 24, 2013, NYCDPR notified the IEM that this material would not be sampled any further.

Approximately 271,801.2 cubic yards of cover layer material were imported to the Site from this source site based on approved materials noted above in Sections 3.1.2.2 and 3.1.2.2.1.

3.1.2.3 East Coast Mines (Lewis Road near Route 104, East Quogue, NY)

Between August 10 and August 12, 2011, NYCDPR and the IEM coordinated a site visit to the East Coast Mines source site (DEC Facility ID: 1-4736-00539), and discussed review requirements. The EDR was ordered by the IEM on August 12, 2011, and the initial EDR files were forwarded to NYCDPR.

The IEM visited the source site on August 17, 2011 to inspect two stockpiles each consisting of approximately 2,000 cubic yards of soil. The soil was inspected and visually appeared to be sand, free of any debris. The material appeared to be native as it was mined from roughly 80-100 feet below original grade. The stockpiles were inspected with a PID, which yielded no detections. The IEM witnessed the collection of a composite and discrete VOC sample from each stockpile, as well as a physical sample to be analyzed for permeability.

The IEM visited the site again on September 29, 2011 to inspect a separate stockpile of proposed cover layer material of approximately 2,000 cubic yards of soil. The soil was inspected and visually appeared to be sand and free of any debris. The material appeared to be native as it was mined from roughly 80-100 feet below original grade. The IEM witnessed the collection of a composite and discrete VOC sample from the stockpile, as well as a physical sample to be analyzed for permeability. The IEM logged the location of the perimeter of the stockpile via GPS. The source site owner and NYCDPR were aware that the stockpiles must remain untouched in order for them to be considered for approval. NYCDPR performed a review of the EDR. The IEM performed a review of NYCDPR's review submittal, as well as a review of the EDR. No RECs were identified. NYCDPR submitted the facility's NYSDEC mining permit to the IEM.

On October 11, 2011, the NYSDEC identified that they had reviewed the initial analytical data for the East Coast Mines source site and authorized the importation of two stockpiles of cover material totaling approximately 3,500 cubic yards. This approval was associated with cover material that was sampled on August 17, 2011. This material was approved for only stockpiling on-site, and had not been approved for spreading on-site. Cover material was stockpiled in the rough of holes 4 and 5 pending NYSDEC approval for spreading. The NYSDEC had not reviewed the September 29, 2011 analytical data resulting in a

maximum allowable import volume from this source site of 3,500 cubic yards. In general, the NYSDEC allowed up to 16,000 cubic yards of approved cover material (from all cover material source sites) to be stockpiled in the rough of holes 4 and 5 (8,000 cubic yards per hole) prior to satisfying the conditions associated with spreading the cover material on-site. These conditions included meeting permeability and shaping layer thickness requirements. On October 21, 2011, the NYSDEC provided NYCDPR with a conditional approval to allow NYCDPR to import cover layer material with a permeability of up to 30 inches per hour pending NYCDPR submitting for approval of an amendment to the Stormwater Pollution Prevention Plan (SWPPP). With this permeability approval, NYCDPR was notified that they could spread cover material on-site at their own risk pending shaping layer thickness compliance.

On April 18, 2012, NYCDPR requested that the IEM witness source site sampling for two 2,000 cubic yard stockpiles at this source site.

The IEM witnessed source site sampling at this source site on April 23, 2012. Four samples were collected for environmental testing and four samples were collected for agronomic testing. The IEM reviewed the environmental and infiltration testing data and confirmed that the environmental results met the Site Permit requirements for cover layer material and three of four stockpiles met the NYSDEC permeability requirements. The stockpile SP2 infiltration rate exceeded the Permit limit. Material from SP2 was not acceptable for import to the Site.

The East Coast Mines stockpiled material sampled on April 23, 2012 was formally approved by the NYSDEC on May 15, 2012. Although the environmental results passed the Site Permit criteria, one of the four stockpiles (each stockpile was 2,000 cubic yards) did not meet the Site Permit infiltration criteria. However, the NYSDEC, after a review of a NYCDPR submittal request, granted approval of the four stockpiles by allowing averaging of the four stockpile infiltration results; the average of the four stockpiles met the Site Permit criteria.

The IEM forwarded the Site environmental testing criteria per the Permit for cover layer material to the lab on July 2, 2012. On July 4, 2012, the IEM notified NYCDPR, the lab, and the source site contact of parameters that had to be re-analyzed or re-reported to coincide with the required Permit limits for potential cover layer material sampled on June 22, 2012. On July 5, 2012, the IEM reviewed the revised lab report for material sampled on June 22, 2012 and determined that the material (6,000 cubic yards) was acceptable for import to the Site. On July 10, 2012, the IEM received a lab report associated with a 10,000 cubic yard stockpile sampled on July 2, 2012. On July 10, 2012, the material was found to be acceptable for import to the Site based upon review of the submitted lab report and NYSDEC review and approval of the infiltration testing results. The NYSDEC approved the infiltration results based on the condition that the stockpiled materials were mixed at the source site prior to import to the Site.

The NYSDEC notified NYCDPR on July 18, 2012 that the proposed 1:3 ratio of mixing for cover layer material stockpiles #1, #3, and #6 at East Coast Mines source site was acceptable and subject to verification by the IEM. The IEM notified NYCDPR and the source site operator on July 18, 2012 that the submitted lab report was missing the analysis of dibenzofuran. NYCDPR and the source site operator

submitted revised lab reports on July 18, 2012. The IEM notified NYCDPR and the source site operator that the two separate stockpiles of material (8,000 cubic yards each) sampled at the East Coast Mines source site on July 11, 2012 were conditionally acceptable for import based upon proper mixing of the stockpiles. The IEM was on-site at the East Coast Mines source site to witness sampling of a new 10,000 cubic yard stockpile and the mixing of the cover soil stockpiles on July 23, 2012. The IEM notified NYCDPR and the source site operator that the sampled materials were acceptable for import to the Site on July 24, 2012.

The IEM was on-site at the East Coast Mines source site on July 31, 2012 to witness mixing of cover layer material stockpiles. On August 6, 2012, the IEM notified NYCDPR that the cover layer materials sampled on July 23, 2012 at the East Coast Mines source site, totaling 14,000 cubic yards, were acceptable for import to the Site based on review of submitted environmental and infiltration lab reports.

On August 20, 2012, the IEM notified NYCDPR that the 8,000 cubic yard stockpile of cover layer material sampled on July 31, 2012 was approved for import to the Site. The approval was based on the submitted environmental results meeting the Site Permit requirements, approval from the NYSDEC to mix and average the infiltration test results, and the mixing of the stockpiled material at the source site which was witnessed by the IEM on August 14, 2012.

On August 30, 2012, the IEM notified NYCDPR that the 12,000 cubic yards of cover layer material sampled on August 14, 2012 was approved for import to the Site. The approval was based on the submitted environmental results meeting the Site Permit requirements, approval from the NYSDEC to mix and average the infiltration test results (August 23, 2012 email), and the mixing of the stockpiled material at the source site which was witnessed by the IEM on September 4, 2012.

On September 12, 2012, the IEM notified NYCDPR that a portion of the 14,000 cubic yards of cover layer material sampled on September 4, 2012 was approved for import to the Site. Stockpile SW consisting of 6,000 cubic yards of cover layer material was approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile DSS consisting of 8,000 cubic yards had acceptable environmental results meeting the Site Permit requirements but was not approved due to infiltration results not meeting the Permit requirements. On September 14, 2012, the IEM notified NYCDPR that Stockpile DSS consisting of 8,000 cubic yards of cover layer material was approved for import to the Site since the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of September 14, 2012.

On September 20, 2012, the IEM notified NYCDPR that a portion of the 14,000 cubic yards of cover layer material sampled on September 14, 2012 was approved for import to the Site. Stockpile FFS consisting of 6,000 cubic yards of cover layer material was approved was based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile NW consisting of 8,000 cubic yards had acceptable environmental results meeting the Site Permit requirements but was not approved due to infiltration results not meeting the Permit requirements. On September 21, 2012, the IEM notified NYCDPR that Stockpile NW consisting of 8,000 cubic yards of cover layer material was

approved for import to the Site since the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of September 21, 2012.

On September 28, 2012, the IEM notified NYCDPR that a portion of the 12,000 cubic yards of cover layer material sampled on September 21, 2012 was approved for import to the Site. Stockpile SW consisting of 2,000 cubic yards of cover layer material was approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile DSS consisting of 10,000 cubic yards had acceptable environmental results meeting the Site Permit requirements but was not approved due to infiltration results not meeting the Permit requirements. On October 2, 2012, the IEM notified NYCDPR that Stockpile DSS consisting of 10,000 cubic yards of cover layer material was approved for import to the Site since the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of October 2, 2012.

On October 8, 2012, the IEM notified NYCDPR that all of the 16,000 cubic yards of cover layer material sampled on October 2, 2012 was approved for import to the Site. Stockpile SW consisting of 6,000 cubic yards of cover layer material was approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile NW consisting of 10,000 cubic yards which had acceptable environmental results meeting the Site Permit requirements was approved based on the fact that the average of the infiltration test results met the Permit requirements and the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of October 9, 2012.

On October 18, 2012, the IEM notified NYCDPR that all of the 16,000 cubic yards of cover layer material sampled on October 9, 2012 was approved for import to the Site. The stockpiled cover layer material was approved was based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results.

On November 7, 2012, the IEM notified NYCDPR that all of the 16,000 cubic yards of cover layer material sampled on October 24, 2012 was approved for import to the Site. Stockpile SW consisting of 6,000 cubic yards of cover layer material and Stockpile NW consisting of 10,000 cubic yards of cover layer material were approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results.

On May 8, 2013, the IEM inspected previously tested and approved cover layer material (sampled October 24, 2012) at the source site and notified NYCDPR that import may resume for the previously approved material.

On July 25, 2013, the IEM notified NYCDPR that the latest round of East Coast Mines cover layer material (approximately 8,000 cubic yards) was acceptable for import to the Site. The submitted infiltration and environmental lab reports for sampling witnessed by the IEM on July 19, 2013 met the Site Permit requirements.

Approximately 167,007.05 cubic yards of cover layer material were imported to the Site from this source site.

3.1.2.4 Amboy Aggregates (415 Main Street, South Amboy, NJ)

The IEM reviewed the infiltration and environmental lab reports for cover layer material (2,000 cubic yards) sampled on August 27, 2012. The IEM notified NYCDPR on September 6, 2012 that the environmental results were acceptable per the Site Permit requirements, however the infiltration results did not pass the Permit requirements for cover layer material. The IEM's involvement on this source site was limited to witnessing the collection of the soil samples for testing and a review of the lab results.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.2.5 Long Island Compost/Great Gardens (445 Horseblock Road, Yaphank, NY)

On November 16, 2012, the IEM notified NYCDPR and LAWS that the Long Island Compost/Great Gardens source site (DEC Permit Number: 1-4722-03647/00001) was conditionally approved to allow for the import of topsoil to be used as cover layer material pending IEM visual inspection and witnessing the collection of soil samples of the proposed material at the source site.

On December 7, 2012, the IEM notified NYCDPR that the 2,000 cubic yard stockpile of cover layer material sampled at this source site on November 30, 2012 was acceptable for import to the Site as both environmental lab results and visual inspection met the Site Permit requirements. The NYSDEC waived infiltration testing requirements for this material as long as the material was used solely in tree pits.

The IEM witnessed sample collection for a 2,000 cubic yard stockpile of proposed cover layer material at this source site on March 20, 2013. On March 28, 2013, the IEM notified NYCDPR and LAWS that the submitted sample results did not pass the Site Permit criteria due to the fact that Benzo(a)pyrene exceeded the permit limit of .061 mg/kg in sample 49369 with a value of .097 mg/kg and Chromium exceeded the permit limit of 19.4 mg/kg in sample 49369 with a value of 22.9 mg/kg. The material was not approved for import to the Site as cover layer material at that time.

On April 9, 2013, the IEM notified NYCDPR and LAWS that the submitted sample results for a 2,000 cubic yard stockpile of proposed cover layer material at this source site (sampled on March 20, 2013) did not pass the Site Permit criteria due to the fact that Benzo(a)pyrene exceeded the permit limit of .061 mg/kg in sample 49369 with a value of .097 mg/kg. The revised lab report dated April 8, 2013 addressed concerns with the analysis of trivalent and hexavalent chromium (the previous lab report had only analyzed total chromium). On April 10, 2013, the NYSDEC notified NYCDPR that after further review of the revised lab results, the 2,000 cubic yards of material was acceptable for import to the Site.

On April 29, 2013, the IEM notified NYCDPR and LAWS that the submitted sample results for a 2,000 cubic yard stockpile of proposed cover layer material at this source site (sampled on April 19, 2013) did not pass the Site Permit criteria due to the fact that Benzo(a)pyrene exceeded the permit limit of 0.061 mg/kg with

a value of 0.140 mg/kg and Dibenzo(a,h)anthracene exceeded the permit limit of 0.014 mg/kg with a value of 0.020 mg/kg. On May 1, 2013, NYCDPR requested approval to use the material as backfill for the tree pits only. On May 1, 2013, the NYSDEC notified NYCDPR that the 2,000 cubic yards of material was acceptable for import to the Site.

On May 14, 2013, the IEM notified NYCDPR and Triton that the submitted environmental and infiltration sample results for 2,000 cubic yards of proposed cover layer material at this source site (witnessed by the IEM and sampled on April 30, 2013) was acceptable for import to the Site as both environmental and infiltration results met the Site Permit requirements.

On October 28, 2013, the IEM notified NYCDPR that that a review was completed for a 2,000 cubic yard stockpile of proposed cover layer material from this source site. The proposed material was visually inspected and sampling was witnessed by the IEM on October 16, 2013. Although the material passed the IEM's physical/visual inspections and did not yield any PID detections, the sampled material did not comply with Site Permit criteria for the following parameters: Benzo(a)pyrene exceeded the permit limit of 0.061 mg/kg in sample GBF65277 with a value of 0.150 mg/kg; Dibenzo(a,h)anthracene exceeded the permit limit of 0.014 mg/kg in sample GBF65277with a value of 0.024 mg/kg; and Dieldrin exceeded the permit limit of 0.044 mg/kg in sample GBF65277 with a value of 0.100 mg/kg. On October 29, 2013, NYCDPR submitted additional documentation to the NYSDEC for evaluation. Based on review of submitted information, the NYSDEC notified NYCDPR on October 29, 2013 that this material may be imported to Site and used solely for backfilling the parking lot curb planters and shall not be used as capping material.

On March 11, 2014, the IEM notified LAWS and NYCDPR that the 2,000 cubic yard stockpile of cover layer material originally sampled and witnessed on October 16, 2013 was acceptable for importation. On March 11, 2014, the IEM completed a site visit and performed a visual inspection of the existing stockpile at the source site.

Approximately 8,434.85 cubic yards of cover layer material were imported to the Site from this source site.

3.2 On-Site Fill Importation Inspections

3.2.1 Process

As required under Special Condition 24 of the 2014 Permit, all fill importation was inspected at the Site by the IEM. Fill material volume (truck volume) was measured and recorded for each delivery of fill material as it arrived on-site by NYCDPR's appointed representative. The fill material was then inspected by the IEM at the observation platform near the entrance to the Site. At this time, the fill material was visually and chemically inspected. The visual inspection included observations of the material, disturbing the material with a shovel, and close-up observations of the material retrieved by shovel while still in the truck or trailer. Chemical inspection of the fill material was executed using a calibrated PID. If the fill material failed to meet the Permit requirements for reasons such as a PID reading above ambient air, the presence of asphalt or some other unauthorized debris, etc., the load was rejected immediately prior to

dumping. If the material was rejected, the truck was not allowed to dump on-site and was directed to exit the site immediately.

If the fill material passed the initial inspection at the IEM observation platform, either it was allowed to dump directly at a work location for immediate use as shaping layer material or cover layer material or it was transported to, and dumped at, a stockpile location. At the dump location, the IEM screened the fill material visually and with a PID for a second time prior to spreading if dumped at an active work location. If the fill material did not meet the permit requirements at the dump location, it was immediately rejected, loaded back onto the same truck, and transported off-site.

After the second round of inspection and after the material was dumped on-site and accepted for use, the IEM recorded dump and stockpile locations utilizing handheld GPS units. The data was uploaded to a web-based GIS system intermittently throughout the process in order to provide real-time data to authorize users including the NYSDEC and NYCDPR and to generate figures used to track the dump locations in the biweekly FMRs. The web-based GIS database was maintained by the IEM. Figure 2, included in each FMR beginning with FMR 246, identifies where fill materials were being used and dumped on the Site during construction activities.

A flow chart detailing the on-site fill importation inspection process is included as Appendix 21.

3.2.2 Trucking Manifests

Trucking manifests were utilized for all imported shaping layer and cover layer materials. A 5-ply manifest form was completed for each load of material to track each load of material from origination at the source site to destination at the Site. The manifest contained information including but not limited to a manifest number, the source site name and address, the truck driver's name, truck and trailer license plate numbers, as well as the time of departure from the source site and arrival time at the Site. See fill import manifests included in Appendix 13.

Note that manifests for material approved for importation prior to November 2008 cannot be retrieved and are not included in Appendix 13. The manifest information was stored in a NYCDPR document repository that was damaged by flooding and the files have been lost. However, the FMRs for the time period prior to 2008 comment on the nature of this work.

3.2.3 Rejected Trucks & Materials (JFK Consent Order Material & Misc. Debris)

Generally, materials were either rejected upon initial inspection at the IEM observation platform or rejected upon dumping at the work area or stockpile location. The most common reasons for rejection were the presence of asphalt or other unauthorized debris mixed with the material or elevated PID readings.

Details for all rejected trucks were included in each bi-weekly Fill Management Report (FMR). Trucking manifests associated with rejected truckloads were marked with the word "REJECTED" by the IEM. Trucking manifests for rejected trucks are included as Appendix 13.

During 2010, fill material from one particular source at JFK Airport was brought on-site and placed in seven different stockpiles ultimately being used as fill material beneath the clubhouse and maintenance building parking lots. The material was believed to be in conformance with permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. On January 10, 2011, NYCDPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to this fill material. The Consent Order is included as Appendix I, of the 2013 Engineering Report included in Appendix 20.

3.3 Fill Tracking

Special Condition 9 of the 2014 Permit required quantification of all imported fill material. Fill importation was continuously tracked by the IEM. To account for the difference in truck volume and in-place volume, the IEM applied a 41.7% correction factor for shaping layer material and an 18% correction factor for cover layer material as set forth in the Permit. Additional details and methodology related to calculation of the shaping layer correction factor is included in a December 11, 2009 letter included in Appendix 19.

The cover layer material correction factor was separated from the shaping layer correction factor and revised in accordance with a NYCDPR submittal dated April 1, 2013 and revised April 8, 2013. The methodology for calculating the cover layer material correction factor is included in the revised April 8, 2013 submittal, which is included in Appendix 19.

As shaping layer and cover layer fill materials were imported to the Site, the IEM tracked volumes for each source site with respect to authorized volume based on approved sample analysis results for each source at the required sampling frequency (i.e. per 10,000 cubic yards for shaping layer material and per 2,000 cubic yards for cover layer material as included in Special Condition 14 of the 2014 Permit). The volume of imported material was tracked real-time as the IEM uploaded source, truck, and fill material volume information as each load of material was dumped on the Site. The fill tracking process, as part of the overall environmental monitoring and database management web-GIS system developed by the IEM and utilized beginning on October 25, 2010, was awarded a New York Chapter American Council of Engineering Companies (ACEC) Platinum Award in April of 2013. The web-GIS system allowed the IEM to upload and store data related to each load of fill material entering the Site, map its location, and allow real-time access to the data and mapping for NYCDPR, NYSDEC, the Contractor, and the general public.

At various times throughout fill importation activities, source site, shaping layer, or cover layer material totals were modified for various reasons. Additional details related to corrections and modifications can be found in Section 4 of corresponding Fill Management Reports, notably FMRs 213, 266, 277, 290, and 305.

Effective with FMR 290 and retroactive to October 25, 2010 (i.e. Woodard & Curran's first day as the IEM on-site at the Site), shaping layer and cover layer material volumes were tracked based upon the calculated volumes within each truck, as calculated by TRC and provided to the IEM (i.e. Tables 4-2 and 4-3 of each FMR). This provided for the most accurate and consistent approach to monitoring the volume

of imported fill materials. Prior to receipt of the calculated volumes from TRC, the IEM tracked estimated volumes as trucks dumped on the Site.

The Fill Delivery Summary Table included in Appendix 11 contains information related to the total amount of shaping layer and cover layer materials imported to the Site. The total volume of shaping layer material imported to the Site since October 18, 2002 was 2,681,338.15 cubic yards (truck volume) or approximately 93.4% of the authorized amount under the Permit. The total volume of cover layer material imported to the Site since October 18, 2002 was 480,959.49 cubic yards (truck volume) or 100.1% of the authorized amount under the Permit.

On April, 17, 2014, the NYSDEC confirmed via email that a minor exceedance of the cover layer in-place volume as included in the Permit is acceptable considering no additional shaping material will need to be imported and that the exceedance could be addressed via as-built drawings and in the final construction certification report. A copy of the email is included in Appendix 19.

The Bronx-Whitestone Bridge bound the "Site" to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south. The project was originally managed under Ferry Point Partners, LLC (FPP).
On July 17, 2000 the New York State Department of Environmental Conservation (NYSDEC) issued Part 360, Solid Waste Management Permit No. 2-6006-00014-000110 jointly to the New York City Department of Parks and Recreation (NYCDPR) and FPP to allow a total of 1,000,000 cubic yards of fill to be imported and placed on the Site. Importation began in August 2000.

On October 18, 2002 the NYSDEC issued Part 360, Solid Waste Management Permit No. 2-6006-00014-000113 (2002 Permit) to allow a total of 1,522,300 cubic yards of fill to be imported and placed on the Site. The fill material was to consist of approximately 1,272,300 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The 2002 Permit also stated that, "approximately 415,000 cubic yards of fill was deposited on the Site prior to the effective date of the permit and the projection for in-place fill material to complete the project was 1,107,300 cubic yards, consisting of approximately 857,300 cubic yards (in-place volume) of select exempt construction debris for the shaping layer and approximately 250,000 cubic yards (in-place volume) of uncontaminated soil for the cover layer.

In 2003, it was determined that the tournament quality and signature status of the course could be significantly improved by making the facility a "links" style course. The changes from the 2002 Permit include:

- Increasing the support mounding between golf holes and grading the course in a links style.
- Re-routing of holes 11, 12 and 13 to reverse their direction in order to improve player circulation and playing time.
- Moving Hole 9 to the west of the golf driving range in order to improve

the safety zone of the driving range and remove the need for high netting.

- Realigning the centerlines of holes: 10, 16, 17 and 18 to improve the strategic layout and visual experience of the golf course.
- Lowering the elevations of tee 4 and 6. This will eliminate the retaining wall proposed at the northeast comer of the Site.
- Adding a golf training area at the north end of the driving range. This required shifting the centerline of Hole 8 slightly north and increasing the support mounding around this area to buffer the adjacent holes.
- Increasing the mounding adjacent to the TBTA toll plaza in order to block noise and adjacent traffic from view.
- Shifting the Site roadway along the east side of the bridge to accommodate a TBTA easement that extends 25 feet east of the bridge. This required changes to the parking lot at the clubhouse and the location of detention/water quality basin, and waterfront park.
- Eliminating the Boathouse Grill restaurant in the Waterfront Park. A restaurant will now be located within the banquet facility. Parking spaces for the banquet facility were increased to accommodate the restaurant. A restaurant may be constructed within the waterfront park in a future phase, based on economic demands.
- Modifying the parking lot for the Waterfront Park. The 120 parking' spaces for the Waterfront Park will be located near the Whitestone Bridge approach structure.

These proposed changes to the golf course would have increased the total in-place fill volume for the project to 2,370,000 cubic yards to shape the course in a links style.

The quantification of the imported fill material was to be continuously tracked by both truck volume and periodic topographic surveys of in-place volumes. Initially it was assumed that truck volume would be reduced by 25% when compacted into place, but a new correction factor was to be calculated. On November 1, 2004, the NYSDEC approved a revised truck reduction factor of 42.4%, which was based upon an October 10, 2003 30% aerial topographic survey, and On December 7, 2004, the NYSDEC approved a revised truck reduction factor of 41%, which was based upon a July 17, 2004 60% aerial topographic survey. These recalculations were performed by dividing the actual in-place volume by the total cubic yards of truck volume delivered to the site as of the date of the survey as per the “2002 Permit

TRC Raymond Keyes Associates, A Division of TRC Engineers, Inc. prepared an, “Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY – Engineering Report; Dated May 31, 2005; Revised June 30, 2005” which comprised of Volume #1, Volume #2 and a twenty six (26) sheet drawing set entitled, “Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2” (2005 Report) . The 2005 Report represented the following scope of work:

- An eighteen (18) hole golf course with practice area.
- Maintenance Area in the northwest corner of the Site.
- Clubhouse Parking Lot in the southwest portion of the Site.
- Banquet Facility in the southwest portion of the site (along Emerson Avenue)
- Community Park
- Waterfront Park with parking lot.
- Drawing G-3 and G-4 of "Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2", showed the deviations in grading between the plans approved on 10/18/02 with the proposed plan.

On November 18, 2005 the NYSDEC issued Part 360, Solid Waste Management Permit No. 2-6006-00014-000113 ("2005 Permit") authorizing the importation of a total of 2,370,000 cubic yards of in-place fill material to the Site. The fill material was to consist of approximately 2,120,000 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The truck reduction factor was 41% and could be further modified.

In 2007, TRC Engineers, Inc. ("TRC") was awarded a one (1) year contract to provide "Civil, Environmental and Construction Services for Compliance with DEC permit Related to the Construction of a Golf Course at Ferry Point Park". The order to work date for that contract was October 25, 2007. The scheduled completion date was October 23, 2008. The contract was extended an additional year to October 24, 2009. On October 26, 2009, "TRC" issued a "Year 2 End Project Summary" and estimated that approximately 202,000 total cubic yards of material was imported to the Site by October 22, 2007.

On October 26, 2007, the NYCDPR and FPP terminated the license agreement to develop, construct and operate the Project at the site and on February 29, 2008 FPP submitted an application to transfer the "2005 Permit" solely to the NYCDPR. On August 12, 2008, the NYSDEC notified the NYCDPR and FPP that the "2005 Permit" had been transferred to the NYCDPR.

The order to work date for construction of the Community Park was August 11, 2008. Fill importation continued as witnessed by the Independent Environmental Monitor (Gannett Fleming). On September 30, 2009, Thomas Balsley Associates, NYCDPR design consultant issued a revised drawing changing the limit of the Community Park. The new Site was reduced in size by moving the fence line in the south further north and by moving the fence along the proposed golf course closer to Balcom Avenue.

On January 22, 2009, in accordance with Special Condition #10 of the "2005 Permit", TRC Engineers, Inc. (TRC) submitted a revised truck reduction factor of 40.3%. On February 11, 2010, NYSDEC approved a truck reduction factor of 41.7%.

The order to work date for construction of the Ferry Point Golf Course was October 23, 2009. The golf course layout that the NYCDPR bid was modified from that which shown in the 2005 Report. One major

change was the total removal of the Banquet Facility in the southeast part of the Site. There were also changes in the placement, alignment and grading of some holes.

On February 1, 2013, the NYSDEC granted a permit modification to increase the limit of cover material to 394,000 cubic yards with the stipulation that the Agency revisit the compaction factor. It was determined that the compaction factor for the granular cover material (sand) would be 18%. This would revise the "trucked in" quantity to 480,488 cubic yards. The compaction factor for cover layer material approved per April 26, 2013 letter from NYSDEC to DPR.

On May 21, 2014, the NYSDEC issued Part 360, Solid Waste Management Permit No. 2-6006-00014-00013 (SW) & 2-6006-00014-00013 (TW) to the NYCDPR to allow a total of 2,514,000 cubic yards of material in-place volume (2,120,000 cubic yards in-place shaping material/394,000 cubic yards in-place cover material).

3.4 Total Carcinogenic Semi-Volatile Organic Compound Tracking

As identified in Special Condition 14 of the 2014 Permit, the NYSDEC Acting Regional Director letter dated October 25, 2006, authorized the import of shaping material with a total carcinogenic SVOC (tcSVOC) level of up to ten parts per million (ppm), which would not otherwise be acceptable, provided the tcSVOC weighted average of all imported material is equal to or less than 3 ppm at the end of each quarter. The tcSVOC weighted average is defined as the sum of the products of the material volume and the material tcSVOC, for each material source, divided by the total volume of the material imported. The weighted average was calculated over the course of construction and the final weighted average for shaping layer and cover layer materials imported to the Site was 0.70 ppm, less than the 3 ppm maximum. The total carcinogenic SVOC weighted average table and computations are included in Appendix 12 for materials imported to the Site after November 18, 2005.

SVOCs were not sampled for at the East Side Access and 2nd Avenue (94th Street) source sites due to the source being undisturbed, virgin rock material generated from subway tunnel boring. NYSDEC email correspondence dated April 15, 2011 stated that the IEM should apply one-half of the method detection limit (MDL) from the latest lab report sampled at that time for materials originating from those two source sites.

4 Construction

4.1 General Construction

4.1.1 Community Park

Construction of the Community Park consisted with capping the 11 acre site, installing baseball fields, a basketball court, walkways, a comfort station, and a landscaped stormwater retention area. Construction started on August 11, 2008. As of December 31, 2011, the stormwater retention pond, passive landfill gas (LFG) vents, and recreation facilities were considered complete. The Order to Work date for the comfort

station was March 19, 2014. The original scheduled completion date was September 15, 2014. The anticipated completion date is currently the Fall of 2015.

4.1.2 Golf Course

Generally, construction for the Golf Course was completed from the northeast to the southwest. The sequence of construction started by grading, rough shaping and compacting each hole, installing major drainage lines and inlet drains, installing irrigation lines and fine shaping the holes, installing branch drainage lines, constructing the greens and tees, installing demarcation material, grading cover material, fine grading cover material, and final stabilization by hydro-seeding. Each hole was constructed individually and then turned over to Trump, who is contracted with NYCDPR to maintain and operate the grounds and golf course, for care and maintenance during the grown-in period and prior to course operations.

LAWS completed construction work, including punch list items associated with their construction contract, and demobilized from the site in July 2014. Trump has and continues to perform various earth disturbance related work on the Site, in addition to standard maintenance of the Site. All permit related activity, including earthwork, general construction, and fill deliveries have been coordinated with the IEM, and the IEM has witnessed the work activity and documented inspection observations in the Daily Observation Reports. Specifically, IEM oversight related to Trump's on-site activity includes, but is not limited to, the replacement and relocation of trees, construction of a clock tower and associated subsurface concrete footing, excavation of trenches and installation of utilities to support various on-site facilities including the temporary clubhouse, installation of a cart barn, re-grading of an existing shaping and cover layer earthen berm and subsequent installation of concrete block letters at the surface, and installation of asphalt. For a detailed description of Trump's work activities requiring IEM oversight subject to the Permit conditions, refer to the Daily Observation Reports located in Appendix 5 beginning on June 19, 2014.

4.1.3 Waterfront Park

Special Condition 37 of the 2014 Permit requires that NYCDPR submit a revised design for the Waterfront Park and provides NYCDPR the flexibility to remove the Waterfront Park from the NYSDEC Part 360 Permit and permit the project under a separate NYSDEC tidal wetlands permit. The Waterfront Park is currently in the process of being conceptually scaled back in magnitude due to the impacts of Hurricanes Irene and Sandy, and design plans are being value engineered and developed. NYCDPR intends to submit plans to the NYSDEC upon completion of an approved design, and handling the construction via a separate NYSDEC tidal wetlands permit. Any SEQR related documents will be updated accordingly. The final end use of the Waterfront Park is anticipated to be publically accessible and consists of a passive recreational feature. NYCDPR will not be performing post-construction monitoring in this area of the Site until construction is completed and approved, and will restrict public access until such time.

4.2 Environmental Controls/Construction

4.2.1 Wells (Landfill gas, groundwater and water balance analysis)

NYSDEC requested NYCDPR on August 6, 2010 to demonstrate that soil being used for final cover material (not specifically the uppermost layer) would have a sufficiently low coefficient of permeability and percentage of organic material to minimize infiltration of water into the lower layer of fill material. These comments were submitted as additional comments to the November 25, 2009 permit application submittal.

NYCDPR performed a site-wide water balance evaluation to predict post-construction infiltration rates. EPA's Hydrologic Evaluation of Landfill Performance (HELP) model was used for this evaluation. The results were presented to NYSDEC on May 13, 2011 as well as incorporated in Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East, Bronx New York October 15, 2013. The model used criteria including a typical one-foot thick soil landfill cover with the proposed soil cover material as designed for the facility. The model also accounted for impermeable areas of the site, irrigation of the golf course, drainage system stormwater capture and the lining of ponds.

The soil cover permeability of 14 inches per hour was used for the overall site model. Using this infiltration rate the overall volume of water penetrating the site would be lowered by approximately 9,700 gallons per day. A subsequent water balance analysis was submitted to NYSDEC on August 10, 2011 presenting infiltration rates with a soil permeability of 30 inches per hour that also lowered the overall volume of water infiltrating the site following completion of construction. Discussion and request for confirmation that the site drainage was adequate for a 30 inch per hour permeability took place and the final maximum permeability of 30 inches per hour was approved by NYSDEC for cover material. Cover material imported to the site was tested subsequent to this approval to insure it was able to meet the goal for material permeability. More specifically, testing was combined from individual stockpiles and sources and the average from those was used to determine acceptability of material. Individual variability in sample results was expected because loading, unloading, stockpiling and spreading over the site was recognized as providing a homogeneous layer over the site. Samples were collected at a frequency of one per 2,000 cubic yards moving forward from January 26, 2012 until importation of material was completed.

Additional impacts on water balance came from lined irrigation and retention ponds. There is one large irrigation pond located on the course and several small retention ponds located throughout the open course. The irrigation pond's purpose is to collect storm runoff during storm events and stor it to be utilized for irrigation of the upper cover layer during non-storm periods. The grading and drainage for the stormwater collection and retention were provided in the November 25, 2009 permit application. NYSDEC requested that infiltration beyond the upper layer of cover material be minimized to the maximum extent possible on August 6, 2010 and this included lining each of the five on-site retention ponds to limit infiltration as much as could be done.

The subsequent changes to cover permeability and the lining of irrigation and retention ponds required a review of the Stormwater Pollution Prevention Plan (SWPPP) in order to confirm the additional flow would

not exceed the design criteria for the storm system. The engineering review conducted at that time (October 18, 2011) confirmed the stormwater system design was adequate to carry this flow.

NYSDEC granted a conditional approval for the Ferry Point Site to accept a 30 in. percolation rate per hour cover material on October 21, 2011. The conditional approval was based on a request for DPR to "submit for approval an amendment to the Stormwater Pollution Prevention Plan (SWPPP) dated November 13, 2009, with plans and computations that reflect the partial lining of the stormwater basins." DPR provided this in a technical memorandum to NYSDEC on November 16, 2011. The memorandum presented a formal submittal of the pond liner design to NYSDEC and included excerpts of calculations from the November 13, 2009, SWPPP. An approval was provided by NYSDEC on December 2, 2011.

Municipal solid waste (MSW) filling operations ceased at the Site in the 1960s, prior to the implementation of the comprehensive environmental regulations now in place, and a formal groundwater sampling program was not required at that time. Information on groundwater quality at a former landfill site such as Ferry Point Park East can be used to help evaluate existing groundwater conditions. For the 2005 Permit application, the Site's history was reviewed and a geotechnical investigation was performed to evaluate the potential for adverse impacts on the Site's groundwater due to the placement of fill during construction of the golf course and parks.

A summary provided in the 2005 Engineering Report concluded "that the placement of fill would not have an adverse impact on pre-development groundwater conditions at the site and that the proposed golf course construction would not result in an increased flow of contamination into the river through groundwater flow." (TRC 2005a).

In their comments of June 25, 2010, NYSDEC asked DPR whether any new information was available regarding groundwater conditions at the Site, and if any new, relevant information was available, to verify the conclusions of the geotechnical portion of the 2005 Engineering Report (TRC 2005a).
Following several discussions with DPR, and because no prior sampling had been required, NYSDEC requested that DPR undertake a groundwater sampling program and develop a reference point for background water quality conditions at the Site.

To comply with this request, DPR prepared written field procedures for new well installations, well development, and groundwater sampling (see Appendix G.1).
The field procedures were submitted to, and approved by, NYSDEC prior to the start of the work effort. Prior to installation, the locations of the monitoring wells were approved by NYSDEC during a meeting held with DPR on September 22, 2011.

Landfill gas monitoring over the entire Site has incorporated various different types and configurations of monitoring points. These include perimeter and interior wells and vents that have been monitored over time on a regular frequency. Monitoring has been recorded and reported according to Special Conditions Monitoring as referenced in the March 2014 permit and results dictate continued additional monitoring when that has been necessary. This monitoring continues under the Post Closure Monitoring

requirements and in accordance with the Landfill Gas Management Plan. A total of thirty seven passive vents were installed throughout the Golf Course and Community Park on an average spacing of approximately one vent for every five acres. These vents are considered passive and allow the natural venting of subsurface gases to take place without any additional vacuum or fans. Additional active vapor removal does take place at each of the constructed buildings on the site. This includes the comfort station and maintenance shed on the Golf Course and comfort station at the Community Park. Active systems operate at both of these locations on a continual basis and vent the subsurface area beneath the associated slabs to the atmosphere. There are no structures planned for or constructed on the Waterfront Park parcel at this time.

Passive gas vents are installed throughout the golf course and are included along the perimeter within the venting trenches, within the overall golf course as individual stand-alone vents and in combined systems of interconnected piping to carry landfill gas from beneath irrigation ponds.
Landfill gas monitoring includes perimeter probes located along an approximate 250 linear ft. interval on the north, east and southern site boundaries; off-site monitoring points along Buttrick, Balcom, Schley, Miles and Emerson Avenues; a passive vent trench installed along the eastern and northern perimeters of the course with piezometers installed along the vent trench to allow for monitoring of the groundwater levels associated with the vent trenches; individual passive vents within the golf course and community park space; a passive vent system of interconnected piping serving the irrigation pond; and sub-slab depressurization systems beneath the enclosed buildings located within the golf course and community park.

In February 2012, eleven new groundwater monitoring wells were installed across the Site to obtain information on current groundwater conditions. Design documents for the groundwater monitoring wells are included in Appendix G.2 of the 2013 Engineering Report, included in Appendix 20. An initial sampling event was completed in February 2012 and included the testing activities described below.

■ Groundwater Elevation Measurements: Water depths were measured at the 11 groundwater monitoring wells. Two measurements were taken from each well within one hour each of high and low tides, starting at the shoreline and moving inland.
■ Elutriate Testing: One soil core sample per well was collected during well installation in order to perform elutriate analysis. Samples were selected from shaping material zones based on visual observation of the soil cores.
■ Groundwater Testing: Groundwater samples were collected at each of the 11 wells and shipped for laboratory analysis in accordance with the required testing as referenced in the 2002 permit.
■ Hydraulic Conductivity Testing: In situ slug testing for hydraulic conductivity was completed at each of the 11 groundwater monitoring wells.

The initial groundwater monitoring data from February 2012 was submitted to NYSDEC by email on March 28, 2012. This data is included in the report for the initial groundwater monitoring event (see Appendix G.5 of the 2013 Engineering Report, included in Appendix 20). At that time, DPR requested direction from

NYSDEC concerning procedures for future sampling events. That is, should future sample collection be modified due to the high turbidity.
(>1,000 nephelometric turbidity units [NTUs]) observed in the initial samples. A call was held with NYSDEC on May 8, 2012, to discuss the initial data and provide guidance on future monitoring (see Appendix G.3 of the 2013 Engineering Report, included in Appendix 20 for call minutes.) Also during this call, NYSDEC directed DPR to perform inorganic analyses on both filtered and unfiltered samples collected during the next sampling event. If the next round of results is found to be in expected ranges, then future sampling events will utilize only filtered samples for inorganic analyses.

NYSDEC provided DPR with requirements for future groundwater monitoring in their FPP Groundwater Characterization/Monitoring Objective, on May 8, 2012 (see Appendix G.4 of the 2013 Engineering Report, included in Appendix 20). DPR implemented the groundwater monitoring program in accordance with the schedule and monitoring parameters requested by NYSDEC.

The schedule included two additional quarterly sampling events, followed by approximately three semi-annual events (through completion of construction) and three post-construction annual sampling events. After the third annual sampling event, DPR may request to reduce the sampling frequency or cease the groundwater sampling program at the Site. Table 4-1 provides a schedule of the monitoring events that will be performed to complete this program and the parameters that will be analyzed for during each event.

Post-construction groundwater monitoring and groundwater monitoring well maintenance requirements are incorporated into the Post-Construction Custodial Care Plan for the Site (see Appendix I).

4.2.2 Liners

A single irrigation pond has been constructed at the Site. The purpose of this pond is to collect and store stormwater runoff and reuse it later for irrigation and maintenance of the golf course vegetative cover. This pond is fully lined to maximize the retention of irrigation water. The irrigation pond design documents were included in the November 25, 2009, permit application package. In addition, there are five smaller water quality ponds designed to provide active stormwater retention and limit the off-site migration of sediment. The geometry and grading (engineering design) of these ponds were also provided in the November 25, 2009, permit application package. DPR considered various methods to meet NYSDEC's request of August 6, 2010, to minimize the infiltration of water through "the lower layers of material to the maximum extent possible." Based on this consideration, DPR is implementing a recommendation contained in the November 16, 2010, memorandum (see Appendix D.1 of the 2013 Engineering Report, included in Appendix 20) to line the five on-site water quality ponds to limit water exfiltration. The pond system has been included in the overall water budget evaluation that was submitted and approved by NYSDEC in addition to the permeability of the upper imported fill material.

Supplemental drawings and specifications for the lining of these ponds are provided in Appendix D.4 of the 2013 Engineering Report, included in Appendix 20. The pond liner designs are consistent with the

previously approved geometry and grading (engineering design) presented in the November 25, 2009, permit application package.

4.2.3 Gas Venting

4.2.3.1 Active

According to the 2009 permit the site wide active landfill gas control system consistent with the proposed with the 2005 permit was withdrawn as a design modification. Active systems were installed at buildings and initially proposed for the irrigation lake.

Based on the Final Engineering report, due to the explosive nature, LFG is not allowed to accumulate within any enclosed structure at the site. Therefore active sub-slab depressurization systems (SSDS) have been installed at each of the enclosed buildings at the site. These systems have continuous explosive gas monitoring components of the design. The irrigation lake was not made active and continues as a passive system as per the September 2009 permit modification application.

The SSDS engineering drawings for the golf course facilities (maintenance building and comfort station) are provided in Appendix F.3 of the 2013 Engineering Report, included as Appendix 20. The Community Park comfort station design was provided in the November 25, 2009, permit application. The Waterfront Park comfort station has not been designed. Maintenance of the SSDS and their monitoring equipment will be performed in accordance with the operations, monitoring, and maintenance (OM&M) program for the Site's Landfill Gas management system (see Section 4.4.4). The design of any additional structures at the Site will be completed in accordance with New York City Department of Buildings requirements. The need for LFG mitigation systems for any future Site structures will be evaluated as part of their design.

4.2.3.2 Passive

The LFG management system as redesigned for the Site (since the November 25, 2009, permit application submittal) is an update of prior conceptual passive LFG designs and includes a passive system for the venting of LFG in all areas not covered by enclosed facilities. The primary goals for the design of the Site's LFG management system are to provide safe operating conditions and protect human health.

The proposed passive system is consistent with the plans presented in the 1999 EAS (AKRF 1999), the 2002 Technical Environmental Assessment (AKRF 2002), and the 2005 Engineering Reports (TRC 2005a, b) and was approved under the 2005 Part 360 Permit. It deviates from the 2009 permit renewal application prepared by TRC Engineers (TRC), which recommended an active system. An active system uses blowers or fans to extract gas through vents from the landfills subsurface, whereas a passive system uses vents without blowers or fans. Supplemental Site investigations and extraction testing performed by TRC Engineers at the Site in 2009 and 2010 were reviewed by Walsh Environmental Scientists and Engineers, LLC (Walsh) in 2010. Emissions modeling was also performed by EEEPC in 2010, as discussed in Section 4.4.1. Based on these evaluations and modeling of Site conditions, a Landfill Gas Management Plan (LFGMP) was prepared (see Appendix F.1 of the 2013 Engineering Report, included in Appendix 20). The plan concluded that a passive venting system is sufficient to achieve safe operating conditions for users and workers of the golf course and parks. A description and details of the Site's LFG management system

are presented in the LFGMP. The LFG management system as currently designed is consistent with the proposed venting system described in the 2005 Permit.

4.2.4 Vent Trench

The landfill gas perimeter trench was the primary gas-management structure installed in or about 2001. The Trench was initially proposed in the 1999 conceptual LFG control system. The purpose of the vent trench was to capture and prevent the off-site migration of LFG. The 2002 AKRF Report included installation details and certified drawings of the trench and its details.

The LFG trench was constructed along the eastern and a portion of the northern perimeter and was completed in 2001. The trench begins at the water's edge at the foot of Emerson Avenue, continues along the length of the Balcom Avenue Site boundary and continues approximately 1050 ft. in a westerly direction past the intersection of Schley and Buttrick Avenues.

The LFG passive trench is essentially a stone-filled /geotextile-wrapped envelope that begins three feet below the groundwater surface and extends upward to just below the ground surface. The upper 6 inches of the trench is dressed and finished with a layer of wood chips that allow LFG entering the trench to vent to the atmosphere. During the construction there were some areas where stability of the fill material at the water table was noted to be an issue and in these areas the trench was extended to a depth of one foot below the groundwater surface. In addition to the gravel filling of the trench to allow for a porous medium allowing LFG to move upward and escape, a continuous 4 to 6 inch diameter perforated PVC pipe was buried in the upper portion of the stone backfill. Vertical passive vents are connected to this horizontal piping to allow for future modifications should the top of the trench need a cap installed above it. The trench will collect and disperse any and all LFG that comes into it but it was primarily designed to remove methane from passing beyond the site boundary. The vent trench was specifically installed below the elevation of measured groundwater in order to maintain a constant layer of saturation within the lower part of the trench. This groundwater layer would prevent landfill gas from migrating beneath the trench and off of the site. Passive vents were also installed within the trench to allow a rapid ascent of LFG out of the trench and into the atmosphere. Concentrations of LFG that could be an issue within the trench would immediately be diffused in the atmosphere and reduced to a concentration that is not a concern.

Following the installation of the trench, methane concentrations were noted to have declined significantly, demonstrating the effectiveness in controlling LFG in the area.

Landfill gas migration is influenced by a number of factors including barometric pressure, diffusion gradients, composition and distribution of subsurface soil and fill material and groundwater. As landfill gas builds up and accumulates, it moves outward from the points or areas /zones where it is generated, spreading into other areas. Landfill gas migrating vertically will reach the surface and diffuse when it mixes with ambient atmospheric air. The other main concern for migration from the landfill was horizontal migration from the landfill to areas off-site. This horizontal migration can be controlled and to a significant extent can be eliminated through the use of LFG trenches. The LFG trench configuration can prevent accumulated gas from passing beyond the site because it creates an area allowing for diffusion and mixing of LFG with ambient air. The overall trench is constructed and filled with material of a higher

permeability than the surrounding soil or fill and typically offers a more direct connection to the open atmosphere. The base of the trench is extended into the water table which performs two functions that both increase the opportunity for LFG to be removed and thus prevent it from migrating offsite. The first offers a more open contact of the shallow groundwater surface to ambient air allowing dissolved concentrations to be volatilized out of the water column into the air and the second prevents LFG that exits from the landfill soil from travelling beneath the trench out beyond the site.

Approximately 5,350 feet of LFG passive vent trench was constructed along the site boundary between May 2001 and December 2001.

Routine inspections of the LFG passive vent trench included the following observations, depth of wood chip layer over geotextile, excessive fine grained materials, vegetation, erosion along the vent trench and any other condition that may have a potential to compromise the ability of the LFG passive vent trench to intercept and transmit LFG to the atmosphere. Refer to the non-conformance table. Monitoring includes routine bi-weekly observations and inspection of the following specific components of the trench:

- Observation of the covering wood chips to insure they extend to and are level with the ground surface and are free of excessive fine grained materials that would restrict the flow of LFG from the trench once it is intercepted.
- Observation of the vertical hard piping risers to insure they do not show signs of cracking bends or breaks;
- Observation of the vertical riser piping to insure they remain vertical and anchored as they were installed;
- Observation of the vertical vents and openings to insure they remain open.

Continued monitoring of the trench is described in Special Conditions 30 of the modified Permit with NYSDEC. This includes monitoring of groundwater levels in the adjacent monitoring wells. If the groundwater is noted below the bottom of the trench, the following actions are initiated:

1. Evaluate the methane concentrations in nearby perimeter methane monitoring wells and semi-permanent monitoring points. If the methane concentrations measured that day are below the site-specific action level of 25% LEL, continue the normal (bi-weekly) methane monitoring frequency and increase the groundwater level measurements at the location of concern to bi-weekly.
2. If the groundwater level measured at the initial bi-weekly monitoring event is above the base of the vent trench, then defer back to the routine monthly piezometer monitoring frequency.
3. If the groundwater level remains below the trench bottom for the first additional bi-weekly monitoring event, but nearby perimeter methane monitoring wells and semi-permanent monitoring points are below the site-specific methane action level of 25% LEL, continue groundwater level and methane monitoring at a bi-weekly frequency until such time as the

groundwater level is above the base of the trench. Then defer back to the routine monthly piezometer monitoring frequency.

4. If the groundwater level remains below trench bottom for the first additional bi-weekly monitoring event, and nearby perimeter methane monitoring wells and semi-permanent monitoring points are at or above the site-specific methane action level of 25% LEL, then continue monitoring the groundwater levels and methane concentrations for the second bi-weekly event.
5. If the groundwater level remains at or below the trench bottom for the second bi-weekly monitoring event, and the nearby perimeter monitoring wells and semi-permanent monitoring points remain at or above the site-specific methane action level of 25% LEL, further recommendations will be made to NYSDEC.

4.2.5 Landfill Cap

In accordance with provisions of the Permit dated May 21, 2014 the landfill was capped with minimum of one foot of shaping layer material over the landfill and one foot of cover layer material over top of the shaping layer material. In areas where there was less than 4 feet of shaping material over the waste layer, a layer of demarcation material was installed. See Section 4.4 for additional information related to the landfill cap construction.

The permit authorized importation of 2,514,000 cubic yards of material to the Site for overall capping of the waste material. This consisted of approximately 2,120,000 cubic yards of select exempt construction and demolition (C&D) debris for the shaping layer, and approximately 394,000 cubic yards of cover material. Specific restrictions were incorporated into the material and those restrictions were maintained and are described under the importation section of this Report. Final surface components of the cap including; greens, contour, heights and top soil) were incorporated into the site under the Nicklaus Design Technical Specification of the June 30, 2005 Engineering Report. This included:

- Greens-Mix imported to the site and tested as per the material testing requirements. Fertilizer and soil amendments applied on the greens after spreading to construction specifications and then grassed as per the specifications.
- Topsoil-Imported to be consistent with native topsoil, and free of rock and debris greater than three quarters of an inch as per Exhibit C of the Engineering Report. Soil amendments, fertilizer applications and seed were added to tee, fairway and rough areas as per Exhibit C of the June 30, 2005 Engineering Report.

4.2.6 Environmental Controls On-Site Structures

Due to its potentially explosive nature, LFG shall not be allowed to accumulate within any enclosed structure at the Site. To protect the occupants, an under slab vent system for each enclosed building shall be installed and continuously operated. The LFGMP (see Appendix F.1 of the 2013 Engineering Report, included in Appendix 20) describes the active sub-slab depressurization systems (SSDS) that have been designed for the under-slab of each enclosed building at the Site. These systems will have continuous explosive gas monitoring with local and remote alarm capabilities. The SSDS engineering drawings for the

golf course facilities (maintenance building and comfort station) are provided in Appendix F.3 of the 2013 Engineering Report, included in Appendix 20. The Community Park comfort station design was provided in the November 25, 2009, permit application.
Maintenance of the SSDS and their monitoring equipment will be performed in accordance with the operations, monitoring, and maintenance (OM&M) program for the Site's Landfill Gas management system (see Section 4.4.4). The design of any additional structures at the Site will be completed in accordance with New York City Department of Buildings requirements. The need for LFG mitigation systems for any future Site structures will be evaluated as part of their design

Low-permeability soil/bentonite collars ("soil collars") will be installed for all utility trenches that contain permeable bedding in order to prevent the migration of LFG into enclosed buildings at the Site. The soil collars will be installed around the water and sewer pipelines, within the trenches at the subsurface location where the pipeline crosses above the building foundation (the building line). Each soil collar will be passively vented as described in the LFGMP (see Appendix F.1 of the 2013 Engineering Report, included in Appendix 20) and as shown on the engineering design drawings in Appendix F.2 of the 2013 Engineering Report, included in Appendix 20. Similarly, conduit seals will be used for electrical conduits that are installed in trenches using permeable bedding materials. The conduit seals will be installed at the building lines. Other utility LFG controls include the under slab passive venting for the aboveground double-check valve (DCV) enclosure. The DCV enclosure is for the potable water supply line as it enters the golf course site. Detailed design drawings for the venting the DCV enclosures are provided in Appendix F.4 of the 2013 Engineering Report, included in Appendix 20. The need for LFG venting for any future Site subsurface vaults will be evaluated as part of their design.

4.3 Municipal Solid Waste (MSW)

Municipal solid waste ("MSW") was generated throughout site development and excavation activities. MSW material was not utilized as fill material on-site after it was encountered and excavated during construction activities with the exception of MSW excavated and reused on-site in accordance with an Order On Consent issued by the NYSDEC and fully executed as of January 4, 2004 (Order On Consent No. R2-20030724-187). A copy of the executed consent order is included in Appendix 19. In accordance with Special Condition 8 of the 2014 Permit, upon encountering MSW during site development, the material was transported and properly secured into segregated stockpile locations prior to off-site disposal. MSW material consisted of metal, glass, tires, plastics, rubber, paper, fabrics, and miscellaneous debris not suitable for the shaping layer. Refer to Section 4.5 of this report to review further details regarding the minimum fill cover over top of the MSW.

Prior to stockpiling any excavated MSW, the existing ground surface was covered with an impermeable plastic membrane. The stockpile was then encircled with silt fence and the stockpile was covered with an impermeable plastic that was secured with sand bags after the MSW was stockpiled and prior to off-site disposal.

Waste characterization sampling was performed prior to off-site removal as required prior to acceptance by each solid waste facility. Prior to disposal, waste samples were collected from each of the stockpiles

and analyzed to determine if the material was hazardous and to determine a suitable NYSDEC facility for disposal by way of a permitted hauler. A January 22, 2010 letter approving Seneca Meadows Landfill as a disposal facility is included in Appendix 19.

Residual MSW excavated by Trump associated with utility and drilling work at the Golf Course stockpiled in the adjacent Waterfront Park have been removed.

4.3.1 Manifests

Manifests were collected for each load of MSW generated and disposed of off-site. Manifests were completed for each load of MSW prior to leaving the Site. Completed manifests contained the following information: driver signatures and appropriate transporter information, facility designation including the address for the facility that was receiving the material, a description of the material being transported, the site generator's mailing and site address, and a total quantity of the material leaving the Site. The weight of MSW was determined by weighing the material (in tons) during the loading process. The MSW was loaded with a pay loader with a scale attached to the bucket. A receipt for the weight of each load was printed and was presented to NYCDPR with the manifest for review. NYCDPR and/or their designated representative signed the manifests as the generator, and then the manifests were then presented to the IEM for final verification.

Copies of the MSW disposal manifests are included in Appendix 14.

Note that MSW manifests accounting for material prior to October 25, 2010 (i.e. Woodard & Curran's first day on-site as the IEM), cannot be retrieved and are not included in the appendix. The information was stored in a NYCDPR document repository that was damaged and the files have been lost. However, the FMRs prior to October 25, 2010 comment on the nature of this work.

4.4 Earthwork/Fill Placement

Earthwork and fill placement for this Project were performed in accordance with the Permit. A response received from NYSDEC on July 28, 2009 (included in Appendix C.2 of the 2013 Engineering Report, included in Appendix 20), provided additional clarification regarding what are considered active and passive recreational areas. As per this letter:

Active Recreation – "…all other areas that are not covered with a building or other impermeable cover system… are deemed active recreational areas."

Passive Recreation – "…the golf course is deemed a "passive recreational area" and is required to have a one foot thick cover layer over a demarcation layer."

Following this directive, NYCDPR requested clarification from NYSDEC regarding the demarcation layer requirement for the extent of the Golf Course. The request for clarification was based on the need for further specificity regarding the use of a demarcation layer on the Golf Course.

In response, NYSDEC and NYSDOH reviewed a summary of the analytical data for all the shaping material imported to the Site. Upon review of the data set, confirmatory analytical sampling of the in-place shaping material was requested by the NYSDEC and NYSDOH. NYCDPR conducted test pit sampling and analysis under an approved work plan and submitted the data to the NYSDEC on February 16, 2011.

In their letter dated March 9, 2011, the NYSDEC stated that "NYSDOH reviewed the shaping layer test pit data and determined that it confirmed existing shaping layer data." The NYSDEC and NYSDOH agreed that a demarcation layer would not be required at areas of the golf course having a fill thickness of five or more feet of combined shaping and cover layer materials. The March 9, 2011 letter is included in Appendix C.3 of the 2013 Engineering Report, included in Appendix 20.

The aforementioned directives were the basis for the earthwork, fill placement, and landfill capping process. Additional details related to shaping layer material placement, demarcation layer installation, cover layer material installation, and related construction is as follows.

4.4.1 Shaping Layer Material

The Permit requires a minimum of one foot of clean shaping layer material to be installed over top of the existing MSW prior to cover layer material placement. Specific to the Golf Course, grading and compaction activities associated with the shaping layer material were generally completed by hole, consistent with the golf course architect's design. Once grading and compaction of the shaping layer material was completed, NYCDPR completed topographic surveys of the newly graded shaping material layer to assist in determining the depth of clean shaping layer material that was present over the pre-existing landfill surface. These shaping layer material surveys were generated intermittently as shaping layer material installation was completed in sections of the Golf Course.

An analysis was conducted by the IEM, which compared compiled historic surveys from 1998 to the final shaping layer surface surveys completed by NYCDPR. The 1998 surveys included elevations representative of the landfill surface for the Site prior to the earthwork associated with the Project. Based on an analysis and comparison of the survey data, portions of the Site that had less than four feet of approved shaping layer material were identified in a series of earthwork analysis drawings that were provided to the NYSDEC. The earthwork analysis drawings are included in Appendix 10. These plans identify the depth of shaping layer material and show the general progression of shaping layer material filling across the Site. Figure SP-001 entitled "Shaping Layer Material Earthwork Analysis via Surveys" includes a site wide earthwork analysis compiled from the various Site surveys and earthwork analyses completed as construction progressed at the Site.

In areas identified on the earthwork analysis drawings to have less than one foot of clean, in-place shaping material, test pits were performed by the Contractor and observed by the IEM to verify that a minimum of one foot of shaping layer material was present over the MSW, per the plans and Permit requirements.

If areas were found to have less than the required one-foot minimum of shaping material and could not receive additional fill based on the design plans, these areas were adjusted by over excavating the MSW

and backfilling with clean shaping layer material. This process was necessary in order to maintain the designed grades and comply with the Permit conditions. With oversight by the IEM, areas with MSW encountered at shallow depths in the tests pits were excavated outwards from the test pit location until one foot of clean shaping layer material was present. See Figure SP-100 entitled "Shaping Layer Material Test Pit Plan", which includes test pit locations superimposed on an earthwork analysis that visually represents the frequency, location, and presence of MSW within the required one foot minimum shaping layer section prior to reshaping. All test pit locations and the limits of the over-excavation were GPS located by the IEM utilizing a handheld GPS unit. Test pit locations were spaced 50 feet apart over the entire areas that the survey analysis estimated to have less than one foot of shaping layer material. In addition, if MSW material was encountered within the one-foot minimum shaping layer, the frequency of test pits were increased at the IEM's discretion to more accurately determine the extent of over-excavation required. Observations of test pit activities associated with evaluating the shaping layer material thickness are detailed in the IEMs Daily Observation Reports.

4.4.2 Demarcation Layer

Consistent with Special Condition 14 of the 2014 Permit, a demarcation layer was installed at the Site, specifically the Golf Course, where the combined thickness of shaping layer and cover layer materials combined were less than five feet. For this Project, "demarcation layer" meant a brightly colored, permeable plastic material placed on top of the Site's shaping layer material and directly beneath the Site's final cover layer material that is easily recognizable during an excavation. The request was made for the protection of Site workers during any future excavation work beneath the cover layer at the Site. Demarcation layer material for this Project consisted of orange construction fencing for the Golf Course.

On July 10, 2012, the NYSDEC confirmed that a nine-inch thick asphalt and subbase layer for the cart paths did not require any underlying cover material or demarcation layer. A black geo-grid material was installed under the cart paths associated with the Golf Course as part of the design. A copy of the correspondence is included in Appendix 19.

On November 21, 2012, the NYSDEC notified NYCDPR that demarcation layer may be eliminated from under ponds as NYCDPR identified that demarcation layer was not required as part of the Permit. A copy of the November 21, 2012 correspondence is included in Appendix 19.

NYCDPR prepared a Demarcation Layer Plan based on a comparison of final design grades and the top of waste elevations extrapolated from soil boring data. The Demarcation Layer Plan is included in Appendix C.4 of the 2013 Engineering Report (Appendix 20). Field verification that the demarcation requirements were being met was performed continuously and routinely by the IEM to confirm Permit compliance as outlined in the shaping layer material section above. Based on the data gathered from the earthwork analysis plans and the test pit excavations, actual areas requiring demarcation layer were identified.

In instances where NYCDPR felt that the installation of demarcation material was not necessary, test pits were excavated to four feet below grade, spaced 50 feet apart, to determine if there was more than four feet of clean shaping layer material installed over MSW. If it was determined via test pits that there was

more than four feet of clean shaping layer material present, demarcation material was not installed. The reasoning assumed a one foot thick cover layer installation and considered the March 9, 2011 NYSDEC/NYSDOH correspondence determining that demarcation layer was not required if the combined fill thickness above MSW was five feet or greater. The March 9, 2011 correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

All areas with less than four feet of shaping layer material present that required the installation of demarcation layer material are identified on Figure SP-200 entitled "Demarcation Layer Plan". The limits of demarcation layer material, as represented on Figure SP-200, were located by the IEM using handheld GPS units at the time of installation, prior to cover layer material installation. Areas associated with the cart paths are also identified on Figure SP-200.

4.4.3 Cover Layer Material

Cover layer material was installed at the Site in accordance with the Permit. Special Condition 15(d) of the 2005 Permit required the following:

"The final placement (including topsoil), location, thickness, and detailed chemical limits of the final cover layers on the Site, including the community park and waterfront park, are subject to the specifications, directions and requirements determined by the NYS Department of Health (NYSDOH) to be applicable. It is the responsibility of the Permitees to obtain a written determination from NYSDOH.
The Permitees must provide the Department with a copy of NYSDOH's determination. No cover layer material may be placed on the Site, until the Department acknowledges receipt of NYSDOH's determination."

As required by Special Condition 15(d) of the 2005 Permit noted above, NYCDPR obtained such written determination from NYSDOH in a letter dated, August 2, 2006 included as Appendix C.3 of the 2013 Engineering Report (Appendix 20).

The NYSDEC's active recreational determination from July 28, 2009, required that NYCDPR install two feet of cover layer material and a demarcation layer throughout the Community Park. Soil probes confirmed extremely consistent and appropriate thickness of cover material throughout the Community Park and Golf Course.

For the Golf Course, the upper portion of the landfill was capped using Permit specified criteria for sand and/or topsoil material formally referred to as cover layer material. A sand material was used for the majority of the golf course cover layer with topsoil being used primarily in tree planting pits and other landscaped areas. The IEM observed capping activities associated with the cover layer material including, inspecting cover material at each source site and at the Site per the conditions set forth in the Permit and supporting reference documents. After installation of the shaping layer material and demarcation layer (as required), the cover layer material was installed. The IEM confirmed the depth of cover layer material placed on the Site in accordance with the Permit at the time of installation.

A minimum of one foot of cover layer material was placed over top of the shaping layer material consistent with the passive recreational determination at the Golf Course. Cover layer material was installed by means of either transporting stockpiled material that was previously inspected and approved by the IEM or by directly dumping the material in the work areas as it was imported to the Site. The material was then spread by bulldozers and specialty golf course shaping equipment. The IEM confirmed the depth of the cover layer material placed on the Golf Course area utilizing a graduated rod as the material was being installed.

Confirmation of the minimum of one foot of cover layer material installation on the Golf Course is included on Figure SP-200 entitled "Cover Layer Material Plan". This plan identifies the DOR report numbers and corresponding dates for when the IEM witnessed and measured a minimum of one foot of cover layer material being installed on the Golf Course. The cover layer material depth checks were completed by the IEM using a graduated rod to confirm that the final placement consisted of a minimum of one foot of cover layer material soil. Individual DORs documenting the IEM's observations are included in Appendix 5.

In addition to the IEM checking and confirming the minimum one foot thickness of cover layer material immediately upon installation, post-construction soil probes were completed in March 2015, and dug by hand to confirm the depth of cover layer material throughout the Golf Course. Prior to March 2015, once the site construction concluded and the vegetation was established throughout the Golf Course, an aerial survey (including topography) was performed by LAWS in Spring/Summer 2014 and provided to NYCDPR and subsequently to the IEM in December 2014. In addition, NYCDPR performed a Golf Course wide ground topographic field survey.

The IEM was provided with electronic AutoCAD files of both surveys that captured the final topography of the cover layer material surface. The IEM performed a cut/fill analysis using Civil 3D software by comparing each cover layer material survey to the previously generated shaping layer material surveyed surface (also field surveyed by NYCDPR). Based on a review of the cut/fill analysis results and subsequent discussions with the NYSDEC and NYCDPR, it was agreed by all parties that both survey results were inconclusive, and could not accurately reflect the thickness of the cover layer material on the Site. Since the 12-inch minimum cover layer material thickness could not be verified via survey, NYCDPR then moved forward with field investigations using handheld soil probing equipment in order to perform comprehensive Golf Course wide physical confirmation depth checks.

The IEM was on-site and witnessed all soil probes, and documented all soil probe locations and depth results using handheld GPS equipment. The soil probing work was completed by NYCDPR staff. Soil probe fieldwork commenced on March 11, 2015 and was completed on March 27, 2015. Soil probes were initially completed on a 50-foot grid but were increased to a 100-foot grid on March 19, 2015 based on the satisfactory initial field results and approval by the NYSDEC in an email dated March 18, 2015 (see Appendix 19 for the March 18, 2015 email).

Refer to Figure SP-003 entitled "Cover Layer Material Soil Probe Investigation Results" which illustrates the results of the soil probing investigation. The final results of the soil probing investigation were reviewed on-site with NYSDEC staff, and the NYSDEC required that NYCDPR correct an area in the vicinity of the Hole 14 Green, which resulted in cover soil layer thicknesses of 3 inches and 6 inches. NYSDEC staff stated that this area would require reconstruction in order to satisfy the intent of the 12-inch cover layer material thickness as required by the Permit. NYSDEC staff concluded that the remaining soil probe results sufficiently addressed the intent of the 12-inch cover layer material thickness Permit requirement, and the remaining Golf Course area did not require any further reconstruction or evaluation of the cover layer material.

As per the IEM's Daily Observation Reports, the IEM witnessed the subsequent field delineation the of the area deemed to be of insufficient cover layer material thickness (i.e. the area adjacent to Hole 14 that resulted in cover layer material depths of 3 inches and 6 inches via soil probe results) during the week of April 20, 2015. This was performed by using the soil probe equipment to accurately delineate the limits of the area having a cover layer material thickness of less than 12 inches, and resulted in an area of approximately 6 feet by 12 feet.

On May 4, 2015, the IEM observed the Trump Organization construction crew over-excavate the previously delineated areas that had less than 12 inches of required cover material, adjacent to Hole 14 Green. The area was over-excavated approximately 24 inches below grade, and 24 inches of Cover Material was backfilled and graded over the excavated area. The excavated area was GPS mapped using a hand held Trimble device. Excavated surplus shaping material was transported to a shaping stockpile adjacent to Pond P2.

Similar to the Golf Course, the 24 inch minimum cover layer/shaping layer materials thickness could not be verified via survey. NYCDPR moved forward with field investigations using soil probes in order to perform physical confirmation depth checks. The IEM was on-site and witnessed all soil probes, and documented all soil probe locations and depth results using handheld GPS equipment. The soil probing work was completed by a NYCDPR subcontractor. Soil probe fieldwork commenced on May 18, 2015 and was completed on May 22, 2015. Soil probes were completed on a 50-foot grid. Refer to Figure SP-004, entitled "Community Park Cover/Shaping Layer Material Soil Probe Investigation Results", which illustrates the results of the soil probing investigation.

4.4.4 Greens and Tees Mix, Bunker Sand

Consistent with Section 2.1.2 "Cover Layer Fill Specifications" included in Volume #2 of the 2005 Engineering Report, environmental testing was not required, consistent with cover layer material requirements for the green and tees mix or bunker sand, and therefore was not completed for these materials.

On June 8, 2012, the NYSDEC confirmed that the sand material used for the tees, greens, and bunkers should not be counted towards the Permit stated allowable cover soil maximum. A copy of the June 8,

2012 correspondence is included in Appendix 19. NYCDPR's consultants estimated the required sand material volumes as follows: Tees and Greens (24,705 cubic yards), Driving Range Tee (3,025 cubic yards), and bunkers (6,076 cubic yards). Since these values were estimated, calculated by NYCDPR's consultants, it shall be noted that actual installed volumes may have fluctuated from the volumes identified above. This information is based on an email from Joe Voss to Faisal Choudhury on June 13, 2012.

Special Condition 15 of the 2005 Permit did require that the tees and greens mix imported to the site to be tested as per material testing requirements to meet the project technical specifications. Fertilizer and soil amendments could be applied on the tees and greens mix after spreading to construction specifications and finally grassed, as per the specifications provided by the agronomist.

4.4.5 Topsoil

Topsoil was used on the Site, in lieu of sand, specifically in tree planting pits and other landscape areas. Any topsoil that was imported and used on the Site was approved and met all of the cover layer material Permit requirements including the specification included in Exhibit C of the 2005 Engineering Report.

4.5 Meetings

On a bi-weekly basis during construction of the Community Park and the Golf Course, progress meetings occurred in the NYCDPR field office trailer on the Site. Various representatives from NYCDPR, Trump, LAWS, KSE, TRC, the IEM, and appointed representatives attended the meetings to discuss construction progress, current issues, and scheduling.

Available meeting minutes from construction progress meetings are attached as Appendix 9.

4.6 As-Built Survey, Record Drawings, Deviations from Approved Design Plans

This section deals specifically with as built drawings, final record drawings and deviations that occurred during construction. It is further broken down into work performed in the Community Park, the Golf Course, the Waterfront Park, deviations to NYSDEC Permit as it pertained to fill importation quantities, modifications to the landfill gas vent trench and additions to the golf course made by the concessionaire.

4.6.1 Community Park

The Community Park project consists of the following features and was designed by Thomas Balsley Associates:

- A softball field and smaller peewee/T-ball field with new drainage
- Two basketball courts
- New formalized park entrances
- Play areas for tots to pre-teens
- Seating areas and lawn for non-programmed activities
- A path and trail system that winds throughout the park
- A detention pond which collectives drainage from the eastern part of the golf course
- Foot bridges
- Shade structure

- Timber deck overlook
- Herbaceous plant materials
- Temporary below grade utilities to service a standard DPR Comfort Station (constructed under a separate contract),
- Below grade infrastructure to service Community Park lighting and fountains,
- Modifications to the Landfill Gas Vent Trench system
- New perimeter fence.
- New Comfort Station. (The comfort station construction is still in progress and expected to be completed in the Fall of 2015)

Deviations to the Community Park project consist of the following:

- The reconfiguration of the location of the perimeter fence on the south and west sides of the Community Park reducing the area of the site[1].
- One missing Vertical Landfill Gas vent just south of the most southerly entrance to the park.
- The relocation of a drain inlet in the softball field[2].
- The utilities servicing the Comfort Station are constructed as of December 10, 2015,[3] which represents the date in which the sanitary sewer connection was completed.

It is noted that below grade features were not examined during a NYCDPR field inspection conducted during July 2014. Community Park as-built information and documentation are included in Appendix 16 and includes a November 18, 2011 letter from LAWS indicating that the Community Park construction was completed as designed (exclusive of the comfort station) as well as three as-built drawings associated with the pond liner construction dated July 14, 2010 as prepared and certified by LAWS (Appendix 16).

4.6.2 Golf Course

The Ferry Point Park Golf Course project consisted of the following:

- A Maintenance Building with an active sub-slab depressurization system.
- A comfort station with as active sub-slab depressurization system, which includes a snack bar.
- A unenclosed rain shelter
- An 18 hole links style golf course
- A practice area
- Fill and topsoil importation
- A site drainage system and retention ponds
- A new irrigation pond and irrigation system
- All the necessary plumbing, electrical, gas, environmental monitoring and control devices for the golf course, maintenance facility and comfort station
- Roadway and parking area construction, paving, striping and drainage in compliance with the DEC permit
- Perimeter fencing and appropriate landscape screenings.

---

[2] See App. 4; Community Park Contract Drawings; Thomas Balsley Associates Constr. Sketch dated 2/11/09

[3] See App. 4; Community Park Contract Drawings; Thomas Balsley Associates Constr. Comfort Station Dwg P-2 dated 1/26/09

Deviations to the Golf Course consist of the following:

- The active venting system around the Irrigation Pond was converted into a passive system. Fiberglass manholes were changed to concrete manholes and additional piping added around the entire pond. Six (6) vertical passive vents were added, one at each box location and installed October 2014, following NYSDEC discussion. On May 22, 2015 the NYSDEC approved the removal of vertical passive vent #5 thereby leaving five (5) vertical passive vents in operation.
- Modifications to the grading plan did occur as well as minor modifications to drainage and are documented in "Ferry Point Site" visit notes produced by "Nicklaus" from 2010 through 2013 and as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- Retention ponds were lined as per NYSDEC requirements as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The golf cart path surface material was changed to asphalt and additional drainage was added as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The Clubhouse Parking Lot paved footprint was increase/installed as per NYSDEC Consent Order # R2-20100521-172. The Clubhouse Parking Lot was completed in May 2014 as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The irrigation pond pipe penetrations were revised as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The Turf Nursery was revised as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The active venting system inside of the Comfort Station was modified as per Integral Engineering, Inc. design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015). System is functioning, and requires the installation of sensor components of the vapor detection system. Contractor procurement for the installation of the sensor components is in its final stage of approval. Implementation is anticipated by Spring 2016 and the final signed and stamped as-built drawing will be submitted to NYSDEC following prompt inspection of the installation.

4.6.3 Waterfront Park

Construction has not begun in the area designated "Waterfront Park".

4.6.4 Additions to the Golf – Concessionaire

The concessionaire running the Golf Course is the Trump Organization. Since in their possession (NYCDPR Use Inspections were held for various parts of the project from September 2012 through March 2014) the following additions/deviations have occurred (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015, revised 4/23/2015, 6/25/2015 & 7/13/2015):

- The construction of a Golf Cart Barn (currently under construction)

- The construction of a sign (currently under construction) and curb line realignment
- The construction of a temporary clubhouse including temporary utility services (trailers placed upon the asphalt parking lot)
- The construction of a "starter" kiosk including utility services as well as minor golf cart path widening around it.
- The construction of a clock.
- The construction of a weather vane/station.
- Minor irrigation changes.
- Additional planting along the perimeter fence line. Removal of the aluminum fence along the Waterfront Park and the Golf Course and the installation of a fiber optic sonar alert system in its place (installation of the fiber optic sonar alert system occurred from July 25, 2015 to August 19, 2015 and was witnessed by the IEM).

5 Environmental Monitoring

5.1 SWPPP

On November 20, 2003, NYCDPR received an Acknowledgement of Notice of Intent for coverage under SPDES General Permit for Stormwater Discharges from Construction Activity (General Permit No. GP-02-01), permit identification number NYR10D547, which transitioned SPDES General Permit coverage previously held under GP-93-06. On May 12, 2009, NYCDPR received an Acknowledgement of Notice of Intent for coverage under SPDES General Permit GP-0-8-001; permit identification number NYR10R112, which was maintained throughout construction completion. A copy of the SPDES General Permit Acknowledgement and Notice of Intent are included in Appendix 1.

In compliance with NYSDEC guidelines for State Pollution Discharge Elimination System (SPDES) General Permit (GP-0-8-001) and General Condition 9 of the 2014 Permit, a Storm Water Pollution Prevention Plan (SWPPP) was implemented during the course of construction at the Site. All work was completed in compliance with the final SWPPP, dated December 22, 2009.

In addition to intermittent IEM SWPPP inspections, NYCDPR representatives also performed SWPPP inspections. NYCDPR performed bi-weekly inspections and associated Site Assessment Reports (filed at the FPP document repository) to ensure compliance with Permit requirements. SWPPP inspections were carried out through the spring of 2014. The SPDES permit will remain effective until completion of ongoing construction including the Golf Course Clubhouse.
Every possible action was taken to avoid non-compliance, such as turbid water leaving the Site. The following is a list of permanent features that were installed at the Site, beyond the SWPPP requirements:

- French drain at the eastern, western, and northern perimeters of the Site to control surface flow of stormwater;
- All ponds were lined, to prevent stormwater infiltration into the solid waste layer; and
- A new trash rack and rock outlet dam at the 60-inch Whitestone sewer outfall draining to the East River.

5.2 Landfill and Off-Site Gas Monitoring

The entire Ferry Point Site is equipped with a Landfill Gas (LFG) Management system to cover both on and off site monitoring. The systems purpose is to allow use of the site in its intended purpose as a golf course without having the occupants on the site and users of the golf course being exposed to harmful conditions that would be the direct result of the existence of the landfill. The Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, New York May/August/Oct 2013, referenced the summary of prior LFG efforts. These included preparation of a model for surface methane emissions using data collected during 2009 and 2010. Data for these studies also included a health impact analysis that is summarized in this final Certification Report and is attached with the 2013 Supplemental Engineering Report as an Appendix 20.

The generation rates for LFG were estimated as far back as 1999 using EPA Guidance documents and the results indicated the LFG rates for Ferry Point were consistent with municipal solid waste landfill rates for a facility of this era and overall age. The analysis in 2010 also evaluated hazardous air pollutants (HAPs) in areas of the course as well as community park. In 2011, NYSDEC concluded that there was not an ambient air impact from gas vent emissions and that there was no health impact in the park. This was a major component that allowed the discontinuation of monitoring the passive vents installed in 12 locations throughout the park. Monitoring of the passive vents is included as Appendix E.3 in the Supplemental Engineering Report (Appendix 20).

The following were included as components of the Ferry Point Park Landfill Gas Control System:

1. Irrigation Lake Venting System-Passive
2. Water Quality Ponds Venting System-Passive
3. Sub-Slab Depressurization Systems
    a. Maintenance Facility-Active
    b. Comfort Station in Golf Course-Active
    c. Comfort Station Community Park-Active
4. LFG Venting for subsurface utilities entering enclosed spaces-Passive
5. Perimeter Vent Trench-Passive
6. Perimeter Vent Trench/East-Passive
7. Golf Course 25 In-ground vents-Passive

The Ecology & Environment 2011 Landfill Gas Management Report describes in detail the landfill gas generation rates, composition, migration pathways and methods for diffusion (Appendix 20). It also discusses both the horizontal and vertical migration of LFG across the landfill. Figure 3-1 in the LFG Report (MSW Fill Progression Map, March 11, 2015) shows the historical fill progression that occurred over the landfill lifespan between 1951 to 1959 and how significant areas of open water was filled in over the life of the landfill .

As far back as 1999, Landfill Gas generation rates were noted to be low and in the range of .00004 cubic feet per minute per square foot or about 2cfm per acre of surface area. These generation rates provided discussion and recommendation for installation of an active system beneath planned structures. A 1999 Report referenced in the Ferry Point East Landfill Gas Management Plan did not recommend installation of active venting systems in open spaces with the exception of specific turf grass areas. The 1999 Report also included numerous LFG Control Systems including; interceptor and venting systems, impermeable liner systems for irrigation ponds, soil plugs and conduit seals for underground utilities that enter buildings (Appendix 20).

The main facility LFG management structure was the perimeter vent trench installed in 2001. The specific purpose was to prevent offsite migration of landfill gas. This was designed, and installed with oversight by TRC. The entire trench was installed along the eastern site boundary and allowed a gas barrier to be present between the site and the neighboring residential homes. Construction included extending the trench from the water's edge at Emerson Avenue along Balcom Avenue and the site boundary, approximately 1050 ft. past the intersection of Schley and Buttrick Avenues.

Monitoring of the venting trench began using a number of wells that were installed along the trench. In 2001 monitoring performed after the trench was installed indicated there was an off-site source of methane. This was identified by AKRF and further evaluation along the venting trench indicated there were additional off-site LFG readings. Test pits were identified to have MSW beyond the site and this was one potential source of the elevated readings. The second was the historic filling in the northeastern portion of the site on a former tidal or marsh wetland. No methane was reported in ambient air at that time and the source of methane was concluded by AKRF to have originated from an off-site source.

The initial facility LFG system was proposed to be installed as an active system. Following the 2009 landfill permit modification submittal, the conceptual passive LFG system was updated to include all areas not covered by enclosed structures. In summary, the passive LFG system meets a number of historic reports including the 1999 EAS (AKRF), 2002 referenced in the Landfill Gas Management Plan (Appendix 20) and Volume #2 Application for Modification to the Solid Waste Permit Engineering Report, June 30, 2005, Appendix 20) and was approved under the 2005 NYSDEC Part 360 permit (Appendix 1). In the 2009 DEC Part 360 Permit Modification Request (November 25, 2009, Appendix 20), an active system was recommended. Supplemental Site investigations and extraction testing was performed by TRC Engineers in the period between 2009 and 2010. This information was reviewed by Walsh Environmental Scientists and Engineers in 2010 (Ferry Point Landfill Gas Report, November 2010, Appendix 20). The resulting analysis and evaluation concluded that the Site was able to be operated safely with a passive venting system which was consistent with the 2005 Permit.

The July 2000 NYSDEC Part 360 Permit (Appendix 1) and February 2002 Part 360 Permit Modification (Appendix 1) approved by NYSDEC included numerous conditions related to material importation and capping. The permit was also specific in requiring the installation of a series of perimeter-based landfill gas monitoring wells. Twenty-one (21) perimeter monitoring wells were initially recommended and a final total of 25 were installed at intervals of approximately 250-300 ft. around the perimeter (PZ-01 to PZ-25),

(SH-21 Groundwater Monitoring Well Construction; November 8, 2011. The perimeter for purposes of these wells would be the edge of the golf course portion of the landfill and the adjacent residential neighborhood. An additional 56 monitoring points were required to be installed as the main component of the off-site monitoring network. The off-site wells were referenced in the modified 360 permit. The combined perimeter and off-site wells comprise the full gas monitoring system for the golf course fill area.

Modifications to the overall Landfill Gas Collection systems were based on and included the following:

- In 1986, a passive venting system was reportedly installed with outflow venting. In 2002, there was a plan presented by TRC to perform test pits in order to identify this system and more specifically, to identify the outflow vent location and to determine if connective piping was functioning. The system was never located and has not been able to be incorporated into any LFG system.
- 2005 Engineering Report Vol. 1 (June 30, 2005, Appendix 20) included several LFG components and systems that were aimed to maintain a similar program to the 1999 proposed EAS. This included active systems for all enclosed buildings and sealed penetrations for utility connections. All perimeter and off-site monitoring wells would be monitored bi-weekly for both methane and oxygen. Monitoring showed several points off-site with elevated levels indicating a source that was also located beyond the site. Groundwater was monitored on a monthly basis to evaluate water level in concert with the LFG trench elevation. Irrigation Lake and ponds were recommended to have gas-venting layers and liners installed at their base to allow for collection and discharge of gas collected from beneath them. Specific instances of impermeable barrier installation could be noted where turf health was necessary to be maintained. Most specifically, the 2005 Report did not recommend LFG venting systems in open space areas (Appendix 20).
- A 2009 Extraction Pilot test was conducted to better understand generation rates for on-site LFG. The interpretation of the results of this test prompted a proposal for a low-flow active LFG system that covered the overall golf course. The reason referenced in the Supplemental Engineering Report for the Solid Waste Facility Permit Application, October 13, Appendix 20) was that methane levels in the subsurface was not expected to be able to be made safe by the opening of the golf course. The irrigation pond system was also included in the plan to be connected to the landfill venting system. One caution in this report was the potential for pulling large volumes of ambient atmospheric air into the subsurface which could cause fires and explosions. The system included some forty control zones of extraction wells, green and tee collection piping all connected to vent flares with in-line fans. This system was never instituted.

Modifications to the gas monitoring system included the design and installation of a landfill gas (LFG) vent trench along much of the eastern park boundary. This trench extends from the water's edge at the foot of Emerson Avenue, along the entire length of the site boundary of Balcom Avenue and along Schley Avenue. The trench continues approximately 1050 linear feet to the west past the intersection of Schley and Buttrick Avenues. The trench totals just over 1 mile in length (5350 feet) and construction began in May 2001 and was completed by the end of December 2001. This trench does not cover the entire upland

perimeter. The remaining portion was covered with an existing trench along Miles Avenue. This was planned to remain following the golf course development and provided an effective cutoff for off-site migration in that direction. The final construction included the trench and drainage.

The LFG passive vent trench was designed to intercept landfill gases (primarily methane) originating and leaving the site. The limits of the municipal solid waste extend beyond the park boundaries and the LFG passive trench was not designed to facilitate collection of or negate the impact of gas generated from that material. The trench presents a sound engineering control that will intercept gas migrating through preferential pathways and other routes of least resistance that intersect it. The LFG trench acts to briefly capture LFG moving out of the park and then allows it to vent to the atmosphere. The trench is designed to have a very high relative permeability with increased porosity in comparison to the landfill waste material. As gas enters the trench is can easily and rapidly mix with ambient air in the pore space and then rise out where it can be discharge to the atmosphere. One of the key components of the trench is that the bottom remains into the water table. As long as the bottom of the trench is submerged in the shallow water table, LFGs at the Park cannot migrate beneath and beyond the trench.

The 25 perimeter monitoring wells (also referred to during the construction as piezometers) were located immediately adjacent to the LFG passive vent trench and along the site perimeter adjacent to Miles Avenue. The specific purpose was to provide consistent data comparing the trench bottom and top of the water table to identify locations where the water table may have dropped below the trench, thus indicating the ability for the trench to intercept and capture all LFG along its entire length.

The LFG passive vent trench was constructed of a geotextile wrapped stone envelope that extends from .5 ft. below the ground surface down to a depth of approximately 3 ft. below the surface of the water table. The upper .5 ft. of the trench has a loose covering of wood chips to allow LFG that has entered the trench to exit and discharge to the atmosphere. There were areas where the final depth of the trench only reached to 1 ft. below the water table. These locations were caused by an unstable sidewall after the groundwater table was reached. The trench was also constructed with horizontal perforated 4 to 6 inch polyethylene tubing placed beneath the wood chips near the top of the stone backfill. The horizontal tubing was installed to allow connection to vertical risers in the event the trench surface is covered at some point in the future with an impervious surface.

LFG monitoring has been performed in accordance with Special Condition 30 from the modified Solid Waste Permit (Response Action Plan, December 10, 2002, Appendix 19). This included monthly monitoring during construction in order to determine if water levels were maintained above the bottom of the trench. Specific protocols were required to be performed in the event groundwater was determined to be below the bottom of the trench.
The following Action Plan items were incorporated for low groundwater levels:

1. Evaluate methane concentrations in nearby perimeter methane monitoring wells and semi-permanent monitoring points. If methane concentrations measured are below site-

specific action levels (25% LEL), the normal frequency methane monitoring will continue and the groundwater level measurements will increase to bi-weekly.

2. When groundwater levels increase to fall back into the envelope of the recovery trench, measurements will return to monthly.
3. If groundwater remains below the trench bottom for one additional bi-weekly monitoring event but nearby well methane levels remain below the action level, groundwater monitoring will continue until such time as routine monitoring can be reinstated.
4. When groundwater is measured below the trench and methane levels are at or above the action level, both groundwater and methane measurements will continue at bi-weekly frequency.
5. If both groundwater and methane remain below the trench bottom and above the action level (respectively) for a second consecutive week, a recommendation for further action will be made to NYSDEC.

During the 2014 Solid Waste Facility issuance several references to continuing monitoring and the documents that would be covered under were made (DEC No. 2-6006-00014/00013 (2-6006-0014/00016 Permit Issuance – Solid Waste Management Facility (Tidal Wetlands), May 21, 2004, Appendix 1). The Ferry Point Park East Post Construction Custodial Care Plan is specifically called out as the governing set of protocols for this. Monthly LFG vent trench monitoring is to be performed during the duration of the permit (October 2013, Appendix 20). Additionally under Special Condition 25 there is continued monthly inspection required for the gas venting trench integrity as well as mulch cover. All repairs are required to be made within two weeks and therefore prior to the next inspection. The mulch cover is required to be replaced each spring. Trench maintenance is also described in the Supplemental Engineering Report, Volume 3, Appendix F (Appendix 20).

Landfill methane monitoring has shown from collection of data within the site to be above general action levels of 25%LEL as well as LEL from within the MSW layer. The resulting measurements between 2008 and 2009 supported the hypothesis that methane was generally present throughout the entire MSW layer rather than just from individual locations. Measurements from the shaping layer above the MSW indicated that concentrations decline rapidly once out of the fill layer. These measurements appear to present a better picture of the landfill gas presence and production because the extraction test performed in 2009 referenced a 2003 Journal of Air &Waste Management with fatal flaws for infiltration of atmospheric air into the landfill. In addition, the 2009 extraction test did not reportedly follow the EPA testing methods and would then incorrectly estimate the presence and production of methane. Testing reportedly used differential pressure at surrounding test wells. EPA specified determining radius of influence based on absolute pressures under static and active extraction conditions. EPA measures ambient air intrusion by percent volume of nitrogen and the testing identified ambient air intrusion by percent oxygen. The conclusions that were reached at that time indicated that atmospheric intrusion noted during the testing would have caused the LFG extraction rate to be significantly higher than actual LFG generation rates within the area of the pilot test. If the entire LFG generation rates were then based on pilot test results, the resulting estimate would be potentially far over the actual LFG generation. Historic data from monitoring indicated that LFG generation rates had sharply declined since the initial

2000 measurements began. The reduction was referenced largely as readings from over 100% LEL to non-detect. While there were a few exceptions, this overall reduction was credited to, among other things, the perimeter venting trench and overall LFG decline. One specific area in the vicinity of MW-0 found to continue to present elevated readings was believed to be impacted from an off-site source.

The Ferry Point Landfill Gas Report (November 2010, Appendix 20) was a summary of various testing across the landfill including flux chamber testing that was used to determine the surface emission rates from the overall landfill. The resulting emission rates were important in making the determinations for receptors and potential impacts of methane and hazardous air pollutants. During this review of testing data and as it was presented in several reports, no methane was detected in field measurements from any of the sample locations. This lack of detectable methane was attributed to rapid attenuation of methane as it passed from the MSW into the shaping material and out into the atmosphere. Hazardous air pollutants in the form of certain VOCs were detected in flux box sampling but all below the reported standards or at levels similar to those identified as background.

Testing within the Community Park was also conducted and methane was also not detected in flux box testing indicating it is not emitted at the ground surface at concentrations that are measureable. This meets NYCRR Part 360 criteria. Measurements from within the top 2 ft. of the shaping material were below 25% of the LEL which also falls within the NYCRR Part 360 requirements for on and off-site structures. Perimeter methane was below Part 360 criteria with the exception of the vicinity of MW-0 along Buttrick Avenue where methane was above 100% LEL. This particular area was beyond the site and consisted of early tidal marsh and pre-1945 MSW filling that is believed to be the contributing source of methane. All measurements from the Community Park vents were below ambient concentrations and well below NYSDEC standards indicating no impact above public exposure thresholds in the vicinity of the vents (Ferry Point Landfill Gas Management Plan, October 2011, Appendix 20).

Modelling of the emissions over several efforts conducted between 1999 to 2010 showed that methane levels were very low and in locations where methane was identified, levels were expected to continue to diminish over time. In order to provide adequate ventilation for enclosed spaces and especially where there is a source of ignition (electrical connections or machinery), mitigation methods would be implemented including Sub Slab depressurization systems (SSDS) at each building. This was further described as conservative as methane concentrations exceeded LEL within the MSW layer back during 2008/2009 in TRC testing of the subsurface. Also during this same monitoring period, methane was not present within the shaping material above the NYCRR Part 360 limit of 25% LEL in any location of proposed buildings. Passive venting of the MSW was recommended as a precautionary measure where no buildings were planned and active venting below or within building footprints.

The Golf Course portion of the Site also includes a sizable irrigation lake and water quality ponds. The purpose for these water bodies covers two positive issues. The first is to help control and limit precipitation and infiltration through the cover material and into the solid waste and the second is to help collect water for controlled release and irrigation. Golf course ponds are typically used for storage and

irrigation regardless of the overall construction. The ponds and lake were each designed to be lined in order to contain as much runoff as possible making it available for irrigation. A gas transmission layer was constructed beneath the irrigation lake. This was connected to perforated piping installed around the lake. The 2009 Part 360 Permit Modification Request included Contract drawings showing this piping as a passive venting system surrounding the lake (Appendix 20).

Water quality ponds were proposed to be lined up to the permanent water level capacity with low permeability low density polyethylene (LDPE) liners with the incorporation of a passive venting system. Ponds where MSW was encountered within the excavation would be lined for the entire volume.

The smaller ponds have also been designed and constructed with a gas transmission layer to promote passive venting. This layer consists of permeable gravel and perforated collection piping extending beneath the ponds and exiting from vent stacks that extend above the breathing zone. The drawings and specifications for the water quality pond liners and passive venting systems were included in the Supplemental Engineering Report Appendices (Appendix 20).

The Community Park portion of Ferry Point Park is located along the northeastern side of the site. This includes walking paths, open space and a single comfort station structure. The LFG components of the Community Park portion consist of 12 LFG vents and an active sub-slab depressurization system beneath the comfort station. Sampling and monitoring of the vents has shown that since at least 2011 there has been no measurable flow in the vents and detectable methane in 3 of the 12 vents. Ranges of methane were between 7.5% to 100% LEL as referenced in the 2011 Ferry Point Landfill Gas Management Plan (Appendix 20).

Twenty-five stand-alone vertical passive vents were installed across the golf course and twelve passive vents were installed in the Community Park. The total area not covered by buildings and water features is approximately 190 acres and the ratio of vents per acre is one per five acres. A greater ratio was applied to the community park which has twelve passive vents in open spaces. All landfill and community park vents operate based on changes to water level, atmospheric pressure and also production of landfill gas. Gas can move through the fill material to a point where it is able to be removed through a vent. Additional smaller gas volumes can move upward into the shaping material to be passed along the surface interface. Based on readings, these concentrations are both low and rapidly diffused indicating the overall volume is much lower.

Following the revision of the active venting proposal for the entire Site, the enclosed buildings and structures were left with the earlier requirement for active venting systems. This was required due to the explosive and accumulating nature of methane and other oxygen displacing gases that exist in landfill conditions as well as being precautionary to prevent the potential of accumulation of explosive gases in these locations. In order to protect occupants and visitors of enclosed structures from accumulation of LFG, active venting of the sub-slab area was recommended. The active sub-slab systems prevent accumulation of gas by actively removing it to the atmosphere and increase the flow of air beneath the buildings. This creates a change in pressure from beneath the slab and the inside of the building which

prevents LFG from entering the building in its more concentrated form. Once LFG leaves the confined space from beneath the landfill and mixes with ambient air, the concentrations are rapidly diminished to levels that are not detectable above background.

The three enclosed buildings (maintenance and two comfort stations) located on the Golf Course and Community Park were required to have SSDS incorporated into the slab design and foundation plan.

Two initial buildings within the golf course (maintenance and comfort station) and one in the community park (comfort station) were recommended to be outfitted with active sub slab venting systems. The maintenance building and comfort station in the golf course and comfort station in the Community Park were each proposed and were outfitted with an active SSDS. The designs were initially submitted in the 2009 DEC Part 360 Permit Modification Request (Appendix 20). Operation and maintenance of the systems (once active) is provided in the Operations, Monitoring and Maintenance Plan and in the Post Construction Custodial Care Plan. Systems will have monitoring, notification controls and remote capabilities in order to allow monitoring of conditions.

Sub slab systems for the three existing structures on site function in a similar fashion by reducing the air pressure beneath the foundation and inducing a slight negative pressure. The negative pressure prevents upward migration, accumulation and infiltration of LFG into the aboveground space. Systems can incorporate varying designs in order to accommodate structural requirements, utilities and layout of the overall building.

The maintenance building and community park systems consist of more typical sub slab systems with perforated piping placed in the backfill material above the municipal solid waste but beneath the foundation slab. Piping is connected to a vacuum blower that exhausts the sub slab gas from a high single point into the atmosphere. The comfort station within the golf course uses a similar manner of equipment with the major difference being the foundation design was modified to include the creation of isolated vaults sandwiched between the lower mat slab and upper floor. No access can be made into those vault spaces and they are filled with low density foam. Vent piping was installed into the sealed vaults and the vapor extraction system effectively creates a higher vacuum (negative pressure) in this vault space than would typically be seen below an open foundation. The piping penetrated the floor in the main portion of the building and was extended into the attic where the blower was mounted. Exhaust was vented through the top of the roof in a dedicated stack. The system was installed in March 2015 and put in operation prior to opening the golf course on April 1, 2015. The comfort system details are also described in the deviations section of this report.

The Maintenance building was constructed with a pile supported slab that covers the entire footprint of the building. The system was constructed as shown on drawings X-001.00 through X-006.00 (Contract drawings for: Construction of a Maintenance Building, A Comfort Station, and One Rain Shelter Within the Ferry Point Golf Course – Contract No. X1256-209M, November 11, 2011, Appendix 4). Prior to pouring the slab, the existing ground surface was prepared with geo-textile fabric, a minimum 12 in. layer of aggregate that is gas permeable to allow flow from all areas beneath the slab into the collection piping,

rigid insulation all covered by an impermeable barrier such as liquid boot or other equivalent. Liquid boot and all barriers used are compatible with the known and identified volatile organics identified at the site. Liquid boot was applied to provide a 60 mil thickness. A special capping material was also placed above the liquid boot to protect it from perforations when the rebar reinforcing rods were set in place. Six inch dia. PVC piping was installed beneath the center of the Maintenance Building floor and this was connected to a vertical riser that would exhaust through the roof. The blower was located as the piping exited the slab into the building and exhaust extended up through the roof. The system was combined with combustible gas meters located in each of the occupied spaces of the building that monitor the atmosphere in each area and are connected to a central alarm. Sub slab monitoring points were also installed along the length of one side of the building to allow for sampling. Each point was installed through the slab into the permeable aggregate and the penetration through the slab was sealed. This system was operational prior to the opening of the golf course as the building was being occupied prior to opening of the golf course.

The system in the comfort station at the Community Park was installed in a similar fashion with a smaller footprint building. This system was a single length piping system installed beneath the foundation using the same construction layering as the maintenance building. The blower and equipment has been completed and the system not yet initiated as that area is not currently open. The system is expected to become active in the very near future.

The comfort station within the golf course was also outfitted with an active system but the slab design for this building was modified so as not to require pile supports. This foundation design included a vapor barrier placed on the prepared subgrade. No MSW was exposed and the fill beneath the building was consistent with shaping material consisting of sand and gravel. A mat slab that was 1.5 ft. thick was poured over the vapor barrier and then 4 ft. vertical walls were formed on the slab to cover the perimeter as well as divide the slab into 4 roughly equal sections. The inner sections of the slab were then filled with solid foam up to just below the top of the walls. Six inch PVC piping similar to that used in the maintenance building sub slab was used and extended to the outer two segments. A vertical riser penetrated the floor inside of the building and was extended up into the attic space where the blower was located. The blower exhaust was directed out of the roof through a vent. The system was designed to create and maintain a lower pressure vacuum on the entire four-chamber sub slab area in order to prevent any sub slab gas from accumulating within that space. Pressure testing of the entire area showed that negative pressure was able to be generated and maintained between the mat slab and floor of the comfort station. This system was installed and began operating prior to opening of the golf course and occupation of the building.

Additional controls installed within the buildings included soil/bentonite collars around utilities servicing the buildings. Foundation penetrations were sealed with these engineering methods to prevent infiltration both into the void spaces and up through foundation slabs where utilities are installed. Additionally, soil/bentonite collars were installed in utility corridors where permeable pipe bedding was used in order to prevent LFG from migrating laterally. All conduit and utility penetrations into floor slabs

were also closed with soil/bentonite seals to prevent those corridors from acting as preferential pathways for LFG migration up into occupied spaces.

The Community Park Comfort Station was constructed in an area of MSW at shallow depths below grade and within the foundation envelope. The foundation was designed to incorporate piles for slab support. All utility trenches that were excavated to the building were installed in either shaping material or if MSW was encountered, it was over excavated and the trench backfilled with granular fill to allow all utilities to be place on bedding that did not contain MSW. During excavation, short duration and dewatering was occasionally necessary. Any water removed during dewatering was pumped a short distance away into existing trenches or other locations.

Off-Site monitoring for methane has been conducted back to the early 2000s. Probing was the primary early monitoring and assessment method. Probes were historically located on Schley, Buttrick, Balcom, Miles and Emerson Avenues. Since 2002, concentrations of methane have been lower than the LEL and this has been used to present the lack of significant source of methane at these off-site sources. In 2002, the Methane Monitoring Study (AKRF) identified the presence of buried MSW beyond the site boundaries. In addition to MSW, soils were logged and identified as fine organic deposits representative of the historic marsh deposits.

OM&M incorporates criteria from NYCRR Part 360-2.17(f) including the following:

- Concentrations of explosive gases must not exceed 25% of the LEL in on-site and off-site structures.
- Concentrations of explosive gases must not exceed LEL at the property boundary.

These requirements are being used to guide mandated additional monitoring under Special Conditions and to govern the construction of all future buildings. Several Special Conditions were included within the 2005 Part 360 Permit (Appendix 1) and are incorporated into regular OM&M and will continue moving forward until they are recommended for elimination as part of the permit.

Special Condition 26 includes the monthly monitoring and inspection of gas venting trenches to evaluate the mulch cover material. This will occur each spring following the winter months.

Special Condition 30 includes the monthly groundwater gauging in the perimeter piezometers in order to evaluate the depth to groundwater with respect to the bottom of the gas venting trench. This measurement will continue through the construction process and that period will be considered complete upon the approval of this Construction Certification Report. The monitoring specifies that id groundwater is measured below the bottom of the trench, DPR will implement Special Conditions monitoring. This is further described below in 5.2.2.

Special Conditions 31 includes specific notification and frequency monitoring if groundwater is identified below the bottom of the trench or if LEL of LFG is noted in adjacent monitoring probes.

Special Conditions 32 and 24 include the bi-weekly monitoring of specific perimeter gas wells and on-site monitoring wells. Results of the monitoring will direct more frequent sampling or monitoring and when monitoring may return to the regular schedule.

Special Condition 37 includes bi-weekly monitoring of the off-site gas monitoring network and the results of this monitoring will direct more frequent monitoring or testing.
Additional parameters were added in 2011 by NYSDEC to include hydrogen sulfide, VOCs and carbon monoxide, all were to be reported in parts per million (PPM) and temperature/pressure.

Work that will continue following construction is included in the Post Construction Custodial Care Plan (Appendix 20). That document covers the efforts beyond this report in order to effectively monitor and report on post construction conditions under the Part 360 Permit.
Monitoring during the entire construction period has been performed in accordance with the Landfill Gas Monitoring Plan and the approval of this Report will serve to conclude all construction monitoring.

The most recent and final documentation submitted under this construction effort is the Ferry Point Park Golf Course Irrigation Pond Vent Boxes Monitoring Final Report submitted in May 3, 2015 (Appendix 20). This Report summarized monitoring data and piping/vent/vale configurations around the irrigation pond at the golf course. The overall purpose for the preparation of the Report was to present information to NYSDEC prior to this Closure Certification Report in order to gain approval to close and remove one vent from the golf course area at vent box #5.

The Report describes and presents the configuration of the piping surrounding the irrigation pond and that the removal of this single vent would not have a detrimental effect on the overall LFG system. The entire lop surrounding the pond collects LFG under the conditions that have been evaluated and calculated over the landfill and that appears to be less than one cubic foot per minute. Based on measurements from specific vent box locations within the overall loop, the LEL readings concentrations indicate two possible theories; that methane may be coming from possibly one area and then slowly migrating or spreading to one or two other vent box areas or it may be concentrated in one area and is also being generated at much lower levels from one or two other areas.

In either case, the volume and rate of methane being generated is similar to much of the remainder of the landfill and while this area has actual vent pipes, the remainder of the landfill is direct vented to the atmosphere through the shaping layer. Removal of the single vent at Vent Box 5 will not impact the collection of methane within the underground passive piping but will only eliminate one outlet location. The valve placement at each box allows for multiple vents to be open or combinations of vents to be either open or closed. In addition, sections of the piping around the irrigation pond can be isolated. There is no specific plan other than to remove the single vent from the overall system and this would not impact the passive systems ability to remove methane from the subsurface.

Landfill and off-site gas monitoring was completed as required by the Permit Special Condition X during construction. The IEM accompanied American Environmental Solutions (AES) during landfill gas

monitoring activities at on-site and off-site locations during the course of construction. Monitoring results were transmitted to the NYSDEC by AES after monitoring was completed and monitoring reports were included in the bi-weekly FMRs for the corresponding periods. Landfill gas monitoring results are attached as Appendix C in each the FMRs which are included as Appendix 6. In addition, refer to Appendix 15 for the spreadsheet compilation of all LFG monitoring results to date in tabular and graphic format.

5.2.1 Bi-Weekly

Methane gas monitoring of the entire site was conducted on a bi-weekly basis. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR (Appendix 6). In addition, refer to Appendix 15 for the spreadsheet compilation of all LFG monitoring results to date in tabular and graphic format.

A review of the historic field data associated with the perimeter LFG vent trench monitoring program from 2001 to present was conducted to evaluate LFG trends at the Site relative to the perimeter passive LFG control (Ferry Point Park East Post Construction Custodial Care Plan, October 2013, Appendix 20) and showed the following:

- After the installation of the vent trench in 2001, methane levels in the vicinity of the LFG vent trench tended to decrease significantly within a year in most LFG monitoring wells;

- Methane levels remained relatively low and below regulatory limits from 2002 through 2004, except for a few wells that sporadically exceeded the regulatory limit;

- In 2005, the measured methane levels tended to increase, likely due to the installation of more reliable monitoring points (new monitoring points and repaired wells); and

- Results from 2008-2011 generally indicate relatively consistent levels of methane, with certain limited sporadic increases above regulatory limits.

Methane levels increased for several on-site perimeter wells, on-site interior wells and off-site semi-permanent wells located during the construction period between 2010 and 2014, especially for the wells located in the northeast portion and south portions of Ferry Point Park; however, the levels were significantly lower than the beginning of the monitoring program, and the levels decreased to zero by 2015 with the exception of two on-site perimeter wells (MW-14 and MW-15) located in the southern portion of the golf course, three on-site interior monitoring wells (MW-0, MW-4 and MW-19), and three off-site semi-permanent wells located on Buttrick Avenue (10, 12R and 14R). The last recorded monitoring event on April 10, 2015 (Special Conditions Landfill Gas Monitoring Report, April 13, 2015, Appendix 7) reported the following methane concentrations (% by volume) exceeding the site specific action level in eight locations:

- MW-0 - 4.5%

- MW-4R - 50.2%
- MW-19 - 83.8%
- MW-15 - 6.7%
- MW-14 - 33.4%
- Well 14R (Buttrick Avenue) - 1.6%
- Well 12R (Buttrick Avenue) - 28.6%
- Well 10 (Buttrick Avenue) - 10.1%

5.2.2 Special Conditions

In accordance with Special Conditions #34 and #37c of the November 18, 2005, Permit Modification (Appendix 1), if any individual monitoring point has a bi-weekly reading that equaled or exceeded 100% LEL, or three consecutive bi-weekly readings that were greater than 25% LEL, methane monitoring of these points was conducted on a weekly basis. Monitoring returned to the bi-weekly monitoring schedule once three consecutive readings were each less than the 25% LEL action level. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR. In addition, refer to Appendix 15 for the spreadsheet compilation of all LFG monitoring results to date in tabular and graphic format.

5.3 Piezometer Monitoring

On a monthly basis, groundwater elevation measurements were taken and recorded in all piezometer locations along the site perimeter vent trench in accordance with Special Condition 28 of the 2014 Permit. Measurements were manually taken using a portable water level meter. The IEM observed piezometer monitoring in the field and groundwater data was submitted to the NYSDEC. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR. Piezometer monitoring results were incorporated into the landfill gas monitoring reports attached as Appendix C in each bi-weekly FMR, which are included as Appendix 6.

5.4 Settlement Plate Monitoring

Short term settlement was performed with plates installed throughout the landfill in order to evaluate settlement and compaction during the fill placement and grading. The majority of the short term plates were installed following the importation of significant amounts of fill material when the areas had been brought near to or at final grade. The 2014 NYSDEC Permit Modification (2-6006-00014/00013) Special Condition #6 required short term settlement monitoring to meet those requirements incorporated in the January 2005 Settlement Evaluation and Long Term Monitoring Plan. Short term monitoring was performed in accordance with the early 2005 Plan and as construction progressed and as per Special Condition #6. Short term settlement plates were either removed or monitoring discontinued when long term monitoring plates were installed in accordance with the revised Permit. Long term settlement plates were installed throughout the landfill in areas shown on the Figure titled Ferry Point Golf Course Settlement Plate Locations 4/11/2012 by KS Engineers, P.C. The locations of the long term plates were identified to be in the same specific vicinity of the short term plates.

The overall Program for monitoring settlement began in 2002 with the construction of 7 instrumented test fills and installation of 6 settlement plates that were located across the site. Test fills varied between 10 to 18 ft. in thickness and the specific locations were placed where future settlement would be most critical (e.g. future green areas and where significant thicknesses of fill were necessary). The majority of the settlement plates were located in the eastern portion of the site at a time when most of the fill had been imported in order to begin monitoring on-going settlement for areas that had been filled for a period of 9 months or longer. Initial settlement monitoring was conducted for a period of over 2 years and monitoring results were transmitted to NYSDEC on a bi-weekly frequency.

Settlement recorded following June 2003 was recorded but noted to have been significantly influenced by the importation if fill and the loading that this had on the areas adjacent to the test fills. Initial settlement was noted to have a range between 3 and 23 inches with the greatest variation in the western section. This was believed to be the result of a significant compressible clay layer near the surface. The recorded measurements were compared by Langan to the estimated values that had been calculated and they were found to be comparative. One positive aspect of this initial measurement and comparison showed the site to be in an optimal character for surcharge as a result of placement of larger fill loads for shorter periods of time in order to maximize the settlement as early as possible and minimize post construction settlement that is a critical issue for the sensitive surface of a golf course.

The resulting settlement analysis provided a recommendation for fill placement and long term predicted settlement. This information and comparison to settlement data is critical in monitoring the underground utilities for maintenance and repair. Piping settlement would result in lower carrying capacity and therefore storm lines were designed to be oversized with welded ends to prevent separation. Sanitary lines were also designed with the additional anticipated settlement incorporated into their long term maintenance. Increased slope, HDPE piping and flexible joints were recommended where piping would pass through areas of different fill thicknesses and therefore a differential in overall settlement would be expected to occur. Recommendations for flexible connections capable of withstanding rotation and extension were made for sewer lines exiting structures.

Settlement over the golf course surface was presented following the initial evaluation and recommendations for anticipated settlement were determined to be within the initially anticipated settlement and possibly sooner for areas where more substantial thicknesses of material were placed. Additional influences on long term settlement will be thickness and depth to the compressible clay layer. The variation in settlement was estimated to be between 3 to 15 inches over a 30 year period. Non-uniform settlement is also anticipated over the life of the golf course due primarily to the variable thickness of imported material and could equal up to 6 inches. Slope stability is not anticipated to be adversely impacted as a result of the long term settlement anticipated at the site.

Areas where significant amounts of fill were identified to be placed, such as the area between the irrigation pond and Hole #1 was required to be placed in a more controlled manner in order to allow the pore pressure to be evenly reduced. This method would prevent slope failures caused by buildup of pore

pressure. Placement of fill was specified to be in 2 ft. lifts per week which would allow for dissipation of pore water in the clay layer.

Special Condition #7 of the revised 2014 NYSDEC Permit specified long term settlement requirements and that they would continue to conform to those established in the earlier permit. Locations of the replacement long term settlement plates shown on the 2012 Figure were referenced and approved as part of the 2014 Permit Modification.

Long term settlement monitoring will be performed at the initially 8 recommended settlement monitoring plates located throughout the golf course for a period of 30 years following completion of construction.

The plates are located in variable subsurface conditions but in general have been placed where the greatest concentrations of fill material have been placed in connection with the thickest compressible soil layers. The locations were also chosen to be adjacent to underground utilities such as water and sewer mains and/or adjacent to green areas where differential settlement is most critical.

The date being used as the construction completion is April 1, 2015. This was described in the March 30, 2015 executed letter between NYSDEC and NYCDPR which referenced the Substantial Completion of Construction Certification allowing the golf course to open on April 1, 2015. The letter states that NYSDEC and NYCDPR agree that the April 1, 2015 opening of the golf course constitutes completion of the filling operation on the Site and construction of the earthwork portion of the Project as contemplated under the NYSDEC Permit (No. 2-6006-00014/00013 and 2-6006-00014/00016). As a result of this completion date, monitoring will continue until April 1, 2045 or until a point that NYSDEC authorizes monitoring to cease if it is prior to April 1, 2045.

Long term settlement will be documented as it is referenced in the Post Construction Custodial Care Plan (October 2013). This includes providing NYSDEC with an annual inspection report certified by a licensed NYS professional engineer. The monitoring will document the following information during the timeframes referenced:

1. Beginning within 60 days of the approval of this Engineering Certification Report and continuing for a period of 5 years, the quarterly monitoring results will be summarized and submitted on an annual basis.
2. Immediately following the initial 5 year period and continuing for an additional 5 years (10 years from the date of Engineering Certification Report approval) monitoring will continue on a reduced bi-annual basis and the results will be summarized annually.
3. Immediately following the year 10 bi-annual report summaries, monitoring will be performed and reported on a reduced annual basis. This annual monitoring and reporting will continue for the duration of the 30 year period or for 20 years.
4. Following the initial 5 year quarterly monitoring period, NYCDPR may petition NYSDEC for a decrease in the monitoring frequency or for cessation of monitoring altogether. In the event that NYSDEC approves terminating the monitoring for any monitoring plates, NYCDPR will evaluate the settlement plates for either abandonment or removal. This evaluation will be performed within

the first year following approval of monitoring cessation. The abandonment or removal documentation will be signed and certified by a NYS licensed professional engineer and provided to NYSDEC within the concurrent post closure reporting period after the completion of the work.

Special Conditions 6 and 7 of the 2014 Permit and the recommendations provided in the Settlement Evaluation and Long-Term Monitoring Plan dated January 26, 2005, prepared by Langan Engineering and Environmental Services, Inc. set forth settlement monitoring requirements related to the placement of fill material across the Site. A copy of the Settlement Evaluation and Long Term Monitoring Plan is included in Appendix 20. Settlement plate monitoring was performed on-site in accordance with the Permit. Settlement monitoring reports are attached as Appendix D in each of the FMRs, which are included as Appendix 6. Monitoring was conducted on-site as follows. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR.

5.4.1 Short Term

The short-term settlement monitoring program began in December 2002 with the bi-weekly monitoring of seven test fills and six settlement plates located throughout the Site. Test fills consisted of an engineered soil fill ranging from 10 to 18 feet deep, generally located on-site in areas where significant thicknesses of fill were required. Settlement plates consisted of a subsurface plate beneath a casing and a flush-mount monitoring access port, similar to a monitoring well. Settlement plates that were part of the short-term settlement monitoring program were generally located in areas of the Site already at or close to final grade. The Settlement Evaluation and Long-Term Monitoring Plan recommended the following adjustments be made to the monitoring program during construction:

- Test fills that obstructed construction activities should be replaced with a settlement plate to be monitored near the location of the test fill.

- Settlement plates that needed to be moved for construction purposes should be relocated to the same general area and monitored until long-term monitoring points were installed.

Monitoring at short-term monitoring points was discontinued as required due to interference with ongoing construction. In an email correspondence dated May 1, 2012, included in Appendix H of the 2013 Engineering Report (Appendix 20), the NYSDEC informed NYCDPR that these short-term monitoring locations did not need to be replaced as long as construction at the Site progressed. As construction was concluded in each area of the Site, long-term monitoring plates were to be installed as described below. Short-term settlement monitoring continued to be performed bi-weekly at the Site until October 14, 2013. The design of the long term settlement monitoring points is presented in a January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. and outlined in a May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by New York State Department of Environmental Conservation. These documents outline the long term settlement plate monitoring locations, detail and required monitoring intervals. Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. As previously stated, the monitoring and reporting schedule will be

modified as the post construction period extends into the future. This has been included in the Post Construction Custodial Care Plan (October 2013).

The following summarizes the efforts with respect to conformance to project design documents:

The approved May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by NYSDEC refers to Appendix H of an October 15, 2013 *Supplemental Engineering Report* for a long term monitoring location plan. Appendix H of the permit which is included as Appendix 20 here, references and includes the April 11, 2012 *Ferry Point Golf Course Settlement Plate Locations* plan prepared by KS Engineers, P.C.

The February 20, 2014 *Ferry Point Golf Course as Built Drawing* prepared by Contractors Line & Grade South, LLC shows the as-built locations of the long term settlement monitoring plates in conformance with the above referenced April 11, 2012 KS Engineers plan. An additional monitoring point between golf course Hole 6 and Hole 7 was added and approved in the May 1, 2012 *Re: Settlement Plates Email* prepared by NYSDEC.

A January 26, 2005 Settlement Evaluation and Long-Term Monitoring Plan prepared by Langan Engineering and Environmental Services, Inc. states that:

> *"These settlement points will be utilized to determine future settlements during the golf course operation. They should be installed once filling operations are completed to within 1 foot of final grades or in other words, during placement of soil cover materials. After their installation, monitoring of the settlement points should be performed once every other month until the construction is complete. Subsequent monitoring should be performed once every 3 months during the first year of golf park operation and once every 6 months for the second year."*

The description above is a deviation from the Post Construction Custodial Care Plan where quarterly monitoring and annual summary reporting will be performed for an initial period of 5 years followed by an opportunity to evaluate and proposed changes. The frequency would without any additional recommendation be reduced to semi-annually following 5 years. This reference accepts a switch to semi-annual monitoring and annual reporting following the first year. This is the only approved change in the settlement monitoring plan outside of the approved 2013 document.

The data from the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran indicate that settlement plate monitoring was conducted every two weeks in conformance with the minimum requirements of the above referenced monitoring plan.

Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. Results of the monitoring are available in the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran.

The November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran do not document any non-conformance issues regarding the construction of the long-term settlement monitoring locations. A settlement monitoring plate detail is provided in the January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. does not identify any deviations from the location plan and all long term settlement plates installed were specifically located as replacements for short term plates installed earlier during construction

5.4.2 Long Term

The design of the long term settlement monitoring points is presented in a January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. and outlined in a May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by New York State Department of Environmental Conservation. These documents outline the long term settlement plate monitoring locations, detail and required monitoring intervals. Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. As previously stated, the monitoring and reporting schedule will be modified as the post construction period extends into the future. This has been included in the Post Construction Custodial Care Plan (October 2013).

The following summarizes the efforts with respect to conformance to project design documents:

The approved h, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by NYSDEC refers to Appendix H of an October 15, 2013 *Supplemental Engineering Report* for a long term monitoring location plan. Appendix H of the permit which is included as Appendix 20 here, references and includes the April 11, 2012 *Ferry Point Golf Course Settlement Plate Locations* plan prepared by KS Engineers, P.C

The February 20, 2014 *Ferry Point Golf Course as Built Drawing* prepared by Contractors Line & Grade South, LLC shows the as-built locations of the long term settlement monitoring plates in conformance with the above referenced April 11, 2012 KS Engineers plan. An additional monitoring point between golf course Hole 6 and Hole 7 was added and approved in the May 1, 2012 *Re: Settlement Plates Email* prepared by NYSDEC.

A January 26, 2005 Settlement Evaluation and Long-Term Monitoring Plan prepared by Langan Engineering and Environmental Services, Inc. states that:

> *"These settlement points will be utilized to determine future settlements during the golf course operation. They should be installed once filling operations are completed to within 1 foot of final grades or in other words, during placement of soil cover materials. After their installation, monitoring of the settlement points should be performed once every other month until the construction is complete. Subsequent monitoring should be performed once every 3 months during the first year of golf park operation and once every 6 months for the second year."*

The description above is a deviation from the Post Construction Custodial Care Plan where quarterly monitoring and annual summary reporting will be performed for an initial period of 5 years followed by an opportunity to evaluate and proposed changes. The frequency would without any additional recommendation be reduced to semi-annually following 5 years. This reference accepts a switch to semi-annual monitoring and annual reporting following the first year. This is the only approved change in the settlement monitoring plan outside of the approved 2013 document.

The data from the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran indicate that settlement plate monitoring was conducted every two weeks in conformance with the minimum requirements of the above referenced monitoring plan.

Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. Results of the monitoring are available in the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran.

The November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran do not document any non-conformance issues regarding the construction of the long-term settlement monitoring locations. A settlement monitoring plate detail is provided in the January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. does not identify any deviations from the location plan and all long term settlement plates installed were specifically located as replacements for short term plates installed earlier during construction

The long term settlement monitoring was performed at the locations shown on the revised Settlement Plate Location Plan and a sketch that includes an additional monitoring point between golf course Hole 6 and Hole 7 included in Appendix H of the Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, NY dated May 31, 2012 (Revised August 31, 2012, October 15, 2013) as described in Appendix I of that report. These locations were approved by NYSDEC in an email dated May 1, 2012. The long-term settlement monitoring points were installed as construction was completed in each area of the Site. Upon installation, the long-term settlement plates were monitored in accordance with the criteria set forth in Special Condition 7 of the Permit.

As a component of this Report section the following list of documents were used:

- A January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc.;
- A May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by New York State Department of Environmental Conservation;
- A April 11, 2012 *Ferry Point Golf Course Settlement Plate Locations* plan prepared by KS Engineers, P.C.;
- A November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran;
- A undated *additional settlement plate sketch;*
- A February 20, 2014 *Ferry Point Golf Course as Built Drawing* prepared by Contractors Line & Grade

South, LLC; and,

- A May 1, 2012 *Re: Settlement Plates Email* prepared by NYSDEC.

The long term settlement monitoring was performed at the locations shown on the revised Settlement Plate Location Plan and a sketch that includes an additional monitoring point between golf course Hole 6 and Hole 7 included in Appendix H of the 2013 Engineering Report and as described in Appendix I of that report. These locations were approved by NYSDEC in an email dated May 1, 2012, which is included in Appendix H of the 2013 Engineering Report (Appendix 20). The long-term settlement monitoring points were installed as construction was completed in each area of the Site. Upon installation, the long-term settlement plates were monitored in accordance with the criteria set forth in Special Condition 7 of the 2014 Permit.

5.5 Groundwater Monitoring

The overall setting of the Ferry Point Park Site with respect to the groundwater regime can be described as an area covering approximately 220 acres bounded along the waters of the East River to the south, Saint Raymond's Cemetery to the north, Balcom and Emerson Avenues to the east and the Bronx-Whitestone Bridge and ramp to the west. The entire site was a former operating municipal solid waste landfill that ended accepting fill material in the 1960's. The overall landfill footprint extended beyond the boundary of the Ferry point Park Site. The period of operation predated the existence of current Solid Waste Facility design and construction requirements and therefore, no groundwater assessment or survey was performed for the construction or during operations of the landfill.

A review of aerial photography was conducted at the time this report was being prepared. The photographs are available on the New York City public website and include those showing the overall site and surrounding area from a period beginning in 1924 and up until 2012. The earliest photo of 1924 shows nearly the entire footprint of the Ferry point Park Site was formerly open water, existing as a large bay of the East River. A review of the 1951 aerial photograph of the same scale shows the northwest portion of the landfill site was filled with what appears to be very light colored fill material. The photo shows filling operations to be expanding from the northwest corner outward and based upon the extreme contrast in color of existing land and fill material to be sand material possibly sourced from in-water dredge operations. This practice was performed in many other areas of the City at this time when harbor deepening and widening took place from 1940 onward. There were no photos between 1951 and 1996 and so there was no further photographic record in this collection to show the progression of landfilling. This period of filling (pre-1951) predated the DSNY recordkeeping and existence and there would not be any expected record of the placement of this fill in Sanitation Department documents. The existence of these photos is important to present the hydrogeologic origin of site groundwater for comparison to that of other groundwater. This history places the entire Site at the base of a larger drainage basin and in direct connection with the East River system of salt and brackish waters. Using this as the basis for the hydrogeologic model, shallow groundwater at the Site would now be considered to be part of the upland groundwater table as a result of the filling and extension of the shoreline into the river. Groundwater

within the fill material could be expected to be tidally influenced but the inland limit of this influence would be dictated by the fill material, its composition and compaction.

As part of the Volume #1 Application for Modification to the Solid Waste Management Facility Permit for Construction of the Ferry Point Park Recreation Facility Engineering Report (June 30, 2005; Appendix 20), a specific groundwater impact assessment was presented. This was based on a qualitative assemblage of data and information from other related studies but not specifically from a focused groundwater evaluation.
A May 31, 2005 letter on the Influence of Fill Placement on Groundwater prepared by Langan Engineering assessed the impact of fill material on the groundwater (found in Appendix VII of Volume #1 Application for Modification to the Solid Waste Management for Construction of Ferry Point Park Recreation Facility Engineering Report, June 30, 2005, Appendix 20). This was based upon information and conditions gathered during geotechnical evaluations and site history knowledge. The findings presented at that time indicated the development of the Ferry Point Park Site as a golf course would not further impact or change groundwater flow patterns or conditions and would therefore not further impact the East River beyond the existing conditions.

Much of the description presented in the Langan assessment focused on the site development and the addition of engineering controls that would become part of the site. These included: paved path and parking areas, significant stormwater collection systems, site grading to control flow, control devices and systems as well as importation and capping of the entire site with a varied but significant layer of clean cover materials that would all have a positive impact and reduce the amount of surface water filtering through the landfill and into the groundwater. The overall completed site development in the 2005 Engineering Report included a total of 26 acres of impervious area and collection of stormwater in detention facilities (Appendix 20).

A total of 26 piezometers were installed to monitor shallow groundwater along and immediately adjacent to the Landfill Gas passive trench. These piezometers, while used for depth to groundwater measurements are not incorporated into the groundwater evaluation as they were specifically used to assist in the design and monitoring of the LFG vent trench. The principal purpose for the piezometers and their association with the LFG trench was to monitor the level of groundwater to determine if groundwater levels went below the LFG passive recovery trench. Groundwater elevation measurements collected from the piezometer locations along the site perimeter vent trench (Special Condition 28) are addressed in section 5.3 (Piezometer Monitoring) of this report. Section 5.5 addresses the baseline groundwater monitoring requirements established in 2010.

The NYSDEC Permit issued on November 18, 2005 for the construction of the 222 acre golf course did not include a specific requirement for a groundwater monitoring plan outside of the singular focus of monitoring groundwater elevation for landfill gas control in the trenches (Appendix 1). In 2010, NYSDEC requested additional information regarding groundwater conditions and if any new, relevant information was available to verify the conclusions of the geotechnical portion of the 2005 Engineering Report (June

30, 2005, Appendix 20). As no information was available, recommendations were made in 2011 by NYSDEC for the installation of a monitoring well network.

A Technical Memorandum was prepared by Ecology & Environment Engineering, P.C. (E&E) outlining the field procedures for establishing reference point groundwater characterization methods including the installation, development, sampling, well gauging and slug testing of 11 new monitoring wells at the Site (Technical Memorandum re: Field Sampling Procedures for Ferry Point Site – Reference Groundwater Characterization, September 19, 2011, Appendix 20). At the time of monitoring well installation (February 2012), construction activities were well underway and estimated to be 80% complete. The baseline characterization was expected to capture the potential measurable impacts to groundwater. Future monitoring is expected to capture the impacts representing a more complete construction condition

The well installation program included consistent and standard well installation and construction methods, well development, baseline sampling, water level survey and aquifer testing. A figure showing the well construction details and installation elevations and locations is presented as S-H21 dated 11/8/2011. Well construction methods included the installation of shallow 2 inch diameter PVC wells with 10 ft. of slotted screen penetrating into the upper surface of the water table and standard construction finishing. All of the wells were developed and monitored using consistent criteria (turbidity, pH, conductivity and temperature), Table 1 and 2, respectively, Fieldwork Summary Report (as part of Groundwater Characterization) (May 31, 2012; Appendix 20). Each of the newly installed wells was then sampled to establish the initial baseline conditions and each was surveyed to determine groundwater level and flow direction conditions. Basic site hydrogeological information was also characterized during this effort, including direction of flow, groundwater elevation gradients, and flow velocity. Based on the initial measurements, flow direction was found to be relatively consistent in that groundwater flow was in the south-southeasterly direction toward the East River (Figure 1, Fieldwork Summary Report, May 31, 2012, Appendix 20). There was one important item noted from the initial conditions assessment and this was the lack of measureable tidal influence on any of the monitoring wells.

One soil sample was collected from each borehole from the shaping material zone with an additional quality assurance sample collected from MW-02. The soils were sampled for synthetic precipitate leaching procedure (SPLP) semi-volatile organic compounds (SVOCs), PCB/pesticides, metals, and cyanide. Seven metals and one SVOC (phenol) were detected in the 13 samples sent to the laboratory
SPLP analysis. For comparison purposes, these results are shown along with the NYSDEC Technical and Operational Guidance Standard 1.1.1, for Class GA groundwater. Four metals, and one SVOC (phenol) were detected with concentrations higher than the comparison standard (Table 6, Fieldwork Summary Report, May 31, 2012, Appendix 20).

Slug testing was performed on each of the wells to evaluate hydraulic conductivity and while this is not a critical measurement for wells installed within landfill material, it is useful in evaluating the consistency of all wells in the system. The results of the slug testing presented a fairly uniform range of hydraulic conductivities within the landfill material.

The results of the baseline groundwater analysis showed that with the exception of metals, the analytical results were in line with a landfill of this type and age. All metal detections were higher than the NYSDEC Class GA groundwater standard, which was used for comparison purposes. It is noted that these samples had high turbidities (e.g., greater than 1000 NTU) and this likely impacted the metals test results. Phenolics and ammonia leachate parameters were also detected higher than the comparison standard (Table 7, Fieldwork Summary Report, May 31, 2012, Appendix 20). As a result, NYSDEC requested that both filtered and unfiltered samples be collected. If the results were consistent, subsequent events would be completed using filtered samples only for the inorganic parameters (May 8, 2012 Ferry Point Groundwater Characterization Conference Call, May 9, 2012, Appendix 20). Filtered and unfiltered groundwater samples were collected during subsequent events.

NYSDEC also provided DPR with requirements for future groundwater monitoring (e.g., Post Construction Monitoring) in their FPP Groundwater Characterization Monitoring Objective on May 8, 2012 (Appendix 20). The objective included the following requirements: reference point/background characterization in three quarterly rounds of sampling for all parameters listed in 6 NYCRR Subpart 360-2.11 baseline parameters. Following completion of the characterization sampling, baseline sampling would continue on a biannual basis after the initial three quarterly rounds until the FPP landfill end use (golf course) is operational. Table 5-X below summarizes the reference point/background characterization events.

Table 5-1. Summary of Reference Point/Background Characterization Events

Sampling Frequency	Wells Sampled	Status
Quarterly 1	GMW-1 – GWM-11	Completed February 2012
Quarterly 2	GMW-1 – GWM-11	Completed May 2012
Quarterly 3	GMW-1 – GWM-11	Completed August 2012
Bi-Annual	GMW-1 -GMW-11	Completed March 2013
Bi-Annual	GMW-1, GMW-2, GMW-3, GMW-4, GMW-5, GMW-6, GMW-7, GMW-8, and GMW-10	Completed March 2014
Bi-Annual	GMW-2, GMW-3, GMW-4, GMW-5, GMW-6, GMW-7 and GMW-8	June 20, 2014
	GMW-1, GMW-7, GMW-10, and GMW-11	July 31, 2014

The three quarterly sample events were completed without modification. The Bi-Annual events were modified following the March 2013 event due to construction of the golf course which limited access to the Site. The modifications include the following:

- No September 2013 Bi-Annual sample event.
- No sample was collected from GMW-9 (well was dry) and GMW-11 (access) during the March 2014 sample event.
- The second biannual sample event for 2014 was split into two events completed in June and July. GMW-9 was not sampled. Groundwater samples were collected from the site on July 22, 2014; however the samples were not analyzed due to compliance issues with the Standard Operating Procedures.

Table 5-1 presents the overall groundwater and analysis date for monitoring wells GMW-1 through GMW-11 covering the period between February 2012 through July 2014 and are consistent with the baseline sample events: metals, phenolics and ammonia compounds, isolated and sporadic VOCs (except for chlorobenzene detected in well GMW-01 and GMW-06 during multiple events) and SVOCs (primarily PAHs) were detected above the NYSDEC Technical and Operational Guidance Class GA Groundwater Criteria. The Class GA Groundwater Criteria were used for screening purposes as groundwater is not used for potable resources. The results of the filtered (dissolved) metals samples are significantly lower than the non-filtered metals samples and in most cases exceedances of non-filtered samples are non-detect or below the Class GA Groundwater Criteria in the filtered samples.

In accordance with the Post Construction Custodial Care Plan (Appendix 20), groundwater monitoring will be performed at all 11 permanent monitoring wells throughout the golf course. Approval of this Closure Certification Report signifies the commencement of operations at the golf course beginning the period of post construction monitoring. Sampling will be performed on an annual basis with collection and analysis of groundwater for those constituents listed in 6 NYCRR Part 360-2.11 routine parameters. This sampling information and data will be summarized and included with the overall annual facility monitoring and inspection report. Monitoring and reporting will begin 60 days following the approval of this closure report and will continue for a period of three years.

Following the completion of the initial 3 year post-operations monitoring, DPR may submit documentation to NYSDEC to request a reduction in sampling or complete cessation of sampling. The initial 3 year period will form the data set to be used in the event a reduction or change in monitoring is requested. The goal of the monitoring will be to provide data showing if the park adversely impacts water quality with respect to leachate quality or quantity and to compare the 2013 permit performance criteria to existing and current conditions.

Should a request for modification or cessation be approved, monitoring wells will be assessed for abandonment or removal within a 1 year period following the ending point of monitoring. Closure documentation will be provided by a New York Professional Engineer during the same annual reporting period.

Upon commencement of operation of the golf course, the frequency of groundwater monitoring changes to annual with samples being analyzed for all constituents listed in 6 NYCRR Subpart Part 360-

2.11 routine parameters and parameters of concern identified during the reference point characterization period. The golf course began operation in April 2015 and post construction monitoring will be initiated in September 2015. Post construction groundwater monitoring is discussed in detail in Section 5.7.4.

Design documents for the groundwater monitoring wells are included in Appendix G.2 of the 2013 Engineering Report (Appendix 20). An initial sampling event was completed in February 2012 and included the testing activities described below.

Groundwater monitoring results are attached in Appendix 15.

5.6 Deed Restriction

Special Condition 32 of the 2014 Permit requires that the Permittee executes and files a NYSDEC approved deed restriction, which shall run with the land in perpetuity, and shall recite and require compliance with the Part 360 Permit's provisions as regards to the custodial care requirements described in Appendix I of the 2013 Engineering Report (Appendix 20).

NYCDPR is in the process of reviewing the language in Attachment A transmitted with the 2014 Permit, and will use this language as the model for the deed restriction. NYCDPR will contact the NYSDEC in the event NYCDPR has any proposed additions, deletions, and/or revisions to the general text of Attachment A.

5.7 Post Construction Monitoring

Post construction monitoring of the Golf Course, Community Park, and Waterfront Park is the responsibility of NYCDPR and will be completed as required by the Permit. Post closure monitoring will be completed in accordance with the plans set forth in Ferry Point Park East Post Construction Custodial Care Plan dated October 2013 included as Appendix I of the 2013 Engineering Report (Appendix 20).

The following table includes each monitoring component, the frequency, and the duration of monitoring dependent upon the cessation of activity:

Component	Frequency	Duration
Final Cover System	Quarterly	5 years
LFG System	Quarterly	5 years
Infrastructure	Bi-Annually Annually	10 years 15 years
Groundwater Monitoring	Annually	3 years*
Long Term Settlement Plates	Quarterly	5 years*
Parking Lot Asphalt Cover (April & October)	Bi-Annually Annually	5 years* 20 years*

*Denotes Dependent on Cessation of Activity

NYCDPR will not be performing post-construction monitoring for the Waterfront Park portion of the Site until construction is complete and approved, and will restrict public access until such time.

NYCDPR is in the process of engaging a full service environmental firm to conduct the post construction monitoring requirements and will complete the post construction monitoring required to comply with the Permit in accordance with the Post Construction Custodial Care Plan and as follows.

5.7.1 Golf Course Operations

The Site will be operated as part of the New York City Department of Parks and Recreation system. The Community Park and the Waterfront Park will be operated and maintained by the NYCDPR Borough of the Bronx Operations and Maintenance division or an appointed representative. NYCDPR has entered into a contract with a golf course concessionaire, Trump Ferry Point LLC to implement post construction care necessary to maintain the Golf Course for operational purposes. Golf Course maintenance and operations exclude those requirements specific to post construction monitoring and maintenance of existing environmental conditions and infrastructure as installed by NYCDPR and specifically defined in this report as being landfill gas systems, groundwater monitoring, and long-term settlement plates.

5.7.2 Landfill Gas Monitoring

NYCDPR will implement post construction monitoring necessary to fulfill the requirements of the Post Construction Custodial Care Plan for landfill gas monitoring. The landfill gas monitoring program includes monitoring for on-site and off-site landfill gas wells, piezometers, passive vent trench, passive vents, sub-slab depressurization systems, and Irrigation Lake venting system. Any necessary repairs or maintenance required as a result of inspection and monitoring activities will be the responsibility of NYCDPR or an appointed representative.

The Site's landfill gas management system will be inspected and monitored in accordance with the Operations, Monitoring, & Maintenance ("OM&M") actions presented in Section 6 of the Landfill Gas Management Plan ("LFGMP") located in Appendix F.1 of the 2013 Engineering Report (Appendix 20).

Monitoring and inspection will commence concurrently within 60 days of the approval of this construction certification report unless otherwise noted within the OM&M plan. Adjustments to monitoring frequencies will be requested of NYSDEC upon meeting the performance criteria thresholds identified in Section 6.3.4.2 of the LFGMP. NYCDPR will submit a request with supporting documentation to NYSDEC 30 days prior to the desired date of the proposed change in monitoring. NYCDPR will not change monitoring frequencies until the request has been approved.

5.7.3 Long Term Settlement Monitoring

NYCDPR will implement post construction monitoring necessary to fulfill the requirements of the Post Construction Custodial Care Plan for nine settlement monitoring plates on the Golf Course.

Monitoring will commence concurrently within 60 days of the approval of this construction certification report for a period of three years. Based on the results of the initial five years of monitoring, NYCDPR may

petition for decreased monitoring or a cessation in monitoring frequencies. NYCDPR will not change monitoring frequencies until the request has been approved.

5.7.4 Groundwater Characterization Monitoring

NYCDPR will implement post construction monitoring to fulfill the requirements of the Ferry Point Park East Post Construction Custodial Care Plan (October 2013). Groundwater monitoring will be performed at the eleven well locations located within the golf course.

Upon commencement of operation of the golf course (April 2015), groundwater sampling will take place annually with samples being analyzed for constituents listed in 6 NYCRR Subpart Part 360-2.11 routine parameters. The results of the groundwater sampling will be presented in a groundwater monitoring report and a summary will be submitted to NYSDEC as a part of the annual monitoring and inspection report. Monitoring and inspection will commence concurrently within 60 days of the approval of the construction certification report for a period of three years with the goal of demonstrating whether operation of the park adversely impacts on water quality with respect to leachate quality or quantity, and whether operation of the park meets the performance criteria established in the Permit.

Post Closure monitoring is anticipated to be conducted on the following schedule:

Sampling Frequency	Requirement	Wells Sampled	Status
Annual - Year 1	Post-Construction Monitoring	GMW-1 – GWM-11	Anticipated September 2015
Annual - Year 2	Post-Construction Monitoring	GMW-1 – GWM-11	Anticipated September 2016
Annual Year 3	Post-Construction Monitoring	GMW-1 – GWM-11	Anticipated September 2017

Upon completion of 3 years of post-operation annual routine groundwater sampling, DPR may submit documentation to NYSDEC in furtherance of a request to reduce or cease groundwater sampling at the Ferry Point Park golf course (Ferry Point Park East Post Construction Custodial Care Plan, October 2013). The Groundwater monitoring and sampling program will cease either at the three year completion or ten years from the date of the initial groundwater sampling event. When the request for cessation is accepted, the groundwater monitoring wells will be evaluated for either abandonment or removal within the first year of the cessation of monitoring. The abandonment or removal documentation, signed and

certified by a licensed NYS Engineer will be provided to DEC within the concurrent post closure reporting period after the completion of the work.

Monitoring and inspection will commence concurrently within 60 days of the approval of this construction certification report for a period of three years. Upon completion of three years of post-operation annual routine groundwater sampling NYCDPR may submit documentation to the NYSDEC in furtherance of a request to reduce or cease groundwater sampling at the golf course. NYCDPR agrees to perform operational groundwater sampling, data analysis and reporting for a minimum of three years after construction, with the goal of demonstrating whether operation of the park adversely impacts water quality with respect to leachate quality or quantity, and whether operation of the park meets the performance criteria established in the Permit. NYCDPR will not change monitoring frequencies until the request has been approved.

5.7.5 Final Cover System

The integrity of the final cover system will be inspected routinely by NYCDPR, or their duly appointed representative, to fulfill the requirements of the Post Construction Custodial Care Plan. Inspections and maintenance will be completed in association with the Maintenance Guidelines for Trump Golf Links at Ferry Point Park included in Appendix I of the 2013 Engineering Report (Appendix 20).

Monitoring and inspection will commence within 60 days of the submittal of this construction certification report and then undertaken annually within 30 days of the submittal of the initial report. NYCDPR agrees to a rolling five-year plan, whereby NYCDPR may petition to modify or terminate the final cover inspection requirements by demonstrating that the integrity of the final cover system has been maintained in accordance with performance criteria established in the Permit.

5.7.6 Parking Lot Asphalt Cover (Consent Order)

During 2010, fill material from a JFK Airport source site was brought on-site and placed in seven different stockpiles. The material was believed to be in conformance with permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. On January 10, 2011, NYCDPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to this fill material, which was used to construct the base of the clubhouse and maintenance facility parking lots.

Specific requirements within the Consent Order as they pertain to post construction operations are as follows:

From Consent Order No R2-20100521-172: “Attachment “A” Proposed Handling of Ferry Point Park Soil Stockpile, Item 6, Once the asphalt top course is installed, the asphalt surfaces of the clubhouse and maintenance facility parking lots will be inspected during April and October every year by a licensed professional engineer (“engineer”) who is registered to practice in New York State. Within thirty days (30) days of such inspections, the engineer will submit to the Department a stamped and certified written detail report, including photo documentation, regarding the condition of the asphalt surfaces and their

adequacy, including photo documentation, regarding the condition of the asphalt surfaces and their adequacy to effectively function as covers. A description of any needed repairs will be included in the engineer's report.

Item 7, any repairs deemed necessary by the engineer must be completed by New York City Department of Parks and Recreation ("NYC Parks") within fifteen (15) days of the notification by the Department to NYCDPR to begin such repairs. A certification, including supporting written and photo documentation must be submitted by NYC Parks within fifteen (15) days after completion of repairs."

6 Summary

Construction activity at the Site began in July 2000 and concluded in July 2014 with physical completion of the Golf Course. Although the Golf Course construction is complete, some incidental work continues to occur at the Site associated with specific improvements necessary for golf course operations by the golf course concessionaire. Construction activity included clearing and grubbing, excavation, grading, importation of fill material, construction of the Community Park and Golf Course and associated appurtenances, installation of site utilities and infrastructure, installation of plantings, and installation of asphalt parking lot. A representative of the NYCDPR was present during all construction activities. To the best of our knowledge, a representative of the IEM was present during all earth moving and soil importation activities. For this project, fill importation followed the Permit requirements and resulted in a large scale earthwork fill conducted in general accordance with NYSDEC requirements as documented in the daily, bi-weekly, and quarterly reports and as summarized herein.

7 Certification

Certification Statement

I, Robert Iaropoli, PE, LS, an employee of the New York City Department of Parks and Recreation, exercising independent judgment and discretion do hereby certify that this Final Construction Certification Report was prepared under my direction and supervision. This Final Construction Certification Report was prepared in accordance with the NYSDEC requirements in 6 NYCRR Part 360, the current Part 360 Permit and approved Part 360 Permit Modification documents. The information contained herein is based upon: 1) Work which I have personally inspected both during and after construction from November 2012 to date; 2) Information provided to me by those directly employed by or under contract with the New York City Parks and Recreation and the New York City Department of Design and Construction as construction project managers;3) Design Consultants; 4) Contractors responsible for construction pursuant to their contracts except as indicated; and 5) third parties, such as manufactures, suppliers, etc., whose materials have not been personally verified by me for accuracy and/or adequacy but believe them to be true and accurate[4].

EXECUTIVE SUMMARY

Maser Consulting P.A. (Maser Consulting), on behalf of The Trump Organization, has prepared this Certification Report for the construction of the permanent Clubhouse at the Trump Ferry Point Golf Links located at 500 Hutchinson River Parkway, Bronx, New York. This report has been prepared pursuant to 6 NYCRR Part 360 of the New York State Solid Waste Management Program and the 2013 Ferry Point Park East Post Construction Custodial Care Plan. This report also includes a summary of a supplemental project to install a new gas main as part of the Clubhouse Construction project.

Acting as the Independent Environmental Monitor (IEM), Maser Consulting witnessed, recorded and confirmed construction of the new Trump Links Clubhouse, including the installation of support pilings, importation of suitable materials used for cover; the application, installation and testing of the Liquid Boot® Vapor Barrier System and the associated Sub-slab Depressurization System (SSDS); and the installation, calibration and testing of the interior Methane Detection System. For each construction and testing component, Maser Consulting confirms compliance with the Permits, plans and specifications of the project. Minor deviations to the plans and specifications are noted in this report and in the As-Built documents contained herein. Minor deviations to the specifications were the result of two main issues: the need to relocate system components to avoid conflicts and interferences with utilities and appurtenances; and the substitution of the materials of construction that were equivalent or superior to the original specifications.

The IEM also monitored, tested and confirmed that soil materials imported for the new Clubhouse construction were derived from pre-approved sources. The IEM conducted periodic surveillance of trucks being loaded at the approved facilities and transported to the Construction Site. For material imports, the IEM visually evaluated loads and scanned loads with direct reading instruments for signs of contamination. Only those loads meeting project permit and specifications standards were permitted to be unloaded at the site.

At times when imported soil materials had to be stockpiled on-site, the IEM took steps to ensure that a controlled staging area was secured. The staging area was established in the parking lot to the west of the new Clubhouse site. The IEM also took steps to ensure that the stockpile was properly covered to prevent erosion by wind and water, and that catch basins in the parking lot were properly protected to ensure that sediments would not enter the storm water system. Weekly erosion control inspections were conducted by the IEM in accordance with NYSDEC's Construction Site Management Program. The IEM immediately communicated deficiencies in the erosion control features to the General Contractor (JCS) such that immediate mitigative action could be taken.

Maser Consulting also acted as the IEM for a supplemental project associated with the new Clubhouse construction. The supplemental project consisted of the installation of an approximately 5,500-foot long, 6-inch diameter gas pipeline installation. The new gas supply line was deemed necessary to provide heating, ventilation, air conditioning and other utility service to the new Clubhouse. The gas pipeline was connected to a Consolidated Edison main located north of the clubhouse along Schley Avenue. The pipeline route generally traverses the western property line before turning east toward the new clubhouse in the vicinity of the Clubhouse parking lot. As IEM for this supplemental project, Maser Consulting witnessed, recorded and confirmed that the gas pipeline installation was conducted in accordance and incompliance with the project permits, plans and specifications.

Similar to the Clubhouse construction project, cover material importation was required for the gas main installation project. The IEM took appropriate measures to ensure that the source material was inspected and tested. Soil quality analytical results have been included within this report. Analyzed permit parameters were found to be acceptable. The IEM also visually assessed and field screened each load to ensure that the quality of the material met project permit requirements and project plans and specifications.

Appendix L – Manifests for Imported Fill from Ranco Sand & Stone
Appendix M – Minutes of Weekly Construction Progress Meetings
Appendix N – Hampton-Clarke Project No. 8081617 Report dated September 14, 2018
Appendix O – Drawings titled "Methane Monitoring System Ceiling Plan (As Built)" prepared by EAI dated February 11, 2019 & "Vapor Remediation Floor Plan (As Built Monitoring Pt Layout as of 8/1/18)" prepared by French & Parrello with annotations by EAI dated August 1, 2018
Appendix P – CETCO/Minerals Technologies Letter to EAI Inc. re: "Liquid Boot Spraying Temp" dated November 9, 2017 & EAI Inc. letter to Maser Consulting P.A. re: "Vapor Remediation System Installation, Ferry Point Clubhouse, Ferry Point Park, Bronx, NY" dated October 18, 2019
Appendix Q – Drawings titled "Ferry Point Clubhouse, 500 Hutchinson Parkway, Bronx, NY" showing new gas line prepared by Victor Famulari Architect P.C. dated July 25, 2018
Appendix R – DORs for Installation of New 6-Inch Gas Line to Clubhouse

I. INTRODUCTION

A. Purpose

This Final Construction Certification Report for the Trump Ferry Point Golf Links clubhouse is submitted to the New York State Department of Environmental Conservation (NYSDEC) and the New York City Department of Parks & Recreation (NYCDPR) upon completion of the construction of a new clubhouse at Ferry Point Park East. Built on top of a former municipal landfill, the major elements of the Clubhouse construction project consisted of the installation of over 200 steel support pilings driven through the former landfill material and into competent rock at an average depth of 75 below grade. During the support piling installation, Maser Consulting (acting as the IEM) measured the ambient air quality for signs of methane gas release from the subsurface. When detected on rare occasions, immediate measures were taken to mitigate methane from the work and breathing zones with the use of engineering controls including physical barriers and the use of industrial explosion-proof fans to ventilate the work zones.

Following the installation of the support pilings, Maser Consulting observed the installation of two added protective elements – a Liquid Boot® Vapor Barrier System and a corresponding SSDS. Both systems were designed to mitigate the intrusion of methane and other landfill gases into the new Clubhouse.

As a means to assess the effectiveness of the Vapor Barrier and the SSDS, a Methane Detection System was installed inside the new Clubhouse. The methane detection system consists of a network of in-floor methane sampling ports as well as a series of methane detectors located throughout the main banquet and reception areas as well as in the smaller offices, the kitchen and other employee and publicly-accessible areas.

This report certifies that the construction of the Liquid Boot® vapor barrier system and the SSDS for the new clubhouse have been completed in accordance with the 6 NYCRR Part 360 Solid Waste Management Permit for Ferry Point Park (copy provided as **Appendix A**). This report further certifies that Methane Detection system was also installed, tested and calibrated in compliance with the project permits, plans and specifications.

B. Report Organization

This report has been generated to provide a written post-construction certification report to comply with the requirements of the above-referenced Part 360 Permit. The narrative and supporting information provided in this report have been organized such that any individual, especially those not familiar with the new clubhouse construction, can gain a concise understanding of the history of improvements at the Site (a former solid waste management facility, i.e. landfill).

The report has been organized into the following sections:

- Section I which briefly describes the purpose and scope of the project, provides details pertaining to the Site background including a Site description, key agencies involved, and permitting history

- Section II describes the Part 360 Permits and modifications, Permit reference documents, nonconformance issues, operational upsets, emergencies, and unusual circumstances, and reporting completed associated with the new clubhouse

- Section III details the fill importation Quality Assurance / Quality Control (QA/QC) program, specifically source site reviews for cover layer material, on-site fill importation inspection, trucking manifests, rejected trucks and materials, fill tracking, and total carcinogenic semi-volatile organic compound (SVOC) tracking

- Section IV provides details related to construction activities on-site including construction of the new clubhouse, environmental controls such as landfill gas monitoring, municipal solid waste handling, earthwork and fill placement, demarcation layer, construction progress meetings, and deviations from the approved design plans and/or Permit requirements with as-built surveys

- Section V details the environmental monitoring completed during the Project including Stormwater Pollution Prevention Plan (SWPPP) erosion control inspections.

- Section VI provides a summary of the report

- Section VII provides report certification

C. Background Information

a. Project Scope

Ferry Point Park in the Bronx (the "Site") is a former landfill covering 222 acres that is bounded by the Bronx-Whitestone Bridge and Hutchinson River Parkway to the west; Balcom, Miles, and Emerson Avenues to the east; Schley Avenue and St. Raymond's Cemetery to the north; and the East River to the south. The project was originally managed under Ferry Point Partners, LLC and was taken over solely by the City of New York Department of Parks and Recreation in October 2007.

The original project scope included the construction of three main elements including a golf course, a community park, and a waterfront park over the 222-acre Site as follows:

- An 18-hole golf course with practice facility, driving range, clubhouse, maintenance facility, irrigation lake, stormwater retention ponds, and a parking lot (192.5 acres);
- A passive recreation waterfront park with walkways and a comfort station (19.5 acres); and
- A community park with baseball fields, basketball court, walkways, comfort station, and landscaped stormwater retention area (10 acres)

A new element of the project was initiated in 2017 with the construction of a permanent clubhouse in the southern corner of the Site. The project began in July 2017 and was completed in August 2018.

A supplemental component of the Clubhouse project was deemed necessary when the existing 2-inch gas service line to the facility was determined to not be capable of providing the volume of gas necessary to support the heating, ventilation and air conditioning units as well as other facility utilities such as the kitchen and other amenities. Construction of the Gas Main Installation began in late August 2018 and was substantially completed by November 2018.

b. Project Site[1]

The origins of the site date back to the early 1900s. At that time, an available 1900 map of the Bronx showed the western edge of the site which now contains the expressway and Whitestone Bridge was a long narrow peninsula extending out to the same area that the northern landing of the Whitestone Bridge now extends. Immediately east of this peninsula was a large open bay which is the area that the Ferry Point Golf Course is now located. Northeast of the bay and well inland was the Baxter Creek that drained into the bay. The eastern landfall of this embayment area is a larger peninsula that contains roadways and a residential development. The road patterns do not resemble the roadways that currently exist in that area and appear to have been changed.

A 1938 aerial photo showing the construction of the Whitestone Bridge shows the Bay, mooring, residential area and land to the west to be virtually the same as shown in the 1900 map. The significant change is in the widening of the western peninsula where the expressway was being constructed leading to the bridge ramps. The widening was not significant at this time but a rectangular area in the extreme northwest corner of what is now the site appears to be filled and graded – possibly to support construction staging area for the bridge/expressway. Areas of filling can be readily identified in the photograph by the contrasting lighter color typically indicative of sandy dredge sand placement. Other areas along the shoreline can be seen as containing a lighter-colored band of fill material and this includes much of the new Ferry Point Park located west of the Whitestone Bridge. Much of the park area was filled and graded by 1938. Bulkheads were constructed with linear components to present a smooth shoreline but one that does not appear to contain a beach where water diminishes in depth to 0. Photos of the eastern area of the bay where mooring and docks can be seen showing large vessels moored against the shore. This would indicate the water had significant depth all of the way to the center of the bay.

Aerial photographs from the 1950s show a drastic change in the area currently referred to as the site. Large expansion of the filling that was evident in 1938-39 up in the northeast corner can be clearly seen. The filling extends well into the bay and it appears that a connective bridge

[1] *Reference: "Ferry Point Park Golf Course & Community Park, Bronx New York, Final Construction Certification Report, NYSDEC Permit #2-6006-00014 / 00013 (SW)" prepared by the City of New York Department of Parks and Recreation dated October 19, 2015 – a.k.a. the 2015 Final Construction Certification Report*

was constructed from the eastern shore to the fill area. It is difficult to discern if this is a usable structure for crossing or if it had some other purpose. The filling operation appears from the photo to consist of the same light-colored material that was placed in the Ferry Point Park and from photos showing a large number of barges in the water filled with material of the same light color. There is specific documentation that presents the specific origin and consistency of the material. but from the prior aerials showing filling and this large expansion, it appears to be of a similar origin which would be dredge sand. In the 1951 aerial, no specific municipal solid waste dumping and disposal can be seen; however, records indicate the landfill operated during this approximate time period. It is therefore assumed that municipal solid waste was disposed shortly after the photo was taken. The landfilling shown in the aerial may have been the initial construction of the upper portion of the landfill with the tidal gate or bridge closing in the upper bay area. Additional aerials of the landfilling were not identified and more recent aerials document the completion of filling as well as the more recent golf course construction.

What can be discerned from this compilation of photos is that the landfill could be located in an area that may have been open water as well as some area that was previously reclaimed land with dredge material.

The Site operated as a landfill from before 1951 to the 1960s. The landfill reportedly accepted municipal solid waste during its operating period and was closed and covered in the mid-1960s, with additional closure operations conducted more recently in the 1980s. Prior Site use was determined from historic aerial photographs from 1938 thru 1991. The aerial photographs span the entire operational period of the prior landfill, from its initial operations to the present, and provides substantial information about the Site's development.

c. Key Agencies

The following were the key agencies associated with the project providing oversight, administration, design, construction, and monitoring services. The following is not intended to be an exhaustive list of involved entities related to the Project:

Primary Regulatory Agency:
New York State Department of Environmental Conservation Region 2 ("NYSDEC")

Project Permittee:
City of New York Department of Parks & Recreation ("NYCDPR")

Primary Design, Engineering, Construction, and Monitoring Consultants:
Hart Howerton Planning, Architecture and Landscape Architecture, P.C. ("Hart Howerton")
French & Parrello Associates ("FPA")

Independent Environmental Monitor ("IEM"):
Maser Consulting P.A. ("Maser Consulting")
Woodard & Curran ("W&C")

General Contractor:
Golf Course Clubhouse: JCS Construction Group, Inc. ("JCS")

Subcontractor for the SSDS and Liquid Boot® Vapor Barrier Installation:
EAI, Inc. ("EAI")

Golf Course Concessionaire/Operator:
The Trump Organization ("Trump")

See **Appendix B** for a list of project participants.

d. Independent Environmental Monitor

The requirement for an IEM on this project was associated with an increased level of monitoring exceeding normal review and oversight practices of the NYSDEC in order to protect public health and the environment. The increased level of review and oversight for this Project was mainly associated with the effort required for evaluation of fill material sources, source site testing and inspection, importation of the fill material, environmental monitoring required at the clubhouse construction site, and later along the gas main installation route. IEM services were also necessary during the installation of over 200 support piles through the former waste pile located beneath the new Clubhouse.

In accordance with Special Condition 24 of the 2014 Permit (**Appendix A**), NYCDPR was responsible to retain an IEM, accountable to NYSDEC, to provide environmental oversight of activities authorized under the Permit including but not limited to the quantification, importation and placement of fill, and the monitoring of the clubhouse construction site. Particular activities performed by the IEM for this Project included the following:

- Report deviations from or non-compliance with permitted activities to NYSDEC;
- Evaluate and inspect fill sources;
- Evaluate, monitor and mitigate methane intrusions during the installation of steel support pilings for the new clubhouse foundation;
- Witness source site investigation, sampling, and compare lab test results to Permit requirements;
- Visual and Photoionization Detector (PID) inspection of imported fill materials to the Site;
- Monitor offloading of trucks and reject unacceptable materials from being dumped on the Site and used for construction;
- Monitor environmental sampling on the Site (i.e. landfill gas);
- Monitor fill operations on the Site, particularly the installation of minimum thickness of shaping layer and cover layer materials as well as demarcation layer installation;
- Complete and submit Daily Observation Reports to NYCDPR;
- Complete weekly Erosion Control Reports; and
- Attend weekly Construction Progress Report meetings

The selection, continued retention, discharge, or replacement of the IEM was subject to the approval of NYSDEC at its sole discretion.

e. Project and Part 360 Permitting History

The following represents an overview of project and permitting history outlining key events:

On May 21, 2014 NYSDEC issued Permit No. 2-6006-00014 / 000013 for a Solid Waste Management Facility for the Ferry Point Park Golf Course; this permit establishes an IEM. A copy of this permit is provided in **Appendix A**.

On June 12, 2017 the Ferry Point Park SSDS Plan prepared by FPA for the proposed permanent clubhouse was submitted to NYSDEC. A copy of this submittal is provided in **Appendix C**.

On June 22, 2017 NYSDEC issued a letter to The Trump Organization approving the Ferry Point Park SSDS Plan. A copy of this letter is provided in **Appendix D**.

On June 7, 2018 Maser Consulting (through The Trump Organization) submitted a Construction Certification for the SSDS to NYSDEC to allow for the temporary, one-day opening of the new clubhouse on June 11, 2018. A copy of this submittal is provided in **Appendix E**.

On July 2, 2018 NYSDEC issued a review letter with comments on the June 7, 2018 Maser Consulting Construction Certification for the SSDS. A copy of this letter is provided in **Appendix F**.

On July 11, 2018 Maser Consulting provided a letter response to NYSDEC's July 2, 2018 review letter. A copy of this letter response is provided in **Appendix G**.

f. Construction Drawings

Construction drawings for the SSDS are included in **Appendix C**.

II. PART 360 PERMIT

A. Part 360 Permits and Modifications

The following permit was issued for this Project:

NYSDEC Permit No. 2-6006-00014 / 000013 (Solid Waste Management Facility – Ferry Point Park Golf Course, Bronx NY) issued on May 21, 2014 (copy provided in **Appendix A**).

B. Reference Documents

Refer to the 2015 Final Construction Certification Report for a list of Permit reference documents. These documents support the original Permit and/or provide basis for subsequent permits renewals and modifications.

C. Non-Conformance Issues

In accordance with Special Condition 24 of the 2014 Permit, the IEM reported on Permit-related non-conformance issues during the duration of construction of the permanent clubhouse and on the gas main installation project. Non-conforming issues identified during the construction of the new facility were immediately addressed and remedied so that activities were in conformance with applicable plans, specifications and permits.

D. Operational Upsets, Emergencies, and Unusual Circumstances

No evidence of security breaches, unauthorized entries, injuries, fires, theft, vandalism etc. were observed during construction of the permanent clubhouse. The only post-construction upset was related to damage caused to the outdoor lighting system from wildlife borrowing and chewing. Corrective measures were undertaken with normal and routine maintenance actions by The Trump Organization maintenance staff.

E. Reporting

The IEM was responsible for daily and weekly reporting to the NYCDPR regarding the status of the work. The IEM participated in weekly on-site construction meetings and submitted weekly Erosion Control Reports during the construction period. Daily Observation Reports ("DOR") were also submitted to the NYCDPR for review and comment.

The IEM reported to the NYCDPR on a generally daily basis on the following information: weather conditions, fill materials imported to the site, detailed notes of construction activities, and non-conformance issues related to the Permit conditions. Non-conformance issues were immediately addressed by the contractors under the supervision of the IEM. The IEM also reported weekly to the NYCDPR on the construction status and pertinent observations regarding the erosion control measures around the construction site and at the imported soil stockpile area.

DORs are provided in **Appendix I** beginning on July 19, 2017 through February 5, 2019.

F. Authorized Fill Volumes

Imported fill material was derived from two pre-approved sources, one for cover material associated with the new Clubhouse and one for cover material used in the installation of the new 6-inch gas main.

New York Recycling located at 475 Exterior Road, Bronx, NY was the source of the material used for the new Clubhouse. A table in **Appendix K** indicates the volumes of material imported from this facility. This material met the soil quality standards set forth in the Permit requirements. During the course of the importation process, the material was re-sampled in order to reconfirm its quality. Analytical testing data can be reviewed in **Appendix J**. A total of 1,062 cubic yards of material was imported from this source site between November 2017 and March 2018.

Ranco Sand and Gravel located at 151 South Street, Manorville, New York was the source site for materials imported for the gas main installation project. A site source inspection was conducted in advance of the imports and analytical testing was performed to establish that imported material would meet all Permit conditions and requirements. A table in **Appendix L** provides a summary of the imports from Ranco Sand & Gravel. A of total 690 cubic yards of material was imported between September and October 2018.

III. FILL IMPORTATION QA/QC PROGRAM

A. Background

Fill material importation for construction of the permanent clubhouse commenced on November 27, 2017 and the last day for fill import was March 12, 2018. The fill importation QA/QC program implemented for the Project based on the Permit and associated reference documents was adhered to. The fill importation consisted of two main components: source site reviews and on-site inspections. A source site review was conducted by the IEM prior to fill material being imported to the Site and additional visual and PID inspections were completed by the IEM upon the material entering the Site at the IEM inspection area and again once the material was dumped at the work or stockpile location on the Site.

B. Source Site Reviews

Prior to cover layer material being imported to the Site, each potential source was thoroughly evaluated by the IEM. An environmental review was performed for proposed source sites in accordance with Special Condition 24 of the 2014 Permit. The source site review process criteria were specified in the Report on Fill Management, Operations and Maintenance, prepared by TRC on May 16, 2000, and revised June 30, 2005 (Volume #2 of the 2005 Engineering Report). The source site review process was modified over time as compared to the original process outlined in the various engineering reports and permit modification requests. The process generally consisted of the following main components:

- NYCDPR would notify the IEM of a new potential source site. NYCDPR would provide the IEM with the site name and location as well as any available historical site information and soil environmental analytical results that existed for the potential source site.

- Once NYCDPR confirmed that their desire to move forward with pursuing the potential source site, NYCDPR authorized the IEM to retrieve available site information. NYCDPR then completed an initial review of the existing site information, generated a sampling plan, and provided the results of the initial review and sampling plan to the IEM. NYCDPR then authorized the IEM to conduct a desktop review of the existing site information, available soil environmental analytical results, and NYCDPR's sampling plan. The IEM provided NYCDPR with comments related to their review and their sampling plan in consultation with NYSDEC. Once a final sampling plan was agreed upon, the source site investigation was initiated and executed per the NYCDPR sampling plan with IEM oversight. For source sites with in-situ material, test pits

were typically completed with additional soil samples inspected, collected, and analyzed in accordance with the Permit requirements. Once the sampling was completed, the IEM reviewed sample results and the IEM generated a memorandum summarizing the review process and provided recommendations and requirements necessary for NYCDPR to address in order to continue pursuing the potential source site. The recommendations typically included conditions associated with overseeing the excavation, loading, and importing of the source site material to the Site in accordance with the Permit. The IEM submitted the memo of recommendations to NYSDEC for review and comment prior to issuing the final memorandum to NYCDPR. NYSDEC would provide final comments and approval of the source site with any additional required conditions.

- If NYCDPR determined that the potential source site was worth pursuing considering site-specific conditions, schedules, etc., they coordinated with the source site operator and IEM on importation schedule and requirements. The IEM provided oversight to confirm that the loading, hauling, and overall import of the approved material was completed in accordance with the memorandum of recommendations, NYSDEC conditions, and the Permit.

- The IEM provided oversight during export from the approved source sites on an as needed basis and provided oversight at each source site during additional sampling activities if the source site was exporting more than the minimum sampling frequency outlined in the Permit (i.e. 10,000 cubic yards for shaping layer material and 2,000 cubic yards for cover layer material).

If at any time during the review process there were reasons for concern identified by the IEM resulting in the potential source site being classified as a "complex" source site, NYSDEC became the primary reviewer and made final recommendations related to additional site investigation requirements or approval/rejection of the potential source site with support from the IEM. A complex source site was defined by the presence of an abundance of or particular Recognized Environmental Concerns ("RECs") and NYSDEC made decisions related to approval and/or associated conditions for further evaluation or import of the fill material.

For both source sites used in this Construction Project, no complex source site determinations were made.

Details of source site review and site testing activities are included in the report text and specific DORs. Source site review supporting information and testing data is included in the 2015 Final Construction Certification Report.

C. Cover Layer Material

Materials accepted for use as cover layer on the Site were sampled prior to acceptance and after each additional 2,000 cubic yards. As per the 2005 Permit modification, the parameters for cover layer material included the complete analyte list of TAGM 4046 for total VOCs, total SVOCs, total pesticides and herbicides, total PCBs, total metals, sulfur, and asbestos.

Based on source site reviews and site testing activities, the cover layer material imported to the Site met the following chemical limits:

Analyte	Shaping Layer
RCRA Metals (mg/kg = ppm)	
Arsenic	28
Barium	2,000
Cadmium	20
Chromium	1,000
Copper	1,000
Lead	400
Mercury	0.57
Selenium	11
Silver	100
TCLP Metals (mg/l)

N/A = Not Available
SB = Site Background
* = Total SVOCs must be less that 500ppm. Total carcinogenic SVOCs must be less than 3 ppm if any one of the cSVOCs** exceeds TAGM.
** = cSVOC list includes: Benzo(a)pyrene, Dibenzo(a,h)anthracene, Benzo(a)anthracene, Benzo(b)fluoranthene, Indeno(1,2,3-cd)pyrene, Benzo(k)fluoranthene, and Chrysene.
*** = Some forms of Cyanide are complex and very stable while other forms are pH dependent and hence are very unstable. Site-specific form(s) of Cyanide should be taken into consideration when establishing soil cleanup objective
**** = Background levels for lead vary widely. Average levels in undeveloped, rural areas may range from 4-61 ppm. Average background levels in metropolitan or suburban areas or near highways are much higher and typically range from 200-500 ppm.
MDL = Method Detection Limit

a. New York Recycling

Details of the New York Recycling (475 Exterior Street, Bronx NY) source site review and site testing for this cover layer material source site are included in the DORs. Analytical sampling and testing was completed at the site in September 2017. A site inspection was performed concurrently with the sampling event.

Approximately 1,062 cubic yards of cover layer material were imported to the Site from this source site for construction of the permanent clubhouse between November 2017 and March 2018. The majority of the material was used to raise the grade elevation in the immediate vicinity of the Clubhouse foundation and the landscape beds surrounding same.

b. Ranco Sand & Stone

The source site review for Ranco Sand & Stone (151 South Street, Manorville NY) consisted of an August 25, 2018 site visit to collect samples of this cover layer material for laboratory analysis; results are included in **Appendix N**. Results indicated that analyzed parameters met the permit standards.

Approximately 690 cubic yards of cover layer material were imported to the Site from this source site for cover material related to the gas main installation project.

D. On-Site Fill Importation Inspections

c. Process

As required under Special Condition 24 of the 2014 Permit, fill importation was inspected at the Site by the IEM. Fill material volume (truck volume) was measured and recorded for each delivery of fill material as it arrived on-site by NYCDPR's appointed representative. The fill material was then inspected by the IEM at the entrance to the Site. At this time, the fill material was visually inspected and field screened for signs of contamination. The visual inspection included observations of the material, disturbing the material with a shovel, and close-up observations of the material retrieved by shovel while still in the truck or trailer. Field screening of the fill material was executed using a PID. If the fill material failed to meet the Permit requirements for reasons such as a PID reading above ambient air, the presence of asphalt, concrete or brick components, or some other unauthorized debris, the load was rejected immediately prior to dumping. If the material was rejected, the truck was not allowed to dump on-site and was directed to exit the site immediately.

During the material imports for the Clubhouse and the gas main installation project, the IEM found no reason to reject the imported loads. Loads met the visual and field screening tests and were subsequently accepted.

If the fill material passed the initial inspection at the IEM observation area, either it was allowed to dump directly at a work location for immediate use as cover layer material or it was transported to, and dumped at, a stockpile location. At the dump location, the IEM screened the fill material visually and with a PID for a second time prior to spreading if dumped at an active work location. If the fill material did not meet the permit requirements at the dump location, it was immediately rejected, loaded back onto the same truck, and transported off-site. During the material imports for the Clubhouse and the gas main installation project, the IEM found no reason to reject the imported loads. Loads met the visual and field screening tests and were subsequently accepted.

d. Trucking Manifests

Trucking manifests were utilized for imported cover layer materials. A three-part manifest form was completed to track each load of material from origination at the source site to destination at the Site. The manifest contained information including but not limited to a manifest number, the source site name and address, the truck driver's name, truck and trailer license plate numbers, volume of material, as well as the time of departure from the source site and arrival time at the Site. Copies of fill import manifests are provided in **Appendix K**.

e. Rejected Trucks & Materials

Materials imported to the Site met the IEM's importation inspections, and none were rejected.

E. Fill Tracking

Testing per 2,000 cubic yards for cover layer material is included in Special Condition 14 of the 2014 Permit).

Cover layer material volumes were tracked based upon the calculated volumes within each truck. This provided for the most accurate and consistent approach to monitoring the volume of imported fill materials. Prior to receipt of the calculated volumes, the IEM tracked estimated volumes as trucks dumped on the Site.

The total volume of cover layer material imported to the Site for construction of the permanent clubhouse was 1,530 cubic yards (truck volume) or 0.39 percent of the authorized amount under the Permit.

F. Total Carcinogenic Semi-Volatile Organic Compound Tracking

As identified in Special Condition 14 of the 2014 Permit, the NYSDEC Acting Regional Director letter dated October 25, 2006 authorized the import of shaping material with a total carcinogenic SVOC (tcSVOC) level of up to 10 parts per million (ppm), which would not otherwise be acceptable, provided the tcSVOC weighted average of all imported material is equal to or less than 3 ppm at the end of each quarter. The tcSVOC weighted average is defined as the sum of the products of the material volume and the material tcSVOC, for each material source, divided by the total volume of the material imported. The weighted average was calculated over the course of construction and the final weighted average for shaping layer and cover layer materials imported to the Site was 0.70 ppm, less than the 3 ppm maximum. The total carcinogenic SVOC weighted average table and computations are included in the 2015 Final Construction Certification Report for materials imported to the Site after November 18, 2005.

SVOCs were sampled for New York Recycling on September 28, 2017. The tcSVOC level did not exceed 10 ppm. A copy of the laboratory report is provided in **Appendix J**.

SVOCs were sampled for Ranco Sand & Stone on August 25, 2018. The tcSVOC level did not exceed 10 ppm. A copy of the laboratory report is provided in **Appendix N**.

IV. PERMANENT CLUBHOUSE CONSTRUCTION

A. General

From July 2017-September 2018, Trump Golf Links at Ferry Point constructed a permanent clubhouse facility. The 14,100 square foot one-story building is located in the far southern section of the Site (immediately west of the 18th fairway) and includes locker rooms, showers, a bar room, a kitchen and associated facilities, ballrooms, administrative offices and a golf pro shop. The Trump Organization contracted with JCS Construction, Inc. to build this facility on piles, as it was formerly a landfill.

B. Environmental Controls / Construction

a. Landfill Gas Monitoring

Steel beams were driven to intermediate depths of approximately 40 feet, welded to another steel beam of the same length, driven to completion depths of approximately 75 feet, then cut to grade. Prior to welding/cutting, the piles were checked at the inlet (i.e. ground surface elevation) with a four-gas MiniRAE Meter. The meter alarm was triggered if concentrations of carbon monoxide, hydrogen sulfide, oxygen and methane (as Lower Explosive Limit) were above OSHA exposure limits; the alarm was not triggered for the vast majority of field activities, and on the few occasions when triggered, soil was placed over the inlet until the meter alarm was not triggered prior to welding/cutting activities. As an added measure of protection, when the meter alarm activated, explosion-proof industrial ventilation fans were activated to vent the work area and disperse gases emanating from the subsurface.

b. Imported Soils Monitoring

Fifty-nine (59) loads of soil (approximately 1,062 cubic yards) were imported from New York Recycling, a donor source located at 475 Exterior Street in the Bronx; and 27 loads of soil (approximately 690 cubic yards) were imported from Ranco Sand & Stone, a donor source located at 151 South Street in Manorville NY. Air monitoring performed during the course of the workday revealed no detections above background on the PID. Visual observation and PID monitoring of each load of soil from New York Recycling and from Ranco Sand & Stone showed no evidence of VOCs or visual signs of debris within the material.

C. Municipal Solid Waste

A Royal Carting commercial municipal solid waste (MSW) six-yard container was available on Site during the duration of clubhouse construction activities. MSW was not encountered or generated during digging, earth-moving or excavation activities associated with the new clubhouse or the gas main installation activities.

D. Earthwork / Fill Placement

Earthwork and fill placement for this Project were performed in accordance with the Permit.

a. Cover Layer Material

Cover layer material was installed at the Site in accordance with the 2014 Permit (**Appendix A**).

Imported soil from New York Recycling and from Ranco Sand & Stone was backfilled and graded around the perimeter of the concrete sub-structure. The soil from New York Recycling was characterized as brown fine-coarse sand with occasional crushed stone roughly 1-1.5 inches in diameter. Materials imported from Ranco Sand & Gravel was characterized as clean, well-rounded white to gray medium sands.

b. Topsoil

Topsoil was used on the Site (in lieu of sand) specifically in tree planting pits and other landscape areas. Topsoil was imported from commercially available sources (i.e. Home Depot) and used on the Site as approved. This material met the cover layer material Permit requirements including the specification included in the 2014 Permit.

E. Meetings

On a weekly basis during construction of the permanent clubhouse, progress meetings were held in the JCS field office trailer or in the temporary clubhouse on site. Various representatives from NYCDPR, the Trump Organization, JCS and the IEM (Maser Consulting) attended the meetings to discuss construction progress, current issues and scheduling.

Available meeting minutes from construction progress meetings are provided in **Appendix M**.

F. SSDS / Liquid Boot® Installation

From November 2-7, 2017 the SSDS was installed. Lateral collection piping was laid, and the SSDS pits were excavated and connected to the lateral collection piping. The IEM provided oversight, including taking measurements of the as-built SSDS component installed locations for use in this report.

Stone cover was then poured over the SSDS prior to Liquid Boot® installation.

From November 8-15, 2017 the stone cover was lined (base fabric), sprayed with Liquid Boot®, and allowed to cure. Smoke testing was then performed, with leaks identified and resprayed. Coupon samples were measured to ensure that the cured thickness met the design requirement. Once smoke testing, coupon measurements and leak repairs were complete, a cover fabric was placed over the floor footprint prior to pouring the slab.

On two separate occasions after the initial spraying, curing and smoke testing of the vapor barrier, repairs had to be made to the barrier layer. IEM observations of damage to the cover fabric provided the impetus for additional spraying and testing. The first event took place in January/February of 2018 when weather conditions and mild temperatures prevailed. A final smoke test and barrier layer repair took place before the concrete floor was poured and once the Clubhouse was being enclosed. During both re-spray events, defects were located, repaired and re-tested for integrity. Like the previous smoke tests, the final smoke test indicated no signs of vapor barrier leaks, tears or defects.

On one occasion, Liquid Boot® was sprayed at temperatures below the recommended 45 degrees F. However, it was determined by experienced applicators and inspectors—based on site specific conditions—that the curing of the spray was acceptable. See documentation from CETCO/Minerals Technologies (the Liquid Boot® manufacturer) dated November 9, 2017 (**Appendix P**).

A letter of completion provided by EAI is provided in **Appendix P**.

G. Six-Inch Gas Main Construction

In July 2018, the existing 2-inch gas service line was determined by FPA engineers to be insufficient to support the demands of the new Clubhouse facility. A new 6-inch gas main was required to meet the demand. Installed between August and October 2018, the new main provides sufficient volumes of natural gas to support the new Clubhouse facility and its amenities.

The new gas line was connected to a Con Ed main located on Schley Drive, north of the golf course. The new pipeline runs along the western perimeter of the site along fairways #6, #7 and #8. The line doglegs to the west side of the maintenance area and generally follows the service cart path along the west side of the property. The line turns to the east toward the new Clubhouse in the general vicinity of the parking lot.

The service connection to the Clubhouse is located in a vault approximately 50 feet west of the Clubhouse, near the driveway entrance.

Architect drawings for this gas main are provided in **Appendix Q**. DORs are provided in **Appendix R** beginning on August 24, 2018 through October 22, 2018.

H. Record Drawings & Deviations from Approved Design Plans

The permanent clubhouse project consisted of the following features and was designed by Hart Howerton and FPA:

- Golf pro shop
- Women's and men's locker rooms
- Dining room
- Bar/grill
- Kitchen
- Terraces
- Offices
- Vestibule and porch
- SSDS/Vapor Barrier

Deviations to the permanent clubhouse construction project were as follows:

- Drawing No. FO-500.00 "Vapor Remediation Underslab Plan" – lateral piping to SSDS pits DP-2B & DP-2C built approximately 2 feet offset from design due to piping conflicts
- Drawing No. FO-501.00 "Vapor Remediation Floor Plan" – riser piping for fan units SF-1 & SF built within walls to conceal system and prevent unauthorized access; gas sensors in Hall 124, Vestibule 101 & Electrical 113 ceilings built approximately 3-5 feet from design due to piping conflicts; monitoring point MP-1 built approximately 9 feet from design due to piping conflicts; monitoring point MP-8 built approximately 50 feet from design due to piping conflicts; monitoring point MP-9 built approximately 14 feet from design due to piping conflicts; monitoring point MP-10 built approximately 14 feet from design due to piping conflicts; monitoring point MP-2 was installed at the location shown in the Plan, however, it appears to have been tiled-over and is no longer accessible as a sampling point
- Drawing No. FO-502.00 "Vapor Remediation Attic & Mezzanine Plan" – fan unit SF-1 built approximately 10 feet to the left of design due to piping conflicts
- Drawing No. FO-504.00 "Vapor Remediation Details" – detail 1B built using hollow (instead of solid) concrete blocks; 'Methane Gas Sensor Detail (option 1)' & 'Methane Gas Sensor Detail (option 2)' added for sensor plenum boxes
- Drawing No. SD201 "Methane Monitoring System Ceiling Plan (As Built)" – methane gas sensor S16 built approximately 5 feet from design due to piping conflicts; methane gas sensor S19 built approximately 4.5 feet from design due to piping conflicts; methane gas sensor S28 built approximately 5 feet from design due to piping conflicts

Copies of the drawings issued for construction are provided in **Appendix C**. Copies of the drawings showing deviations from design are provided in **Appendices E and O**.

V. ENVIRONMENTAL MONITORING

A. Stormwater Pollution Prevention Plan (SWPPP)

The IEM performed weekly erosion control inspections to ensure compliance with Permit requirements. Erosion control inspections were carried out through the duration of permanent clubhouse construction. The SPDES permit remained effective until completion of ongoing construction including the permanent clubhouse. Copies of erosion control inspection reports are provided in **Appendix H**.

B. Landfill Gas Monitoring

NYCDPR will implement post-construction monitoring necessary to fulfill the requirements of the Post-Construction Custodial Care Plan for landfill gas monitoring per the 2015 Final Construction Certification Report.

VI. SUMMARY

Construction of a permanent clubhouse in the southern corner of the Site began in July 2017 and was substantially completed in October 2018. Activities included clearing and grubbing, excavation, installation of support pilings, grading, importation of fill material, construction of the permanent clubhouse with a protective vapor barrier system and associated SSDS and associated appurtenances, installation, testing and calibration of an interior methane detection system, installation of utilities and infrastructure, installation of plantings, and installation of a new gas main. A representative of the IEM was present during construction activities. For this project, fill importation and SSDS/Vapor Barrier construction followed the Permit and NYSDEC requirements as documented in the DORs as summarized herein.

VII. CERTIFICATION

Certification Statement

I, Donald Bowman, an employee of Maser Consulting P.A. and a Registered Professional Engineer licensed by the State of New York, exercising independent judgment and discretion do hereby certify that this Subslab Depressurization System (SSDS) for the Trump Golf Links at Ferry Point Clubhouse was constructed under my direction and supervision. The information contained herein is based upon: (1) work which I have personally inspected both during and after construction from July 2017 to date; (2) information provided to me by those directly employed by Maser Consulting P.A.; (3) Design Consultants; and (4) contractors responsible for construction pursuant to their contracts except as indicated[2].

I certify that, from July 2017 to date, Maser Consulting representatives observed the installation of the critical elements of the SSDS for the Trump Golf Links at Ferry Point Clubhouse, with the following deviations from design:

- Drawing No. FO-500.00 "Vapor Remediation Underslab Plan" – lateral piping to SSDS pits DP-2B & DP-2C built approximately 2 feet offset from design due to piping conflicts
- Drawing No. FO-501.00 "Vapor Remediation Floor Plan" – riser piping for fan units SF-1 & SF built within walls to conceal system and prevent unauthorized access; gas sensors in Hall 124, Vestibule 101 & Electrical 113 ceilings built approximately 3-5 feet from design due to piping conflicts; monitoring point MP-1 built approximately 9 feet from design due to piping conflicts; monitoring point MP-8 built approximately 50 feet from design due to piping conflicts; monitoring point MP-9 built approximately 14 feet from design due to piping conflicts; monitoring point MP-10 built approximately 14 feet from design due to piping conflicts; monitoring point MP-2 was installed at the location shown in the Plan, however it appears to have been tiled-over and is no longer accessible as a sampling point
- Drawing No. FO-502.00 "Vapor Remediation Attic & Mezzanine Plan" – fan unit SF-1 built approximately 10 feet to the left of design due to piping conflicts
- Drawing No. FO-504.00 "Vapor Remediation Details" – detail 1B built using hollow (instead of solid) concrete blocks; 'Methane Gas Sensor Detail (option 1)' & 'Methane Gas Sensor Detail (option 2)' added for sensor plenum boxes

[2] Certification means a statement of professional opinion based upon investigation, analysis, knowledge and belief that is stated to be true and accurate. 6 NYCRR Part 360-1.2(b)24.

- Drawing No. SD201 "Methane Monitoring System Ceiling Plan (As Built)" – methane gas sensor S16 built approximately 5 feet from design due to piping conflicts; methane gas sensor S19 built approximately 4.5 feet from design due to piping conflicts; methane gas sensor S28 built approximately 5 feet from design due to piping conflicts

3.1 Source Site Reviews 25

3.1.1 Shaping Layer Material 28

3.1.1.1 PS-310 (942 62nd Street, Brooklyn, NY) 30

3.1.1.2 PSAC 30

3.1.1.3 Barclays Arena (620 Atlantic Avenue, Brooklyn, NY) 30

3.1.1.4 JFK Jet Blue/Delta Runway (Jamaica, NY) 31

3.1.1.5 Columbia University 31

3.1.1.6 Long Island Jewish Center (270-05 76th Avenue, New Hyde Park, NY) 31

3.1.1.7 Highbridge Terrace (220 West 167th Street/Sedgewick Avenue, Bronx, NY) 31
3.1.1.8 Astoria (27-07 23rd Avenue, Queens, NY) 32
3.1.1.9 Eastside Access (Queens Street and Jackson Avenue, Queens, NY) 32
3.1.1.10 Kew Gardens (Van Wyck Expressway between Grand Central Avenue and 86th Avenue, Queens, NY) 34
3.1.1.11 PS-285 (1065 Martin Luther King Boulevard, Bronx, NY) 37
3.1.1.12 Flushing Hotel (133-63 Roosevelt Avenue/39-20 Prince Street, Queens, NY) 37
3.1.1.13 2nd Avenue (2nd Avenue and 94th Street, New York, NY) 38
3.1.1.14 2nd Avenue (2nd Avenue and 72nd Street, New York, NY) 39
3.1.1.15 Alexander Hamilton Bridge (Bronx, NY) 39
3.1.1.16 Throgg's Neck/Target/USPS (815 Hutchinson River Parkway, Bronx, NY) 40
3.1.1.17 PS-287 (110-10 Northern Boulevard, Queens, NY) 41
3.1.1.18 City Point Brooklyn (1 DeKalb Avenue, Brooklyn, NY) 42
3.1.1.19 400 Park Avenue South (New York, NY) 43
3.1.1.20 Union Street (43-31 Union Street, Flushing, NY) 43
3.1.1.21 Mount Vernon Recycling Corp. (113 Edison Avenue, Mount Vernon, NY) 43
3.1.1.22 228th Street (Rosedale, NY) 43
3.1.1.23 Evergreen Recycling/Tully Environmental (Willets Point Boulevard, Corona, NY) 44
3.1.1.24 Waterpointe-Whitestone 44
3.1.1.25 Don Carlo Environmental/Brooklyn (1247 38th Street, Brooklyn, NY) 44
3.1.1.26 Castle Hill Recycling (1000 Zerega Avenue, Bronx, NY) 45
3.1.1.27 Springfield Gardens 45
3.1.1.28 Calvert Vaux (Brooklyn, NY) 45
3.1.1.29 160 Myrtle Avenue (Brooklyn, NY) 45
3.1.1.30 215 E. 68th Street (New York, NY) 46
3.1.1.31 DEP Valhalla (10 Walker Road, Valhalla, NY) 46
3.1.1.32 Tilcon (Bronx) (980 East 149th Street, Bronx, NY) 46
3.1.1.33 NY Recycling (475 Exterior Street, Bronx, NY) 47
3.1.1.34 Little Bay (Queens, NY) 48
3.1.2 Cover Layer Material 49
3.1.2.1 Bloomingburg (C.M. & Sons Trucking Site, 680 Bloomingburg Road, Bloomingburg, NY) 50

3.1.2.2 Ranco Sand (115 South Street, Manorville, NY) [LAWS] 52
3.1.2.2.1 Ranco Sand (115 South Street, Manorville, NY) [MFM] 56
3.1.2.2.2 Ranco Sand (115 South Street, Manorville, NY) [Triton] 57
3.1.2.3 East Coast Mines (Lewis Road near Route 104, East Quogue, NY) 57
3.1.2.4 Amboy Aggregates (415 Main Street, South Amboy, NJ) 61
3.1.2.5 Long Island Compost/Great Gardens (445 Horseblock Road, Yaphank, NY) 61
3.2 On-Site Fill Importation Inspections 62
3.2.1 Process 62
3.2.2 Trucking Manifests 63
3.2.3 Rejected Trucks & Materials (JFK Consent Order Material & Misc. Debris) 63
3.3 Fill Tracking 64
3.4 Total Carcinogenic Semi-Volatile Organic Compound Tracking 68

1 Introduction

1.1 Purpose

This Final Construction Certification Report for the Ferry Point Park Golf Course is submitted to the New York State Department of Environmental Conservation upon completion of the construction of Ferry Point Park East, a solid waste management facility, which includes the resultant information prepared in accordance with 6NYCRR Part 360 of the New York State Solid Waste Management Program.

This report is to certify that the construction of Ferry Point Park East has been completed in accordance with the 6NYCRR Part 360 and the Ferry Point Park Part 360 permits. Therefore, this report will present in great detail each specific approved component of the project – what was approved, what was actually constructed initially (with pictures), the changes that were made, and the final status and design as of the date of this report (with pictures).

1.2 Report Organization

This report has been generated to provide a written post-construction certification report to comply with the requirements of the Project's Part 360 Permits. The narrative and supporting information provided in this report have been organized such that any individual, especially those not familiar with the project, can gain a concise understanding of the history of improvements at the Site. As such, the report has been organized into the following sections:

- This report begins with this introductory chapter (Section 1) which briefly describes the purpose and scope of the project, provides details pertaining to the Site background including a Site description, key agencies involved, and Project and permitting history.

- Section 2 describes the Part 360 Permits and modifications, Permit reference documents, non-conformance issues, operational upsets, emergencies, and unusual circumstances, and reporting completed associated with the Project.

- Section 3 details the fill importation QA/QC program, specifically source site reviews for shaping layer and cover layer material, on-site fill importation inspection, trucking manifests, rejected trucks and materials, fill tracking, and total carcinogenic semi-volatile organic compound tracking.

- Section 4 provides details related to construction activities on-site including construction of the Community Park and the Golf Course, status of the Waterfront Park, environmental controls such as landfill gas wells, groundwater wells, liners, gas venting systems, vent trench, landfill cap, municipal solid waste handling, earthwork and fill placement, demarcation layer, miscellaneous golf course materials such as greens and tees mix, construction progress meetings, and deviations from the approved design plans and/or Permit requirements with as-built surveys.

- Section 5 details the environmental monitoring completed during the Project including Stormwater Pollution Prevention Plan (SWPPP), landfill gas, piezometer, settlement plate, and groundwater monitoring as well as information related to the deed restriction and post construction monitoring requirements at the Site.

- Section 6 provides a summary of the report.

- Report certification is provided in Section 7.

1.3 Background Information

1.3.1 Project Scope

Ferry Point Park in the Bronx (the "Site") is a former landfill covering 222 acres that is bounded by the Bronx-Whitestone Bridge and Hutchinson River Parkway to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south (See Figure 1-1 Ferry Point Park Project Area Map). The project was originally managed under Ferry Point Partners, LLC and was taken over solely by the City of New York Department of Parks and Recreation in October 2007.

The original project scope (the "Project") included the construction of three main elements including a golf course, a community park, and a waterfront park over the 222-acre Site (see Figure 2-1 Ferry Point Park Site Layout) as follows:

1. An 18-hole golf course with practice facility, driving range, clubhouse, maintenance facility, irrigation lake, stormwater retention ponds, and a parking lot (192.5 acres);
2. A passive recreation waterfront park with walkways and a comfort station (19.5 acres); and
3. A community park with baseball fields, basketball court, walkways, comfort station, and landscaped stormwater retention area (10 acres).

1.3.2 Project Site

The origins of the site for purposes of presenting a description of the site and surrounding area for this report extend back to the early 1900's. At that time an available 1900 map of the Bronx (Figure 2-2) showed the western edge of the site which now contains the expressway and Whitestone Bridge was a long narrow peninsula extending out to the same area that the northern landing of the Whitestone Bridge now extends to. Immediately east of this peninsula was a large open bay which is the area that the Ferry Point Golf Course is located within. Further to the northeast of this bay and well inland and beyond the current golf course was the Baxter Creek that drained into the bay. The eastern landfall of this embayment area is a larger peninsula that contains roadways and what appears to be residential development. The road patterns do not resemble the roadways that currently exist in that area and appear to have been changed.

A 1938 aerial photo (Figure 2-3) showing the construction of the Whitestone Bridge shows the Bay, mooring, residential area and land to the west to be virtually the same as shown in the 1900 map (Fig. 2-2). The significant change is in the widening of the western peninsula where the expressway was being constructed leading to the bridge ramps. The widening was not significant at this time but a rectangular area in the extreme northwest corner of what is now the site does appear to be filled and graded possible for bridge and expressway construction staging or support. Areas of filling can be readily identified by the contrasting lighter color typically indicative of sandy dredge sand placement. Other areas along the shoreline can be seen as containing a lighter colored band of fill material and this includes much of the new Ferry Point Park located west of the Whitestone Bridge. Much of the park area was filled, graded and completed by 1938. Bulkheads were constructed with linear components to present a smooth shoreline but one that does not appear to contain a beach where water diminishes in depth to 0. Photos of the eastern area of the bay where mooring and docks can be seen showing large vessels moored against the shore. This would indicate the water has significant depth all of the way to the center of the bay.

Aerial photographs from the 1950's (Figure 2-4) show a drastic change in the area currently referred to as the site. Large expansion of the filling that was evident in 1938-39 up in the northeast corner can be clearly seen. The filling extends well into the bay and it appears that a connective bridge was constructed from the eastern shore to the fill area. It is difficult to discern if this is a usable structure for crossing or if it had some other purpose. The filling operation appears from the photo to consist of the same light colored material that was placed in the Ferry point Park and from photos showing a large number of barges in the water filled with material of the same light color. There is no specific logs and documentation that presents the specific origin and consistency of the material but from the prior aerials showing filling and this large expansion, it appears to be of a similar origin which would be dredge sand. In the 1951 aerial, no specific municipal solid waste dumping and disposal can be seen but the records indicate the landfill operated from this approximate time period. So it can be assumed that municipal solid waste was dumped within the site area very soon after that. The filling shown in the aerial may very well have been the initial construction of the upper portion of the landfill with the tidal gate or bridge closing in the upper bay area. Additional aerials of the landfilling were not identified and more recent aerials document the completion of filling as well as the more recent golf course construction.
What can be discerned from this compilation of photos is that the landfill was located on area that may have been completely filled open water as well as some area that was previously reclaimed land with dredge material.

The Site operated as a landfill from before 1951 to the 1960's. The landfill reportedly accepted municipal solid waste during its operating period and was closed and covered in the mid-1960's, with additional closure operations conducted more recently in the 1980's. Prior Site use was determined from historic aerial photographs from 1951 thru 1991. The aerial photographs span practically the entire operational period of the prior landfill, from its initial operations to the present, and provides substantial information about the Site's development.

1.3.3 Key Agencies

The following were the key agencies associated with the project providing oversight, administration, design, construction, and monitoring services. The following is not intended to be an exhaustive list of involved entities related to the Project. A more extensive list of project participants is included in Appendix 18.

Primary Regulatory Agency:
New York State Department of Environmental Conservation Region 2 ("NYSDEC")

Project Permittee (Prior to October 2007):
Ferry Point Partners, LLC ("FPP")
City of New York Department of Parks and Recreation ("NYCDPR")

Project Permittee (Post October 2007):
City of New York Department of Parks and Recreation ("NYCDPR")

Primary Design, Engineering, Construction, and Monitoring Consultants:
Sanford Golf Design ("Sanford")
Nicklaus Design ("Nicklaus")
TRC Companies, Inc. ("TRC")
Langan Engineering & Environmental Services, Inc. ("Langan")
Ecology and Environment, Inc. ("E&E")
KS Engineers PC ("KSE")
Wesler Cohen Associates ("WCA")
The Pignato Group ("TPG")
Thomas Balsley Associates ("TBA")
Green Bases, Inc. ("GBI")

Independent Environmental Monitor ("IEM"):
ARCADIS/Geraghty & Miller (July 2000 – December 2000)
Gannett Fleming (December 2000 – October 24, 2010)
Woodard & Curran ("WC") (October 25, 2010 – Project Completion)

General Contractor:
Golf Course and Community Park: LAWS Construction Corp. ("LAWS")
Community Park Comfort Station: TJM Construction Corp. / Long Island Concrete, Inc.
Golf Course Maintenance Building, Rain Shelter, Comfort Station: Triton Structural Concrete, Inc.
Golf Course Cover Layer Material Importation: MFM Contracting Corp.

Golf Course Concessionaire/Operator:
The Trump Organization ("Trump")

1.3.4 Independent Environmental Monitor

The requirement for an Independent Environmental Monitor ("IEM") on this project was associated with an increased level of monitoring exceeding normal review and oversight practices of the NYSDEC in order to protect public health and the environment. The increased level of review and oversight for this Project was mainly associated with the extensive effort required for evaluation of fill material sources, source site testing and inspection, importation of the fill material, extensive earthwork, and environmental monitoring required at the 222-acre Site.

In accordance with Special Condition 24 of the 2014 Permit, NYCDPR was responsible to retain an IEM, accountable to the NYSDEC, to provide environmental oversight of all activities authorized under the Permit including but not limited to the quantification, importation and placement of fill, and the monitoring of the Site. Particular activities performed by the IEM for this Project included the following:

- Report deviations from or non-compliance with permitted activities to the NYSDEC;
- Evaluate and inspect fill sources;
- Witness source site investigation, sampling, and compare lab test results to Permit requirements;
- Visual and Photo-Ionization Detector (PID) inspection of imported fill materials to the Site;
- Monitor offloading of all trucks and reject unacceptable materials from being dumped on the Site and used for construction;
- Monitor environmental sampling on the Site (i.e. landfill gas, piezometer, groundwater, settlement, etc.);
- Monitor all aspects of fill operations on the Site, particularly the installation of minimum thickness of shaping layer and cover layer materials as well as demarcation layer installation; and
- Complete and submit to the NYSDEC Daily Observation Reports, bi-weekly Fill Management Reports, and Quarterly Reports related to Project activities.

The selection, continued retention, discharge, or replacement of the IEM was subject to the approval of the NYSDEC, at its sole discretion.

1.3.5 Project and Part 360 Permitting History

The following represents an overview of project and permitting history outlining key events associated with the Project. For more detailed and additional supporting information, reference the updated Permit Modification application package titled "Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East", dated May 31, 2012 and subsequently revised on August 31, 2012, June 20, 2013, and October 15, 2013 ("2013 Engineering Report") included in Appendix 20.

In May 1997, a Request for Proposals was released for the development of the Site. In May of 1998 Ferry Point Partners, LLC ("FPP") was selected as the developer and in the late May 2000, the City of New York Department of Parks and Recreation ("NYCDPR") initially entered into a license agreement with FPP to develop, construct, and operate the new recreation facility. The facility included a Jack Nicklaus signature golf course, a community park, a waterfront park, and related facilities (the "Project"). At that time, all required reviews for the Project were completed under the City Environmental Quality Review (CEQR),

State Environmental Quality Review Act (SEQRA), and New York City's Uniform Land Use Review Procedure (ULURP).

On July 17, 2000, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-00014-00011) (the "2000 Permit") jointly to NYCDPR and FPP (the "Permittee"), for a non-specific "facility" under Part 360-1.9(b) at the Site (see Appendix 1 for a copy of the permit). This permit allowed the Permittee to import and place fill necessary to construct the Project. This permit allowed for 1,000,000 cubic yards of fill material (in-place volume) to be imported and placed on the Site. The Permittee prepared an Engineering Report, dated April 11, 2000 and a Report on Fill Management Operations & Maintenance, dated May 16, 2000 as part of the permit application.

After the receipt of the original Part 360 Permit in July 2000, FPP entered into a contract with LAWS Construction Company, Inc. (the "Contractor") to construct the golf course, parks and other features of the Project, and to identify, secure and import the off-site fill material to be used to meet the design elevations of the grading plans referenced in the 2000 Permit.

Initially ARCADIS/Geraghty & Miller, Inc. was retained as the IEM. ARCADIS/Geraghty & Miller, Inc. was retained as the IEM for a period from July 2000 to December 2000 and was replaced as the IEM by Gannett Fleming Engineers and Architects, P.C. in December 2000.

FPP began importing fill to the Site in August 2000 and continued, with some interruptions, until January 2002 when fill deliveries were halted pending the modification of the 2000 Permit.

On January 10, 2001, the NYSDEC issued a letter addressing quality control protocol for potential sources of material from sites that previously experienced backfilling with soil, but not with waste materials, for the use in the shaping layer.

On May 21, 2001, the NYSDEC issued a Fill Procurement Protocol letter addressing acceptance of uncontaminated, unprocessed construction and demolition debris ("C&D") from registered C&D processing facilities.

On May 24, 2001, the NYSDEC issued a Fill Procurement Protocol letter addressing paragraph b in the May 21, 2001 letter and clarifying the definition of processed material.

From May to December 2001, based on the results of the Site perimeter methane gas monitoring, the NYSDEC required the construction of a landfill gas passive vent trench along most stretches of the Site perimeter from the water's edge near the foot of Emerson Avenue, along the entire length of the Site boundary with Balcom Avenue, and along Schley Avenue and continuing approximately 1,050 feet to the west past the intersection of Schley Avenue and Buttrick Avenue. In total, approximately 5,350 feet of passive vent trench was constructed (see Section B.3.a of Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx,

NY, Engineering Report, dated June 30, 2005 (revised) for additional information). Additional discussion related to the vent trench construction is included in Sections 4.2.4 and 4.6 of this report.

In February 2002, the Permittee requested a modification to the 2000 Permit to increase the volume of in-place fill to approximately 1,550,000 cubic yards and changes in design features. The Permittee prepared a Supplement to the Engineering Report, dated February 11, 2002 and a Response to Request for the Additional Information, dated July 2, 2002 as part of the permit modification.

On October 18, 2002, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-0014-00013) (the "2002 Permit") to allow the Permittee to place 1,522,300 cubic yards of in-place fill on the Site (see Appendix 1 for a copy of the permit modification). Prior to October 18, 2002, 446,500 cubic yards of shaping material had been imported to the Site.

After the NYSDEC issued the 2002 Permit in October 2002, FPP resumed importing fill to the Site. The importation of fill to the Site was performed in accordance with the 2000 Permit, the 2002 Permit, the 2000 Fill Report and the Fill Procurement Protocol per the NYSDEC letters dated January 10, 2002, May 21, 2001 and May 24, 2001.

On December 10, 2002, NYCDPR submitted the Response Action Plan ("RAP") as required by Special Condition 31 of the 2002 Permit. A copy of the RAP is included in Appendix 19.

On March 10, 2003, NYCDPR submitted a proposal to the NYSDEC to repair and replace methane monitoring system components. A copy of the proposal is included in Appendix 19.

In response to NYCDPR's March 10, 2003 request to repair and replace methane monitoring system components, the NYSDEC approved replacement of 34, 25-foot spaced, semi-permanent monitoring wells with eighteen, 50-foot spaced, monitoring wells along Miles and Emerson Avenues, in accordance with Special Condition #37 of the 2002 Permit, on March 17, 2003. Installation of the replacement monitoring wells was completed in May 2003.

On November 18, 2003, the NYSDEC approved the Work Plan for the Final Consent Order, Case No. R2-20030724-187, dated November 18, 2003. This provided for the placement on Site of the solid waste material excavated during the construction of the gas venting trench, the size reduction of concrete on Site, and the processing and composting of existing wood on Site. The solid waste material was moved and placed in January 2004 and the processing and composting of the wood was completed in the spring of 2004. A copy of the approval is included in Appendix 19.

On January 12, 2004, the NYSDEC transmitted a copy of the executed Order on Consent No. R2-20030724-187 to NYCDPR. A copy of the fully executed consent order is included in Appendix 19.

On November 1, 2004, the NYSDEC approved the revised truck compaction factor of 42.4% based on the October 10, 2003 30% aerial topographic survey as was required per the 2002 Permit.

On December 7, 2004, the NYSDEC approved the revised truck compaction factor of 41% based on the July 17, 2004 60% aerial topographic survey as was required per the 2002 Permit.

In May 2005, the Permittee requested a modification to the permit to increase the volume of in-place fill to approximately 2,370,000 cubic yards among other items in order to reshape the Golf Course related to a revised design by the golf course architect. The Permittee prepared Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associated dated June 30, 2005 (revised) and Volume #2, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associated dated June 30, 2005 (collectively known as the "2005 Engineering Report"). A copy of the 2005 Engineering Report is included in Appendix 20.

On August 2, 2005, NYCDPR responded to NYSDEC comments on the previously submitted June 30, 2005 Permit Modification and Engineering Report. A copy of the comment response is included in Appendix 19.

On November 18, 2005, the NYSDEC issued the modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013) to place a total of 2,543,729 cubic yards of in-place fill on the Site (see Appendix 1 for a copy of the permit modification). This action was followed by a December 27, 2005, revision (No. 2-6006-00014/00013) that amended the total in-place fill volume to 2,370,000 cubic yards (the "2005 Permit").

On April 4, 2006, NYCDPR submitted a request for a determination related to cover layer material chemical criteria to the NYSDOH. On August 2, 2006, the NYSDOH provided written determination related to fill material chemical criteria required under Permit Special Condition 15(d) of the 2005 Permit. The submission and response are included in Appendix 19.

On October 25, 2006, the NYSDEC authorized the importation of shaping layer material from otherwise allowable sites with a total carcinogenic SVOC level in exceedance of the site limit, but 10 ppm or lower provided that a weighted average equal to or less than 3 ppm would be achieved by the end of each quarter of each year. A copy of the correspondence is included in Appendix C.1 of the 2013 Engineering Report (Appendix 20).

On October 26, 2007, the NYCDPR terminated the license agreement with Ferry Point Partners, LLC and took over site development activities. Ferry Point Partners, LLC was no longer involved with the Project or a Permittee.

On February 29, 2008, FPP submitted an application to the NYSDEC to transfer the Part 360 Permit solely to NYCDPR.

On July 25, 2008, a permit renewal application package to the 2005 Permit was submitted by NYCDPR. This submittal requested a modification of the 2005 Permit to allow the use of dredge and processed dredge material (PDM) as fill and the barge delivery of such fill material to the Site.

On August 12, 2008, the NYSDEC notified NYCDPR and FPP that the Part 360 Permit had been transferred to NYCDPR.

On October 24, 2008, the NYSDEC issued a Notice of Incomplete Application and comments to the July 25, 2008 submittal.

On December 2, 2008, the NYSDEC issued a letter to advise NYCDPR that the 2005 Part 360 Permit (with the corresponding November 30, 2008, expiration date) remained in full force and effect until NYSDEC approved the permit renewal application, as per Section 401(2) of the State Administrative Procedure Act (SAPA). See Appendix A of the 2013 Engineering Report (Appendix 20) for a copy of the SAPA letter.

On December 26, 2008, a response to NYSDEC's comments of October 24, 2008 was submitted by NYCDPR with a supplemental permit application package to the 2005 Permit.

On April 8, 2009, the NYSDEC issued comments to the December 26, 2008, permit application submittal. A copy of the comment letter is included in Appendix 19.

On April 9, 2009, the NYCDPR withdrew its request for a permit modification to allow the use of Processed Dredged Material ("PDM") as fill.

On April 30, 2009, the NYSDEC directed NYCDPR to not accept or place on the Site any cover layer materials with arsenic concentrations greater than 16 ppm or lead concentrations greater than 400 ppm. A copy of the correspondence is included in Appendix C.2 of the 2013 Engineering Report (Appendix 20).

On July 9, 2009, NYCDPR submitted proposed cover layer material chemical criteria to NYSDEC for review and approval. A copy of the correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

On July 28, 2009, the NYSDEC notified NYCDPR that cover material is divided between two classifications: Active (suitable for use in Active or Passive Recreation areas), and Passive (suitable for use in Passive Recreation areas only). NYSDEC provided a table to NYCDPR listing modified heavy metal chemical limits for the cover layer at the Site. A copy of the correspondence is included in Appendix C.2 of the 2013 Engineering Report (Appendix 20).

On September 18, 2009, NYCDPR submitted rationale for a revised shaping layer correction factor based on the latest survey and fill imports volumes at that time. A December 11, 2012 letter evaluating the September 18, 2009 submittal was also submitted to the NYSDEC. The submissions are included in Appendix 19.

On September 25, 2009, the NYSDEC revised and clarified the chromium chemical limits for the cover layer previously presented in the July 28, 2009 correspondence. A copy of the correspondence is included in Appendix C.2 of the 2013 Engineering Report (Appendix 20).

On November 25, 2009, a response to NYSDEC's comments of April 8, 2009, was submitted by NYCDPR with a second supplemental permit application package to the 2005 Permit. This submittal withdrew the request to allow the use of dredge material and PDM as fill and the barge delivery of such fill material to the Site. This submittal also proposed a design modification for a Site-wide active landfill gas control system. The 2005 Permit included passive venting systems for the Site, with active systems proposed only in enclosed structures. The November 25, 2009 permit renewal application is included in Appendix 20.

On June 25, 2010, the NYSDEC issued a Notice of Incomplete Application and comments on the November 25, 2009, permit application submittal. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On August 6, 2010, the NYSDEC issued additional comments on the November 25, 2009, permit application submittal. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On September 29, 2010, a response to NYSDEC's comments of June 25 and August 6, 2010, was submitted by NYCDPR with a third supplemental permit application package for the 2005 Permit. This submittal withdrew the proposed design modification of a Site-wide active landfill gas control system and proposed a system consistent with the 2005 Permit. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On October 7, 2010, a supplemental response to NYSDEC's comments of June 25 and August 6, 2010, was submitted by NYCDPR to accompany the September 29, 2010, permit renewal application submittal. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On October 25, 2010, Woodard & Curran replaced Gannett Fleming, assuming the duties of the IEM for the Project.

On December 17, 2010, NYCDPR submitted supplemental information to the NYSDEC related to the Landfill Gas Report originally submitted to the NYSDEC on November 16, 2010 to address requests from the NYSDEC from a December 2, 2010 meeting. The November 2010 Landfill Gas Report and the December 17, 2010 supplemental information are included in Appendix E of the 2013 Engineering Report (Appendix 20).

On January 3, 2011, the NYSDEC issued a letter directing NYCDPR to collect and provide additional landfill gas data to better elucidate the subsurface conditions at a frequency described in the 2005 Permit. The letter requested that NYCDPR expand the landfill gas monitoring to include concentrations of hydrogen

sulfide, volatile organic compounds, and carbon monoxide, well temperature, and well pressure. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On January 10, 2011, NYCDPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to fill material imported to the Site that violated the Permit. During 2010, fill material was brought on-site and placed in seven different stockpiles. The material was believed to be in conformance with Permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. Under the terms of the consent order, the material was allowed to remain on-site under controlled conditions. The material was used to construct the base of the clubhouse and maintenance facility parking lots. Additional details are included in the Order on Consent, which is included in as Appendix I of the 2013 Engineering Report (Appendix 20).

On January 12, 2011, NYSDEC issued a response to NYCDPR's Request for Explanation of NYSDEC Request for Expansion of Ferry Point Park Landfill Gas Monitoring Parameters. Additional parameters included collecting data for hydrogen sulfide, volatile organic compounds and carbon monoxide, well temperature and well pressure. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On February 16, 2011, NYCDPR submitted test pit analytical data to NYSDEC for review related to demarcation layer installation requirements. A copy of the correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

On March 9, 2011, the NYSDEC issued a response to NYCDPR's February 16, 2011 correspondence requiring demarcation layer to be installed on the Site only in areas where there was less than five feet of shaping and cover layer materials. A copy of the correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

On May 13, 2011, NYCDPR issued a memorandum to the NYSDEC presenting the results of a site-wide water balance based on a cover layer material permeability of 14 inches per hour, which indicated that there would be a reduction in the infiltration rate over the entire Site. A copy of the correspondence, which includes additional details on the topic, is included in Appendix D.1 of the 2013 Engineering Report (Appendix 20).

On May 26, 2011, NYCDPR requested confirmation from the NYSDEC that the use of USEPA Analytical Method 625/8270 was an acceptable alternative method for the analysis of dioxin and furan constituents. The NYSDEC provided verbal confirmation that this was an acceptable method to be used. A copy of the correspondence is included in Appendix C.5 of the 2013 Engineering Report (Appendix 20).

NYCDPR issued a June 2011 report to the NYSDEC regarding sampling and analysis of landfill gas vents at the Community Park. A copy of the report, which includes further details of this sampling and analysis, is included in Appendix E.3 of the 2013 Engineering Report (Appendix 20). On July 1, 2011, the NYSDEC concluded that there were no ambient air impacts due to the landfill gas emissions from the twelve vents

located in the Community Park and that no further monitoring was necessary beyond routine maintenance.

On August 10, 2011, NYCDPR issued a subsequent water balance memorandum indicating that a higher cover layer material permeability of 30 inches per hour would also result in a lower volume of water infiltrating through the surface of the Site after completion of construction. Section 4.2.1 includes the description relating to the site permeability modifications. Additional details related to the water balance are included in Appendix D.2 of the 2013 Engineering Report (Appendix 20).

On September 19, 2011, NYCDPR prepared technical memorandum Field Sampling Procedures for Ferry Point Site related to groundwater characterization. The memorandum is included in Appendix G of the 2013 Engineering Report (Appendix 20).

On October 18, 2011, NYCDPR submitted a technical drainage review memorandum to the NYSDEC for review regarding the final cover material and site wide water balance. A copy of the correspondence is included in Appendix D.5 of the 2013 Engineering Report (Appendix 20).

On October 21, 2011, the NYSDEC provided a response to NYCDPR's October 18, 2001 technical drainage review memorandum including a conditional approval allowing cover layer material to have a percolation rate of up to 30 inches per hour. The condition was that NYCDPR was required to submit for approval an amendment to the Stormwater Pollution Prevention Plan (SWPPP) including plans and computations that reflect the partial lining of stormwater basins. A copy of the correspondence is included in Appendix D.5 of the 2013 Engineering Report (Appendix 20).

On November 16, 2011, NYCDPR provided NYSDEC with a technical memorandum addressing the conditions included in the October 21, 2011 conditional approval for the cover layer material percolation rate. A copy of the correspondence is included in Appendix D.6 of the 2013 Engineering Report (Appendix 20).

On December 2, 2011, the NYSDEC provided an approval for NYCDPR's SWPPP amendment via email. A copy of the correspondence is included in Appendix D.6 of the 2013 Engineering Report (Appendix 20).

On January 26, 2012, the NYSDEC clarified that the average percolation rate from all samples collected within one cover layer material stockpile could be used as the representative percolation rate of that stockpile due to the mixing that occurred during loading, unloading, transport, stockpiling, and spreading of the material. A copy of the correspondence is included in Appendix 19.

On March 28, 2012, NYCDPR submitted to the NYSDEC initial groundwater monitoring data from the installation of 11 new monitoring wells installed and sampled in February 2012. NYCDPR requested additional direction from the NYSDEC concerning procedures for future sampling events.

On May 1, 2012, the NYSDEC acknowledged that settlement plate monitoring at several points has been discontinued due to interference with ongoing construction, and informed NYCDPR that the short-term monitoring locations did not need to be replaced as long as construction at the Site progressed and the long-term plates were installed as construction was completed. A copy of the correspondence is included in Appendix H of the 2013 Engineering Report (Appendix 20).

On May 8, 2012, a conference call was held between NYCDPR and the NYSDEC to discuss the initial groundwater monitoring data submitted on March 28, 2012 and to discuss guidance for future groundwater monitoring. The NYSDEC provided NYCDPR with requirements for future groundwater monitoring in their May 8, 2012 Ferry Point Park Groundwater Characterization/Monitoring Objective. Meeting minutes are included in Appendix G of the 2013 Engineering Report (Appendix 20).

On May 24, 2012, the NYSDEC verified via email that there were no outstanding enforcement actions for the Site. A copy of the correspondence is included in Appendix B of the 2013 Engineering Report (Appendix 20).

In May 2012, the Permittee requested a modification to the Permit presenting studies, modeling, investigations, and design work that were performed to resolve outstanding comments that were received by the Permittee after the April 8, 2009 Notice of Incomplete Application and the November 25, 2009 permit application to the NYSDEC. NYCDPR submitted the initial version of the Supplemental Engineering Report dated May 31, 2012.

On June 8, 2012, the NYSDEC confirmed that the sand material used for the tees, greens, and sand traps (bunkers) should not be counted towards the Permit stated allowable cover soil maximum of 250,000 cubic yards. Based on information provided to the IEM by NYCDPR, NYCDPR's consultants have estimated the required sand material volumes as follows: Tees and Greens (24,705 cubic yards), Driving Range Tee (3,025 cubic yards), and bunkers (6,076 cubic yards). Since these values were estimated and calculated by NYCDPR's consultants, it shall be noted that actual installed volumes may fluctuate from the volumes identified above. Information is from an email from Joe Voss to Faisal Choudhury on June 13, 2012. A copy of the correspondence is included in Appendix 19.

On January 23, 2013, NYCDPR submitted the rationale for increasing the amount of cover layer material that could be imported to the Site under the Permit. A copy of the correspondence is included in Appendix 19.

On February 1, 2013, The NYSDEC issued an amendment to the 2005 Permit (last modified October 17, 2012) authorizing the Permittee to import a total of 2,514,000 cubic yards of in-place fill totaling approximately 2,120,000 cubic yards of shaping layer material and approximately 394,000 cubic yards of cover layer material. A copy of the amendment is included in Appendix 1.

On April 26, 2013, the NYSDEC notified NYCDPR that the compaction factor for cover layer material was revised to 18%, approving NYCDPR's revised April 8, 2013 submittal. A copy of the approval letter and submittal are included in Appendix 19.

On October 15, 2013, NYCDPR submitted the final version of the "2013 Engineering Report", entitled Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, NY dated May 31, 2012 (Revised August 31, 2012, October 15, 2013) to address concerns raised by the NYSDEC since the Notice of Incomplete Application of November 25, 2009 to modify the 2005 Permit. The 2013 Engineering Report is attached in Appendix 20.

On April, 17, 2014, the NYSDEC confirmed via email that a minor exceedance of the cover layer in-place volume as included in the Permit is acceptable considering no additional shaping material will need to be imported and that the exceedance could be addressed via as-built drawings and in the final construction certification report. A copy of the email is included in Appendix 19.

On May 21, 2014, the NYSDEC issued the modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013 (SW)) and Tidal Wetlands Permit (No. 2-6006-00014/00016 (TW)) (the "2014 Permit"). See Appendix 1 for a copy of the permit.

On October 29, 2014, the NYSDEC issued an amendment to Special Condition 24 of the 2014 Permit stating that during fill delivery and earthwork, NYCDPR should submit quarterly reports to the NYSDEC summarizing all Site activities set forth in the Permit. Each report should provide details of all rejected fill material, quantify the amount of material imported to the Site using truck volumes, and the results of all on-site monitoring for that period. All fill tracking, earthwork activities, landfill gas monitoring, and associated reporting requirements typically contained within each Fill Management Report would be addressed by Quarterly Reports moving forward and Fill Management Reports would no longer be issued. FMRs were no longer being issued due to a significant reduction in fill importation and earthwork activities at the Site. A copy of the letter is included in Appendix 1.

For a detailed history of site operations and activities prior to June 30, 2005, see Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associated dated June 30, 2005 (revised) which is attached in Appendix 20.

1.3.6 Construction Drawings

The project included a substantial number of different construction drawings associated with the Project. Construction drawings are included in Appendix 4.

2 Part 360 Permit

2.1 Part 360 Permits and Modifications

The following is a list of the permits and modifications issued for this Project:

On July 17, 2000, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-00014-00011) (the "2000 Permit").

On October 18, 2002, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-0014-00013) (the "2002 Permit").

On November 18, 2005, the NYSDEC issued a modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013), followed by a December 27, 2005 revision (the "2005 Permit").

On May 21, 2014, the NYSDEC issued a modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013 (SW)) and a Tidal Wetlands Permit (No. 2-6006-00014/00016 (TW)) (the "2014 Permit").

Note that a separate SPDES General Permit for Stormwater Discharges from Construction Activity (GP-08-001) was obtained for the Project and the Acknowledgement of Notice of Intent is dated May 12, 2009 (Permit Identification No. NYR10R112).

Copies of the aforementioned permits and modifications are included in Appendix 1.

2.2 Reference Documents

Refer to Appendix 2 for a list of Permit reference documents. These documents support the original Permit and/or provide basis for subsequent permits renewals and modifications.

2.3 Non-Conformance Issues

In accordance with Special Condition 24, the IEM reported on Permit related non-conformance issues during the duration of construction at the Site. A complete list of all non-conformance issues observed and corrective actions taken during the Project is included in Appendix 3.

2.4 Operational Upsets, Emergencies, and Unusual Circumstances

2.4.1 Security breaches, Unauthorized Entries, Injuries, Fires, Theft, Vandalism, etc.

The following information was gathered from TRC, NYCDPR's design and construction consultant:

In July/August of 2013, a CBS film crew received authorization from the Agency to scout and film areas within the Ferry Point Golf Course proper. There were no known issues with those activities.

TRC did not have specific detailed reports for thefts or vandalism that occurred on the Site. To the best of their knowledge, there were two incidents of vandalism to contractor equipment (broken glass

windows and spray painted vehicles), and a few incidents when the perimeter fence was damaged (bent/scratched vertical bars). Landfill gas vent caps were damaged, but there was no evidence of vandalism; the vent caps may have been damaged by lawn mowers or other equipment running over them.

There were no known major fires or injuries during the construction time period.

The only unusual event was the discovery of the body of a construction worker who had fallen from the Throggs Neck Bridge and washed up at the Waterfront Park. For several days there was police presence and other related activity. However, that event was not related to the work at the golf course nor did it delay or adversely affect the progress of the project.

As reported by the IEM:

On the evening of August 18, 2011, the Site was broken into by unknown persons. LAWS equipment storage containers were forced open and various tools and copper piping was stolen. The trespassers appeared to have entered the Site at the back entrance to the golf course along Balcom Avenue. The fence was observed cut open in that area.

Upon arrival at the Site on August 26, 2011, IEM staff observed that the IEM trailer had been broken into by unidentified persons. On-site security and LAWS representatives were notified as well as the local police (by LAWS). Two digital cameras were stolen from the IEM trailer.

On June 25, 2012, the IEM witnessed a trailer of imported fill material slide off its frame during dumping activities. No injuries were reported.

On October 31 and November 1, 2012, IEM staff performed on-site inspections to assess damage caused by Hurricane Sandy. IEM staff observed many areas around the Site where restoration work needs to be performed on the vent trench, silt fence repair, site security fence repair, and garbage/debris removal. The southern site boundary was observed to have significant damage and washout. The entire south end of the Site was open without protection and it was filled with debris from the storm.

On October 25, 2012, the IEM witnessed both a truck and a trailer roll over onto their side during dumping activities. No injuries were reported.

Various Permit non-conformance issues were observed related to unsatisfactory security at the Site beginning with non-conformance issue 12 on October 1, 2003 where security fence and other controls were not properly maintained on-site allowing for unauthorized entry to the Site. Site security, control, and unauthorized access were the subject of non-conformance issues 15, 72, 90, 93, 97, 98, 122, and 127. Ultimately, all of these non-conformance issues were resolved and closed out during construction on an ongoing/as-needed basis.

There was a presence of coyotes at the Site as tracked and studied as part of the Gotham Coyote Project. The work was conducted under NYCDPR permits and information was released to NYCDPR for informational purposes. Coyotes were initially monitored by game camera in Ferry Point Park beginning in January 2012 through 2013. Coyote monitoring did not occur at the Site in 2014.

2.5 Reporting

The IEM was responsible for reporting to the NYSDEC related to Permit activities and compliance for the Project in accordance with Special Condition 24 of the 2014 Permit. The IEM prepared and submitted to the NYSDEC Daily Observation Reports ("DOR"), bi-weekly Fill Management Reports ("FMR"), and Quarterly Reports ("QR"). These reports are attached as appendices to this report and available at the NYCDPR Bronx Borough Headquarters (Ranaqua) document repository and are part of the public record. The address of the repository is 1 Bronx River Parkway, Bronx, NY 10462, telephone: (718) 430-1800.

2.5.1 Daily Observation Reports (DOR)

The IEM reported to the NYSDEC on a daily basis on the following information: weather conditions, municipal solid waste material removal from the site, fill materials imported to the site, detailed notes of construction activities, and non-conformance issues related to the Permit conditions.

DORs are attached in Appendix 5 beginning on October 25, 2010. Daily site activity observations for the time period prior to October 25, 2010 are summarized in the IEM's Fill Management Reports.

2.5.2 Fill Management Reports (FMR)

The IEM prepared Fill Management Reports (FMRs) that were submitted to the NYSDEC on a bi-weekly basis. Generally, the FMRs contained the following information and data: a project summary including an overview of site activities, Permit non-conformance issues, fill source site review activities and associated data, site testing activities, filling and shaping activities, and environmental monitoring. FMRs contained figures identifying imported material dump locations and any active filling, grading, and shaping areas associated with the landfill cap.

FMRs were discontinued on October 31, 2014 with FMR 346. FMRs were discontinued because the importation of shaping layer and cover layer materials and earthwork activities were significantly reduced in scope and scale on the Site. In a Permit amendment issued to NYCDPR on October 29, 2014, the NYSDEC stated that all fill tracking, earthwork activities, landfill gas monitoring, and associated reporting requirements would be addressed by Quarterly Reports thereafter.

FMRs 1 through 346 are attached in Appendix 6.

2.5.3 Quarterly Reports

The IEM prepared Quarterly Reports (QRs) that were submitted to the NYSDEC on a quarterly basis. Generally, the QRs contained summarized and aggregated information included in FMRs over each quarterly reporting period.

QRs beginning with the 4th Quarter of 2002 through the 1st Quarter of 2015 (with the exception of the 1st Quarter of 2011) are attached in Appendix 7. Observations for site activities for the 1st Quarter of 2011 are included in FMRs 247 through 253.

2.6 Authorized Fill Volumes

On July 17, 2000, the NYSDEC issued 2000 Permit jointly to NYCDPR and FPP to allow for a total of 1,000,000 cubic yards of fill to be imported and placed on the Site including approximately 750,000 cubic yards of in-place shaping layer material and 250,000 cubic yards of in-place cover layer material.

On October 18, 2002, the NYSDEC issued the 2002 Permit to allow a total of 1,522,300 cubic yards of fill (in-place) to be imported and placed on the Site. The fill material was to consist of approximately 1,272,300 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The 2002 Permit also stated that, "approximately 415,000 cubic yards of fill was deposited on the Site prior to the effective date of the Permit and the projection for in-place fill material to complete the project was 1,107,300 cubic yards, consisting of approximately 857,300 cubic yards (in-place volume) of select exempt construction debris for the shaping layer and approximately 250,000 cubic yards (in-place volume) of uncontaminated soil for the cover layer.

In 2003, the golf course architect determined that the tournament quality and signature status of the course could be significantly improved by making the facility a "links" style golf course. The changes to the Project as compared to the work authorized under the 2002 Permit included:

- Increasing the support mounding between golf holes and grading the course in a links style.
- Re-routing of holes 11, 12 and 13 to reverse their direction in order to improve player circulation and playing time.
- Moving Hole 9 to the west of the golf driving range in order to improve the safety zone of the driving range and remove the need for high netting.
- Realigning the centerlines of holes: 10, 16, 17, and 18 to improve the strategic layout and visual experience of the golf course.
- Lowering the elevations of tees 4 and 6. This eliminated the retaining wall proposed at the northeast corner of the Site.
- Adding a golf training area at the north end of the driving range. This required shifting the centerline of Hole 8 slightly north and increasing the support mounding around this area to buffer the adjacent holes.
- Increasing the mounding adjacent to the TBTA toll plaza in order to block noise and adjacent traffic from view.
- Shifting the Site roadway along the east side of the bridge to accommodate a TBTA easement that extends 25 feet east of the bridge. This required changes to the parking lot at the clubhouse and the location of detention/water quality basin and Waterfront Park.
- Eliminating the Boathouse Grill restaurant in the Waterfront Park. A restaurant would be located within the banquet facility. Parking spaces for the banquet facility were increased to

accommodate the restaurant. A restaurant may be constructed within the Waterfront Park in a future phase, based on economic demands.

- Modifying the parking lot for the Waterfront Park. The 120 parking spaces for the Waterfront Park will be located near the Whitestone Bridge approach structure.

These proposed changes to the Project increased the total needed in-place fill volume for the project to 2,370,000 cubic yards to shape the golf course in a links style.

The quantification of the imported fill material was continuously tracked by both truck volume and periodic topographic surveys of in-place volumes. Initially it was assumed that truck volume would be reduced by 25% when compacted into place, but a new correction factor was to be calculated. On November 1, 2004, the NYSDEC approved a revised truck correction factor of 42.4%, which was based upon an October 10, 2003 30% aerial topographic survey, and on December 7, 2004, the NYSDEC approved a revised truck correction factor of 41%, which was based upon a July 17, 2004 60% aerial topographic survey. These recalculations were performed by dividing the actual in-place volume by the total cubic yards of truck volume delivered to the Site as of the date of the survey, as required by the 2002 Permit.

TRC prepared the 2005 Engineering Report, which comprised of Volume #1, Volume #2, and a 26 sheet drawing set entitled, "Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2". The 2005 Engineering Report is included in Appendix 20 and represented the following scope of work:

- An 18 hole golf course with practice area;
- Maintenance Area in the northwest corner of the Site;
- Clubhouse parking lot in the southwest portion of the Site;
- Banquet Facility in the southwest portion of the Site (along Emerson Avenue);
- Community Park;
- Waterfront Park with parking lot; and
- Drawing G-3 and G-4 of "Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2", showed the deviations in grading between the plans approved on October 18, 2002 with the proposed plan.

On November 18, 2005, the NYSDEC issued the 2005 Permit authorizing the importation of a total of 2,370,000 cubic yards of in-place fill material to the Site. The fill material was to consist of approximately 2,120,000 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The correction factor was 41% at that time and could be further modified.

On January 22, 2009, in accordance with Special Condition 10 of the 2005 Permit, TRC submitted a revised truck reduction factor of 40.3%. On September 18, 2009 TRC submitted a truck reduction factor of 43.3% based on a May 10 2009 aerial topographic survey. On February 11, 2010, the NYSDEC approved a truck reduction factor of 41.7% as submitted by the IEM on December 11, 2009 (included in Appendix 19).

The Golf Course layout that NYCDPR moved forward with was modified from what was shown in the 2005 Engineering Report as revised by the 2013 Engineering Report. One major change was the complete removal of the Banquet Facility in the southeast part of the Site. There were also changes in the placement, alignment, and grading of some holes on the Golf Course.

On February 1, 2013, the NYSDEC granted a permit modification to increase the limit of cover material from 250,000 to 394,000 cubic yards with the stipulation that NYCDPR revisit the correction factor for cover layer material. It was determined that the correction factor for the granular cover material (sand) was 18%. This revised the truck volume to 480,488 cubic yards. The correction factor for cover layer material was approved per an April 26, 2013 letter from NYSDEC to NYCDPR as included in Appendix 19.

On May 21, 2014, the NYSDEC issued the 2014 Permit to NYCDPR to allow the import of a total of 2,514,000 cubic yards of in-place fill material including 2,120,000 cubic yards of in-place shaping layer material and 394,000 cubic yards of in-place cover layer material.

3 Fill Importation QA/QC Program

Fill material importation commenced on August 2, 2000 and the last day for fill import was May 5, 2015. The fill importation QA/QC program implemented for the Project based on the Permit and associated reference documents was adhered to. The fill importation consisted of two main components including source site reviews and on-site inspections. A source site review was conducted by the IEM prior to any fill material being imported to the Site and additional visual and photo-ionization detector (PID) inspections were completed by the IEM upon the material entering the Site at the IEM inspection platform and again once the material was dumped at the work or stockpile location on the Site.

3.1 Source Site Reviews

Prior to any shaping layer or cover layer material being imported to the Site, each potential source was thoroughly evaluated by the IEM. An environmental review was performed for all proposed source sites in accordance with Special Condition 24 of the 2014 Permit. The source site review process criteria was specified in the Report on Fill Management, Operations and Maintenance, prepared by TRC on May 16, 2000, and revised June 30, 2005 (Volume #2 of the 2005 Engineering Report). The source site review process was modified over time as compared to the original process outlined in the various engineering reports and permit modification requests. The process generally consisted of the following main components:

1. NYCDPR would notify the IEM of a new potential source site. NYCDPR would provide the IEM with the site name and location as well as any available historical site information and soil environmental analytical results that existed for the potential source site.

2. Once NYCDPR confirmed that they wanted to move forward with pursuing the potential source site, NYCDPR authorized the IEM to retrieve any available site information from Environmental Data Resources, Inc. (EDR) which included environmental and historical land use records for the source site property under evaluation including Sanborn maps, city directories, topographic maps, and aerial photographs. NYCDPR then completed an initial review of the existing site information,

generated a sampling plan, and provided the results of the initial review and sampling plan to the IEM. NYCDPR then authorized the IEM to conduct a desktop review of the existing site information (i.e. EDR), any available soil environmental analytical results, and NYCDPR's sampling plan. The IEM provided NYCDPR with comments related to their review and their sampling plan in consultation with the NYSDEC. Once a final sampling plan was agreed upon, the source site investigation was initiated and executed per the NYCDPR sampling plan with IEM oversight. For source sites with in situ material, test pits were typically completed with additional soil samples inspected, collected, and analyzed in accordance with the Permit requirements. Once all the sampling was completed, the IEM reviewed sample results and the IEM generated a memorandum summarizing the review process and provided recommendations and requirements necessary for NYCDPR to address in order to continue pursuing the potential source site. The recommendations typically included conditions associated with overseeing the excavation, loading, and import of the source site material to the Site in accordance with the Permit. The IEM submitted the memo of recommendations to the NYSDEC for review and comment prior to issuing the final memorandum to NYCDPR. The NYSDEC would provide final comments and approval of the source site with any additional required conditions.

3. If NYCDPR determined that the potential source site was worth pursuing considering site-specific conditions, schedules, etc., they coordinated with the source site operator and IEM on importation schedule and requirements. The IEM provided oversight to confirm that the loading, hauling, and overall import of the approved material was completed in accordance with the memorandum of recommendations, NYSDEC conditions, and the Permit.

4. The IEM provided oversight during export from the approved source sites on an as needed basis and provided oversight at each source site during additional sampling activities if the source site was exporting more than the minimum sampling frequency outlined in the Permit (i.e. 10,000 cubic yards for shaping layer material and 2,000 cubic yards for cover layer material).

If at any time during the review process there were reasons for concern identified by the IEM resulting in the potential source site being classified as a "complex" source site, the NYSDEC became the primary reviewer and made final recommendations related to additional site investigation requirements or approval/rejection of the potential source site with support from the IEM. A complex source site was defined by the presence of an abundance of or particular Recognized Environmental Concerns ("RECs") and the NYSDEC made any decisions related to approval and/or associated conditions for further evaluation or import of the fill material.

A flow chart detailing the source site review process is included as Appendix 21.

Details of source site review and site testing activities are included in the report text and tables of each bi-weekly Fill Management Report issued by the IEM. Source site review supporting information and testing data is included in Appendix 8.

The following is a listing of source site reviews completed by the IEM since October 25, 2010. Since October 25, 2010, Woodard & Curran's first day as the IEM, 42 potential source sites were formally identified as potential fill source options by NYCDPR. Of the 42 potential source sites identified since October 25, 2010, 39 were advanced to at least a preliminary review stage. Potential source sites did not advance to a full source site review for various reasons such as changes in schedule, insufficient material, financial infeasibility, red flags identified with past uses of the source site, etc. Details of each source site review and site testing activities completed by the IEM, prior to any importation to the Site, are included in Sections 3.1.1 and 3.1.2 below.

A total of 15 of the potential source sites evaluated after October 25, 2010 and through project completion resulted in material being imported to the Site during that same time period. It is noted that all of the source site reviews included in Sections 3.1.1 and 3.1.2, are associated with the Golf Course and all cover layer material exposed at the surface within the golf course was imported from the cover layer material source sites included in Section 3.1.2 below. Refer to FMRs 1 through 241 for details related to source site reviews and site testing prior to October 25, 2010, which are included in Appendix 6.

For a list of source sites that imported material to the Site between November 18, 2005 and October 25, 2010, see the table included in Appendix 12. Refer to FMRs in Appendix 6 for source sites and estimated fill material imported to the Site prior to November 18, 2005.

The following were potential source sites that were identified by NYCDPR since October 25, 2010 where a review was not initiated:

1. 10 Byron Place (Larchmont, NY)
2. College Point
3. PS-331 (Tremont Avenue, Bronx, NY)

The following were potential shaping layer source sites that were identified by NYCDPR since October 25, 2010 with some level of source site review being completed. Source sites that resulted in a complete review and the importation of shaping layer material to the Site after October 25, 2010 are identified with bold text.

1. **PS-310 (942 62nd Street, Brooklyn, NY)**
2. PSAC
3. Barclays Arena (620 Atlantic Avenue, Brooklyn, NY)
4. JFK Jet Blue/Delta Runway (Jamaica, NY)
5. Columbia University
6. Long Island Jewish Center (270-05 76th Avenue, New Hyde Park, NY)
7. Highbridge Terrace (220 West 167th Street/Sedgewick Avenue, Bronx, NY)
8. Astoria (27-07 23rd Avenue, Queens, NY)
9. **Eastside Access (Queens Street and Jackson Avenue, Queens, NY)**

10. **Kew Gardens (Van Wyck Expressway between Grand Central Avenue and 86th Avenue, Queens, NY)**
11. PS-285 (1065 Martin Luther King Boulevard, Bronx, NY)
12. Flushing Hotel (133-63 Roosevelt Avenue/39-20 Prince Street, Queens, NY)
13. **2nd Avenue (2nd Avenue and 94th Street, New York, NY)**
14. 2nd Avenue (2nd Avenue and 72nd Street, New York, NY)
15. Alexander Hamilton Bridge (Bronx, NY)
16. **Throgg's Neck/Target/USPS (815 Hutchinson River Parkway, Bronx, NY)**
17. **PS-287 (110-10 Northern Boulevard, Queens, NY)**
18. City Point Brooklyn (1 Dekalb Avenue, Brooklyn, NY)
19. 400 Park Avenue South (New York, NY)
20. **Union Street (43-31 Union Street, Flushing, NY)**
21. **Mount Vernon Recycling Corp. (113 Edison Avenue, Mount Vernon, NY)**
22. 228th Street (Rosedale, NY)
23. Evergreen Recycling/Tully Environmental (Willets Point Boulevard, Corona, NY)
24. Waterpointe-Whitestone
25. Don Carlo Environmental/Brooklyn (1247 38th Street, Brooklyn, NY)
26. Castle Hill Recycling (1000 Zerega Avenue, Bronx, NY)
27. Springfield Gardens
28. Calvert Vaux (Brooklyn, NY)
29. 160 Myrtle Avenue (Brooklyn, NY)
30. 215 E. 68th Street (New York, NY)
31. **DEP Valhalla (10 Walker Road, Valhalla, NY)**
32. **Tilcon (Bronx) (980 East 149th Street, Bronx, NY)**
33. **NY Recycling (475 Exterior Street, Bronx, NY)**
34. Little Bay (Queens, NY)

The following were potential cover layer source sites that were identified by NYCDPR after October 25, 2010 with some level of source site review being completed. Source sites that resulted in complete reviews and the importation of cover layer material to the Site after October 25, 2010 are identified with bold text.

1. **Bloomingburg (C.M. & Sons Trucking Site, 680 Bloomingburg Road, Bloomingburg, NY)**
2. **Ranco Sand (115 South Street, Manorville, NY)**
3. **East Coast Mines (Lewis Road near Route 104, East Quogue, NY)**
4. Amboy Aggregates (415 Main Street, South Amboy, NJ)
5. **Long Island Compost/Great Gardens (445 Horseblock Road, Yaphank, NY)**

3.1.1 Shaping Layer Material

Materials accepted for use as shaping layer on the Site were sampled prior to acceptance and after the import of each additional 10,000 cubic yards as required by Special Condition 14 of the 2014 Permit. For recycling facilities, sampling was conducted after each additional 5,000 cubic yards. As per the November

18, 2005, Permit Modification, each soil sample was analyzed for TCLP VOCs and metals as well as total VOCs, SVOCs, priority pollutant metals, pesticides, PCBs, sulfur, and asbestos.

Fill material imported to the Site and used for the shaping layer was analyzed for the following parameters, per Special Condition 14 of the 2014 Permit. A description of which can be found below as included in Section 4.2.1.1 of the 2013 Engineering Report.

Based on source site reviews and site testing activities, the shaping layer material imported to the Site met the following chemical limits:

Total carcinogenic SVOC levels less than 10 ppm from individual fill material sources, provided that a weighted average of equal or less than 3 ppm for the entire Project. The following are the list of carcinogenic SVOCs that are subject to this 10 ppm limit: Benzo(a)pyrene, Dibenzo(a,h) anthracene, Benzo(a)anthracene, Benzo(b)fluoranthene, Indeno(1,2,3-cd)pyrene, Benzo(k)fluoranthene, and Chrysene.

Total SVOCs less than 500 ppm.

Metals:

- Arsenic less than 28 ppm;
- Barium less than 2,000 ppm;
- Cadmium less than 20 ppm;
- Chromium less than 1,000 ppm;
- Copper less than 1,000 ppm;
- Lead less than 400 ppm;
- Mercury less than 0.57 ppm;
- Selenium less than 11 ppm;
- Silver less than 100 ppm

Asbestos for all layers 0.5% or less
Total sulfur for all layers 0.5% or less
Total PCBs less than 10 ppm
Total Pesticides less than 10 ppm
VOCs (all individual analytes less than TAGM 4046)

In a letter dated October 25, 2006 (included in Appendix C.1 of the 2013 Engineering Report), the NYSDEC provided a clarification adding that a carcinogenic SVOC limit of 10 ppm or lower is allowable from individual fill material sources, provided that a weighted average of equal or less than 3 ppm is achieved by the end of the Permit.

NYCDPR followed the NYSDEC's directives since receipt of each one associated with the importation of shaping layer material to the Site.

Details of the source site reviews and site testing for each potential shaping layer material source site are as follows:

3.1.1.1 PS-310 (942 62nd Street, Brooklyn, NY)

Source site testing analytical results for the PS-310 site were provided to the IEM by NYCDPR in a submittal dated October 6, 2010, and reviewed by the IEM for potential shaping layer material, based on the site visit performed by Gannett Fleming (the previous IEM) on September 21, 2010, and as recommended in their memo dated September 28, 2010. Samples were collected and tested by Analytical Chemists and issued via lab reports dated October 1, 2010. Analytical results were collected from five test pits from both the fill and natural formation soil layers. An exceedance of lead relative to the Site Permit shaping layer material chemical limits was noted in the fill layer within test pit #3. This information was factored into the final memo of recommendations issued by the IEM dated October 26, 2010 regarding the approved locations and depths of shaping layer material from the source site.

The IEM was on-site on November 10, 2010 to visually inspect and confirm that all fill and petroleum impacted fill from Areas of Concern 1 and 2 were removed. The IEM was also on-site on November 12, 2010 to observe the sampling of three additional sample locations of natural formation soil. The IEM submitted a detailed email to the NYSDEC and NYCDPR summarizing the November 12, 2010 site visit. Shaping material analytical results were reviewed for the PS-310 source site for three samples collected on November 12, 2010. All parameters met Permit criteria for import to the Site.

Approximately 5,308.48 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.2 PSAC

Initial site and fill material information was provided to the IEM between October 25 and November 5, 2010 by Gannett Fleming (the previous IEM). No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.3 Barclays Arena (620 Atlantic Avenue, Brooklyn, NY)

Initial site and material information was provided to the IEM by Gannett Fleming (the previous IEM) between October 18 and November 5, 2010. An initial site visit was completed by the IEM to initially inspect site conditions and materials at the source site. The IEM issued a memo of recommendations for the source site on November 16, 2010 based on materials available at that time. Materials were not reviewed further or imported to the Site at that time.

New material became available at this source site and additional data was provided for IEM review between December 18 and December 31, 2010. The review of this additional data and associated information was initiated. The sampling plan from mid-November 2010 was resubmitted to NYCDPR for the new materials being evaluated at Barclays Arena between January 1 and January 14, 2011 as the

original plan still applied to the additional/revised materials being made available. NYCDPR subsequently notified the IEM that the site source manager did not consider the Site as a viable option at that time.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.4 JFK Jet Blue/Delta Runway (Jamaica, NY)

On December 3, 2010, NYCDPR forwarded the IEM initial lab data for this potential source site associated with a Jet Blue/Delta runway at JFK Airport. On December 6, 2010, the IEM visited the potential source site to inspect the material totaling an estimated 7,000 cubic yards. The IEM witnessed evidence of asphalt and slag in the fill material and notified NYCDPR and the NYSDEC that the material was not a viable option for import to the Site. (See section 3.2.3)

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.5 Columbia University

Initial site and material information was provided to the IEM by Gannett Fleming (the previous IEM) between October 25 and November 5, 2010.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.6 Long Island Jewish Center (270-05 76th Avenue, New Hyde Park, NY)

The IEM conducted an initial site visit on November 5, 2010. An email containing the summary of site visit activities and summary of recommendations was provided. The IEM issued a formal memo of recommendations on November 11, 2010.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.7 Highbridge Terrace (220 West 167th Street/Sedgewick Avenue, Bronx, NY)

On January 10, 2011, a formal fill source site review was initiated for the Highbridge Terrace source site. Sanborn Maps, historical topography maps, historical aerial photos, and the EDR and NYSDEC Spill Databases were reviewed. Approximately 5,900 cubic yards of potential fill material was reportedly available. Initial analytical data was provided however, the IEM was informed by NYCDPR that this potential source site was no longer a viable option at the time and further review did not occur.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.8 Astoria (27-07 23rd Avenue, Queens, NY)

A formal fill source site review was conducted for the Astoria source site February 3, 2011 and consisted of the review of historical information and existing source site sampling data and EDR information. The existing sample data was reviewed and some sample results did not meet the Site Permit limits for shaping material. Preliminarily, the site contractor estimated approximately 2,000 cubic yards of potentially approvable material. The initial review was completed and NYCDPR reported that this source site was no longer a viable option and no further action was expected.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.9 Eastside Access (Queens Street and Jackson Avenue, Queens, NY)

A coordination call was held with the IEM, NYCDPR, and the source site contractor on February 8, 2011. The IEM witnessed initial source site sampling as requested by NYCDPR at the Eastside Access source site on February 9, 2011. A total of seven grab sample collections were observed and one discrete VOC sample collection was observed. The existing stockpile was estimated to measure approximately 2,000-4,000 cubic yards based on an approximation of stockpile dimensions by the IEM.

The IEM received a submittal of information from NYCDPR between February 12 and February 25, 2011. The IEM reviewed the material and found the site to be noncompliant with the Site Permit as material could not be segregated and stockpiled at the source site. Per NYSDEC directive, NYCDPR would be coordinating directly with the NYSDEC for further site review. The site was reviewed by the NYSDEC and a site-specific analytical parameter list (for Metals) was approved by the NYSDEC between March 12 and March 25, 2011.

Between March 26 and April 8, 2011, the IEM was notified by the NYSDEC and NYCDPR that this source site had been approved to export fill materials to the Site by the NYSDEC. The IEM discussed the conditions of the approval with the NYSDEC and began witnessing sample collection of the East Side Access crushed stone material and review of lab reports.

The IEM conducted monitoring of shaping layer material sampling and loading at the East Side Access source site for materials exported to the Site. Sampling at this source site generally occurred the day before materials were expected to ship to the Site. Samples were being analyzed for metals, laboratory results were compared to the Site Permit requirements, and no exceedances of shaping material limits were identified.

Between April 2011 and December 2011, the IEM continued monitoring for this source site. The IEM witnessed sample collection of East Side Access crushed stone material every 10,000 cubic yards, reviewed lab reports, and periodically monitored loading of trucks with shaping layer materials for export to the Site as materials were shipped to the Site.

The IEM reviewed the lab results related to the IEM witnessed source site sampling conducted on December 12, 2011 for proposed shaping material at the East Side Access source site and found the sampled material to be unacceptable for import to the Site based on the fact that the detected value for Arsenic was 48.7 ppm. The permit allowable maximum concentration for Arsenic is 28 ppm. The sampled material was determined to be unacceptable for import to the Site as shaping layer material per the Permit.

NYCDPR requested that the material sampled on December 12, 2011 be removed from consideration for import to the Site and requested that a sample be collected for the next available material at the East Side Access source site. The IEM reviewed the lab results dated December 14, 2011 related to the IEM witnessed sampling conducted on December 13, 2011 for the proposed shaping material and found them to be acceptable based on the fact that the RCRA metals results fell below the Permit shaping layer material allowable maximum concentrations and the Permit USEPA referenced testing method was used. It was determined that approved shaping material to be imported to the Site could only originate from the stockpiles witnessed during the December 13, 2011 sampling event. Material previously sampled on December 12, 2011 was not imported to the Site.

NYCDPR and their associated representatives hypothesized that the unacceptable sample results for arsenic may be a result of a change in the rock removal process, which included drilling, blasting, and crushing to generate the shaping layer material. On December 16, 2011, the NYSDEC stated that if the mining technique did not change (i.e. drilling as opposed to blasting) the sampling frequency could remain unchanged on the basis of the number of successful past results. However, in the event of another failure, the sampling frequency would become one sample per 2,000 cubic yards. The IEM proceeded with observing one sample per 2,000 cubic yards based on a change in mining operations as per discussions with the source site operator.

On February 7, 2012, the NYSDEC stated that based on the number of successful test results for the East Side Access material since the December 12, 2011 failure due to high arsenic content, the NYSDEC approved NYCDPR's request for future testing of East Side Access material at a reduced frequency of one sample per 10,000 cubic yards.

On December 18, 2012, Analytical Chemists collected samples from stockpiled East Side Access Source Site shaping material at the Site that had elevated PID readings when scanned during the on-site inspection process upon import and after dumping. The six segregated loads of East Side Access shaping layer material passed the Site Permit criteria for shaping layer material based on sampling conducted at the Site. Sampling consisted of collected samples witnessed by the IEM on December 18, 2012. Therefore, the material remained on-site and was used as shaping layer material.

Approximately 191,293.87 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.10 Kew Gardens (Van Wyck Expressway between Grand Central Avenue and 86th Avenue, Queens, NY)

Initial site and material information was provided to Woodard & Curran by Gannett Fleming (the previous IEM) between October 25 and November 5, 2010.

A formal fill source site review was initiated for the Kew Gardens between November 6 and November 19, 2010 consisting of compiling and reviewing historical maps, photos, EDRs, and spills database and available information from the source site contractor.

A formal fill source site review was continued for the Kew Gardens source site between November 20 and December 3, 2010 and consisted of the review of Sanborn maps, topographic maps, aerial photographs, NYSDEC spills and remediation database, and the City Directory. A Phase II Environmental Site Assessment (ESA) and associated analytical data was reviewed and sample results did not exceed the Permit limits for shaping layer material. Preliminarily, the source site contractor estimated approximately 10,000 to 15,000 cubic yards of potentially approvable material was available.

On February 11, 2011, the IEM issued a memo of recommendations and sampling plan for the Kew Gardens source site.

The IEM conducted fill material source site sampling oversight at the Kew Gardens site on February 17, 2011. Six areas (1, 2, 3, 4, 5, and 9) were assessed by IEM desktop review and a sampling plan was submitted to, and approved by the NYSDEC for potential cover material evaluation. Representatives from the laboratory, NYCDPR, IEM, and the source site operator met prior to the initiation of sampling activities. The source site operator stated that the full extents of Areas 4, 5, and 9 would not be accessible for visual screening and analytical sample collection and soils in Area 9 were being actively loaded for off-site use. NYCDPR requested that source material evaluation proceed for accessible material. Composite grab and discrete VOC soil samples were collected for laboratory composite and analysis from Areas 1, 2, 5, and 9. Area 4 was not accessible for evaluation. Asphalt and other materials non-compliant with the Site Permit were observed on various soil horizons in Area 3, and as such, no samples were collected as the material was no longer considered for import to the Site.

On February 25, 2011, NYCDPR submitted draft analytical data from the Kew Gardens site for IEM review. At the request of NYCDPR, the IEM performed an initial review of the draft analytical data for cover material, understanding that no final determination can be made until the complete and final data package has been submitted, reviewed by the IEM, and approved by the NYSDEC. The initial IEM review identified cadmium in composite samples from Areas 1, 2, 5, and 9 at concentrations that exceed the Site Permit requirements for cover material. NYCDPR was informed and subsequently requested the material be evaluated for shaping layer material. No exceedances of the Site Permit requirements were identified in the draft data submittal. Additional draft data from the Kew Gardens source site was submitted on March 8, 2011. No exceedances of the Site Permit requirements were identified in that draft data submittal.

Final laboratory data was submitted to the IEM for review on March 18, 2011. Laboratory results were compared to the Site Permit requirements and no exceedances of shaping layer material limits were identified. Metals concentrations in the samples did exceed cover layer material limits. Fill material from

the Kew Gardens source site was approved by the NYSDEC for importation to the Site for use as shaping layer material on March 24, 2011.

Per NYCDPR request, the IEM submitted the Kew Gardens EDR files to NYCDPR on July 1, 2011.

Beginning on August 5, 2011, NYCDPR indicated to the IEM that they had renewed interest in considering shaping layer material from Area 17 at the Kew Gardens source site. The IEM provided a list of concerns and items to address in the sampling plan associated with the attempt to obtain approval for this shaping layer material. On August 11, 2011, NYCDPR indicated that the Kew Gardens review was on hold.

On September 19, 2011, IEM representatives were on-site at Area 17 of the Kew Gardens Source Site to perform a visual, physical, and PID inspection of the existing soil via a total of seven test pits excavated from ground surface to approximately 12 feet to 16 feet below the existing ground surface. The first four test pits were excavated to approximately terminal depth. The last three test pits were terminated prior to reaching terminal depth due to instability of the sidewalls as a result of the presence of dry sand material. The test pits were completed consecutively moving from south to north. The area consisted of approximately 10,000 cubic yards of proposed shaping layer material as identified by NYCDPR and the source site contractor. In addition, the IEM witnessed the collection of grab samples for chemical analysis by NYCDPR's laboratory and logged the test pit locations using handheld GPS equipment.

IEM staff observed an initial layer of organics, which contained a slight odor attributable to decomposition and yielded PID results of 0.1 to 0.5 ppm. This material was not approved for use at the Site and this was communicated directly to NYCDPR and the site contractor. The IEM indicated that any potential approval of shaping layer material from Area 17 would require the full removal of the organic layer prior to any loading and shipping of potentially approval soils to the Site, which would need to be confirmed by the IEM.

The soil below the initial organic layer (beginning approximately 0.5’-1.5’ below grade) consisted of brown, silt with some sand and a trace of clay. Cobbles and boulders were also evident throughout the soil profile. No soil staining or odors were observed, and the material encountered below the organic layer was generally consistent in composition. The soil shifted to more of a sand and cobble composition as the test pits progressed towards the north. No asphalt or any other debris was observed in the soil, and the PID scans did not yield any detections.

IEM staff observed the collection of a grab samples at approximately two-foot intervals in each of the seven test pits completed at the Kew Gardens Source Site on September 19, 2011. It was estimated by NYCDPR and the site contractor that approximately 10,000 cubic yards were available from Area 17 of the source site. In addition to the required discrete sampling of VOCs/TCLP VOCs, the lab was instructed by NYCDPR to run three composite samples for the remaining analyses. The composite samples consisted of the grabs from each depth interval. The first two test pits completed represented composite sample #1, the second two test pits represented composite sample #2, and the last three test pits represented composite sample #3.

The IEM completed a preliminary review of shaping layer material originally sampled on September 19, 2011 proposed for import to the Site from Area 17. The IEM required a revised lab report from Analytical Chemists which contained the TCLP VOA and Metals results as well as the dioxin/furan scan using SW 8270. All other lab data was complete and did not exceed any of the Site Permit criteria. Prior to final

approval to import this material to the Site, NYCDPR was required to obtain the NYSDEC's approval to use the alternative dioxin/furan analysis.

NYCDPR received NYSDEC approval to use Method 8270 for analysis of dioxins/furans at this source site on January 3, 2012. The IEM completed a final review of shaping layer material (originally sampled on September 19, 2011) proposed for import to the Site from Area 17 on January 4, 2012. The review of available lab data identified that sampled material does not exceed any of the Site Permit criteria. On January 5, 2012, the IEM inspected the source site and visually confirmed the removal of the top 0.5 feet to 1.5 feet of soil which consisted of an initial layer of organics that were previously considered unacceptable for import to the Site. It was determined that the available shaping layer materials from Area 17 totaling approximately 500 cubic yards of the original estimated 10,000 cubic yards were approved for export to the Site.

The source site operator provided the IEM with a proposed excavation plan on December 5, 2012 for additional materials available at the source site. On December 8, 2012, the IEM notified NYCDPR that the previous desktop review (i.e. EDR, etc.) performed for this source site was still applicable for the latest area proposed for excavation. The IEM was on-site at the Kew Gardens source site on December 14, 2012 to witness test pits and environmental sampling for additional shaping layer materials being considered for import to the Site.

On January 3, 2013, the IEM provided a memo of recommendations to the NYSDEC regarding an additional estimated 7,500 cubic yards of shaping layer material being considered for import to the Site that was sampled on December 14, 2012. On January 4, 2013, the NYSDEC approved the importation of this material to the Site subject to the following conditions. The outer limits and depths of all areas of excavation should be clearly delineated in the field and confirmed by the IEM in the field prior to any excavation, loading, or trucking of approved soils. The approval only applied to the material samples and inspected on December 14, 2012, consisting of what appeared to be native material, free of debris and any traces of organics. The limits beyond test pit #8 consisted of observed unauthorized C&D material mixed into the soil (i.e. metal and glass, etc.), and were not approved for import to the Site. The IEM periodically inspected the excavation and hauling activities at the Kew Gardens Phase II site to perform visual and physical screening of the proposed shaping layer material. Inspection frequency was at the discretion of the IEM and the NYSDEC. The exportation of all material to the Site was conducted in accordance with the current Permit requirements (i.e. trucking manifests, etc.).

On June 5, 2013, the IEM issued a third memo of recommendations dated June 5, 2013 for the Kew Gardens source site. The IEM notified NYCDPR that the latest round of shaping layer material (approximately 5,000 CY) was acceptable for import to the Site due to the fact that the material met the Site Permit requirements. The approval applied to the material sampled and inspected on May 22, 2013, consisting of what appeared to be native material, free of debris and any traces of organics, and as delineated horizontally and vertically on the provided test pit plan. The top portion of unauthorized soil (i.e. RCA, geotextile, organic) was stripped and removed off-site to the depths and locations listed on the provided test pit plan, and this condition was witnessed by the IEM prior to importation to the Site. The importation of all material to the Site was conducted in accordance with the Permit requirements (i.e. trucking manifests, etc.).

Approximately 11,988.51 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.11 PS-285 (1065 Martin Luther King Boulevard, Bronx, NY)

On March 10 and 11, 2011 the IEM was provided with fill source site documentation for the PS-285 source site. The IEM initiated review of the source site materials provided per request of NYCDPR. Site visits to the PS-285 source site by the IEM were completed on March 14, 2011 to observe test pits and on March 25, 2011 to discuss the approval process and submittal requirements. NYCDPR requested the IEM purchase an EDR Report for the site on March 25, 2011.

The IEM witnessed additional test pits and sampling on March 29, 2011. At the time of sampling, certain portions of the source site were not accessible for sampling. Samples were collected from four test pits and composited into two samples. Lab results were provided on March 30, 2011, but were deemed incomplete by the IEM. A revised report was submitted to the IEM addressing the missing parameters, but it did not address the non-compliant dioxin/furan USEPA Test method used to generate the lab report. Final laboratory data was submitted to the IEM for review on April 5, 2011. Laboratory results were compared to the Site Permit requirements and no exceedances of shaping material limits were identified. Additional review by the IEM and the NYSDEC was required to determine if the source site was approved for material importation to the Site. The IEM completed the review of NYCDPR's EDR and desktop review, and issued a memo to the NYSDEC detailing the IEM's review results on April 5, 2011. The NYSDEC provided their review comments on April 7, 2011.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.12 Flushing Hotel (133-63 Roosevelt Avenue/39-20 Prince Street, Queens, NY)

NYCDPR requested that the IEM order and provide the EDR materials to NYCDPR for their review and submission to the IEM. The draft initial submittal was provided to the IEM over the course of several days (April 5, 6, and 7, 2011). The IEM’s review commenced during this timeframe.

The IEM witnessed test pits and sampling at the Flushing Hotel source site on April 8, 2011. Final laboratory data was submitted to the IEM for review on April 19, 2011. Laboratory results were compared to the Site Permit requirements and no exceedances of shaping layer material limits were identified. Additional review by the IEM and the NYSDEC was required to determine if the source site was approved for material importation to the Site.

The IEM conducted a review of NYCDPR's EDR review, as well as a full review of the EDR, and submitted Phase I and Phase II ESA reports. The IEM reviewed the lab results provided on April 19, 2011. The IEM prepared a review document dated April 20, 2011 titled "Flushing Hotel Source Site - Desktop Submittal Review" and submitted it to NYSDEC and NYCDPR. The NYSDEC provided a response on April 21, 2011.

NYCDPR provided the IEM with supplemental historical lab data and two (2) separate Phase II reports on April 26, 2011. The IEM provided additional review comments based on the aforementioned documents to NYCDPR via conference call and email on April 29, 2011. NYCDPR provided a draft submittal response package dated May 5, 2011.

NYCDPR provided the IEM with a final submittal dated May 13, 2011 in response to IEM comments. The IEM reviewed the final submittal and transmitted that submittal to the NYSDEC for review and comment on May 18, 2011. Due to the fact that this was a complex site, final comments regarding acceptance for import to the Site was to be provided by the NYSDEC.

Conditional approval for the export of shaping material from rows 4, 5, and 6 was provided from the NYSDEC on May 27, 2011. The IEM witnessed the first day of test pits on June 3, 2011 as requested by NYCDPR. Five test pits were excavated at the source site to the maximum depth reachable by the heavy equipment available. The IEM witnessed a second day of test pits on June 6, 2011 as requested by NYCDPR. Three additional test pits were excavated to the maximum depth reachable by the heavy equipment available. NYCDPR submitted a revised site review proposal for importing shaping layer material from this source site on June 15, 2011.

A total of eight (8) test pits were excavated at the Flushing Hotel source site on June 3 and June 6, 2011. One composite sample and one discrete VOC sample was collected from each test pit. Lab results were submitted to the IEM on June 10, 2011. The IEM provided preliminary review and comments to NYCDPR regarding the source site review proposal on June 17, 2011.

The IEM submitted the memo of recommendations to the NYSDEC on June 20, 2011. The IEM visited the site on June 21, 2011 to confirm conditions within the memo of recommendations were met or could be achieved. The IEM reported conclusions to the NYSDEC via email on June 21, 2011. The observed site conditions did not allow for the source site to be approved due to the presence of asphalt, objectionable material, and stockpiles that did not allow for the confirmation of soil elevations. The NYSDEC also indicated that as of June 21, 2011, a formal submittal from NYCDPR to NYSDEC had not occurred to date. The IEM's site observations from June 21, 2011, were emailed to NYCDPR on June 23, 2011. NYCDPR submitted a revised site proposal on June 27, 2011. On June 28, 2011, the IEM indicated that items included in NYCDPR's submittal were non-complaint with the current Site Permit requirements, and therefore required approval from the NYSDEC.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.13 2nd Avenue (2nd Avenue and 94th Street, New York, NY)

The IEM witnessed fill material sampling for this potential source site on May 12 (two samples) and May 16, 2011 (one sample) regarding acceptance of crushed rock from NYCMTA's 2nd Avenue Subway construction project at 94th Street in Manhattan. Samples were analyzed for the nine RCRA metals and all passed the Site Permit requirements relative to the nine RCRA metals. One sample on May 12 was collected from material directly out of the hopper after it was deposited into a truck and the other sample was taken from a stockpile. The May 16 sample was also taken from material that came directly out of the hopper and deposited directly into a truck. The NYSDEC performed all associated reviews for this

source site similar to the East Side Access source site due to the nature of the material that was being generated from subway tunnel construction.

The NYSDEC provided approval for this source site to export shaping layer material to the Site. Shaping layer material sampling began on May 26, 2011 and occurred on a continual basis after each consecutive 2,000 cubic yards of material was imported to the Site.

Approximately 86,667.95 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.14 2nd Avenue (2nd Avenue and 72nd Street, New York, NY)

NYSDEC staff reviewed NYCDPR's submittal dated October 28, 2011 regarding acceptance of crushed rock from NYCMTA's 2nd Avenue Subway construction project at 72nd Street in Manhattan which was proposed for import to the Site. NYCDPR's proposal was acceptable to the NYSDEC provided that a composite sample of this material was tested for the proposed analytical parameters and the sample results were obtained (and approved) prior to loading material for export to the Site.

The IEM reviewed the lab results related to the IEM witnessed source site sampling conducted on December 5, 2011 for the proposed shaping layer material at the source site. The IEM identified that the sampled material was unacceptable for import to the Site based on the fact that the detected value for Arsenic was 38.4 ppm. The permit allowable maximum concentration for Arsenic is 28 ppm. The sampled material was determined to be unacceptable for import to the Site as shaping layer material per the Permit. It was determined that no material may be imported from the 2nd Avenue at 72nd Street source site to the Site. The IEM also witnessed that the physical composition of the sampled material was not that of pure stone dust as witnessed previously at the 2nd Avenue (94th Street) and East Side Access source sites. This material had stones as large as 12 inches to 24 inches in size. The IEM was advised that the hopper at the 2nd Avenue at 72nd Street source site used a screen that contained openings that were 24 inches by 20 inches.

On December 5, 2011, NYCDPR requested that the IEM witness one additional sample from the 2nd Avenue at 72nd Street source site. On December 6, 2011 in response to NYCDPR’s request to perform one additional sample, the NYSDEC stated that if re-sampling produced acceptable results, a more stringent sampling frequency would be required for this source (i.e. one sample per 2,000 cubic yards instead of one sample per 10,000 cubic yards). NYCDPR advised the IEM that they were not pursuing material from this source site any further because it did not meet the specified physical properties for the golf course construction.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.15 Alexander Hamilton Bridge (Bronx, NY)

NYCDPR notified the IEM on February 8, 2012 that NYCDPR was interested in the opportunity to obtain potential shaping layer materials from the Alexander Hamilton Bridge source site (originally sampled July

7, 2009) which had been reviewed and approved in the past by the previous IEM. The IEM requested, obtained, and reviewed the previous files for the source site including previous approvals and corresponding lab data. On February 10, 2012, the IEM requested and received the proposed location for the recently considered shaping layer material.

The IEM visited the Alexander Hamilton Bridge source site on February 22, 2012. The IEM visually inspected a stockpile of approximately 3,000 to 5,000 cubic yards of potential shaping layer material from the previously approved source site (as per IEM records from 2009). Upon a visual inspection, it was determined that the material did not meet the Site Permit requirements due to the presence of unauthorized C&D material including asphalt and metal, as well as other miscellaneous debris. Site observations were photo documented. The IEM notified NYCDPR of its observations and NYCDPR determined that they did not want to pursue this source site any further at that time.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.16 Throgg's Neck/Target/USPS (815 Hutchinson River Parkway, Bronx, NY)

On February 28, 2012, NYCDPR requested that the IEM begin the source site review for the Throgg's Neck/Target/USPS source site. The source site was an existing USPS building that was proposed to be redeveloped with a new Target retail building. The anticipated volume of material being considered as potential shaping layer material was reported to be approximately 20,000 cubic yards per information forwarded to the IEM by NYCDPR. The IEM ordered the EDR and provided the EDR information to NYCDPR. The IEM reviewed the Phase I ESA and the Phase II ESA. The IEM completed a review of the EDR on March 9, 2012. NYCDPR provided the IEM with an EDR review memo on March 27, 2012. The IEM provided NYCDPR with some initial comments and NYCDPR submitted a revised EDR review memo on April 2, 2012.

NYCDPR provided the IEM with a proposed sample location plan with proposed depths for source site sampling on April 19, 2012. The IEM provided comments on a revised sampling plan identifying the location and quantity of test pits on April 20, 2012.

The IEM witnessed three of ten proposed test pits and the associated source site sampling at the source site on April 25, 2012. The remaining test pits were completed and witnessed by the IEM on May 11 and May 14, 2012.

The IEM reviewed the lab data (originally dated May 15 and May 24, 2012 and revised May 30, 2012) and no exceedances of shaping layer material limits were identified. The IEM prepared a memo of recommendations and submitted it to the NYSDEC on May 30, 2012. The NYSDEC reviewed the IEM's May 30, 2012 memo of recommendations for the source site. On May 31, 2012, the NYSDEC approved importation of shaping material from this source site to the Site, provided that all recommendations in the memo of recommendations were implemented. The source site commenced trucking shaping layer material to the Site.

The IEM conducted an inspection of the source site on November 6, 2012. The purpose of the inspection was to determine if site conditions warranted allowing the source site to resume importation of shaping layer material to the Site, in light of the nine truck rejections (due to presence of asphalt) that occurred on October 23, 2012 (resulting in ceasing of importation that same day). Based on the IEM inspection and observations, it was determined that importation may resume to the Site. Observations included surface asphalt had been stripped from within the approved limits of excavation between former TP-6 and TP-8, stockpiles of excavated soil from areas outside the approved excavation limits (i.e. cut along Weiner Place) were located outside the approved excavation limits, and no stockpiles of asphalt material or other poor housekeeping practices were observed within the current area in preparation for export to the Site. NYCDPR was notified that all importation must comply with all previous conditions outlined in the source site approval memo of recommendations (i.e. top +/-3 feet of fill was not approved for importation to the Site; this layer was clearly identifiable due to its color and consistency relative to the native approved material).

The IEM was on-site at the source site on February 6, 2013 to complete a source site inspection associated with a request to resume import to the Site. The site was approved to resume importation of shaping layer material on February 6, 2013 based on the IEM's inspection, which confirmed that the material originated from IEM inspected/approved areas, and the fact that the material is the native approved soil, and there are no signs of asphalt or historical fill on-site in the vicinity of the work area. The area inspected was consistent with the approved areas included in the original NYSDEC approval and IEM memo of recommendations.

Approximately 27,262.77 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.17 PS-287 (110-10 Northern Boulevard, Queens, NY)

On March 2, 2012, NYCDPR requested that the IEM begin the source site review for the PS-287 source site. The source site was a former parking facility that was being redeveloped into a new school. The anticipated volume of material being considered as potential shaping layer material was reported to be approximately 7,000 to 9,000 cubic yards per information forwarded to the IEM by NYCDPR. The source site operator expected to remove the top two feet of asphalt and historical fill, as well as a one-foot buffer. The potential shaping layer material that was being considered was what was claimed to be native soils from a depth of approximately 3 feet to 15 feet below grade. NYCDPR and the site operator wanted to proceed with sampling prior to review of the EDR. A sampling plan was provided to the IEM for review. The IEM completed a review of submitted documents including the Phase I ESA, Phase II ESA, and the proposed sampling plan and issued a review memorandum with comments on March 7, 2012. The site operator submitted a revised sampling plan for review by the IEM on March 8, 2012.

The IEM received NYCDPR's initial review of the EDR on March 14, 2012. The IEM completed a review of the EDR and forwarded a copy to NYCDPR on March 16, 2012. On March 16, 2012, the IEM requested that NYCDPR submit a revised EDR review memo incorporating the identified Recognized Environmental Concerns ("RECs") and other site conditions that were not included in the original review memo.

On March 22, 2012, the IEM received sample results for shaping layer source site sampling that occurred on March 15, 2012. The IEM completed an initial review of the sample data and although there were no exceedances relative to the Site Permit limits for the parameters that were analyzed in the lab reports, there were multiple parameters missing from the lab report.

The IEM received a revised lab report for the PS-287 source site on March 28, 2012. The IEM reviewed the revised lab report for the previously missing lab data and confirmed that the tested soil met the Site Permit criteria for shaping layer material. The IEM issued a memo of recommendations for this source site to the NYSDEC on March 28, 2012. The IEM visited the source site on March 30, 2012 and confirmed that all asphalt, historic fill, and areas not being considered for import to the Site were previously removed from the source site to the appropriate depth including the one-foot buffer below the fill layer. The NYSDEC approved the PS-287 source site for shaping layer material and NYCDPR was notified of the approval on April 2, 2012.

Approximately 6,754.8 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.18 City Point Brooklyn (1 DeKalb Avenue, Brooklyn, NY)

The IEM issued a desktop review summary for the City Point Brooklyn source site to the NYSDEC on July 27, 2012. The review included information acquired or provided to the IEM including EDR files, Phase II report, and boring information. The material being considered was approximately 22,000 cubic yards of native material proposed to be used as shaping layer material.

The NYSDEC approved the City Point Brooklyn source site for further investigation (i.e. physical and visual inspection via test pits and sampling) on August 13, 2012 since all environmental samples for the source site were made available to the IEM for review.

The IEM was on-site at the source site on August 31, 2012 to witness site investigation and sampling activities for 8,000 cubic yards of potential shaping layer material.

On September 11, 2012, the IEM received sample results for source site sampling that occurred on August 31, 2012. On September 20, 2012, the IEM issued a Site Investigation Memorandum (dated September 19, 2012) to the NYSDEC for review for the source site related to IEM witnessed activities that occurred at the source site on August 31, 2012.

On September 25, 2012, the NYSDEC notified the IEM that the City Point source site was conditionally approved pending implementation of the recommendations included in the IEM's September 19, 2012 Site Investigation Memorandum and satisfactory responses to NYSDEC questions.

On October 10, 2012, the IEM notified NYCDPR that the City Point Brooklyn source site was approved by the NYSDEC considering implementation of the recommendations included in the IEM's September 19,

2012 Site Investigation Memorandum. The IEM needed to complete a final inspection of the proposed material prior to importation to the Site.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.19 400 Park Avenue South (New York, NY)

The IEM received initial documents associated with this source site beginning on July 3, 2012. The IEM performed an initial review of the submitted documents. The IEM requested a proposed sampling plan on July 11, 2012.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.20 Union Street (43-31 Union Street, Flushing, NY)

On May 15, 2012, NYCDPR submitted a request to the NYSDEC to import shaping layer material from the Union Street source site. On June 11, 2012, the NYSDEC provided NYCDPR with email approval to import up to 30,000 cubic yards of shaping layer material from the Union Street source site based on environmental testing results submitted to the NYSDEC that was not witnessed by the IEM. On June 14, 2012, NYCDPR notified the IEM that they would begin importing, no earlier than June 18, 2012, an estimated 5,000 to 10,000 cubic yards of shaping layer material from this source site to the Site. The material originated from 30 to 55 feet below grade.

Approximately 1,675.69 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.21 Mount Vernon Recycling Corp. (113 Edison Avenue, Mount Vernon, NY)

On November 27, 2012, the IEM notified NYCDPR that the topsoil on-site that originated from the Mount Vernon Recycling Corp. facility was approved as shaping layer material based on previous NYSDEC approval allowing material to be used as shaping material, and the fact that the material passed all Site Permit criteria per IEM witnessed sample collection and a review of the associated analytical reports. The IEM witnessed sampling on October 11 and November 12, 2012. The approval was pending a receipt of all truck tickets/manifests, and confirmation of the volume of on-site soil. The Site Permit requires that this material be covered with a minimum 1-foot thick layer of approved cover soil.

Approximately 3,920.0 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.22 228th Street (Rosedale, NY)

The IEM completed a review of initial lab data dated December 28, 2012 for the 228th Street source site. Of the 12 lab reports that were reviewed, none of the sampled soil exceeded Site Permit levels for the shaping layer parameters that were analyzed in the reports. A significant number of parameters (including some VOCs, SVOCs, pesticides, and metals) were not analyzed and NYCDPR was notified of the review

findings on January 22, 2013. Sample collection for the submitted lab reports was not witnessed by the IEM.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.23 Evergreen Recycling/Tully Environmental (Willets Point Boulevard, Corona, NY)

On January 28, 2013, the IEM notified NYCDPR that an initial review of the lab data provided for the Evergreen Recycling source site (operated by Tully Environmental) was completed. Sampling was not witnessed by the IEM. There were no exceedances relative to the Site Permit criteria for shaping layer material, however there were a significant number of parameters that were not analyzed. The IEM received a Registration Form for a Waste Management Facility (DEC Registration # 41W93) for the source site. The IEM performed a visual inspection of stockpiled material at the source site material on January 30, 2013 and identified asphalt fragments in the source site material. The stockpiled material was not acceptable for import to the Site based on the presence of asphalt.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.24 Waterpointe-Whitestone

On February 1, 2013, the IEM notified NYCDPR that an initial review of the lab data provided for the Waterpointe-Whitestone source site was completed. Sampling was not witnessed by the IEM. There were no exceedances relative to the Site Permit criteria for shaping layer material, however there were a significant number of parameters that were not analyzed.

On March 27, 2013, the NYSDEC informed NYCDPR that shaping layer material from the Waterpointe-Whitestone source site could be imported to the Site if the material meets the required Permit limits and that the NYSDEC review would continue once involved staff was available to complete the review. On April 3, 2013, the IEM forwarded the NYSDEC correspondence regarding previous NYSDEC work plan acceptance for the proposed source site, which was for work occurring as part of a separate project under NYSDEC review.

On April 3, 2013, the NYSDEC confirmed that the Waterpointe-Whitestone source site was not approved as a potential source for shaping layer material.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.25 Don Carlo Environmental/Brooklyn (1247 38th Street, Brooklyn, NY)

On February 1, 2013, the IEM notified NYCDPR that an initial review of the lab data provided for the Don Carlo Environmental/Brooklyn source site was completed. Sampling was not witnessed by the IEM. The results in the submitted report exceeded the levels in the Site Permit for shaping layer material for the

VOC's ethylbenzene (6.9 ppm vs. 5.5 ppm), toluene (2.1 ppm vs. 1.5 ppm), and xylenes (57 ppm vs. 1.2 ppm). There were a significant number of parameters that were not analyzed.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.26 Castle Hill Recycling (1000 Zerega Avenue, Bronx, NY)

On February 11, 2013, NYCDPR provided the IEM with a permit for Castle Hill Recycling (DEC Registration #03-W-94) that was being considered as a potential shaping layer material source site. The IEM was notified that the source site was creating a 2,000 cubic yard stockpile for sampling. Castle Hill Recycling was a NYSDEC registered solid waste management facility.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.27 Springfield Gardens

On February 21, 2013, the IEM completed an initial review of a soil analysis summary documentation (no lab reports) for approximately 2,500 cubic yards of potential shaping layer material at the Springfield Gardens source site as provided by NYCDPR. The IEM did not witness sample collection. The IEM notified NYCDPR that there were several parameters exceeding the Site Permit criteria and multiple required parameters were not analyzed.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.28 Calvert Vaux (Brooklyn, NY)

On February 20, 2013, NYCDPR provided the IEM and NYSDEC with lab data for the Calvert Vaux source site for approximately 500 cubic yards of shaping layer material. On February 22, 2013, the IEM was notified by the NYSDEC that the NYSDEC would be handling the review of this source site.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.29 160 Myrtle Avenue (Brooklyn, NY)

On February 20, 2013, NYCDPR forwarded the IEM initial sample data information for a potential shaping layer material source site located at 160 Myrtle Avenue, Brooklyn, NY. The potential shaping layer materials totaled approximately 40,000 cubic yards. On February 21, 2013, the IEM notified NYCDPR that the initial review of the soil analysis summary documentation (no lab reports) was completed for the information provided to the IEM. The reviewed material had exceedances for lead and mercury relative to the Site Permit criteria.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.30 215 E. 68th Street (New York, NY)

On March 7, 2013, NYCDPR requested that the IEM review initial lab data for approximately 3,000 to 4,000 cubic yards of potential shaping material at 215 E. 68th Street, New York, NY. On March 8, 2013, the IEM notified NYCDPR that there were exceedances for Mercury and total cSVOC's for multiple samples and multiple VOC, SVOC, Pesticide, and TCLP VOC parameters were missing in all samples.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.1.31 DEP Valhalla (10 Walker Road, Valhalla, NY)

On February 25, 2013, the IEM initiated review of potential shaping material at the DEP Valhalla source site (Catskill and Delaware Water Treatment Facility). On March 1, 2013, the IEM notified the NYSDEC that a review of the initial lab results and site background information was completed. The initial review indicated that there were no exceedances relative to shaping layer material criteria for the hardcopy data, some sample parameters were missing, and there were no records indicating unacceptable background conditions. The IEM notified the NYSDEC that there was a discrepancy in the hardcopy and electronic data and clarification was requested from NYCDPR/NYCDEP. On March 5, 2013, the IEM completed a visual and physical inspection of the potential shaping layer material at the source site. On March 6, 2013, the IEM notified NYCDPR and the NYSDEC that the potential shaping layer material passed all visual and physical inspection requirements and the material passed the Site Permit criteria for shaping layer material (hardcopy data) although not all parameters were tested. In addition, the data provided electronically on CD contained information demonstrating that previous soil investigations identified soil containing elevated levels of lead and mercury that did not pass the Site Permit criteria for shaping layer material. It was communicated to the IEM verbally that the NYCDEP has been handling all impacted soil separate from the stockpiled material that was inspected, and that all impacted soil has been disposed of off-site and tracked accordingly.

On March 13, 2013, the IEM received requested documentation from the source site owner/operator regarding conditions of the existing soil stockpile and removal of contaminated materials at the DEP Valhalla source site. On March 14, 2013, the IEM notified NYCDPR that the IEM must be notified prior to importation of shaping layer material from the DEP Valhalla source site in order to witness initial loading of trucks at the source site.

Approximately 6,631.2 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.32 Tilcon (Bronx) (980 East 149th Street, Bronx, NY)

On April 1, 2013, the IEM received initial lab data and a NYSDEC Registration Form for a Solid Waste Management Facility (NYSDEC Registration #03W39R) for the Tilcon (Bronx) source site. On April 1, 2013, the NYSDEC confirmed that the Tilcon (Bronx) source site had a valid Registration Form for a Solid Waste Management Facility. On April 2, 2013, the IEM notified NYCDPR that a review of the initial lab data was completed and noted that sampled parameters did not exceed Site Permit criteria for shaping layer

material (samples WCA-1 to WCA-6), however the following parameters were not analyzed: TCLP Metals missing for sample WCA-3, WCA-5, and WCA-6, VOC: 1,2,4-trichlorobenzene, methyl ethyl ketone, and tetrachloroethylene in all samples, SVOC: 4-chloro-3-methylphenol, 2-chlorophenol, 4-methylphenol, and naphthalene in all samples, and Pesticides: 2,4 D, dibenzo-p-dioxins, endrin ketone, gamma-bhc, gamma-chlordane, mitotane (2,4 DDD), and parathion. On April 3, 2013, the IEM witnessed sampling of approximately 4,000 cubic yards of the proposed shaping material at the Tilcon (Bronx) source site.

On April 9, 2013, the IEM notified NYCDPR that the Tilcon (Bronx) shaping layer material, totaling approximately 4,000 cubic yards, witnessed by the IEM on April 3, 2013, was acceptable for import to the Site due to the fact that environmental results met the Site Permit requirements. The IEM conducted a visual inspection of material, and the IEM confirmed that the material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.).

Approximately 3,041.8 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.33 NY Recycling (475 Exterior Street, Bronx, NY)

On April 23, 2013, NYCDPR requested that the IEM initiate review of a potential shaping layer material source site named New York Recycling. On April 24, 2013, the IEM verified that the facility's NYSDEC registration was valid and that the submitted analytical results did not reveal any exceedances relative to the Site shaping layer material Permit requirements; however, several parameters were missing including TCLP metals, TCLP VOCs, and four pesticide parameters. NYCDPR was notified that in order to proceed with this potential source site, the IEM will need to complete a site visit to the facility for visual and physical inspection of the material, and witness collection of samples for chemical testing. In addition, NYCDPR would be required to collect a sample of the fines for submittal to the NYSDEC for review. On April 25, 2013, NYCDPR requested that the IEM take a grab sample of the material fines and provide that sample to the NYSDEC as required. On April 30, 2013, the IEM performed a visual, physical, and PID inspection of the material and collected a sample of fines using a No. 35 sieve. The sample was delivered to the NYSDEC on April 30, 2013.

On Friday, May 24, 2013, the IEM notified NYCDPR that Stockpile #1 of NY Recycling shaping layer material (approximately 8,000 CY) was acceptable for import to the Site due to the fact that the source site qualified as a valid NYSDEC registered C&D processing facility, the IEM conducted a visual/physical inspection of the stockpile on April 30, 2013, the IEM confirmed that the stockpiled material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.), all PID readings measured 0 ppm, and the environmental results were acceptable per the Site Permit requirements for IEM witnessed sampling completed on May 21, 2013. In addition, a sample of fines was collected by the IEM and submitted to NYSDEC for visual review, and subsequent approval. Approved shaping material to be trucked to the Site could only originate from the stockpile witnessed during the May 21, 2013 sampling event.

On June 19, 2013, the IEM notified NYCDPR that Stockpile #2 of NY Recycling shaping layer material (approximately 10,000 cubic yards) as witnessed by the IEM on June 11, 2013, was acceptable for import

to the Site. The IEM conducted a visual/physical inspection of stockpile #2 on June 11, 2013, and the IEM confirmed that the stockpiled material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.). The site qualified as a valid NYSDEC registered C&D processing facility and the test results were acceptable per the Site Permit requirements. Approved shaping material to be trucked to the Site could only originate from the stockpile witnessed during the June 11, 2013 sampling event.

On July 16, 2013, the IEM notified NYCDPR that the latest stockpile of shaping layer material (approximately 5,000 cubic yards) from the NY Recycling source site was acceptable for import to the Site. The submitted lab report met all Permit chemical requirements for sample collection witnessed by the IEM on July 11, 2013 and met Permit visual and physical criteria as per inspection by the IEM.

On August 1, 2013, the IEM notified NYCDPR that the latest stockpile of shaping layer material (approximately 5,000 cubic yards) from the NY Recycling source site was acceptable for import to the Site. The submitted lab report met all Permit chemical requirements for sample collection witnessed by the IEM on July 29, 2013 and met Permit visual and physical criteria as per inspection by the IEM.

On October 24, 2013, the IEM notified NYCDPR that the latest 5,000 cubic yard stockpile of NY Recycling shaping layer material as represented by the submitted TAGM lab report and per samples witnessed by the IEM on October 11, 2013, was acceptable for import to the Site. The approval was based on the fact that the source site qualified as a valid NYSDEC registered C&D processing facility and the IEM conducted a visual/physical inspection of the stockpile on October 11, 2013. The IEM confirmed that the stockpiled material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.), and all PID readings registered in at 0 ppm. The test results were acceptable per the Site Permit requirements. Approved shaping material to be trucked to the Site could only originate from the stockpile witnessed during the October 11, 2013 sampling event.

Approximately 26,688.05 cubic yards of shaping layer material were imported to the Site from this source site.

3.1.1.34 Little Bay (Queens, NY)

On October 16, 2013, the IEM notified NYCDPR of the findings associated with a preliminary review of available data for the Little Bay source site. The IEM reviewed lab data for Stockpiles 1 through 9 (S-1 through S-9). The lab report did not capture all of the parameters required for testing by the Site Permit, and was missing the full TCLP VOC and TCLP Metals analyses, as well as several SVOC, VOC, Pesticide/Herbicide, and PCB parameters. Based on the data presented, at a minimum, the following stockpiles did not pass the Site Permit criteria as shaping layer material: S-1 exceeded for copper, lead, mercury, and total PCBs; S-4 exceeded for mercury; S-5 exceeded for lead and mercury; and S-9 exceeded for mercury and total PCBs.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.2 Cover Layer Material

Materials accepted for use as cover layer on the Site were sampled prior to acceptance and after each additional 2,000 cubic yards. As per the 2005 Permit modification, the parameters for cover layer material included the complete analyte list of TAGM 4046 for total VOCs, total SVOCs, total pesticides and herbicides, total PCBs, total metals, sulfur, and asbestos.

Fill material imported to the Site and used for the cover layer was subject to the following requirements, per Special Condition 14 of the 2014 Permit and Section 4.2.1.2 of the 2013 Engineering Report. A table of the cover layer material chemical acceptance criteria listed below is included in Appendix C.2 of the 2013 Engineering Report.

In order for topsoil material to be used on the Site for the cover layer, it was sampled prior to acceptance and after the importation of each additional 2,000 cubic yards (in truck volumes). Each soil sample was analyzed for the entire analyte list in the NYSDEC Technical and Administrative Guidance Memorandum (TAGM) 4046, total volatile organic compounds (VOCs), total semi-volatile organic compounds (SVOCs), pesticides and herbicides, polychlorinated biphenyls (PCBs), and metals (including Resource Conservation and Recovery Act (RCRA) metals).

Based on source site reviews and site testing activities, the cover layer material imported to the Site met the following chemical limits:

TAGM 4046 Table 1 – Volatile Organic Compounds (VOCs)

TAGM 4046 Table 2 – Semi-Volatile Organic Compounds (SVOCs)

TAGM 4046 Table 3 – Pesticides/Herbicides and Polychlorinated Biphenyls (PCBs)

TAGM 4046 Table 4 – Metals

Total Asbestos 0.5% or less

Total Sulfur 0.5% or less

The following additional criteria were directed in NYSDEC correspondence:

April 30, 2009 – Directed NYCDPR not to accept or place on the Site any cover layer materials with arsenic concentrations greater than 16 ppm or lead concentrations greater than 400 ppm.

July 28, 2009 – Provided a table to NYCDPR listing modified heavy metal chemical limits for the cover layer at the Site.

September 25, 2009 – Revised and clarified the chromium chemical limits for the cover layer previously presented in the July 28, 2009 letter.

NYCDPR followed the NYSDEC's directives since receipt of each one associated with the importation of cover layer material to the Site.

Details of the source site reviews and site testing for each potential cover layer material source site are as follows.

3.1.2.1 Bloomingburg (C.M. & Sons Trucking Site, 680 Bloomingburg Road, Bloomingburg, NY)

NYCDPR requested that the IEM witness fill material sampling for this potential source site on May 9, 2011. The Site is a sand and gravel supply yard. Material was separated into sand and gravel of various sizes and stockpiled. The source site had been importing sand and gravel material from a nearby real estate development under construction. Material being considered for the Site included two stockpiles (SP-1 and SP-2) of a brown, medium to coarse sand. Both stockpiles were from material generated on-site. Each stockpile was approximately 25,000 cubic yards. Prior to sample collection the piles were screened in various locations using a calibrated PID. No detections of VOCs were observed. The material was inspected using a 3/4-inch screen. No prohibited materials were observed in the screened material. The IEM witnessed a total of six samples collected from two separate stockpiles. Per the AES sampling plan, three samples were collected from each stockpile. Each sample consisted of 20 grabs (depths ranging from the surface to three feet into the pile) which were composited. One discrete grab per sample was collected specifically for VOC analysis without being composited.

NYCDPR provided the IEM authorization to commence review of this source site on May 24, 2011. NYCDPR requested this source site review be put on hold on May 27, 2011. It was requested by NYCDPR that the IEM witness sampling for physical parameters on June 1, 2011. NYCDPR provided authorization to the IEM to order the EDR on NYCDPR's behalf on June 8, 2011.

On June 24, 2011, the IEM emailed the final source site review updates to NYCDPR which identified that Sample #2 for SP-1 failed to meet the cover layer material Permit requirements due to an Antimony exceedance. NYCDPR requested that the source site review be put on hold on June 24, 2011. On June 30, 2011, NYCDPR requested that the IEM resume the source site review. The IEM notified NYCDPR that the review was completed on June 24, 2011 and forwarded the original June 24, 2011 review findings/comments to NYCDPR. On July 1, 2011, NYCDPR requested that the IEM provide the EDR files to NYCDPR which were ordered for the site in June. The IEM resubmitted the EDR files to NYCDPR.

On July 8, 2011, NYCDPR submitted a preliminary review of the EDR to the IEM via email. The IEM provided comments to NYCDPR via email. On July 11, 2011, NYCDPR submitted a preliminary site review submittal via email and the IEM provided comments to NYCDPR via email. On July 12, 2011, NYCDPR submitted the site review submittal to the NYSDEC and the IEM via email. On July 12, 2011, the NYSDEC requested that the IEM provide preliminary comments of NYCDPR's submittal and the IEM provided comments to the

NYSDEC via email. On July 15, 2011, the NYSDEC provided comments to the IEM and a request for clarification on NYCDPR's submittal.

The IEM provided NYCDPR a review status update with respect to this source site via phone and email on July 20, 2011. The update contained action items required for NYCDPR to advance the review process. The IEM provided the NYSDEC with an update on the status of NYCDPR submittals for this source site on July 22, 2011 via email. NYCDPR provided the cover layer material permeability testing results to the IEM on July 22, 2011. The IEM consulted with the NYSDEC beginning on July 22, 2011 regarding the permeability results and the IEM notified NYCDPR on July 28, 2011 that the cover soil permeability rate of 1.51 X 10-2 cm/s (21.4 in/hr.) did not meet the NYSDEC maximum allowable permeability of 1 x 10-2 cm/s (14.7 in/hr.). The IEM also requested clarification on NYCDPR's intent on handling the SP-1 Antimony exceedance as identified in lab reports.

NYCDPR requested the analytical lab data from the IEM on August 8, 2011 and indicated that they would be submitting a final proposal to the NYSDEC regarding the request to import cover material from the Bloomingburg source site by addressing outstanding metals and permeability requirements. The IEM forwarded requested lab data to NYCDPR via email on August 8, 2011.

IEM staff visited the Bloomingburg source site to inspect the cover layer material on October 6, 2011 and the existing material appeared to be the same material that the IEM inspected originally in May 2011 with the exception that SP-1 had been removed off-site and was no longer available. The results of the site visit were consistent with what the IEM was told by the site operator earlier on October 6, 2011. The IEM confirmed that the GPS coordinates of the stockpile (SP-2) were consistent with the original location, the soil appeared to be the same color and consistency, and the stockpile had vegetation growing on it, indicative that it had been untouched for an extended period. The IEM witnessed the loading of one truck on October 6, 2011 headed to the Site, which was carrying approximately 26 cubic yards of cover layer material. IEM staff was on-site at Bloomingburg on October 7, 2011 to witness the initial rounds of cover layer material loading.

In general, the NYSDEC allowed up to 16,000 cubic yards of approved cover material (from all cover material source sites) to be stockpiled in the rough of holes 4 and 5 (8,000 cubic yards per hole) prior to satisfying the conditions associated with spreading the cover material on the Site. These conditions included meeting permeability and shaping layer thickness requirements. On October 21, 2011, the NYSDEC provided NYCDPR with a conditional approval to allow NYCDPR to import cover layer material with a permeability of up to 30 inches per hour pending NYCDPR submitting for approval of an amendment to the Stormwater Pollution Prevention Plan (SWPPP). With this permeability approval, NYCDPR was notified that they could spread cover material on-site at their own risk pending shaping layer thickness compliance which occurred at a later time.

Approximately 4,768.0 cubic yards of cover layer material were imported to the Site from this source site.

3.1.2.2 Ranco Sand (115 South Street, Manorville, NY) [LAWS]

On December 2, 2011, the IEM was directed by NYCDPR to order the EDR for the Ranco Sand source site located in Manorville, NY. The IEM visited the Ranco Sand source site on December 8, 2011 to inspect a stockpile of approximately 10,000 to 12,000 cubic yards of proposed cover soil. The soil was inspected and visually appeared to be 100% sand, free of any debris. The material appeared to be native as it was mined from a NYSDEC permitted facility, extending approximately 100 feet below original grade. The stockpile of sand that was inspected was mined from below the water table.

The IEM witnessed the collection of six composite soil samples and six discrete VOC samples, as well as a physical sample to be analyzed for permeability. The IEM logged the location of the perimeter of the stockpile via GPS. The source site owner and NYCDPR were made aware that the stockpile must remain untouched in order for the material to be considered for approval.

NYCDPR/LAWS submitted a copy of a previous NYSDEC mining permit containing the source site's previous permit number (1-4722-00218/00001). LAWS was informed by the source site representative that the source site is operating under a NYSDEC authorized permit extension.

The EDR was ordered on December 9, 2011. The IEM performed a review of the EDR and provided observations and a list of RECs to the NYSDEC. The IEM received the lab data (from the December 8, 2011 sample event) from LAWS on December 19, 2011. The IEM completed review of the lab data on December 19, 2011 and found that the material met the Site Permit criteria for cover layer soil. The IEM reviewed the NYCDPR submittal associated with the EDR for the source site. Based on review of the NYCDPR EDR review memo, site visits, inspections, and data review, the IEM did not have any objections associated with proceeding with this source site. Prior to receiving approval for importation of this cover material to the Site, the NYSDEC needed to receive and review the permeability testing data.

On January 4, 2012, the IEM forwarded the NYSDEC the permeability data for review. On January 9, 2012, the NYSDEC identified that this source site was conditionally approved as a source for cover material based on samples meeting the approved permeability specification at a frequency of one sample per five hundred cubic yards for the initial 2,000 cubic yards (analysis for permeability only). Thereafter, sampling for permeability would be performed at a frequency of one sample per 2,000 cubic yards if the permeability results for the initial 2,000 cubic yards were satisfactory. This conditional approval was based upon information provided by NYCDPR in its January 5, 2012 email and the IEM's January 4, 2012 email to the NYSDEC. Additional permeability sampling witnessed by the IEM was required since only one IEM witnessed sample has occurred (i.e. January 2, 2012). The IEM witnessed permeability testing at the source site on January 10, 2012.

NYCDPR transmitted additional percolation testing results to the NYSDEC on January 26, 2012. The results were for IEM witnessed sampling completed on January 10, 2012 and January 23, 2012. On January 26, 2012, the NYSDEC provided NYCDPR with approval to use the average of twenty permeability test results as representative of the 12,000 cubic yards of stockpiled cover layer material at the source site. This

approval was based on the fact that loading, transporting, stockpiling, and spreading of the material would result in thorough mixing. The initial 12,000 cubic yards were approved for import to the Site.

On February 1, 2012, IEM staff was on-site to observe loading and transportation of cover layer materials from the approved stockpile and completion of trucking manifests. On February 7, 2012, IEM staff notified NYCDPR and NYSDEC that the IEM had reviewed the environmental sample data for the second round of environmental sampling completed on January 30, 2012 for cover soil (i.e. eight composite samples from an approximately 15,000 cubic yard stockpile). Per the results in the lab report transmitted to the IEM, the IEM verified that the material complied with the Site permit criteria for cover layer material. On February 9, 2012, the IEM reviewed the infiltration rate test results for the second stockpile of cover layer material, and all of the sample results met the Site Permit criteria (i.e. less than 29.4 in/hr.). Based on a review of the submitted environmental data and the infiltration testing data, the second stockpile (up to 16,000 cubic yards) was approved for import to the Site since it met all of the Site Permit criteria.

The IEM was on-site at the Ranco Sand source site on February 22, 2012 to witness sampling of a new stockpile of potential cover layer material (stockpile #3). The IEM witnessed the collection of five samples from the stockpile consisting of approximately 10,000 cubic yards of potential cover layer material.

The IEM reviewed the environmental sampling results from the February 22, 2012 sampling event for this source site and found that the sample results fell below the Site Permit limits. The IEM reviewed the percolation test results and found that the percolation rates for stockpile #3 exceeded the established threshold of 29.4 inches/hour. The IEM required a proposal from NYCDPR on an acceptable approach to remedy the percolation rate exceedance.

On March 15, 2012, the NYSDEC notified the IEM that the environmental testing (TAGM) frequency for this source site had been reduced from one sample per 2,000 cubic yards to one sample per 10,000 cubic yards of cover layer material. The percolation testing frequency remained unchanged at one sample per 2,000 cubic yards.

On March 15, 2012, the NYSDEC found NYCDPR's proposed truck loading and mixing protocol acceptable to address elevated percolation rates for the stockpile #3 materials. On March 19, 2012, the IEM informed NYCDPR that stockpile #3 at the Ranco Sand source site had been approved for import as cover layer material based upon the acceptable environmental testing results and the percolation results in conjunction with the required mixing and truck loading protocol. The IEM witnessed the appropriate truck loading protocol of the first round of trucks at the source site on March 16, 2012. Trucks were loaded in an alternating pattern from both stockpile #2 and stockpile #3.

The IEM witnessed source site sampling at this source site on March 30, 2012. The IEM received a lab report on April 5, 2012 containing infiltration testing data for ten samples collected from stockpile #4. The IEM reviewed the infiltration testing data and confirmed that the results met the permeability requirement for cover soil.

The IEM received the environmental (TAGM) lab report on April 6, 2012 for the samples collected for stockpile #4 on March 30, 2012. On April 9, 2012, the IEM confirmed that sample results for stockpile #4 did not exceed any of the Permit criteria for cover material and the material was acceptable for import to the Site.

The IEM received the environmental (TAGM) lab report on May 9, 2012 for the samples collected for stockpile #5 on April 30, 2012. On May 10, 2012, the IEM confirmed that sample results for stockpile #5 did not exceed any of the Permit criteria for cover material and the material was acceptable for import to the Site. The IEM reviewed the infiltration testing data on May 17, 2012 and confirmed that the results met the permeability requirement for cover soil.

The IEM approved Ranco stockpile #5 on May 17, 2012, as the environmental testing results did not exceed any of the Permit criteria for cover layer material. The 20,000 cubic stockpile from Ranco that was tested and witnessed by the IEM met the Site Permit criteria and was acceptable for import to the Site. Infiltration testing was also approved by the IEM. The NYSDEC lowered the frequency of infiltration testing to one infiltration sample per 10,000 cubic yards for this source site on May 11, 2012. Through May 17, 2012, this source site was approved to export 78,000 cubic yards of cover material to the Site.

The IEM was on-site at this source site on June 8, 2012 to witness the collection of samples from stockpile #6. Two samples were collected for environmental and infiltration analysis for the approximate 20,000 cubic yard stockpile. The IEM received infiltration testing data on June 14, 2012. Infiltration test results were reviewed and approved on June 19, 2012. The IEM received environmental testing lab results on June 18, 2012. The environmental testing lab results were reviewed and approved on June 19, 2012. Stockpile #6 (20,000 CY) did not exceed any of the Site Permit criteria for cover layer material and infiltration requirements and was therefore acceptable for import to the Site.

The IEM was on-site at this source site on July 17, 2012 to witness sampling of stockpile #7 consisting of 10,000 cubic yards of cover layer material. On July 26, 2012, the IEM notified NYCDPR and LAWS that the material from stockpile #7 was acceptable for import to the Site based on the fact that the submitted environmental and infiltration lab reports met the Site Permit requirements.

The IEM reviewed the infiltration and environmental lab reports for stockpile #8 of cover layer material (10,000 cubic yards) sampled on August 14, 2012. The IEM notified NYCDPR on August 22, 2012 that the material was approved for import to the Site as both infiltration and environmental results were acceptable per the Site permit requirements.

On September 17, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #9 of cover layer material sampled at this source site on September 7, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

On October 1, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #10 of cover layer material sampled at this source site on September 21, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

On November 7, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #11 of cover layer material sampled at this source site on October 17, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

On December 10, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #12 of cover layer material sampled at this source site on November 16, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

IEM staff was on-site February 1, 2013 at this source site to perform the visual inspection and witness sampling of the cover soil for environmental and infiltration testing associated with stockpile #13 (10,000 cubic yards). The IEM witnessed collection of one environmental sample and one infiltration sample.

On February 19, 2013, the IEM notified NYCDPR that the latest round of cover layer material for this source site was acceptable for import to the Site based on the fact that both the environmental and infiltration results met the Site Permit requirements. The results were for sampling witnessed by the IEM on February 1, 2013 for stockpile #13.

The IEM witnessed sample collection for stockpiles #14 and #15 totaling 20,000 cubic yards worth of proposed cover layer material at this source site on March 19, 2013. Based on review of submitted lab results, the proposed cover layer material was approved for import to the Site as both infiltration and environmental results were acceptable per the Site Permit requirements.

On June 3, 2013, the IEM notified NYCDPR that the latest round of cover layer material for stockpiles #16 and #17 totaling approximately 20,000 cubic yards were acceptable for import to the Site as both infiltration and environmental results met the Site Permit requirements. Submitted infiltration and environmental lab reports were for sampling witnessed by the IEM on May 22, 2013.

On August 5, 2013, the IEM notified NYCDPR that the latest round of cover layer material for stockpile #18 (approximately 10,000 cubic yards) was acceptable for import to the Site. The submitted infiltration and environmental lab reports for sampling witnessed by the IEM on July 26, 2013 met the Site Permit requirements.

On August 29, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #19 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on August 21, 2013.

On September 13, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #20 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on September 6, 2013.

On October 3, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #21 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on September 25, 2013.

On October 28, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #22 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on October 16, 2013.

On November 8, 2013, the IEM notified NYCDPR that the latest cover layer material stockpile #23 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on October 25, 2013.

On November 18, 2013, the IEM notified NYCDPR that the latest cover layer material stockpile #24 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on November 8, 2013.

On March 14, 2014, the IEM notified LAWS and NYCDPR that the cover layer material stockpile #24, originally sampled and witnessed on November 8, 2013 was acceptable for importation. On March 14, 2014, the IEM completed a site visit and performed a visual inspection of the existing stockpile on-site.

3.1.2.2.1 Ranco Sand (115 South Street, Manorville, NY) [MFM]

On July 10, 2012, the IEM received lab results for a 10,000 cubic yard stockpile of cover layer material sampled at the Ranco Sand source site on July 2, 2012 for MFM. On July 11, 2012, the IEM confirmed that the environmental lab testing results did not exceed any of the Site Permit criteria for cover layer material environmental analyses however the stockpile could not be approved for import as infiltration test results were not reviewed and approved.

The NYSDEC approved the infiltration test results on August 21, 2012 for stockpiled cover layer material (10,000 cubic yards) sampled on July 2, 2012. Based on the NYSDEC approval of the infiltration results, the IEM notified NYCDPR on August 22, 2012 that the stockpiled material was approved for import to the Site as both infiltration and environmental results were acceptable per the Site Permit requirements.

3.1.2.2.2 Ranco Sand (115 South Street, Manorville, NY) [Triton]

On June 6, 2013, the IEM notified NYCDPR that the revised environmental lab report for a 5,000 cubic yard stockpile met the Site Permit requirements for IEM witnessed sampling completed on May 31, 2013. On June 7, 2013, the IEM notified NYCDPR that the infiltration testing results did not meet the Site Permit requirements.

On June 24, 2013, the IEM notified NYCDPR that the additional infiltration tests analyzed for a 5,000 cubic yard stockpile did not meet the Site Permit requirements for IEM witnessed sampling completed on May 31, 2013 and it was not approved for import to the Site. On June 24, 2013, NYCDPR notified the IEM that this material would not be sampled any further.

Approximately 271,801.2 cubic yards of cover layer material were imported to the Site from this source site based on approved materials noted above in Sections 3.1.2.2 and 3.1.2.2.1.

3.1.2.3 East Coast Mines (Lewis Road near Route 104, East Quogue, NY)

Between August 10 and August 12, 2011, NYCDPR and the IEM coordinated a site visit to the East Coast Mines source site (DEC Facility ID: 1-4736-00539), and discussed review requirements. The EDR was ordered by the IEM on August 12, 2011, and the initial EDR files were forwarded to NYCDPR.

The IEM visited the source site on August 17, 2011 to inspect two stockpiles each consisting of approximately 2,000 cubic yards of soil. The soil was inspected and visually appeared to be sand, free of any debris. The material appeared to be native as it was mined from roughly 80-100 feet below original grade. The stockpiles were inspected with a PID, which yielded no detections. The IEM witnessed the collection of a composite and discrete VOC sample from each stockpile, as well as a physical sample to be analyzed for permeability.

The IEM visited the site again on September 29, 2011 to inspect a separate stockpile of proposed cover layer material of approximately 2,000 cubic yards of soil. The soil was inspected and visually appeared to be sand and free of any debris. The material appeared to be native as it was mined from roughly 80-100 feet below original grade. The IEM witnessed the collection of a composite and discrete VOC sample from the stockpile, as well as a physical sample to be analyzed for permeability. The IEM logged the location of the perimeter of the stockpile via GPS. The source site owner and NYCDPR were aware that the stockpiles must remain untouched in order for them to be considered for approval. NYCDPR performed a review of the EDR. The IEM performed a review of NYCDPR's review submittal, as well as a review of the EDR. No RECs were identified. NYCDPR submitted the facility's NYSDEC mining permit to the IEM.

On October 11, 2011, the NYSDEC identified that they had reviewed the initial analytical data for the East Coast Mines source site and authorized the importation of two stockpiles of cover material totaling approximately 3,500 cubic yards. This approval was associated with cover material that was sampled on August 17, 2011. This material was approved for only stockpiling on-site, and had not been approved for spreading on-site. Cover material was stockpiled in the rough of holes 4 and 5 pending NYSDEC approval for spreading. The NYSDEC had not reviewed the September 29, 2011 analytical data resulting in a

maximum allowable import volume from this source site of 3,500 cubic yards. In general, the NYSDEC allowed up to 16,000 cubic yards of approved cover material (from all cover material source sites) to be stockpiled in the rough of holes 4 and 5 (8,000 cubic yards per hole) prior to satisfying the conditions associated with spreading the cover material on-site. These conditions included meeting permeability and shaping layer thickness requirements. On October 21, 2011, the NYSDEC provided NYCDPR with a conditional approval to allow NYCDPR to import cover layer material with a permeability of up to 30 inches per hour pending NYCDPR submitting for approval of an amendment to the Stormwater Pollution Prevention Plan (SWPPP). With this permeability approval, NYCDPR was notified that they could spread cover material on-site at their own risk pending shaping layer thickness compliance.

On April 18, 2012, NYCDPR requested that the IEM witness source site sampling for two 2,000 cubic yard stockpiles at this source site.

The IEM witnessed source site sampling at this source site on April 23, 2012. Four samples were collected for environmental testing and four samples were collected for agronomic testing. The IEM reviewed the environmental and infiltration testing data and confirmed that the environmental results met the Site Permit requirements for cover layer material and three of four stockpiles met the NYSDEC permeability requirements. The stockpile SP2 infiltration rate exceeded the Permit limit. Material from SP2 was not acceptable for import to the Site.

The East Coast Mines stockpiled material sampled on April 23, 2012 was formally approved by the NYSDEC on May 15, 2012. Although the environmental results passed the Site Permit criteria, one of the four stockpiles (each stockpile was 2,000 cubic yards) did not meet the Site Permit infiltration criteria. However, the NYSDEC, after a review of a NYCDPR submittal request, granted approval of the four stockpiles by allowing averaging of the four stockpile infiltration results; the average of the four stockpiles met the Site Permit criteria.

The IEM forwarded the Site environmental testing criteria per the Permit for cover layer material to the lab on July 2, 2012. On July 4, 2012, the IEM notified NYCDPR, the lab, and the source site contact of parameters that had to be re-analyzed or re-reported to coincide with the required Permit limits for potential cover layer material sampled on June 22, 2012. On July 5, 2012, the IEM reviewed the revised lab report for material sampled on June 22, 2012 and determined that the material (6,000 cubic yards) was acceptable for import to the Site. On July 10, 2012, the IEM received a lab report associated with a 10,000 cubic yard stockpile sampled on July 2, 2012. On July 10, 2012, the material was found to be acceptable for import to the Site based upon review of the submitted lab report and NYSDEC review and approval of the infiltration testing results. The NYSDEC approved the infiltration results based on the condition that the stockpiled materials were mixed at the source site prior to import to the Site.

The NYSDEC notified NYCDPR on July 18, 2012 that the proposed 1:3 ratio of mixing for cover layer material stockpiles #1, #3, and #6 at East Coast Mines source site was acceptable and subject to verification by the IEM. The IEM notified NYCDPR and the source site operator on July 18, 2012 that the submitted lab report was missing the analysis of dibenzofuran. NYCDPR and the source site operator

submitted revised lab reports on July 18, 2012. The IEM notified NYCDPR and the source site operator that the two separate stockpiles of material (8,000 cubic yards each) sampled at the East Coast Mines source site on July 11, 2012 were conditionally acceptable for import based upon proper mixing of the stockpiles. The IEM was on-site at the East Coast Mines source site to witness sampling of a new 10,000 cubic yard stockpile and the mixing of the cover soil stockpiles on July 23, 2012. The IEM notified NYCDPR and the source site operator that the sampled materials were acceptable for import to the Site on July 24, 2012.

The IEM was on-site at the East Coast Mines source site on July 31, 2012 to witness mixing of cover layer material stockpiles. On August 6, 2012, the IEM notified NYCDPR that the cover layer materials sampled on July 23, 2012 at the East Coast Mines source site, totaling 14,000 cubic yards, were acceptable for import to the Site based on review of submitted environmental and infiltration lab reports.

On August 20, 2012, the IEM notified NYCDPR that the 8,000 cubic yard stockpile of cover layer material sampled on July 31, 2012 was approved for import to the Site. The approval was based on the submitted environmental results meeting the Site Permit requirements, approval from the NYSDEC to mix and average the infiltration test results, and the mixing of the stockpiled material at the source site which was witnessed by the IEM on August 14, 2012.

On August 30, 2012, the IEM notified NYCDPR that the 12,000 cubic yards of cover layer material sampled on August 14, 2012 was approved for import to the Site. The approval was based on the submitted environmental results meeting the Site Permit requirements, approval from the NYSDEC to mix and average the infiltration test results (August 23, 2012 email), and the mixing of the stockpiled material at the source site which was witnessed by the IEM on September 4, 2012.

On September 12, 2012, the IEM notified NYCDPR that a portion of the 14,000 cubic yards of cover layer material sampled on September 4, 2012 was approved for import to the Site. Stockpile SW consisting of 6,000 cubic yards of cover layer material was approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile DSS consisting of 8,000 cubic yards had acceptable environmental results meeting the Site Permit requirements but was not approved due to infiltration results not meeting the Permit requirements. On September 14, 2012, the IEM notified NYCDPR that Stockpile DSS consisting of 8,000 cubic yards of cover layer material was approved for import to the Site since the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of September 14, 2012.

On September 20, 2012, the IEM notified NYCDPR that a portion of the 14,000 cubic yards of cover layer material sampled on September 14, 2012 was approved for import to the Site. Stockpile FFS consisting of 6,000 cubic yards of cover layer material was approved was based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile NW consisting of 8,000 cubic yards had acceptable environmental results meeting the Site Permit requirements but was not approved due to infiltration results not meeting the Permit requirements. On September 21, 2012, the IEM notified NYCDPR that Stockpile NW consisting of 8,000 cubic yards of cover layer material was

approved for import to the Site since the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of September 21, 2012.

On September 28, 2012, the IEM notified NYCDPR that a portion of the 12,000 cubic yards of cover layer material sampled on September 21, 2012 was approved for import to the Site. Stockpile SW consisting of 2,000 cubic yards of cover layer material was approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile DSS consisting of 10,000 cubic yards had acceptable environmental results meeting the Site Permit requirements but was not approved due to infiltration results not meeting the Permit requirements. On October 2, 2012, the IEM notified NYCDPR that Stockpile DSS consisting of 10,000 cubic yards of cover layer material was approved for import to the Site since the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of October 2, 2012.

On October 8, 2012, the IEM notified NYCDPR that all of the 16,000 cubic yards of cover layer material sampled on October 2, 2012 was approved for import to the Site. Stockpile SW consisting of 6,000 cubic yards of cover layer material was approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile NW consisting of 10,000 cubic yards which had acceptable environmental results meeting the Site Permit requirements was approved based on the fact that the average of the infiltration test results met the Permit requirements and the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of October 9, 2012.

On October 18, 2012, the IEM notified NYCDPR that all of the 16,000 cubic yards of cover layer material sampled on October 9, 2012 was approved for import to the Site. The stockpiled cover layer material was approved was based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results.

On November 7, 2012, the IEM notified NYCDPR that all of the 16,000 cubic yards of cover layer material sampled on October 24, 2012 was approved for import to the Site. Stockpile SW consisting of 6,000 cubic yards of cover layer material and Stockpile NW consisting of 10,000 cubic yards of cover layer material were approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results.

On May 8, 2013, the IEM inspected previously tested and approved cover layer material (sampled October 24, 2012) at the source site and notified NYCDPR that import may resume for the previously approved material.

On July 25, 2013, the IEM notified NYCDPR that the latest round of East Coast Mines cover layer material (approximately 8,000 cubic yards) was acceptable for import to the Site. The submitted infiltration and environmental lab reports for sampling witnessed by the IEM on July 19, 2013 met the Site Permit requirements.

Approximately 167,007.05 cubic yards of cover layer material were imported to the Site from this source site.

3.1.2.4 Amboy Aggregates (415 Main Street, South Amboy, NJ)

The IEM reviewed the infiltration and environmental lab reports for cover layer material (2,000 cubic yards) sampled on August 27, 2012. The IEM notified NYCDPR on September 6, 2012 that the environmental results were acceptable per the Site Permit requirements, however the infiltration results did not pass the Permit requirements for cover layer material. The IEM's involvement on this source site was limited to witnessing the collection of the soil samples for testing and a review of the lab results.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

3.1.2.5 Long Island Compost/Great Gardens (445 Horseblock Road, Yaphank, NY)

On November 16, 2012, the IEM notified NYCDPR and LAWS that the Long Island Compost/Great Gardens source site (DEC Permit Number: 1-4722-03647/00001) was conditionally approved to allow for the import of topsoil to be used as cover layer material pending IEM visual inspection and witnessing the collection of soil samples of the proposed material at the source site.

On December 7, 2012, the IEM notified NYCDPR that the 2,000 cubic yard stockpile of cover layer material sampled at this source site on November 30, 2012 was acceptable for import to the Site as both environmental lab results and visual inspection met the Site Permit requirements. The NYSDEC waived infiltration testing requirements for this material as long as the material was used solely in tree pits.

The IEM witnessed sample collection for a 2,000 cubic yard stockpile of proposed cover layer material at this source site on March 20, 2013. On March 28, 2013, the IEM notified NYCDPR and LAWS that the submitted sample results did not pass the Site Permit criteria due to the fact that Benzo(a)pyrene exceeded the permit limit of .061 mg/kg in sample 49369 with a value of .097 mg/kg and Chromium exceeded the permit limit of 19.4 mg/kg in sample 49369 with a value of 22.9 mg/kg. The material was not approved for import to the Site as cover layer material at that time.

On April 9, 2013, the IEM notified NYCDPR and LAWS that the submitted sample results for a 2,000 cubic yard stockpile of proposed cover layer material at this source site (sampled on March 20, 2013) did not pass the Site Permit criteria due to the fact that Benzo(a)pyrene exceeded the permit limit of .061 mg/kg in sample 49369 with a value of .097 mg/kg. The revised lab report dated April 8, 2013 addressed concerns with the analysis of trivalent and hexavalent chromium (the previous lab report had only analyzed total chromium). On April 10, 2013, the NYSDEC notified NYCDPR that after further review of the revised lab results, the 2,000 cubic yards of material was acceptable for import to the Site.

On April 29, 2013, the IEM notified NYCDPR and LAWS that the submitted sample results for a 2,000 cubic yard stockpile of proposed cover layer material at this source site (sampled on April 19, 2013) did not pass the Site Permit criteria due to the fact that Benzo(a)pyrene exceeded the permit limit of 0.061 mg/kg with

a value of 0.140 mg/kg and Dibenzo(a,h)anthracene exceeded the permit limit of 0.014 mg/kg with a value of 0.020 mg/kg. On May 1, 2013, NYCDPR requested approval to use the material as backfill for the tree pits only. On May 1, 2013, the NYSDEC notified NYCDPR that the 2,000 cubic yards of material was acceptable for import to the Site.

On May 14, 2013, the IEM notified NYCDPR and Triton that the submitted environmental and infiltration sample results for 2,000 cubic yards of proposed cover layer material at this source site (witnessed by the IEM and sampled on April 30, 2013) was acceptable for import to the Site as both environmental and infiltration results met the Site Permit requirements.

On October 28, 2013, the IEM notified NYCDPR that that a review was completed for a 2,000 cubic yard stockpile of proposed cover layer material from this source site. The proposed material was visually inspected and sampling was witnessed by the IEM on October 16, 2013. Although the material passed the IEM's physical/visual inspections and did not yield any PID detections, the sampled material did not comply with Site Permit criteria for the following parameters: Benzo(a)pyrene exceeded the permit limit of 0.061 mg/kg in sample GBF65277 with a value of 0.150 mg/kg; Dibenzo(a,h)anthracene exceeded the permit limit of 0.014 mg/kg in sample GBF65277with a value of 0.024 mg/kg; and Dieldrin exceeded the permit limit of 0.044 mg/kg in sample GBF65277 with a value of 0.100 mg/kg. On October 29, 2013, NYCDPR submitted additional documentation to the NYSDEC for evaluation. Based on review of submitted information, the NYSDEC notified NYCDPR on October 29, 2013 that this material may be imported to Site and used solely for backfilling the parking lot curb planters and shall not be used as capping material.

On March 11, 2014, the IEM notified LAWS and NYCDPR that the 2,000 cubic yard stockpile of cover layer material originally sampled and witnessed on October 16, 2013 was acceptable for importation. On March 11, 2014, the IEM completed a site visit and performed a visual inspection of the existing stockpile at the source site.

Approximately 8,434.85 cubic yards of cover layer material were imported to the Site from this source site.

3.2 On-Site Fill Importation Inspections

3.2.1 Process

As required under Special Condition 24 of the 2014 Permit, all fill importation was inspected at the Site by the IEM. Fill material volume (truck volume) was measured and recorded for each delivery of fill material as it arrived on-site by NYCDPR's appointed representative. The fill material was then inspected by the IEM at the observation platform near the entrance to the Site. At this time, the fill material was visually and chemically inspected. The visual inspection included observations of the material, disturbing the material with a shovel, and close-up observations of the material retrieved by shovel while still in the truck or trailer. Chemical inspection of the fill material was executed using a calibrated PID. If the fill material failed to meet the Permit requirements for reasons such as a PID reading above ambient air, the presence of asphalt or some other unauthorized debris, etc., the load was rejected immediately prior to

dumping. If the material was rejected, the truck was not allowed to dump on-site and was directed to exit the site immediately.

If the fill material passed the initial inspection at the IEM observation platform, either it was allowed to dump directly at a work location for immediate use as shaping layer material or cover layer material or it was transported to, and dumped at, a stockpile location. At the dump location, the IEM screened the fill material visually and with a PID for a second time prior to spreading if dumped at an active work location. If the fill material did not meet the permit requirements at the dump location, it was immediately rejected, loaded back onto the same truck, and transported off-site.

After the second round of inspection and after the material was dumped on-site and accepted for use, the IEM recorded dump and stockpile locations utilizing handheld GPS units. The data was uploaded to a web-based GIS system intermittently throughout the process in order to provide real-time data to authorize users including the NYSDEC and NYCDPR and to generate figures used to track the dump locations in the biweekly FMRs. The web-based GIS database was maintained by the IEM. Figure 2, included in each FMR beginning with FMR 246, identifies where fill materials were being used and dumped on the Site during construction activities.

A flow chart detailing the on-site fill importation inspection process is included as Appendix 21.

3.2.2 Trucking Manifests

Trucking manifests were utilized for all imported shaping layer and cover layer materials. A 5-ply manifest form was completed for each load of material to track each load of material from origination at the source site to destination at the Site. The manifest contained information including but not limited to a manifest number, the source site name and address, the truck driver's name, truck and trailer license plate numbers, as well as the time of departure from the source site and arrival time at the Site. See fill import manifests included in Appendix 13.

Note that manifests for material approved for importation prior to November 2008 cannot be retrieved and are not included in Appendix 13. The manifest information was stored in a NYCDPR document repository that was damaged by flooding and the files have been lost. However, the FMRs for the time period prior to 2008 comment on the nature of this work.

3.2.3 Rejected Trucks & Materials (JFK Consent Order Material & Misc. Debris)

Generally, materials were either rejected upon initial inspection at the IEM observation platform or rejected upon dumping at the work area or stockpile location. The most common reasons for rejection were the presence of asphalt or other unauthorized debris mixed with the material or elevated PID readings.

Details for all rejected trucks were included in each bi-weekly Fill Management Report (FMR). Trucking manifests associated with rejected truckloads were marked with the word "REJECTED" by the IEM. Trucking manifests for rejected trucks are included as Appendix 13.

During 2010, fill material from one particular source at JFK Airport was brought on-site and placed in seven different stockpiles ultimately being used as fill material beneath the clubhouse and maintenance building parking lots. The material was believed to be in conformance with permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. On January 10, 2011, NYCDPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to this fill material. The Consent Order is included as Appendix I, of the 2013 Engineering Report included in Appendix 20.

3.3 Fill Tracking

Special Condition 9 of the 2014 Permit required quantification of all imported fill material. Fill importation was continuously tracked by the IEM. To account for the difference in truck volume and in-place volume, the IEM applied a 41.7% correction factor for shaping layer material and an 18% correction factor for cover layer material as set forth in the Permit. Additional details and methodology related to calculation of the shaping layer correction factor is included in a December 11, 2009 letter included in Appendix 19.

The cover layer material correction factor was separated from the shaping layer correction factor and revised in accordance with a NYCDPR submittal dated April 1, 2013 and revised April 8, 2013. The methodology for calculating the cover layer material correction factor is included in the revised April 8, 2013 submittal, which is included in Appendix 19.

As shaping layer and cover layer fill materials were imported to the Site, the IEM tracked volumes for each source site with respect to authorized volume based on approved sample analysis results for each source at the required sampling frequency (i.e. per 10,000 cubic yards for shaping layer material and per 2,000 cubic yards for cover layer material as included in Special Condition 14 of the 2014 Permit). The volume of imported material was tracked real-time as the IEM uploaded source, truck, and fill material volume information as each load of material was dumped on the Site. The fill tracking process, as part of the overall environmental monitoring and database management web-GIS system developed by the IEM and utilized beginning on October 25, 2010, was awarded a New York Chapter American Council of Engineering Companies (ACEC) Platinum Award in April of 2013. The web-GIS system allowed the IEM to upload and store data related to each load of fill material entering the Site, map its location, and allow real-time access to the data and mapping for NYCDPR, NYSDEC, the Contractor, and the general public.

At various times throughout fill importation activities, source site, shaping layer, or cover layer material totals were modified for various reasons. Additional details related to corrections and modifications can be found in Section 4 of corresponding Fill Management Reports, notably FMRs 213, 266, 277, 290, and 305.

Effective with FMR 290 and retroactive to October 25, 2010 (i.e. Woodard & Curran's first day as the IEM on-site at the Site), shaping layer and cover layer material volumes were tracked based upon the calculated volumes within each truck, as calculated by TRC and provided to the IEM (i.e. Tables 4-2 and 4-3 of each FMR). This provided for the most accurate and consistent approach to monitoring the volume

of imported fill materials. Prior to receipt of the calculated volumes from TRC, the IEM tracked estimated volumes as trucks dumped on the Site.

The Fill Delivery Summary Table included in Appendix 11 contains information related to the total amount of shaping layer and cover layer materials imported to the Site. The total volume of shaping layer material imported to the Site since October 18, 2002 was 2,681,338.15 cubic yards (truck volume) or approximately 93.4% of the authorized amount under the Permit. The total volume of cover layer material imported to the Site since October 18, 2002 was 480,959.49 cubic yards (truck volume) or 100.1% of the authorized amount under the Permit.

On April, 17, 2014, the NYSDEC confirmed via email that a minor exceedance of the cover layer in-place volume as included in the Permit is acceptable considering no additional shaping material will need to be imported and that the exceedance could be addressed via as-built drawings and in the final construction certification report. A copy of the email is included in Appendix 19.

The Bronx-Whitestone Bridge bound the "Site" to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south. The project was originally managed under Ferry Point Partners, LLC (FPP).
On July 17, 2000 the New York State Department of Environmental Conservation (NYSDEC) issued Part 360, Solid Waste Management Permit No. 2-6006-00014-000110 jointly to the New York City Department of Parks and Recreation (NYCDPR) and FPP to allow a total of 1,000,000 cubic yards of fill to be imported and placed on the Site. Importation began in August 2000.

On October 18, 2002 the NYSDEC issued Part 360, Solid Waste Management Permit No. 2-6006-00014-000113 (2002 Permit) to allow a total of 1,522,300 cubic yards of fill to be imported and placed on the Site. The fill material was to consist of approximately 1,272,300 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The 2002 Permit also stated that, "approximately 415,000 cubic yards of fill was deposited on the Site prior to the effective date of the permit and the projection for in-place fill material to complete the project was 1,107,300 cubic yards, consisting of approximately 857,300 cubic yards (in-place volume) of select exempt construction debris for the shaping layer and approximately 250,000 cubic yards (in-place volume) of uncontaminated soil for the cover layer.

In 2003, it was determined that the tournament quality and signature status of the course could be significantly improved by making the facility a "links" style course. The changes from the 2002 Permit include:

- Increasing the support mounding between golf holes and grading the course in a links style.
- Re-routing of holes 11, 12 and 13 to reverse their direction in order to improve player circulation and playing time.
- Moving Hole 9 to the west of the golf driving range in order to improve

the safety zone of the driving range and remove the need for high netting.

- Realigning the centerlines of holes: 10, 16, 17 and 18 to improve the strategic layout and visual experience of the golf course.
- Lowering the elevations of tee 4 and 6. This will eliminate the retaining wall proposed at the northeast comer of the Site.
- Adding a golf training area at the north end of the driving range. This required shifting the centerline of Hole 8 slightly north and increasing the support mounding around this area to buffer the adjacent holes.
- Increasing the mounding adjacent to the TBTA toll plaza in order to block noise and adjacent traffic from view.
- Shifting the Site roadway along the east side of the bridge to accommodate a TBTA easement that extends 25 feet east of the bridge. This required changes to the parking lot at the clubhouse and the location of detention/water quality basin, and waterfront park.
- Eliminating the Boathouse Grill restaurant in the Waterfront Park. A restaurant will now be located within the banquet facility. Parking spaces for the banquet facility were increased to accommodate the restaurant. A restaurant may be constructed within the waterfront park in a future phase, based on economic demands.
- Modifying the parking lot for the Waterfront Park. The 120 parking' spaces for the Waterfront Park will be located near the Whitestone Bridge approach structure.

These proposed changes to the golf course would have increased the total in-place fill volume for the project to 2,370,000 cubic yards to shape the course in a links style.

The quantification of the imported fill material was to be continuously tracked by both truck volume and periodic topographic surveys of in-place volumes. Initially it was assumed that truck volume would be reduced by 25% when compacted into place, but a new correction factor was to be calculated. On November 1, 2004, the NYSDEC approved a revised truck reduction factor of 42.4%, which was based upon an October 10, 2003 30% aerial topographic survey, and On December 7, 2004, the NYSDEC approved a revised truck reduction factor of 41%, which was based upon a July 17, 2004 60% aerial topographic survey. These recalculations were performed by dividing the actual in-place volume by the total cubic yards of truck volume delivered to the site as of the date of the survey as per the “2002 Permit

TRC Raymond Keyes Associates, A Division of TRC Engineers, Inc. prepared an, “Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY – Engineering Report; Dated May 31, 2005; Revised June 30, 2005” which comprised of Volume #1, Volume #2 and a twenty six (26) sheet drawing set entitled, “Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2” (2005 Report) . The 2005 Report represented the following scope of work:

- An eighteen (18) hole golf course with practice area.
- Maintenance Area in the northwest corner of the Site.
- Clubhouse Parking Lot in the southwest portion of the Site.
- Banquet Facility in the southwest portion of the site (along Emerson Avenue)
- Community Park
- Waterfront Park with parking lot.
- Drawing G-3 and G-4 of "Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2", showed the deviations in grading between the plans approved on 10/18/02 with the proposed plan.

On November 18, 2005 the NYSDEC issued Part 360, Solid Waste Management Permit No. 2-6006-00014-000113 ("2005 Permit") authorizing the importation of a total of 2,370,000 cubic yards of in-place fill material to the Site. The fill material was to consist of approximately 2,120,000 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The truck reduction factor was 41% and could be further modified.

In 2007, TRC Engineers, Inc. ("TRC") was awarded a one (1) year contract to provide "Civil, Environmental and Construction Services for Compliance with DEC permit Related to the Construction of a Golf Course at Ferry Point Park". The order to work date for that contract was October 25, 2007. The scheduled completion date was October 23, 2008. The contract was extended an additional year to October 24, 2009. On October 26, 2009, "TRC" issued a "Year 2 End Project Summary" and estimated that approximately 202,000 total cubic yards of material was imported to the Site by October 22, 2007.

On October 26, 2007, the NYCDPR and FPP terminated the license agreement to develop, construct and operate the Project at the site and on February 29, 2008 FPP submitted an application to transfer the "2005 Permit" solely to the NYCDPR. On August 12, 2008, the NYSDEC notified the NYCDPR and FPP that the "2005 Permit" had been transferred to the NYCDPR.

The order to work date for construction of the Community Park was August 11, 2008. Fill importation continued as witnessed by the Independent Environmental Monitor (Gannett Fleming). On September 30, 2009, Thomas Balsley Associates, NYCDPR design consultant issued a revised drawing changing the limit of the Community Park. The new Site was reduced in size by moving the fence line in the south further north and by moving the fence along the proposed golf course closer to Balcom Avenue.

On January 22, 2009, in accordance with Special Condition #10 of the "2005 Permit", TRC Engineers, Inc. (TRC) submitted a revised truck reduction factor of 40.3%. On February 11, 2010, NYSDEC approved a truck reduction factor of 41.7%.

The order to work date for construction of the Ferry Point Golf Course was October 23, 2009. The golf course layout that the NYCDPR bid was modified from that which shown in the 2005 Report. One major

change was the total removal of the Banquet Facility in the southeast part of the Site. There were also changes in the placement, alignment and grading of some holes.

On February 1, 2013, the NYSDEC granted a permit modification to increase the limit of cover material to 394,000 cubic yards with the stipulation that the Agency revisit the compaction factor. It was determined that the compaction factor for the granular cover material (sand) would be 18%. This would revise the "trucked in" quantity to 480,488 cubic yards. The compaction factor for cover layer material approved per April 26, 2013 letter from NYSDEC to DPR.

On May 21, 2014, the NYSDEC issued Part 360, Solid Waste Management Permit No. 2-6006-00014-00013 (SW) & 2-6006-00014-00013 (TW) to the NYCDPR to allow a total of 2,514,000 cubic yards of material in-place volume (2,120,000 cubic yards in-place shaping material/394,000 cubic yards in-place cover material).

3.4 Total Carcinogenic Semi-Volatile Organic Compound Tracking

As identified in Special Condition 14 of the 2014 Permit, the NYSDEC Acting Regional Director letter dated October 25, 2006, authorized the import of shaping material with a total carcinogenic SVOC (tcSVOC) level of up to ten parts per million (ppm), which would not otherwise be acceptable, provided the tcSVOC weighted average of all imported material is equal to or less than 3 ppm at the end of each quarter. The tcSVOC weighted average is defined as the sum of the products of the material volume and the material tcSVOC, for each material source, divided by the total volume of the material imported. The weighted average was calculated over the course of construction and the final weighted average for shaping layer and cover layer materials imported to the Site was 0.70 ppm, less than the 3 ppm maximum. The total carcinogenic SVOC weighted average table and computations are included in Appendix 12 for materials imported to the Site after November 18, 2005.

SVOCs were not sampled for at the East Side Access and 2nd Avenue (94th Street) source sites due to the source being undisturbed, virgin rock material generated from subway tunnel boring. NYSDEC email correspondence dated April 15, 2011 stated that the IEM should apply one-half of the method detection limit (MDL) from the latest lab report sampled at that time for materials originating from those two source sites.

4 Construction

4.1 General Construction

4.1.1 Community Park

Construction of the Community Park consisted with capping the 11 acre site, installing baseball fields, a basketball court, walkways, a comfort station, and a landscaped stormwater retention area. Construction started on August 11, 2008. As of December 31, 2011, the stormwater retention pond, passive landfill gas (LFG) vents, and recreation facilities were considered complete. The Order to Work date for the comfort

station was March 19, 2014. The original scheduled completion date was September 15, 2014. The anticipated completion date is currently the Fall of 2015.

4.1.2 Golf Course

Generally, construction for the Golf Course was completed from the northeast to the southwest. The sequence of construction started by grading, rough shaping and compacting each hole, installing major drainage lines and inlet drains, installing irrigation lines and fine shaping the holes, installing branch drainage lines, constructing the greens and tees, installing demarcation material, grading cover material, fine grading cover material, and final stabilization by hydro-seeding. Each hole was constructed individually and then turned over to Trump, who is contracted with NYCDPR to maintain and operate the grounds and golf course, for care and maintenance during the grown-in period and prior to course operations.

LAWS completed construction work, including punch list items associated with their construction contract, and demobilized from the site in July 2014. Trump has and continues to perform various earth disturbance related work on the Site, in addition to standard maintenance of the Site. All permit related activity, including earthwork, general construction, and fill deliveries have been coordinated with the IEM, and the IEM has witnessed the work activity and documented inspection observations in the Daily Observation Reports. Specifically, IEM oversight related to Trump's on-site activity includes, but is not limited to, the replacement and relocation of trees, construction of a clock tower and associated subsurface concrete footing, excavation of trenches and installation of utilities to support various on-site facilities including the temporary clubhouse, installation of a cart barn, re-grading of an existing shaping and cover layer earthen berm and subsequent installation of concrete block letters at the surface, and installation of asphalt. For a detailed description of Trump's work activities requiring IEM oversight subject to the Permit conditions, refer to the Daily Observation Reports located in Appendix 5 beginning on June 19, 2014.

4.1.3 Waterfront Park

Special Condition 37 of the 2014 Permit requires that NYCDPR submit a revised design for the Waterfront Park and provides NYCDPR the flexibility to remove the Waterfront Park from the NYSDEC Part 360 Permit and permit the project under a separate NYSDEC tidal wetlands permit. The Waterfront Park is currently in the process of being conceptually scaled back in magnitude due to the impacts of Hurricanes Irene and Sandy, and design plans are being value engineered and developed. NYCDPR intends to submit plans to the NYSDEC upon completion of an approved design, and handling the construction via a separate NYSDEC tidal wetlands permit. Any SEQR related documents will be updated accordingly. The final end use of the Waterfront Park is anticipated to be publically accessible and consists of a passive recreational feature. NYCDPR will not be performing post-construction monitoring in this area of the Site until construction is completed and approved, and will restrict public access until such time.

4.2 Environmental Controls/Construction

4.2.1 Wells (Landfill gas, groundwater and water balance analysis)

NYSDEC requested NYCDPR on August 6, 2010 to demonstrate that soil being used for final cover material (not specifically the uppermost layer) would have a sufficiently low coefficient of permeability and percentage of organic material to minimize infiltration of water into the lower layer of fill material. These comments were submitted as additional comments to the November 25, 2009 permit application submittal.

NYCDPR performed a site-wide water balance evaluation to predict post-construction infiltration rates. EPA's Hydrologic Evaluation of Landfill Performance (HELP) model was used for this evaluation. The results were presented to NYSDEC on May 13, 2011 as well as incorporated in Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East, Bronx New York October 15, 2013. The model used criteria including a typical one-foot thick soil landfill cover with the proposed soil cover material as designed for the facility. The model also accounted for impermeable areas of the site, irrigation of the golf course, drainage system stormwater capture and the lining of ponds.

The soil cover permeability of 14 inches per hour was used for the overall site model. Using this infiltration rate the overall volume of water penetrating the site would be lowered by approximately 9,700 gallons per day. A subsequent water balance analysis was submitted to NYSDEC on August 10, 2011 presenting infiltration rates with a soil permeability of 30 inches per hour that also lowered the overall volume of water infiltrating the site following completion of construction. Discussion and request for confirmation that the site drainage was adequate for a 30 inch per hour permeability took place and the final maximum permeability of 30 inches per hour was approved by NYSDEC for cover material. Cover material imported to the site was tested subsequent to this approval to insure it was able to meet the goal for material permeability. More specifically, testing was combined from individual stockpiles and sources and the average from those was used to determine acceptability of material. Individual variability in sample results was expected because loading, unloading, stockpiling and spreading over the site was recognized as providing a homogeneous layer over the site. Samples were collected at a frequency of one per 2,000 cubic yards moving forward from January 26, 2012 until importation of material was completed.

Additional impacts on water balance came from lined irrigation and retention ponds. There is one large irrigation pond located on the course and several small retention ponds located throughout the open course. The irrigation pond's purpose is to collect storm runoff during storm events and stor it to be utilized for irrigation of the upper cover layer during non-storm periods. The grading and drainage for the stormwater collection and retention were provided in the November 25, 2009 permit application. NYSDEC requested that infiltration beyond the upper layer of cover material be minimized to the maximum extent possible on August 6, 2010 and this included lining each of the five on-site retention ponds to limit infiltration as much as could be done.

The subsequent changes to cover permeability and the lining of irrigation and retention ponds required a review of the Stormwater Pollution Prevention Plan (SWPPP) in order to confirm the additional flow would

not exceed the design criteria for the storm system. The engineering review conducted at that time (October 18, 2011) confirmed the stormwater system design was adequate to carry this flow.

NYSDEC granted a conditional approval for the Ferry Point Site to accept a 30 in. percolation rate per hour cover material on October 21, 2011. The conditional approval was based on a request for DPR to "submit for approval an amendment to the Stormwater Pollution Prevention Plan (SWPPP) dated November 13, 2009, with plans and computations that reflect the partial lining of the stormwater basins." DPR provided this in a technical memorandum to NYSDEC on November 16, 2011. The memorandum presented a formal submittal of the pond liner design to NYSDEC and included excerpts of calculations from the November 13, 2009, SWPPP. An approval was provided by NYSDEC on December 2, 2011.

Municipal solid waste (MSW) filling operations ceased at the Site in the 1960s, prior to the implementation of the comprehensive environmental regulations now in place, and a formal groundwater sampling program was not required at that time. Information on groundwater quality at a former landfill site such as Ferry Point Park East can be used to help evaluate existing groundwater conditions. For the 2005 Permit application, the Site's history was reviewed and a geotechnical investigation was performed to evaluate the potential for adverse impacts on the Site's groundwater due to the placement of fill during construction of the golf course and parks.

A summary provided in the 2005 Engineering Report concluded "that the placement of fill would not have an adverse impact on pre-development groundwater conditions at the site and that the proposed golf course construction would not result in an increased flow of contamination into the river through groundwater flow." (TRC 2005a).

In their comments of June 25, 2010, NYSDEC asked DPR whether any new information was available regarding groundwater conditions at the Site, and if any new, relevant information was available, to verify the conclusions of the geotechnical portion of the 2005 Engineering Report (TRC 2005a).
Following several discussions with DPR, and because no prior sampling had been required, NYSDEC requested that DPR undertake a groundwater sampling program and develop a reference point for background water quality conditions at the Site.

To comply with this request, DPR prepared written field procedures for new well installations, well development, and groundwater sampling (see Appendix G.1).
The field procedures were submitted to, and approved by, NYSDEC prior to the start of the work effort. Prior to installation, the locations of the monitoring wells were approved by NYSDEC during a meeting held with DPR on September 22, 2011.

Landfill gas monitoring over the entire Site has incorporated various different types and configurations of monitoring points. These include perimeter and interior wells and vents that have been monitored over time on a regular frequency. Monitoring has been recorded and reported according to Special Conditions Monitoring as referenced in the March 2014 permit and results dictate continued additional monitoring when that has been necessary. This monitoring continues under the Post Closure Monitoring

requirements and in accordance with the Landfill Gas Management Plan. A total of thirty seven passive vents were installed throughout the Golf Course and Community Park on an average spacing of approximately one vent for every five acres. These vents are considered passive and allow the natural venting of subsurface gases to take place without any additional vacuum or fans. Additional active vapor removal does take place at each of the constructed buildings on the site. This includes the comfort station and maintenance shed on the Golf Course and comfort station at the Community Park. Active systems operate at both of these locations on a continual basis and vent the subsurface area beneath the associated slabs to the atmosphere. There are no structures planned for or constructed on the Waterfront Park parcel at this time.

Passive gas vents are installed throughout the golf course and are included along the perimeter within the venting trenches, within the overall golf course as individual stand-alone vents and in combined systems of interconnected piping to carry landfill gas from beneath irrigation ponds.
Landfill gas monitoring includes perimeter probes located along an approximate 250 linear ft. interval on the north, east and southern site boundaries; off-site monitoring points along Buttrick, Balcom, Schley, Miles and Emerson Avenues; a passive vent trench installed along the eastern and northern perimeters of the course with piezometers installed along the vent trench to allow for monitoring of the groundwater levels associated with the vent trenches; individual passive vents within the golf course and community park space; a passive vent system of interconnected piping serving the irrigation pond; and sub-slab depressurization systems beneath the enclosed buildings located within the golf course and community park.

In February 2012, eleven new groundwater monitoring wells were installed across the Site to obtain information on current groundwater conditions. Design documents for the groundwater monitoring wells are included in Appendix G.2 of the 2013 Engineering Report, included in Appendix 20. An initial sampling event was completed in February 2012 and included the testing activities described below.

■ Groundwater Elevation Measurements: Water depths were measured at the 11 groundwater monitoring wells. Two measurements were taken from each well within one hour each of high and low tides, starting at the shoreline and moving inland.
■ Elutriate Testing: One soil core sample per well was collected during well installation in order to perform elutriate analysis. Samples were selected from shaping material zones based on visual observation of the soil cores.
■ Groundwater Testing: Groundwater samples were collected at each of the 11 wells and shipped for laboratory analysis in accordance with the required testing as referenced in the 2002 permit.
■ Hydraulic Conductivity Testing: In situ slug testing for hydraulic conductivity was completed at each of the 11 groundwater monitoring wells.

The initial groundwater monitoring data from February 2012 was submitted to NYSDEC by email on March 28, 2012. This data is included in the report for the initial groundwater monitoring event (see Appendix G.5 of the 2013 Engineering Report, included in Appendix 20). At that time, DPR requested direction from

NYSDEC concerning procedures for future sampling events. That is, should future sample collection be modified due to the high turbidity.
(>1,000 nephelometric turbidity units [NTUs]) observed in the initial samples. A call was held with NYSDEC on May 8, 2012, to discuss the initial data and provide guidance on future monitoring (see Appendix G.3 of the 2013 Engineering Report, included in Appendix 20 for call minutes.) Also during this call, NYSDEC directed DPR to perform inorganic analyses on both filtered and unfiltered samples collected during the next sampling event. If the next round of results is found to be in expected ranges, then future sampling events will utilize only filtered samples for inorganic analyses.

NYSDEC provided DPR with requirements for future groundwater monitoring in their FPP Groundwater Characterization/Monitoring Objective, on May 8, 2012 (see Appendix G.4 of the 2013 Engineering Report, included in Appendix 20). DPR implemented the groundwater monitoring program in accordance with the schedule and monitoring parameters requested by NYSDEC.

The schedule included two additional quarterly sampling events, followed by approximately three semi-annual events (through completion of construction) and three post-construction annual sampling events. After the third annual sampling event, DPR may request to reduce the sampling frequency or cease the groundwater sampling program at the Site. Table 4-1 provides a schedule of the monitoring events that will be performed to complete this program and the parameters that will be analyzed for during each event.

Post-construction groundwater monitoring and groundwater monitoring well maintenance requirements are incorporated into the Post-Construction Custodial Care Plan for the Site (see Appendix I).

4.2.2 Liners

A single irrigation pond has been constructed at the Site. The purpose of this pond is to collect and store stormwater runoff and reuse it later for irrigation and maintenance of the golf course vegetative cover. This pond is fully lined to maximize the retention of irrigation water. The irrigation pond design documents were included in the November 25, 2009, permit application package. In addition, there are five smaller water quality ponds designed to provide active stormwater retention and limit the off-site migration of sediment. The geometry and grading (engineering design) of these ponds were also provided in the November 25, 2009, permit application package. DPR considered various methods to meet NYSDEC's request of August 6, 2010, to minimize the infiltration of water through "the lower layers of material to the maximum extent possible." Based on this consideration, DPR is implementing a recommendation contained in the November 16, 2010, memorandum (see Appendix D.1 of the 2013 Engineering Report, included in Appendix 20) to line the five on-site water quality ponds to limit water exfiltration. The pond system has been included in the overall water budget evaluation that was submitted and approved by NYSDEC in addition to the permeability of the upper imported fill material.

Supplemental drawings and specifications for the lining of these ponds are provided in Appendix D.4 of the 2013 Engineering Report, included in Appendix 20. The pond liner designs are consistent with the

previously approved geometry and grading (engineering design) presented in the November 25, 2009, permit application package.

4.2.3 Gas Venting

4.2.3.1 Active

According to the 2009 permit the site wide active landfill gas control system consistent with the proposed with the 2005 permit was withdrawn as a design modification. Active systems were installed at buildings and initially proposed for the irrigation lake.

Based on the Final Engineering report, due to the explosive nature, LFG is not allowed to accumulate within any enclosed structure at the site. Therefore active sub-slab depressurization systems (SSDS) have been installed at each of the enclosed buildings at the site. These systems have continuous explosive gas monitoring components of the design. The irrigation lake was not made active and continues as a passive system as per the September 2009 permit modification application.

The SSDS engineering drawings for the golf course facilities (maintenance building and comfort station) are provided in Appendix F.3 of the 2013 Engineering Report, included as Appendix 20. The Community Park comfort station design was provided in the November 25, 2009, permit application. The Waterfront Park comfort station has not been designed. Maintenance of the SSDS and their monitoring equipment will be performed in accordance with the operations, monitoring, and maintenance (OM&M) program for the Site's Landfill Gas management system (see Section 4.4.4). The design of any additional structures at the Site will be completed in accordance with New York City Department of Buildings requirements. The need for LFG mitigation systems for any future Site structures will be evaluated as part of their design.

4.2.3.2 Passive

The LFG management system as redesigned for the Site (since the November 25, 2009, permit application submittal) is an update of prior conceptual passive LFG designs and includes a passive system for the venting of LFG in all areas not covered by enclosed facilities. The primary goals for the design of the Site's LFG management system are to provide safe operating conditions and protect human health.

The proposed passive system is consistent with the plans presented in the 1999 EAS (AKRF 1999), the 2002 Technical Environmental Assessment (AKRF 2002), and the 2005 Engineering Reports (TRC 2005a, b) and was approved under the 2005 Part 360 Permit. It deviates from the 2009 permit renewal application prepared by TRC Engineers (TRC), which recommended an active system. An active system uses blowers or fans to extract gas through vents from the landfills subsurface, whereas a passive system uses vents without blowers or fans. Supplemental Site investigations and extraction testing performed by TRC Engineers at the Site in 2009 and 2010 were reviewed by Walsh Environmental Scientists and Engineers, LLC (Walsh) in 2010. Emissions modeling was also performed by EEEPC in 2010, as discussed in Section 4.4.1. Based on these evaluations and modeling of Site conditions, a Landfill Gas Management Plan (LFGMP) was prepared (see Appendix F.1 of the 2013 Engineering Report, included in Appendix 20). The plan concluded that a passive venting system is sufficient to achieve safe operating conditions for users and workers of the golf course and parks. A description and details of the Site's LFG management system

are presented in the LFGMP. The LFG management system as currently designed is consistent with the proposed venting system described in the 2005 Permit.

4.2.4 Vent Trench

The landfill gas perimeter trench was the primary gas-management structure installed in or about 2001. The Trench was initially proposed in the 1999 conceptual LFG control system. The purpose of the vent trench was to capture and prevent the off-site migration of LFG. The 2002 AKRF Report included installation details and certified drawings of the trench and its details.

The LFG trench was constructed along the eastern and a portion of the northern perimeter and was completed in 2001. The trench begins at the water's edge at the foot of Emerson Avenue, continues along the length of the Balcom Avenue Site boundary and continues approximately 1050 ft. in a westerly direction past the intersection of Schley and Buttrick Avenues.

The LFG passive trench is essentially a stone-filled /geotextile-wrapped envelope that begins three feet below the groundwater surface and extends upward to just below the ground surface. The upper 6 inches of the trench is dressed and finished with a layer of wood chips that allow LFG entering the trench to vent to the atmosphere. During the construction there were some areas where stability of the fill material at the water table was noted to be an issue and in these areas the trench was extended to a depth of one foot below the groundwater surface. In addition to the gravel filling of the trench to allow for a porous medium allowing LFG to move upward and escape, a continuous 4 to 6 inch diameter perforated PVC pipe was buried in the upper portion of the stone backfill. Vertical passive vents are connected to this horizontal piping to allow for future modifications should the top of the trench need a cap installed above it. The trench will collect and disperse any and all LFG that comes into it but it was primarily designed to remove methane from passing beyond the site boundary. The vent trench was specifically installed below the elevation of measured groundwater in order to maintain a constant layer of saturation within the lower part of the trench. This groundwater layer would prevent landfill gas from migrating beneath the trench and off of the site. Passive vents were also installed within the trench to allow a rapid ascent of LFG out of the trench and into the atmosphere. Concentrations of LFG that could be an issue within the trench would immediately be diffused in the atmosphere and reduced to a concentration that is not a concern.

Following the installation of the trench, methane concentrations were noted to have declined significantly, demonstrating the effectiveness in controlling LFG in the area.

Landfill gas migration is influenced by a number of factors including barometric pressure, diffusion gradients, composition and distribution of subsurface soil and fill material and groundwater. As landfill gas builds up and accumulates, it moves outward from the points or areas /zones where it is generated, spreading into other areas. Landfill gas migrating vertically will reach the surface and diffuse when it mixes with ambient atmospheric air. The other main concern for migration from the landfill was horizontal migration from the landfill to areas off-site. This horizontal migration can be controlled and to a significant extent can be eliminated through the use of LFG trenches. The LFG trench configuration can prevent accumulated gas from passing beyond the site because it creates an area allowing for diffusion and mixing of LFG with ambient air. The overall trench is constructed and filled with material of a higher

permeability than the surrounding soil or fill and typically offers a more direct connection to the open atmosphere. The base of the trench is extended into the water table which performs two functions that both increase the opportunity for LFG to be removed and thus prevent it from migrating offsite. The first offers a more open contact of the shallow groundwater surface to ambient air allowing dissolved concentrations to be volatilized out of the water column into the air and the second prevents LFG that exits from the landfill soil from travelling beneath the trench out beyond the site.

Approximately 5,350 feet of LFG passive vent trench was constructed along the site boundary between May 2001 and December 2001.

Routine inspections of the LFG passive vent trench included the following observations, depth of wood chip layer over geotextile, excessive fine grained materials, vegetation, erosion along the vent trench and any other condition that may have a potential to compromise the ability of the LFG passive vent trench to intercept and transmit LFG to the atmosphere. Refer to the non-conformance table. Monitoring includes routine bi-weekly observations and inspection of the following specific components of the trench:

- Observation of the covering wood chips to insure they extend to and are level with the ground surface and are free of excessive fine grained materials that would restrict the flow of LFG from the trench once it is intercepted.
- Observation of the vertical hard piping risers to insure they do not show signs of cracking bends or breaks;
- Observation of the vertical riser piping to insure they remain vertical and anchored as they were installed;
- Observation of the vertical vents and openings to insure they remain open.

Continued monitoring of the trench is described in Special Conditions 30 of the modified Permit with NYSDEC. This includes monitoring of groundwater levels in the adjacent monitoring wells. If the groundwater is noted below the bottom of the trench, the following actions are initiated:

1. Evaluate the methane concentrations in nearby perimeter methane monitoring wells and semi-permanent monitoring points. If the methane concentrations measured that day are below the site-specific action level of 25% LEL, continue the normal (bi-weekly) methane monitoring frequency and increase the groundwater level measurements at the location of concern to bi-weekly.
2. If the groundwater level measured at the initial bi-weekly monitoring event is above the base of the vent trench, then defer back to the routine monthly piezometer monitoring frequency.
3. If the groundwater level remains below the trench bottom for the first additional bi-weekly monitoring event, but nearby perimeter methane monitoring wells and semi-permanent monitoring points are below the site-specific methane action level of 25% LEL, continue groundwater level and methane monitoring at a bi-weekly frequency until such time as the

groundwater level is above the base of the trench. Then defer back to the routine monthly piezometer monitoring frequency.

4. If the groundwater level remains below trench bottom for the first additional bi-weekly monitoring event, and nearby perimeter methane monitoring wells and semi-permanent monitoring points are at or above the site-specific methane action level of 25% LEL, then continue monitoring the groundwater levels and methane concentrations for the second bi-weekly event.
5. If the groundwater level remains at or below the trench bottom for the second bi-weekly monitoring event, and the nearby perimeter monitoring wells and semi-permanent monitoring points remain at or above the site-specific methane action level of 25% LEL, further recommendations will be made to NYSDEC.

4.2.5 Landfill Cap

In accordance with provisions of the Permit dated May 21, 2014 the landfill was capped with minimum of one foot of shaping layer material over the landfill and one foot of cover layer material over top of the shaping layer material. In areas where there was less than 4 feet of shaping material over the waste layer, a layer of demarcation material was installed. See Section 4.4 for additional information related to the landfill cap construction.

The permit authorized importation of 2,514,000 cubic yards of material to the Site for overall capping of the waste material. This consisted of approximately 2,120,000 cubic yards of select exempt construction and demolition (C&D) debris for the shaping layer, and approximately 394,000 cubic yards of cover material. Specific restrictions were incorporated into the material and those restrictions were maintained and are described under the importation section of this Report. Final surface components of the cap including; greens, contour, heights and top soil) were incorporated into the site under the Nicklaus Design Technical Specification of the June 30, 2005 Engineering Report. This included:

- Greens-Mix imported to the site and tested as per the material testing requirements. Fertilizer and soil amendments applied on the greens after spreading to construction specifications and then grassed as per the specifications.
- Topsoil-Imported to be consistent with native topsoil, and free of rock and debris greater than three quarters of an inch as per Exhibit C of the Engineering Report. Soil amendments, fertilizer applications and seed were added to tee, fairway and rough areas as per Exhibit C of the June 30, 2005 Engineering Report.

4.2.6 Environmental Controls On-Site Structures

Due to its potentially explosive nature, LFG shall not be allowed to accumulate within any enclosed structure at the Site. To protect the occupants, an under slab vent system for each enclosed building shall be installed and continuously operated. The LFGMP (see Appendix F.1 of the 2013 Engineering Report, included in Appendix 20) describes the active sub-slab depressurization systems (SSDS) that have been designed for the under-slab of each enclosed building at the Site. These systems will have continuous explosive gas monitoring with local and remote alarm capabilities. The SSDS engineering drawings for the

golf course facilities (maintenance building and comfort station) are provided in Appendix F.3 of the 2013 Engineering Report, included in Appendix 20. The Community Park comfort station design was provided in the November 25, 2009, permit application.
Maintenance of the SSDS and their monitoring equipment will be performed in accordance with the operations, monitoring, and maintenance (OM&M) program for the Site's Landfill Gas management system (see Section 4.4.4). The design of any additional structures at the Site will be completed in accordance with New York City Department of Buildings requirements. The need for LFG mitigation systems for any future Site structures will be evaluated as part of their design

Low-permeability soil/bentonite collars ("soil collars") will be installed for all utility trenches that contain permeable bedding in order to prevent the migration of LFG into enclosed buildings at the Site. The soil collars will be installed around the water and sewer pipelines, within the trenches at the subsurface location where the pipeline crosses above the building foundation (the building line). Each soil collar will be passively vented as described in the LFGMP (see Appendix F.1 of the 2013 Engineering Report, included in Appendix 20) and as shown on the engineering design drawings in Appendix F.2 of the 2013 Engineering Report, included in Appendix 20. Similarly, conduit seals will be used for electrical conduits that are installed in trenches using permeable bedding materials. The conduit seals will be installed at the building lines. Other utility LFG controls include the under slab passive venting for the aboveground double-check valve (DCV) enclosure. The DCV enclosure is for the potable water supply line as it enters the golf course site. Detailed design drawings for the venting the DCV enclosures are provided in Appendix F.4 of the 2013 Engineering Report, included in Appendix 20. The need for LFG venting for any future Site subsurface vaults will be evaluated as part of their design.

4.3 Municipal Solid Waste (MSW)

Municipal solid waste ("MSW") was generated throughout site development and excavation activities. MSW material was not utilized as fill material on-site after it was encountered and excavated during construction activities with the exception of MSW excavated and reused on-site in accordance with an Order On Consent issued by the NYSDEC and fully executed as of January 4, 2004 (Order On Consent No. R2-20030724-187). A copy of the executed consent order is included in Appendix 19. In accordance with Special Condition 8 of the 2014 Permit, upon encountering MSW during site development, the material was transported and properly secured into segregated stockpile locations prior to off-site disposal. MSW material consisted of metal, glass, tires, plastics, rubber, paper, fabrics, and miscellaneous debris not suitable for the shaping layer. Refer to Section 4.5 of this report to review further details regarding the minimum fill cover over top of the MSW.

Prior to stockpiling any excavated MSW, the existing ground surface was covered with an impermeable plastic membrane. The stockpile was then encircled with silt fence and the stockpile was covered with an impermeable plastic that was secured with sand bags after the MSW was stockpiled and prior to off-site disposal.

Waste characterization sampling was performed prior to off-site removal as required prior to acceptance by each solid waste facility. Prior to disposal, waste samples were collected from each of the stockpiles

and analyzed to determine if the material was hazardous and to determine a suitable NYSDEC facility for disposal by way of a permitted hauler. A January 22, 2010 letter approving Seneca Meadows Landfill as a disposal facility is included in Appendix 19.

Residual MSW excavated by Trump associated with utility and drilling work at the Golf Course stockpiled in the adjacent Waterfront Park have been removed.

4.3.1 Manifests

Manifests were collected for each load of MSW generated and disposed of off-site. Manifests were completed for each load of MSW prior to leaving the Site. Completed manifests contained the following information: driver signatures and appropriate transporter information, facility designation including the address for the facility that was receiving the material, a description of the material being transported, the site generator's mailing and site address, and a total quantity of the material leaving the Site. The weight of MSW was determined by weighing the material (in tons) during the loading process. The MSW was loaded with a pay loader with a scale attached to the bucket. A receipt for the weight of each load was printed and was presented to NYCDPR with the manifest for review. NYCDPR and/or their designated representative signed the manifests as the generator, and then the manifests were then presented to the IEM for final verification.

Copies of the MSW disposal manifests are included in Appendix 14.

Note that MSW manifests accounting for material prior to October 25, 2010 (i.e. Woodard & Curran's first day on-site as the IEM), cannot be retrieved and are not included in the appendix. The information was stored in a NYCDPR document repository that was damaged and the files have been lost. However, the FMRs prior to October 25, 2010 comment on the nature of this work.

4.4 Earthwork/Fill Placement

Earthwork and fill placement for this Project were performed in accordance with the Permit. A response received from NYSDEC on July 28, 2009 (included in Appendix C.2 of the 2013 Engineering Report, included in Appendix 20), provided additional clarification regarding what are considered active and passive recreational areas. As per this letter:

Active Recreation – "…all other areas that are not covered with a building or other impermeable cover system… are deemed active recreational areas."

Passive Recreation – "…the golf course is deemed a "passive recreational area" and is required to have a one foot thick cover layer over a demarcation layer."

Following this directive, NYCDPR requested clarification from NYSDEC regarding the demarcation layer requirement for the extent of the Golf Course. The request for clarification was based on the need for further specificity regarding the use of a demarcation layer on the Golf Course.

In response, NYSDEC and NYSDOH reviewed a summary of the analytical data for all the shaping material imported to the Site. Upon review of the data set, confirmatory analytical sampling of the in-place shaping material was requested by the NYSDEC and NYSDOH. NYCDPR conducted test pit sampling and analysis under an approved work plan and submitted the data to the NYSDEC on February 16, 2011.

In their letter dated March 9, 2011, the NYSDEC stated that "NYSDOH reviewed the shaping layer test pit data and determined that it confirmed existing shaping layer data." The NYSDEC and NYSDOH agreed that a demarcation layer would not be required at areas of the golf course having a fill thickness of five or more feet of combined shaping and cover layer materials. The March 9, 2011 letter is included in Appendix C.3 of the 2013 Engineering Report, included in Appendix 20.

The aforementioned directives were the basis for the earthwork, fill placement, and landfill capping process. Additional details related to shaping layer material placement, demarcation layer installation, cover layer material installation, and related construction is as follows.

4.4.1 Shaping Layer Material

The Permit requires a minimum of one foot of clean shaping layer material to be installed over top of the existing MSW prior to cover layer material placement. Specific to the Golf Course, grading and compaction activities associated with the shaping layer material were generally completed by hole, consistent with the golf course architect's design. Once grading and compaction of the shaping layer material was completed, NYCDPR completed topographic surveys of the newly graded shaping material layer to assist in determining the depth of clean shaping layer material that was present over the pre-existing landfill surface. These shaping layer material surveys were generated intermittently as shaping layer material installation was completed in sections of the Golf Course.

An analysis was conducted by the IEM, which compared compiled historic surveys from 1998 to the final shaping layer surface surveys completed by NYCDPR. The 1998 surveys included elevations representative of the landfill surface for the Site prior to the earthwork associated with the Project. Based on an analysis and comparison of the survey data, portions of the Site that had less than four feet of approved shaping layer material were identified in a series of earthwork analysis drawings that were provided to the NYSDEC. The earthwork analysis drawings are included in Appendix 10. These plans identify the depth of shaping layer material and show the general progression of shaping layer material filling across the Site. Figure SP-001 entitled "Shaping Layer Material Earthwork Analysis via Surveys" includes a site wide earthwork analysis compiled from the various Site surveys and earthwork analyses completed as construction progressed at the Site.

In areas identified on the earthwork analysis drawings to have less than one foot of clean, in-place shaping material, test pits were performed by the Contractor and observed by the IEM to verify that a minimum of one foot of shaping layer material was present over the MSW, per the plans and Permit requirements.

If areas were found to have less than the required one-foot minimum of shaping material and could not receive additional fill based on the design plans, these areas were adjusted by over excavating the MSW

and backfilling with clean shaping layer material. This process was necessary in order to maintain the designed grades and comply with the Permit conditions. With oversight by the IEM, areas with MSW encountered at shallow depths in the tests pits were excavated outwards from the test pit location until one foot of clean shaping layer material was present. See Figure SP-100 entitled "Shaping Layer Material Test Pit Plan", which includes test pit locations superimposed on an earthwork analysis that visually represents the frequency, location, and presence of MSW within the required one foot minimum shaping layer section prior to reshaping. All test pit locations and the limits of the over-excavation were GPS located by the IEM utilizing a handheld GPS unit. Test pit locations were spaced 50 feet apart over the entire areas that the survey analysis estimated to have less than one foot of shaping layer material. In addition, if MSW material was encountered within the one-foot minimum shaping layer, the frequency of test pits were increased at the IEM's discretion to more accurately determine the extent of over-excavation required. Observations of test pit activities associated with evaluating the shaping layer material thickness are detailed in the IEMs Daily Observation Reports.

4.4.2 Demarcation Layer

Consistent with Special Condition 14 of the 2014 Permit, a demarcation layer was installed at the Site, specifically the Golf Course, where the combined thickness of shaping layer and cover layer materials combined were less than five feet. For this Project, "demarcation layer" meant a brightly colored, permeable plastic material placed on top of the Site's shaping layer material and directly beneath the Site's final cover layer material that is easily recognizable during an excavation. The request was made for the protection of Site workers during any future excavation work beneath the cover layer at the Site. Demarcation layer material for this Project consisted of orange construction fencing for the Golf Course.

On July 10, 2012, the NYSDEC confirmed that a nine-inch thick asphalt and subbase layer for the cart paths did not require any underlying cover material or demarcation layer. A black geo-grid material was installed under the cart paths associated with the Golf Course as part of the design. A copy of the correspondence is included in Appendix 19.

On November 21, 2012, the NYSDEC notified NYCDPR that demarcation layer may be eliminated from under ponds as NYCDPR identified that demarcation layer was not required as part of the Permit. A copy of the November 21, 2012 correspondence is included in Appendix 19.

NYCDPR prepared a Demarcation Layer Plan based on a comparison of final design grades and the top of waste elevations extrapolated from soil boring data. The Demarcation Layer Plan is included in Appendix C.4 of the 2013 Engineering Report (Appendix 20). Field verification that the demarcation requirements were being met was performed continuously and routinely by the IEM to confirm Permit compliance as outlined in the shaping layer material section above. Based on the data gathered from the earthwork analysis plans and the test pit excavations, actual areas requiring demarcation layer were identified.

In instances where NYCDPR felt that the installation of demarcation material was not necessary, test pits were excavated to four feet below grade, spaced 50 feet apart, to determine if there was more than four feet of clean shaping layer material installed over MSW. If it was determined via test pits that there was

more than four feet of clean shaping layer material present, demarcation material was not installed. The reasoning assumed a one foot thick cover layer installation and considered the March 9, 2011 NYSDEC/NYSDOH correspondence determining that demarcation layer was not required if the combined fill thickness above MSW was five feet or greater. The March 9, 2011 correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

All areas with less than four feet of shaping layer material present that required the installation of demarcation layer material are identified on Figure SP-200 entitled "Demarcation Layer Plan". The limits of demarcation layer material, as represented on Figure SP-200, were located by the IEM using handheld GPS units at the time of installation, prior to cover layer material installation. Areas associated with the cart paths are also identified on Figure SP-200.

4.4.3 Cover Layer Material

Cover layer material was installed at the Site in accordance with the Permit. Special Condition 15(d) of the 2005 Permit required the following:

"The final placement (including topsoil), location, thickness, and detailed chemical limits of the final cover layers on the Site, including the community park and waterfront park, are subject to the specifications, directions and requirements determined by the NYS Department of Health (NYSDOH) to be applicable. It is the responsibility of the Permitees to obtain a written determination from NYSDOH.
The Permitees must provide the Department with a copy of NYSDOH's determination. No cover layer material may be placed on the Site, until the Department acknowledges receipt of NYSDOH's determination."

As required by Special Condition 15(d) of the 2005 Permit noted above, NYCDPR obtained such written determination from NYSDOH in a letter dated, August 2, 2006 included as Appendix C.3 of the 2013 Engineering Report (Appendix 20).

The NYSDEC's active recreational determination from July 28, 2009, required that NYCDPR install two feet of cover layer material and a demarcation layer throughout the Community Park. Soil probes confirmed extremely consistent and appropriate thickness of cover material throughout the Community Park and Golf Course.

For the Golf Course, the upper portion of the landfill was capped using Permit specified criteria for sand and/or topsoil material formally referred to as cover layer material. A sand material was used for the majority of the golf course cover layer with topsoil being used primarily in tree planting pits and other landscaped areas. The IEM observed capping activities associated with the cover layer material including, inspecting cover material at each source site and at the Site per the conditions set forth in the Permit and supporting reference documents. After installation of the shaping layer material and demarcation layer (as required), the cover layer material was installed. The IEM confirmed the depth of cover layer material placed on the Site in accordance with the Permit at the time of installation.

A minimum of one foot of cover layer material was placed over top of the shaping layer material consistent with the passive recreational determination at the Golf Course. Cover layer material was installed by means of either transporting stockpiled material that was previously inspected and approved by the IEM or by directly dumping the material in the work areas as it was imported to the Site. The material was then spread by bulldozers and specialty golf course shaping equipment. The IEM confirmed the depth of the cover layer material placed on the Golf Course area utilizing a graduated rod as the material was being installed.

Confirmation of the minimum of one foot of cover layer material installation on the Golf Course is included on Figure SP-200 entitled "Cover Layer Material Plan". This plan identifies the DOR report numbers and corresponding dates for when the IEM witnessed and measured a minimum of one foot of cover layer material being installed on the Golf Course. The cover layer material depth checks were completed by the IEM using a graduated rod to confirm that the final placement consisted of a minimum of one foot of cover layer material soil. Individual DORs documenting the IEM's observations are included in Appendix 5.

In addition to the IEM checking and confirming the minimum one foot thickness of cover layer material immediately upon installation, post-construction soil probes were completed in March 2015, and dug by hand to confirm the depth of cover layer material throughout the Golf Course. Prior to March 2015, once the site construction concluded and the vegetation was established throughout the Golf Course, an aerial survey (including topography) was performed by LAWS in Spring/Summer 2014 and provided to NYCDPR and subsequently to the IEM in December 2014. In addition, NYCDPR performed a Golf Course wide ground topographic field survey.

The IEM was provided with electronic AutoCAD files of both surveys that captured the final topography of the cover layer material surface. The IEM performed a cut/fill analysis using Civil 3D software by comparing each cover layer material survey to the previously generated shaping layer material surveyed surface (also field surveyed by NYCDPR). Based on a review of the cut/fill analysis results and subsequent discussions with the NYSDEC and NYCDPR, it was agreed by all parties that both survey results were inconclusive, and could not accurately reflect the thickness of the cover layer material on the Site. Since the 12-inch minimum cover layer material thickness could not be verified via survey, NYCDPR then moved forward with field investigations using handheld soil probing equipment in order to perform comprehensive Golf Course wide physical confirmation depth checks.

The IEM was on-site and witnessed all soil probes, and documented all soil probe locations and depth results using handheld GPS equipment. The soil probing work was completed by NYCDPR staff. Soil probe fieldwork commenced on March 11, 2015 and was completed on March 27, 2015. Soil probes were initially completed on a 50-foot grid but were increased to a 100-foot grid on March 19, 2015 based on the satisfactory initial field results and approval by the NYSDEC in an email dated March 18, 2015 (see Appendix 19 for the March 18, 2015 email).

Refer to Figure SP-003 entitled "Cover Layer Material Soil Probe Investigation Results" which illustrates the results of the soil probing investigation. The final results of the soil probing investigation were reviewed on-site with NYSDEC staff, and the NYSDEC required that NYCDPR correct an area in the vicinity of the Hole 14 Green, which resulted in cover soil layer thicknesses of 3 inches and 6 inches. NYSDEC staff stated that this area would require reconstruction in order to satisfy the intent of the 12-inch cover layer material thickness as required by the Permit. NYSDEC staff concluded that the remaining soil probe results sufficiently addressed the intent of the 12-inch cover layer material thickness Permit requirement, and the remaining Golf Course area did not require any further reconstruction or evaluation of the cover layer material.

As per the IEM's Daily Observation Reports, the IEM witnessed the subsequent field delineation the of the area deemed to be of insufficient cover layer material thickness (i.e. the area adjacent to Hole 14 that resulted in cover layer material depths of 3 inches and 6 inches via soil probe results) during the week of April 20, 2015. This was performed by using the soil probe equipment to accurately delineate the limits of the area having a cover layer material thickness of less than 12 inches, and resulted in an area of approximately 6 feet by 12 feet.

On May 4, 2015, the IEM observed the Trump Organization construction crew over-excavate the previously delineated areas that had less than 12 inches of required cover material, adjacent to Hole 14 Green. The area was over-excavated approximately 24 inches below grade, and 24 inches of Cover Material was backfilled and graded over the excavated area. The excavated area was GPS mapped using a hand held Trimble device. Excavated surplus shaping material was transported to a shaping stockpile adjacent to Pond P2.

Similar to the Golf Course, the 24 inch minimum cover layer/shaping layer materials thickness could not be verified via survey. NYCDPR moved forward with field investigations using soil probes in order to perform physical confirmation depth checks. The IEM was on-site and witnessed all soil probes, and documented all soil probe locations and depth results using handheld GPS equipment. The soil probing work was completed by a NYCDPR subcontractor. Soil probe fieldwork commenced on May 18, 2015 and was completed on May 22, 2015. Soil probes were completed on a 50-foot grid. Refer to Figure SP-004, entitled "Community Park Cover/Shaping Layer Material Soil Probe Investigation Results", which illustrates the results of the soil probing investigation.

4.4.4 Greens and Tees Mix, Bunker Sand

Consistent with Section 2.1.2 "Cover Layer Fill Specifications" included in Volume #2 of the 2005 Engineering Report, environmental testing was not required, consistent with cover layer material requirements for the green and tees mix or bunker sand, and therefore was not completed for these materials.

On June 8, 2012, the NYSDEC confirmed that the sand material used for the tees, greens, and bunkers should not be counted towards the Permit stated allowable cover soil maximum. A copy of the June 8,

2012 correspondence is included in Appendix 19. NYCDPR's consultants estimated the required sand material volumes as follows: Tees and Greens (24,705 cubic yards), Driving Range Tee (3,025 cubic yards), and bunkers (6,076 cubic yards). Since these values were estimated, calculated by NYCDPR's consultants, it shall be noted that actual installed volumes may have fluctuated from the volumes identified above. This information is based on an email from Joe Voss to Faisal Choudhury on June 13, 2012.

Special Condition 15 of the 2005 Permit did require that the tees and greens mix imported to the site to be tested as per material testing requirements to meet the project technical specifications. Fertilizer and soil amendments could be applied on the tees and greens mix after spreading to construction specifications and finally grassed, as per the specifications provided by the agronomist.

4.4.5 Topsoil

Topsoil was used on the Site, in lieu of sand, specifically in tree planting pits and other landscape areas. Any topsoil that was imported and used on the Site was approved and met all of the cover layer material Permit requirements including the specification included in Exhibit C of the 2005 Engineering Report.

4.5 Meetings

On a bi-weekly basis during construction of the Community Park and the Golf Course, progress meetings occurred in the NYCDPR field office trailer on the Site. Various representatives from NYCDPR, Trump, LAWS, KSE, TRC, the IEM, and appointed representatives attended the meetings to discuss construction progress, current issues, and scheduling.

Available meeting minutes from construction progress meetings are attached as Appendix 9.

4.6 As-Built Survey, Record Drawings, Deviations from Approved Design Plans

This section deals specifically with as built drawings, final record drawings and deviations that occurred during construction. It is further broken down into work performed in the Community Park, the Golf Course, the Waterfront Park, deviations to NYSDEC Permit as it pertained to fill importation quantities, modifications to the landfill gas vent trench and additions to the golf course made by the concessionaire.

4.6.1 Community Park

The Community Park project consists of the following features and was designed by Thomas Balsley Associates:

- A softball field and smaller peewee/T-ball field with new drainage
- Two basketball courts
- New formalized park entrances
- Play areas for tots to pre-teens
- Seating areas and lawn for non-programmed activities
- A path and trail system that winds throughout the park
- A detention pond which collectives drainage from the eastern part of the golf course
- Foot bridges
- Shade structure

- Timber deck overlook
- Herbaceous plant materials
- Temporary below grade utilities to service a standard DPR Comfort Station (constructed under a separate contract),
- Below grade infrastructure to service Community Park lighting and fountains,
- Modifications to the Landfill Gas Vent Trench system
- New perimeter fence.
- New Comfort Station. (The comfort station construction is still in progress and expected to be completed in the Fall of 2015)

Deviations to the Community Park project consist of the following:

- The reconfiguration of the location of the perimeter fence on the south and west sides of the Community Park reducing the area of the site[1].
- One missing Vertical Landfill Gas vent just south of the most southerly entrance to the park.
- The relocation of a drain inlet in the softball field[2].
- The utilities servicing the Comfort Station are constructed as of December 10, 2015,[3] which represents the date in which the sanitary sewer connection was completed.

It is noted that below grade features were not examined during a NYCDPR field inspection conducted during July 2014. Community Park as-built information and documentation are included in Appendix 16 and includes a November 18, 2011 letter from LAWS indicating that the Community Park construction was completed as designed (exclusive of the comfort station) as well as three as-built drawings associated with the pond liner construction dated July 14, 2010 as prepared and certified by LAWS (Appendix 16).

4.6.2 Golf Course

The Ferry Point Park Golf Course project consisted of the following:

- A Maintenance Building with an active sub-slab depressurization system.
- A comfort station with as active sub-slab depressurization system, which includes a snack bar.
- A unenclosed rain shelter
- An 18 hole links style golf course
- A practice area
- Fill and topsoil importation
- A site drainage system and retention ponds
- A new irrigation pond and irrigation system
- All the necessary plumbing, electrical, gas, environmental monitoring and control devices for the golf course, maintenance facility and comfort station
- Roadway and parking area construction, paving, striping and drainage in compliance with the DEC permit
- Perimeter fencing and appropriate landscape screenings.

---

[1] See App. 4; Community Park Contract Drawings; Thomas Balsley Associates Constr. Dwg L1.3 & L1.6 dated 03/06/09, revised 09/30/09.

[2] See App. 4; Community Park Contract Drawings; Thomas Balsley Associates Constr. Sketch dated 2/11/09

[3] See App. 4; Community Park Contract Drawings; Thomas Balsley Associates Constr. Comfort Station Dwg P-2 dated 1/26/09

Deviations to the Golf Course consist of the following:

- The active venting system around the Irrigation Pond was converted into a passive system. Fiberglass manholes were changed to concrete manholes and additional piping added around the entire pond. Six (6) vertical passive vents were added, one at each box location and installed October 2014, following NYSDEC discussion. On May 22, 2015 the NYSDEC approved the removal of vertical passive vent #5 thereby leaving five (5) vertical passive vents in operation.
- Modifications to the grading plan did occur as well as minor modifications to drainage and are documented in "Ferry Point Site" visit notes produced by "Nicklaus" from 2010 through 2013 and as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- Retention ponds were lined as per NYSDEC requirements as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The golf cart path surface material was changed to asphalt and additional drainage was added as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The Clubhouse Parking Lot paved footprint was increase/installed as per NYSDEC Consent Order # R2-20100521-172. The Clubhouse Parking Lot was completed in May 2014 as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The irrigation pond pipe penetrations were revised as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The Turf Nursery was revised as shown on supplemental design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015)
- The active venting system inside of the Comfort Station was modified as per Integral Engineering, Inc. design drawings. (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015 and revised 4/23/2015). System is functioning, and requires the installation of sensor components of the vapor detection system. Contractor procurement for the installation of the sensor components is in its final stage of approval. Implementation is anticipated by Spring 2016 and the final signed and stamped as-built drawing will be submitted to NYSDEC following prompt inspection of the installation.

4.6.3 Waterfront Park

Construction has not begun in the area designated "Waterfront Park".

4.6.4 Additions to the Golf – Concessionaire

The concessionaire running the Golf Course is the Trump Organization. Since in their possession (NYCDPR Use Inspections were held for various parts of the project from September 2012 through March 2014) the following additions/deviations have occurred (Refer to Appendix 16; Deviations; Construction Deviation Drawings 1 through 12, dated 4/10/2015, revised 4/23/2015, 6/25/2015 & 7/13/2015):

- The construction of a Golf Cart Barn (currently under construction)

- The construction of a sign (currently under construction) and curb line realignment
- The construction of a temporary clubhouse including temporary utility services (trailers placed upon the asphalt parking lot)
- The construction of a "starter" kiosk including utility services as well as minor golf cart path widening around it.
- The construction of a clock.
- The construction of a weather vane/station.
- Minor irrigation changes.
- Additional planting along the perimeter fence line. Removal of the aluminum fence along the Waterfront Park and the Golf Course and the installation of a fiber optic sonar alert system in its place (installation of the fiber optic sonar alert system occurred from July 25, 2015 to August 19, 2015 and was witnessed by the IEM).

5 Environmental Monitoring

5.1 SWPPP

On November 20, 2003, NYCDPR received an Acknowledgement of Notice of Intent for coverage under SPDES General Permit for Stormwater Discharges from Construction Activity (General Permit No. GP-02-01), permit identification number NYR10D547, which transitioned SPDES General Permit coverage previously held under GP-93-06. On May 12, 2009, NYCDPR received an Acknowledgement of Notice of Intent for coverage under SPDES General Permit GP-0-8-001; permit identification number NYR10R112, which was maintained throughout construction completion. A copy of the SPDES General Permit Acknowledgement and Notice of Intent are included in Appendix 1.

In compliance with NYSDEC guidelines for State Pollution Discharge Elimination System (SPDES) General Permit (GP-0-8-001) and General Condition 9 of the 2014 Permit, a Storm Water Pollution Prevention Plan (SWPPP) was implemented during the course of construction at the Site. All work was completed in compliance with the final SWPPP, dated December 22, 2009.

In addition to intermittent IEM SWPPP inspections, NYCDPR representatives also performed SWPPP inspections. NYCDPR performed bi-weekly inspections and associated Site Assessment Reports (filed at the FPP document repository) to ensure compliance with Permit requirements. SWPPP inspections were carried out through the spring of 2014. The SPDES permit will remain effective until completion of ongoing construction including the Golf Course Clubhouse.
Every possible action was taken to avoid non-compliance, such as turbid water leaving the Site. The following is a list of permanent features that were installed at the Site, beyond the SWPPP requirements:

- French drain at the eastern, western, and northern perimeters of the Site to control surface flow of stormwater;
- All ponds were lined, to prevent stormwater infiltration into the solid waste layer; and
- A new trash rack and rock outlet dam at the 60-inch Whitestone sewer outfall draining to the East River.

5.2 Landfill and Off-Site Gas Monitoring

The entire Ferry Point Site is equipped with a Landfill Gas (LFG) Management system to cover both on and off site monitoring. The systems purpose is to allow use of the site in its intended purpose as a golf course without having the occupants on the site and users of the golf course being exposed to harmful conditions that would be the direct result of the existence of the landfill. The Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, New York May/August/Oct 2013, referenced the summary of prior LFG efforts. These included preparation of a model for surface methane emissions using data collected during 2009 and 2010. Data for these studies also included a health impact analysis that is summarized in this final Certification Report and is attached with the 2013 Supplemental Engineering Report as an Appendix 20.

The generation rates for LFG were estimated as far back as 1999 using EPA Guidance documents and the results indicated the LFG rates for Ferry Point were consistent with municipal solid waste landfill rates for a facility of this era and overall age. The analysis in 2010 also evaluated hazardous air pollutants (HAPs) in areas of the course as well as community park. In 2011, NYSDEC concluded that there was not an ambient air impact from gas vent emissions and that there was no health impact in the park. This was a major component that allowed the discontinuation of monitoring the passive vents installed in 12 locations throughout the park. Monitoring of the passive vents is included as Appendix E.3 in the Supplemental Engineering Report (Appendix 20).

The following were included as components of the Ferry Point Park Landfill Gas Control System:

1. Irrigation Lake Venting System-Passive
2. Water Quality Ponds Venting System-Passive
3. Sub-Slab Depressurization Systems
    a. Maintenance Facility-Active
    b. Comfort Station in Golf Course-Active
    c. Comfort Station Community Park-Active
4. LFG Venting for subsurface utilities entering enclosed spaces-Passive
5. Perimeter Vent Trench-Passive
6. Perimeter Vent Trench/East-Passive
7. Golf Course 25 In-ground vents-Passive

The Ecology & Environment 2011 Landfill Gas Management Report describes in detail the landfill gas generation rates, composition, migration pathways and methods for diffusion (Appendix 20). It also discusses both the horizontal and vertical migration of LFG across the landfill. Figure 3-1 in the LFG Report (MSW Fill Progression Map, March 11, 2015) shows the historical fill progression that occurred over the landfill lifespan between 1951 to 1959 and how significant areas of open water was filled in over the life of the landfill .

As far back as 1999, Landfill Gas generation rates were noted to be low and in the range of .00004 cubic feet per minute per square foot or about 2cfm per acre of surface area. These generation rates provided discussion and recommendation for installation of an active system beneath planned structures. A 1999 Report referenced in the Ferry Point East Landfill Gas Management Plan did not recommend installation of active venting systems in open spaces with the exception of specific turf grass areas. The 1999 Report also included numerous LFG Control Systems including; interceptor and venting systems, impermeable liner systems for irrigation ponds, soil plugs and conduit seals for underground utilities that enter buildings (Appendix 20).

The main facility LFG management structure was the perimeter vent trench installed in 2001. The specific purpose was to prevent offsite migration of landfill gas. This was designed, and installed with oversight by TRC. The entire trench was installed along the eastern site boundary and allowed a gas barrier to be present between the site and the neighboring residential homes. Construction included extending the trench from the water's edge at Emerson Avenue along Balcom Avenue and the site boundary, approximately 1050 ft. past the intersection of Schley and Buttrick Avenues.

Monitoring of the venting trench began using a number of wells that were installed along the trench. In 2001 monitoring performed after the trench was installed indicated there was an off-site source of methane. This was identified by AKRF and further evaluation along the venting trench indicated there were additional off-site LFG readings. Test pits were identified to have MSW beyond the site and this was one potential source of the elevated readings. The second was the historic filling in the northeastern portion of the site on a former tidal or marsh wetland. No methane was reported in ambient air at that time and the source of methane was concluded by AKRF to have originated from an off-site source.

The initial facility LFG system was proposed to be installed as an active system. Following the 2009 landfill permit modification submittal, the conceptual passive LFG system was updated to include all areas not covered by enclosed structures. In summary, the passive LFG system meets a number of historic reports including the 1999 EAS (AKRF), 2002 referenced in the Landfill Gas Management Plan (Appendix 20) and Volume #2 Application for Modification to the Solid Waste Permit Engineering Report, June 30, 2005, Appendix 20) and was approved under the 2005 NYSDEC Part 360 permit (Appendix 1). In the 2009 DEC Part 360 Permit Modification Request (November 25, 2009, Appendix 20), an active system was recommended. Supplemental Site investigations and extraction testing was performed by TRC Engineers in the period between 2009 and 2010. This information was reviewed by Walsh Environmental Scientists and Engineers in 2010 (Ferry Point Landfill Gas Report, November 2010, Appendix 20). The resulting analysis and evaluation concluded that the Site was able to be operated safely with a passive venting system which was consistent with the 2005 Permit.

The July 2000 NYSDEC Part 360 Permit (Appendix 1) and February 2002 Part 360 Permit Modification (Appendix 1) approved by NYSDEC included numerous conditions related to material importation and capping. The permit was also specific in requiring the installation of a series of perimeter-based landfill gas monitoring wells. Twenty-one (21) perimeter monitoring wells were initially recommended and a final total of 25 were installed at intervals of approximately 250-300 ft. around the perimeter (PZ-01 to PZ-25),

(SH-21 Groundwater Monitoring Well Construction; November 8, 2011. The perimeter for purposes of these wells would be the edge of the golf course portion of the landfill and the adjacent residential neighborhood. An additional 56 monitoring points were required to be installed as the main component of the off-site monitoring network. The off-site wells were referenced in the modified 360 permit. The combined perimeter and off-site wells comprise the full gas monitoring system for the golf course fill area.

Modifications to the overall Landfill Gas Collection systems were based on and included the following:

- In 1986, a passive venting system was reportedly installed with outflow venting. In 2002, there was a plan presented by TRC to perform test pits in order to identify this system and more specifically, to identify the outflow vent location and to determine if connective piping was functioning. The system was never located and has not been able to be incorporated into any LFG system.
- 2005 Engineering Report Vol. 1 (June 30, 2005, Appendix 20) included several LFG components and systems that were aimed to maintain a similar program to the 1999 proposed EAS. This included active systems for all enclosed buildings and sealed penetrations for utility connections. All perimeter and off-site monitoring wells would be monitored bi-weekly for both methane and oxygen. Monitoring showed several points off-site with elevated levels indicating a source that was also located beyond the site. Groundwater was monitored on a monthly basis to evaluate water level in concert with the LFG trench elevation. Irrigation Lake and ponds were recommended to have gas-venting layers and liners installed at their base to allow for collection and discharge of gas collected from beneath them. Specific instances of impermeable barrier installation could be noted where turf health was necessary to be maintained. Most specifically, the 2005 Report did not recommend LFG venting systems in open space areas (Appendix 20).
- A 2009 Extraction Pilot test was conducted to better understand generation rates for on-site LFG. The interpretation of the results of this test prompted a proposal for a low-flow active LFG system that covered the overall golf course. The reason referenced in the Supplemental Engineering Report for the Solid Waste Facility Permit Application, October 13, Appendix 20) was that methane levels in the subsurface was not expected to be able to be made safe by the opening of the golf course. The irrigation pond system was also included in the plan to be connected to the landfill venting system. One caution in this report was the potential for pulling large volumes of ambient atmospheric air into the subsurface which could cause fires and explosions. The system included some forty control zones of extraction wells, green and tee collection piping all connected to vent flares with in-line fans. This system was never instituted.

Modifications to the gas monitoring system included the design and installation of a landfill gas (LFG) vent trench along much of the eastern park boundary. This trench extends from the water's edge at the foot of Emerson Avenue, along the entire length of the site boundary of Balcom Avenue and along Schley Avenue. The trench continues approximately 1050 linear feet to the west past the intersection of Schley and Buttrick Avenues. The trench totals just over 1 mile in length (5350 feet) and construction began in May 2001 and was completed by the end of December 2001. This trench does not cover the entire upland

perimeter. The remaining portion was covered with an existing trench along Miles Avenue. This was planned to remain following the golf course development and provided an effective cutoff for off-site migration in that direction. The final construction included the trench and drainage.

The LFG passive vent trench was designed to intercept landfill gases (primarily methane) originating and leaving the site. The limits of the municipal solid waste extend beyond the park boundaries and the LFG passive trench was not designed to facilitate collection of or negate the impact of gas generated from that material. The trench presents a sound engineering control that will intercept gas migrating through preferential pathways and other routes of least resistance that intersect it. The LFG trench acts to briefly capture LFG moving out of the park and then allows it to vent to the atmosphere. The trench is designed to have a very high relative permeability with increased porosity in comparison to the landfill waste material. As gas enters the trench is can easily and rapidly mix with ambient air in the pore space and then rise out where it can be discharge to the atmosphere. One of the key components of the trench is that the bottom remains into the water table. As long as the bottom of the trench is submerged in the shallow water table, LFGs at the Park cannot migrate beneath and beyond the trench.

The 25 perimeter monitoring wells (also referred to during the construction as piezometers) were located immediately adjacent to the LFG passive vent trench and along the site perimeter adjacent to Miles Avenue. The specific purpose was to provide consistent data comparing the trench bottom and top of the water table to identify locations where the water table may have dropped below the trench, thus indicating the ability for the trench to intercept and capture all LFG along its entire length.

The LFG passive vent trench was constructed of a geotextile wrapped stone envelope that extends from .5 ft. below the ground surface down to a depth of approximately 3 ft. below the surface of the water table. The upper .5 ft. of the trench has a loose covering of wood chips to allow LFG that has entered the trench to exit and discharge to the atmosphere. There were areas where the final depth of the trench only reached to 1 ft. below the water table. These locations were caused by an unstable sidewall after the groundwater table was reached. The trench was also constructed with horizontal perforated 4 to 6 inch polyethylene tubing placed beneath the wood chips near the top of the stone backfill. The horizontal tubing was installed to allow connection to vertical risers in the event the trench surface is covered at some point in the future with an impervious surface.

LFG monitoring has been performed in accordance with Special Condition 30 from the modified Solid Waste Permit (Response Action Plan, December 10, 2002, Appendix 19). This included monthly monitoring during construction in order to determine if water levels were maintained above the bottom of the trench. Specific protocols were required to be performed in the event groundwater was determined to be below the bottom of the trench.
The following Action Plan items were incorporated for low groundwater levels:

1. Evaluate methane concentrations in nearby perimeter methane monitoring wells and semi-permanent monitoring points. If methane concentrations measured are below site-

specific action levels (25% LEL), the normal frequency methane monitoring will continue and the groundwater level measurements will increase to bi-weekly.

2. When groundwater levels increase to fall back into the envelope of the recovery trench, measurements will return to monthly.
3. If groundwater remains below the trench bottom for one additional bi-weekly monitoring event but nearby well methane levels remain below the action level, groundwater monitoring will continue until such time as routine monitoring can be reinstated.
4. When groundwater is measured below the trench and methane levels are at or above the action level, both groundwater and methane measurements will continue at bi-weekly frequency.
5. If both groundwater and methane remain below the trench bottom and above the action level (respectively) for a second consecutive week, a recommendation for further action will be made to NYSDEC.

During the 2014 Solid Waste Facility issuance several references to continuing monitoring and the documents that would be covered under were made (DEC No. 2-6006-00014/00013 (2-6006-0014/00016 Permit Issuance – Solid Waste Management Facility (Tidal Wetlands), May 21, 2004, Appendix 1). The Ferry Point Park East Post Construction Custodial Care Plan is specifically called out as the governing set of protocols for this. Monthly LFG vent trench monitoring is to be performed during the duration of the permit (October 2013, Appendix 20). Additionally under Special Condition 25 there is continued monthly inspection required for the gas venting trench integrity as well as mulch cover. All repairs are required to be made within two weeks and therefore prior to the next inspection. The mulch cover is required to be replaced each spring. Trench maintenance is also described in the Supplemental Engineering Report, Volume 3, Appendix F (Appendix 20).

Landfill methane monitoring has shown from collection of data within the site to be above general action levels of 25%LEL as well as LEL from within the MSW layer. The resulting measurements between 2008 and 2009 supported the hypothesis that methane was generally present throughout the entire MSW layer rather than just from individual locations. Measurements from the shaping layer above the MSW indicated that concentrations decline rapidly once out of the fill layer. These measurements appear to present a better picture of the landfill gas presence and production because the extraction test performed in 2009 referenced a 2003 Journal of Air &Waste Management with fatal flaws for infiltration of atmospheric air into the landfill. In addition, the 2009 extraction test did not reportedly follow the EPA testing methods and would then incorrectly estimate the presence and production of methane. Testing reportedly used differential pressure at surrounding test wells. EPA specified determining radius of influence based on absolute pressures under static and active extraction conditions. EPA measures ambient air intrusion by percent volume of nitrogen and the testing identified ambient air intrusion by percent oxygen. The conclusions that were reached at that time indicated that atmospheric intrusion noted during the testing would have caused the LFG extraction rate to be significantly higher than actual LFG generation rates within the area of the pilot test. If the entire LFG generation rates were then based on pilot test results, the resulting estimate would be potentially far over the actual LFG generation. Historic data from monitoring indicated that LFG generation rates had sharply declined since the initial

2000 measurements began. The reduction was referenced largely as readings from over 100% LEL to non-detect. While there were a few exceptions, this overall reduction was credited to, among other things, the perimeter venting trench and overall LFG decline. One specific area in the vicinity of MW-0 found to continue to present elevated readings was believed to be impacted from an off-site source.

The Ferry Point Landfill Gas Report (November 2010, Appendix 20) was a summary of various testing across the landfill including flux chamber testing that was used to determine the surface emission rates from the overall landfill. The resulting emission rates were important in making the determinations for receptors and potential impacts of methane and hazardous air pollutants. During this review of testing data and as it was presented in several reports, no methane was detected in field measurements from any of the sample locations. This lack of detectable methane was attributed to rapid attenuation of methane as it passed from the MSW into the shaping material and out into the atmosphere. Hazardous air pollutants in the form of certain VOCs were detected in flux box sampling but all below the reported standards or at levels similar to those identified as background.

Testing within the Community Park was also conducted and methane was also not detected in flux box testing indicating it is not emitted at the ground surface at concentrations that are measureable. This meets NYCRR Part 360 criteria. Measurements from within the top 2 ft. of the shaping material were below 25% of the LEL which also falls within the NYCRR Part 360 requirements for on and off-site structures. Perimeter methane was below Part 360 criteria with the exception of the vicinity of MW-0 along Buttrick Avenue where methane was above 100% LEL. This particular area was beyond the site and consisted of early tidal marsh and pre-1945 MSW filling that is believed to be the contributing source of methane. All measurements from the Community Park vents were below ambient concentrations and well below NYSDEC standards indicating no impact above public exposure thresholds in the vicinity of the vents (Ferry Point Landfill Gas Management Plan, October 2011, Appendix 20).

Modelling of the emissions over several efforts conducted between 1999 to 2010 showed that methane levels were very low and in locations where methane was identified, levels were expected to continue to diminish over time. In order to provide adequate ventilation for enclosed spaces and especially where there is a source of ignition (electrical connections or machinery), mitigation methods would be implemented including Sub Slab depressurization systems (SSDS) at each building. This was further described as conservative as methane concentrations exceeded LEL within the MSW layer back during 2008/2009 in TRC testing of the subsurface. Also during this same monitoring period, methane was not present within the shaping material above the NYCRR Part 360 limit of 25% LEL in any location of proposed buildings. Passive venting of the MSW was recommended as a precautionary measure where no buildings were planned and active venting below or within building footprints.

The Golf Course portion of the Site also includes a sizable irrigation lake and water quality ponds. The purpose for these water bodies covers two positive issues. The first is to help control and limit precipitation and infiltration through the cover material and into the solid waste and the second is to help collect water for controlled release and irrigation. Golf course ponds are typically used for storage and

irrigation regardless of the overall construction. The ponds and lake were each designed to be lined in order to contain as much runoff as possible making it available for irrigation. A gas transmission layer was constructed beneath the irrigation lake. This was connected to perforated piping installed around the lake. The 2009 Part 360 Permit Modification Request included Contract drawings showing this piping as a passive venting system surrounding the lake (Appendix 20).

Water quality ponds were proposed to be lined up to the permanent water level capacity with low permeability low density polyethylene (LDPE) liners with the incorporation of a passive venting system. Ponds where MSW was encountered within the excavation would be lined for the entire volume.

The smaller ponds have also been designed and constructed with a gas transmission layer to promote passive venting. This layer consists of permeable gravel and perforated collection piping extending beneath the ponds and exiting from vent stacks that extend above the breathing zone. The drawings and specifications for the water quality pond liners and passive venting systems were included in the Supplemental Engineering Report Appendices (Appendix 20).

The Community Park portion of Ferry Point Park is located along the northeastern side of the site. This includes walking paths, open space and a single comfort station structure. The LFG components of the Community Park portion consist of 12 LFG vents and an active sub-slab depressurization system beneath the comfort station. Sampling and monitoring of the vents has shown that since at least 2011 there has been no measurable flow in the vents and detectable methane in 3 of the 12 vents. Ranges of methane were between 7.5% to 100% LEL as referenced in the 2011 Ferry Point Landfill Gas Management Plan (Appendix 20).

Twenty-five stand-alone vertical passive vents were installed across the golf course and twelve passive vents were installed in the Community Park. The total area not covered by buildings and water features is approximately 190 acres and the ratio of vents per acre is one per five acres. A greater ratio was applied to the community park which has twelve passive vents in open spaces. All landfill and community park vents operate based on changes to water level, atmospheric pressure and also production of landfill gas. Gas can move through the fill material to a point where it is able to be removed through a vent. Additional smaller gas volumes can move upward into the shaping material to be passed along the surface interface. Based on readings, these concentrations are both low and rapidly diffused indicating the overall volume is much lower.

Following the revision of the active venting proposal for the entire Site, the enclosed buildings and structures were left with the earlier requirement for active venting systems. This was required due to the explosive and accumulating nature of methane and other oxygen displacing gases that exist in landfill conditions as well as being precautionary to prevent the potential of accumulation of explosive gases in these locations. In order to protect occupants and visitors of enclosed structures from accumulation of LFG, active venting of the sub-slab area was recommended. The active sub-slab systems prevent accumulation of gas by actively removing it to the atmosphere and increase the flow of air beneath the buildings. This creates a change in pressure from beneath the slab and the inside of the building which

prevents LFG from entering the building in its more concentrated form. Once LFG leaves the confined space from beneath the landfill and mixes with ambient air, the concentrations are rapidly diminished to levels that are not detectable above background.

The three enclosed buildings (maintenance and two comfort stations) located on the Golf Course and Community Park were required to have SSDS incorporated into the slab design and foundation plan.

Two initial buildings within the golf course (maintenance and comfort station) and one in the community park (comfort station) were recommended to be outfitted with active sub slab venting systems. The maintenance building and comfort station in the golf course and comfort station in the Community Park were each proposed and were outfitted with an active SSDS. The designs were initially submitted in the 2009 DEC Part 360 Permit Modification Request (Appendix 20). Operation and maintenance of the systems (once active) is provided in the Operations, Monitoring and Maintenance Plan and in the Post Construction Custodial Care Plan. Systems will have monitoring, notification controls and remote capabilities in order to allow monitoring of conditions.

Sub slab systems for the three existing structures on site function in a similar fashion by reducing the air pressure beneath the foundation and inducing a slight negative pressure. The negative pressure prevents upward migration, accumulation and infiltration of LFG into the aboveground space. Systems can incorporate varying designs in order to accommodate structural requirements, utilities and layout of the overall building.

The maintenance building and community park systems consist of more typical sub slab systems with perforated piping placed in the backfill material above the municipal solid waste but beneath the foundation slab. Piping is connected to a vacuum blower that exhausts the sub slab gas from a high single point into the atmosphere. The comfort station within the golf course uses a similar manner of equipment with the major difference being the foundation design was modified to include the creation of isolated vaults sandwiched between the lower mat slab and upper floor. No access can be made into those vault spaces and they are filled with low density foam. Vent piping was installed into the sealed vaults and the vapor extraction system effectively creates a higher vacuum (negative pressure) in this vault space than would typically be seen below an open foundation. The piping penetrated the floor in the main portion of the building and was extended into the attic where the blower was mounted. Exhaust was vented through the top of the roof in a dedicated stack. The system was installed in March 2015 and put in operation prior to opening the golf course on April 1, 2015. The comfort system details are also described in the deviations section of this report.

The Maintenance building was constructed with a pile supported slab that covers the entire footprint of the building. The system was constructed as shown on drawings X-001.00 through X-006.00 (Contract drawings for: Construction of a Maintenance Building, A Comfort Station, and One Rain Shelter Within the Ferry Point Golf Course – Contract No. X1256-209M, November 11, 2011, Appendix 4). Prior to pouring the slab, the existing ground surface was prepared with geo-textile fabric, a minimum 12 in. layer of aggregate that is gas permeable to allow flow from all areas beneath the slab into the collection piping,

rigid insulation all covered by an impermeable barrier such as liquid boot or other equivalent. Liquid boot and all barriers used are compatible with the known and identified volatile organics identified at the site. Liquid boot was applied to provide a 60 mil thickness. A special capping material was also placed above the liquid boot to protect it from perforations when the rebar reinforcing rods were set in place. Six inch dia. PVC piping was installed beneath the center of the Maintenance Building floor and this was connected to a vertical riser that would exhaust through the roof. The blower was located as the piping exited the slab into the building and exhaust extended up through the roof. The system was combined with combustible gas meters located in each of the occupied spaces of the building that monitor the atmosphere in each area and are connected to a central alarm. Sub slab monitoring points were also installed along the length of one side of the building to allow for sampling. Each point was installed through the slab into the permeable aggregate and the penetration through the slab was sealed. This system was operational prior to the opening of the golf course as the building was being occupied prior to opening of the golf course.

The system in the comfort station at the Community Park was installed in a similar fashion with a smaller footprint building. This system was a single length piping system installed beneath the foundation using the same construction layering as the maintenance building. The blower and equipment has been completed and the system not yet initiated as that area is not currently open. The system is expected to become active in the very near future.

The comfort station within the golf course was also outfitted with an active system but the slab design for this building was modified so as not to require pile supports. This foundation design included a vapor barrier placed on the prepared subgrade. No MSW was exposed and the fill beneath the building was consistent with shaping material consisting of sand and gravel. A mat slab that was 1.5 ft. thick was poured over the vapor barrier and then 4 ft. vertical walls were formed on the slab to cover the perimeter as well as divide the slab into 4 roughly equal sections. The inner sections of the slab were then filled with solid foam up to just below the top of the walls. Six inch PVC piping similar to that used in the maintenance building sub slab was used and extended to the outer two segments. A vertical riser penetrated the floor inside of the building and was extended up into the attic space where the blower was located. The blower exhaust was directed out of the roof through a vent. The system was designed to create and maintain a lower pressure vacuum on the entire four-chamber sub slab area in order to prevent any sub slab gas from accumulating within that space. Pressure testing of the entire area showed that negative pressure was able to be generated and maintained between the mat slab and floor of the comfort station. This system was installed and began operating prior to opening of the golf course and occupation of the building.

Additional controls installed within the buildings included soil/bentonite collars around utilities servicing the buildings. Foundation penetrations were sealed with these engineering methods to prevent infiltration both into the void spaces and up through foundation slabs where utilities are installed. Additionally, soil/bentonite collars were installed in utility corridors where permeable pipe bedding was used in order to prevent LFG from migrating laterally. All conduit and utility penetrations into floor slabs

were also closed with soil/bentonite seals to prevent those corridors from acting as preferential pathways for LFG migration up into occupied spaces.

The Community Park Comfort Station was constructed in an area of MSW at shallow depths below grade and within the foundation envelope. The foundation was designed to incorporate piles for slab support. All utility trenches that were excavated to the building were installed in either shaping material or if MSW was encountered, it was over excavated and the trench backfilled with granular fill to allow all utilities to be place on bedding that did not contain MSW. During excavation, short duration and dewatering was occasionally necessary. Any water removed during dewatering was pumped a short distance away into existing trenches or other locations.

Off-Site monitoring for methane has been conducted back to the early 2000s. Probing was the primary early monitoring and assessment method. Probes were historically located on Schley, Buttrick, Balcom, Miles and Emerson Avenues. Since 2002, concentrations of methane have been lower than the LEL and this has been used to present the lack of significant source of methane at these off-site sources. In 2002, the Methane Monitoring Study (AKRF) identified the presence of buried MSW beyond the site boundaries. In addition to MSW, soils were logged and identified as fine organic deposits representative of the historic marsh deposits.

OM&M incorporates criteria from NYCRR Part 360-2.17(f) including the following:

- Concentrations of explosive gases must not exceed 25% of the LEL in on-site and off-site structures.
- Concentrations of explosive gases must not exceed LEL at the property boundary.

These requirements are being used to guide mandated additional monitoring under Special Conditions and to govern the construction of all future buildings. Several Special Conditions were included within the 2005 Part 360 Permit (Appendix 1) and are incorporated into regular OM&M and will continue moving forward until they are recommended for elimination as part of the permit.

Special Condition 26 includes the monthly monitoring and inspection of gas venting trenches to evaluate the mulch cover material. This will occur each spring following the winter months.

Special Condition 30 includes the monthly groundwater gauging in the perimeter piezometers in order to evaluate the depth to groundwater with respect to the bottom of the gas venting trench. This measurement will continue through the construction process and that period will be considered complete upon the approval of this Construction Certification Report. The monitoring specifies that id groundwater is measured below the bottom of the trench, DPR will implement Special Conditions monitoring. This is further described below in 5.2.2.

Special Conditions 31 includes specific notification and frequency monitoring if groundwater is identified below the bottom of the trench or if LEL of LFG is noted in adjacent monitoring probes.

Special Conditions 32 and 24 include the bi-weekly monitoring of specific perimeter gas wells and on-site monitoring wells. Results of the monitoring will direct more frequent sampling or monitoring and when monitoring may return to the regular schedule.

Special Condition 37 includes bi-weekly monitoring of the off-site gas monitoring network and the results of this monitoring will direct more frequent monitoring or testing.
Additional parameters were added in 2011 by NYSDEC to include hydrogen sulfide, VOCs and carbon monoxide, all were to be reported in parts per million (PPM) and temperature/pressure.

Work that will continue following construction is included in the Post Construction Custodial Care Plan (Appendix 20). That document covers the efforts beyond this report in order to effectively monitor and report on post construction conditions under the Part 360 Permit.
Monitoring during the entire construction period has been performed in accordance with the Landfill Gas Monitoring Plan and the approval of this Report will serve to conclude all construction monitoring.

The most recent and final documentation submitted under this construction effort is the Ferry Point Park Golf Course Irrigation Pond Vent Boxes Monitoring Final Report submitted in May 3, 2015 (Appendix 20). This Report summarized monitoring data and piping/vent/vale configurations around the irrigation pond at the golf course. The overall purpose for the preparation of the Report was to present information to NYSDEC prior to this Closure Certification Report in order to gain approval to close and remove one vent from the golf course area at vent box #5.

The Report describes and presents the configuration of the piping surrounding the irrigation pond and that the removal of this single vent would not have a detrimental effect on the overall LFG system. The entire lop surrounding the pond collects LFG under the conditions that have been evaluated and calculated over the landfill and that appears to be less than one cubic foot per minute. Based on measurements from specific vent box locations within the overall loop, the LEL readings concentrations indicate two possible theories; that methane may be coming from possibly one area and then slowly migrating or spreading to one or two other vent box areas or it may be concentrated in one area and is also being generated at much lower levels from one or two other areas.

In either case, the volume and rate of methane being generated is similar to much of the remainder of the landfill and while this area has actual vent pipes, the remainder of the landfill is direct vented to the atmosphere through the shaping layer. Removal of the single vent at Vent Box 5 will not impact the collection of methane within the underground passive piping but will only eliminate one outlet location. The valve placement at each box allows for multiple vents to be open or combinations of vents to be either open or closed. In addition, sections of the piping around the irrigation pond can be isolated. There is no specific plan other than to remove the single vent from the overall system and this would not impact the passive systems ability to remove methane from the subsurface.

Landfill and off-site gas monitoring was completed as required by the Permit Special Condition X during construction. The IEM accompanied American Environmental Solutions (AES) during landfill gas

monitoring activities at on-site and off-site locations during the course of construction. Monitoring results were transmitted to the NYSDEC by AES after monitoring was completed and monitoring reports were included in the bi-weekly FMRs for the corresponding periods. Landfill gas monitoring results are attached as Appendix C in each the FMRs which are included as Appendix 6. In addition, refer to Appendix 15 for the spreadsheet compilation of all LFG monitoring results to date in tabular and graphic format.

5.2.1 Bi-Weekly

Methane gas monitoring of the entire site was conducted on a bi-weekly basis. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR (Appendix 6). In addition, refer to Appendix 15 for the spreadsheet compilation of all LFG monitoring results to date in tabular and graphic format.

A review of the historic field data associated with the perimeter LFG vent trench monitoring program from 2001 to present was conducted to evaluate LFG trends at the Site relative to the perimeter passive LFG control (Ferry Point Park East Post Construction Custodial Care Plan, October 2013, Appendix 20) and showed the following:

- After the installation of the vent trench in 2001, methane levels in the vicinity of the LFG vent trench tended to decrease significantly within a year in most LFG monitoring wells;

- Methane levels remained relatively low and below regulatory limits from 2002 through 2004, except for a few wells that sporadically exceeded the regulatory limit;

- In 2005, the measured methane levels tended to increase, likely due to the installation of more reliable monitoring points (new monitoring points and repaired wells); and

- Results from 2008-2011 generally indicate relatively consistent levels of methane, with certain limited sporadic increases above regulatory limits.

Methane levels increased for several on-site perimeter wells, on-site interior wells and off-site semi-permanent wells located during the construction period between 2010 and 2014, especially for the wells located in the northeast portion and south portions of Ferry Point Park; however, the levels were significantly lower than the beginning of the monitoring program, and the levels decreased to zero by 2015 with the exception of two on-site perimeter wells (MW-14 and MW-15) located in the southern portion of the golf course, three on-site interior monitoring wells (MW-0, MW-4 and MW-19), and three off-site semi-permanent wells located on Buttrick Avenue (10, 12R and 14R). The last recorded monitoring event on April 10, 2015 (Special Conditions Landfill Gas Monitoring Report, April 13, 2015, Appendix 7) reported the following methane concentrations (% by volume) exceeding the site specific action level in eight locations:

- MW-0 - 4.5%

- MW-4R - 50.2%
- MW-19 - 83.8%
- MW-15 - 6.7%
- MW-14 - 33.4%
- Well 14R (Buttrick Avenue) - 1.6%
- Well 12R (Buttrick Avenue) - 28.6%
- Well 10 (Buttrick Avenue) - 10.1%

5.2.2 Special Conditions

In accordance with Special Conditions #34 and #37c of the November 18, 2005, Permit Modification (Appendix 1), if any individual monitoring point has a bi-weekly reading that equaled or exceeded 100% LEL, or three consecutive bi-weekly readings that were greater than 25% LEL, methane monitoring of these points was conducted on a weekly basis. Monitoring returned to the bi-weekly monitoring schedule once three consecutive readings were each less than the 25% LEL action level. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR. In addition, refer to Appendix 15 for the spreadsheet compilation of all LFG monitoring results to date in tabular and graphic format.

5.3 Piezometer Monitoring

On a monthly basis, groundwater elevation measurements were taken and recorded in all piezometer locations along the site perimeter vent trench in accordance with Special Condition 28 of the 2014 Permit. Measurements were manually taken using a portable water level meter. The IEM observed piezometer monitoring in the field and groundwater data was submitted to the NYSDEC. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR. Piezometer monitoring results were incorporated into the landfill gas monitoring reports attached as Appendix C in each bi-weekly FMR, which are included as Appendix 6.

5.4 Settlement Plate Monitoring

Short term settlement was performed with plates installed throughout the landfill in order to evaluate settlement and compaction during the fill placement and grading. The majority of the short term plates were installed following the importation of significant amounts of fill material when the areas had been brought near to or at final grade. The 2014 NYSDEC Permit Modification (2-6006-00014/00013) Special Condition #6 required short term settlement monitoring to meet those requirements incorporated in the January 2005 Settlement Evaluation and Long Term Monitoring Plan. Short term monitoring was performed in accordance with the early 2005 Plan and as construction progressed and as per Special Condition #6. Short term settlement plates were either removed or monitoring discontinued when long term monitoring plates were installed in accordance with the revised Permit. Long term settlement plates were installed throughout the landfill in areas shown on the Figure titled Ferry Point Golf Course Settlement Plate Locations 4/11/2012 by KS Engineers, P.C. The locations of the long term plates were identified to be in the same specific vicinity of the short term plates.

The overall Program for monitoring settlement began in 2002 with the construction of 7 instrumented test fills and installation of 6 settlement plates that were located across the site. Test fills varied between 10 to 18 ft. in thickness and the specific locations were placed where future settlement would be most critical (e.g. future green areas and where significant thicknesses of fill were necessary). The majority of the settlement plates were located in the eastern portion of the site at a time when most of the fill had been imported in order to begin monitoring on-going settlement for areas that had been filled for a period of 9 months or longer. Initial settlement monitoring was conducted for a period of over 2 years and monitoring results were transmitted to NYSDEC on a bi-weekly frequency.

Settlement recorded following June 2003 was recorded but noted to have been significantly influenced by the importation if fill and the loading that this had on the areas adjacent to the test fills. Initial settlement was noted to have a range between 3 and 23 inches with the greatest variation in the western section. This was believed to be the result of a significant compressible clay layer near the surface. The recorded measurements were compared by Langan to the estimated values that had been calculated and they were found to be comparative. One positive aspect of this initial measurement and comparison showed the site to be in an optimal character for surcharge as a result of placement of larger fill loads for shorter periods of time in order to maximize the settlement as early as possible and minimize post construction settlement that is a critical issue for the sensitive surface of a golf course.

The resulting settlement analysis provided a recommendation for fill placement and long term predicted settlement. This information and comparison to settlement data is critical in monitoring the underground utilities for maintenance and repair. Piping settlement would result in lower carrying capacity and therefore storm lines were designed to be oversized with welded ends to prevent separation. Sanitary lines were also designed with the additional anticipated settlement incorporated into their long term maintenance. Increased slope, HDPE piping and flexible joints were recommended where piping would pass through areas of different fill thicknesses and therefore a differential in overall settlement would be expected to occur. Recommendations for flexible connections capable of withstanding rotation and extension were made for sewer lines exiting structures.

Settlement over the golf course surface was presented following the initial evaluation and recommendations for anticipated settlement were determined to be within the initially anticipated settlement and possibly sooner for areas where more substantial thicknesses of material were placed. Additional influences on long term settlement will be thickness and depth to the compressible clay layer. The variation in settlement was estimated to be between 3 to 15 inches over a 30 year period. Non-uniform settlement is also anticipated over the life of the golf course due primarily to the variable thickness of imported material and could equal up to 6 inches. Slope stability is not anticipated to be adversely impacted as a result of the long term settlement anticipated at the site.

Areas where significant amounts of fill were identified to be placed, such as the area between the irrigation pond and Hole #1 was required to be placed in a more controlled manner in order to allow the pore pressure to be evenly reduced. This method would prevent slope failures caused by buildup of pore

pressure. Placement of fill was specified to be in 2 ft. lifts per week which would allow for dissipation of pore water in the clay layer.

Special Condition #7 of the revised 2014 NYSDEC Permit specified long term settlement requirements and that they would continue to conform to those established in the earlier permit. Locations of the replacement long term settlement plates shown on the 2012 Figure were referenced and approved as part of the 2014 Permit Modification.

Long term settlement monitoring will be performed at the initially 8 recommended settlement monitoring plates located throughout the golf course for a period of 30 years following completion of construction.

The plates are located in variable subsurface conditions but in general have been placed where the greatest concentrations of fill material have been placed in connection with the thickest compressible soil layers. The locations were also chosen to be adjacent to underground utilities such as water and sewer mains and/or adjacent to green areas where differential settlement is most critical.

The date being used as the construction completion is April 1, 2015. This was described in the March 30, 2015 executed letter between NYSDEC and NYCDPR which referenced the Substantial Completion of Construction Certification allowing the golf course to open on April 1, 2015. The letter states that NYSDEC and NYCDPR agree that the April 1, 2015 opening of the golf course constitutes completion of the filling operation on the Site and construction of the earthwork portion of the Project as contemplated under the NYSDEC Permit (No. 2-6006-00014/00013 and 2-6006-00014/00016). As a result of this completion date, monitoring will continue until April 1, 2045 or until a point that NYSDEC authorizes monitoring to cease if it is prior to April 1, 2045.

Long term settlement will be documented as it is referenced in the Post Construction Custodial Care Plan (October 2013). This includes providing NYSDEC with an annual inspection report certified by a licensed NYS professional engineer. The monitoring will document the following information during the timeframes referenced:

1. Beginning within 60 days of the approval of this Engineering Certification Report and continuing for a period of 5 years, the quarterly monitoring results will be summarized and submitted on an annual basis.
2. Immediately following the initial 5 year period and continuing for an additional 5 years (10 years from the date of Engineering Certification Report approval) monitoring will continue on a reduced bi-annual basis and the results will be summarized annually.
3. Immediately following the year 10 bi-annual report summaries, monitoring will be performed and reported on a reduced annual basis. This annual monitoring and reporting will continue for the duration of the 30 year period or for 20 years.
4. Following the initial 5 year quarterly monitoring period, NYCDPR may petition NYSDEC for a decrease in the monitoring frequency or for cessation of monitoring altogether. In the event that NYSDEC approves terminating the monitoring for any monitoring plates, NYCDPR will evaluate the settlement plates for either abandonment or removal. This evaluation will be performed within

the first year following approval of monitoring cessation. The abandonment or removal documentation will be signed and certified by a NYS licensed professional engineer and provided to NYSDEC within the concurrent post closure reporting period after the completion of the work.

Special Conditions 6 and 7 of the 2014 Permit and the recommendations provided in the Settlement Evaluation and Long-Term Monitoring Plan dated January 26, 2005, prepared by Langan Engineering and Environmental Services, Inc. set forth settlement monitoring requirements related to the placement of fill material across the Site. A copy of the Settlement Evaluation and Long Term Monitoring Plan is included in Appendix 20. Settlement plate monitoring was performed on-site in accordance with the Permit. Settlement monitoring reports are attached as Appendix D in each of the FMRs, which are included as Appendix 6. Monitoring was conducted on-site as follows. Results of these monitoring events were forwarded directly to the NYSDEC once they were available and summarized in each bi-weekly FMR.

5.4.1 Short Term

The short-term settlement monitoring program began in December 2002 with the bi-weekly monitoring of seven test fills and six settlement plates located throughout the Site. Test fills consisted of an engineered soil fill ranging from 10 to 18 feet deep, generally located on-site in areas where significant thicknesses of fill were required. Settlement plates consisted of a subsurface plate beneath a casing and a flush-mount monitoring access port, similar to a monitoring well. Settlement plates that were part of the short-term settlement monitoring program were generally located in areas of the Site already at or close to final grade. The Settlement Evaluation and Long-Term Monitoring Plan recommended the following adjustments be made to the monitoring program during construction:

- Test fills that obstructed construction activities should be replaced with a settlement plate to be monitored near the location of the test fill.

- Settlement plates that needed to be moved for construction purposes should be relocated to the same general area and monitored until long-term monitoring points were installed.

Monitoring at short-term monitoring points was discontinued as required due to interference with ongoing construction. In an email correspondence dated May 1, 2012, included in Appendix H of the 2013 Engineering Report (Appendix 20), the NYSDEC informed NYCDPR that these short-term monitoring locations did not need to be replaced as long as construction at the Site progressed. As construction was concluded in each area of the Site, long-term monitoring plates were to be installed as described below. Short-term settlement monitoring continued to be performed bi-weekly at the Site until October 14, 2013. The design of the long term settlement monitoring points is presented in a January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. and outlined in a May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by New York State Department of Environmental Conservation. These documents outline the long term settlement plate monitoring locations, detail and required monitoring intervals. Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. As previously stated, the monitoring and reporting schedule will be

modified as the post construction period extends into the future. This has been included in the Post Construction Custodial Care Plan (October 2013).

The following summarizes the efforts with respect to conformance to project design documents:

The approved May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by NYSDEC refers to Appendix H of an October 15, 2013 *Supplemental Engineering Report* for a long term monitoring location plan. Appendix H of the permit which is included as Appendix 20 here, references and includes the April 11, 2012 *Ferry Point Golf Course Settlement Plate Locations* plan prepared by KS Engineers, P.C.

The February 20, 2014 *Ferry Point Golf Course as Built Drawing* prepared by Contractors Line & Grade South, LLC shows the as-built locations of the long term settlement monitoring plates in conformance with the above referenced April 11, 2012 KS Engineers plan. An additional monitoring point between golf course Hole 6 and Hole 7 was added and approved in the May 1, 2012 *Re: Settlement Plates Email* prepared by NYSDEC.

A January 26, 2005 Settlement Evaluation and Long-Term Monitoring Plan prepared by Langan Engineering and Environmental Services, Inc. states that:

> *"These settlement points will be utilized to determine future settlements during the golf course operation. They should be installed once filling operations are completed to within 1 foot of final grades or in other words, during placement of soil cover materials. After their installation, monitoring of the settlement points should be performed once every other month until the construction is complete. Subsequent monitoring should be performed once every 3 months during the first year of golf park operation and once every 6 months for the second year."*

The description above is a deviation from the Post Construction Custodial Care Plan where quarterly monitoring and annual summary reporting will be performed for an initial period of 5 years followed by an opportunity to evaluate and proposed changes. The frequency would without any additional recommendation be reduced to semi-annually following 5 years. This reference accepts a switch to semi-annual monitoring and annual reporting following the first year. This is the only approved change in the settlement monitoring plan outside of the approved 2013 document.

The data from the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran indicate that settlement plate monitoring was conducted every two weeks in conformance with the minimum requirements of the above referenced monitoring plan.

Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. Results of the monitoring are available in the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran.

The November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran do not document any non-conformance issues regarding the construction of the long-term settlement monitoring locations. A settlement monitoring plate detail is provided in the January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. does not identify any deviations from the location plan and all long term settlement plates installed were specifically located as replacements for short term plates installed earlier during construction

5.4.2 Long Term

The design of the long term settlement monitoring points is presented in a January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. and outlined in a May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by New York State Department of Environmental Conservation. These documents outline the long term settlement plate monitoring locations, detail and required monitoring intervals. Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. As previously stated, the monitoring and reporting schedule will be modified as the post construction period extends into the future. This has been included in the Post Construction Custodial Care Plan (October 2013).

The following summarizes the efforts with respect to conformance to project design documents:

The approved h, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by NYSDEC refers to Appendix H of an October 15, 2013 *Supplemental Engineering Report* for a long term monitoring location plan. Appendix H of the permit which is included as Appendix 20 here, references and includes the April 11, 2012 *Ferry Point Golf Course Settlement Plate Locations* plan prepared by KS Engineers, P.C

The February 20, 2014 *Ferry Point Golf Course as Built Drawing* prepared by Contractors Line & Grade South, LLC shows the as-built locations of the long term settlement monitoring plates in conformance with the above referenced April 11, 2012 KS Engineers plan. An additional monitoring point between golf course Hole 6 and Hole 7 was added and approved in the May 1, 2012 *Re: Settlement Plates Email* prepared by NYSDEC.

A January 26, 2005 Settlement Evaluation and Long-Term Monitoring Plan prepared by Langan Engineering and Environmental Services, Inc. states that:

> *"These settlement points will be utilized to determine future settlements during the golf course operation. They should be installed once filling operations are completed to within 1 foot of final grades or in other words, during placement of soil cover materials. After their installation, monitoring of the settlement points should be performed once every other month until the construction is complete. Subsequent monitoring should be performed once every 3 months during the first year of golf park operation and once every 6 months for the second year."*

The description above is a deviation from the Post Construction Custodial Care Plan where quarterly monitoring and annual summary reporting will be performed for an initial period of 5 years followed by an opportunity to evaluate and proposed changes. The frequency would without any additional recommendation be reduced to semi-annually following 5 years. This reference accepts a switch to semi-annual monitoring and annual reporting following the first year. This is the only approved change in the settlement monitoring plan outside of the approved 2013 document.

The data from the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran indicate that settlement plate monitoring was conducted every two weeks in conformance with the minimum requirements of the above referenced monitoring plan.

Monitoring of final settlement plates began on October 30, 2013 and continued throughout the remainder of construction. Results of the monitoring are available in the November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran.

The November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran do not document any non-conformance issues regarding the construction of the long-term settlement monitoring locations. A settlement monitoring plate detail is provided in the January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc. does not identify any deviations from the location plan and all long term settlement plates installed were specifically located as replacements for short term plates installed earlier during construction

The long term settlement monitoring was performed at the locations shown on the revised Settlement Plate Location Plan and a sketch that includes an additional monitoring point between golf course Hole 6 and Hole 7 included in Appendix H of the Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, NY dated May 31, 2012 (Revised August 31, 2012, October 15, 2013) as described in Appendix I of that report. These locations were approved by NYSDEC in an email dated May 1, 2012. The long-term settlement monitoring points were installed as construction was completed in each area of the Site. Upon installation, the long-term settlement plates were monitored in accordance with the criteria set forth in Special Condition 7 of the Permit.

As a component of this Report section the following list of documents were used:

- A January 26, 2005 *Settlement Evaluation and Long-Term Monitoring Plan* prepared by Langan Engineering and Environmental Services, Inc.;
- A May 21, 2014 *DEC Permit (DEC No. 2-6006-00014-00013 (SW) & DEC No. 2-6006-00014-00016 (TW))* prepared by New York State Department of Environmental Conservation;
- A April 11, 2012 *Ferry Point Golf Course Settlement Plate Locations* plan prepared by KS Engineers, P.C.;
- A November 12, 2010 through October 31, 2014 *Fill Management Report No. 242 through No. 346* prepared by Woodard & Curran;
- A undated *additional settlement plate sketch;*
- A February 20, 2014 *Ferry Point Golf Course as Built Drawing* prepared by Contractors Line & Grade

South, LLC; and,

- A May 1, 2012 *Re: Settlement Plates Email* prepared by NYSDEC.

The long term settlement monitoring was performed at the locations shown on the revised Settlement Plate Location Plan and a sketch that includes an additional monitoring point between golf course Hole 6 and Hole 7 included in Appendix H of the 2013 Engineering Report and as described in Appendix I of that report. These locations were approved by NYSDEC in an email dated May 1, 2012, which is included in Appendix H of the 2013 Engineering Report (Appendix 20). The long-term settlement monitoring points were installed as construction was completed in each area of the Site. Upon installation, the long-term settlement plates were monitored in accordance with the criteria set forth in Special Condition 7 of the 2014 Permit.

5.5 Groundwater Monitoring

The overall setting of the Ferry Point Park Site with respect to the groundwater regime can be described as an area covering approximately 220 acres bounded along the waters of the East River to the south, Saint Raymond's Cemetery to the north, Balcom and Emerson Avenues to the east and the Bronx-Whitestone Bridge and ramp to the west. The entire site was a former operating municipal solid waste landfill that ended accepting fill material in the 1960's. The overall landfill footprint extended beyond the boundary of the Ferry point Park Site. The period of operation predated the existence of current Solid Waste Facility design and construction requirements and therefore, no groundwater assessment or survey was performed for the construction or during operations of the landfill.

A review of aerial photography was conducted at the time this report was being prepared. The photographs are available on the New York City public website and include those showing the overall site and surrounding area from a period beginning in 1924 and up until 2012. The earliest photo of 1924 shows nearly the entire footprint of the Ferry point Park Site was formerly open water, existing as a large bay of the East River. A review of the 1951 aerial photograph of the same scale shows the northwest portion of the landfill site was filled with what appears to be very light colored fill material. The photo shows filling operations to be expanding from the northwest corner outward and based upon the extreme contrast in color of existing land and fill material to be sand material possibly sourced from in-water dredge operations. This practice was performed in many other areas of the City at this time when harbor deepening and widening took place from 1940 onward. There were no photos between 1951 and 1996 and so there was no further photographic record in this collection to show the progression of landfilling. This period of filling (pre-1951) predated the DSNY recordkeeping and existence and there would not be any expected record of the placement of this fill in Sanitation Department documents. The existence of these photos is important to present the hydrogeologic origin of site groundwater for comparison to that of other groundwater. This history places the entire Site at the base of a larger drainage basin and in direct connection with the East River system of salt and brackish waters. Using this as the basis for the hydrogeologic model, shallow groundwater at the Site would now be considered to be part of the upland groundwater table as a result of the filling and extension of the shoreline into the river. Groundwater

within the fill material could be expected to be tidally influenced but the inland limit of this influence would be dictated by the fill material, its composition and compaction.

As part of the Volume #1 Application for Modification to the Solid Waste Management Facility Permit for Construction of the Ferry Point Park Recreation Facility Engineering Report (June 30, 2005; Appendix 20), a specific groundwater impact assessment was presented. This was based on a qualitative assemblage of data and information from other related studies but not specifically from a focused groundwater evaluation.
A May 31, 2005 letter on the Influence of Fill Placement on Groundwater prepared by Langan Engineering assessed the impact of fill material on the groundwater (found in Appendix VII of Volume #1 Application for Modification to the Solid Waste Management for Construction of Ferry Point Park Recreation Facility Engineering Report, June 30, 2005, Appendix 20). This was based upon information and conditions gathered during geotechnical evaluations and site history knowledge. The findings presented at that time indicated the development of the Ferry Point Park Site as a golf course would not further impact or change groundwater flow patterns or conditions and would therefore not further impact the East River beyond the existing conditions.

Much of the description presented in the Langan assessment focused on the site development and the addition of engineering controls that would become part of the site. These included: paved path and parking areas, significant stormwater collection systems, site grading to control flow, control devices and systems as well as importation and capping of the entire site with a varied but significant layer of clean cover materials that would all have a positive impact and reduce the amount of surface water filtering through the landfill and into the groundwater. The overall completed site development in the 2005 Engineering Report included a total of 26 acres of impervious area and collection of stormwater in detention facilities (Appendix 20).

A total of 26 piezometers were installed to monitor shallow groundwater along and immediately adjacent to the Landfill Gas passive trench. These piezometers, while used for depth to groundwater measurements are not incorporated into the groundwater evaluation as they were specifically used to assist in the design and monitoring of the LFG vent trench. The principal purpose for the piezometers and their association with the LFG trench was to monitor the level of groundwater to determine if groundwater levels went below the LFG passive recovery trench. Groundwater elevation measurements collected from the piezometer locations along the site perimeter vent trench (Special Condition 28) are addressed in section 5.3 (Piezometer Monitoring) of this report. Section 5.5 addresses the baseline groundwater monitoring requirements established in 2010.

The NYSDEC Permit issued on November 18, 2005 for the construction of the 222 acre golf course did not include a specific requirement for a groundwater monitoring plan outside of the singular focus of monitoring groundwater elevation for landfill gas control in the trenches (Appendix 1). In 2010, NYSDEC requested additional information regarding groundwater conditions and if any new, relevant information was available to verify the conclusions of the geotechnical portion of the 2005 Engineering Report (June

30, 2005, Appendix 20). As no information was available, recommendations were made in 2011 by NYSDEC for the installation of a monitoring well network.

A Technical Memorandum was prepared by Ecology & Environment Engineering, P.C. (E&E) outlining the field procedures for establishing reference point groundwater characterization methods including the installation, development, sampling, well gauging and slug testing of 11 new monitoring wells at the Site (Technical Memorandum re: Field Sampling Procedures for Ferry Point Site – Reference Groundwater Characterization, September 19, 2011, Appendix 20). At the time of monitoring well installation (February 2012), construction activities were well underway and estimated to be 80% complete. The baseline characterization was expected to capture the potential measurable impacts to groundwater. Future monitoring is expected to capture the impacts representing a more complete construction condition

The well installation program included consistent and standard well installation and construction methods, well development, baseline sampling, water level survey and aquifer testing. A figure showing the well construction details and installation elevations and locations is presented as S-H21 dated 11/8/2011. Well construction methods included the installation of shallow 2 inch diameter PVC wells with 10 ft. of slotted screen penetrating into the upper surface of the water table and standard construction finishing. All of the wells were developed and monitored using consistent criteria (turbidity, pH, conductivity and temperature), Table 1 and 2, respectively, Fieldwork Summary Report (as part of Groundwater Characterization) (May 31, 2012; Appendix 20). Each of the newly installed wells was then sampled to establish the initial baseline conditions and each was surveyed to determine groundwater level and flow direction conditions. Basic site hydrogeological information was also characterized during this effort, including direction of flow, groundwater elevation gradients, and flow velocity. Based on the initial measurements, flow direction was found to be relatively consistent in that groundwater flow was in the south-southeasterly direction toward the East River (Figure 1, Fieldwork Summary Report, May 31, 2012, Appendix 20). There was one important item noted from the initial conditions assessment and this was the lack of measureable tidal influence on any of the monitoring wells.

One soil sample was collected from each borehole from the shaping material zone with an additional quality assurance sample collected from MW-02. The soils were sampled for synthetic precipitate leaching procedure (SPLP) semi-volatile organic compounds (SVOCs), PCB/pesticides, metals, and cyanide. Seven metals and one SVOC (phenol) were detected in the 13 samples sent to the laboratory
SPLP analysis. For comparison purposes, these results are shown along with the NYSDEC Technical and Operational Guidance Standard 1.1.1, for Class GA groundwater. Four metals, and one SVOC (phenol) were detected with concentrations higher than the comparison standard (Table 6, Fieldwork Summary Report, May 31, 2012, Appendix 20).

Slug testing was performed on each of the wells to evaluate hydraulic conductivity and while this is not a critical measurement for wells installed within landfill material, it is useful in evaluating the consistency of all wells in the system. The results of the slug testing presented a fairly uniform range of hydraulic conductivities within the landfill material.

The results of the baseline groundwater analysis showed that with the exception of metals, the analytical results were in line with a landfill of this type and age. All metal detections were higher than the NYSDEC Class GA groundwater standard, which was used for comparison purposes. It is noted that these samples had high turbidities (e.g., greater than 1000 NTU) and this likely impacted the metals test results. Phenolics and ammonia leachate parameters were also detected higher than the comparison standard (Table 7, Fieldwork Summary Report, May 31, 2012, Appendix 20). As a result, NYSDEC requested that both filtered and unfiltered samples be collected. If the results were consistent, subsequent events would be completed using filtered samples only for the inorganic parameters (May 8, 2012 Ferry Point Groundwater Characterization Conference Call, May 9, 2012, Appendix 20). Filtered and unfiltered groundwater samples were collected during subsequent events.

NYSDEC also provided DPR with requirements for future groundwater monitoring (e.g., Post Construction Monitoring) in their FPP Groundwater Characterization Monitoring Objective on May 8, 2012 (Appendix 20). The objective included the following requirements: reference point/background characterization in three quarterly rounds of sampling for all parameters listed in 6 NYCRR Subpart 360-2.11 baseline parameters. Following completion of the characterization sampling, baseline sampling would continue on a biannual basis after the initial three quarterly rounds until the FPP landfill end use (golf course) is operational. Table 5-X below summarizes the reference point/background characterization events.

Table 5-1. Summary of Reference Point/Background Characterization Events

Sampling Frequency	Wells Sampled	Status
Quarterly 1	GMW-1 – GWM-11	Completed February 2012
Quarterly 2	GMW-1 – GWM-11	Completed May 2012
Quarterly 3	GMW-1 – GWM-11	Completed August 2012
Bi-Annual	GMW-1 -GMW-11	Completed March 2013
Bi-Annual	GMW-1, GMW-2, GMW-3, GMW-4, GMW-5, GMW-6, GMW-7, GMW-8, and GMW-10	Completed March 2014
Bi-Annual	GMW-2, GMW-3, GMW-4, GMW-5, GMW-6, GMW-7 and GMW-8	June 20, 2014
	GMW-1, GMW-7, GMW-10, and GMW-11	July 31, 2014

The three quarterly sample events were completed without modification. The Bi-Annual events were modified following the March 2013 event due to construction of the golf course which limited access to the Site. The modifications include the following:

- No September 2013 Bi-Annual sample event.
- No sample was collected from GMW-9 (well was dry) and GMW-11 (access) during the March 2014 sample event.
- The second biannual sample event for 2014 was split into two events completed in June and July. GMW-9 was not sampled. Groundwater samples were collected from the site on July 22, 2014; however the samples were not analyzed due to compliance issues with the Standard Operating Procedures.

Table 5-1 presents the overall groundwater and analysis date for monitoring wells GMW-1 through GMW-11 covering the period between February 2012 through July 2014 and are consistent with the baseline sample events: metals, phenolics and ammonia compounds, isolated and sporadic VOCs (except for chlorobenzene detected in well GMW-01 and GMW-06 during multiple events) and SVOCs (primarily PAHs) were detected above the NYSDEC Technical and Operational Guidance Class GA Groundwater Criteria. The Class GA Groundwater Criteria were used for screening purposes as groundwater is not used for potable resources. The results of the filtered (dissolved) metals samples are significantly lower than the non-filtered metals samples and in most cases exceedances of non-filtered samples are non-detect or below the Class GA Groundwater Criteria in the filtered samples.

In accordance with the Post Construction Custodial Care Plan (Appendix 20), groundwater monitoring will be performed at all 11 permanent monitoring wells throughout the golf course. Approval of this Closure Certification Report signifies the commencement of operations at the golf course beginning the period of post construction monitoring. Sampling will be performed on an annual basis with collection and analysis of groundwater for those constituents listed in 6 NYCRR Part 360-2.11 routine parameters. This sampling information and data will be summarized and included with the overall annual facility monitoring and inspection report. Monitoring and reporting will begin 60 days following the approval of this closure report and will continue for a period of three years.

Following the completion of the initial 3 year post-operations monitoring, DPR may submit documentation to NYSDEC to request a reduction in sampling or complete cessation of sampling. The initial 3 year period will form the data set to be used in the event a reduction or change in monitoring is requested. The goal of the monitoring will be to provide data showing if the park adversely impacts water quality with respect to leachate quality or quantity and to compare the 2013 permit performance criteria to existing and current conditions.

Should a request for modification or cessation be approved, monitoring wells will be assessed for abandonment or removal within a 1 year period following the ending point of monitoring. Closure documentation will be provided by a New York Professional Engineer during the same annual reporting period.

Upon commencement of operation of the golf course, the frequency of groundwater monitoring changes to annual with samples being analyzed for all constituents listed in 6 NYCRR Subpart Part 360-

2.11 routine parameters and parameters of concern identified during the reference point characterization period. The golf course began operation in April 2015 and post construction monitoring will be initiated in September 2015. Post construction groundwater monitoring is discussed in detail in Section 5.7.4.

Design documents for the groundwater monitoring wells are included in Appendix G.2 of the 2013 Engineering Report (Appendix 20). An initial sampling event was completed in February 2012 and included the testing activities described below.

Groundwater monitoring results are attached in Appendix 15.

5.6 Deed Restriction

Special Condition 32 of the 2014 Permit requires that the Permittee executes and files a NYSDEC approved deed restriction, which shall run with the land in perpetuity, and shall recite and require compliance with the Part 360 Permit's provisions as regards to the custodial care requirements described in Appendix I of the 2013 Engineering Report (Appendix 20).

NYCDPR is in the process of reviewing the language in Attachment A transmitted with the 2014 Permit, and will use this language as the model for the deed restriction. NYCDPR will contact the NYSDEC in the event NYCDPR has any proposed additions, deletions, and/or revisions to the general text of Attachment A.

5.7 Post Construction Monitoring

Post construction monitoring of the Golf Course, Community Park, and Waterfront Park is the responsibility of NYCDPR and will be completed as required by the Permit. Post closure monitoring will be completed in accordance with the plans set forth in Ferry Point Park East Post Construction Custodial Care Plan dated October 2013 included as Appendix I of the 2013 Engineering Report (Appendix 20).

The following table includes each monitoring component, the frequency, and the duration of monitoring dependent upon the cessation of activity:

Component	Frequency	Duration
Final Cover System	Quarterly	5 years
LFG System	Quarterly	5 years
Infrastructure	Bi-Annually Annually	10 years 15 years
Groundwater Monitoring	Annually	3 years*
Long Term Settlement Plates	Quarterly	5 years*
Parking Lot Asphalt Cover (April & October)	Bi-Annually Annually	5 years* 20 years*

*Denotes Dependent on Cessation of Activity

NYCDPR will not be performing post-construction monitoring for the Waterfront Park portion of the Site until construction is complete and approved, and will restrict public access until such time.

NYCDPR is in the process of engaging a full service environmental firm to conduct the post construction monitoring requirements and will complete the post construction monitoring required to comply with the Permit in accordance with the Post Construction Custodial Care Plan and as follows.

5.7.1 Golf Course Operations

The Site will be operated as part of the New York City Department of Parks and Recreation system. The Community Park and the Waterfront Park will be operated and maintained by the NYCDPR Borough of the Bronx Operations and Maintenance division or an appointed representative. NYCDPR has entered into a contract with a golf course concessionaire, Trump Ferry Point LLC to implement post construction care necessary to maintain the Golf Course for operational purposes. Golf Course maintenance and operations exclude those requirements specific to post construction monitoring and maintenance of existing environmental conditions and infrastructure as installed by NYCDPR and specifically defined in this report as being landfill gas systems, groundwater monitoring, and long-term settlement plates.

5.7.2 Landfill Gas Monitoring

NYCDPR will implement post construction monitoring necessary to fulfill the requirements of the Post Construction Custodial Care Plan for landfill gas monitoring. The landfill gas monitoring program includes monitoring for on-site and off-site landfill gas wells, piezometers, passive vent trench, passive vents, sub-slab depressurization systems, and Irrigation Lake venting system. Any necessary repairs or maintenance required as a result of inspection and monitoring activities will be the responsibility of NYCDPR or an appointed representative.

The Site's landfill gas management system will be inspected and monitored in accordance with the Operations, Monitoring, & Maintenance ("OM&M") actions presented in Section 6 of the Landfill Gas Management Plan ("LFGMP") located in Appendix F.1 of the 2013 Engineering Report (Appendix 20).

Monitoring and inspection will commence concurrently within 60 days of the approval of this construction certification report unless otherwise noted within the OM&M plan. Adjustments to monitoring frequencies will be requested of NYSDEC upon meeting the performance criteria thresholds identified in Section 6.3.4.2 of the LFGMP. NYCDPR will submit a request with supporting documentation to NYSDEC 30 days prior to the desired date of the proposed change in monitoring. NYCDPR will not change monitoring frequencies until the request has been approved.

5.7.3 Long Term Settlement Monitoring

NYCDPR will implement post construction monitoring necessary to fulfill the requirements of the Post Construction Custodial Care Plan for nine settlement monitoring plates on the Golf Course.

Monitoring will commence concurrently within 60 days of the approval of this construction certification report for a period of three years. Based on the results of the initial five years of monitoring, NYCDPR may

petition for decreased monitoring or a cessation in monitoring frequencies. NYCDPR will not change monitoring frequencies until the request has been approved.

5.7.4 Groundwater Characterization Monitoring

NYCDPR will implement post construction monitoring to fulfill the requirements of the Ferry Point Park East Post Construction Custodial Care Plan (October 2013). Groundwater monitoring will be performed at the eleven well locations located within the golf course.

Upon commencement of operation of the golf course (April 2015), groundwater sampling will take place annually with samples being analyzed for constituents listed in 6 NYCRR Subpart Part 360-2.11 routine parameters. The results of the groundwater sampling will be presented in a groundwater monitoring report and a summary will be submitted to NYSDEC as a part of the annual monitoring and inspection report. Monitoring and inspection will commence concurrently within 60 days of the approval of the construction certification report for a period of three years with the goal of demonstrating whether operation of the park adversely impacts on water quality with respect to leachate quality or quantity, and whether operation of the park meets the performance criteria established in the Permit.

Post Closure monitoring is anticipated to be conducted on the following schedule:

Sampling Frequency	Requirement	Wells Sampled	Status
Annual - Year 1	Post-Construction Monitoring	GMW-1 – GWM-11	Anticipated September 2015
Annual - Year 2	Post-Construction Monitoring	GMW-1 – GWM-11	Anticipated September 2016
Annual Year 3	Post-Construction Monitoring	GMW-1 – GWM-11	Anticipated September 2017

Upon completion of 3 years of post-operation annual routine groundwater sampling, DPR may submit documentation to NYSDEC in furtherance of a request to reduce or cease groundwater sampling at the Ferry Point Park golf course (Ferry Point Park East Post Construction Custodial Care Plan, October 2013). The Groundwater monitoring and sampling program will cease either at the three year completion or ten years from the date of the initial groundwater sampling event. When the request for cessation is accepted, the groundwater monitoring wells will be evaluated for either abandonment or removal within the first year of the cessation of monitoring. The abandonment or removal documentation, signed and

certified by a licensed NYS Engineer will be provided to DEC within the concurrent post closure reporting period after the completion of the work.

Monitoring and inspection will commence concurrently within 60 days of the approval of this construction certification report for a period of three years. Upon completion of three years of post-operation annual routine groundwater sampling NYCDPR may submit documentation to the NYSDEC in furtherance of a request to reduce or cease groundwater sampling at the golf course. NYCDPR agrees to perform operational groundwater sampling, data analysis and reporting for a minimum of three years after construction, with the goal of demonstrating whether operation of the park adversely impacts water quality with respect to leachate quality or quantity, and whether operation of the park meets the performance criteria established in the Permit. NYCDPR will not change monitoring frequencies until the request has been approved.

5.7.5 Final Cover System

The integrity of the final cover system will be inspected routinely by NYCDPR, or their duly appointed representative, to fulfill the requirements of the Post Construction Custodial Care Plan. Inspections and maintenance will be completed in association with the Maintenance Guidelines for Trump Golf Links at Ferry Point Park included in Appendix I of the 2013 Engineering Report (Appendix 20).

Monitoring and inspection will commence within 60 days of the submittal of this construction certification report and then undertaken annually within 30 days of the submittal of the initial report. NYCDPR agrees to a rolling five-year plan, whereby NYCDPR may petition to modify or terminate the final cover inspection requirements by demonstrating that the integrity of the final cover system has been maintained in accordance with performance criteria established in the Permit.

5.7.6 Parking Lot Asphalt Cover (Consent Order)

During 2010, fill material from a JFK Airport source site was brought on-site and placed in seven different stockpiles. The material was believed to be in conformance with permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. On January 10, 2011, NYCDPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to this fill material, which was used to construct the base of the clubhouse and maintenance facility parking lots.

Specific requirements within the Consent Order as they pertain to post construction operations are as follows:

From Consent Order No R2-20100521-172: “Attachment “A” Proposed Handling of Ferry Point Park Soil Stockpile, Item 6, Once the asphalt top course is installed, the asphalt surfaces of the clubhouse and maintenance facility parking lots will be inspected during April and October every year by a licensed professional engineer (“engineer”) who is registered to practice in New York State. Within thirty days (30) days of such inspections, the engineer will submit to the Department a stamped and certified written detail report, including photo documentation, regarding the condition of the asphalt surfaces and their

adequacy, including photo documentation, regarding the condition of the asphalt surfaces and their adequacy to effectively function as covers. A description of any needed repairs will be included in the engineer's report.

Item 7, any repairs deemed necessary by the engineer must be completed by New York City Department of Parks and Recreation ("NYC Parks") within fifteen (15) days of the notification by the Department to NYCDPR to begin such repairs. A certification, including supporting written and photo documentation must be submitted by NYC Parks within fifteen (15) days after completion of repairs."

6 Summary

Construction activity at the Site began in July 2000 and concluded in July 2014 with physical completion of the Golf Course. Although the Golf Course construction is complete, some incidental work continues to occur at the Site associated with specific improvements necessary for golf course operations by the golf course concessionaire. Construction activity included clearing and grubbing, excavation, grading, importation of fill material, construction of the Community Park and Golf Course and associated appurtenances, installation of site utilities and infrastructure, installation of plantings, and installation of asphalt parking lot. A representative of the NYCDPR was present during all construction activities. To the best of our knowledge, a representative of the IEM was present during all earth moving and soil importation activities. For this project, fill importation followed the Permit requirements and resulted in a large scale earthwork fill conducted in general accordance with NYSDEC requirements as documented in the daily, bi-weekly, and quarterly reports and as summarized herein.

7 Certification

Certification Statement

I, Robert Iaropoli, PE, LS, an employee of the New York City Department of Parks and Recreation, exercising independent judgment and discretion do hereby certify that this Final Construction Certification Report was prepared under my direction and supervision. This Final Construction Certification Report was prepared in accordance with the NYSDEC requirements in 6 NYCRR Part 360, the current Part 360 Permit and approved Part 360 Permit Modification documents. The information contained herein is based upon: 1) Work which I have personally inspected both during and after construction from November 2012 to date; 2) Information provided to me by those directly employed by or under contract with the New York City Parks and Recreation and the New York City Department of Design and Construction as construction project managers;3) Design Consultants; 4) Contractors responsible for construction pursuant to their contracts except as indicated; and 5) third parties, such as manufactures, suppliers, etc., whose materials have not been personally verified by me for accuracy and/or adequacy but believe them to be true and accurate[4].

EXECUTIVE SUMMARY

Maser Consulting P.A. (Maser Consulting), on behalf of The Trump Organization, has prepared this Certification Report for the construction of the permanent Clubhouse at the Trump Ferry Point Golf Links located at 500 Hutchinson River Parkway, Bronx, New York. This report has been prepared pursuant to 6 NYCRR Part 360 of the New York State Solid Waste Management Program and the 2013 Ferry Point Park East Post Construction Custodial Care Plan. This report also includes a summary of a supplemental project to install a new gas main as part of the Clubhouse Construction project.

Acting as the Independent Environmental Monitor (IEM), Maser Consulting witnessed, recorded and confirmed construction of the new Trump Links Clubhouse, including the installation of support pilings, importation of suitable materials used for cover; the application, installation and testing of the Liquid Boot® Vapor Barrier System and the associated Sub-slab Depressurization System (SSDS); and the installation, calibration and testing of the interior Methane Detection System. For each construction and testing component, Maser Consulting confirms compliance with the Permits, plans and specifications of the project. Minor deviations to the plans and specifications are noted in this report and in the As-Built documents contained herein. Minor deviations to the specifications were the result of two main issues: the need to relocate system components to avoid conflicts and interferences with utilities and appurtenances; and the substitution of the materials of construction that were equivalent or superior to the original specifications.

The IEM also monitored, tested and confirmed that soil materials imported for the new Clubhouse construction were derived from pre-approved sources. The IEM conducted periodic surveillance of trucks being loaded at the approved facilities and transported to the Construction Site. For material imports, the IEM visually evaluated loads and scanned loads with direct reading instruments for signs of contamination. Only those loads meeting project permit and specifications standards were permitted to be unloaded at the site.

At times when imported soil materials had to be stockpiled on-site, the IEM took steps to ensure that a controlled staging area was secured. The staging area was established in the parking lot to the west of the new Clubhouse site. The IEM also took steps to ensure that the stockpile was properly covered to prevent erosion by wind and water, and that catch basins in the parking lot were properly protected to ensure that sediments would not enter the storm water system. Weekly erosion control inspections were conducted by the IEM in accordance with NYSDEC's Construction Site Management Program. The IEM immediately communicated deficiencies in the erosion control features to the General Contractor (JCS) such that immediate mitigative action could be taken.

Maser Consulting also acted as the IEM for a supplemental project associated with the new Clubhouse construction. The supplemental project consisted of the installation of an approximately 5,500-foot long, 6-inch diameter gas pipeline installation. The new gas supply line was deemed necessary to provide heating, ventilation, air conditioning and other utility service to the new Clubhouse. The gas pipeline was connected to a Consolidated Edison main located north of the clubhouse along Schley Avenue. The pipeline route generally traverses the western property line before turning east toward the new clubhouse in the vicinity of the Clubhouse parking lot. As IEM for this supplemental project, Maser Consulting witnessed, recorded and confirmed that the gas pipeline installation was conducted in accordance and incompliance with the project permits, plans and specifications.

Similar to the Clubhouse construction project, cover material importation was required for the gas main installation project. The IEM took appropriate measures to ensure that the source material was inspected and tested. Soil quality analytical results have been included within this report. Analyzed permit parameters were found to be acceptable. The IEM also visually assessed and field screened each load to ensure that the quality of the material met project permit requirements and project plans and specifications.

Appendix M – Minutes of Weekly Construction Progress Meetings
Appendix N – Hampton-Clarke Project No. 8081617 Report dated September 14, 2018
Appendix O – Drawings titled "Methane Monitoring System Ceiling Plan (As Built)" prepared by EAI dated February 11, 2019 & "Vapor Remediation Floor Plan (As Built Monitoring Pt Layout as of 8/1/18)" prepared by French & Parrello with annotations by EAI dated August 1, 2018
Appendix P – CETCO/Minerals Technologies Letter to EAI Inc. re: "Liquid Boot Spraying Temp" dated November 9, 2017 & EAI Inc. letter to Maser Consulting P.A. re: "Vapor Remediation System Installation, Ferry Point Clubhouse, Ferry Point Park, Bronx, NY" dated October 18, 2019
Appendix Q – Drawings titled "Ferry Point Clubhouse, 500 Hutchinson Parkway, Bronx, NY" showing new gas line prepared by Victor Famulari Architect P.C. dated July 25, 2018
Appendix R – DORs for Installation of New 6-Inch Gas Line to Clubhouse

I. INTRODUCTION

A. Purpose

This Final Construction Certification Report for the Trump Ferry Point Golf Links clubhouse is submitted to the New York State Department of Environmental Conservation (NYSDEC) and the New York City Department of Parks & Recreation (NYCDPR) upon completion of the construction of a new clubhouse at Ferry Point Park East. Built on top of a former municipal landfill, the major elements of the Clubhouse construction project consisted of the installation of over 200 steel support pilings driven through the former landfill material and into competent rock at an average depth of 75 below grade. During the support piling installation, Maser Consulting (acting as the IEM) measured the ambient air quality for signs of methane gas release from the subsurface. When detected on rare occasions, immediate measures were taken to mitigate methane from the work and breathing zones with the use of engineering controls including physical barriers and the use of industrial explosion-proof fans to ventilate the work zones.

Following the installation of the support pilings, Maser Consulting observed the installation of two added protective elements – a Liquid Boot® Vapor Barrier System and a corresponding SSDS. Both systems were designed to mitigate the intrusion of methane and other landfill gases into the new Clubhouse.

As a means to assess the effectiveness of the Vapor Barrier and the SSDS, a Methane Detection System was installed inside the new Clubhouse. The methane detection system consists of a network of in-floor methane sampling ports as well as a series of methane detectors located throughout the main banquet and reception areas as well as in the smaller offices, the kitchen and other employee and publicly-accessible areas.

This report certifies that the construction of the Liquid Boot® vapor barrier system and the SSDS for the new clubhouse have been completed in accordance with the 6 NYCRR Part 360 Solid Waste Management Permit for Ferry Point Park (copy provided as **Appendix A**). This report further certifies that Methane Detection system was also installed, tested and calibrated in compliance with the project permits, plans and specifications.

B. Report Organization

This report has been generated to provide a written post-construction certification report to comply with the requirements of the above-referenced Part 360 Permit. The narrative and supporting information provided in this report have been organized such that any individual, especially those not familiar with the new clubhouse construction, can gain a concise understanding of the history of improvements at the Site (a former solid waste management facility, i.e. landfill).

The report has been organized into the following sections:

- Section I which briefly describes the purpose and scope of the project, provides details pertaining to the Site background including a Site description, key agencies involved, and permitting history

- Section II describes the Part 360 Permits and modifications, Permit reference documents, nonconformance issues, operational upsets, emergencies, and unusual circumstances, and reporting completed associated with the new clubhouse

- Section III details the fill importation Quality Assurance / Quality Control (QA/QC) program, specifically source site reviews for cover layer material, on-site fill importation inspection, trucking manifests, rejected trucks and materials, fill tracking, and total carcinogenic semi-volatile organic compound (SVOC) tracking

- Section IV provides details related to construction activities on-site including construction of the new clubhouse, environmental controls such as landfill gas monitoring, municipal solid waste handling, earthwork and fill placement, demarcation layer, construction progress meetings, and deviations from the approved design plans and/or Permit requirements with as-built surveys

- Section V details the environmental monitoring completed during the Project including Stormwater Pollution Prevention Plan (SWPPP) erosion control inspections.

- Section VI provides a summary of the report

- Section VII provides report certification

C. Background Information

a. Project Scope

Ferry Point Park in the Bronx (the "Site") is a former landfill covering 222 acres that is bounded by the Bronx-Whitestone Bridge and Hutchinson River Parkway to the west; Balcom, Miles, and Emerson Avenues to the east; Schley Avenue and St. Raymond's Cemetery to the north; and the East River to the south. The project was originally managed under Ferry Point Partners, LLC and was taken over solely by the City of New York Department of Parks and Recreation in October 2007.

The original project scope included the construction of three main elements including a golf course, a community park, and a waterfront park over the 222-acre Site as follows:

- An 18-hole golf course with practice facility, driving range, clubhouse, maintenance facility, irrigation lake, stormwater retention ponds, and a parking lot (192.5 acres);
- A passive recreation waterfront park with walkways and a comfort station (19.5 acres); and
- A community park with baseball fields, basketball court, walkways, comfort station, and landscaped stormwater retention area (10 acres)

A new element of the project was initiated in 2017 with the construction of a permanent clubhouse in the southern corner of the Site. The project began in July 2017 and was completed in August 2018.

A supplemental component of the Clubhouse project was deemed necessary when the existing 2-inch gas service line to the facility was determined to not be capable of providing the volume of gas necessary to support the heating, ventilation and air conditioning units as well as other facility utilities such as the kitchen and other amenities. Construction of the Gas Main Installation began in late August 2018 and was substantially completed by November 2018.

b. Project Site[1]

The origins of the site date back to the early 1900s. At that time, an available 1900 map of the Bronx showed the western edge of the site which now contains the expressway and Whitestone Bridge was a long narrow peninsula extending out to the same area that the northern landing of the Whitestone Bridge now extends. Immediately east of this peninsula was a large open bay which is the area that the Ferry Point Golf Course is now located. Northeast of the bay and well inland was the Baxter Creek that drained into the bay. The eastern landfall of this embayment area is a larger peninsula that contains roadways and a residential development. The road patterns do not resemble the roadways that currently exist in that area and appear to have been changed.

A 1938 aerial photo showing the construction of the Whitestone Bridge shows the Bay, mooring, residential area and land to the west to be virtually the same as shown in the 1900 map. The significant change is in the widening of the western peninsula where the expressway was being constructed leading to the bridge ramps. The widening was not significant at this time but a rectangular area in the extreme northwest corner of what is now the site appears to be filled and graded – possibly to support construction staging area for the bridge/expressway. Areas of filling can be readily identified in the photograph by the contrasting lighter color typically indicative of sandy dredge sand placement. Other areas along the shoreline can be seen as containing a lighter-colored band of fill material and this includes much of the new Ferry Point Park located west of the Whitestone Bridge. Much of the park area was filled and graded by 1938. Bulkheads were constructed with linear components to present a smooth shoreline but one that does not appear to contain a beach where water diminishes in depth to 0. Photos of the eastern area of the bay where mooring and docks can be seen showing large vessels moored against the shore. This would indicate the water had significant depth all of the way to the center of the bay.

Aerial photographs from the 1950s show a drastic change in the area currently referred to as the site. Large expansion of the filling that was evident in 1938-39 up in the northeast corner can be clearly seen. The filling extends well into the bay and it appears that a connective bridge

[1] *Reference: "Ferry Point Park Golf Course & Community Park, Bronx New York, Final Construction Certification Report, NYSDEC Permit #2-6006-00014 / 00013 (SW)" prepared by the City of New York Department of Parks and Recreation dated October 19, 2015 – a.k.a. the 2015 Final Construction Certification Report*

was constructed from the eastern shore to the fill area. It is difficult to discern if this is a usable structure for crossing or if it had some other purpose. The filling operation appears from the photo to consist of the same light-colored material that was placed in the Ferry Point Park and from photos showing a large number of barges in the water filled with material of the same light color. There is specific documentation that presents the specific origin and consistency of the material. but from the prior aerials showing filling and this large expansion, it appears to be of a similar origin which would be dredge sand. In the 1951 aerial, no specific municipal solid waste dumping and disposal can be seen; however, records indicate the landfill operated during this approximate time period. It is therefore assumed that municipal solid waste was disposed shortly after the photo was taken. The landfilling shown in the aerial may have been the initial construction of the upper portion of the landfill with the tidal gate or bridge closing in the upper bay area. Additional aerials of the landfilling were not identified and more recent aerials document the completion of filling as well as the more recent golf course construction.

What can be discerned from this compilation of photos is that the landfill could be located in an area that may have been open water as well as some area that was previously reclaimed land with dredge material.

The Site operated as a landfill from before 1951 to the 1960s. The landfill reportedly accepted municipal solid waste during its operating period and was closed and covered in the mid-1960s, with additional closure operations conducted more recently in the 1980s. Prior Site use was determined from historic aerial photographs from 1938 thru 1991. The aerial photographs span the entire operational period of the prior landfill, from its initial operations to the present, and provides substantial information about the Site's development.

c. Key Agencies

The following were the key agencies associated with the project providing oversight, administration, design, construction, and monitoring services. The following is not intended to be an exhaustive list of involved entities related to the Project:

Primary Regulatory Agency:
New York State Department of Environmental Conservation Region 2 ("NYSDEC")

Project Permittee:
City of New York Department of Parks & Recreation ("NYCDPR")

Primary Design, Engineering, Construction, and Monitoring Consultants:
Hart Howerton Planning, Architecture and Landscape Architecture, P.C. ("Hart Howerton")
French & Parrello Associates ("FPA")

Independent Environmental Monitor ("IEM"):
Maser Consulting P.A. ("Maser Consulting")
Woodard & Curran ("W&C")

General Contractor:
Golf Course Clubhouse: JCS Construction Group, Inc. ("JCS")

Subcontractor for the SSDS and Liquid Boot® Vapor Barrier Installation:
EAI, Inc. ("EAI")

Golf Course Concessionaire/Operator:
The Trump Organization ("Trump")

See **Appendix B** for a list of project participants.

d. Independent Environmental Monitor

The requirement for an IEM on this project was associated with an increased level of monitoring exceeding normal review and oversight practices of the NYSDEC in order to protect public health and the environment. The increased level of review and oversight for this Project was mainly associated with the effort required for evaluation of fill material sources, source site testing and inspection, importation of the fill material, environmental monitoring required at the clubhouse construction site, and later along the gas main installation route. IEM services were also necessary during the installation of over 200 support piles through the former waste pile located beneath the new Clubhouse.

In accordance with Special Condition 24 of the 2014 Permit (**Appendix A**), NYCDPR was responsible to retain an IEM, accountable to NYSDEC, to provide environmental oversight of activities authorized under the Permit including but not limited to the quantification, importation and placement of fill, and the monitoring of the clubhouse construction site. Particular activities performed by the IEM for this Project included the following:

- Report deviations from or non-compliance with permitted activities to NYSDEC;
- Evaluate and inspect fill sources;
- Evaluate, monitor and mitigate methane intrusions during the installation of steel support pilings for the new clubhouse foundation;
- Witness source site investigation, sampling, and compare lab test results to Permit requirements;
- Visual and Photoionization Detector (PID) inspection of imported fill materials to the Site;
- Monitor offloading of trucks and reject unacceptable materials from being dumped on the Site and used for construction;
- Monitor environmental sampling on the Site (i.e. landfill gas);
- Monitor fill operations on the Site, particularly the installation of minimum thickness of shaping layer and cover layer materials as well as demarcation layer installation;
- Complete and submit Daily Observation Reports to NYCDPR;
- Complete weekly Erosion Control Reports; and
- Attend weekly Construction Progress Report meetings

The selection, continued retention, discharge, or replacement of the IEM was subject to the approval of NYSDEC at its sole discretion.

e. Project and Part 360 Permitting History

The following represents an overview of project and permitting history outlining key events:

On May 21, 2014 NYSDEC issued Permit No. 2-6006-00014 / 000013 for a Solid Waste Management Facility for the Ferry Point Park Golf Course; this permit establishes an IEM. A copy of this permit is provided in **Appendix A**.

On June 12, 2017 the Ferry Point Park SSDS Plan prepared by FPA for the proposed permanent clubhouse was submitted to NYSDEC. A copy of this submittal is provided in **Appendix C**.

On June 22, 2017 NYSDEC issued a letter to The Trump Organization approving the Ferry Point Park SSDS Plan. A copy of this letter is provided in **Appendix D**.

On June 7, 2018 Maser Consulting (through The Trump Organization) submitted a Construction Certification for the SSDS to NYSDEC to allow for the temporary, one-day opening of the new clubhouse on June 11, 2018. A copy of this submittal is provided in **Appendix E**.

On July 2, 2018 NYSDEC issued a review letter with comments on the June 7, 2018 Maser Consulting Construction Certification for the SSDS. A copy of this letter is provided in **Appendix F**.

On July 11, 2018 Maser Consulting provided a letter response to NYSDEC's July 2, 2018 review letter. A copy of this letter response is provided in **Appendix G**.

f. Construction Drawings

Construction drawings for the SSDS are included in **Appendix C**.

II. PART 360 PERMIT

A. Part 360 Permits and Modifications

The following permit was issued for this Project:

NYSDEC Permit No. 2-6006-00014 / 000013 (Solid Waste Management Facility – Ferry Point Park Golf Course, Bronx NY) issued on May 21, 2014 (copy provided in **Appendix A**).

B. Reference Documents

Refer to the 2015 Final Construction Certification Report for a list of Permit reference documents. These documents support the original Permit and/or provide basis for subsequent permits renewals and modifications.

C. Non-Conformance Issues

In accordance with Special Condition 24 of the 2014 Permit, the IEM reported on Permit-related non-conformance issues during the duration of construction of the permanent clubhouse and on the gas main installation project. Non-conforming issues identified during the construction of the new facility were immediately addressed and remedied so that activities were in conformance with applicable plans, specifications and permits.

D. Operational Upsets, Emergencies, and Unusual Circumstances

No evidence of security breaches, unauthorized entries, injuries, fires, theft, vandalism etc. were observed during construction of the permanent clubhouse. The only post-construction upset was related to damage caused to the outdoor lighting system from wildlife borrowing and chewing. Corrective measures were undertaken with normal and routine maintenance actions by The Trump Organization maintenance staff.

E. Reporting

The IEM was responsible for daily and weekly reporting to the NYCDPR regarding the status of the work. The IEM participated in weekly on-site construction meetings and submitted weekly Erosion Control Reports during the construction period. Daily Observation Reports ("DOR") were also submitted to the NYCDPR for review and comment.

The IEM reported to the NYCDPR on a generally daily basis on the following information: weather conditions, fill materials imported to the site, detailed notes of construction activities, and non-conformance issues related to the Permit conditions. Non-conformance issues were immediately addressed by the contractors under the supervision of the IEM. The IEM also reported weekly to the NYCDPR on the construction status and pertinent observations regarding the erosion control measures around the construction site and at the imported soil stockpile area.

DORs are provided in **Appendix I** beginning on July 19, 2017 through February 5, 2019.

F. Authorized Fill Volumes

Imported fill material was derived from two pre-approved sources, one for cover material associated with the new Clubhouse and one for cover material used in the installation of the new 6-inch gas main.

New York Recycling located at 475 Exterior Road, Bronx, NY was the source of the material used for the new Clubhouse. A table in **Appendix K** indicates the volumes of material imported from this facility. This material met the soil quality standards set forth in the Permit requirements. During the course of the importation process, the material was re-sampled in order to reconfirm its quality. Analytical testing data can be reviewed in **Appendix J**. A total of 1,062 cubic yards of material was imported from this source site between November 2017 and March 2018.

Ranco Sand and Gravel located at 151 South Street, Manorville, New York was the source site for materials imported for the gas main installation project. A site source inspection was conducted in advance of the imports and analytical testing was performed to establish that imported material would meet all Permit conditions and requirements. A table in **Appendix L** provides a summary of the imports from Ranco Sand & Gravel. A of total 690 cubic yards of material was imported between September and October 2018.

III. FILL IMPORTATION QA/QC PROGRAM

A. Background

Fill material importation for construction of the permanent clubhouse commenced on November 27, 2017 and the last day for fill import was March 12, 2018. The fill importation QA/QC program implemented for the Project based on the Permit and associated reference documents was adhered to. The fill importation consisted of two main components: source site reviews and on-site inspections. A source site review was conducted by the IEM prior to fill material being imported to the Site and additional visual and PID inspections were completed by the IEM upon the material entering the Site at the IEM inspection area and again once the material was dumped at the work or stockpile location on the Site.

B. Source Site Reviews

Prior to cover layer material being imported to the Site, each potential source was thoroughly evaluated by the IEM. An environmental review was performed for proposed source sites in accordance with Special Condition 24 of the 2014 Permit. The source site review process criteria were specified in the Report on Fill Management, Operations and Maintenance, prepared by TRC on May 16, 2000, and revised June 30, 2005 (Volume #2 of the 2005 Engineering Report). The source site review process was modified over time as compared to the original process outlined in the various engineering reports and permit modification requests. The process generally consisted of the following main components:

- NYCDPR would notify the IEM of a new potential source site. NYCDPR would provide the IEM with the site name and location as well as any available historical site information and soil environmental analytical results that existed for the potential source site.

- Once NYCDPR confirmed that their desire to move forward with pursuing the potential source site, NYCDPR authorized the IEM to retrieve available site information. NYCDPR then completed an initial review of the existing site information, generated a sampling plan, and provided the results of the initial review and sampling plan to the IEM. NYCDPR then authorized the IEM to conduct a desktop review of the existing site information, available soil environmental analytical results, and NYCDPR's sampling plan. The IEM provided NYCDPR with comments related to their review and their sampling plan in consultation with NYSDEC. Once a final sampling plan was agreed upon, the source site investigation was initiated and executed per the NYCDPR sampling plan with IEM oversight. For source sites with in-situ material, test pits

were typically completed with additional soil samples inspected, collected, and analyzed in accordance with the Permit requirements. Once the sampling was completed, the IEM reviewed sample results and the IEM generated a memorandum summarizing the review process and provided recommendations and requirements necessary for NYCDPR to address in order to continue pursuing the potential source site. The recommendations typically included conditions associated with overseeing the excavation, loading, and importing of the source site material to the Site in accordance with the Permit. The IEM submitted the memo of recommendations to NYSDEC for review and comment prior to issuing the final memorandum to NYCDPR. NYSDEC would provide final comments and approval of the source site with any additional required conditions.

- If NYCDPR determined that the potential source site was worth pursuing considering site-specific conditions, schedules, etc., they coordinated with the source site operator and IEM on importation schedule and requirements. The IEM provided oversight to confirm that the loading, hauling, and overall import of the approved material was completed in accordance with the memorandum of recommendations, NYSDEC conditions, and the Permit.

- The IEM provided oversight during export from the approved source sites on an as needed basis and provided oversight at each source site during additional sampling activities if the source site was exporting more than the minimum sampling frequency outlined in the Permit (i.e. 10,000 cubic yards for shaping layer material and 2,000 cubic yards for cover layer material).

If at any time during the review process there were reasons for concern identified by the IEM resulting in the potential source site being classified as a "complex" source site, NYSDEC became the primary reviewer and made final recommendations related to additional site investigation requirements or approval/rejection of the potential source site with support from the IEM. A complex source site was defined by the presence of an abundance of or particular Recognized Environmental Concerns ("RECs") and NYSDEC made decisions related to approval and/or associated conditions for further evaluation or import of the fill material.

For both source sites used in this Construction Project, no complex source site determinations were made.

Details of source site review and site testing activities are included in the report text and specific DORs. Source site review supporting information and testing data is included in the 2015 Final Construction Certification Report.

C. Cover Layer Material

Materials accepted for use as cover layer on the Site were sampled prior to acceptance and after each additional 2,000 cubic yards. As per the 2005 Permit modification, the parameters for cover layer material included the complete analyte list of TAGM 4046 for total VOCs, total SVOCs, total pesticides and herbicides, total PCBs, total metals, sulfur, and asbestos.

Based on source site reviews and site testing activities, the cover layer material imported to the Site met the following chemical limits:

Analyte	Shaping Layer
RCRA Metals (mg/kg = ppm)	
Arsenic	28
Barium	2,000
Cadmium	20
Chromium	1,000
Copper	1,000
Lead	400
Mercury	0.57
Selenium	11
