## ENVIRONMENTAL ASSESSMENT STATEMENT

## PART I: APPLICANT INFORMATION & ACTION SUMMARY

### A. LEAD AGENCY

Agency: **New York City Department of Parks & Recreation**

Contact: **Joanne G. Imohiosen, Asst. Commissioner, and Jane Cleaver, Chief of Parklands**

Address: **The Arsenal, Central Park**

**New York, NY 10021**

Phone: **(212) 360-3404/ 360-3401**

Fax: **(212) 360-3434/ 360-3461**

### B. APPLICANT

Applicant: **New York City Department of Parks & Recreation**

Contact: **Joanne G. Imohiosen, Asst. Commissioner, and Jane Cleaver, Chief of Parklands**

Address: **The Arsenal, Central Park**

**New York, NY 10021**

Phone: **(212) 360-3401**

Fax: **(212) 360-3461**

### C. APPLICATION IDENTIFICATION

Project name: **Ferry Point Park**

CEQR # (agency initials followed by year and number): **99DPR006X**

BSA #:

September 30, 1999

ULURP #:

LEGISLATIVE INTRO #:

CAPA #:

## D. ACTION DESCRIPTION

1. Provide a Sanborn or other land use map showing the boundaries of the directly affected area.*

   **See Figure 1**

2. Describe the location of the directly affected area as follows:

   Borough **Bronx**

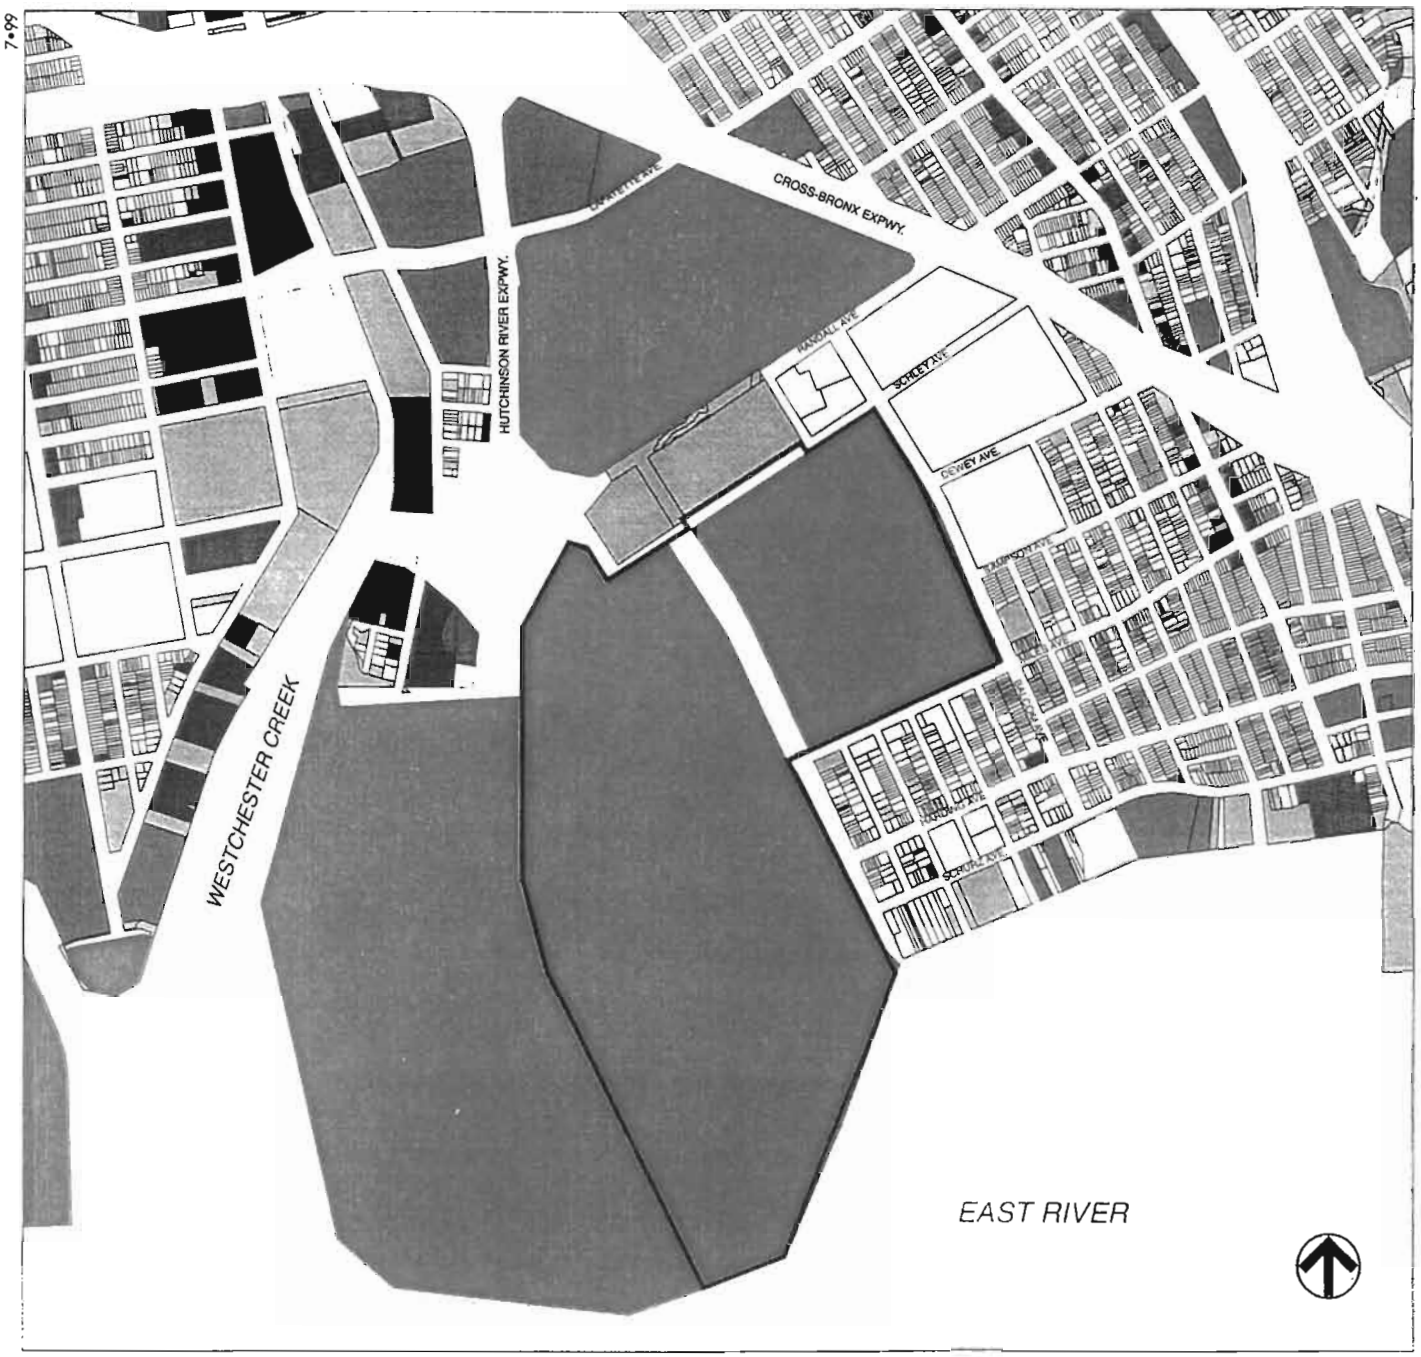
   Community District(s) **10**

   Tax block(s) and lot(s) **Block 5583, Lot 100 and Block 5622, Lot 1.**

   Street address, vanity address and nearest cross streets (minimum of two) to property:

   **The eastern portion of Ferry Point Park, bounded by the Bronx-Whitestone Bridge to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue to the north, and the East River to the south.**

* The directly affected area consists of the project site and the area subject to any change in regulatory controls that the action includes.



*Ferry Point Park*

**Land Use**

*Figure 1*

If the action would apply to the entire City or to areas that are so extensive that site-specific description is not appropriate or practicable, describe the areas likely to be affected by the action:

**N/A.**

3. Describe the action for which environmental review is being performed and, briefly, what consequences would result from or be generated by the action:

**The proposed project has the following actions which will require discretionary approvals and are subject to environmental review:**

- **The application by the New York City Department of Parks and Recreation (DPR) to the City Planning Commission (CPC) for a major concession for the development, construction, operation, management, and maintenance of a public recreation facility at Ferry Point Park, and the issuance of a license agreement by DPR to Ferry Point Partners, LLC, for the development, construction, operation, management, and maintenance of a public recreation facility at Ferry Point Park. The project site (after the proposed demapping of the two unbuilt and undeveloped streets discussed below) is approximately 222 acres. The proposed public recreation center would include a waterfront park of approximately 19.5 acres (including a waterfront esplanade, walkways, kiosks, and a boathouse grill restaurant); a community park of approximately 7 acres (including active and passive recreational areas such as a ballfield, basketball court, and children's recreation area); and a comprehensive golf facility (including an 18-hole tournament quality golf course, driving range, practice areas, clubhouse with full-service pro shop/snack bar/ locker rooms, maintenance building, and facility managers residence), and fine dining/ banquet facility on approximately 195.5 acres. The proposed public recreation facility would be developed on the eastern portion of Ferry Point Park, an area of the park that is undeveloped except for an organic recycling and composting facility that is located in the northwestern portion of the project site (currently operated by DPR, and planned to be relocated), informal dirt bike paths, an informal model airplane area in the western portion of the project site, and a ballfield and basketball court located on the northeastern portion of the project site. The proposed public recreation center would function primarily as a regional park. Vehicular, pedestrian and bicycle access to the site would be via I-678 under the Bronx-Whitestone Bridge. Pedestrian connections would be provided between the project site and the portion of Ferry Point Park located to the west of the Bronx-Whitestone Bridge. Access for emergency vehicles would be provided via Emerson Avenue.**

- **The application by DPR to CPC to demap two unbuilt and undeveloped streets—Emerson Avenue between Miles and Schley Avenues, and Schley Avenue between Buttrick and Emerson Avenues—which would be incorporated into Ferry Point Park and add approximately 6 acres of new parkland. Sewer corridors or easements would be provided for both of these demapped streets.**

**The proposed project will be subject to New York City's Uniform Land Use Review Procedure (ULURP).**

4. Physical dimensions and scale of project (fill in dimensions as appropriate):

Total contiguous square feet owned or controlled by project sponsor:

**9.67 million*** square feet.

Project square feet to be developed: **9.67 million** square feet.

Gross floor area of project, in square feet: **53,100****

If the action is an expansion, indicate percent of expansion proposed in the number of units, square feet or other appropriate measure: **Demapping will add approximately 266,500 square feet of new parkland.**

_____ % of _____

Dimensions (in feet) of largest proposed structure***:

**150'** height; **30'** width; **440'** length.

Linear feet of frontage along a public thoroughfare **7,700 feet**

5. Construction:

Will the action result in demolition of or significant physical alteration to any improvement?

**Yes.**

**Notes:**

* Approximate area of existing parkland subject to this action is 9.45 million square feet. This does not include existing parkland west of the Bronx-Whitestone Bridge/Hutchinson River Parkway, and does not include parklands in the East River under water. Approximate area of Emerson and Schley Avenues to be demapped as part of this action is 266,500 square feet.

** Approximate area of buildings above grade.

*** The driving range will include tees in a structure of approximately 30 by 440 feet and an open driving range of approximately 400 by 950 feet, surrounded by netting approximately 50 to 150 feet in height. The driving range may include a removable dome that would be approximately 400 by 400 feet and 120 feet in height. The dome would be utilized during the winter months.

Will the action involve either above ground construction resulting in any ground disturbance or in-ground construction?

**Yes. The project would involve ground disturbance for construction of the proposed public recreation facility (including the golf facility, the community park, and the waterfront park). In-ground construction would include the five proposed buildings planned as part of the project (i.e., clubhouse, facility managers residence, boathouse grill, maintenance building, and fine dining/banquet facility), the support system for the golf driving range, park gazebo, kiosks, shelters, restroom facilities, utility connections, and irrigation and drainage systems.**

If single phase project:

Anticipated period of construction (including demolition): **30** months

If multi-phased:

Total number of phases anticipated: _____ (number)

Describe phases and construction schedule:

Anticipated date of commencement of phase 1 (including demolition):

**January** month **2000** year

Approximate completion date of final phase:

**Spring** month **2002** year

## E. APPROVALS

1. Will the action be reviewed pursuant to the Uniform Land Use Review Procedure (ULURP) set forth in section 197-c of the Charter?
   **Yes.**

2. Identify below and describe as appropriate all City approvals required for the action, regardless of whether environmental review is required for any individual approval.

LAND USE APPROVALS SOUGHT

(For BSA approvals, see following section):

Zoning text amendment: _____

Zoning map amendment: _____

City map change: _____

Street map change: **Demapping of Emerson Avenue between Miles and Schley Avenues, and Schley Avenue between Buttrick and Emerson Avenues.**

Park map change: **To include demapped streets that are to be remapped as park land.**

Special permit: _____

Specify type: _____

Specify section of Zoning Resolution: _____

New or renewal? _____

Expiration date: _____

Site selection for public facility: _____

Acquisition of real property by the City: _____

Public easement: **Sewer easements to be provided.**

Franchise: _____

Type of franchise: _____

New or renewal? _____

Expiration date: _____

Urban renewal area designation or alteration: _____

Urban renewal plan: _____

New or amended? _____

Concession: **Major concession pursuant to a license agreement.**

Sanitary or waterfront landfill: _____

Revocable consent: _____

New, modified or renewal? _____

Expiration date: _____

City Planning authorization: _____

Charter §197-a plan: _____

Disposition of City property: _____

Other (specify): _____

BOARD OF STANDARDS AND APPEALS APPROVALS SOUGHT:

Special permit: _____

Type of special permit: _____

Specify section of Zoning Resolution: _____

New or renewal? _____

Expiration date: _____

Variance: _____

Type of variance, if known (use or bulk): _____

Other (specify): _____

OTHER CITY APPROVALS SOUGHT:

Legislation: _____

Rulemaking: _____

Specify agency: _____

Construction of public facilities: _____

Specify: _____

Funding of construction: _____

Specify: _____

Funding of programs: _____

Specify: _____

Policy or plan: _____

Landmarks Preservation Commission approvals (exempt from CEQR): _____

Department of Buildings approvals (exempt from CEQR): **Yes.**

Other (specify): _____

**New York City Department of Environmental Protection (DEP)**
**Stormwater Pollution Prevention Plan Review; sewer and water connections.**
**New York City Department of Transportation (DOT)**
**Roadway repair for existing Parks road.**
**New York City Art Commission**
**Landscape and building design approval.**
**New York City Department of City Planning (DCP)**
**Review for consistency with Local Waterfront Revitalization Program.**

2. Specify all State and federal approvals, actions or funding required for the action, regardless of whether environmental review is required for any individual action.

Possible Involved Agencies:

**New York State Department of Environmental Conservation (DEC)**
**Stormwater Pollution Prevention Plan Review.**
**Triborough Bridge and Tunnel Authority (TBTA)**
**Maintenance facility under Bridge.**

## F. ACTION TYPE

Is the action a Type I action or an unlisted action? Consult the Type I list in 6 NYCRR §617.12(b) and the City list at §6-15(a) of Executive Order No. 91 of 1977. (See attachments 3 and 4.) Type I actions have been determined to be more likely to require preparation of an environmental impact statement than other actions. Prior to finalizing the EAS, it may be appropriate to reconsider the answer to this question in light of other parts of the EAS or supporting materials. Check below as appropriate:

Unlisted: _____

Type I: ✓

Specify Type I category or categories: **Alteration of parkland of over 2.5 acres.**

After completing or receiving Part I, the lead agency must send a copy of it, with any other information it deems necessary, to the Mayor's Office of Environmental Coordination -- 100 Gold Street, Second Floor, New York, New York, 10038. In addition, if an action includes discretionary actions/approvals by city agencies other than the lead agency, the lead agency should provide those involved agencies with notice of its lead agency status and send them Part I of the EAS.

## PART II: SITE AND ACTION DESCRIPTION

This Part provides a detailed description of the proposed action and addresses the physical and socioeconomic context of the proposed action. Materials prepared for other purposes may be used to satisfy this Part where appropriate. Where appropriate, the action description should include the cumulative effects of related actions. This Part also requires applicants to submit analyses for all applicable categories of environmental impacts.

### A. CATEGORIZING YOUR ACTION

(1) LOCALIZED ACTIONS include: a) site specific actions which would result in a specific or known development at particular locations; and b) actions involving changes in regulatory controls that affect one or more sites in a well defined localized geographic area and are not associated with specific or known development on each of those sites. Localized actions may be a mix of (a) and (b).

(2) AREAWIDE/PROGRAMMATIC ACTIONS include those actions that would apply to the entire City, or to areas that are so extensive that site-specific description and/or analysis would not be appropriate or practicable.

Check the category of action that is reflection of the actions proposed:

Category 1: (a) ✓ and/or (b) _____

Category 2: _____

For more information on categorizing your action, consult the introduction to the EAS Guidebook, at pages 8-9.

Subparts B, D, E and F of this Part should be completed for all localized actions. Subpart C, entitled "Project Description," is generally completed only for site specific actions which would result in a specific or known development at particular locations.

If your action is localized and involves changes in regulatory controls that affect one or more sites not associated with a specific development, then it is generally appropriate to include in Subpart E one or more reasonable development scenarios for such sites and, to the extent possible, to provide information about such scenario(s) similar to that requested in Subpart C.

If your action is areawide/programmatic, then you may generally skip subparts B through E of this Part (pages 16-25 of this form), unless completion of those subparts is helpful in describing your action, and proceed directly to subpart F on page 25. If you skip subparts B through E, be sure to attach texts and/or maps that will serve as the action description in lieu of completion of those subparts.

## B. SITE DESCRIPTION

Except where otherwise indicated, answer the following questions with regard to the directly affected areas. (The directly affected area, also called the area directly affected by the action, consists of the project site and the area subject to any change in regulatory controls that the action includes.) Indicate N.A. if not applicable.

1. MAPS:

   In addition to the Sanborn or other land use map requested in Part I, provide a tax map and zoning map showing the boundaries of the directly affected area.

   **See Figures 2, 3a, and 3b.**

2. PHYSICAL SETTING
   (both developed and undeveloped areas):

   Total square feet of directly affected area: **9.67 million** square feet

   Current general breakdown of area:

   **The project site is currently undeveloped parkland, with the exception of an organic recycling facility (in the northwestern), a composting area (in the middle), and a ball-field and basketball court (the northeastern). There are other unauthorized uses.**

   Water surface area: **0** square feet

   Roads, buildings and other paved surfaces: **130,000** square feet

   Other: _____ square feet

3. PRESENT LAND USE:

   Residential **None.**

   Total no. of dwelling units: **0**

   Number of low-to-moderate income units:* **N/A.**

   Gross floor area (square feet): **N/A.**

   Number of stories: **N/A.**

   Describe type of residential structures:

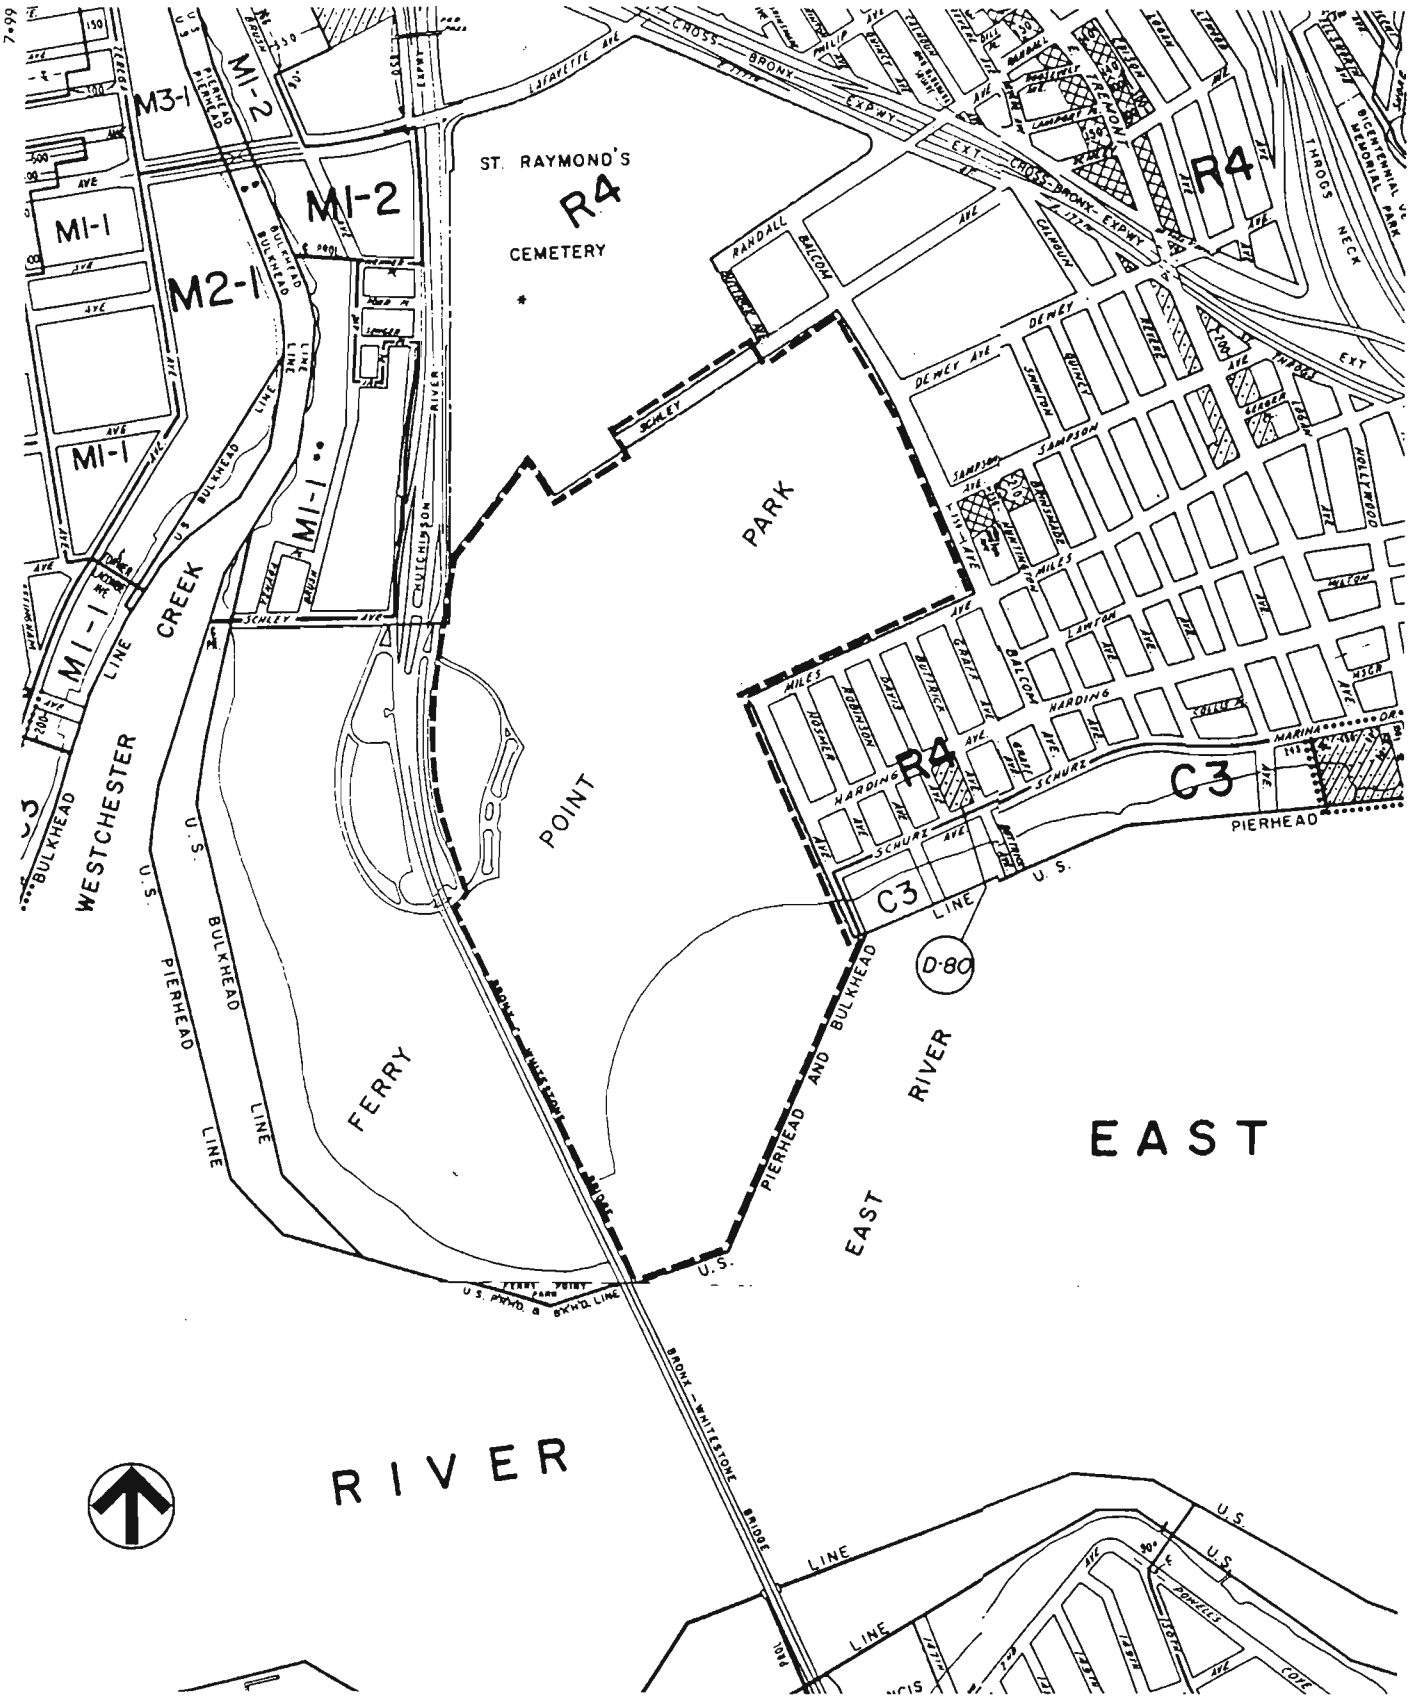
   **N/A.**

   Commercial **None.**

   Retail **0** Number of buildings and gross floor area of each building (sq. ft):

---

* Low-to-moderate income units are units with monthly carrying costs of not more than 30% of the median area monthly income. The Department of Housing Preservation and Development may be contacted for assistance in applying this definition.



*Ferry Point Park*

**Zoning**

*Figure 2*

Office: 0 Number of buildings and gross floor area of each building (sq. ft):

Other: 0 Number of buildings and gross floor area of each building (sq. ft):

Specify type(s):
**N/A.**

Number of stories and height of each building:
**N/A.**

Manufacturing/Industrial **None.**
Type of use(s):
**N/A.**

Number of buildings and gross floor area of each building (sq. ft.):
**N/A.**

Number of stories and height of each building:
**N/A.**

Open storage area: **N/A.** square feet.
If any unenclosed activities, specify:
**N/A.**

Community Facility **None.**
Number of buildings and gross floor area of each building (sq. ft.):
**N/A.**

Number of stories and height of each building:

**N/A.**

Type of community facility:

**N/A.**

Vacant Land

Is there any vacant land in the directly affected area? Describe briefly.

**The site is primarily unimproved and undeveloped park land and remapped as park land.**

Publicly Accessible Open Space

Is there any existing publicly accessible open space in the directly affected area? Describe briefly.

**Yes. The project site is primarily unimproved and undeveloped parkland. The ballfield and basketball court in the northeastern portion of the site occupy approximately 274,000 sq. ft., and the composting area and organic recycling facility occupy approximately 414,000 sq. ft.**

Does the directly affected area include any mapped City, State or Federal parkland or any mapped or otherwise known wetland?

**Yes. The project site is mapped City parkland, except for those portions of Schley and Emerson Avenues proposed to be demapped.**

Other Land Use

Gross floor area: _____ square feet.

Number of stories: _____

Type of use:

4. EXISTING PARKING:

Garages: **None.**

Number of spaces accessible to public: **0**

Number of spaces not accessible to public: **0**

Attended or non-attended? **N/A**

Operating hours: **N/A**

Self-park: **N/A**

Non-self-park (please specify): **N/A.**

Lots: **None.**

Number of spaces accessible to public: **0**

Number of spaces not accessible to public: **0**

Attended or non-attended? **N/A.**

Operating hours: **N/A.**

Self-park: **N/A.**

Non-self-park (please specify): **N/A.**

Other: (including street parking). Please specify and provide same data as for lots and garages, as appropriate

5. STORAGE TANKS: **None**

Gas or service stations: _____

Oil storage facility: _____

Other, specify:

Size of tanks:

Last NYFD inspection date:

Location and depth of tanks:

6. CURRENT USERS:

Number of residents: 0

Number and type of businesses:

**One organic recycling and composting facility. Both are run by the Department of Parks & Recreation and will be relocated.**

Number and type of workers by business:

**Fewer than 10 workers.**

Number and type of non-residents who are not workers:

**0.**

7. HISTORIC AND ARCHAEOLOGICAL RESOURCES:

Answer the following two questions with regard to the directly affected area, lots abutting that area, lots along the same blockfront or directly across the street from the same blockfront, and, where the directly affected area includes a corner lot, lots which front on the same street intersection. (See Section F of the EAS Guidebook.)

Do any of the areas listed above contain an improvement, interior, landscape feature, aggregate of landscape features, or archaeological resource that:

(a) has been designated (or is calendared for consideration as) a New York City Landmark, Interior Landmark or Scenic Landmark;
(b) is within a designated New York City Historic District;
(c) has been listed on, or determined eligible for, the New York State or National Register of Historic Places;
(d) is within a New York State or National Register Historic District; or
(e) has been recommended by the New York State Board for listing on the New York State or National Register of Historic Places?

Identify any resource.

**No. See Attachment N, "Archaeological Sensitivity."**

Do any of the areas listed in the introductory paragraph to 7 on page 19 contain any historic or archaeological resource, other than those listed in response to the previous question? Identify any resource.

**No.**

8. WATERFRONT:

Is any part of the directly affected area within the City's Waterfront Revitalization Program boundaries? (A map of the boundaries can be obtained at the Department of City Planning bookstore.) If yes, append a map showing the directly affected area as it relates to such boundaries. A map requested in other parts of this form may be used. (See Section K of the EAS Guidebook.)

**Yes. See Figure 4 and Attachment H, "Waterfront Revitalization Program."**

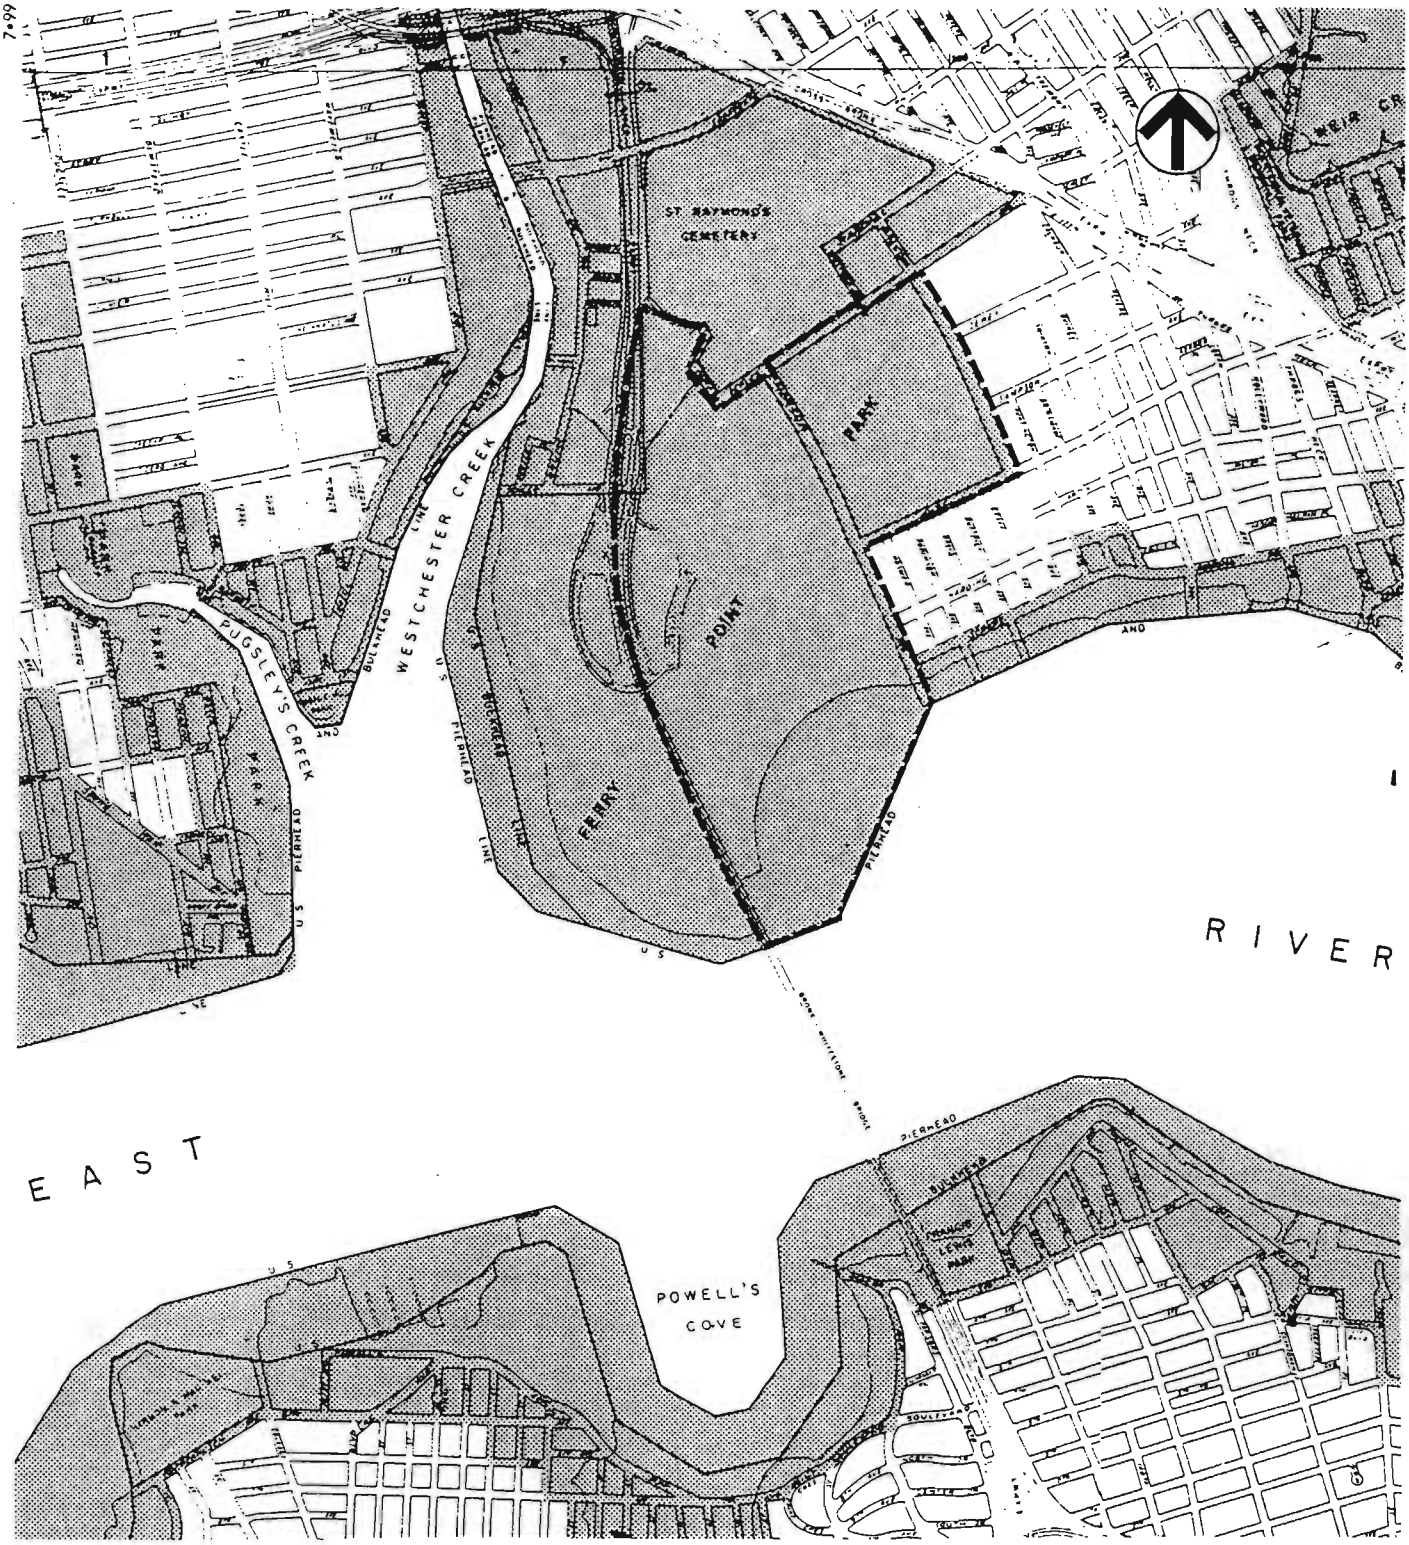
## C. PROJECT DESCRIPTION

This subpart should generally be completed only if your action includes a specific or known development at particular locations.

1. PROPOSED USES:

Residential

| | | |
|---|---|---|
| Total no. of dwelling units: | **4 in 1 structure.** | |
| Number of low-to-moderate income units: | **0** | |
| Gross floor area: | **4,500** | square feet. |



SOURCE: NYC DCP

*Ferry Point Park*

## Coastal Zone Boundary

*Figure 4*

Number of stories: 2

Describe type(s) of residential structures:

**One proposed structure for facility managers residence. One to two units would be approximately 1,000-2,000 square feet; the remaining units would be approximately 600-800 square feet.**

Commercial **See description of proposed buildings and uses under "Publicly Accessible Open Space."**

Retail: **None** Number of buildings and gross floor area of each building (sq. ft):

Office: **0** Number of buildings and gross floor area of each building (sq. ft):

Other: **0** Number of buildings and gross floor area of each building (sq. ft):

Specify type(s):

Number of stories and height of each building:

Manufacturing/Industrial **None.**

Type of use(s):

**N/A.**

Number of buildings and gross floor area of each building (sq. ft.):

**N/A.**

Number of stories and height of each building:

**N/A.**

Open storage area: N/A square feet.

If any unenclosed activities, specify:

**N/A.**

Community Facility

Number of buildings and gross floor area of each building (square feet):

**N/A.**

Number of stories and height of each building:

**N/A.**

Type of community facility:

**N/A.**

Vacant Land

Is there any vacant land in the directly affected area? Describe briefly.

**No.**

Publicly Accessible Open Space

Is there any existing publicly accessible open space to be removed or altered? If yes, describe:

**Yes. The proposed project would provide a public recreation center which would include a waterfront park; community park; comprehensive golf facility (including an 18-hole tournament quality golf course, driving range, practice areas, clubhouse with full-service pro shop/snack bar/locker rooms of approx. 7,500 square feet, maintenance building of approx. 7,500 square feet, and facility managers residence of approx. 4,500 square feet); boathouse grill restaurant of approx. 13,000 square feet; and fine dining/banquet facility of approx. 25,000 square feet in the largely undeveloped and underutilized eastern portion of Ferry Point Park. The portion of Ferry Point Park where this public recreation center will be developed will be altered, and the portions of the two streets to be demapped—Emerson and Schley Avenues—will become additional parkland. The site currently contains an organic recycling and composting facility, informal dirt bike paths, an informal model airplane facility, and a ballfield and basketball court.**

Any publicly accessible open space to be added? If yes, describe:

**Yes. The portions of the two streets to be demapped—Emerson and Schley Avenues—will add approximately 266,500 square feet of additional parkland.**

Other Land Use **None.**

Gross floor area: N/A square feet.

Number of stories: N/A

Type of use:

2. PROPOSED PARKING:

Garages **None.**

Number of spaces accessible to public: 0

Number of spaces not accessible to public: 0

Attended or non-attended? **N/A.**

Operating hours: **N/A.**

Self-park: **N/A.**

Non-self-park (please specify): **N/A.**

Lots:

Number of spaces accessible to public: **965 self-park spaces (including 20 spaces for maintenance vehicles), of which 350 self-park spaces located near the fine dining/banquet facility can be converted to 500 valet-parking spaces providing a total of 1095 total spaces. See Table 1.**

Number of spaces not accessible to public: 0

Attended or non-attended? **Both will be provided.**

Operating hours: **To be determined.**

Self-park: **945 spaces**

Non-self-park (please specify):

**350 self-park spaces can be converted to 500 valet parking spaces for the banquet facility.**

Other: (including street parking). Please specify and provide some data as for lots and garages, as appropriate.

**N/A.**

Number and location of proposed curb cuts:

**N/A.**

3. PROPOSED STORAGE TANKS:

Gas or service stations: _____

Oil storage facility: _____

Other, specify:

Size of tanks: **2-2,500 gallon tanks (1 for diesel and 1 for gasoline at maintenance building).**

Location and depth of tanks **Above ground, double-walled tanks**

4. PROPOSED USERS:

Number of residents: **Up to 10.**

Number and type of businesses:

**Pursuant to a Request for Proposals (RFP) process, Ferry Point Partners, LLC, is the designated licensee for the public recreation facility. Ferry Point Partners, LLC, subject to approval from the Department of Parks & Recreation, may designate other entities to operate portions of the proposed facilities.**

Number and type of workers for each business:

**Restaurant and catering facility uses: 300 workers. Golf course and driving range: 45 workers.**

Number and type of non-residents who are not workers:

**Recreation facility users are estimated to be a maximum of 1,300 per day (750 at the waterfront park, 250 at the community park, and 300 at the golf course and driving range).**

**Table 1**

## Parking by Location and Use

| Parking Location and Use | Number of Spaces |
|---|---|
| Golf facility | 350 self-park |
| Boathouse grill restaurant | 125 self-park |
| Waterfront park | 120 self-park |
| Fine dining/banquet facility | 350 self-park convertible to 500 valet-park |
| Maintenance building | 20 self-park for staff only |
| Total | 965 self-park (1,115 self/valet-park) |

5. HISTORIC AND ARCHAEOLOGICAL RESOURCES:

Will the action affect any historic or archaeological resource identified in response to either of the two questions at number 7 on pages 19 and 20? Describe briefly.

**No. See Attachment N, "Archaeological Sensitivity."**

6. DISPLACEMENT:

Will the action directly displace specific business or affordable and/or low income residential units? Describe briefly. (See Section C of the EAS Guidebook.)

**No.**

7. CHANGES TO EXISTING COMMUNITY FACILITIES:

Will the action directly eliminate, displace or alter public or publicly funded community facilities such as educational facilities, libraries, hospitals and other health care facilities, day care centers, police stations, or fire stations? (See Section D of the EAS Guidebook.)

**The organic recycling and composting facility will be relocated. DPR will use its best efforts to relocate the informal model airplane facility to another site.**

## D. ZONING INFORMATION

What is the zoning classification(s) of the directly affected area?

**The project site is mapped New York City park land.**

What is the maximum amount of floor area that can be developed in the directly affected area under the present zoning? Describe in terms of bulk for each use.

**N/A.**

What is the proposed zoning of the directly affected area?

**There is no proposed change in zoning.**

What is the maximum amount of floor area that can be developed in the directly affected area under the proposed zoning? Describe in terms of bulk for each use.

**N/A.**

What is the predominant land uses and zoning classifications within a ¼-mile radius of the proposed action?

**Predominant land uses within a ¼-mile radius include residential, commercial and manufacturing uses, and a cemetery in R4, C1-4, C3, and M1-1 zoning classifications. Additional zoning classifications within a ½-mile radius include M1-2, M2-1, and M3-1.**

## E. ADDITIONAL INFORMATION

Attach any additional information as may be needed to describe the action. If your action involves changes in regulatory controls that affect one or more sites not associated with a specific development, it is generally appropriate to include here one or more reasonable development scenarios for such sites and, to the extent possible, to provide information about such scenario(s) similar to that requested in subpart C on pages 20-24 above.

## F. ANALYSES

Attach analyses for each of the impact categories listed below (or indicate where an impact category is not applicable). For localized actions, sections B through N of the EAS Guidebook set forth methodologies developed by the City to be used in analyses prepared for the listed categories. Other methodologies developed or approved by the lead agency may also be utilized. If a different methodology is contemplated, it may be advisable to consult with OEC. For areawide/programmatic actions, consult section A of the guidebook. You should also attach any other necessary analyses or information relevant to the determination whether the action may have a significant effect on the

environment, including, where appropriate, information on combined or cumulative impacts, as might occur, for example, where actions are interdependent or occur within a discrete geographical area or time frame.

If you believe that a positive declaration is appropriate because the action may have a significant effect on the environment, you may indicate that here and explain briefly. In that case, the analyses otherwise required by this subpart do not have to be submitted (unless the lead agency specifically requests them).

*Figure 3b*

### Socioeconomic Conditions

According to the *CEQR Technical Manual*, a socioeconomic assessment should be conducted if an action may reasonably be expected to create substantial socioeconomic changes within the area. The proposed project would not result in the direct displacement of residential units or businesses, nor would it result in the development of new residential units or commercial space. Therefore, no adverse effects are anticipated, and no further analysis of socioeconomic conditions is required.

### Community Facilities

The proposed project would not displace any public or publicly funded community facilities. However, the project would generate approximately 345 new workers to the area. The proposed project would not affect schools, libraries, hospitals, or day care centers. The project is not expected to affect the ability of the local police or fire department to provide protection services. Furthermore, the project would develop an approximately 217-acre public recreation facility, and, with the demapping of Emerson Avenue between Miles and Schley Avenues and of Schley Avenue between Buttrick and Emerson Avenues, would add approximately 6 acres of new parkland. Therefore, no impacts to community facilities are anticipated with this project.

### Open Space

The proposed action would not displace any public or private open space, nor increase the residential population of the area. The demapping of portions of Emerson and Schley Avenues would add approximately 6 acres of new parkland. In addition, the licensee would create a waterfront park of approximately 19.5 acres, a community park of approximately 7 acres, and a comprehensive public golf facility of approximately 195.5 acres in an area of Ferry Point Park which is largely undeveloped and unused. Therefore, no adverse impacts to open space are expected.

### Shadows

The support poles for the netting for the driving range would range from approximately 50 to 150 feet in height. These poles would be approximately 100 feet apart. In addition, the driving range may include a removable dome of approximately 120 feet in height that would be utilized during the winter months. The maximum length of the shadow cast by either the netting structure or the removable dome would be approximately 645 feet in length and would occur during a very short period in December. During the rest of the year, the length of the shadow would be significantly smaller than that length. Even during this brief period, the shadows would not affect any sensitive land uses, parkland, or open space other than the proposed recreation facility.

### Historic and Archaeological Resources

Aerial photos of the project site taken in 1951 show that large portions of the project site were located either under water in the East River or were land being created by landfill. (See Attachment G, "Hazardous Materials," for historic aerial photographs.) The site was in operation as a municipal solid waste landfill from before 1951 to the early 1960's. The proposed project would introduce approximately 700,000-800,000 cubic yards of fill, of which, approximately 600,000-700,000 would be new fill brought to the site, atop the existing landfill. It is not expected that this proposed project would require excavation to the soils into the waste material layer. Therefore, no adverse impacts on archaeological resources are expected (see Attachment N, "Archaeological Sensitivity").

In terms of historic or architectural resources, there are no significant structures on the project site. The adjacent Bronx-Whitestone Bridge built in 1939 was one of many bridges built by Robert Moses. It is a suspension bridge designed by Othmar Ammann, one of the great bridge designers of this century. However, it is not listed nor determined eligible for listing on the State and National Registers, nor is it a New York City Landmark. None of the residential structures in the surrounding neighborhoods are listed or determined eligible for listing, nor are they New York City Landmarks. Therefore, no impacts to historic resources are anticipated. However, it should be noted that Robert Moses's original plans for the area had proposed a golf course at the project site which would be realized as part of the proposed action.*

### Construction Impacts

The proposed project would be completed in 30 months. Construction of the proposed project would have the potential for adverse impacts in terms of traffic, air quality, noise, and soils and hazardous materials. In terms of traffic, impacts are expected to be minimal because access to the project site would be via the Hutchinson River Parkway Service Road, and parking for workers and material storage will be provided on-site. In terms of air quality, appropriate control measures will be taken to minimize fugitive dust emissions. In terms of noise, the project would be required to comply with applicable federal, state, and city control measures; construction activities will be limited to weekdays between the hours of 7 AM and 6 PM, and construction material will be handled and transported in such a manner as to not create unnecessary noise. In terms of soils and hazardous materials, appropriate control measures will be utilized to eliminate any adverse health effects, and a Health and Safety plan will be utilized to protect worker safety. These measures are described in Attachment G, "Hazardous Materials." With these measures, no significant adverse impacts would be expected due to construction activities.

**NOTE: Any persons who knowingly makes a false statement or who knowingly falsifies any statement on this form or allows any such statement to be falsified shall be guilty of an offense punishable by fine or imprisonment or both, pursuant to section 10-154 of the New York City Administrative Code, and may be liable under other applicable laws.**

## PART III: ENVIRONMENTAL ASSESSMENT AND DETERMINATION

The lead agency should complete this Part after Parts I and II have been completed. In completing this Part, the lead agency should consult 6 NYCRR §617.11 (attached), which contains the State Department of Environmental Conservation's criteria for determining significance.

The lead agency should ensure the creation of a record sufficient to support the determinations in this Part. The record may be based upon analyses submitted by the applicant with Part II of the EAS. The EAS Guidebook sets forth methodologies developed by the City to be used in analyses prepared for the listed categories. Alternative or additional methodologies may be utilized by the lead agency.

1. For each of the impact categories below, consider whether the action may have a significant effect on the environment with respect to that impact category. If it may, answer yes.

| | |
|---|---|
| Neighborhood Character | **No** |
| Socioeconomic Impacts/Displacement | **No** |
| Community Facilities | **No** |
| Open Space | **No** |
| Historic and Archaeological Resources | **No** |
| Transportation | **No** |
| Air Quality | **No** |
| Infrastructure and Energy | **No** |
| Natural Resources | **No** |

| | |
|---|---|
| Waterfront Revitalization | **No** |
| Hazardous Materials | **No** |
| Noise | **No** |
| Solid Waste | **No** |

2. Are there any aspects of the action relevant to the determination whether the action may have a significant effect on the environment, such as combined or cumulative impacts, that were not fully covered by other responses and supporting materials? If there are such aspects, explain them and state where, as a result of them, the action may have a significant effect on the environment.

   **None.**

3. If the lead agency has determined in its answers to questions 1 and 2 of this Part that the action will have no significant effect on the environment, a negative declaration is appropriate. The lead agency may, in its discretion, further elaborate here upon the reasons for issuance of a negative declaration. **Based on the EAS, DPR finds that the proposed actions would not have a significant adverse effect on the environment, and therefore determines, as lead agency under CEQR/SEQRA to issue a Negative Declaration for the proposed actions (see attached findings following page 31).**

4. If the lead agency has determined in its answers to questions 1 and 2 of this Part that the action may have a significant effect on the environment, a conditional negative declaration (CND) may be appropriate if there is a private applicant for the action and the action is not Type I. A CND is only appropriate where the mitigation measures identified will modify the proposed action so that no significant adverse environmental impacts will result. If a CND is appropriate, the lead agency should describe here the conditions to the action that will be undertaken and how they will mitigate potential significant impacts.

5. If the lead agency has determined that the action may have a significant effect on the environment, and if a conditional negative declaration is not appropriate, then the lead agency should issue a positive declaration. Where appropriate, the lead agency may, in its discretion, further elaborate here upon the reasons for issuance of a positive declaration. In particular, if supporting materials do not make clear the basis for a positive declaration, the lead agency should describe briefly the impacts it has identified that may have a significant effect on the environment.

## FERRY POINT PARK FINDINGS

### Description of the Proposed Actions

The New York City Department of Parks and Recreation (DPR) proposes to develop a 222-acre regional public recreation facility at the eastern portion of Ferry Point Park in the Bronx. The project site is bounded by the Bronx-Whitestone Bridge to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south. Subject to satisfactory completion of applicable environmental reviews (including the City Environmental Quality Review [CEQR], and State Environmental Quality Review Act [SEQRA]), land use reviews (including the City's Uniform Land Use Review Procedure [ULURP]), and compliance with other applicable laws and approvals, DPR proposes to enter into a license agreement with Ferry Point Partners, LLC, to develop, construct, and operate the new public recreation facility. The proposed licensee was selected by DPR following the completion of an extensive Request for Proposals (RFP) process.

The project site, which comprises the eastern portion of Ferry Point Park, is a largely unused and undeveloped former landfill that accepted municipal solid waste from before 1951 to the 1960's, and was closed and covered in the mid-1960's, with additional closure operations conducted in the early 1980's. The project site now contains an organic recycling and composting facility (operated by DPR) that is located in the northwestern portion of the project site, informal dirt bike paths, an informal model airplane area in the western portion of the project site, and a ballfield and basketball court located on the northeastern portion of the project site.

The project would permit the development of a 19.5-acre waterfront park with walkways and a boathouse grill, a 7-acre community park with both active and passive recreational facilities, a comprehensive golf facility (with an 18-hole golf course, clubhouse, driving range, practice areas, and maintenance building), and a fine dining/banquet facility at the currently undeveloped eastern portion of Ferry Point Park. As part of the proposed project, two unbuilt and undeveloped streets—Emerson Avenue between Miles and Schley Avenues, and Schley Avenue between Buttrick and Emerson Avenues—would be demapped, adding approximately 6 acres of new parkland.

With the exception of the community park, all access to the facility would be from the west—vehicular, bicycle, and pedestrian access would be from the I-678 north- and southbound service roads under the Bronx-Whitestone Bridge. The service road under the Bronx-Whitestone Bridge, which currently is a two-way roadway, would become a two-lane, one-way roadway. Visitors would enter the site at this location, pass by a stone gateway on the entrance road, and choose to proceed either north to the golf clubhouse area, or south to the waterfront park and the boathouse grill or the fine dining/banquet facility. (Additional access for emergency vehicles would be available via Emerson Avenue to the east.) Parking would be provided at the golf facility, Boathouse Grill restaurant, fine dining/banquet facility, maintenance building, and the waterfront park to accommodate users of the proposed facilities. Pedestrian pathways would connect the proposed waterfront park to the existing Ferry Point Park located to the west of the bridge. In addition, pedestrians and bicyclists would be able to access the site through the main entrance road.

### Actions

The proposed project has the following actions which will require discretionary approvals and are subject to environmental review:

- The application by DPR to the City Planning Commission (CPC) for a major concession for the development, construction, operation, management, and maintenance of a public recreation facility at Ferry Point Park, and the issuance of a license agreement by DPR to Ferry Point

Partners, LLC, for the development, construction, operation, management, and maintenance of a public recreation facility at Ferry Point Park, and;

- The application by DPR to the CPC to demap two unbuilt and undeveloped streets—Emerson Avenue between Miles and Schley Avenues, and Schley Avenue between Buttrick and Emerson Avenues—which would be incorporated into Ferry Point Park.

**Findings**

In order to assess the potential environmental impacts of the proposed actions, DPR has prepared, with the cooperation and assistance of Ferry Point Partners, LLP, a detailed Environmental Assessment Statement (EAS) for the proposed action. Drafts of the EAS were provided to the New York City Departments of City Planning, Environmental Protection, Transportation, Sanitation, Fire, and the staff of the Landmarks Preservation Commission, and to the New York State Departments of Environmental Conservation, and Transportation, and the staff of the Triborough Bridge and Tunnel Authority, for review. DPR staff also met with representatives of all such departments and received comments from most of such agencies. As a result, DPR is satisfied that the final EAS identifies the relevant areas of environmental concern associated with the Ferry Point Park proposal and takes a hard look at each of these areas of potential environmental impact.

Based on the EAS, and for the reasons stated below, DPR finds that the proposed actions would not have a significant adverse effect on the environment, and therefore determines, as lead agency under CEQR/SEQRA, to issue a Negative Declaration for the proposed actions.

**Potential Environmental Effects**

Land Use, Zoning, and Public Policy. The project site lies under and to the east of the Bronx-Whitestone Bridge in the eastern portion of Ferry Point Park. Currently, the majority of project site is unimproved and undeveloped parkland, and is generally inaccessible to the public (portions of the park are fenced off). However, DPR operates an organic recycling and composting facility on approximately 414,000 square feet at the northwestern corner of the site, and occupies approximately 274,000 square feet of open field at the northeastern corner of the site, including a community ballfield and basketball court. Informal uses include dirt bike paths and a model airplane area on the western portion of the site.

Uses within the ½ mile study area (bounded roughly by the Westchester Creek on the west, Lafayette Avenue on the north, East Tremont Avenue on the East, and the East River on the south) are primarily residential to the north and east of the project site, and commercial and industrial to the west of the project site. The project site is mapped as City parkland and is therefore not within a zoning district. Within a ½-mile radius of the project site, zoning classifications include residential R4, commercial C1-4 and C3, and manufacturing M1-1, M1-2, M2-1, and M3-1. The project site is located in Community Board 10.

The proposed project would change the site by creating a regional public recreation facility on the currently undeveloped and generally publicly inaccessible portion of Ferry Point Park. The proposed project complements the existing park use to the west of the Bronx-Whitestone Bridge, and would have a positive impact relative to land use. DPR will endeavor to relocate the organic recycling and composting facility and the model airplane area, that are currently located on the project site, to nearby locations. The existing community ballfield and basketball court will be relocated and expanded in the new community park planned as part of the project. The proposed project would not impact zoning at the project site or in the study area, and would be consistent with public policy for the site.

Archaeological Resources. The proposed project would not require excavation into or below the waste material layer, and consequently, based upon an archaeological assessment, no significant adverse impact is expected to archaeological resources.

Visual Resources. The site is almost entirely undeveloped, with the exception of a organic recycling and composing facility near the bridge on the western portion of the site, an informal model airplane field in the center of the site, and a community park located along Balcom Avenue at Schley Avenue on the northeastern side of the site. On the western and northern sides of the site, the Bronx-Whitestone Bridge and St. Raymond's Cemetery are physical barriers separating the site from more distant views in these two directions. Balcom, Dewey, and Harding Avenues are the main conduits through the study area east and south of the project site.

The proposed Ferry Point Park development would improve the visual character of the project site in a number of ways and from a number of viewpoints. There would be three distinct sections of the park: a golf facility occupying the majority of the site, a waterfront park in the section of the site adjacent to the East River, and a community park near Balcom and Schley Avenues. Each of these sections of the former landfill site would be redeveloped and landscaped in accordance with design standards for such facilities and in consideration of the sensitivity of the neighboring viewers. The proposed project would create a regional public recreation facility with landscaping, and would represent a substantial visual improvement over the existing landfill site with its unkempt natural vegetation. In addition, the landscaping and maintenance of the park's border with the neighborhood, in combination with the removal of the debris and unkempt vegetation, is expected to improve views of the site from nearby residences. Some residents in higher structures to the east of the project site may see the driving range's removable dome (which would only be in place during winter months); however, the dome would obstruct views of the Bronx-Whitestone toll plaza and the I-678 approaches to the toll plaza. This would not be a negative visual impact. Overall, given the visual screening and buffers provided as part of the project, there would be no significant adverse impacts to the visual or urban design character of the surrounding area.

Neighborhood Character. Currently, the project site is composed primarily of undeveloped park land, with the exception of an organic recycling and composting facility operated by the DPR at the northwestern corner of the site, and a ballfield and basketball court at the northeastern corner of the site. Informal uses on the site include dirt bike trails and a model airplane field. The rest of the project site is generally covered with vegetation, and the rocky waterfront area at the southeastern edge of the site along the East River is strewn with debris. Portions of the site are surrounded by chain link fence. Surrounding the project site are the currently developed portion of Ferry Point Park and industrial, commercial, and residential uses (west of the Bronx-Whitestone Bridge), St. Raymond's Cemetery (to the north of the project site), and residential uses (to the east of the project site). Traffic conditions in the area generally reflect the study area's uses and location near the Bronx-Whitestone Bridge, with connections to the Throgs Neck Bridge and the Cross-Bronx Expressway. Streets within the study area have a mixed character, including lightly traveled local streets (e.g., Balcom, Schley Avenues) and a major roadway (East Tremont Avenue) that provides access to and from the Throgs Neck Bridge. With respect to noise, the project site and its immediate environs are subject to frequent flyovers by aircrafts traveling to and from La Guardia Airport. As a result, the entire study area experiences marginally unacceptable noise levels. However, the residential portion of the study area, which is east of the project site, experiences marginally acceptable noise levels..

The proposed project would not cause significant adverse impacts in any of the following elements that make up the character of the neighborhood: land use and zoning, visual resources, traffic, or noise. The project would change the land use and visual character of the project site; bring new activity to the currently undeveloped portion of Ferry Point Park; and would increase traffic, air pollutant concentrations, and noise levels. However, as discussed in various sections of the EAS, the

proposed project would not have any significant adverse impacts in any of these areas. Overall, the proposed project, which would expand park use in the area by upgrading the community park and adding the waterfront park, would not have any significant effect on the neighborhood character of the surrounding area.

Natural Resources. Currently, the project site supports a mixture of common reed (*Phragmites australis*), clusters of trees (tree of heaven (*Ailanthus altissima*), black locust (*Robinia pseudo-acacia*), willow (*Salix* sp.), cherry (*Prunus* spp), and mixed grasses growing on landfill. The site has seven distinct categories of plant communities/land use: two types of urban meadow, developed land, recreational land, urban woodland, emergent wetland, and estuarine intertidal flat. Most of the site is covered by the two urban meadow communities—differentiated by the composition of plant species. The species composition of the plant communities reflects the site's disturbed nature and urban setting. The organic composting and recycling facility, the existing community park, and the informal model airplane area are located in the developed and recreational portions of the site. Approximately 12 acres are covered with wooded areas, with approximately 600 trees with diameters of 6 inches or more. The estuarine intertidal community is devoid of vascular plants, except for a very small patch of smooth cordgrass (*Spartina alterniflora*) proximate to the southern tip of the site. New York State Department of Environmental Conservation (DEC) freshwater wetlands maps do not indicate the presence of any DEC freshwater wetlands on the site. There are, however, three very small isolated freshwater wetlands located in the northwestern corner of the site, that total approximately 11,815 square feet (0.27 acres). This portion of the site will be cleared, filled, and graded as part of the proposed project. The filing of these wetlands will be performed in accordance with Nationwide Permit No. 26 per a letter of authorization from the Corps of Engineers. The loss of this very small amount of wetlands would not be significant.

Due to the uniformity of the plant communities covering extensive portions of the site, particularly the common reed dominated portion of the urban meadow community, and frequent intrusions by human activities, most of the wildlife species inhabiting the site tend to be habitat generalists, and can adapt to varying environmental conditions and are relatively tolerant of human activity. With respect to aquatic resources, the East River's hydrodynamics and estuarine character, coupled with the numerous municipal and industrial discharges that have operated there for many years, makes it a physically harsh environment. Therefore, many of the species using the area are tolerant of highly variable conditions. The upper East River is used as a passageway for several anadromous and estuarine fishes, and as a seasonal, temporary residence for a variety of marine species involved in more general coastal or shoreward movements.

The New York State Natural Heritage Program (NYSNHP) reports no known occurrences of rare or state-listed animals or plants, or significant natural communities for the Ferry Point Park. The NYSNHP identified one significant habitat area near the site, a waterfowl wintering area that extends along the shoreline from the Bronx-Whitestone Bridge east to the Westchester County/Bronx County border. The proposed project would not have a significant impact on this area. The U.S. Department of the Interior, Fish and Wildlife Service (USFWS) reported that the peregrine falcon (*Falco peregrinus*), formerly a federal-listed and currently a state-listed endangered species, is known to breed in the vicinity of the proposed project, and to nest at a distance greater than 1.5 miles from the eastern border of the site. The USFWS has requested and the licensee has agreed that the project will take appropriate measures to protect this species and its habitat. According, no significant adverse impacts would occur. Except for occasional transient individuals, no other federally listed or proposed endangered or threatened species under USFWS jurisdiction are known to exist in the project impact area.

By developing the proposed public recreation facility, the project would remove much of the existing vegetation on the site. However, because the site was previously a landfill, no pristine native plant

communities exist on the site. The project would replace existing ruderal plant communities with new plant communities typical of those found on manicured golf course landscapes and urban parks. In addition, the removal of vegetation associated with development will result in an unavoidable loss of wildlife habitat, such as the loss of nesting, den, loafing, and feeding sites for various wildlife species. However, this wildlife would not experience significant long-term impacts, and could find suitable replacement habitats in nearby comparable areas (e.g., Soundview Park or Pugsley Creek Park). An Integrated Golf Course Management Plan would minimize pesticide use to eliminate any significant risks to plant and remaining wildlife communities.

As noted earlier, the project would fill three small, isolated wetland areas of low diversity, comprising approximately 0.27 acres. No significant impacts to existing aquatic communities are expected to result from the proposed project.

As part of the proposed project, a tree replacement program will be developed, in coordination with the licensee, to enhance existing woodlands communities on the site. At maturity, the new trees planted as part of the tree replacement program, and other vegetation planted as part of the proposed landscaping plan, will provide a greater diversity of plant communities than the ruderal plant communities currently existing on the site. The objective of this program is to first minimize the number of trees removed as a result of project development, and then to plant new trees selected with the goal of establishing a healthier and more diverse woodlands habitat. Furthermore, native grasses will be planted in the waterfront park and between the golf course and St. Raymond's Cemetery, which could serve as new habitats. In planting of new trees, priority will be given to replacing trees onsite, followed by planting trees on the western portion of Ferry Point Park. With the planting of new trees, the tree planting program will ultimately result in higher quality vegetation communities and habitats than currently exist on the site.

Measures will be undertaken to minimize adverse effects during construction activities. Furthermore, selection and placement of fill material, the landscaping plan, the creation of lake and vegetated stormwater detention basins, and an integrated golf course management plan will be undertaken to minimize the adverse effects during operation of the facility.

Turf Management and Water Quality Risk Assessment. The project design includes an Integrated Golf Course Management Plan (IGCMP) for turf management. The IGCMP is based on the latest principles of integrated pest management (IPM). Its basic philosophy can be expressed as follows: 1) minimize the need for pesticides by growing turf quickly and keeping it healthy; 2) generally focus on controlling pests rather than eradicating them, and; 3) utilize the wide range of techniques that can be applied to prevent and minimize pest damage. The key to this holistic approach toward IPM is the judicious use of pesticides and other chemicals. A key part of the IGCMP is a risk assessment. Any potential turf chemical impacts on environmental quality will be addressed by modifying the draft management plan and/or the golf course design, as appropriate. The following protective measures/design improvements will be considered for incorporation into the site plan as appropriate:

- Turf Management Measures. Concern about some pesticides or chemicals may be addressed by using alternative pesticides or chemicals, restricting application methods or areas, and/or the establishment of special management zones.
- Civil Engineering/Drainage Plan Measures. A comprehensive drainage plan has been developed with wet and dry detention to polish the quality of stormwater before it reaches the East River. Additional areas of the course can be planted with naturalized vegetation that can receive stormwater runoff if the risk assessment indicates the need. In addition, if necessary, runoff collected in the numerous shallow drains throughout the course may be pumped to certain detention ponds to ensure longer treatment. Other options considered are construction of grassy swales and percolation areas.

An assessment of the potential effect of the proposed project on pollutant loads due to changes in impervious cover and land use was performed to determine whether the proposed project would have the potential for causing any adverse effect on water quality in the East River. The methodology allows pollutant reduction best management practices (BMPs), included as part of the project design, to be accounted for in the analysis. In addition, the proposed golf facility will utilize a turf management plan designed to decrease the use of pesticides and fertilizers and control the potential for their off-site migration. The analysis results indicate that nitrogen, phosphorous, and BOD will decrease from current loads with the proposed project, while concentrations of heavy metals will remain the same. Therefore, the proposed project would not result in any significant adverse impacts to water quality.

Overall, then, no significant adverse impacts are expected to occur to water quality or ecology as a result of the project.

Hazardous Materials. The project site is a former landfill that was operated by the New York City Department of Sanitation. Municipal solid waste was accepted at the site from before 1951 until the early 1960's, and the landfill was closed and covered in the mid-1960's, with additional closure operations conducted in the 1980's. Soil borings and soil and gas sampling showed results consistent with a municipal landfill of that age. The test programs indicated high methane concentrations at some locations at a depth of two- to three- feet below the surface of the landfill. However, negligible concentrations have been found at the surface. Waste materials test results indicated that SVOCs, PCBs, arsenic and lead are the only contaminants detected at levels exceeding risk based criteria. Soil cover test results indicated that SVOCs and arsenic exceeded risk-based criteria at a limited number of locations. The project is being designed to incorporate a number of measures to minimize exposure pathways for both methane and any soil contaminants. These include the following:

- A health and safety plan will be developed to protect workers and park users from potential exposures to harmful levels of landfill gases and soil and waste materials;
- The proposed project will be designed with a number of measures to prevent the collection of landfill gas (i.e., methane) and its potential safety and nuisance impacts. The measures will include landfill gas interception and venting systems in the vicinity of buildings, periodic low permeability soil plugs to limit gas migration in pipe trenches, conduit seals in electric conduits at handholes and building penetrations, use of special construction techniques for buried storm drain pipe, and storm drain catch basins and drain inlets which reduce the potential for landfill gas accumulation.
- Contaminants in the soils and waste materials on-site will be covered with a shaping layer (which will be used to contour the site and be comprised of excess cover materials moved from other areas of the site, and imported uncontaminated construction and demolition [C&D] materials, which meet the 6 NYCRR Part 360-7 regulations) and a final cover/topsoil layer (comprising uncontaminated soil materials from non-industrial sites which do not exceed background levels);
- The final cover/topsoil layer will be 12 to 24 inches thick in the two public parks. However in all cases a minimum of 24 inches of cover which are similar or identical to typical background soil levels would be placed in or retained for the two public parks. A minimum of 12 inches of material meeting such background levels would be placed or retained in the golf course, excluding the rough waste (out-of-bound) areas. In the rough waste areas of the golf course, a minimum of 6 inches of material meeting such background would be placed or retained; and
- Any waste materials excavated due to construction would be disposed of off-site in compliance with all applicable rules and regulations.

These measures will insure that workers and park users are not subjected to harmful or hazardous materials. Therefore, the project would not have any significant adverse impacts.

Waterfront Revitalization Program. The proposed project would develop a regional public recreation facility, including a waterfront park of approximately 19 acres, on a currently underdeveloped portion of Ferry Point Park adjacent to the East River. The facility would enhance the existing waterfront and provide additional public access to the waterfront. The proposed project would be consistent with the City's Local Waterfront Revitalization Program (LWRP) including the 44 State Coastal Zone Management Program policies and the 12 City LWRP policies.

Infrastructure. Currently, there are existing water mains around the perimeter of the project site. This area of the Bronx is served by a combined sewer system, which ultimately discharges to and is treated at the Hunts Point Sewage Treatment Plant. There are major combined sewer mains along Miles, Emerson, Balcom, and Schley Avenues. A small amount of solid waste and a small demand on energy are generated by the operations at organic recycling and composting facility.

The project will utilize the existing sewer, water and drainage systems adjacent to and throughout the project site to service the proposed golf course, parks, restaurant, banquet facility and other secondary uses. Total average daily demand from the project on the water system, and therefore on the sanitary sewer system (to be treated at the Hunts Point Sewage Treatment Plant), is estimated to be 551,066 gallons per day (gpd). The existing on-site drainage system would be expanded to accommodate additional demand generated by the proposed project. Solid waste would be handled by a private commercial operator to be retained by the licensee. The project will consume energy in the form of electricity and natural gas and will generate solid waste. Estimated demand is 1,090 kilowatts (kw) for electricity, and 5,750 cubic feet per hour (cfh) for gas, and is not expected to result in adverse impacts on the existing system.

With the proposed project, the site would be divided into seven primary drainage areas. The system is designed to mitigate runoff contaminants generated by the proposed project, using wet and dry detention basins. Areas that discharge out of the detention system and into the City's combined sewer system have been designed to include the detention volume necessary to insure that the post-development discharge rates do not exceed the estimated allowable discharge rates based on the estimated design capacity of the existing combined sewer system. The stormwater management system for the site has been designed to adequately control stormwater runoff from the site so as not to adversely affect the receiving system or the adjacent properties.

Overall, the project would not result in any significant adverse impacts on the existing infrastructure or adjacent users.

Transportation. Existing traffic volumes in the study area were based on counts collected during the weekday PM peak hour of 5 to 6 PM, the Saturday midday peak hour of 12 to 1 PM, and the Saturday PM peak hour of 5 to 6 PM. These peaks were selected based on the anticipated peak hours of the proposed project. A capacity analysis for the study area's signalized and unsignalized intersections indicates that all intersection approaches operated acceptably, at mid-range LOS D or better for the weekday PM, Saturday midday, and Saturday PM peak hours.

Based on a proposed program including a 1,000 seat fine dining/banquet facility, 400 seat boathouse grill, 18-hole public golf course, 100-stall driving range, 19.5-acre waterfront park, and 7-acre community park, the project would generate 652, 603, and 654 vehicle trips during the weekday PM, Saturday midday, and Saturday PM peak periods, respectively. The project would provide 965 parking spaces for users throughout the facility.

The following traffic improvements are proposed as part of the project:

- At the intersection of Lafayette Avenue and the I-678 southbound service road, the restriping of the westbound approach from two to three lanes (an exclusive left-turn lane and two through lanes), the addition of an exclusive left turn phase, and coordination of the westbound signal with the intersection of Lafayette Avenue and the I-678 northbound service road. Signal coordination would ensure that left-turn queues can be accommodated within available storage capacity.
- At the intersection of East Tremont Avenue and Lafayette Avenue, daylighting, which would restrict the use of up to three parking spaces at the northbound approach during the weekday PM peak period, to improve traffic flow at this location.

With these improvements, all of the study area intersections would operate at LOS C or better for Build conditions (an improvement from existing conditions), and the proposed project would not cause any significant traffic impacts.

The addition of a proposed bus stop with a shelter at the intersection of Schley Avenue and the I-678 southbound service road will be coordinated with New York City Transit. Pedestrian and bicycle access and connections would connect the park to the existing portion of Ferry Point Park and the entrance road to the public recreation facility.

Overall, the proposed development of a public recreation facility is not expected to result in any significant impacts to traffic, parking, transit, pedestrian, or bicycle conditions in the study area.

Air Quality. While operation of the proposed project would result in increased mobile source emissions in the immediate vicinity of the project site, a detailed microscale carbon monoxide analysis showed that the proposed project would not result in any exceedances of the CO standards or the New York City *de minimis* criteria, and would be consistent with the New York State Air Quality Implementation Plan. Therefore, the proposed project would not have a significant mobile source air quality impact.

The only stationary source of air pollutants associated with the proposed project would be the emissions from the oil- or gas-fired HVAC systems. The primary pollutant of concern when burning oil is sulfur dioxide, and when burning natural gas is nitrogen dioxide. Based on the methodologies in the *CEQR Technical Manual*, either case would not result in any significant stationary source air quality impacts. Because there would be no tall structures or elevated receptors adjacent to the project site, the results of this analysis show that there would be no significant air quality impacts from the proposed project's HVAC system.

Methane concentrations were not detected in the ambient air during a landfill gas survey conducted as part of the project's soil assessment. The proposed project would not change the quantity or overall concentration of this pollutant.

In sum, no significant adverse impacts to air quality are expected to result from development of the proposed project.

Noise. The residential area to the east of the project site would be most sensitive to noise associated with the proposed project. The entire project site and its immediate environs are within the 65 $L_{dn}$ contour of La Guardia Airport, and the area is subject to frequent aircraft flyovers. Three noise receptor locations adjacent to residences on the eastern side of the project site were selected for analysis. At all three sites there were frequent overflights by aircraft. Existing noise levels at the receptor locations were relatively low at all three sites, and in terms of the New York City CEPO-CEQR standards, were in the "marginally acceptable" category. Existing noise levels in some areas of the park are above the 55 dBA $L_{10}$ levels recommended for park use in the *CEQR Technical Manual*.

$L_{10}$ levels in the park vary from approximately 78-80 dBA on the western edge of the park, adjacent to the Bronx-Whitestone Bridge/Hutchinson River Parkway, to approximately 52-53 dBA on interior, northern, and eastern locations, which do not have any adjacent vehicular traffic.

Project-generated traffic would increase noise levels on the feeder roadways to the project site by an imperceptible level (i.e., less than 0.2 dBA) and therefore would not result in any significant noise impacts. Noise generated by the proposed project due to three other sources—grass maintenance, including grass mowing operations, operation of the fine dining/banquet facility including noise from its parking lots, and from use of the ballfield at the community park—would result in imperceptible changes in noise levels and would not result in any significant impacts. The project would be designed so that noise from operation of all mechanical equipment, including HVAC equipment, would meet all applicable codes. The proposed project would be creating new parkland, and would conform to the CEPO-CEQR guideline levels for outdoor areas potentially sensitive to noise. Noise at the back of the fine dining/banquet facility would be minimized by the construction of an 8 to 10 foot noise barrier with landscaping along Emerson Avenue so that no significant impacts would result at nearby residences.

Conclusion. As indicated above, the proposed actions will not have any significant adverse impacts in any area of potential environmental concern and will improve environmental conditions in Ferry Point Park itself. Under these circumstances, and in accordance with CEQR/SEQRA, a Negative Declaration may be issued and no environmental impact statement need be prepared in connection with the proposed action.

**Attachment A:** **Project Description**

## A. INTRODUCTION

The New York City Department of Parks and Recreation (DPR) proposes to develop a public recreation facility at the eastern portion of Ferry Point Park in the Bronx. The project site is bounded by the Bronx-Whitestone Bridge to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south (see Figure A-1). Following completion of an extensive request for proposals process, DPR selected Ferry Point Partners, LLC, to develop, construct, and operate a new public recreation facility at Ferry Point Park, pursuant to a license agreement that, subject to satisfactory completion of applicable environmental reviews (including the City Environmental Quality Review [CEQR], and State Environmental Quality Review Act [SEQR]), land use reviews (including the City's Uniform Land Use Review Procedure [ULURP]), and compliance with other applicable laws and approvals, DPR proposes to enter into with that licensee. This attachment provides a description of the principal components of the proposed new public recreation facility.

## B. DESCRIPTION OF EXISTING SITE

The project site, which comprises the eastern portion of Ferry Point Park, is largely unused and undeveloped. The project site is a former landfill that accepted municipal solid waste from before 1951 to the 1960's, and was closed and covered in the mid-1960's with additional closure operations conducted in the late 1980's (see discussion of site history in Attachment G, "Hazardous Materials"). The project site now contains an organic recycling and composting facility (operated by DPR) that is located in the northwestern portion of the project site, informal dirt bike paths, an informal model airplane area in the western portion of the project site, and a ballfield and basketball court located on the northeastern portion of the project site.

The project site contains vegetative communities and terrestrial wildlife that one would expect on a former landfill site—largely natural grasses and scattered stands principally of non-specimen trees, approximately 0.27 acres of freshwater wetlands, a variety of wildlife species commensurable with the habitat in an area of highly disturbed land in an urban setting, and no threatened or endangered species, other species of special concern, or special habitat areas. (See Attachment F, "Turf Management," for a discussion of natural resources.)

## C. PROJECT DESCRIPTION

### OVERALL SITE PLAN

The site plan for the proposed facility has been developed through a series of in-depth interviews, consultations, and meeting with community representatives, governmental representatives, and park and recreational facility experts. The proposed site plan is a result of months of research and design development to achieve a first-class recreation environment for the golfer,

the park user, and neighboring residents. The proposed project plan provides for a world-class recreation facility, including a private golf club experience for the public golfer, as well as superb public park land for the non-golfing public (see Figure A-2 for site plan).

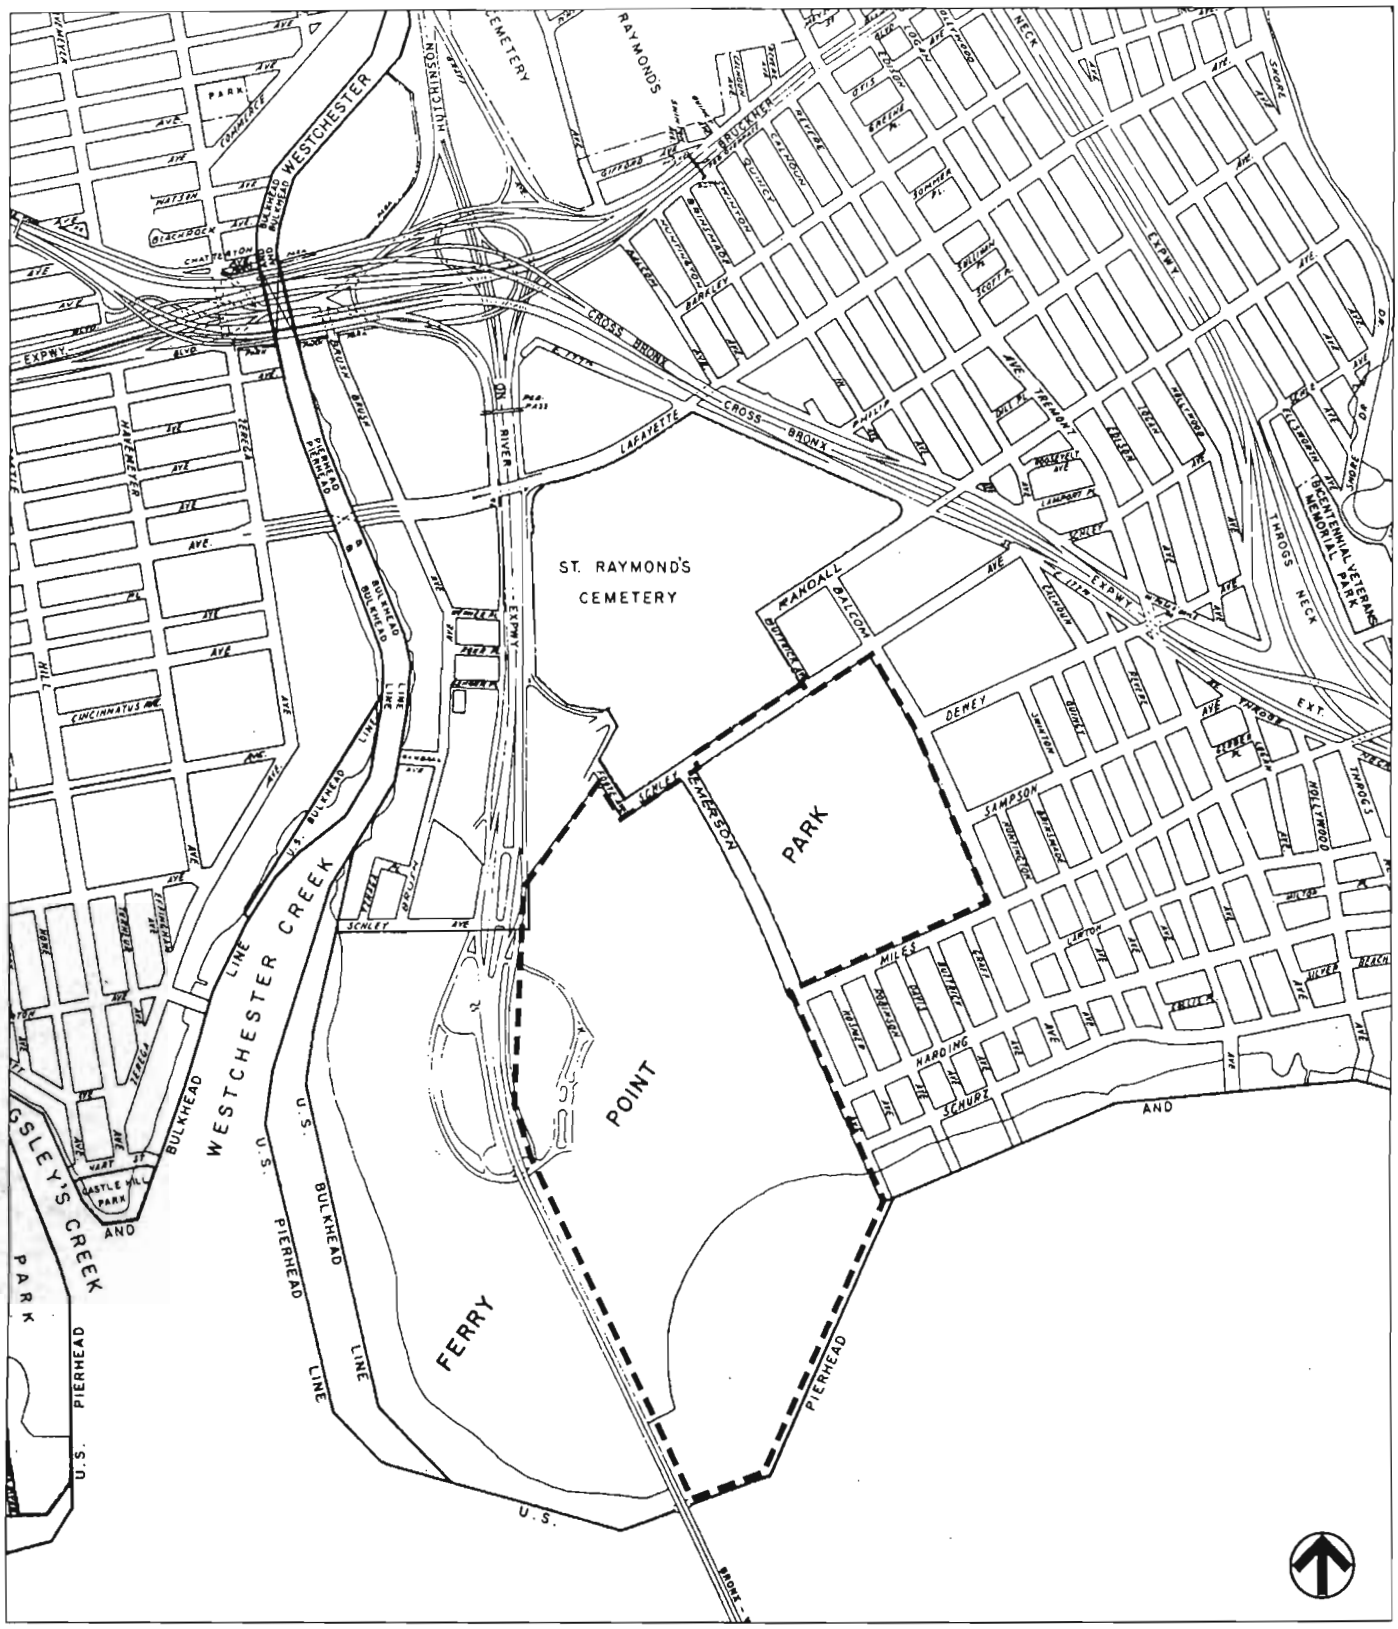
The proposed project, which includes four major elements—waterfront park, community park, comprehensive golf facility, and fine dining/banquet facility—would together constitute a new regional park. The centerpiece of the site plan is the creation of a Jack Nicklaus signature golf course. What was once a relatively flat landfill site, overgrown with scrub grasses and dotted by a few trees, would be transformed and contoured into a tournament level golf course; new lakes would be created to provide definition to the site, a challenge to the golfer, and a bucolic atmosphere; and a landscape containing native and ornamental grasses and trees that would separate and define the out-of-play areas from the manicured tee, green, fairway, and rough areas. Where feasible, particularly in out-of-play and rough areas, native grasses and plantings would be utilized. Trees would be strategically placed throughout the course for articulation and safety precautions. The waterfront park would include walkways, plantings, a tot lot, a comfort station, and the boathouse grill for dining. The community park would replace and substantially expand existing recreational facilities for the residential neighborhood to the east of the project site, while the fine dining/banquet facility will permit park visitors and others to enjoy both fine dining and exceptional views of the East River and Manhattan in the distance.

With the exception of the community park, all access would be from the west—vehicular, bicycle, and pedestrian access would be from the I-678 north- and southbound service roads under the Bronx-Whitestone Bridge. Vehicular access/egress point to the site would be from the southeastern portion of the I-678 north- and southbound service roads under the Bronx-Whitestone Bridge, which currently is a two-way roadway and would become a two-lane, one-way roadway (see Attachment J, "Transportation"). Visitors would enter the site at this location, pass by a stone gateway on the entrance road (the crescent road), and choose to either proceed north to the golf clubhouse area, or south to the community park and the boathouse grill, waterfront park, or fine dining/banquet facility. Access for emergency vehicles would be via Emerson Avenue. Parking would be provided at each of these areas to accommodate park users. Table A-1 shows the amount of parking provided at each use.

**Table A-1**
**Parking by Location and Use**

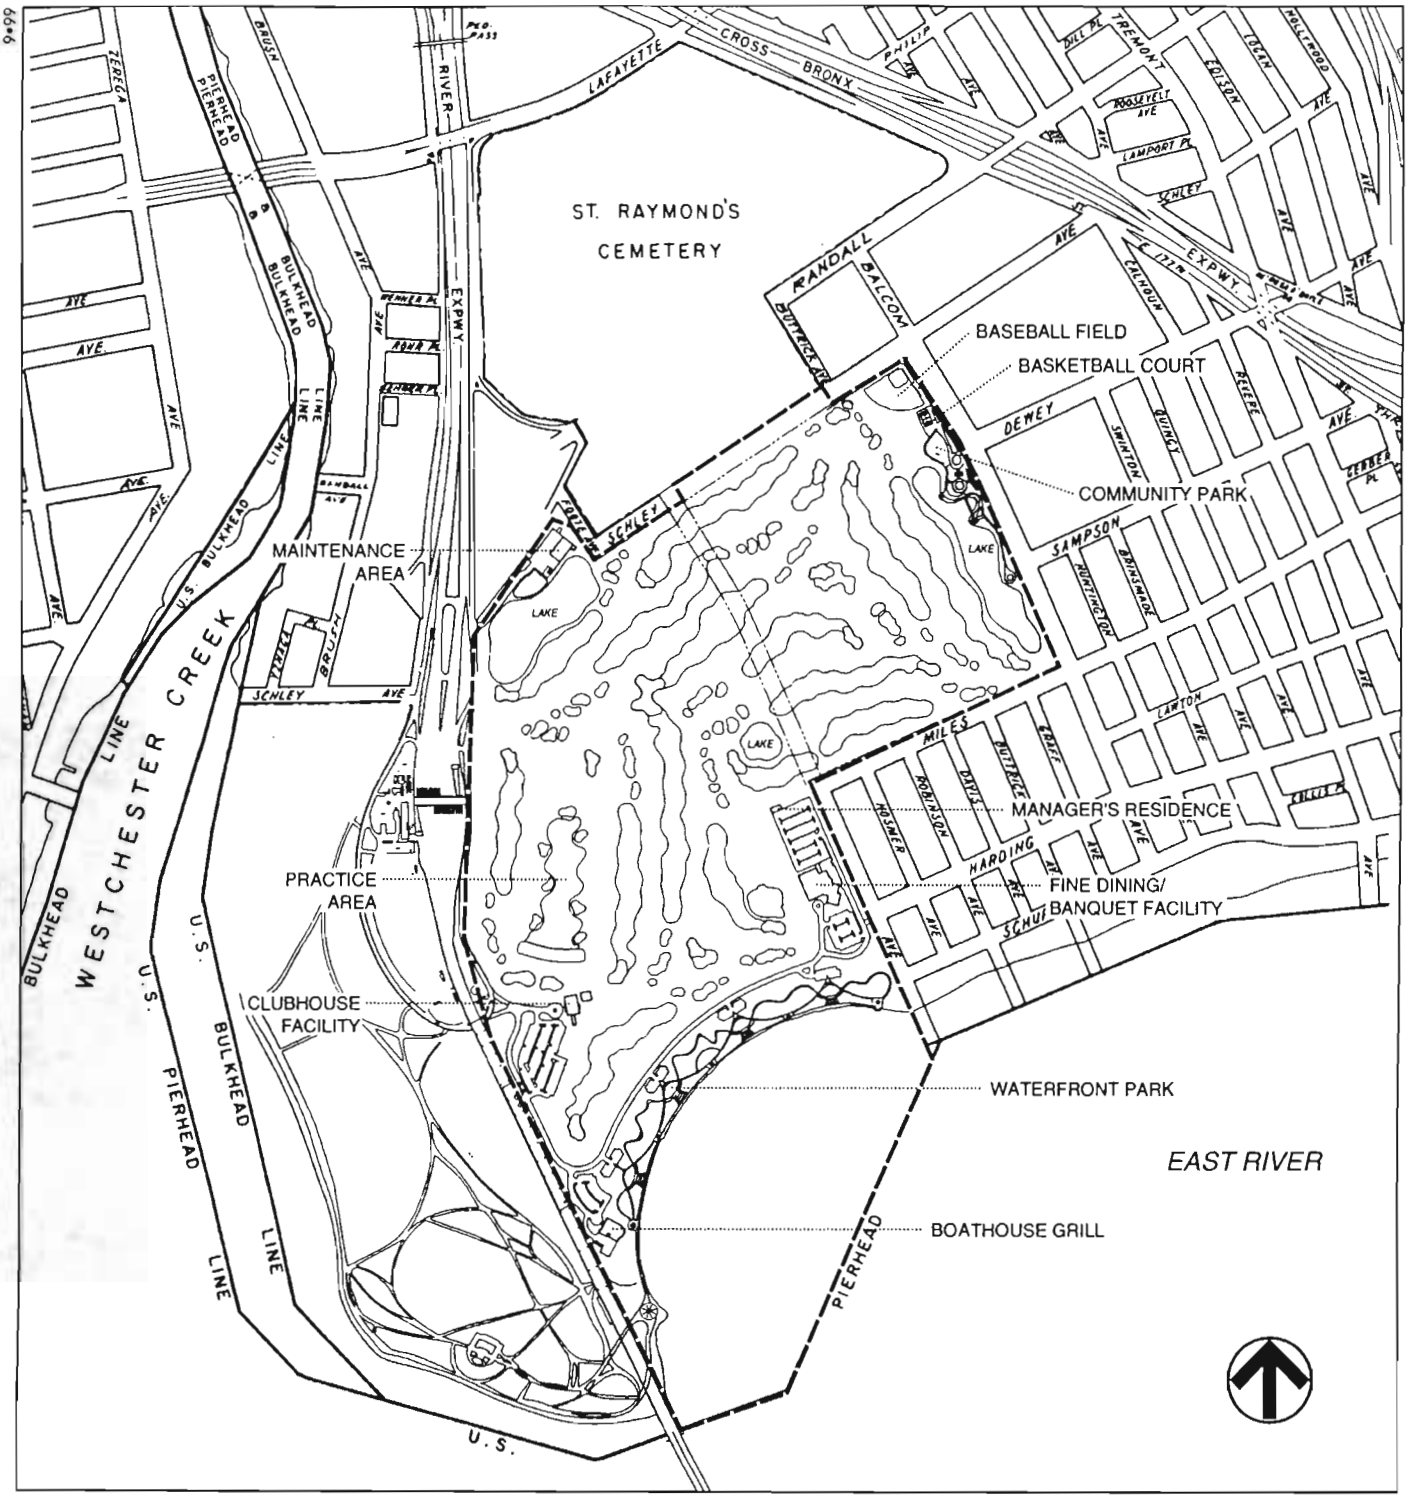
| Parking Location and Use | Number of Spaces |
|---|---|
| Golf facility | 350 self-park |
| Boathouse grill Restaurant | 125 self-park |
| Waterfront park | 120 self-park |
| Fine dining/banquet facility | 350 self-park convertible to 500 valet-park |
| Maintenance Building | 20 self-park for staff only |
| **Total** | **965 self-park (1,115 self/valet-park)** |

Pedestrian connections would connect the proposed waterfront park with the existing Ferry Point Park located to the west of the bridge. In addition, pedestrians and bicyclists would be able to access the project site through the same entrance road as vehicles. Bicycle racks would be provided in the waterfront park.



**Project Location**

*Figure A-1*



*Ferry Point Park*

**Site Plan**

*Figure A-2*

The architecture and landscaping utilized in the site plan can be characterized as providing a natural, inviting feeling. The buildings have been designed to utilize natural-looking materials, with large pitched roofs with chimneys, and large dormer windows to take advantage of the spectacular views. The architecture can be classified as shingle, a somewhat eclectic, informal style of architecture that was prevalent in northeastern seaside communities at the turn of the century. Landscaping utilizes native plants and trees, where feasible. Areas adjacent to residents on the east side of the project site would all be well buffered and landscaped to provide a pleasant compatible environment.

The proposed project, like other park facilities, would be open from dawn to dusk with the following exceptions (which would be open for night use): the boathouse grill, the fine dining/banquet facility, the Golden Bear Golf Center, the clubhouse building, and possibly three holes of the golf course (holes 1, 8, and 9). The following sections discuss each of the major project elements—waterfront park, community park, comprehensive golf facility, and fine dining/banquet facility in more detail.

*WATERFRONT PARK*

A waterfront park of approximately 19.5 acres would be created on a depth of approximately 300 feet of land adjacent to the East River (see Figure A-3). This park would connect to the waterfront portion of the existing Ferry Point Park providing park users with a total of approximately 6,600 feet of continuous riverfront promenade (i.e., approximately 4,000 feet in the existing western portion of Ferry Point Park and approximately 2,600 feet in the proposed eastern portion of Ferry Point Park).

The park would be a passive recreation area with sitting areas and walking paths. It would contain three levels of pedestrian paths—a primary path system that would be a barrier-free waterfront promenade constructed adjacent to the existing rip-rap at the East River's edge, a secondary path system that provides pathways connecting the four parking areas to the waterfront and paths for leisurely walking, and a tertiary path system that provides a more leisurely, serene, meandering pathway system linking the primary and secondary paths. Bicycle access would be provided via the crescent road, and bicycle racks would be provided at the parking areas.

Native grasses and plantings, and natural materials would be used where feasible to provide a rustic nature. Along the paths, benches and rocks would be placed, forming natural sitting areas so that park users can enjoy the waterfront views. Picnic tables would be located in shaded areas adjacent to the two central parking areas.

Besides the amenities described above, the waterfront park would contain four kiosks, a comfort station, refreshment (and possibly other park-associated vendor) stands, a tot lot, and the boathouse grill.

The tot lot, a unique children's play environment, would be a destination play space offering small children a diverse play experience. It would be a visually stimulating environment imbued with form, texture, and color. Its spatial layout, landscape elements, and play equipment would be designed to provide year-round enjoyment and a learning experience through provocative exploration. Its design will include slides, platforms, climbing features, and other interactive learning devices.

Most important, throughout the waterfront park, users would have wonderful views of the East River, Queens, and the Bronx-Whitestone and Throgs Neck Bridges, and would have the opportunity to enjoy a natural waterfront environment.

The boathouse grill is planned to be located in the southwestern portion of the site in the waterfront park and provides a location for casual dining with spectacular views of the East River, Bronx-Whitestone Bridge, Throgs Neck Bridge, and Queens. Vehicular access to the boathouse grill would be as vehicles head south via the main entrance roadway to the project site. Park users could also access this restaurant via the pedestrian paths in the proposed waterfront park and via new connections being provided that link the portion of Ferry Point Park to the west of the Bronx-Whitestone Bridge with the proposed waterfront park to the east of the Bronx-Whitestone Bridge. Bicyclists would access the restaurant via the crescent road; bicycle racks would be available at the parking areas. The boathouse grill would be a building totaling approximately 13,000 square feet and rising to a maximum height of approximately 35 feet (see Figure A-4). It is a 1-story building that provides interior seating for approximately 250 people, and contains a large exterior porch which, during periods of good weather, could provide exterior seating for approximately 150 additional people. The building has been designed, in keeping with the overall natural theme of the project site, in the shingle style. It would utilize natural-looking materials, a pitched roof with chimneys, skylights, and large dormer windows. The building would contain a large fireplace, open bar, and five sets of bay windows with bay window seating. The building design provides a rustic, inviting feeling that allows patrons to feel that they are dining at a restaurant in a private club in New England or boathouse that is located on the water.

*COMMUNITY PARK*

A community park of approximately 7 acres (approximately 300 feet by 1,000 feet) would be created in the northeastern portion of the project site, on Balcom and Miles Avenues (see Figure A-5). The park would contain both active and passive recreation uses; facilities for both young and old, and a large lake with stunning park views. Community access to the this park would be provided along Schley and Balcom Avenues.

The design of the community park takes a largely underdeveloped area of Ferry Point Park, which currently contains a baseball field and basketball court, and transforms it into a viable center of recreation for the community. The interests of the community and the proximity to the proposed Ferry Point Park Golf Course have been acknowledged in the design of the Community park, such as providing:

- A new baseball field and basketball court;
- A tot lot for small children;
- A tot lawn area;
- A rolling lawn area;
- Game tables
- Areas with shaded seating, as well as areas with sunning seating;
- Areas with lakefront seating;
- Walkway and pastoral area bridging water;
- A botanical discovery path; and
- Gazebos.

**Community Park**

*Figure A-5*

The design of the community park shown in Figure A-5 integrates these diverse elements into a cohesive and engaging recreation area. The park is designed to complement the golf course, though the park and golf course would function as two separate facilities. No access between the community park and golf course would be provided.

The circular tot lot will be paved with a highly resilient, colorful, rubberized surface to minimize the danger of accidents from children falling. A circular guardian seating area would be provided surrounding the play area. The play equipment would be selected to reflect the natural landscape setting, enhancing its effects with constructed forms whose color, materials, and shapes have been selected to complement their surroundings.

The organization of the community park requires a separation of uses. This is addressed by the placement of the baseball field and basketball court toward the northern portion of the park and the lawn area and lakefront area more to the central and southern portion of the park. The lawn area would serve to separate the contemplative nature of the lakefront recreation from the active play at the ballfield and basketball court. There would be a liberal tree buffer to ensure safe play between the ballfield and the golf course. The space that separates the structured features of the lakefront area from the active play of the ballfield and basketball court is the lawn.

The existing topography in the area of the proposed community park is virtually flat. To create an interesting vista and usable lounging lawn, the land would be contoured with additional soil brought to the site.

The proposed park design provides users who are not using the baseball field or basketball court with a choice—water's edge or bucolic lawn. From the entry, a landscaped bridge pathway spans a stream of grasses to usher children into the tot lot. This pathway also directs pedestrians to the tree-lined lakefront walk and the dappled shade of the "patios" at the lake's edge. The lakefront has been designed to wrap around this area of the park creating opportunities for discovery and beauty at every turn. A walk around the tot lot reveals another bridge, this time crossing the lake at the cove where a botanical discovery zone starts. There is another choice—walk over the bridge or embark on a nature walk provided by a stone dust path that defines the eastern boundary of the lake. This natural environment—also planted with native and ornamental grasses—meanders along the lake's edge, revealing numerous botanical associations with descriptive plaques nestled in the displays. There would also be two gazebos, one at the outlet of the bridge and a second as the terminus of the discovery walk.

*GOLF FACILITY*

The golf facility is proposed to contain an 18-hole tournament quality golf course, a Golden Bear Golf Center with driving range and practice areas for chipping and putting, the clubhouse building with full service pro shop/snack bar/locker rooms, the maintenance building, and the facility managers residence.

The golf course would be a tournament-level 18-hole par 72 daily fee course designed by renowned golf-course architect, Jack Nicklaus. The course has been designed to accommodate a full range of playing skills within a diverse setting that provides stunning views of the East River, Bronx-Whitestone Bridge, Throgs Neck Bridge, Queens, and Manhattan. Water, vegetation, and views would be woven into the course design to maximize both visual quality and playability. Soil would be brought on site to contour the land (see Attachment G, "Hazardous Materials," for a detailed discussion). In addition, four lakes would be created on-site. Golf

features (i.e., hills, sand traps, rough, and water hazards) would be strategically located to reasonably test skills and provide a beautiful setting.

From the championship tees, the course would be approximately 7,000 yards and from the forward tees about 5,500 yards. Tees would be positioned to allow all levels of playing skills to be accommodated. The course has been strategically designed to provide the golfer with a variety of experiences that balance power and precision. Three of the holes nearest to the driving range (holes 1, 8, and 9) may be lit for night play.

The golf facility would include a Golden Bear Golf Center, which includes a driving or practice range, short-game area, and teaching and instructional facilities. These facilities would offer golfers a wide variety of practice experiences.

The driving range would be an all-weather facility with a total of approximately 80 stations or tees on two levels. The tees, instructional area, and related available facilities would be located in a 2-story structure, which would be lit for night play, and would be approximately 400 feet wide and 30 feet deep. The range would be approximately 900 feet long, with swales, bunkers, target greens to simulate on-course conditions, safety netting mounted on support poles (ranging from approximately 50 to 150 feet), that would be placed approximately 100 feet apart around the range area. Lights would be mounted on these poles for night use. The tee area of the range would be heated to accommodate use during cold weather periods. In addition, during the winter months, portions of the range may be covered with a climate controlled dome, approximately 400 feet wide, 400 feet deep, and 120 feet high, to allow year-round use of the driving range. In addition, the three holes of the golf course immediately adjacent to the driving range may be lit to permit night play. The lights would be mounted on the netting support poles of the driving range.

The short-game areas would allow golfers the full range of shot making needs—practice chipping, pitching, sand play, and putting—under conditions similar to those they might experience on a golf course.

Instruction would be available from accredited teaching professionals trained in the Jack Nicklaus/Jim Flick philosophy and method. A full range of instructional programs would be offered, including community-oriented programs for schools, civic groups, and senior citizens.

The clubhouse building is proposed to be located in the center of the western portion of the site and would serve as a focal point for the golf facility. All golfers using the golf facility would pass through this building. Access to the clubhouse building would be heading north via the main entrance roadway to the project site. Preliminary plans for the clubhouse building show a footprint of approximately 8,200 square feet and rises to a maximum height of approximately 34 feet (see Figures A-6 through A-8). It is a 1-story building with a lower or basement level. Site conditions (i.e, depth to the level of waste materials) may require that the basement level be eliminated, and the footprint of the building be expanded to allow the functions currently envisioned for the basement level at-grade. The building has been designed in keeping with the overall natural theme of the project site utilizing natural-looking materials, a pitched roof with chimney, and large dormer windows. The architecture can be classified as shingle style, a somewhat eclectic, informal style of architecture that was prevalent in northeastern seaside communities at the turn of the century. It provides a rustic, inviting feeling combining residential scale in a public facility.

0 20 40 FEET
SCALE

# Fine Dining/Banquet Facility

## Main Level Floor Plan

*Ferry Point Park*

*Figure A-8*

The main floor of the clubhouse building is about 7,500 square feet. It has a porch on the east side, with some limited outdoor seating, and access to handicapped toilets. Inside is the check-in area for the golf course, driving range, and short-game area, a pro shop, a bar and grill, locker rooms with shower and bathroom facilities, and golf facility offices and the grill kitchen. The lower level of the clubhouse building has been designed for golf cart storage, service, and repair, golf bag and general storage, mechanical and electrical rooms, and handicapped toilets.

The maintenance building is a pre-engineered, 1-story, metal building of about 7,500 square feet in area, with a maximum height of approximately 15 feet. It would be located in the northwestern corner of the site, and would have its own access roadway from the northbound I-678 north- and southbound service roads. The building and adjacent maintenance area would contain space for equipment, chemical and pesticide storage, equipment washdown and maintenance, and maintenance personnel offices. The turf nursery would be located in this area. In addition, the pump station used for irrigation of the golf course would be located adjacent to this building. The building and surrounding maintenance area would be landscaped and shielded by trees from the rest of the facility and the surrounding area.

The facility managers residence is proposed to be a 2-story building located in the eastern portion of the site, adjacent to the fine dining/banquet facility parking area. The building would be approximately 4,500 square feet, with a maximum height of approximately 35 feet. Four or five dwelling units for living quarters for the facility managers residence and groundskeeping and/or security personnel would be provided in the building. The building, like most of the other buildings on the project site has been designed in the shingle style of architecture, utilizing natural-looking materials, and a pitched roof with chimney, to provide a rustic, inviting feeling. While it would not be readily visible to the adjacent residential community to the east of the project site, it would be of a scale that blends well with the residential buildings to the east.

*FINE DINING/BANQUET FACILITY*

The fine dining/banquet facility building is located in the southeastern portion of the site and serves as a location for fine or elegant dining or for private parties, special occasions, and events. The building has a footprint of approximately 25,000 square feet and rises to a maximum height of approximately 40 feet (see Figure A-9). It is basically a 1-story building, although it does contain some office space and some service space (for kitchens and storage) in a partial basement or lower level. Site conditions (i.e, depth to the level of waste materials) may require that the basement level be eliminated, and the footprint of the building be expanded to allow the functions currently envisioned for the basement level at-grade. Like the other major buildings proposed for the project site, this building has been designed in keeping with the overall natural theme of the project site, in the shingle style. It utilizes natural-looking materials, a pitched roof with chimneys, and large glass windows and doors to take advantage of the spectacular views of the golf course, East River, Bronx-Whitestone Bridge, and Queens. The building design provides a rustic, inviting feeling that blends well with its surroundings, and makes this relatively large building seem in scale with its surroundings.

Access to the fine dining/banquet building would be heading south via the main entrance roadway/crescent road to the project site. Restaurant patrons would either self-park or valet park. Attendees of events utilizing the banquet halls would, except for small events, generally utilize valet parking.

The ground floor of the building is divided into three main areas: a restaurant for elegant dining, which is approximately 3,000 square feet and seats approximately 150 people; a catering hall, which is approximately 4,500 square feet and seats approximately 350 people; and a second catering room, which is approximately 6,000 square feet and seats approximately 475 people. Each of the banquet rooms has a separate terrace overlooking and adjacent to the golf course lake, while the restaurant overlooks the waterfront park and portions of the golf course. The two catering rooms can be combined to accommodate large events requiring seating for up to approximately 825 people. An additional paved area, adjacent to the banquet hall terraces would allow for a removable tent for special events (e.g., weddings).

The fine dining/banquet facility is designed to include an 8- to 10-foot noise barrier with landscaping along Emerson Avenue. This barrier would be located behind the fine dining/banquet facility to minimize the effects of this facility on the adjacent community. This barrier would also reduce noise from any vehicle movements and truck deliveries or other service area events. ❖

## Attachment B: Land Use, Zoning, and Public Policy

## Attachment B: Land Use, Zoning, and Public Policy

# A. INTRODUCTION

For a study area extending up to a ½-mile radius from the project site, this examines existing land use, zoning, and public policy; projects future conditions without the proposed project through the Build year, 2002; and assesses potential impacts of the proposed project. The ½-mile study area is bounded roughly by Westchester Creek on the west, Lafayette Avenue on the north, East Tremont Avenue on the east, and the East River on the south (see Figure 1, "Land Use," in the EAS).

# B. SITE HISTORY

The project site is a former landfill owned by the City of New York and administered by the New York City Department of Parks & Recreation (DPR). Aerial photos of the project site taken in 1951 show that large portions of project site were previously located either under water in the East River or were land being created by landfill. (See Attachment G, "Hazardous Materials," for historic aerial photographs.) The site was in operation as a municipal solid waste landfill from before 1951 to the 1960's, with additional closure operations occurring as recently as the late 1980's. During its operation as a landfill, a ballfield and basketball court were present on a northeastern portion of the project site. The landfill was closed and covered in the mid-1960's, and has been in its current condition, with growth and development of its current vegetation, since the 1980's. DPR began operation of an organic recycling and composting facility on a northwestern portion of the site in 1994. Robert Moses, in his 1950 plans for the eventual development of the park, envisioned a golf course at this location.

# C. EXISTING CONDITIONS

## LAND USE

*PROJECT SITE*

The approximately 222-acre project site encompasses the eastern portion of Ferry Point Park under the Bronx-Whitestone Bridge, and is bounded by Schley Avenue and St. Raymond's Cemetery to the north; Balcom, Miles, and Emerson Avenues to the east; the East River to the south, and the I-678 north- and southbound service roads and the western portion of Ferry Point Park to the west. Currently, the majority of project site is unimproved and undeveloped parkland, and is generally inaccessible to the public (portions of the park are fenced off). However, DPR operates an organic recycling and composting facility on approximately 414,000 square feet at the northwestern corner of the site, and occupies approximately 274,000 square feet of open field at the northeastern corner of the site, including a community ballfield and basketball court. Informal uses include dirt bike paths and a model airplane area on the western portion of the site.

The roadways surrounding the site include Schley, Emerson, Miles, and Balcom Avenues—lightly traveled local roads that serve the residential uses bordering the eastern portion of project site. Schley, Emerson, and Miles Avenues do not provide through access to the project site. The Ferry Point Park access road borders the western portion of the site and is a two-way road operating with one lane in each direction. The developed portion of Ferry Point Park lies to the west of the Bronx-Whitestone Bridge, and is accessed via the lightly traveled Ferry Point Park access road, which connects the I-678 north- and southbound service roads under the Bronx-Whitestone Bridge.

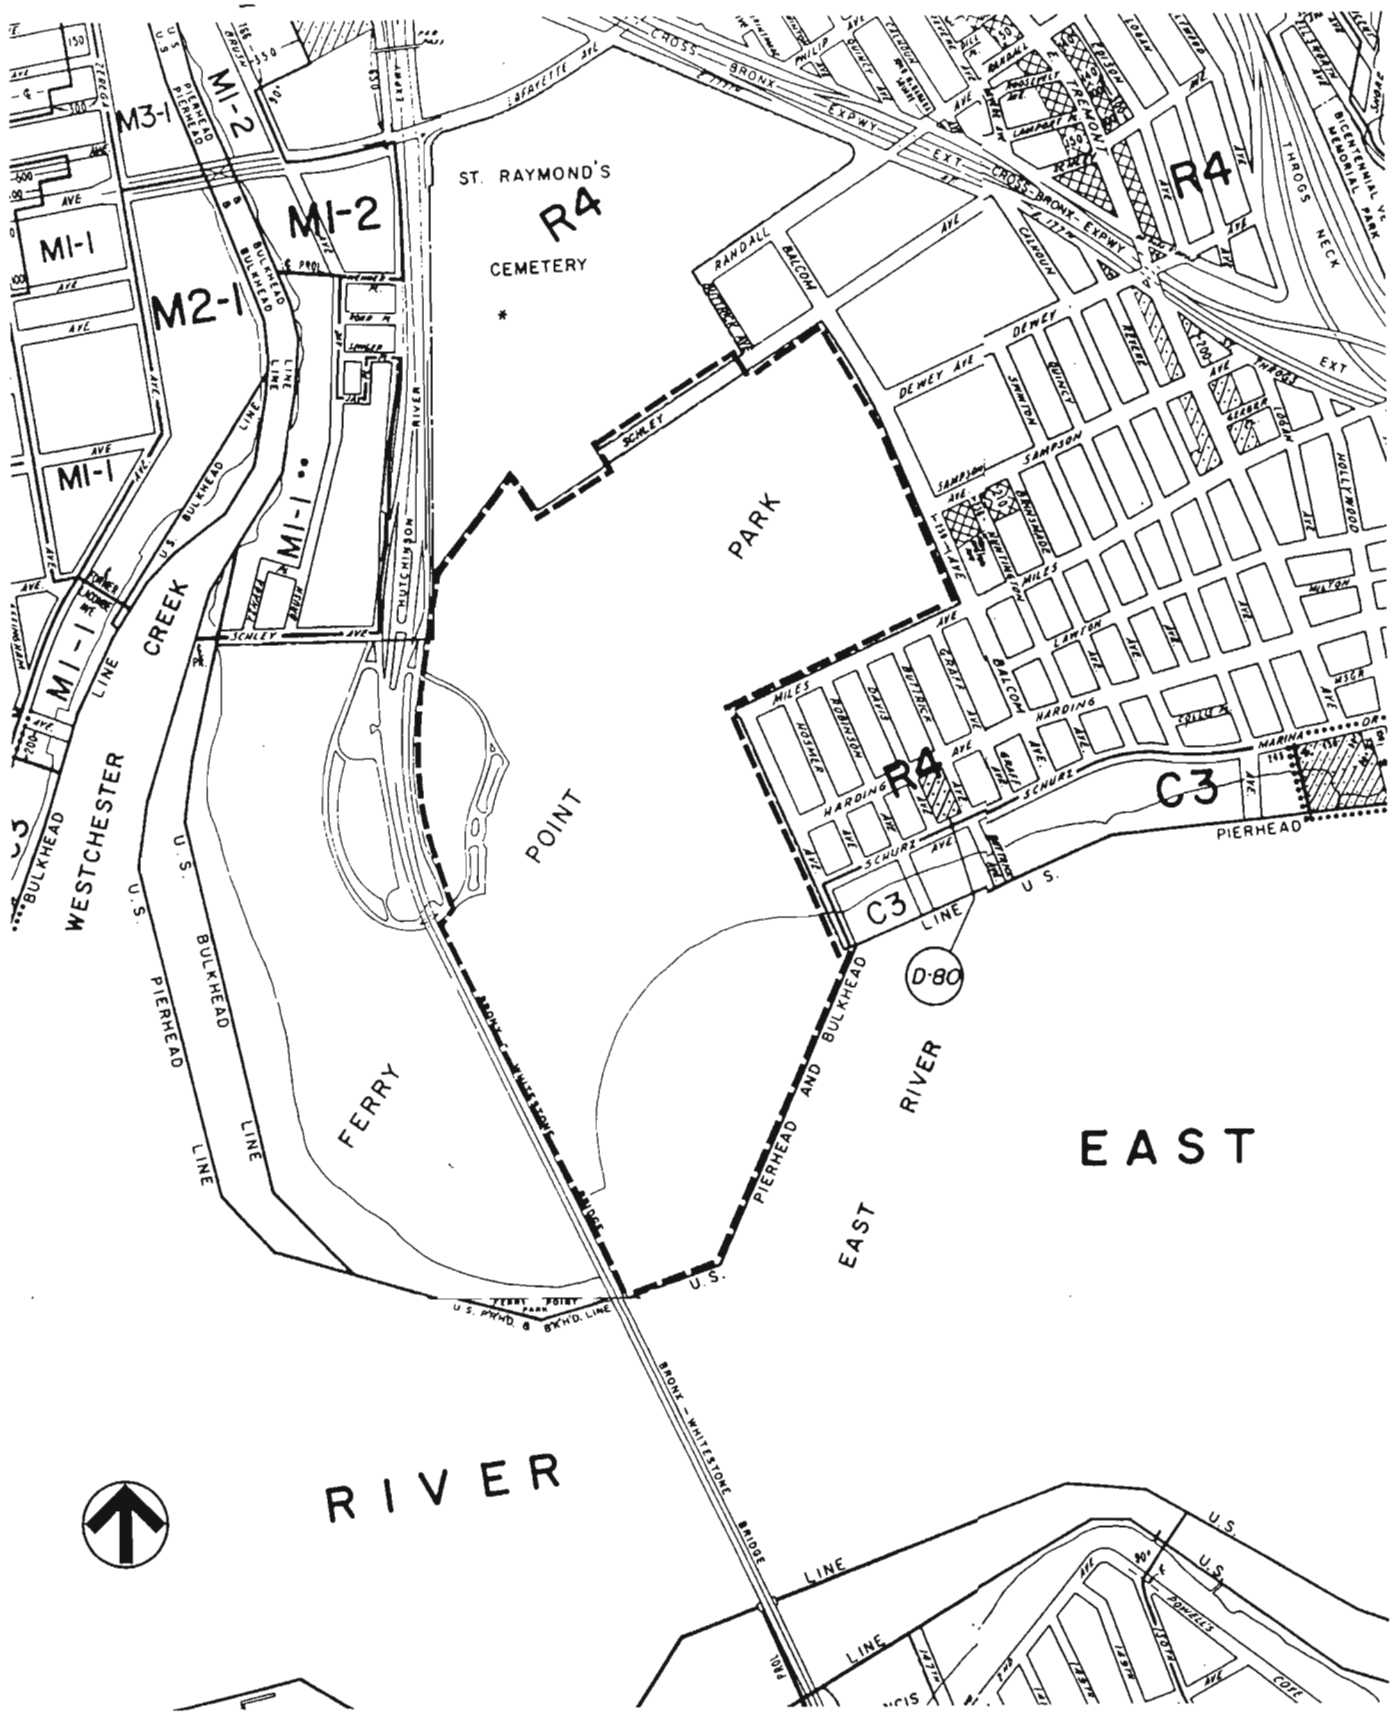
*STUDY AREA*

Uses in the study area are primarily residential to the north and east of the project site, and commercial and industrial to the west of the project site. As noted above, the project site lies under and to the east of the Bronx-Whitestone Bridge in the eastern portion of Ferry Point Park. The portion of Ferry Point Park that lies to the west of the Bronx-Whitestone Bridge includes ballfields and picnic areas, and contains a waterfront walking area. The park serves variety of users, and draws people from throughout the Bronx. As mentioned earlier, the project site is currently an undeveloped portion of the existing park.

Major roadways in the study area include Lafayette Avenue, the I-678 north- and southbound service roads, East Tremont Avenue, and the Cross-Bronx Expressway.

The eastern portion of the project study area is predominantly residential. Residential uses including single- and two-family attached and detached homes, as well as public housing facilities such as the Throggs Neck Houses and the Randall-Balcom Houses, border the project site. Open spaces within these public housing complexes are landscaped and include outdoor community spaces with benches and a ballfield. Single- and two-family attached and detached houses, as well as walk-up apartment buildings, can be found to the north of Lafayette Avenue east of the I-678 northbound service road, and to the east of the project site, in the area bounded by Balcom, Miles, Emerson, and Hollywood Avenues and the East River. Construction of new residential units bordering the site along Miles Avenue near Hosmer Avenue is under way. There are six schools located within this portion of the study area: St. Joseph School for the Deaf near the intersection of Lafayette Avenue and the I-678 northbound service road, P.S. 10 and P.S. 401 on Lafayette Avenue to the west of East Tremont Avenue, P.S. 72 on Dewey Avenue near East Tremont Avenue, St. Frances De Chantal School on Harding Avenue near Hollywood Avenue, and Preston High School on Schurz Avenue near Huntington Avenue. Along East Tremont Avenue between Lafayette and Miles Avenues, there are commercial and retail uses, light industrial uses, and auto-related uses, including local retail stores, restaurants, and gas stations.

The southwestern portion of the study area bounded by Lafayette and Schley Avenues between the I-678 southbound service road and Westchester Creek contains predominantly warehousing/storage yard and heavy industrial uses. There are also residential and commercial uses in this area including single- and two-family detached houses, a hotel, and office buildings. This portion of the study area also contains some vacant lots. Warehousing and heavy industrial uses in this area are generally located to the west side of Brush Avenue. Land uses across Westchester Creek are similar to those on the east side of the creek, primarily including commercial, industrial, and warehousing uses, along with a number of overgrown vacant parcels.



*Ferry Point Park*

**Zoning**

*Figure B-1*

The northern portion of the study area bounded by Lafayette and Zerega Avenues between Brush Avenue and the I-678 northbound service road includes primarily industrial uses with some vacant lots. Monsignor Scanlon High School and St. Helena Commercial High School are located at the northwest corner of the intersection of Lafayette Avenue and the I-678 southbound service road.

## ZONING

The project site is mapped as City parkland and is therefore not within a zoning district. As shown in Figure B-1, within a ½-mile radius of the project site, zoning classifications include residential R4, commercial C1-4 and C3, and manufacturing M1-1, M1-2, M2-1, and M3-1. Generally, allowable uses in the residential R4 district include rowhouses and small multiple dwellings, in addition to community facility and retail uses. In the commercial C3 district, permitted uses include waterfront recreation and uses related to boating and fishing, in addition to allowable uses, such as residential and community facility uses. Manufacturing M1-1, M1-2, M2-1, and M3-1 districts include manufacturing uses as well as commercial and residential uses. Table B-1 summarizes zoning districts and floor-area ratios (FAR) in the study area. A comparison of Figures B-1 "Zoning," and Figure 1 "Land Use," in the EAS shows that the zoning of the study area generally is consistent with its land use patterns.

**Table B-1**
**Zoning in the Study Area**

| Zone | Use | Floor Area Ratio (FAR) |
|---|---|---|
| **Residential Zoning** | | |
| R4 | Low-density residential | 0.75 R plus 0.15 attic allowance, 0.75 to 2.0 CF |
| **Commercial Zoning** | | |
| C1-4 | Commercial (local shopping and services) | 1.0 C, 0.75 R plus 0.15 attic allowance |
| C3 | Waterfront Recreation District | 0.5 C, 0.5 R plus 0.1 attic allowance, 0.5 to 1.0 CF |
| **Manufacturing Zoning** | | |
| M1-1 | Light manufacturing, high performance standards | 1.0 M, 1.0 C |
| M1-2 | Light manufacturing, high performance standards | 2.0 M, 2.0 C |
| M2-1 | Medium manufacturing, medium performance standards | 2.0 M, 2.0 C |
| M3-1 | Heavy manufacturing, low performance standards | 2.0 M, 2.0 C |

**Note:** CF = Community Facility, R = Residential, C = Commercial.
**Source:** New York City Zoning Resolution.

There are currently two unbuilt and undeveloped streets located on the project site—Emerson Avenue between Miles and Schley Avenues, and Schley Avenue between Buttrick and Emerson Avenues.

## PUBLIC POLICY

The project site is located in Community Board 10, which encompasses the area bounded by the Bronx City Line to the north, the Hutchinson River Parkway and Westchester Creek to the west, Eastchester Bay to the east, and the East River to the south, and includes the communities of Westchester Square-Zerega, Throgs Neck, Pelham Bay, Country Club, City Island, and Co-Op City. The Community Board's *Fiscal Year 1999 District Needs Statement* addresses a variety of concerns, including the need for evening youth recreation programs and the effects of budget cuts on the Park Enforcement Program, which enforces existing ordinances and regulations of

the Parks Department. The statement also recognizes the importance of Ferry Point Park and local playgrounds and parks to the district.

## D. THE FUTURE WITHOUT THE PROJECT

### LAND USE

In the future without the proposed project, land uses are expected to remain similar to those in existing conditions. The residential condominium units now under construction bounded by Miles and Harding Avenues and Emerson and Robinson Avenues (adjacent to the southeastern portion of the project site) will be completed. In addition, other residential sites to the east of the project site are likely to be developed, and mapped, unbuilt streets in the area, such as Miles Avenue between Emerson and Robinson Avenues, would likely be built.

### ZONING

According to a representative of the Bronx Department of City Planning (DCP) borough office, zoning in the study area is not anticipated to change by the year 2002.

### PUBLIC POLICY

There would be no changes to public policies in the future without the project.

## E. PROBABLE IMPACTS OF THE PROPOSED PROJECT

### LAND USE

The proposed project would change the site by creating a regional public recreation facility on the currently undeveloped and generally publicly inaccessible portion of Ferry Point Park to the east of the Bronx-Whitestone Bridge. Ultimately, the proposed project, which would result in three distinct sections, represents the expansion of the existing park use, and would develop 7.0 acres of community park (near Balcom and Schley Avenues) and 19.5 acres of waterfront park (adjacent to the East River) in addition to a golf facility and restaurant uses (on the majority of the site). As part of the proposed project, two unbuilt and undeveloped streets—Emerson Avenue between Miles and Schley Avenues, and Schley Avenue between Buttrick and Emerson Avenues—would be demapped, adding approximately 6 acres of new parkland. As part of the proposed project, best efforts would be made to relocate the existing informal model airplane facility.

The proposed project's location adjacent to the Bronx-Whitestone Bridge, the Hutchinson River Parkway (I-678) and its service roads, and the Ferry Point Park access road allows for site access without adding vehicular traffic to the adjacent residential community located to the east of the project site. With the exception of the community park, the proposed recreation facility would be primarily a regional park.

The New York City Department of City Planning's (NYC DCP) *Greenway Plan for New York City (1993)* proposes, in general, a greenway along the I-678 north- and southbound service roads, as well as along the Bronx Whitestone Bridge (via bus service). In addition, NYC DCP's and DPR's *1999 Draft Greenway Master Plan: Soundview Park to Ferry Point Park* proposes possible locations for a greenway connection from Brush Avenue and Lafayette Avenue to the I-678 northbound service road. With the proposed park road improvements, a two-way bicycle

path could be feasible on the I-678 southbound service road; this bicycle path could connect to the proposed project's entrance road.

The proposed project would add a waterfront park that would provide a pedestrian and bicycle connection between the existing waterfront portion of the western part of Ferry Point Park and a community park, public restaurants and banquet facilities with water views, as well as a high-quality public golf facility. The waterfront park is designed to reclaim the waterfront for public use. The community park would transform the existing underdeveloped community park at Schurz and Balcom Avenues into a viable center of community recreation and leisure. This park would be directly accessible to residential areas to the east of the project site. In addition, the existing ballfield and basketball court would be rebuilt at the northern end of the community park. The golf facility would be the culmination of the concept of providing a public golf facility at this site developed by Robert Moses. Currently, New York City, like other downstate areas, does not have a sufficient number of golf courses to meet public demand. This facility would help satisfy the need for a high-quality, public golf facility within the City. Therefore, the proposed project would add needed recreation facilities and would have a positive impact relative to land use.

### ZONING

Development of the proposed recreation facility would not require any changes to zoning at the project site or in the study area.

### PUBLIC POLICY

The proposed project would introduce additional developed parkland to the community and would be consistent with the Park Enforcement Program. The project would provide a public recreation facility on parkland that is generally undeveloped, unused, and inaccessible to the public. This development would be consistent the Community Board's quality of life goals for the area. Therefore, the proposed project would be consistent with public policy.

## CONCLUSION

The proposed project would create an approximately 222-acre regional public recreation facility with a waterfront park, fine dining/banquet facility, golf facility, and a community park on currently underdeveloped parkland, and would have a positive impact relative to land use. The proposed project would not impact zoning at the project site or in the study area, and would be consistent with public policy. ❖

## Attachment C: Visual Resources

## A. INTRODUCTION

This attachment considers the potential effects of development of Ferry Point Park on its visual environment. Because the project, from a visual resources standpoint, consists primarily of landscaping and five moderately sized buildings, the distance from which it would be seen is limited to a radius of only a few blocks in most cases. The structures nearest the project site are small-scale low residential buildings and low-rise multi-family housing generally without long views. The closest views of the proposed structures on the project site are from the blocks adjacent to the proposed banquet facility and facility managers residence along Emerson Avenue. The Bronx-Whitestone Bridge forms a strong physical and visual boundary along the western edge of the site; this defines the study area as bounded to the west by the Bronx-Whitestone Bridge and its approaches, to the north by St. Raymond's Cemetery, to the east by a line running approximately from the intersection of Swinton and Dewey Avenues to the intersection of Balcom and Schurz Avenues, and to the south by the East River (see Figure C-1).

## B. EXISTING CONDITIONS

### PROJECT SITE

The Bronx-Whitestone Bridge and its Hutchinson River Parkway approaches divide Ferry Point Park in half and define the western boundary of the project site (see Figure C-2, View 1). The project site, a former landfill, is located on the East River southeast of St. Raymond's Cemetery and Schley Avenue (see Figure C-2, View 2).

The site is almost entirely undeveloped, with the exception of a small organic recycling facility near the bridge on the western portion of the site, an informal model airplane field in the center of the site, and a community park located along Balcom Avenue at Schley Avenue on the northeast side of the site. The organic recycling facility consists of a gray aluminum pole barn of recent construction (see Figure C-3, View 3). There are two simple aluminum shelters in a fenced enclosure associated with the model airplane field. Access to these two sites is via the I-678 north- and southbound service roads. Elsewhere in the vicinity there are old tires and other debris. The community park features a baseball diamond with backstop, a basketball court, and a large lawn with mature trees along Schley Avenue (see Figure C-3, View 4).

Several informal dirt bike trails wind through the project site (see Figure C-4, View 5). Access to these trails is from the eastern edge of the site through the community park. The section of the site roughly north of a line extending northwest on line with Emerson Avenue is grassland and above the grade of the surrounding streets. The rest of the project site is at a slightly lower grade and has more vegetation, with a number of trees that have grown up on the former landfill. The southeastern edge of the site on the East River takes the form of a crescent. This rocky waterfront area is strewn with debris and has a remnant of an old rubble wall at its eastern end (see

Figure C-4, View 6). The northern section of the project site lies adjacent to St. Raymond's Cemetery and is similar to the rest of the undeveloped site (see Figure C-5, View 7).

The site boundary along Miles Avenue is overgrown with some vegetation reaching into the street. Trees and large bushes edge the site. On Emerson Avenue plant growth is even more dominant, with the knee-high grasses of the northern section of the site giving way to 6-foot-tall reeds and scraggly bushes.

## STUDY AREA

On the west and north sides of the site, the Bronx-Whitestone Bridge and St. Raymond's Cemetery are physical barriers separating the site from more distant views in these two directions. Balcom, Dewey, and Harding Avenues are the main conduits through the study area east and south of the project site. Balcom shares a border with the project site from Schley Avenue south to Miles Avenue. Dewey and Harding Avenues run west-east, with their western ends terminating at the project site (see Figure C-5, View 8). The neighborhood to the north and east of the project site is divided into two different areas by Sampson Avenue.

### *NORTH OF SAMPSON AVENUE*

North of the project site and in the block east of Buttrick Avenue, there are three L-shaped six-story apartment buildings with red and brown brick facades. Known as the Randall-Balcom Houses, they are arranged around a circular central courtyard and associated walking paths. A one-story aluminum Quonset hut of recent vintage has been constructed along Buttrick Avenue at the Randall-Balcom Houses. Between Randall and Sampson Avenues are the Throggs Neck Houses, a complex of both three-story and eight- to nine-story brick apartment buildings (see Figure C-6, View 9). These buildings built in the 1940's through the 1960's occupy three superblocks. Four eight-story apartment buildings front Balcom Avenue. On the facades, dark red and beige bricks are in a rectilinear pattern that relieves the flat facades. The buildings are elevated on columns leaving space underneath for outdoor community space. The open space surrounding the buildings is landscaped with trees and bushes and benches are provided. There is a small parking lot at the northern corner of the intersection of Balcom and Schley Avenues diagonally across the street from the community park on the project site. More parking lots and a ballfield are on the far side of the eight-story buildings. The rest of the Throggs Neck Houses are smaller three-story apartment buildings that feature stylized brushed aluminum entrances and some brick quoining at the corners. There are courtyards and pathways that provide pedestrian access to the interior of the block. These three-story buildings front the project site along Balcom Avenue between Dewey and Sampson Avenues (see Figure C-6, View 10). There is a basketball court in the interior of this block.

### *SOUTH OF SAMPSON AVENUE*

Southwest of Sampson Avenue, the street plan is a typical urban grid pattern. There are a variety of housing styles and types, including attached rowhouse buildings, large peaked-roof houses, and smaller hipped-roof bungalows. None of these structures are taller than three stories and most of the single-family homes are one to two stories. The rowhouse buildings have flat or mansard roofs and are built in strips of 5 to 10 duplex or triplex units. The buildings are typically set back from the curb amidst driveways and walkways, while the remainder of the houses are separated by lawns and other open spaces. Some of the houses in this section appear to have been built around 1920, while others are of recent construction. The older buildings are almost

exclusively wood-frame construction, while the more recent multi-family rowhouse-type dwellings generally have red or pink brick facades.

Across Sampson Avenue and bordering the project site along Balcom Avenue is a strip of nine attached, beige brick houses with porches at the entrance level facing the project site (see Figure C-7, View 11). Identical rowhouse strips are found along Huntington and Brinsmade Avenues to the northeast. At the southeast end of these rowhouses is a debris-ridden vacant lot that abuts the project site and extends northeasterly to the middle line of the next block, obstructing passage through Balcom and Huntington Avenues to points southeast.

At the northern corner of the intersection of Balcom and Miles Avenues and adjacent to the project site is a mansard-roofed, three-story, 10-unit brick apartment building that faces Miles Avenue and extends along the block all the way to Huntington Avenue. Several more of these three-story brick rowhouse buildings, with varying numbers of units, are found on Balcom Avenue southeast of Miles Avenue, on Miles Avenue between Buttrick and Davis Avenues, and near Miles Avenue on Graff, Robinson, and Hosmer Avenues. Also predominant on the streets terminating at Miles Avenue are some older 1½- to 2½-story frame houses and bungalows (see Figure C-7, View 12).

Miles Avenue abuts the project site between Balcom and Emerson Avenues. The avenue descends into a valley and then back to a higher grade in the block between Balcom and Graff Avenues (see Figure C-8, View 13). South of Graff Avenue, it is unpaved and irregular due to the encroachment of vegetation from the project site. This is the only unpaved street section in the study area. The ends of the blocks fronting Miles Avenues, with the exception of the rowhouse buildings already mentioned, are weed-choked, trash-strewn vacant lots marked with scrub brush and trees.

Miles Avenue at its intersection with Hosmer narrows to about 15 feet of passable roadway due to the overgrowth from both the project site and the vacant lots to the southeast. Bushes and weeds encroach on the dirt roadway and an abandoned street lamp pole tilts northward at a sharp angle. The western limit of Miles Avenue, at its intersection with Emerson Avenue, is an impassable mound of fill overgrown with weeds and marked with litter and debris. There is a small footpath that allows pedestrians access to Emerson Avenue. The houses at the northwestern limit of Emerson Avenue are largely obscured by this overgrowth when viewed from Miles Avenue.

Emerson Avenue is fully paved and better maintained than Miles Avenue. The dead end is marked with a barrier and a sign, and a combination of fences and barriers keep the park's wild growth from encroaching on the street's right-of-way. In contrast with Miles Avenue, nearly every building along Emerson actually fronts on the street (see Figure C-8, View 14).

Buildings fronting Emerson Avenue southeasterly from its intersection with Miles Avenue exhibit a diversity consistent with the surrounding study area. These include 1- to 1½-story brick and frame houses, a three-story three-unit brick rowhouse building with at-grade garages and entrances, a wood shake sided two-story frame house, and a three-story multi-family dwelling with second level entrances reached by a stoop, among others.

At the intersection of Emerson and Hosmer Avenues are two groups of rowhouses with their sides toward the project site. The buildings are brick-faced frame structures and face each other across Hosmer Avenue. Facing the project site along Emerson Avenue between Hosmer and Schurz Avenues are a brick, two-story, three-unit building with below-grade garages, and two

frame bungalows. The intersection with Schurz Avenue is marked by a large lot occupied by a single-frame bungalow on Schurz. The termini of Harding and Schurz Avenues with the project site are marked by highway barriers and signs, mostly overgrown from neglect. There is a small footpath from the intersection of Schurz and Hosmer Avenues southward toward the waterfront of the project site.

The surrounding streets that do not directly abut the proposed project site closely resemble the development already described (see Figure C-9, View 15). Exceptions to this predominant mixture of frame houses and brick multi-unit rowhouse groups include the Sea View Apartments, a complex of four two-story buildings on the block bounded by Davis, Harding, Robinson, and Schurz Avenues; and recently constructed suburban-style condominiums on the block bounded by Buttrick, Harding, Davis, and Schurz Avenues. The condominiums are two to three stories tall, and have brick facades and glass block circular exterior stairs. Balconies and patios face out toward the street with parking and entrances arranged around the interior parking lot.

Harding Avenue is wide, devoid of large trees, and correspondingly sunny in comparison with Miles and Schurz Avenues (see Figure C-9, View 16). The houses along Schurz Avenue on the East River side are mostly two-story frame houses on large lots. The view of the river is largely obscured by verdant plant growth in the rear of the houses and along the shoreline. Towering, mature deciduous trees especially mark this section of the study area.

## C. THE FUTURE WITHOUT THE PROJECT

### PROJECT SITE

If the proposed project is not implemented, it is assumed that the existing organic recycling and composting facility, the informal dirt bike trails and model airplane facility, ballfield and basketball court, park infrastructure, and vegetation growing on the former landfill site will remain undisturbed.

### STUDY AREA

The condominium rowhouse buildings under construction on Hosmer Avenue are expected to be completed and landscaped. It is possible that some of the other vacant lots and older single-family dwellings will be replaced with similar rowhouse development. Further, the unbuilt streets will likely be built.

## D. PROBABLE IMPACTS OF THE PROPOSED PROJECT

### PROJECT SITE

The proposed Ferry Point Park development would improve the visual character of the project site in a number of ways and from a number of viewpoints. There would be three distinct sections of the park: a golf facility occupying the majority of the site, a waterfront park in the section of the site adjacent to the East River, and a community park near Balcom and Schley Avenues. Each of these sections of the former landfill site would be redeveloped and landscaped in accordance with the highest design standards for such facilities and in consideration of the sensitivity of the neighboring viewers.

View to the northwest of Balcom Avenue at Harding Avenue **15**

View to the northwest of Buttrick Avenue at Harding Avenue **16**

*GOLF FACILITY*

The currently flat terrain of the northern portion of the site would be manipulated to create the ponds and the gently sloping topography that distinguishes golf courses. Native and ornamental grasses would define out-of-play areas from manicured tees, greens, fairways and rough. Trees would be strategically placed throughout the course for articulation and safety precautions. A fence would be constructed along the site's border with the Hutchinson River Parkway. A maintenance building and an artificial lake would be constructed in the northwestern corner of the site adjacent to the existing St. Raymond's cemetery.

There would be three major buildings on the golf course section of the park: the clubhouse, fine-dining/banquet facility, and maintenance building. The clubhouse would be located just east of the bridge. The materials and construction of these buildings would be consistent with a river-oriented location and have wraparound porches and low sloping roofs. The two-story clubhouse would have siding and wood trim. A colonnaded sitting porch would be located on the east side of the building. The large peaked roof would be marked by several semi-circular dormer windows and a prominent chimney. The clubhouse would measure about 110 feet along its east/west elevations and about 75 feet along its north/south side elevations.

The fine-dining/banquet facility would be on the eastern side of the golf course near the waterfront park (described below) and Emerson Avenue. North of the fine-dining/banquet facility and near the intersection of Emerson and Miles Avenues would be the facility managers residence. While the designs for these two buildings have not been finalized, it is expected that the restaurant would be oriented to provide river views for its patrons and the back of the building would face east. In order to buffer the views of the parking areas and the service area of the banquet and dining facility, a landscaped visual barrier most likely consisting of a berm and low wall on top of the berm would be provided along Emerson Avenue (see Figure C-10). The maintenance building would be in the northeastern portion of the site. It would be accessed via the I-678 service road. The building would be landscaped and generally would not affect views of the project site.

With the exception of the community park, all access to the proposed project would be from the west—vehicular, bicycle, and pedestrian access would be from the I-678 service roads under the Bronx-Whitestone Bridge. Vehicular access/egress point to the site would be from the southeastern portion of the I-678 north- and southbound service roads under the Bronx-Whitestone Bridge, which currently is a two-way roadway and would become a two-lane, one-way roadway (see Attachment J, "Transportation"). Visitors would enter the site at this location, pass by a stone gateway on the entrance road (the crescent road), and choose to either proceed north to the golf clubhouse area, or south to the community park and the boathouse grill, waterfront park, or fine dining/banquet facility. Access for emergency vehicles would be via Emerson Avenue. Parking would be provided at each of these areas to accommodate park users.

Pedestrian connections would connect the proposed waterfront park with the existing Ferry Point Park located to the west of the bridge. In addition, pedestrians would be able to access the project site through the same entrance road as vehicles. The proposed project allows for the future implementation of elements of NYC DCP's *1999 Draft Greenway Master Plan: Soundview Park to Ferry Point Park.* Bicycle racks would be provided in the waterfront park.

The driving range would be located near the bridge and north of the clubhouse. The driving range will be lighted for night use, and three adjacent holes of the golf course will be designed

to accommodate lighting for night use. In this location, it is anticipated that the lights illuminating the driving range (and possibly the three adjacent holes—holes 1, 8, and 9—of the golf course) would be designed to accommodate area-specific lighting that is not intrusive to residents in the adjacent area. The driving range will include tees in a structure of approximately 30 by 440 feet and an open driving range area of approximately 400 by 950 feet surrounded by netting approximately 50 to 150 feet in height. The driving range may include a removable dome (for use during the winter months) that would be approximately 400 by 400 feet and approximately 120 feet in height. Views of the driving range from the study area are discussed below.

*WATERFRONT PARK*

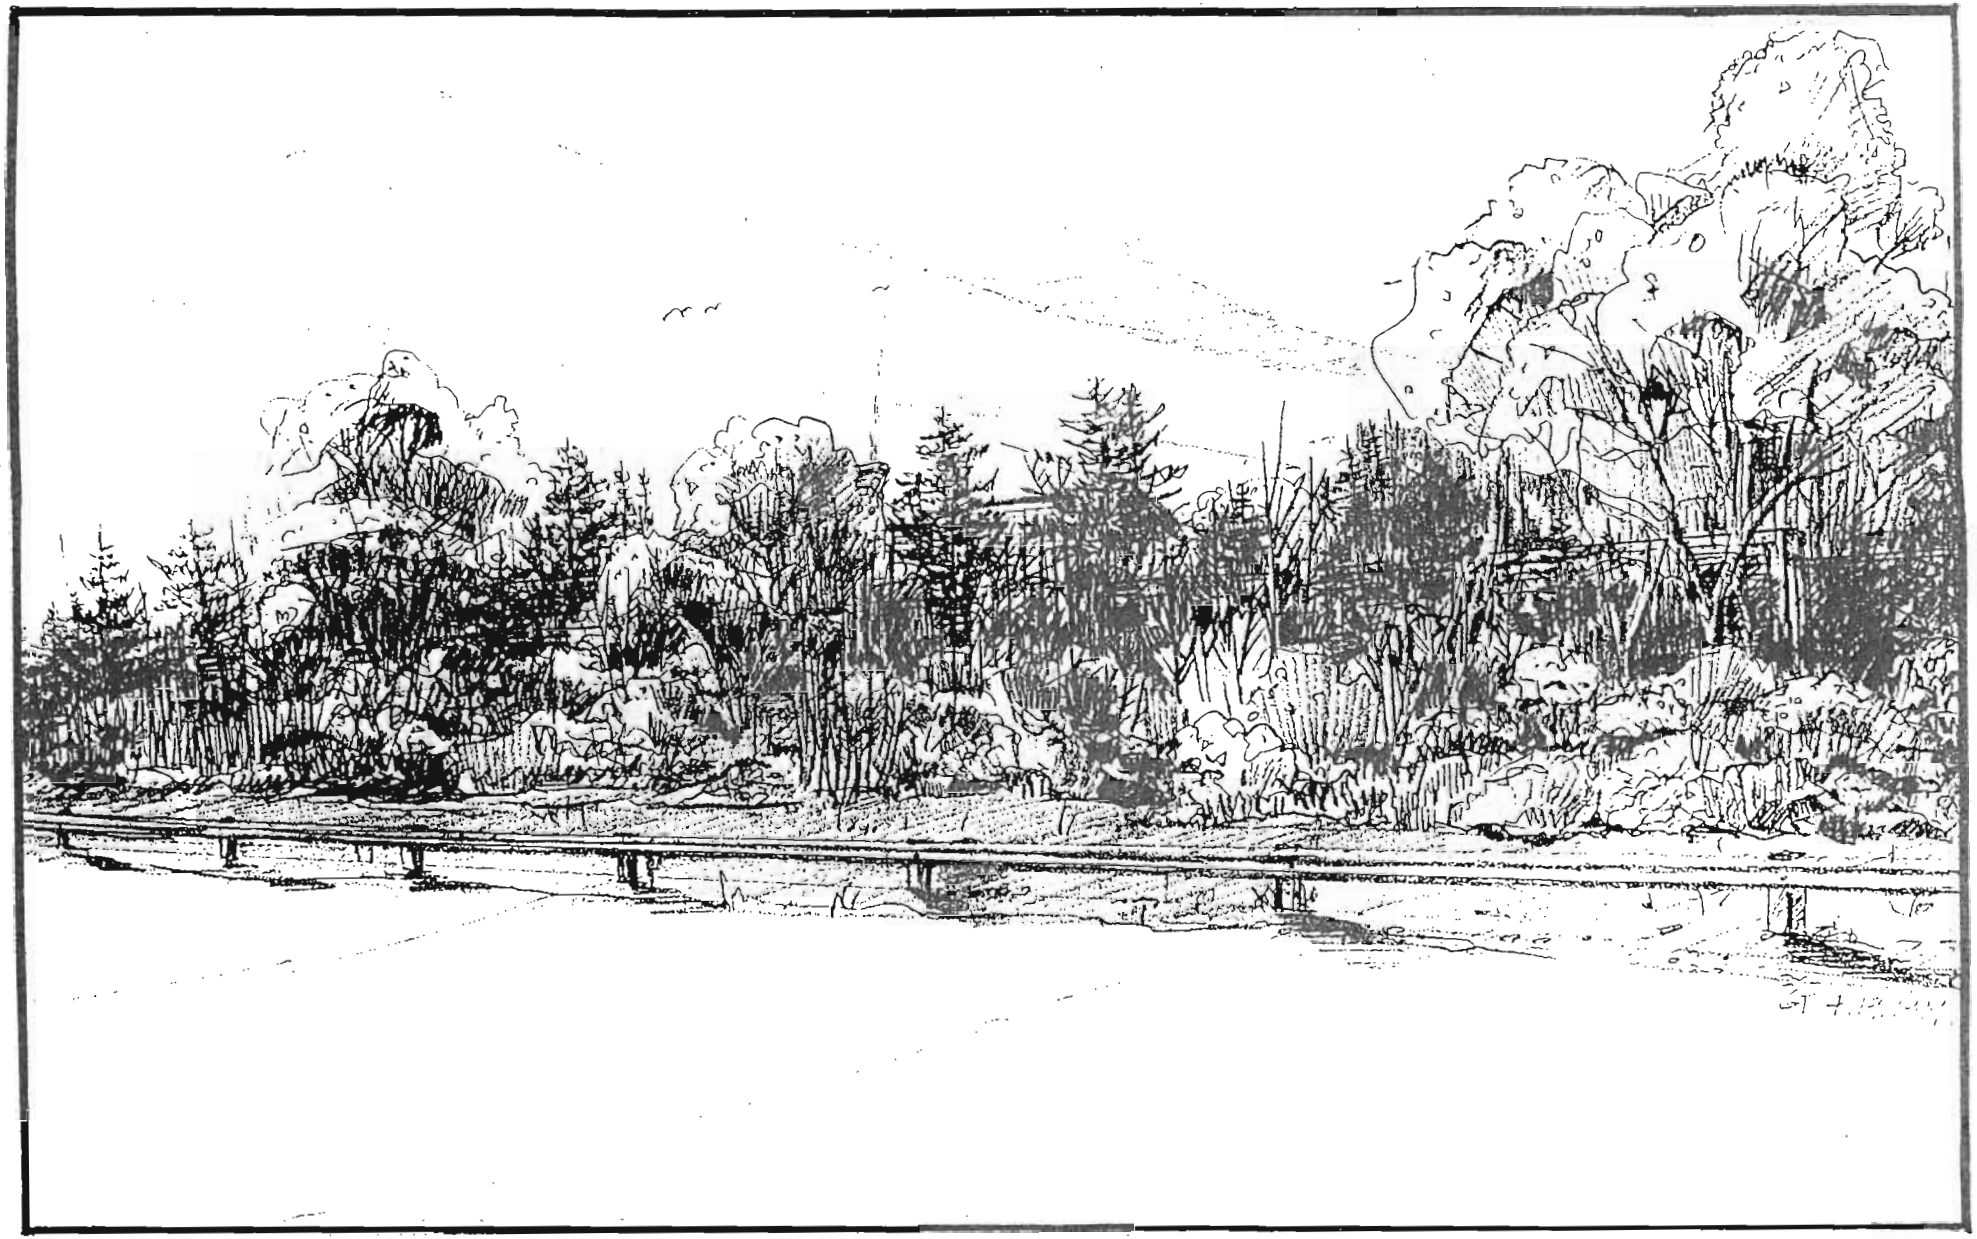
Vegetation and trees would be created to separate the golf course from the waterfront park along the East River. The park is designed to reclaim the waterfront for public use. Pedestrian connections would connect the proposed waterfront park with the existing Ferry Point Park located to the west of the bridge. A barrier-free promenade would rim the water's edge. Paths slightly inland would wind through the newly planted natural grasses. Benches and boulders would provide informal seating opportunities for park visitors. A comfort station and refreshment stand would be provided. The park would connect to the more active section of Ferry Point Park lying west of the Bronx-Whitestone Bridge.

The waterfront park's dining facility, the boathouse grill, would be located just east of the Bronx-Whitestone Bridge. It would be similar in design and materials to the clubhouse and feature a wraparound veranda and a bank of large bay windows facing east toward the park and the river. The building would be 140 feet long (east-west) and approximately 48 feet wide. Its hipped roof would be lower than the gable-ended clubhouse roof and would have identical chimneys at its northern and southern ends. Up to 400 patrons may be accommodated at once in the Boathouse Grill.

*COMMUNITY PARK*

The community park at Schurz and Balcom Avenues would be transformed from an underdeveloped amenity to a viable center of community recreation and leisure. Community access to the this park would be provided along Schley and Balcom Avenues. The active play area would include a basketball court that would be relocated to be adjacent to the new ballfield. A new artificial lake would be created along Balcom Avenue, extending nearly to its intersection with Miles Avenue. The exact type and location of amenities in the redesigned community park would be determined in consultation with the local Community Board, and are expected to include a tot lot for small children, a rolling lawn area, game tables, shaded seating, sunny seating, lakefront seating, bridge crossings, a botanical discovery path, and a gazebo. From the entry, a landscaped bridge pathway spans a stream of grasses to usher children into the tot lot. This pathway would also direct pedestrians to the tree-lined waterfront walk and the dappled shade of the patios at the lake's edge. The existing ball field would be rebuilt at the northern end of the community park. Separation of uses between the active ball field and the passive landscaped area would be accomplished by the lawn and a liberal tree buffer.

The existing topography is virtually flat. The proposed redesign suggests sculpting the land to create an interesting view vista of the golf course and a usable lounging lawn. The pastoral lawn could be enjoyed from the tree-lined plaza along Balcom Avenue or from the park itself. The rear of the park and the rest of the project site's border with the surrounding streets along



*Ferry Point Park*

**View Along Emerson at Fine Dining/Banquet Facility**

*Figure C-10*

Balcom (southeast of Sampson Avenue), Miles, and Emerson Avenues would be raised in grade and feature a landscaped berm, fence, and trees (see Figures C-11 and C-12).

## STUDY AREA

Overall, the landscaping and maintenance of the park's border with the neighborhood, in combination with the removal of the debris and unkempt vegetation, is expected to improve views of the site from nearby residences.

### *NORTH OF SAMPSON AVENUE*

In the vicinity of the community park and its relationship to the Throggs Neck Houses at Balcom Avenue, the view would change from an undeveloped grassy plain in the background to a landscaped, welcoming facility including a lake, lawn, gazebo, and abundant seating. The addition of trees at the rear of the park would screen errant golf balls while allowing glimpses of the golf course beyond. Residents at many locations would have a bucolic lakeside setting with views looking toward the project site. Some residents in higher structures may see the driving range's removable dome; however, the dome would obstruct views of the Bronx-Whitestone toll plaza and the I-678 approaches to the toll plaza. This would not be a negative visual impact.

### *SOUTH OF SAMPSON AVENUE*

Views of the project site from Miles and Emerson Avenues south of Sampson Avenue would be primarily of the landscaped berm at the site's edge. This berm would limit views of the golf course and help finally to define a well-manicured edge for the avenues. Views of the netting and removable, temporary, winter season dome associated with the driving range, service area and parking for the fine-dining/banquet facility, and the facility managers residence near Emerson Avenue would also be buffered by the landscaped berm. Some views of the driving range's removable dome would obstruct views of the Bronx-Whitestone bridge toll plaza and the I-678 approaches to the toll plaza. However, this would not be a negative visual impact. The design of these buildings is intended to be consistent with the riverfront location of the site and with the study area in scale and materials, and are not expected to significantly disrupt the visual enjoyment of the site from the surrounding sidewalks and streets in the surrounding area. Therefore, the proposed project would have no significant adverse visual impacts.

### *VIEW FROM THE BRIDGE*

While viewers on the bridge may have only fleeting views of the site, the introduction of a landscaped and maintained golf course, waterfront park, and community park would be a substantial improvement compared with existing views of an undeveloped landfill site. The netting and removable dome associated with the driving range would be visible from the bridge, but would be consistent with other views of the golf course. Further, the new landscape would be in keeping with original plans for the site which included a golf course at the base of the bridge.

## CONCLUSION

Overall, the proposed project would represent a substantial visual improvement over the existing landfill site with its unkempt natural vegetation. Given the visual screening and buffers provided as part of the project, no adverse impacts to the visual or urban design character of the surrounding area are anticipated. ❖

*Figure C-12*

**Attachment D: Neighborhood Character**

## A. INTRODUCTION

The analysis of neighborhood character addresses the project's potential effects on the character of the surrounding neighborhood. The elements that determine neighborhood character vary depending on any given community, but generally include some or all of the following: land use and zoning, urban design and visual resources, traffic, and noise, as discussed below. The assessments in this attachment rely on the analyses of these issues prepared for other attachments to the Environmental Assessment Statement (EAS). As described below, the proposed action would change the character of the project site, but would not result in significant adverse impacts to neighborhood character.

## B. EXISTING CONDITIONS

The study area for neighborhood character is the same as that analyzed for land use, zoning, and public policy (Attachment B, "Land Use, Zoning, and Public Policy"). The ½-mile study area is bounded by Westchester Creek on the west; Lafayette Avenue on the north; East Tremont Avenue on the east; and the East River on the south.

### PROJECT SITE

As described in Attachments B and C, "Visual Resources," the project site is composed primarily of undeveloped park land, with the exception of an organic recycling and composting facility operated by the New York City Department of Parks and Recreation (DPR) at the northwestern corner of the site, and a ballfield and basketball court at the northeastern corner of the site. The organic recycling facility consists of a gray aluminum pole barn. Informal uses on the site include dirt bike trails and a model airplane field. There are two simple aluminum shelters in a fenced enclosure associated with the informal model airplane field. The organic recycling and composting facility and model airplane field uses can be accessed from the I-678 north- and southbound service roads; the ballfield and basketball court and dirt bike trail uses can be accessed from the eastern edge of the site via Balcom and Schley Avenues. The rest of the project site is generally covered with vegetation, and the rocky waterfront area at the southeastern edge of the site along the East River is strewn with debris. Portions of the site are surrounded by chain link fence.

### STUDY AREA

Surrounding the project site are the currently developed portion of Ferry Point Park and industrial, commercial, and residential uses (west of the Bronx-Whitestone Bridge), St. Raymond's Cemetery (to the north of the project site), and residential uses (to the east of the project site).

Today, the eastern portion of the study area consists of residential uses and local commercial activity. Overall, the study area includes a wide range of building types, densities, and heights; the structures nearest the project site are small-scale low residential buildings and low-rise

multi-family housing generally without long views. Larger and taller buildings in the area include the Randall-Balcom Houses, which are 6 stories high, and the Throggs Neck Houses, which are 8 to 9 stories high. These public housing complexes are located on large blocks near the northeastern portion of the site. South of Sampson Avenue, there are a variety of housing styles and types, including attached rowhouse buildings, larger peaked-roof houses, and smaller hipped-roof bungalows. These structures are generally 3 stories, with the single-family homes generally standing at 1 to 2 stories. The rowhouse buildings are generally in strips of 5 to 10 duplex or triplex units. Most residential units are set back from the curb with driveways and walkways, and some houses are separated by lawns and other open spaces. St. Raymond's Cemetery, provides a visual and physical barrier on the north side of the project site.

The elevated Bronx-Whitestone Bridge, a suspension bridge that bisects the park, forms a strong visual boundary between the eastern and western portions of Ferry Point Park. The two-way Ferry Point Park access road loops under the bridge, and connects the I-678 north- and southbound service roads. The western portion of the park is currently developed, and includes ballfields and picnic areas, along with a waterfront walking area. The western portion of the study area between the I-678 service roads and Westchester Creek contains predominantly warehousing/storage yard and heavy industrial uses. There are also residential and commercial uses in this area including single- and two-family detached houses, a hotel, and office buildings. This portion of the study area also contains some vacant lots. Warehousing and heavy industrial uses in this area are generally located to the west side of Brush Avenue. Land uses across Westchester Creek are similar to those on the east side of the creek, primarily including commercial, industrial, and warehousing uses, along with a number of overgrown vacant parcels. The buildings in this area generally range from 1 to 2 stories.

Traffic conditions in the area, as discussed in Attachment J, "Traffic," generally reflect the study area's uses and location near the Bronx-Whitestone Bridge, with connections to the Throgs Neck Bridge and the Cross-Bronx Expressway. Streets within the study area have a mixed character; east of the project site, lightly traveled local streets, including Balcom, Schley, and Miles Avenues serve the residential uses discussed above. East Tremont Avenue, a major roadway in the study area that provides access to and from the Throgs Neck Bridge, serves commercial development, including a drugstore, supermarket, and local restaurants and offices. At the northern portion of the study area, Lafayette Avenue provides access to the local residential streets located between East Tremont Avenue and the I-678 northbound service road. Brush Avenue, which is also lightly traveled, is a north-south roadway located at the western portion of the study area, and serves the primarily industrial uses along Westchester Creek. Brush Avenue also provides access between the Lafayette Avenue, the I-678 service roads, Bruckner Boulevard, and the Cross-Bronx Expressway.

As discussed in Attachment L, "Noise," the project site and its immediate environs are subject to frequent flyovers by aircrafts traveling to and from LaGuardia Airport. As a result, the entire study area experiences marginally unacceptable noise levels. However, the residential portion of the study area, east of the project site, experiences marginally acceptable noise levels that may be attributed to a combination of general background traffic levels in the area, as well as aircraft flyovers.

## C. THE FUTURE WITHOUT THE PROJECT

### PROJECT SITE

In the future without the proposed project, there would be no changes to existing uses on the project site.

### STUDY AREA

As described in Attachment B, "Land Use, Zoning, and Public Policy," additional residential units are currently under construction within the study area and will be completed by 2002, the analysis year for the project. However, this development is similar to existing residential uses east of the project site, and the overall character of the study area is not expected to change in the future without the proposed project. Additionally, overall background traffic growth at study area intersections would occur, but the character of traffic in the study area will remain the same. There would be no significant changes to noise levels in the area.

## D. PROBABLE IMPACTS OF THE PROPOSED PROJECT

The proposed project would not cause significant adverse impacts in any of the following elements that make up the character of the neighborhood: land use and zoning, visual resources, traffic, or noise. The project would change the land use and visual character of the project site; bring new activity to the currently undeveloped portion of Ferry Point Park; and would increase traffic. Overall, the project would not change the neighborhood character of the immediate area by expanding a currently existing park use.

### PROJECT SITE

The project would change the land use and appearance of the site by replacing vacant and overgrown land with a landscaped, organized recreational use. The proposed regional recreation facility would result in three distinct sections of the park: a golf facility occupying the majority of the site; a waterfront park in the section of the site adjacent to the East River; and a community park near Balcom and Schley Avenues. Furthermore, the waterfront park is designed to reclaim the waterfront for public use. Overall, the project would result in the expansion of the existing park use, and would develop 7.0 acres of community park and 19.5 acres of waterfront park, in addition to a golf facility, restaurant, and fine dining/banquet uses. As part of the proposed project, two unbuilt and undeveloped streets—Emerson Avenue between Miles and Schley Avenues, and Schley Avenue between Buttrick and Emerson Avenues—would be demapped and remapped as park land, adding approximately 6 acres of new park land. The development of the project would connect the site to the more active section of Ferry Point Park west of the Bronx-Whitestone Bridge. The organic recycling and composting facility currently on the site would be relocated. Best efforts would be made to relocate the informal model airplane field.

Visually, the project consists primarily of landscaping and five moderately sized buildings, which would be seen from a radius of only a few blocks in most cases. The residential structures nearest to the project site are low-rise buildings generally without long views. The closest views of the proposed structures on the project site are from the blocks adjacent to the proposed fine dining/banquet facility and the facility manager's quarters along Emerson Avenue. Visual screening and buffers would be provided as part of the project, and landscaping would represent a visual improvement over the existing landfill site with its unkempt natural vegetation. Along

Emerson Avenue, the golf facility portion of the site where the clubhouse, fine dining/banquet facility, and maintenance building would also be located, would be buffered by a landscaped visual barrier most likely consisting of a berm and low wall on top of the berm. In addition, the fine dining/banquet facility is designed to include an 8- to 10-foot noise barrier with landscaping along Emerson Avenue. This barrier would be located behind the fine dining/banquet facility to minimize the effects of this facility on the adjacent community. This barrier would also reduce noise from any vehicle movements and truck deliveries or other service area events. Near the bridge at the western portion of the site, the driving range will be lighted for night use; the lighting associated with this use will be designed to accommodate area-specific lighting that is not intrusive to residents in the adjacent area. The driving range will include tees in a structure approximately 30 feet in height, and will be surrounded by netting approximately 50 to 100 feet in height. The driving range may also include a removable dome (approximately 120 feet in height) that would be utilized during the winter months. This netting and removable, temporary, winter season dome would be visible from the Bronx-Whitestone Bridge, and would be consistent with other views of the golf course. Views of the driving range's removable dome would obstruct views of the Bronx-Whitestone Bridge toll plaza and its approaches from the upper levels of some residences. Furthermore, landscaping associated with the park's border with the neighborhood would likely screen residences at lower levels from views of the driving range. The waterfront park, which would connect the currently developed portion of Ferry Point Park west of the Bronx-Whitestone Bridge, would be separated from the golf course by a ridge, and a barrier-free promenade would rim the water's edge. The existing community park at the northeastern portion of the project site would be transformed from an underdeveloped amenity to a viable center of community recreation and leisure, and would be accessible to residential areas in the eastern section of the study area. The existing ballfield and basketball court would be rebuilt at the northern end of the community park.

With the exception of the community park, all access to the proposed recreation facility would be from the west—vehicular, bicycle, and pedestrian access would be from the I-678 service roads under the Bronx-Whitestone Bridge. Vehicular access/egress point to the site would be from the southeastern portion of the I-678 north- and southbound service roads under the Bronx-Whitestone Bridge, which currently is a two-way roadway and would become a two-lane, one-way roadway (see Attachment J, "Transportation"). With the exception of the community park, the proposed recreation facility would be primarily a regional park. Visitors would enter the site at this location, pass by a stone gateway on the entrance road (the crescent road), and choose to either proceed north to the golf clubhouse area, or south to the community park and the boathouse grill, waterfront park, or fine dining/banquet facility. Access for emergency vehicles would be via Emerson Avenue. Parking would be provided at each of these areas to accommodate park users. Pedestrian connections would connect the proposed waterfront park with the existing Ferry Point Park located to the west of the bridge. In addition, pedestrians would be able to access the project site through the same entrance road as vehicles. Bicycle racks would be provided in the waterfront park.

Incremental noise associated with newly created park land and park activities, including grass maintenance and mowing operations, operation of the fine dining/banquet facility, and the new ballfield in the community park, is not expected to be significant.

## STUDY AREA

The project would complement the existing developed western portion of Ferry Point Park by connecting its waterfront portion to the proposed recreation facility that would include public restaurants and banquet facilities with water views as well as a public golf facility. The community park would serve residents to the east of the site, and would be accessed separately via Schley and Balcom Avenues. The proposed project would add recreation facilities and would have a positive impact relative to land use. The project would also be in keeping with Robert Moses's original plans for the site, which included a golf course at the base of the bridge. Overall, the landscaping and maintenance of the park's border with the neighborhood, in combination with the removal of the debris and unkempt vegetation, is expected to improve views of the site from nearby residences. Residents at many locations near the northeastern portion of the project site (north of Sampson Avenue) would have a bucolic lakeside setting with views looking toward the project site. South of Sampson Avenue, views would be primarily of the landscaped berm at the site's edge, which would define a well-manicured edge for Miles and Emerson Avenues. Views from the Bronx-Whitestone Bridge would include a landscaped and maintained golf course, waterfront park, and community park, which would be a substantial improvement compared with existing views of an undeveloped landfill site.

The proposed actions would add park users traveling through the study area and would therefore add some new vehicles to the area's streets. Additional traffic generated by the proposed project would not have a significant adverse impact on the local community, and planned improvements to the Ferry Point Park Access Road, the intersection of Lafayette Avenue and the I-678 service roads, and the intersection of Lafayette and East Tremont Avenues would facilitate traffic flows. These improvements include coordinating the signal at the I-678 northbound service road at Lafayette Avenue with the signal at the I-678 southbound service road at Lafayette Avenue, restriping the westbound approach at the I-678 southbound service road at Lafayette Avenue to include an exclusive left-turn lane and signal phase, and daylighting (restricting the use of up to three parking spaces) the northbound approach at the intersection of East Tremont and Lafayette Avenues during the weekday PM peak period. As noted in Attachment J, "Transportation," traffic generated by the project would not result in noticeable changes in noise levels in the study area.

Overall, no significant adverse impacts on neighborhood character from the proposed project would occur. ❖

## *1.0 INTRODUCTION*

The purpose of this attachment is to describe the existing natural conditions on the eastern portion of Ferry Point Park, and the potential effects of the proposed public recreational facility on these resources. Recommended measures to ensure that potential adverse impacts are avoided are also discussed. The following sections describe: the methods used in the evaluations, the existing natural resources on the Ferry Point Park site, and the future conditions of the natural resources both with and without development of the proposed public recreational facility.

## *2.0 STUDY AREA*

The Ferry Point Park site, the study area, is located on approximately 220 acres owned by the City of New York in Bronx County, New York. It is bounded by the Bronx-Whitestone Bridge along Interstate Route 678 (Hutchinson River Parkway) to the west; Balcom, Miles, and Emerson Avenues to the east; St. Raymond's cemetery and Schley Avenue to the north; and the East River to the south. The Ferry Point Park site makes up the eastern portion of the 414-acre Ferry Point Park, which is split by the Bronx-Whitestone Bridge. This portion of the park was used to dispose municipal solid waste in the 1950's up through the early 1960's. The relatively low-quality ruderal (plant that is colonizing waste ground) communities found on the site are fairly typical of disturbed lands in this region of the state.

The western portion of Ferry Point Park consists of recreational playing fields, grassy areas and woodlands bounded by Westchester Creek to the west, the bridge to the east, the East River to the south and developed land to the north—will not be altered as part of this project. Only the eastern portion of the park will be developed as part of the proposed public recreation facility, and is the focus of this evaluation.

## *3.0 SUMMARY OF THE PROPOSED PROJECT*

Attachment A provides a detailed project description. This section provides a brief overview of the most salient project features. The Ferry Point Park project is a public recreation facility, consisting of an 18-hole comprehensive golf facility, boathouse grill/restaurant, fine dining/banquet facility, waterfront park, and community park. Parking areas will be provided for each of the facilities.

## 3.1 *Golf Facility*

The comprehensive golf facility will consist of a clubhouse, a driving range, tees, greens, fairways and rough, and cart paths, ponds, and vegetated out-of-play areas with native and ornamental grasses, and some trees. The course elevation will vary from 10 feet above sea level along the East River, to 40 feet above sea level at the interior of the site. Table 3.1 presents a breakdown of the acreages for the various components.

*Table 3.1* *Acreages for golf course components*

| Component | Acres |
|---|---|
| Tee Areas | 5.88 |
| Fairway | 36.6 |
| Rough | 71.3 |
| Bunkers | 3.43 |
| Greens | 4.52 |
| Waste Areas (grasses and other natural vegetation with some trees) | 1.48 |
| Lakes (four lakes) | 10.24 |
| Dry basins | 1.58 |
| Native Areas | 22.85 |

Impermeable areas total approximately 14.62 acres. They include parking lots, rooftops, cart paths, and roadways.

The golf course area will be cleared of existing vegetation. The lakes will be excavated first and graded to serve as sediment control basins during construction. To create the undulations in the golf course, between 300,000 and 500,000 cubic yards of dirt will be imported to the site. Attachment G provides a description of the fill material. Approximately 1 to 1.5 feet of fill will cover the golf course area, topped by 6 inches of clean soil. The waterfront park and community park, discussed below, will have 1.5 feet of soil over any fill material. The irrigation system will be installed at this time. Following the contouring and stabilization of the fill material, the clubhouse, boathouse grill/restaurant, fine dining/banquet facility, and two parks will be constructed.

## 3.2 *Waterfront Park*

The approximately 19.5-acre waterfront park will provide passive recreational opportunities such as walking, birdwatching, and picnicking, as well as the boathhouse grill/restaurant. It will include a waterside trail surrounded with low-growing natural vegetation that joins with a system of paths interwoven throughout the park. The interior of the park will be landscaped with natural vegetation associations. Benches and boulders will be scattered along the pathways to provide seating. Picnic tables will also be provided along with parking for approximately 120 vehicles.

A comfort station and refreshment stands will be provided in the middle of the park waterfront. The boathouse grill/restaurant will be located at the southwestern tip of the waterfront park. It will consist of the building housing the restaurant, parking for approximately 75 vehicles, bike racks, and stormwater management facilities.

### 3.3 *Community Park*

The approximately 7.0-acre community park will be located at the northeast corner of the site where Schley intersects with Balcom Avenue. It will provide active and passive recreational opportunities through its softball/baseball field, basketball court, tot lot for small children, tot lawn area, game tables, lawn area, shaded seating, sunning seating, lake-front seating, bridge crossings, botanical discovery path, gazebos, and an overlook next to the approximately 4.5-acre lake (part of the stormwater management system) immediately to the south of this park.

The pathway portion of the park next to the lake will be planted with trees. The botanical discovery path will be lined with native and ornamental grasses as it meanders along the lake's edge. A portion of the path to the lake will be tree-lined.

## 4.0 *SITE EVALUATION METHODS*

Site visits were made to the project area on the following dates:

- 18 and 19 May 1999 to delineate wetlands, initiate the natural resources inventory and meet with the surveyors;
- 16 June 1999 to complete the wetlands delineation, continue the natural resources inventory, and document woodland resources; and
- 22 June 1999 to complete the natural resources inventory and document woodland resources.
- 15 September 1999 to discuss a small area dominated by high marsh grasses along the East River with representatives from the State and City.

The following sections discuss the methods used to conduct the wetlands assessment, and the survey of vegetation communities, and terrestrial and aquatic animals.

### 4.1 *Wetlands*

In the State of New York, freshwater wetlands are under the jurisdiction of New York State Department of Environmental Conservation (DEC) and the U.S. Army Corps of Engineers (COE). In accordance with *The Freshwater Wetlands Act* (Article 24, Freshwater Wetlands), DEC limits its jurisdiction to wetlands 12.4 acres or larger. These wetlands are indicated on DEC freshwater

wetlands maps. DEC also regulates activities in tidal wetlands in accordance with The Tidal Wetlands Act (Article 25 of the Environmental Conservation Law). COE regulates the placement of dredged and fill materials in "Waters of the United States"; this includes streams, lakes, impoundments, intermittent drainageways and associated wetlands in accordance with Section 404 of the *Clean Water Act* and the placement of structures over, in, or on the banks of navigable waters in accordance with Section 10 of the *Rivers and Harbors Act of 1899*.

COE defines wetlands as:

> "Those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas."

The *U.S. Army Corps of Engineers Wetlands Delineation Manual of 1987 (Environmental Laboratory 1987)* is the preferred wetland delineation manual of both COE and DEC. In accordance with this manual, our scientists used existing soil, wetland, and topographic information, in conjunction with field investigations, to describe and delineate areas of the site under the jurisdiction of COE.

The delineation procedure presented in the *U.S. Army Corps of Engineers Wetlands Delineation Manual of 1987* involves a thorough investigation of vegetation, soil and hydrology. Based on this approach, an area is defined as a wetland if it exhibits, under normal circumstances, all of the following characteristics:

- The land supports a dominance of hydrophytic vegetation.
- The substrate is hydric soil.
- The soil/substrate is at least periodically saturated or inundated during a significant portion of the growing season.

A hydrophyte is any plant that has the ability to grow in water or on a substrate that is at least periodically deficient in oxygen as a result of excessive water content and depleted soil oxygen levels. The U.S. Fish and Wildlife Service (USFWS) has prepared a list of wetland plant species for the Northeast Region, Region I (USFWS 1988). The plant species listed in this publication are classified based on their affinity for wetlands. Table 4.1 lists the wetland indicator classification assigned to each species.

*Table 4.1* ***Plant affinity for water condition***

| Classification | Percent Occurrence in Wetlands |
|---|---|
| Obligate (OBL) | >99 |
| Facultative Wetland (FACW) | 67-99 |
| Facultative (FAC) | 34-66 |
| Facultative Upland (FACU) | 1-33 |
| Non-wetland (UPL) | <1 |

A positive (+) or negative (-) symbol used in conjunction with one of the facultative indicator classes relates to a species preference to either the wetter or drier end of its indicator class. The positive sign indicates a preference to the wetter end. This wetland indicator classification was used for plant species found at the site. A designation of NI (no indicator) was indicated in the regional list for those species for which insufficient information was available to assign an indicator class. We assigned a designation of NL if a species was not present in the list. Plants not listed are presumed to be upland species (Environmental Laboratory 1987).

Hydric soils are very poorly drained, poorly drained, or somewhat poorly drained soils that have the seasonal high water table within 6 inches of the surface (Environmental Laboratory 1987). These soils are typically predominantly gray and mottled immediately below the "A" horizon and have thick, dark colored surface layers.

Areas that were not wetlands, but under State jurisdiction (i.e., streams, lakes, impoundments and intermittent drainageways), were also delineated. Positive indicators of wetland hydrology were noted whenever encountered. Any changes in the environment that may influence the hydrology of the area such as ditches or drainage systems were also noted.

Prior to initiation of its fieldwork, our scientists conducted a thorough review of available data sources such as the USFWS National Wetland Inventory maps, and site plans depicting topography. For the wetlands investigation, representative sampling points were established along the wetlands line. At each sampling point, we collected data regarding the vegetation, soil and hydrology to determine whether the area met the wetlands definition. This information will be provided to COE as part of the request for jurisdictional determination.

The limit of all areas determined to be regulated or possibly regulated by either COE or DEC were identified and flagged in the field. The flag locations were surveyed and the proposed wetland boundaries were included on the site plans. The limit of COE jurisdiction along the East River is indicated by the limit of the mean high water line.

## 4.2 *Vegetation Communities*

The vegetation communities were mapped and classified during all of the site visits. Our scientists traversed all portions of the site, described the vegetation observed, and then identified the various plant communities on a site map or aerial photograph. Plant species were recorded for each plant community. Once the woodland areas were identified, we counted the number of specimens with a diameter at breast height (dbh) greater than 6 inches.

## 4.3 *Wildlife*

Wildlife observations were recorded during all site visits. Direct observations (sightings) as well as indirect observations (calls, tracks and scat) were recorded, along with the vegetation community where the animal was observed. On the 16 June 1999 site visit, wildlife observations were initiated at sunrise to record bird activity. Aquatic species were recorded from visual observation of the intertidal area at low tide.

# 5.0 *EXISTING CONDITIONS*

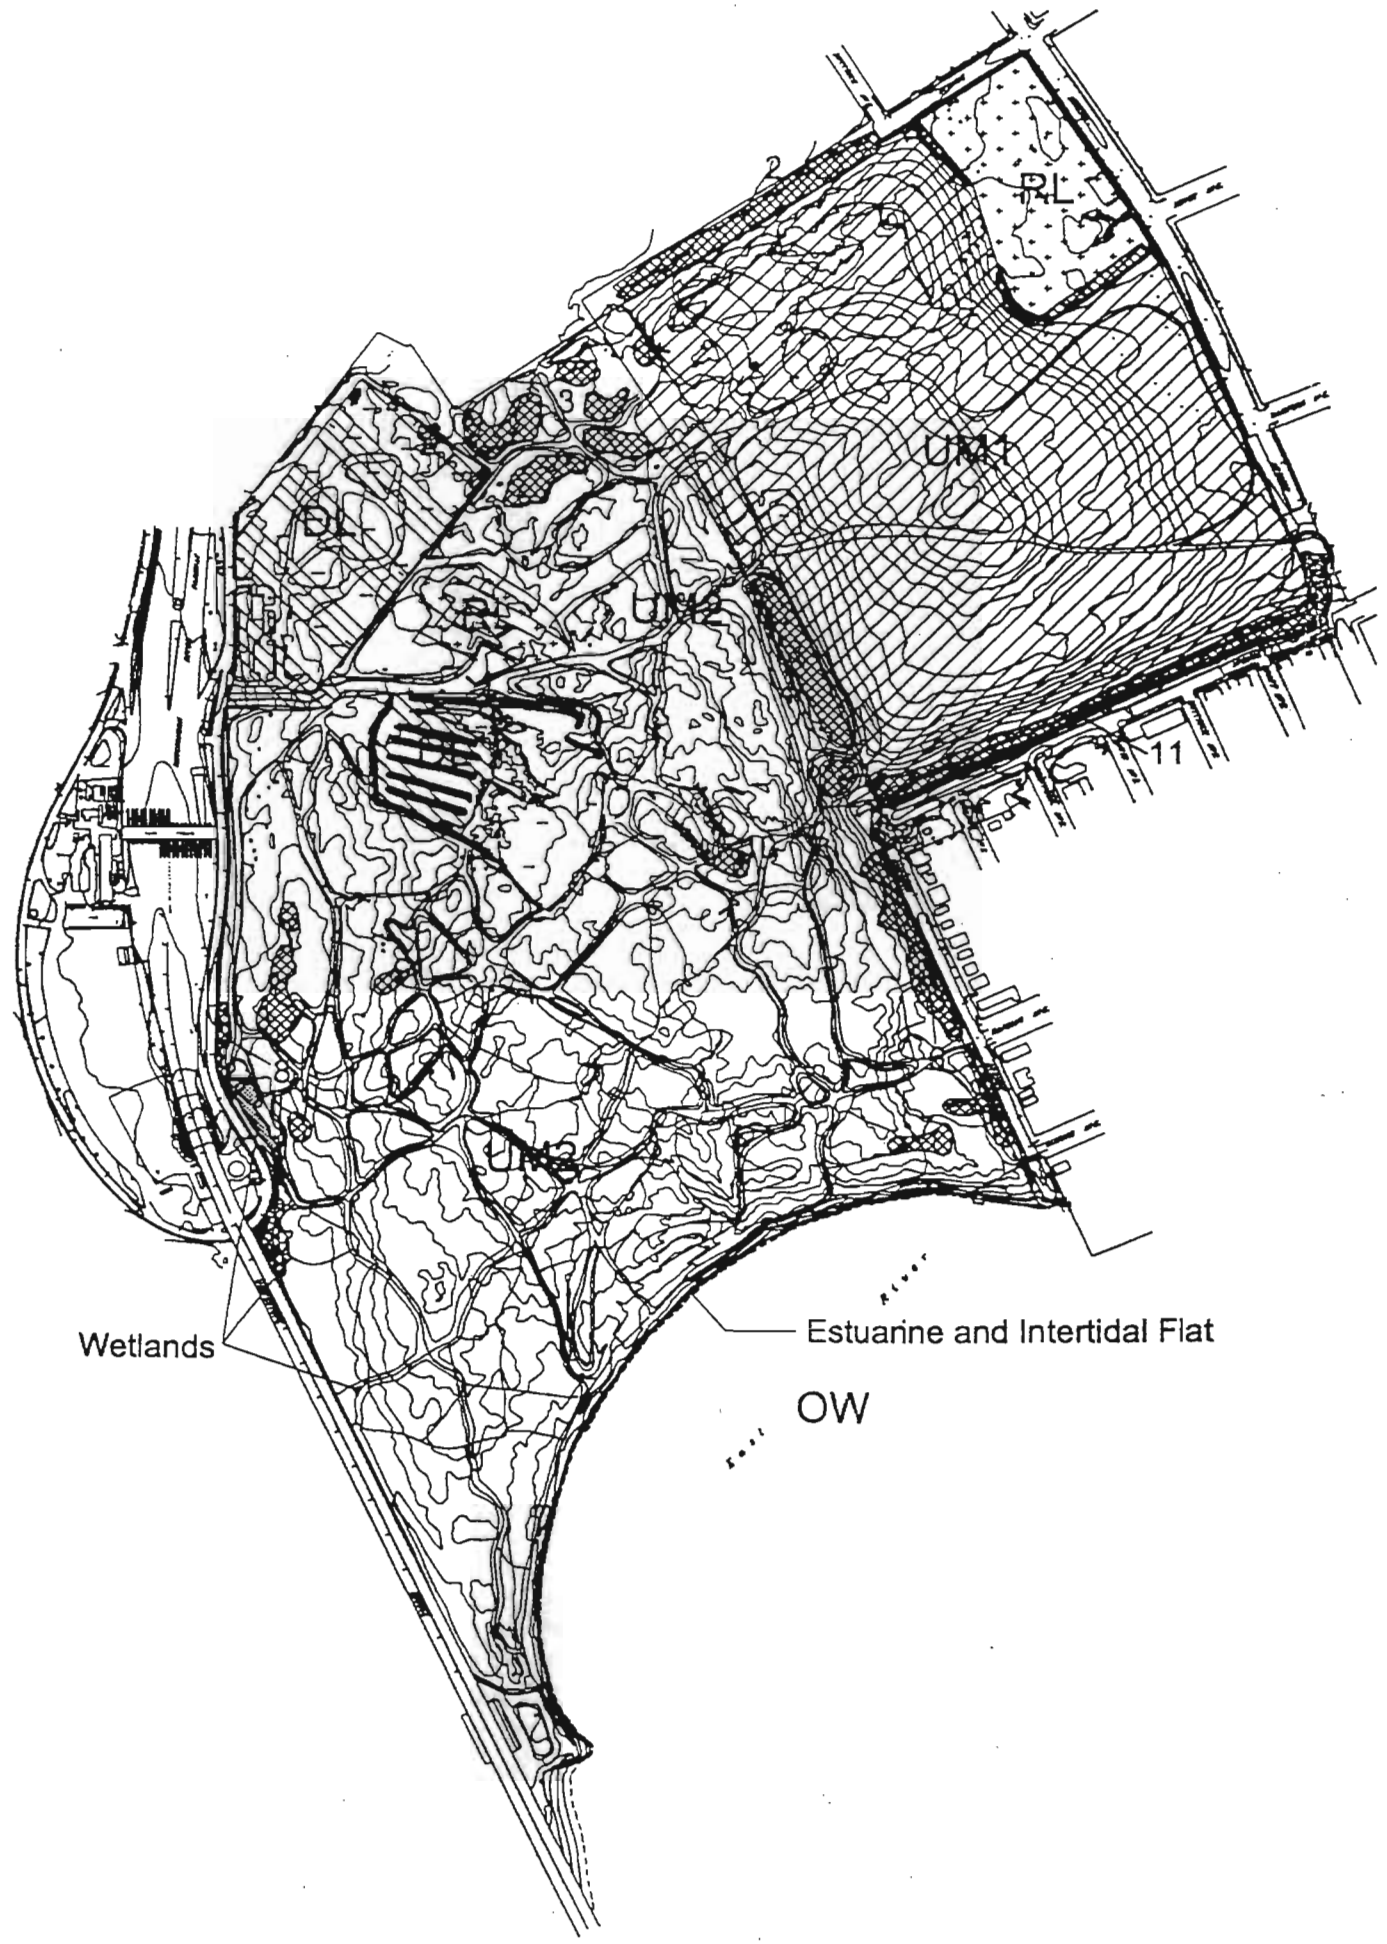
This section describes the existing vegetation communities including woodlands and wetlands, and wildlife observed or expected to occur on the site, as well as the aquatic resources of the East River in the vicinity of the Ferry Point Park site.

## 5.1 *Vegetation Communities*

In general, the two sides of the park support different vegetation communities. This assessment focused on the eastern portion of the park, the Ferry Point Park site, where the project has been proposed. The eastern portion of Ferry Point Park supports a mixture of common reed (*Phragmites australis*), clusters of trees (tree of heaven (*Ailanthus altissima*), black locust (*Robinia pseudoacacia*), willow (*Salix* sp.), cherry (*Prunus* spp), and mixed grasses growing on landfill. A detailed description of the existing plant communities is presented below. The western portion of the park will not be modified by the project—it consists of recreational fields, grassy areas, and scattered tree stands. The largest stand of trees is adjacent to the Bronx-Whitestone Bridge—it contains American beech and red maple and has a fairly well developed understory. Adjacent to Westchester Creek on the western border of this section, vegetation consists of numerous saplings, unpruned hornbeam, and high grasses and herbs. The western portion of the park provides active recreational (athletic fields) and passive recreational (walking and bird watching) opportunities (Urban Forest & Education Program 1994).

Appendix E1 lists the plant species observed in the project area and the community types where they were found. The Ferry Point Park site (Figure 5.1) has seven distinct categories of plant communities/land use: two types of

# Plant Communities and Landuse Categories for Ferry Point Park Public Recreational Facility



- Urban Meadow 1
- Urban Meadow 2
- Recreational Land
- Developed Land
- Woodland Areas
- Wetlands
- OW — Open Water

Figure 5.1

urban meadow, developed land, recreational land, urban woodland, emergent wetland, and estuarine intertidal flat. Most of the site is covered by the two urban meadow communities—differentiated by the composition of plant species. The species composition of the plant communities reflects the site's disturbed nature and urban setting. A small area (no greater than 12 by 8 feet) dominated by high marsh grasses occurs at the top or the revetment along the East River that DEC and the New York City Department of Parks and Recreation (DPR) have requested be preserved. The following sections describe the remaining plant communities found on the site.

### 5.1.1 *Urban Meadow 1 (Mixed Grasses)*

This urban meadow community occurs on the eastern portion of the site, and covers approximately 59 acres. A variety of pasture grasses and forbs dominate this community. Common grass species observed in this community type include: smooth brome grass (*Bromus inermis*), orchard grass (*Dactylis glomerata*), red fescue (*Festuca rubra*), Kentucky blue grass (*Poa pratense*) and downy cheese (*Bromus tectorum*). A few patches of common reed (*Phragmites australis*) are scattered through the meadow. A variety of forbs occur interspersed throughout this grassland community that include: daisy fleabane (*Erigeron annuus*), yarrow (*Achillea millefolium*), yellow sweet clover (*Melilotus officinale*), everlasting pea (*Lathyrus latifolius*), chicory (*Cichorium intybus*), ox-eye daisy (*Chyrsanthemum leucanthemum*), rough-fruited cinquefoil (*Potentilla recta*) and mugwort (*Artemisia vulgaris*). Woody plants such as tree of heaven (*Ailanthus altissima*), black locust (*Robinia pseudoacacia*) and staghorn sumac (*Rhus typhina*) are present in small patches along the periphery of this area. Other woody species identified in this area included rugose rose (*Rosa rugosa*) and tartarian honeysuckle (*Lonicera tartarica*)

The dominance of pasture grasses in this portion of the site and the absence of these species elsewhere, suggests a different history for this portion of the site. Based on the types of species identified in this area, it is likely that this area as once seeded with a pasture mix.

### 5.1.2 *Urban Meadow 2 (Common Reed/Mugwort Community)*

The second urban meadow (common reed/mugwort) plant community occupies approximately 119 acres in the western portion of the site. This community is a mosaic of areas dominated by either common reed or mugwort that are readily apparent in the field, but not easily distinguished on aerial photography.

In general, the common-reed-dominated areas occur mostly in the western-most portion of this community type. These areas are essentially dense, mono-specific stands of common reed with few other species. Other herbaceous species observed within stands of common reed include blackberry (*Rubus allegheniensis*) and mugwort. Additional species such as pineapple weed

(*Matricaria matricaroides*), downy cheese, ragweed (*Ambrosia artemisiifolia*), spiderwort (*Tradescantia virginiana*), path rush (*Juncus tenuis*), deptford pink (*Dianthus armeria*), and lamb's quarters (*Chenopodium album*), occur along the edges of the paths that dissect the common-reed-dominated areas.

The mugwort-dominated component of the Urban Meadow 2 community type occurs mostly in the eastern and northern portions of this mapping unit. It has a more diverse species composition than the common reed dominated areas. Other species identified in mugwort dominated areas include: ragweed, bull thistle (*Cirsium vulgaris*), rough-fruited cinquefoil, common milkweed (*Asclepias syriaca*), dogbane (*Apocynum* sp.), evening lychnis (*Lychnis alba*), seaside goldenrod (*Solidago sempervirens*), daisy fleabane, quack grass, curled dock (*Rumex crispus*) and field bindweed (*Convolvulus arvensis*).

Patches or individuals of staghorn sumac, tree-of-heaven, black locust or cottonwood (*Populus deltoides)* are also scattered through this area. Larger patches of woodland vegetation are described in subsequent sections.

### 5.1.3 *Developed Land*

The approximately 14-acre developed land, land use type, is assigned to areas where land use precludes the establishment of vegetation. These areas include the two New York City Department of Sanitation facilities—a composting facility and an organic recycling facility—in the northwest portion of the site, proximate to the tollbooths of the Bronx-Whitestone Bridge.

### 5.1.4 *Recreational Land*

This community type is assigned to two areas that are subjected to frequent mowing to facilitate recreational activities. The largest recreational area (approximately 6.6 acres) is located near the intersection of Schley Avenue and Balcom Avenue, and includes a softball field and a basketball court. The second recreational area (approximately 3.2 acres), an informal model airplane area, is used as an airfield for an organized group of radio-controlled model airplane enthusiasts. It is located to the south of St. Raymond's cemetery and adjacent to the New York City Department of Sanitation facilities. The area includes a macadam runway, a gravel runway, a gravel parking lot, and a pavilion.

Lawn grasses and a variety of weeds dominate the vegetation in the recreational areas. The species observed include: dandelion, English plantain (*Plantago lanceolata*), common plantain (*Plantago major*), white clover (*Trifolium repens*) and pineapple weed. Some woody vegetation is located in the recreational area with the ball field. A row of sycamore (*Platanus* sp.), basswood (*Tilia* sp.) and black locust occur along Balcom Avenue. Several willow oak (*Quercus phellos*), a red mulberry, and a gingko (*Gingko biloba*)

occur in the northwest corner of this area. The gingko is a multi-stemmed tree in which the cumulative diameter at breast height (dbh) of the three stems totals approximately 47 inches.

### 5.1.5 *Urban Woodland*

Wooded areas, comprised mostly of species typical of disturbed habitats, are scattered throughout the site. They cover approximately 12 acres in total. Each of the areas designated on Figure 5.1 as woodland possesses at least ten trees with a dbh greater than 6 inches. Scattered individual trees could not be accurately mapped on the site plan, but are included in the census of the trees with a dbh greater than 6 inches, as appropriate. The following sections describe each woodland area and the number of trees possessing a dbh greater than 6 inches.

*Woodland Area 1*

For the most part, this woodland area borders the western and southern edge of the recreational area in the northeast corner of the site. This narrow band of woodland consists almost entirely of cottonwood. In addition, there are several black locust, basswood, willow oak, red mulberry and a gingko present in the park. While not mapped, these individuals are included in the census. This woodland has 46 trees with a dbh greater than 6 inches.

*Woodland Area 2*

This area consists of widely scattered trees bordering an abandoned unimproved road adjacent to the cemetery. The 72 trees in this area are a mixture of cottonwood and black locust.

*Woodland Area 3*

The largest woodland area, area 3 is located in the western portion of the site, at the northeast corner of the New York City Department of Sanitation facilities. It consists of several distinct patches of woodland separated by urban meadow. Each distinct patch of woodland is dominated by either cottonwood, black locust, or tree-of-heaven. Approximately 204 trees with dbh in excess of 6 inches are found in this woodland.

*Woodland Area 4*

This woodland corridor is located between the Urban Meadow 1 (Mixed Grass) community and the Urban Meadow 2 (Common reed/Mugwort) community in the center of the site. Approximately 45 trees with a dbh greater than 6 inches are present in this woodland, which consists almost entirely of black locust with a single sassafras (*Sassafras albidum*). A large stand of staghorn sumac occurs at the eastern end.

*Woodland Area 5*

This area consists of a single species patch of tree-of-heaven that is located just north of where Miles Avenue intersects with Emerson Avenue. Approximately 23 trees have a dbh greater than 6 inches.

*Woodland Area 6*

This woodland is located along nearly the entire length of Emerson Avenue, south of where it intersects with Miles Avenue—it is the most species rich woodland on the site and has approximately 157 individuals with a dbh greater than 6 inches. The species observed in this woodland include: sweet cherry (*Prunus avium*), Norway maple (*Acer platanoides*), tree-of-heaven, black locust, black cherry (*Prunus serotina*), red mulberry, pin oak (*Quercus palustris*), white ash (*Fraxinus americana*), black willow (*Salix nigra*) and silver maple (*Acer saccharinum*). The fairly well developed understory includes Japanese honeysuckle (*Lonicera japonica*), poison ivy (*Toxicodendron radicans*), and grape (*Vitis* sp.). Japanese knotweed (*Polygonum cuspidatum*) is also present.

*Woodland Area 7*

This woodland area is consists of a single species stand of black locust located at the southeastern corner of the site between Emerson Avenue and the East River. There are 15 trees with a dbh greater than 6 inches and numerous individuals of smaller caliper within this woodland.

*Woodland Area 8*

This area consists of several distinct patches of woodland located in the western portion of the site, near the Bronx-Whitestone Bridge and U.S. Route I-678. The westernmost portion of the woodland has the greatest species diversity and includes black locust, red mulberry, American elm (*Ulmus americana*), cottonwood, basswood (*Tilia americana*), box elder (*Acer negundo*), tree-of-heaven, and hackberry (*Celtis occidentalis*). Most of the trees are growing on mounds of fill. Tree-of-heaven and cottonwood dominate the remainder of Woodland Area 8. A total of 105 trees with a dbh in excess of 6 inches occur in this woodland.

*Woodland Area 9*

This woodland is a monospecific stand of black locust surrounded by urban meadow and located northeast of Woodland Area 8. It has 22 trees with a dbh greater than 6 inches.

*Woodland Area 10*

Woodland Area 10 is located to the west of the intersection of Miles Avenue and Emerson Avenue, to the west of Woodland Area 5. The woodland is a single species stand of black locust of varying age. It has 27 individuals with a dbh greater than 6 inches.

*Woodland Area 11*

This woodland borders the drainage ditch adjacent to Miles Avenue. It is relatively dense in the eastern portion of the area, while the trees in the western portion of the area are more widely spaced. Cottonwood and black willow (*Salix nigra*) are the dominant species. There are 33 individuals with a dbh greater than 6 inches.

In addition to the trees included in the above areas, there are approximately 30 additional trees in either small groups or as individuals scattered throughout the site and numerous smaller diameter trees. Fewer than 30 trees on the site have a dbh of 20 inches or greater. Because many of these trees consisted of multiple trunks, the total diameter is not a good indication of maturity.

### 5.1.6 *Wetlands*

The following sections describe the two wetland categories identified at the Ferry Point Park Site, Intertidal Flat, and Emergent Wetlands.

*Estuarine Intertidal Flat*

This community type is assigned to the portion of the site subjected to the ebb and flow of the East River. The upper limit of this community is approximately the mean high tide line. This estuarine intertidal community is devoid of vascular plants, except for a very small patch of smooth cordgrass (*Spartina alterniflora*) proximate to the southern tip of Ferry Point. Brown algae (*Fucus* sp.) was observed covering the rocks along the entire shoreline of the site.

*Emergent Wetlands*

The limit of all areas determined to be regulated, or possibly regulated, by either COE or DEC were identified and the limits of each area marked in the field and subsequently surveyed. The limit of COE jurisdiction along the East River is the limit of the mean high water line. DEC freshwater wetlands maps do not indicate the presence of any freshwater wetlands on the site. Figure 5.1 indicates the proposed wetland boundaries.

The on-site freshwater wetlands are limited to three small isolated areas located in the northwestern corner of the site, that total approximately 11,815 square feet (0.27 acres). This portion of the site will be cleared, filled, and graded as part of the proposed project. The three wetland areas are palustrine emergent wetlands (PEM), according to the classification system in Cowardin et al. (1979). Near- monospecific stands of common reed, with some purple loosestrife, cover all three wetland areas. The hydrology of each of these wetland areas appears to be subject to flooding for long periods in the winter and spring, and periodic inundation throughout the remainder of the year. The soils in each wetland consist of fill material.

The drainage ditch adjacent to Miles Avenue was included in the delineation since it possesses many attributes typically associated with wetlands such as

hydrophytic vegetation and water. This area will probably not, however, fall under COE jurisdiction since COE does not typically regulate manmade ditches. A jurisdictional determination will be requested from the COE with regard to all of the delineated areas present on the site.

## 5.2 *Terrestrial Wildlife*

Appendix E2 lists the wildlife observed, or likely to occur, on the project site and the habitat types where they were found. Excluding the open water habitat of the river, there are seven distinct habitat types present on the site that correspond to the plant community/land use categories—two types of urban meadow, developed land, recreational land, urban woodland, emergent wetland, and estuarine intertidal flat. The two types of urban meadow provide the most extensive habitat types on the site. The habitats on the site reflect a history of disturbance typical of made land, or highly disturbed land, in an urban setting. As discussed in Section 5.1, monospecific stands of ruderal species such as common reed or mugwort dominate extensive portions of the site. Although most of the habitats identified on the site do not possess the habitat quality characteristics of a more pristine system, the site nevertheless supports a variety of wildlife species. The presence of a tidally influenced body of water, such as the East River, substantially increases the site's species richness potential.

Due to the uniformity of the plant communities covering extensive portions of the site, particularly the common reed dominated portion of the urban meadow community, and frequent intrusions by human activities, most of the wildlife species inhabiting the site tend to be habitat generalists. Species considered to be habitat generalists can adapt to varying environmental conditions and are relatively tolerant of human activity. Avian species commonly found in such urban meadows in the New York Metropolitan area include: mourning dove (*Zenaidea màcroura*), starling (*Sturnus vulgaris*), common crow (*Corvus brachyrhnches*), common grackle (*Quisculus quiscula*), rock dove (*Columba livia*), brown-headed cowbird (*Molotherus ater*), killdeer (*Charadrius vociferus*), song sparrow (*Melospiza melodia*), and American goldfinch (*Carduelis tristis*). During the site visits, ring-necked pheasant were observed throughout the urban meadowland communities. In the winter, these areas of the site may also be utilized by field sparrow (*Spizella pusilla*), tree sparrow (*Spizella arborea*) and dark-eyed junco (*Junco hyemalis*). Other winter visitors that could be reasonably expected to use this portion of the site are Canada goose (*Branta canadensis*) and northern harrier (*Circus cyaneus*). Mammals expected to inhabit the urban meadows include eastern cottontail (*Sylvilagus floridanus*) and various species of rodents.

Developed land and recreational land areas tend to be relatively unattractive to most wildlife species due to the frequent human activity and lack of cover. Therefore, they would support relatively small populations of wildlife. Most

of the species anticipated to use the developed portions of the site are habitat generalists or inquiline species (species that reside in the houses of others) that can adapt to a broad range of environmental conditions, and are tolerant of human activities. Inquiline species are typically found in direct association with man. Avian species that are typically found in habitats such as those found in the developed land, and, to a greater extent, in the recreational portions of the site, include: house sparrow (*Passer domesticus*), mourning dove (*Zenaida macroura*), starling (*Sturnus vulgaris*), rock dove (*Columba livia*), common crow (*Corvus brachyrhynchos*) and brown-headed cowbird (*Molothrus ater*). Mammals expected to utilize these areas include eastern cottontail, gray squirrel (*Sciurus carolinesis*), and various other species of rodents.

Urban woodland areas provide the greatest structural diversity on the site, and should also provide habitat for the greatest number of species. However, due to the relatively small size, young age, and urban setting of the woodlands, wildlife species richness is not anticipated to be high. Most of the woodlands appear to be relatively young transitional communities that possess features of a woodland, but retain other features more typical of fields. Most of the woodlands consist of patches of young trees and shrubs, surrounded by herbaceous vegetation. In addition, the relatively small area and narrowness of the woodlands on the site, would tend to exclude area and habitat specific species, particularly neo-tropical migrant birds that require interior forest habitats. The on-site woodlands provide suitable habitat for a variety of less sensitive generalist species of birds including mockingbird, common yellowthroat (*Geothlypis trichus*), bluejay (*Cyanocitta cristata*), yellow warbler (*Dendroica petechia*), catbird (*Dumetella corolinensis*), mourning dove, and song sparrow (*Melospiza melodia*). Taller trees overlooking the urban meadows also provide perches for raptors such as American kestrel (*Falco sparverius*). Mammals such as gray squirrel and eastern cottontail are typically found in similar woodlands; both were observed in this area during the site investigation.

As previously stated, the overall species richness of wildlife on the site is enhanced due to the presence of the East River and the intertidal habitat. The open water and estuarine intertidal flat habitat of the East River provide the habitat elements needed to support a species rich wildlife community. The estuarine intertidal flat provides suitable foraging habitat for a variety of birds including wading birds, gulls and waterfowl. Birds expected to be commonly encountered during the appropriate season include: Canada goose (*Branta canadensis*), great black backed gull (*Larus marinus*), herring gull (*Larus argentus*), ringed bill gull *(Larus delawarensis*), great blue heron (*Ardea herodias*), black crowned night heron (*Nycticorax nycticorax*), snowy egret (*Egretta thula*) and great egret (*Casmeroides albus*). Mammals that may utilize this area include: raccoon (*Procyon lotor*), Norway rat (*Rattus*

*norvegicus*), feral dogs and feral cats. The estuarine intertidal flat area may also be used by migratory shorebirds.

The open water of the East River provides suitable foraging and loafing habitat for a variety of waterfowl. The shallow water of the cove on the east side of Ferry Point would likely be used by migratory and overwintering waterfowl such as gadwall (*Anas strepera*), ring-necked duck (*Aythya collaris*), greater scaup (*Aythya marila*), and brant (*Branta bernicula*). Due to frequent human activity along the shoreline, nesting is anticipated to be limited. However, the presence of a mallard with young observed feeding along the shoreline in June of 1999 suggests that some nesting may be occurring near the site. Other birds expected to use the open water of the East River include double crested cormorant (*Phalacrocorax auritus*).

The freshwater emergent wetlands on the site are not extensive and are dominated by common reed. Because of the dominance of common reed, small size of the three wetlands, and isolation, the mammals and birds utilizing these wetlands are not anticipated to be substantially different than those found in the adjacent uplands. Due to the near absence of freshwater on the site, the presence of amphibians is likely to be limited to more terrestrial species such as Fowler's toad (*Bufo woodhousii*). Although, suitable habitat exists for this species, none were observed during the site investigation.

## 5.3 *Aquatic Resources*

The following sections provide an overview of the water quality, habitats, and biota found in the East River within the vicinity of the site. This information was derived from the existing literature.

### 5.3.1 *Setting*

The East River is essentially a tidal strait connecting New York Harbor with the western end of Long Island Sound. Its circulation and salinity structure is thus largely determined by conditions in the Harbor and Sound, and its fish, benthic and plankton communities are strongly influenced by the composition and abundance of these communities in adjacent waterbodies.

From a geomorphic perspective, it is convenient to divide the East River, which extends for a distance of 25.5 km (15.8 miles) from the Battery to Willets Point (just east of the Throgs Neck Bridge), into upper and lower sections. The demarcation between the upper and lower river is at Hell Gate, about 12.5 km (7.8 miles) above the Battery. The upper East River, where the Ferry Point Park site is located, is shallower and wider than the lower East River (Table 5.1). Bottom substrates in the lower section are characteristically hard and rocky while those in the upper East River are somewhat softer and smoother. While some limited cove habitat still exists in the upper East River, the shoreline in the lower East River is virtually entirely bulkheaded or riprapped. Current velocities are rapid in the East River—maximum velocities

in the lower river reach 5 knots. Current speeds in the upper river are not as great since it is wider, and more of the tidal prism of the East River is exchanged with the Harbor than with the Sound (Jay and Bowman 1975).

*Table 5.1* ***Dimensions of lower and upper sections of the East River.***

| Section of River | Surface Area (square kilometers) | Mean Depth Below MLW (meters) | Volume Below MLW (cubic meters) |
|---|---|---|---|
| Lower East River | 10.37 | 10.95 | 113.f X $10^6$ |
| Upper East River | 22.15 | 7.20 | 159.0 X $10^6$ |

Source: Jay and Bowman 1975.

The mean tidal range is considerable—approximately 1.3 meters at the Battery and increasing to 2.2 meters at Willets Point. The phase of the tide at Willets Point lags the Battery by about 3 hours. This phase difference (and the difference in resulting water elevations between the Battery and Willets Point) is chiefly responsible for the rapid tidal currents in this waterbody. Tidal excursion distances vary between 16 and 21 kilometers (9.9 to 13 miles) in the upper East River. A shipping channel in excess of 11 meters (36 feet) in depth is maintained along the entire length of the East River (Hazan and Sawyer 1983).

### 5.3.2 *Water Quality*

The primary inflow of freshwater to the East River is from the Hudson River, occurring at the Battery and the Harlem River. Other sources of freshwater are the sewage treatment plants that discharge effluent into the River. The fact that the East River is clearly polyhaline (18-30 parts per thousand (ppt)) suggests that the influence of saltwater intrusion originating from the ocean is considerable. The overall mean salinity at Willets Point is 25.2 ppt, compared to a mean salinity of 21.4 ppt at the Battery. In the upper East River, the estuarine circulation leads to a net transport of freshwater towards Long Island Sound and saltwater towards the Harbor. Vertical salinity stratification is almost non-existent in the lower East River, and is slightly greater in the upper region. In the vicinity of Willets Point, the difference between top-to-bottom salinity was estimated to range between 0.5 and 1.0 ppt (Hazen and Sawyer 1983).

The New York City Department of Environmental Protection (DEP) collects water quality monitoring data from 12 sites in the upper East River and Western Long Island Sound. These data suggest an increasing trend in dissolved oxygen (DO) in the water column between 1970 and 1998, in both surface and bottom waters (DEP 1999). DEC classifies the water use for the portion from Hell Gate to the Bronx-Whitestone Bridge as Class I—considered acceptable for secondary contact and recreation (e.g., fishing

and boating). These waters are required to maintain a DO concentration at or above 4.0 milligrams per liter (mg/L), and a monthly geometric mean of fecal coliforms less than or equal to 2000 cells/100 milliliters (mL). East of the Bronx-Whitestone Bridge, DEC classifies the water use as Class SB—considered acceptable for swimming and recreation. These waters are required to maintain a DO concentration of 5 mg/L, and a monthly geometric mean of fecal coliforms less than or equal to 200 cells/100 mL.

Dissolved oxygen is indicative of overall water quality in aquatic systems, and areas with extremely low DO are often avoided by finfish. Breakdown of algae and other organic compounds from various sources can deplete DO. Exposure to short periods of DO below 4.0 mg/L is generally not as stressful to organisms as prolonged exposure—periodic exposure to low DO occurs naturally, and estuarine organisms, in most cases, have adapted to these short periods of stress. DO concentrations in the East River follow a seasonal pattern: lowest during the summer, and highest during the late winter/early spring months when water temperature is coolest.

Although the trend in DO has greatly improved over time, and average summer DO values exceed the 4 mg/L standard for fishing, individual readings often fall below 4 mg/L during summer months at certain upper East River/Western Long Island Sound locations. Summer DO values that failed to comply with the DO standards appeared to be more prevalent in the area east of the Throgs Neck Bridge. A 1998 study conducted by the Interstate Sanitation Commission (ISC 1999) indicated that at a station just east of the Whitestone Bridge, the average summer surface DO was 4.5 mg/L, with the average bottom DO being slightly higher.

Harborwide, coliform bacteria concentrations have declined from 1989 to the present. Within the upper East River, this downward trend has measured over an order of magnitude over the past twenty years (DEP 1999). Fecal coliform concentrations in this region met standards suitable for bathing 90 percent of the time over the past decade. A trend analysis conducted on all New York Harbor stations, monitored in the summer, indicated widespread reductions in coliform concentrations between 1968 and 1993. Four stations sampled in the upper East River showed a significant downward trend in coliform concentration over time, and all were shown to be currently within compliance with their intended use classification. The declines in coliform concentrations from 1968 to 1988 are thought to be primarily in response to plant construction and upgrades; continued declines after 1989 are attributed to other New York City pollution control and abatement programs (Brosnan and O'Shea 1996).

Other water quality parameters such as nutrients (e.g., phosphorus, nitrogen) are routinely monitored as part of the New York Harbor Water Quality Survey. Nutrients are present in the East River year-round. However they are most important to aquatic plant growth during the spring/fall growing season.

(See Brosnan and O'Shea [1995] for nutrient data and trend analysis for certain months in the Harbor.)

There is concern over recent increases in chlorophyll *a* levels (indicative of eutrophic or nutrient enriched waters) that have been observed in the upper East River/ Western Long Island Sound study area (DEP 1999). However, the highest concentrations of chlorophyll have been observed in Western Long Island Sound, not the upper East River. Furthermore, in 1997 and 1998, mean summer chlorophyll levels in this region dropped to below 20 micrograms per liter (µg/L), marking only the second time since 1991 that levels dropped below 20 µg/L for two consecutive years. Steps currently being taken to reduce nitrogen discharges to the East River, as part of the Long Island Sound Study, are expected to reduce enrichment to these waters (DEP 1999).

### 5.3.3 *Characterization of Aquatic Biota*

The East River's hydrodynamics and estuarine character, coupled with the numerous municipal and industrial discharges that have operated there for many years, makes it a physically harsh environment—therefore, many of the species using the area are tolerant of highly variable conditions. The upper East River is used as a passageway for several anadromous and estuarine fishes, and as a temporary residence (seasonal) for a variety of marine species involved in more general coastal or shoreward movements. The following sections provide a brief description of the aquatic biota.

*Phytoplankton*

Phytoplankton are microscopic plants whose movements within the system are largely governed by prevailing tides and currents. Several species can obtain larger sizes as chains or in colonial forms. Light penetration, turbidity and nutrient concentrations are important factors in determining phytoplankton productivity and biomass. While nutrient concentrations in most areas of New York Harbor are very high, low light penetration has often precluded the occurrence of phytoplankton blooms.

Investigators have collected 77 phytoplankton genera, several of which were represented by a number of different species, from the East River. Diatoms are generally the most widely represented class of phytoplankton, accounting for over 90 percent of the different taxa collected in one survey (Hazen and Sawyer 1983). The green algae, *Nannochloris,* was, however, the most abundant single taxa. Brosnan and O'Shea (1995) identified 29 taxa of phytoplankton in a 1993 survey of New York Harbor. They noted that the diatom *Skeletonema costatum* and the green algae *Nannochlorus atomus* were the most abundant species at the monitored sites. The average summer cell counts in that year ranged from 6,300 to 97,000 cells/mL. Investigators have suggested that the overall composition and relative abundance of phytoplankton taxa is more heavily influenced by the influx from waters of the

Sound and New York Harbor, than by localized water quality conditions (Con Edison 1982).

*Macrophytes*

Macrophytes are plants that include submerged aquatic vegetation (SAV) and benthic algae. SAVs are rooted aquatic plants that are often found in shallow areas of estuaries—they are important for the nursery and refuge habitat they provide for fish. Benthic algae can be large multicellular algae that are important primary producers in the aquatic environment. They are often seen on rocks, jetties, pilings, and sandy or muddy bottoms. Since these organisms require sunlight as their primary energy, the limited light penetration of New York Harbor limits their distribution to shallow areas. Light penetration, turbidity and nutrient concentrations are all-important factors in determining SAV and benthic algae productivity and biomass.

None of the studies of the East River reviewed as part of this assessment reported the presence of SAVs in the lower East River. The extensively developed shoreline, swift currents and steeply sloped riverbanks make inhabitation by macrophytes unlikely. However, in the upper East River, there are a number of areas suitable for macrophyte habitat. One study reported common species including *Fucus*, *Ulva*, and *Enteromorpha* (Perlmutter 1971). On a recent site visit, *Fucus* was observed growing along the Ferry Point Park shoreline.

*Zooplankton*

Zooplankton are an integral component of aquatic food webs—they are primary grazers on phytoplankton and detrital material, and are themselves used by organisms of higher trophic levels as food. The higher level consumers of zooplankton typically include forage fish, such as bay anchovy, and early life stages of commercially and recreationally important species, such as striped bass and white perch. Predacious zooplankton species consume eggs and larvae, and can have a detrimental effect on striped bass and white perch.

Zooplankton studies conducted in New York Harbor and the East River found crustacean taxa to be the most prevalent in collected samples. The most dominant species include the copepods *Acatia tonsa, Acartia hudsonica, Eurytemora affinis*, and *Temora longicornis*, with each species being prevalent in certain seasons (Stepien et al. 1981, Londale and Cosper 1994, Perlmutter 1971, Lauer 1971, Hazen and Sawyer 1983). The data suggest that the copepods collected in the East River may be extensions of populations established in Long Island Sound and New York Harbor.

The macrozooplankton *Neomysis americana* (mysid shrimp) is also likely to occur in the vicinity of the site. Mysid shrimp have been found year round in the East River (Con Edison 1982, Malcolm Pirnie, Inc. 1982). Decapod larvae, including blue crab (*Callinectes sapidus*), and the crab *Ovalipes ocellatus,*

have been found in the East River (Con Edison 1982) and are likely to occur in the vicinity of the site.

*Benthic Invertebrates*

Invertebrate organisms that inhabit the river bottom sediments, and surfaces of submerged objects, such as rocks, pilings, or debris are commonly referred to as benthic invertebrates. These organisms are important to the energy flow of the ecosystem. They use detrital and suspended organic material as food sources, and in turn, are integral components of the diets of ecologically and commercially important fish and waterfowl species. Benthic invertebrates are also essential in promoting the exchange of nutrients between the sediment and water column.

A number of studies of the distribution and abundance of benthic invertebrates have been conducted in New York Harbor and the East River. A compilation of these studies (Coastal Environmental Services 1987) indicated that over 100 taxa had been identified for the East River, most of which were either crustaceans or polychaete worms. A more recent literature review identified over 180 benthic taxa in the Hudson River, East River, and upper New York Harbor (PBS&J 1998).

Hazen and Sawyer (1983) identified two separate but intermingled benthic invertebrate subcommunities based on sediment hardness in the East River. The hard substrate community was characterized by organisms that were either firmly attached to rocks and other hard objects (e.g., mussels or barnacles) or those that built or lived in tubes (e.g., the polychaete *Sabellaria vulgaris*). Other species of polychaetes and amphipods also occur on the hard bottom surfaces. Several species (e.g., the amphipod *Unicola*, the polychaete *Nereis*, and a few nematode species) have become adapted to the hard bottoms and rapid currents by living within the abandoned tubes of other species (Hazen and Sawyer 1985). The soft substrate community is characteristic of the more protected areas within the upper East River, where detritus, clay, silt and sand has been allowed to accumulate. Common soft substrate organisms observed include oligochaete worms, the soft shelled clam *Mya arenaria*, and a variety of flatworms, nemerteans, polychaetes and crustaceans. A recent field visit indicated hard clam, mussel, and horseshoe crab populations in the site vicinity.

None of the invertebrate populations in the East River are of commercial or recreational value. In accordance with Title 6, Part 41, Section 41.1 of the Codes, Rules and Regulations of the State of New York, commercial and recreational shellfishing (clams, oysters, mussels and scallops) is prohibited in the East River because of public health concerns. Although recreational crabbing is permitted, it is not extensively pursued.

*Fish*

The East River supports a large and diverse fish community consisting of marine, estuarine, anadromous, and catadromous species. Most species collected are either marine or anadromous. Although the East River supports only a few resident estuarine populations, many more species inhabit the area, for several weeks or months as part of seaward or coastal movements. A literature study identified 64 fish species collected in the East River and adjacent Little Neck Bay (Coastal Environmental Services 1987). A more recent literature compilation identified 70 species from lower Hudson and East Rivers, and upper New York Bay (PBS&J 1998). Appendix E3 presents a list of these fish species.

The marine species that would most likely occur in the study area include: winter flounder (*Pseudopleuronectes americanus*), bay anchovy (*Anchoa mitchilli*), weakfish (*Cynoscion regalis*), cunner (*Tautogolabrus adspersus*), Atlantic silverside (*Menidia menidia*), Atlantic menhaden (*Brevoortia tyrannus*), black sea bass (*Centropristis striata*), and spotted hake (*Urophycis regius*). The common estuarine species inhabiting the study region include mummichog (*Fundulus heteroclitus*), hogchoker (*Trinectes maculatus*) and white perch (*Morone americana*). These species migrate within the estuary and would occur in the East River during certain seasons. The mummichog and Atlantic silverside have been reported to occur in the study area in relatively large numbers. The ability of these two species to establish populations in the East River has been partially attributed to their ability to withstand low dissolved oxygen levels (Con Edison 1982).

Atlantic tomcod (*Microgadus tomcod*), striped bass (*Morone saxatilis*), alewife (*Alosa pseudoharengus*), and American shad (*Alosa sapidissima*) are the most common anadromous fish occurring in the region. These fish may be found in the upper East River on their way to the upstream Hudson River freshwater spawning grounds. They may also use the upper East River during fall and winter months as they migrate to sea via Long Island Sound. The collection of these species in the East River and areas such as Lawrence Point and Little Neck Bay supports this conclusion. On a recent site visit, a fisherman was observed with a striped bass collected from the Ferry Point shoreline. American eel (*Anguilla rostrata*) is the only catadromous (i.e. spawns in the ocean, migrates to freshwater) species to occur in the study area.

Although most of the species that reside in the study region do not spawn there, some spawning and larval development probably does occur in the upper East River. Data suggest that eggs reported in water column collections are those of bay anchovy, which has a wide geographic spawning range in marine and estuarine waters in warmer months. Clupeid larvae and winter flounder larvae have been recorded at the Astoria East River Power Plant and at New York Harbor stations. Eggs of some of the most abundant populations (e.g., mummichog, silverside, and winter flounder) are demersal and/or

adhesive and would not be expected to be well represented in water column collections.

Commercial fishing in the East River is restricted. Recreational fishing does occur, with the primary species of interest being striped bass, bluefish (*Pomatomus saltatrix*), scup (*Stenotomus chrysops*), spot (*Leiostomus xanthurus*), and American eel.

The New York State Department of Health (DOH) has issued a general health advisory that people eat no more than ½-pound of fish per week from the State's freshwaters, and some marine waters at the mouth of the Hudson River, which includes the East River to the Throgs Neck Bridge. The general advisory is to protect against eating large amounts of fish that have not been tested, or that may contain unidentified contaminants. DOH recommends that infants, children under age 15, and women of childbearing age, not consume fish from these areas. For the East River, DOH has issued advisories for Atlantic needlefish, bluefish, striped bass, and white perch because of potential PCB contamination. DOH recommends that no American eel be consumed because of potential PCB contamination (DOH 1998).

## 5.4 *Significant Habitat and Threatened or Endangered Species*

### 5.4.1 *Terrestrial Species*

The New York State Natural Heritage Program (NHP) maintains a database of rare plants and animals native to New York, as well as a listing of significant ecological communities within the state. DEC, Division of Fish, Wildlife and Marine Resources, Wildlife Resources Center, maintains the Natural Heritage Program files. A request for information on threatened or endangered species, other species of special concern, as well as special habitat areas in and within the vicinity of Ferry Point Park was submitted to NHP on 20 May 1999. NHP (Appendix E4, Mackey 1999) has no record of known occurrences of rare or state-listed animals and plants, or significant natural communities for the Ferry Point Park site.

NHP identified one significant habitat area near the site, a waterfowl wintering area that extends along the shoreline from the Bronx-Whitestone Bridge east to the Westchester County/Bronx County border.

The U.S. Department of the Interior, Fish and Wildlife Service (USFWS) is responsible for the management of federally listed, or proposed, rare, threatened or endangered species. A request for information on these species within the vicinity of the study area was submitted to the USFWS on 20 May 1999. The USFWS (Stilwell 1999, Appendix E4), reported that the peregrine falcon (*Falco peregrinus*), a formerly federally-listed, and State-listed endangered species, is known to breed in the vicinity of the proposed project. The USFWS delisted the peregrine falcon on 25 August 1999. According to

Barbara Loucks (1999), peregrine falcons are nesting at a distance greater than 1.5 miles from the eastern border of the site. The USFWS has requested that:

- the environmental documents associated with this project evaluate potential direct, indirect, and cumulative effects on the peregrine falcon or its habitat, and include appropriate measures, to protect this species and its habitat; and
- Final project plans and environmental documents be submitted to the Cortland, NY, USFWS office to determine the need for further consultation pursuant to Section 7 of the Endangered Species Act of 1973 (87 Stat. 884, as amended; 16 USC 1531 et seq.).

Except for the peregrine falcon, and occasional transient individuals, no other federally listed or proposed endangered or threatened species under USFWS jurisdiction are known to exist in the project impact area.

No peregrine falcons were observed during any of the site visits. One State-listed threatened species, a juvenile northern harrier (*Circus cyaneus*), was observed on the site during one of the site visits. Section 7.0 of this attachment discusses potential impacts to both of these species from the proposed project.

### 5.4.2 *Aquatic Species*

The federally and State-listed endangered shortnose sturgeon (*Acipenser brevirostrum*) is the only threatened or endangered fish species with the potential to occur in the vicinity of the Ferry Point Park site. On the basis of the information presented in Meylan and Sadove (1986), Gerle and Sadove (1996) and Morreale, et. al. (1992), four State-listed turtle species have the potential to occur in the vicinity of the site. These include the endangered leatherback sea turtle (*Dermochelys coriacea*), the endangered Kemp's ridley sea turtle (*Lepidochelys kempii*), the threatened loggerhead sea turtle (*Caretta caretta*), and the threatened green sea turtle (*Chelonia mydas*). Section 7.0 of this Attachment discusses potential impacts to these species from the proposed project.

## 6.0 *FUTURE CONDITIONS WITHOUT THE PROPOSED PROJECT*

Without the proposed project, the Ferry Point Park site will remain in its current condition. The existing terrestrial resources will generally remain unchanged, although there may be some changes in vegetation distribution due to natural succession. The area will probably continue to be used as a dumping ground for rubbish and debris, and as temporary shelter by the homeless. Should New York City conduct road improvement activities on Miles Avenue (along Woodland Area 11) adjacent to the eastern portion of the site, the amount of surface runoff draining to the ditch between the site and the road may be affected along with the vegetation lining the ditch. Road improvement

activities may also result in the loss of some of the vegetation on this part of the site. Widening of the road would probably necessitate piping of the ditched area, as part of the stormwater management plan.

With respect to aquatic resources, most current activities associated with the aquatic environment of the upper East River would be expected to continue unchanged from the existing conditions should Ferry Point Park not be developed as proposed. Non-point source runoff discharging to the river is not expected to differ substantially from the present in terms of quality and quantity. As there would be no large-scale actions proposed for the immediate area, water quality and the integrity of the biotic communities should remain intact.

Water quality in New York Harbor, including the upper East River, has been improving in recent years as evidenced by a decline in coliform bacteria, increases in DO concentrations, and decreases in floatable pollutants. Improvements in water quality have been attributed to a number of water pollution control actions, including the construction and upgrading of Water Pollution Control Plants (WPCPs), increased maintenance of sewage systems, increased capture and treatment of Combined Sewer Overflows (CSOs), and abatement of illegal discharges. The continuation of the City's water pollution control programs (e.g., the CSO Abatement, Floatables, Shoreline Survey, and Industrial Pretreatment Programs) should result in continued maintenance or improvement in overall water quality in the East River.

DEP will continue the Shoreline Survey Program, a physical shoreline inspection program, to identify damaged or improperly operating outfall locations as well as previously unknown or unidentified outfalls. Since 1989, this program has helped eliminate 1.5 million gallons per day of illegal discharges and has assisted in improving water quality in New York Harbor, including the upper East River.

The City's CSO Abatement Program will continue in the future. This program includes planning and implementing continued upgrades to WPCPs to provide the needed treatment capacity for increased capture of CSO effluent during storm events, thereby reducing the discharge of CSOs directly to the receiving waters. As part of the CSO Abatement Program, the City has implemented a Floatables Program to improve the capture of floatables and reduce their occurrence. It has been estimated that 95 percent of floatables (debris that floats on or below the water surface) originates from CSOs and storm sewers that convey street litter (DEP).

Floatables contribute to navigational interference, beach closings, and wildlife entanglement. A number of stationary booms, skimmers, and skimming vessels are in use and have noticeably improved the capture of floatables. Additionally, pilot studies are under way that include evaluation of swirl concentrators and pipe netting, as well as a successful pilot program that uses a capture tank and multi-net containment system to capture and remove floatables. Without the proposed project, it is expected that the future

upgrades and continuation of the various abatement programs will contribute to the overall improvement in water quality.

The municipal sewer and stormwater permitting program, administered by the New York City Industrial Pretreatment Program (IPP), will continue in the future. The program consists of intense screening of industrial discharges, monitoring and enforcement programs, and amendment of sewer use regulations. The overall intent is to monitor and control any additional flows or increased volumes to the WPCPs and CSOs, and to limit any factors that could potentially degrade water quality or the efficiency of the WPCPs. The program focus has been primarily on metals contamination and has resulted in an order of magnitude reduction in total metals contributions to wastewater between 1974 and 1995. The sewerage and stormwater permitting programs will continue to require industry and businesses to treat liquid wastes before they are discharged to the sewer systems, and will continue to be expanded in the future to include more industrial sources. Future efforts will target organic priority pollutants in wastewater discharges. As such, it can be expected that overall water quality will continue to improve in the future without the proposed project.

Aquatic communities including phytoplankton, benthic algae, zooplankton, benthic invertebrates and fish will continue to use the East River habitats much as they have in the past, and as they do now. The improvement in water quality observed in recent years should help maintain the stability of East River aquatic resources.

## *7.0 FUTURE CONDITIONS WITH THE PROPOSED PROJECT*

### *7.1 Potential Effects on Natural Resources*

This section describes potential changes to the existing natural resources based on the final site development plan, the turf management plan, and the plans for the waterfront and community parks.

#### *7.1.1 Vegetation Communities*

As with many development projects, much of the existing vegetation will be removed for the proposed public recreational facility. Because of the site's past use as a landfill, and its continued history of anthropogenic disturbance, no pristine native plant communities exist on the site—most of the site is dominated by invasive ruderal species that are typical of disturbed habitats. The area designated as the Urban Meadow 1 (mixed grass) community contains an unusual plant community for an urban setting, because it consists of grasses typically found in pastures. However, even this area is dominated by species that are not native to this region.

Although not pristine, the value of the ruderal communities found at Ferry Point must be assessed from an urban landscape perspective. These areas

provide a "green island" in an otherwise highly developed environment. Development of the site will require the removal of nearly all of the existing ruderal plant communities—they will be replaced with new plant communities that are typical of the more manicured landscapes of a golf course and urban park. Some of these new plant communities include a maritime grassland in the waterfront park along the East River, a 2.2-acre grassland habitat for an area along Schley Avenue, native grasses and trees associated with the golf course, and native and ornamental grasses and trees associated with the recreational area at the northeast corner of the site. In general, the concept is to create a naturally landscaped environment that is readily accessible to the general public. It is anticipated that grasses such as little blue stem (*Schizachyrium scoparium*), switch grass (*Panicum virgatum*) and Indian grass (*Sorgastrum nutans*) will be used in the grassland habitats.

Construction of the golf course, waterfront park, community park, and other structures included in the proposed action will, of necessity, require the removal of much of the existing vegetation in these areas, including approximately 350-400 trees with a dbh greater than 6 inches and numerous smaller diameter trees. Some of the woodlands along the periphery of the site, specifically Woodland Areas 2, 6, and possibly part of 11 will remain and be incorporated into the site design as buffer areas. Because these two woodlands contain large amounts of assorted debris and rubbish, they may be temporarily impacted during the removal of this material. Care will be taken to minimize damage to trees and other vegetation during removal of the debris and rubbish, and any ruts or other disturbance of the ground surface will be repaired. Other peripheral woodland areas will also be incorporated into the site design whenever feasible.

As part of the proposed action, a tree replacement program will be developed, in coordination with the licensee, to enhance existing woodlands communities on the site. At maturity, the new trees planted as part of the tree replacement program, and other vegetation planted as part of the proposed landscaping plan, will provide a greater diversity of plant communities than the ruderal plant communities currently existing on the site. Table 7.1 lists the vegetation proposed for the Ferry Point project as part of the landscaping plan.

The objective of this program is to first minimize the number of trees removed as a result of project development, and then to plant new trees selected with the goal of establishing a healthier and more diverse woodlands habitat. In planting of new trees, priority will be given to replacing trees onsite, followed by planting trees on the western portion of Ferry Point Park. With the planting of new trees, the tree planting program will ultimately result in higher quality vegetation communities and habitats than currently exist on the site.

### *7.1.2 Wetland*

Based on the current development plans proposed for the site, the three small, isolated wetland areas of low diversity will be filled. The total acreage of these

wetlands is 0.27 acres. The filling of these wetlands will be performed in accordance with Nationwide Permit No. 26 per a letter of authorization from COE. This permit allows for the filling of up to 0.33 acres of headwater or isolated wetlands.

### 7.1.3 *Terrestrial Biota*

As described in Section 5.2, excluding the open water habitat provided by the river, seven distinct habitat types were identified on site—two types of urban meadow, developed land, recreational land, urban woodland, emergent wetland, and estuarine intertidal flat. The urban meadow communities covered most of the site. Due to the disturbed nature of the site, the urban landscape in which the site is located, and the frequent intrusions of human activity, most of the species observed, or which may occur at the site, are habitat generalists or inquiline species. These species have adapted to a broad range of environmental conditions, and are tolerant of frequent human activities. None of these species represent a unique population that cannot be found elsewhere in the surrounding region.

As with many development projects, the removal of vegetation required for this project will result in an unavoidable loss of wildlife habitat. The development will result in the loss of nesting, den, loafing and feeding sites for various wildlife species. However, the wildlife using the portions of the site proposed for development tend to be common in the geographic region. These generalist species are broadly tolerant of changing environmental conditions and no long-term adverse impacts on these species (starling, mourning dove, house sparrow, and red-winged blackbird) are anticipated. The impact on the populations of many of the common generalist bird species that may inhabit the woodland areas such as mourning dove, blue jay and mockingbird, are anticipated to be short-term and transient, since some may relocate nearby in comparable areas (e.g., Soundview Park or Pugsley Creek Park), and since suitable replacement habitat for these species will become available as project landscaping matures. While many of the ring-necked pheasants will be affected by the construction of the proposed project, some that remain in the undisturbed areas of the site should be able to recolonize the altered portions of the site, where habitat is suitable. The maritime grassland proposed for the waterfront park and the grassland area to be constructed along Schley Avenue will provide suitable habitat for some of these displaced birds.

The American kestrel should continue to utilize the park for feeding or loafing. American kestrels use a variety of open to semi-open habitats such as farmland and urban habitats for nesting and foraging. Because kestrels nest in tree cavities and old woodpecker holes or cavities in banks and cliffs, as well as abandoned nests and nest boxes (Scott et al. 1977, Cade 1982, in Cooperrider et al. 1986), a nest box program for this species will be incorporated into

the final site plan to provide suitable nesting sites while the planted trees mature.

Smaller mammals will also be subjected to some degree of displacement as a result of habitat loss in the grassland areas, but are expected to repopulate the replanted areas.

While efforts will be made to preserve woodlands along the perimeter of the site, the proposed development will necessitate the removal of many, if not most, of the areas designated as woodland. Although most of the woodlands removed are relatively small and dominated by immature trees, these areas do possess some of the structural attributes needed to attract wildlife species. The loss of successional woodland will result in temporary losses to wildlife habitat. However, due to the relatively small size and fragmented nature of the woodlands, and the site's urban character, the wildlife inhabiting these areas are anticipated to be very common in the region. As previously stated, portions of these woodlands along the periphery of the site will be preserved as buffers. To compensate for the loss of trees, woody plants will be installed throughout the comprehensive golf facility, the waterfront park, and the community park. The establishment of woody vegetation will provide perching sites for birds. The incorporation of fruit and nut bearing trees and shrubs will also provide a source of food for mammals and birds. Therefore, it is concluded that impacts to wildlife species will be minimal, and in many cases, of a temporary nature.

As part of the redevelopment, four lakes/ponds and six vegetated dry detention basins are proposed. The creation of these water features will increase the diversity of habitat available to the wildlife of Ferry Point Park. To improve the aesthetic and wildlife elements of the proposed lakes/ponds, the vegetation around the ponds will be natural, including herbaceous, shrub and tree species, landscaped to provide occasional views of the water.

Another habitat on the site is the estuarine intertidal flat and the adjacent open waters of the East River. This area provides suitable habitat for nesting, loafing or feeding by a variety of birds. No development will occur within this riparian or tidal wetland habitats, therefore no adverse impacts are anticipated.

Potential impacts to both plants and wildlife communities could occur after site development, from indiscriminate, or excess use of harmful chemicals for golf course maintenance activities, resulting in uptake and potential bioaccumulation of these chemicals by plants and animals. The Integrated Golf Course Management Plan (IGCMP), as fully described in Attachment F and summarized in Section 7.3, incorporates measures to minimize pesticide use and avoid such impacts. The measures to reduce or avoid these risks are described in the IGCMP. This plan would eliminate any significant risks to plant and wildlife communities.

### 7.1.4 *Aquatic Biota*

The project should have no adverse impact to aquatic organisms inhabiting the East River. There are no project activities proposed along or in the East River that would directly affect organisms or their habitats. Activities associated with construction and maintenance of the golf course will occur away from the water, and will be separated from the East River by the public park. Pollutants in the form of suspended sediments, nutrients, pesticides, etc., that may be generated by golf course activities will be treated on-site, through a series of design BMPs, prior to any release of stormwater to the East River.

Modeling efforts (Attachment M) indicate that the stormwater management proposed for the project will ensure that stormwater discharges leaving the site will be of acceptable water quality. Furthermore, the IGCMP will ensure that the pesticides selected for use in this project will pose little risk to the aquatic biota. The rapid dispersion of these contaminants by the rather large East River current velocities will further minimize these risks.

The existing aquatic communities (phytoplankton, benthic algae, zooplankton, benthic invertebrates, and fish) will continue to use the East River habitats as they do now. As stated earlier, the water quality of the upper East River has improved significantly over the past 30 years. This improvement is a result of construction and upgrading of WPCPs, increased maintenance of sewage systems, increased capture and treatment of CSOs, and a variety of industrial pretreatment and abatement programs administered by DEP. Trends in dissolved oxygen and coliform bacteria concentrations are markedly improved. The improvement in water quality observed in recent years should help maintain the diversity and stability of the East River aquatic resources. It is therefore, extremely unlikely that project activities will have any adverse impacts on these resources.

### 7.1.5 *Significant Habitat and Threatened or Endangered Species*

Terrestrial Species

The peregrine falcon (State-listed endangered) and northern harrier (State-listed threatened) are the only two species of special concern known to occur on or adjacent to the project site.

The peregrine falcon is a medium-sized hawk with long pointed wings, that is one of the swiftest birds of prey. The crow-sized adults have slate blue-gray wings and backs barred with black, pale undersides, white faces with a black stripe on each cheek, and large, dark eyes. Although they live mostly along mountain ranges, river valleys and coastlines, some peregrines have accepted man-made structures such as skyscraper ledges, tall towers and bridges for breeding habitat in addition to the typical cliff ledge nesting habitat. Peregrines feed primarily on other birds—songbirds, shorebirds, and ducks, and starlings and pigeons in urban areas—striking and killing their prey in mid-air.

Although the peregrine falcon population reached an all-time low of 324 nesting pairs in North America, due to the negative impacts of DDT and its metabolites, the USFWS recovery plan resulted in an increase to 1593 nesting pairs in 1997. The peregrine falcon's recovery has been so successful that the USFWS removed it from the endangered species list on 25 August 1999.

The proposed public recreational facility will not affect the peregrine falcons located near or visiting the site. The project will not affect the current nesting site. In addition, it will not alter any aquatic habitats in the East River and therefore will not affect the presence of waterfowl, a common prey item for peregrine falcons. Once constructed, the golf course will provide sufficient habitat for the common urban species, starlings and pigeons, also consumed by the peregrine falcon. The Appendix to "Turf Management," Attachment F, describes the IGCMP's proposed measures to minimize potential impacts to the peregrine falcon's prey species, and to minimize potential toxicological impacts to this raptor.

During the wildlife survey, an immature male northern harrier (based the observation that the plumage of its underparts was distinctly darker than the white plumage of an adult bird) was observed feeding in the Urban Meadow 1 community. The northern harrier breeds and feed in grasslands and marshes. Its primary prey items include small mammals, reptiles or amphibians, and birds. The northern harrier is a common winter visitor to the New York metropolitan area. While nesting adults in the region are not common, nesting does occur on Long Island (Loucks 1999). The observation of one male juvenile northern harrier does not suggest that breeding is occurring on the site. Because the proposed Ferry Point Park project will not provide the large areas of grasslands or marshes that this species requires, the individual observed on the site may relocate elsewhere. However, since no signs of breeding were observed on the site during the four site visits, the existing northern harrier population in the vicinity of the site should not be adversely impacted.

Because the proposed project will not alter the existing waterfowl habitat adjacent to the site, the waterfowl wintering area identified by NHP will not be affected.

*Aquatic Species*

The project should have no adverse impacts to shortnose sturgeon. Shortnose sturgeon would not be expected to occur in the immediate vicinity of the project site—they prefer colder, deeper waters, and spawn, develop and overwinter well upriver in the Hudson. Fish that may pass through the portion of the East River near the site would be expected to use the deeper channel areas. Out of the 1000+ trawls taken in the Westway study in the Hudson and East River, only one shortnose sturgeon was collected, in the deep water habitat, near the Peekskill-Haverstraw section of the Hudson River (LMS 1983, Malcolm Pirnie 1984a and b). Long-term Hudson River monitoring

data, collected by the New York Utilities and others since the 1970's, have also indicated shortnose sturgeon inhabit deep water habitats, and occur in greatest abundance north of the Tappan Zee Bridge.

The project is also unlikely to have significant adverse impacts to any of the four listed species of turtles with the potential to occur in the vicinity of the site. Very few turtles would be expected to occur in the project area. New York turtles mostly inhabit Long Island Sound and Peconic and Southern Bays. They neither nest in the New York area, nor reside there year-round. With the exception of the leatherback, all individual turtles in New York waters are juveniles or subadults. They generally arrive in June and July and leave in October when colder temperatures force them to migrate south (Morreale and Standora 1995). Turtles that occur past November often become victims of cold stunning, which occurs on a regular basis (Meylan and Sadove 1986, Standora et al. 1989, Burke et al. 1990, Morreale, et. al. 1992).

Turtles leaving Long Island Sound for the winter usually do so by heading east to the Atlantic Ocean before turning south (Standora et al. 1990)—it is extremely unlikely that they would head west into East River, travel past Manhattan Island, and through New York Harbor on their southward migration. While it is possible that the loggerhead and even Kemp's ridley may occasionally reach the project area via New York Harbor, the leatherback and green turtle would not be expected to do so, due to the general lack of habitat for them in the East River. Given the paucity of sea turtles in the project area and vicinity, it is concluded that the Ferry Point project would have no adverse impact on these species.

The impacts to marine mammals are also not expected to be significant. These species are rarely observed from the project vicinity. Those that may occur in the area include the harbor seal, and possibly grey seal. Occasional sightings of porpoises in the Harbor are probably of individuals that are lost or unhealthy. Notable in the Summer of 1995 was the sighting of a manatee in the East River. The manatee, named Chessie by USFWS, was sighted traveling north into Long Island Sound (Brosnan and O'Shea 1995).

In summary, there should be no adverse impact to any aquatic threatened or endangered species inhabiting this region of the estuary. The reasons for this are as follows.

- There are no project activities proposed along or in the East River that would directly affect these organisms or their habitats.
- Aquatic threatened or endangered species are rarely encountered at the site, do not reside there for extended periods, and do not use the area for spawning or nursery grounds.
- Rapid flushing of the East River would disperse any contaminants that might leave the project site and be discharged into the East River.

## 7.2 *Measures to Minimize Adverse Effects During Construction*

Attachment A (Project Description), Attachment G (Hazardous Materials), Attachment F (Turf Management), and Attachment I (Infrastructure) provide information on proposed measures to minimize potential effects on natural resources during construction of the golf course and the two parks. Construction activities will abide by an approved erosion and sediment control plan and stormwater management plan to minimize the discharge of sediments to surface waters. The following measures are expected to be implemented during construction of the golf course to minimize potential impacts.

- Install protective fencing to define areas of existing vegetation that should not be disturbed.
- Establish designated sediment/erosion control infiltration areas to protect surface water features.
- Install temporary seeding or matting, silt fencing, hay bales, and filter fabric as necessary for erosion and sediment control until permanent vegetation is complete.
- Establish shoulders to direct surface runoff into the existing soils and undisturbed portions of the secondary roughs.
- Install fencing and silt barriers (filter fabric or straw bales) to identify construction circulation corridors through otherwise undisturbed areas within the golf course.
- Stabilize material not used as fill for topsoil, seeding and sodding.
- Designate construction equipment and employee entrances.
- Designate staging areas that minimally disturb existing vegetation for: employee parking, equipment parking, maintenance and fuel compound, storage of construction materials, and construction management offices and restrooms.
- Provide a list of equipment to be used on site throughout construction.
- Specify equipment to be used in removing trash and rubbish from the two woodlands that will be preserved, Woodland Area 2 and Woodland Area 6, that will minimize potential tree damage and disturbance of ground surface. All ruts will be restored and destroyed trees will be replaced with a suitable species, which will ultimately be of greater habitat value.
- Establish measures necessary to minimize dust emissions.
- During the initial phase of construction activities, if feasible, establish grassland habitat at the northern border of the golf course, south of the cemetery, to provide habitat for species such as ring-necked pheasant.
- Implement the tree replacement program described in Section 7.1.

- Ensure that contractors comply with regulations and any special requirements outlined in the Final Development Plan, including any special safety precautions that should be followed by workers during construction.

## 7.3 *Measures to Minimize Adverse Effects During Operation*

Attachment A (Project Description), Attachment G (Hazardous Materials), Attachment F (Turf Management) and Attachment I (Infrastructure) present detailed descriptions of measures that are expected to be implemented as part of the project design and operation. The following sections briefly describe these measures.

### 7.3.1 *Golf Course*

*Selection and Placement of Fill Material*

Attachment G describes the specifications for the fill material that will be transported to the site to create the comprehensive golf facility. The specifications for the fill material will meet the standards agreed to by DEC and the developer of the Ferry Point Park Project.

*Landscaping Plan*

A vegetative buffer with detention ponds will be planted between the golf facility and the waterfront park along the East River. This buffer will: enhance habitat and separate the golf course from the waterfront park, reduce floodplain erosion, enhance native shrub communities, and improve riparian habitat.

Within natural areas of the golf course, vegetation will be selected to complement the comprehensive golf facility while at the same time providing wildlife cover and forage. Trees will be planted where possible to compensate for those greater than 6-inch dbh lost to the development of the site. A few large diameter trees will be planted to provide kestrel perching sites. In coordination with DEC, kestrel nest boxes will be placed throughout the comprehensive golf facility at suitable locations.

*Creation of Lake and Vegetated Stormwater Detention Basins*

The four lakes (ponds) will be designed to meet stormwater management requirements, as well as to provide wildlife habitat. They will be vegetated along the edge to provide a diversity of natural plant cover including herbaceous, shrub and tree species, landscaped to provide occasional views of the water. The six detention basins proposed as part of the stormwater management system will be vegetated with wetlands plants suitable for areas experiencing periodic flooding, that will not interfere with the stormwater management function.

*Management Plan*

The IGCMP will adopt principles from *Golf & the Environment, Environmental Principles for Golf Courses (1996).* In addition to using low maintenance non-invasive turf-type grass, it will incorporate Best Management Practices (BMPs), including an integrated pest management (IPM) program to minimize potential effects on natural resources, as presented in the IPM Strategy and BMPs developed for the golf course (Attachment F).

The IPM is an interdisciplinary program that considers the merits of predominant pest control tactics and incorporates them into a single system to prevent unacceptable levels of pest damage. The control methods are designed not to eradicate pest populations, but to economically manage them while minimizing potential effects on people, the environment, and property. Pesticides are used in appropriate amounts, only after other measures of control have been considered and applied. The IPM focuses attention on monitoring soil nutrition so that specific fertilizers are applied during periods of maximum plant uptake. The objective of any IPM program is to reduce pest populations while keeping pesticide applications to a minimum (Erusha 1995).

In order to comply with the conditions outlined in the IGCMP, the Golf Course Superintendent and professional staff will be provided with the following resources:

- Expertise to make informed choices for managing and enhancing the vegetative buffers with native plants, and written BMPs that ensure wetland preservation and reduction of erosion.
- Access to consultants who will assist with the IPM program and maximize the results during the grow-in period.
- Availability of local ecologists to assist in making informed choices concerning native plants, opportunities for wetland creation, and habitat enhancement.
- Proper equipment and diagnostic tools for pest identification.
- Sufficient staff time to consistently monitor each management unit.

### 7.3.2 *Waterfront Park*

Landscaping Plan—Existing vegetation in the Waterfront Park will be removed, with the exception of a few trees, and replaced with indigenous vegetation to create a more diverse vegetation community. Kestrel nesting boxes and perching trees will be incorporated into the design where suitable.

### 7.3.3 *Community Park*

Landscaping Plan—Existing vegetation will be removed, with the exception of a few trees, and replaced with indigenous vegetation to create a more

diverse vegetation community. Kestrel nest boxes and perching trees will be incorporated into the design where suitable.

## Table 7-1

LANDSCAPE PLANT LIST

**New Deciduous Shade Trees:**

| | |
|---|---|
| Celtis occidentalis | hackberry |
| Nyssa sylvatica | blackgum |
| Plantanus acerifolia | london plane |
| Populus alba 'Bolleava' | poplar |
| Populus tremuloides | quaking aspen |
| Prunus serotina | choke cherry |
| Quercus alba | white oak |
| Salix acerfolia | willow |
| Sassafras albidum | sassafras |
| Tilia americana | american linden |
| Ulmus parvifolia | chinese elm |

**New Evergreen Trees:**

| | |
|---|---|
| Cupressocyparis leylandii | leyland cypress |
| Juniperus virginiana | eastern red cedar |
| Picea pungens | colorado blue spruce |
| Pinus densiflora 'umbraculifera' | tanyosho pine |

**New Evergreen Buffer & Screening:**

| | |
|---|---|
| Abies concolor | white fir |
| Berberis thunbergii | japanese barberry |
| Cupressocyparis leylandii | leyland cypress |
| Ilex glabra | inkberry |
| Juniperus chinensis | juniper |
| Juniperus virginiana | eastern red cedar |
| Picea abies | norway spruce |
| Picea pungens | colorado blue spruce |

**New Seasonal Understory (Minor Trees):**

| | |
|---|---|
| Amalanchier arborea | downy serviceberry |
| Amalanchier canadensis | shadblow |
| Amalanchier grandiflora | |
| Crataegus crusgalli | cockspur hawthorne |
| Crataegus phaenopyrum | washington hawthorne |
| Elaeagnus angustifolia | russian olive |
| Elaeagnus umbellata | autumn olive |
| Prunus maritima | beach plum |
| Prunus x cistena | purpleleaf sand cherry |
| Rhus typhina | staghorn sumac |
| Vibernum spp. | virburnum |

**Native Deciduous Shrubs:**

| | |
|---|---|
| Amelanchier canadensis | shadblow (shrub form) |
| Aronia arbutifolia | red chokeberry |
| Aronia melanocarpa | black chokeberry |
| Clethra alnifolia | summersweet |
| Cytisus scoparius | scotch broom |
| Ilex glabra | inkberry |

| | |
|---|---|
| Kalmia latifolia | mountain laurel |
| Myrica pensylvanica | bayberry |
| Rhododendron nudiflorem | pinxter flower |
| Rhus copallina | sumac |
| Rosa nitida | |
| Rosa Rugosa | beach rose |
| Rosa virginiana | wild rose |
| Rubus allegheniensis | northern blackberry |
| Salix nigra | black willow |
| Viburnum spp. | viburnum |

**Ornamental Shrubs:**

| | |
|---|---|
| Ligustrum ovalifolium | california privet |
| Lonicera tatarica | tatarian honeysuckle |
| Potentilla spp. | potentilla |
| Syringa vulgaris | common lilac |
| Tamarix africana | african tamarisk |
| Juniperus spp. | juniperus |
| Pinus mugo | mugo pine |
| Lavendula | english lavender |
| Rhododendron spp. | Rhododendron |
| Spirea spp. | spirea |
| Paeonia spp. | chinese peony |

**Tall Native Grasses/ Herbaceous Perennials:**

| | |
|---|---|
| Andropogon gerardii | big blue stem/ beard grass |
| Calamagrostis arundinacea 'Karl Foerster' | feather reed grass |
| Calamagrostis arundinacea 'overdam' | feather reed grass |
| Miscanthus spp. | maiden grass |
| Panicum virgatum | switch grass |

**Medium Meadow Grasses/ Herbaceous Perennials:**

| | |
|---|---|
| Ammophila breviligulata | dune grass |
| Andropogon scoparius | little blue stem |
| Carex morrowii 'aurea-variegata' | varigated japanese sedge |
| Erianthus ravennae | pampas grass |
| Hydrangea macrophylla | 'blue lace cap' |
| Hydrangea quercifolia | oak leaved hydrangea |
| Ophiopogon japonicus | mondo grass |
| Pennisetum spp. | fountain grass |
| Perovskia atriplicifolia | russian sage |
| Phalaris arundinacea picta | ribbon grass |
| Rhubus allegheniensis | northern blackberry |
| Solidago odora | sweet goldenrod |

**Low Native Grasses:**

| | |
|---|---|
| Cumptonia peregrina | sweetfern |
| Festuca ovina glauca 'Eijah Bue' | blue fescue |
| Helictotrichon sempervirens | blue oat grass |
| Imperata cylindrica 'rubra' | japanese blood grass |
| Limonium carolinianum | sea lavender |
| Liatris spicata | gayfeather |
| Potentilla | cinquefoil |
| Rudbeckia | black-eyed Susan |
| Echinaea purpure 'Bright Star' | purple coneflower |
| Coreopsis | tickseed |

| | |
|---|---|
| Hemerocallis | daylilly |
| Eupatorium maculatum | Joe Pyeweed |
| Koeleria cristata | junegrass |
| Ophiopogon japonicus nanus | dwarf mondo grass |
| Sisyrinchium angustifolium | blue-eyed grass (iris family) |
| Stokesia laevis 'blue danube' | stokes aster |

**Ground Covers: Grasses/ Herbaceous Perennials:**

| | |
|---|---|
| Arctostaphylus ura-ursi | bearberry |
| Epigaea repans | trailing arbutus (wild strawberry) |
| Festuca ovina 'glauca' | blue fescue |
| Viola pedata | birds-foot violet |

**Emergents:**

| | |
|---|---|
| Distichlis spicata | spike grass |
| Limonium carolinianum | sea lavender |
| Sparina patens | salt meadow cordgrass |
| Spartina alterniflora | smooth cordgrass |
| Spartina cynosuroides | big cordgrass |
| Typha angustifolia | narrowleaf cattail |

**Beach Grass:**

| | |
|---|---|
| Ammophila breviliqulata | beach grass |
| Artemisia stellerana | beach wormwood |
| Lathyrus japonicus | beach pea |
| Solidago sempervirens | seaside goldenrod |
| Solidago odora | sweet goldenrod |
| Spartina spp. | cordgrass |

**Pond Borders:**

| | |
|---|---|
| Carex crinita | fringed sedge |
| Carex lurida | shallow sedge |
| Carex spp. | sedge |
| Hibiscus palustris | marshmallow |
| Iris veriscolor | blue flag iris |
| Juncus effusus | soft rush |
| Leersia oryzoides | rice cutgrass |
| Saggittaria latifolia | arrowood |
| Scirpus americanus | swordgrass |
| Typha augustifolia | narrow-leaved cattail |

*Appendix E1*

*Plant Species Observed on the Ferry Point Park Site*

## *APPENDIX E1 Plant Species Observed on the Ferry Point Park Site*

The following is a list of vascular plant species identified at the Ferry Point Park site, Bronx County, New York City, New York. The community type where each species was observed is provided. Key to community types: RL - Recreational Land, DL - Developed Land, EF - Estuarine Flat, W - Urban Woodland, UM1 - Urban Meadow 1 (mixed grass community), UM2 - Urban Meadow 2 (Common Reed/ Mugwort Community) and EW - Emergent Wetland.

| Species Name Scientific | Common | Community Type |
|---|---|---|
| *Aceraceae* | | |
| Acer rubrum | Red maple | W |
| Acer platanoides | Norway maple | W |
| Acer saccharinum | Silver maple | W |
| Acer negundo | Box elder | W |
| *Anacardiaceae* | | |
| Rhus typhina | Staghorn sumac | UM1, UM2 |
| Toxicodendron radicans | Poison ivy | W |
| *Apocynaceae* | | |
| Apocynum sp. | Dogbane | UM1, UM2 |
| *Asclepiadaceae* | | |
| Asclepias syriaca | Common milkweed | UM1 |
| *Asteraceae* | | |
| Ambrosia artemisiifolia | Common ragweed | UM1,UM2 |
| Achillea millefolium | Yarrow | UM1 |
| Artemesia vulgaris | Mugwort | UM2 |
| Baccharis halmifolia | Groundsel tree | UM2 |
| Coreopsis lanceolata | Lance lvd. coreopsis | UM1 |
| Crysanthemum leucanthemum | Ox-eye daisy | UM1 |
| Erigeron annuus | Daisy fleabane | UM1, UM2 |
| Rudbeckia hirta | Black-eyed susan | UM1 |
| Matricaria matricaroides | Pineapple weed | UM1, UM2 |
| Solidago sempervirens | Seaside goldenrod | UM1, UM2 |
| Taraxacum officinale | Common dandelion | RL |
| Eupatorium maculatum | Joe-pye-weed | UM2, EW |
| Centuarea sp. | Knapweed | UM1 |
| Chichorium intybus | Chickory | UM1 |
| Xanthium strumarium | Cocklebur | UM1 |
| *Balsaminaceae* | | |

*Appendix E1 Continued*

| Species Name Scientific | Common | Community Type |
|---|---|---|
| Impatiens capensis | Jewelweed | EW |
| *Brassicaceae* | | |
| Lepidium virginicum | Pepper grass | UM1 |
| *Caprifoliaceae* | | |
| Lonicera japonica | Japanese honeysuckle | W |
| Lonicera | Shrub honeysuckle | |
| Sambucus canadensis | Common elder | UW1 |
| *Caryophyllaceae* | | |
| Lychnis alba | Evening lychnis | UM1, UM2 |
| Dianthus armeria | Deptford pink | UM1 |
| *Celastraceae* | | |
| Celastrus orbiculatus | Oriental bittersweet | W |
| *Chenopodiaceae* | | |
| Chenopodium album | Lamb=s quarters | UM1 |
| *Commelinaceae* | | |
| Tradescantia virginiana | Spiderwort | UM2 |
| *Convolvulaceae* | | |
| Convolvulus arvensis | Field bindweed | UM1 |
| Ipomea sp. | Morning glory | UM2 |
| *Cyperaceae* | | |
| Cyperus | Yellow nut sedge | EW |
| Eleocharis sp. | Spike rush | EW |
| Scirpus tabernaemontanii | Soft stemmed bulrush | EW |
| *Fagaceae* | | |
| Quercus palustris | Pin oak | W |
| Quercus phellos | Willow oak | RL |
| *Gramineae* | | |
| Agropyron repens | Quack grass | UM1 |
| Bromus tectorum | Downy cheese | UM1, UM2 |
| Bromus inermis | Smooth brome grass | UM1 |
| Dactylis glomerata | Orchard grass | UM1 |
| Festuca rubra | Red fescue | UM1 |
| Hordeum jubatum | Squirreltail grass | UM1 |
| Anthoxanthum odoratum | Sweet vernal grass | UM2 |

| | | |
|---|---|---|
| Panicum virgatum | Switch grass | UM1 |
| Poa pratensis | Kentucky blue grass | UM1 |
| Phleum pratense | Timothy | UM1 |
| Phragmites australis | Common reed | UM1, UM2, W |
| Spartina alterniflora | Saltwater cordgrass | EF |
| *Hypericaceae* | | |
| Hypericum perforatum | St. John's-wort | UM2 |

*Appendix E1 Continued*

| Species Name Scientific | Common | Community Type |
|---|---|---|
| *Juncaceae* | | |
| Juncus effusus | Soft rush | EW |
| Lauraceae | | |
| Sassafras albidum | Sassafras | W |
| *Fabaceae* | | |
| Coronilla varia | Crown vetch | UM1 |
| Medicago sativa | Alfalfa | UM1 |
| Melilotus officinalis | Yellow sweet clover | UM1 |
| Lathyrus latifolius | Everlasting pea | UM1 |
| Robinia pseudoacacia | Black locust | W, UM2 |
| Trifolium repens | White clover | RL, |
| Trifolium pratense | Red clover | UM1 |
| Trifolium arvensis | Rabbit=s foot clover | RL, UM1 |
| Trifolium procumbens | Smaller hop clover | UM1 |
| *Labiatae* | | |
| Glecoma hederacea | Ground ivy | UM1 |
| *Liliaceae* | | |
| Allium vineale | Field garlic | UM1 |
| Hemerocallis fulva | Day lily | UM2 |
| *Lythtraceae* | | |
| Lythrum salicaria | Purple loosestrife | EW |
| *Moraceae* | | |
| Morus rubra | Red mulberry | W |
| *Oleaceae* | | |
| Fraxinus americana | White ash | W |
| *Onagraceae* | | |
| Oenothera biennis | Common evening-primrose | UM1, UM2 |
| *Phytolaccaceae* | | |
| Phytolacca americana | Common pokeweed | UM2, W |
| *Platanaceae* | | |
| Platanus sp. | Sycamore | RL |

*Appendix E1 Continued*

| Species Name Scientific | Common | Community Type |
|---|---|---|
| *Plantaginaceae* | | |
| Plantago lanceolata | English plantain | UM1, RL |
| Plantago major | Common plantain | UM1, RL |
| *Polygonaceae* | | |
| Polygonum cuspidatum | Japanese knotweed | UM1, UM2, W |
| Polygonum persicarea | Lady's thumb | EW |
| Rumex crispus | Curly dock | UM1, UM2 |
| *Rosaceae* | | |
| Prunus serotina | Black cherry | W |
| Prunus avium | Sweet cherry | W |
| Rosa multiflora | Multiflora rose | W |
| Rosa rugosa | Rugose rose | UM1 |
| Rubus alleghaniensis | Allegheny blackberry | UM1, UM2 |
| *Rubiaceae* | | |
| Galium sp. | Bedstraw | UM2, W |
| *Salicaceae* | | |
| Populus deltoides | Cottonwood | W, UM2 |
| Salix nigra | Black willow | W |
| *Scrophulariaceae* | | |
| Verbascum thapsus | Common mullein | UM1 |
| Verbascum blattaria | Moth mullein | UM1, UM2 |
| Linaria vulgaris | Butter & eggs | UM1 |
| *Simarubaceae* | | |
| Ailanthus altissima | Tree-of-Heaven | W, UM1, UM2 |
| *Solanaceae* | | |
| Datura stramonium | Jimson weed | UM2 |
| Solanum dulcamara | Nightshade | W |
| *Tiliaceae* | | |
| Tilia sp. | Basswood | W |
| *Ulmaceae* | | |
| Ulmus americana | American elm | W |
| *Vitaceae* | | |
| Parthencissus quinquefolia | Virginia creeper | W |
| Vitis sp. | Wild grape | W |

*Appendix E2*

*Wildlife Species Observed on the Ferry Point Park Site*

*Appendix E2 Continued*

| Species Name Scientific | Common | Habitat |
|---|---|---|
| *Raptors* | | |
| Cathartes aura | Turkey vulture | UM1, UM2 |
| Accipiter striatus | Sharp-shinned hawk | UM1, UM2 |
| Accipiter cooperii | Coopers hawk | UM1, UM2 |
| Circus cyaneus* | Northern harrier | UM1, UM2 |
| Buteo jamaicensis* | Red-tailed hawk | UM1, UM2 |
| Falco sparverius | American kestrel | UM1 |
| Falco peregrinus | Peregrine falcon | IS, UM1, UM2 |
| Otus asio | Eastern screech owl | W |
| Asio flammeus | Short eared owl | UM1, UM2 |
| *Fowl* | | |
| Phasianus colchicus | Ring-necked pheasant | UM1, UM2 |
| *Doves* | | |
| Zenaida macroura | Mourning dove | RL, DL, UM1, UM2 |
| Columba livia | Rock dove | RL, DL, IS, UM |
| *Nightjars* | | |
| Chordeiles minor | Nighthawk | UM1, UM2 |
| *Swifts* | | |
| Chaetura pelagica | Chimney swift | UM1, UM2 |
| *Woodpeckers* | | |
| Colaptes auratus* | Northern flicker | W, RL |
| Picoides pubescens* | Downy woodpecker | W |
| *Kingfishers* | | |
| Ceryle alcyon | Belted kingfisher | ET, OW |
| *Passerines* | | |
| Myiarchus crinitus | Great-crested flycatcher | W |
| Contopus virens | Eastern wood pewee | W |
| Empidonax trailii* | Willow flycatcher | UM1, UM2, W |
| Hirundo rustica* | Barn swallow | UM1, UM2, OW, RL |
| Tachycineta bicolor* | Tree swallow | UM1, UM2, OW, RL |
| Tyrannus tyrannus | Eastern kingbird | W, RL |
| Cyanocitta cristata* | Blue jay | RL, W, |
| Corvus brachyrhynchos* | American crow | UM1, UM2, OW, RL |
| Corvus ossifragus | Fish crow | UM1, UM2, OW, RL |

## *APPENDIX E2* *Wildlife Species Observed or Likely to Occur on the Ferry Point Site*

### *BIRDS*

The following is a list of birds that were either observed or may be possible visitors or residents of the Ferry Point Park site. Key to habitat types: RL - Recreational Land, DL - Developed Land, IS - Intertidal Rocky Shoreline, W - Urban Woodland, UM1 - Urban Meadow 1 (mixed grass community), UM2 - Urban Meadow 2 (Common reed/ Mugwort Community), OW -Open water and EW - Emergent Wetland. Species observed during the site inspection are marked with an asterisk.

| **Species Name** Scientific | Common | Habitat |
|---|---|---|
| *Cormorants* | | |
| Phalacrocorax auritus* | Double crested cormorant | OW |
| *Wading birds* | | |
| Ardea herodius | Great blue heron | IS |
| Nycticorax nycticorax* | Black crowned night heron | IS |
| Egretta thula* | Snowy egret | IS |
| Casmerodius albus* | Great egret | IS |
| Plegadis falcinellus* | Glossy ibis | IS |
| *Waterfowl* | | |
| Branta canadensis* | Canada goose | OW, IS |
| Branta bernicla | Brant | OW |
| Anas platyrhynchos* | Mallard | OW, IS |
| Anas rubripes | American black duck | OW, IS |
| Althya ferina | Canvasback | OW |
| Aythya collaris | Ring-necked duck | OW |
| Aythya marila | Greater scaup | OW |
| *Bucephala albeola* | Bufflehead | OW |
| *Shorebirds* | | |
| Charadrius vociferus | Killdeer | IS, RL, DL, UM1 |
| Scolopax minor* | American woodcock | EW, W |
| *Gulls* | | |
| Larus argentus* | Herring gull | OW |
| Larus marinus* | Great black-backed gull | OW |
| Larus delawarensis* | Ring-billed gull | OW |
| Larus atricca* | Laughing gull | OW |

*Appendix E2 Continued*

*MAMMALS*

The following is a list of mammals that were either observed or may be possible visitors or residents of the Ferry Point Park site. Key to habitat types: RL - Recreational Land, DL - Developed Land, IS - Intertidal Rocky Shoreline, W - Urban Woodland, UM1 - Urban Meadow 1 (mixed grass community), UM2 - Urban Meadow 2 (Common reed/ Mugwort Community), OW -Open water and EW - Emergent Wetland. Species observed during the site inspection are marked with an asterisk.

| Species Name Scientific | Common | Habitat |
|---|---|---|
| Blarina brevicanda | Short-tailed shrew | UM1, UM2,W, RL |
| Scalopus aquaticus | Eastern mole | UM1, UM2,W, RL |
| Myotis leibii | Eastern small-footed myotis | UM1, UM2,W, RL |
| Lasionycteris noctivagans | Silver-haired bat | UM1, UM2,W, RL, DL |
| Pipistrellus subflavus | Eastern pipistrelle | UM1, UM2,W, RL, DL |
| Eptesicus fuscus | Big brown bat | W, DL, RL, UM1, UM2 |
| Sylvilagus floridanus* | Eastern cottontail | UM1, UM2 |
| Tamias striatus | Eastern chipmunk | UM1, UM2 |
| Marmota monax | Woodchuck | W, UM2 |
| Sciurus carolinensis* | Eastern gray squirrel | UM1, UM2 |
| Peromyscus leucopus | White-footed mouse | UM1, UM2 |
| Peromyscus maniculatus | Deer mouse | UM1, UM2 |
| Microtus pennsylvanius | Meadow vole | UM1, UM2 |
| Procyon lotor | Raccoon | W, UM1, UM2 |
| Mephitis mephites | Striped skunk | W |
| Rattus norvegicus | Norway rat | W, DL |
| Mus musculus | House mouse | UM1, UM2 |
| Didelphis marsupaialis | Opossum | UM1, UM2, W |
| Felis domisticus | Feral cat | UM1, UM2, W, RL, DL |
| Canis domesticus | Feral dog | UM1, UM2, W, RL, DL |

*Appendix E2 Continued*

| Species Name Scientific | Common | Habitat |
|---|---|---|
| Carduelis tristis* | American goldfinch | UM1, UM2 |
| Carpodacus mexicanus | House finch | UM1, UM2, RL |
| Parus bicolor | Tufted titmouse | W |
| Parus atricapillus | Black capped chickadee | W, RL |
| Sitta carolinensis | White-breasted nuthatch | W, RL |
| Troglodytes aedon | House wren | W, RL |
| Turdus migratorius* | American robin | W, RL, UM1 |
| Dumetella caroliniensis* | Gray catbird | W |
| Mimus polyglottos* | Northern mockingbird | W, RL |
| Toxostoma rufum | Brown thrasher | W, UM1, UM2 |
| Sturnus vulgaris* | Starling | UM1, UM2, DL, RL |
| Vireo griseus | White-eyed vireo | W |
| Dendroica petechia* | Yellow warbler | W, UM1, UM2, |
| Geothlypis trichas* | Common yellowthroat | W, UM1, UM2, |
| Cardinalis cardinalis | Northern cardinal | W, UM1, UM2 |
| Passerina cyanea | Indigo bunting | W, UM1, UM2 |
| Pipilo erythrophthalmus | Rufous-sided towhee | W |
| Spizella passerina | Chipping sparrow | W, RL |
| Spizella pusilla | Field sparrow | UM1, UM2 |
| Melospiza melodia* | Song sparrow | UM1, UM2,W, RL |
| Zonotrichia albicollis | White throated sparrow | UM1, UM2,W, RL |
| Junco hyemalis | Dark-eyed junco | UM1, UM2,W, RL |
| Agelaius phoeniceus* | Red-winged blackbird | UM1, UM2,W, RL |
| Molothrus ater* | Brown-headed cowbird | UM1, UM2,W, RL |
| Quiscalus quiscula | Common grackle | UM1, UM2,W, RL |
| Passer domesticus* | House sparrow | UM1, UM2,W, RL, DL |

*Appendix E2 Continued*

*REPTILES AND AMPHIBIANS*

The following is a list of reptiles and amphibians that were either observed or may be possible visitors or residents of the Ferry Point Park site. Key to habitat types: RL - Recreational Land, DL - Developed Land, IS -Intertidal Rocky Shoreline, W - Urban Woodland, UM1 - Urban Meadow 1 (mixed grass community), UM2 - Urban Meadow 2 (Common reed/ Mugwort Community), OW -Open water and EW - Emergent Wetland. Species observed during the site inspection are marked with an asterisk..

| **Species Name** Scientific | Common | Habitat |
|---|---|---|
| *Turtles* | | |
| Melanoclemys terrapin | Diamond-backed terrapin | IS |
| *Frogs and Toads* | | |
| Bufo woodhousei | Fowler=s toad | UM1, UM2 |

*Appendix E3*

# *List of Fish Species Found in the Lower Hudson River, East River, and Upper New York Bay*

*APPENDIX E3* ***List of Fish Species Found in the lower Hudson River, East River, and Upper New York Bay 1982-1994***

| Common Name | Scientific Name |
|---|---|
| Atlantic sturgeon | Acipenser oxyrhynchus |
| American eel | Anguilla rostrata |
| Conger eel | Conger oceanicus |
| Blueback herring | Alosa aestivalis |
| Hickory shad | Alosa mediocris |
| Alewife | Alosa pseudoharengus |
| American shad | Alosa sapidissima |
| Atlantic menhaden | Brevoortia tyrannus |
| Atlantic herring | Clupea harengus |
| Gizzard shad | Dorosoma cepedianum |
| Bay anchovy | Anchoa mitchilli |
| Rainbow smelt | Osmerus mordax |
| Inshore lizardfish | Synodus foetens |
| Oyster toadfish | Opsanus tau |
| Fourbeard rockling | Enchelypous cimbrius |
| Silver hake | Merluccius bilinearis |
| Tomcod | Microgadus tomcod |
| Pollock | Pollachius virens |
| Spotted hake | Urophycis regius |
| Red hake | Urophycis chuss |
| Atlantic cod | Gadus morhua |
| Cusk eel | Lepophidium cervinum |
| Atlantic silversides | Menidia menidia |
| Threespine stickleback | Gasterosteus aculeatus |
| Lined seahorse | Hippocampus erectus |
| Northern pipefish | Syngnathus fuscus |
| Mummichog | Fundulus heteroclitus |
| Striped killifish | Fundulus majalis |
| Banded killifish | Fundulus diaphanus |
| Atlantic needlefish | Tylosurus marinus |
| Grubby | Myoxocephalus aenaeus |
| Longhorn sculpin | M. octodecimspinosus |
| Black sea bass | Centropristis striata |
| Short bigeye | Pseudopriacanthis altus |
| Grey snapper | Lutjanus griseus |
| White perch | Morone americana |
| Striped bass | Morone saxatilis |
| Bluegill | Lepomis macrochinus |
| Bluefish | Pomatomus saltatrix |
| Crevalle jack | Caranx hippos |
| Lookdown | Selene vomer |
| Rough scad | Trachurus lathami |
| Silver perch | Bairdiella chrysura |
| Weakfish | Cynoscion regalis |
| Spot | Leiostomus xanthurus |
| Northern kingfish | Menticirrhus saxatilis |

***Appendix E3 Continued***

| Common Name | Scientific Name |
|---|---|
| Scup | Stenotomus chrysops |
| Spotfin butterflyfish | Chaetodon ocellatus |
| Striped mullet | Mugil cephalus |
| White mullet | Mugil curema |
| Blackfish | Tautoga onitis |
| Cunner | Tautogolabrus adspersus |
| Rock gunnel | Pholis gunnellus |
| American sandlance | Ammodytes americanus |
| Butterfish | Peprilus triacanthus |
| Northern searobin | Prionotus carolinus |
| Striped searobin | Prionotus evolans |
| Smallmouth flounder | Etropus microstomus |
| Summer flounder | Paralichthys dentatus |
| Four-spot flounder | Paralichthys oblongus |
| Windowpane | Scophthalamus aquosus |
| Winter flounder | Pseudophleuronectes americanus |
| Hogchoker | Trinectes maculatus |
| Planehead filefish | Monocanthus hispidus |
| Northern puffer | Sphoeroides maculatus |
| Atlantic croaker | Micropogonias undulatus |
| Atlantic mackerel | Scomber scombrus |
| Atlantic moonfish | Selene setapinnis |
| Goosefish | Lophius americanus |
| White hake | Urophycis tenuis |
| Tautog | Tautoga onitis |

Dear Ms. Collins:

In response to your recent request, we have reviewed the New York Natural Heritage Program databases with respect to the proposed Public Golf Course on a portion of Ferry Point Park, area as indicated on the map you provided. Site is located in the Bronx, New York City.

Enclosed is a report of rare or state-listed animals and plants, of significant natural communities, and of other significants habitats, which our databases indicate occur, or may occur, on your site or in the immediate vicinity of your site. The information contained in this report is considered sensitive and may not be released to the public without permission from the New York Natural Heritage Program.

For most sites, comprehensive field surveys have not been conducted; the enclosed report only includes records from our databases. We cannot provide a definitive statement on the presence or absence of all rare or state-listed species or significant natural communities. This information should not be substituted for on-site surveys that may be required for environmental impact assessment.

Our databases are continually growing as records are added and updated. If this proposed project is still under development one year from now, we recommend that you contact us again so that we may update this response with the most current information.

This response applies only to known occurrences of rare or state-listed animals and plants, of significant natural communities, and of other significant habitats. For information regarding regulated areas or permits that may be required under state law (e.g., regulated wetlands), please contact the appropriate NYS DEC Regional Office, Division of Environmental Permits, at the enclosed address.

Sincerely,

Teresa Mackey, Information Services
NY Natural Heritage Program

# USERS GUIDE TO NY NATURAL HERITAGE DATA

New York Natural Heritage Program, 700 Troy-Schenectady Road, Latham NY 12110-2400 phone: (518) 783-3932

NATURAL HERITAGE PROGRAM: The Natural Heritage Program is an ongoing, systematic, scientific inventory whose goal is to compile and maint on the rare plants and animals native to New York State, and significant ecological communities. The data provided in the report facilitate sound pl conservation, and natural resource management and help to conserve the plants, animals and ecological communities that represent New York's natural h

DATA SENSITIVITY: The data provided in the report are ecologically sensitive and should be treated in a sensitive manner. The report is for your ir use and should not be released, distributed or incorporated in a public document without prior permission from the Natural Heritage Program.

NATURAL HERITAGE REPORTS (may contain any of the following types of data):

COUNTY NAME: County where the occurrence of a rare species or significant ecological community is located.

TOWN NAME: Town where the occurrence of a rare species or significant ecological community is located.

USGS 7 ½' TOPOGRAPHIC MAP: Name of 7.5 minute US Geological Survey (USGS) quadrangle map (scale 1:24,000).

LAT: Centrum latitude coordinate of the location of the occurrence. Caution: latitude & longitude must be used with PRECISION (e.g. the location occurrence with M (minute) precision is not precisely known & is thought to occur within a 1.5 mile radius of the latitude/longitude coordinate

LONG: Centrum longitude coordinate of the location of the occurrence. See also LAT above.

PRECISION: S - seconds: location known precisely. (within a 300' or 1-second radius of the latitude and longitude given.
M - minutes: location known only to within a 1.5 mile (1 minute) radius of the latitude and longitude given.
G - general: location known to within a 5 mile radius of the latitude and longitude given.

SIZE (acres): Approximate acres occupied by the rare species or significant ecological community at this location.

SCIENTIFIC NAME: Scientific name of the occurrence of a rare species or significant ecological community.

COMMON NAME: Common name of the occurrence of a rare species or significant ecological community.

ELEMENT TYPE: Type of element (i.e. plant, animal, significant ecological community, other, etc.)

LAST SEEN: Year rare species or significant ecological community last observed extant at this location.

EO RANK: Comparative evaluation summarizing the quality, condition, viability and defensibility of this occurrence. Use with LAST SEEN and PRECISI

A-E = Extant: A=excellent, B=good, C=marginal, D=poor, E=extant but with insufficient data to assign a rank of A - D.
F = Failed to find. Did not locate species, but habitat is still there and further field work is justified.
H = Historical. Historical occurrence without any recent field information.
X = Extirpated. Field/other data indicates element/habitat is destroyed and the element no longer exists at this location.
? = Unknown.
Blank = Not assigned.

NEW YORK STATE STATUS (animals): Categories of Endangered and Threatened species are defined in New York State Environmental Conservati Law section 11-0535. Endangered, Threatened, and Special Concern species are listed in regulation 6NYCRR 182.5.

E = Endangered Species: any species which meet one of the following criteria:
1) Any native species in imminent danger of extirpation or extinction in New York.
2) Any species listed as endangered by the United States Department of the Interior, as enumerated in the Code of Federal Regulations 50 CFR 17.11

T = Threatened Species: any species which meet one of the following criteria:
1) Any native species likely to become an endangered species within the foreseeable future in NY.
2) Any species listed as threatened by the U.S. Department of the Interior, as enumerated in the Code of the Federal Regulations 50 CFR 17.11.

SC = Special Concern Species: those species which are not yet recognized as endangered or threatened, but for which documented concern exists for the continued welfare in New York. Unlike the first two categories, species of special concern receive no additional legal protection under Environments Conservation Law section 11-0535 (Endangered and Threatened Species).

P = Protected Wildlife (defined in Environmental Conservation Law section 11-0103): wild game, protected wild birds, and endangered species of wildlife

U = Unprotected (defined in Environmental Conservation Law section 11-0103): the species may be taken at any time without limit; however a license t take may be required.

G = Game (defined in Environmental Conservation Law section 11-0103): any of a variety of big game or small game species as stated in the Environmental Conservation Law; many normally have an open season for at least part of the year, and are protected at other times.

NEW YORK STATE STATUS (plants): The following categories are defined in regulation 6NYCRR part 193.3 and apply to NYS Environmental Conservation Law section 9-1503.

(blank) = no state status

E = Endangered Species: listed species are those with:
1) 5 or fewer extant sites, or
2) fewer than 1,000 individuals, or
3) restricted to fewer than 4 U.S.G.S. 7 ½ minute topographical maps, or
4) species listed as endangered by U.S. Department of Interior, as enumerated in Code of Federal Regulations 50 CFR 17.11.

T = Threatened: listed species are those with:
1) 6 to fewer than 20 extant sites, or
2) 1,000 to fewer than 3,000 individuals, or
3) restricted to not less than 4 or more than 7 U.S.G.S. 7 and ½ minute topographical maps, or
4) listed as threatened by U.S. Department of Interior, as enumerated in Code of Federal Regulations 50 CFR 17.11.

R = Rare: listed species have:
1) 20 to 35 extant sites, or
2) 3,000 to 5,000 individuals statewide.

U = Unprotected

V = Exploitably vulnerable: listed species are likely to become threatened in the near future throughout all or a significant portion of their range within the state if causal factors continue unchecked.

NEW YORK STATE STATUS (communities): At this time there are no categories defined for communities.

continued on next page

FEDERAL STATUS (plants and animals): The categories of federal status are defined by the United States Department of the Interior as part of Endangered Species Act (see Code of Federal Regulations 50 CFR 17). The species listed under this law are enumerated in the Federal Register vol. 5 pp. 39526 - 39527.

(blank) = No Federal Endangered Species Act status.
LE = The taxon is formally listed as endangered.
LT = The taxon is formally listed as threatened.
LELT = The taxon is formally listed as endangered in part of its range and threatened in other parts.
PE = The taxon is proposed as endangered.
PT = The taxon is proposed as threatened.
C1 = Candidate, category 1 - There is sufficient information to list the taxon as endangered or threatened.
C2 = Candidate, category 2 - The taxon may be appropriate for listing but more data are needed.
3A = The taxon considered extinct by the U. S. Fish and Wildlife Service (USFWS).
3B = The taxon is no longer considered taxonomically distinct by the USFWS and thus is not appropriate for listing.
3C = The taxon has been shown to be more abundant, widespread, or better protected than previously thought and therefore not in need of official
* = The taxon is possibly extinct.
** = The taxon is thought to be extinct in the wild but extant in cultivation.
Additional codes:
(C2NL) = Heritage code indicating that the taxon is a candidate in some areas, not listed in other areas.
(E/SA) = Heritage code indicating that the taxon is endangered because of similarity of appearance to other endangered species or subspecies.

FEDERAL STATUS (ecological communities): At this time there are no federal status categories defined for ecological communities.

GLOBAL AND STATE RANKS (animals, plants, ecological communities and others): Each element has a global and state rank as determined by Natural Heritage Program. These ranks carry no legal weight. The global rank reflects the rarity of the element throughout the world and the state ran the rarity within New York State. Infraspecific taxa are also assigned a taxon rank to reflect the infraspecific taxon's rank throughout the world.

GLOBAL RANK:

G1 = Critically imperiled globally because of extreme rarity (5 or fewer occurrences), or very few remaining acres, or miles of stream) or especially vu to extinction because of some factor of its biology.
G2 = Imperiled globally because of rarity (6 - 20 occurrences, or few remaining acres, or miles of stream) or very vulnerable to extinction throughout because of other factors.
G3 = Either rare and local throughout its range (21 to 100 occurrences), or found locally (even abundantly at some of its locations) in a restricted rang physiographic region), or vulnerable to extinction throughout its range because of other factors.
G4 = Apparently secure globally, though it may be quite rare in parts of its range, especially at the periphery.
G5 = Demonstrably secure globally, though it may be quite rare in parts of its range, especially at the periphery.
GH = Historically known, with the expectation that it might be rediscovered.
GX = Species believed to be extinct.
GU = Status unknown.

STATE RANK:

S1 = Typically 5 or fewer occurrences, very few remaining individuals, acres, or miles of stream, or some factor of its biology making it especially vul in New York State.
S2 = Typically 6 to 20 occurrences, few remaining individuals, acres, or miles of stream, or factors demonstrably making it very vulnerable in New York
S3 = Typically 21 to 100 occurrences, limited acreage, or miles of stream in New York State.
S4 = Apparently secure in New York State.
S5 = Demonstrably secure in New York State.
SH = Historically known from New York State, but not seen in the past 15 years.
SX = Apparently extirpated from New York State.
SA = Accidental or casual in the state.
SE = Exotic, not native to New York State.
SP = Element potentially occurs in the state but there are no occurrences reported.
SR = Reported in the state but without persuasive documentation.
SU = Status unknown.
TAXON (T) RANK: The T-ranks (T1 - T5) are defined the same way the Global ranks (G1 - G5) are but the T-rank only refers to the rarity of the subsp taxon of the species as a whole.
T1 through T5 = See Global Rank definitions above.
Q = Indicates a question exists whether or not the taxon is a good taxonomic entity.
? = Indicates a question exists about the rank.

OFFICE USE: Information for use by the Natural Heritage Program.

SIGNIFICANT HABITAT DATABASE REPORTS (Use of this database is slowly being discontinued as the data is integrated into Heritage databas

REPORT ID: Significant habitat file code.
NAME OF AREA: Site name where the significant habitat is located.
TYPE OF AREA: Type of significant habitat.
COUNTY/TOWN OR CITY: County and town where the significant habitat is located.
QUADRANGLE: Name of the USGS 7.5 minute topographic map where the significant habitat is located.
LATITUDE: Latitude coordinate (degrees, minutes, seconds) for the location of the significant habitat.
LONGITUDE: Longitude coordinate for the location of the significant habitat.

Ms. Sandra L. Collins
Senior Scientist
PBS&J
4201 North View Drive, Suite 302
Bowie, MD 20716

Dear Ms. Collins:

This responds to your letter of May 20, 1999, requesting information on the presence of Federally listed or proposed endangered or threatened species in the vicinity of the proposed public golf course at Ferry Point Park in the City of New York, Bronx County, New York.

The peregrine falcon (*Falco peregrinus*) is a Federally listed endangered species known to breed in the vicinity of the proposed project. This project's environmental documents should, therefore, include an evaluation of the potential direct, indirect, and cumulative effects of specific project-related activities on the peregrine falcon or its habitat, and include appropriate measures, if necessary, to protect this species and its habitat. When specific plans are identified, the plans and the results of the evaluation should be provided to this office to determine the need for further consultation pursuant to Section 7 of the Endangered Species Act of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.).

Except for the peregrine falcon, and occasional transient individuals, no other Federally listed or proposed endangered or threatened species under our jurisdiction are known to exist in the project impact area. Should project plans change, or if additional information on listed or proposed species becomes available, this determination may be reconsidered. A compilation of Federally listed and proposed endangered and threatened species in New York is enclosed for your information.

The above comments pertaining to endangered species under our jurisdiction are provided pursuant to the Endangered Species Act. This response does not preclude additional U.S. Fish and Wildlife Service (Service) comments under the Fish and Wildlife Coordination Act or other legislation.

This species is also listed as endangered by the New York State Department of Environmental Conservation (State). Project plans and the results of the evaluation discussed above should be coordinated with both this office and with the State. The State contact for the peregrine falcon is Mr. Peter Nye, Endangered Species Unit, Wildlife Resources Center, Delmar, NY 12054-9767 (telephone: [518] 439-7635).

Federally listed endangered and threatened marine species may be found near the project area. These species are under the jurisdiction of the National Marine Fisheries Service. You should contact Mr. Stanley Gorski, Habitat and Protected Resources Division, Area Coordinator, National Marine Fisheries Service, James J. Howard Marine Sciences Laboratory, 74 Magruder Road, Highlands, NJ 07732, for additional information (telephone: [908] 872-3037).

For additional information on fish and wildlife resources or State-listed species, we suggest you contact:

New York State Department
of Environmental Conservation
Region 2
47-40 21st Street
Long Island City, NY 11101
(718) 482-4900

New York State Department
of Environmental Conservation
Wildlife Resources Center - Information Services
New York Natural Heritage Program
700 Troy-Schenectady Road
Latham, NY 12110-2400
(518) 783-3932

National Wetlands Inventory (NWI) maps may or may not be available for the project area. However, while the NWI maps are reasonably accurate, they should not be used in lieu of field surveys for determining the presence of wetlands or delineating wetland boundaries for Federal regulatory purposes. Copies of specific NWI maps can be obtained from:

Cornell Institute for Resource Information Systems
302 Rice Hall
Cornell University
Ithaca, NY 14853
(607) 255-4864

Work in certain waters and wetlands of the United States may require a permit from the U.S. Army Corps of Engineers (Corps). If a permit is required, in reviewing the application pursuant to the Fish and Wildlife Coordination Act, the Service may concur, with or without stipulations, or recommend denial of the permit depending upon the potential adverse impacts on fish and wildlife resources associated with project implementation. The need for a Corps permit may be determined by contacting Mr. Joseph Seebode, Chief, Regulatory Branch, U.S. Army Corps of Engineers, 26 Federal Plaza, New York, NY 10278 (telephone: [212] 264-3996).

If you require additional information please contact Michael Stoll at (607) 753-9334.

Sincerely,

Mark W. Clough

**Attachment F: Turf Management**

## A. INTRODUCTION

The New York City Department of Parks and Recreation (DPR) has proposed to develop a public recreation facility, which includes a comprehensive golf facility, at the eastern portion of Ferry Point Park in the Bronx. The site is approximately 220 acres, and the golf facility will occupy approximately 195.5 acres. The site is at the north end of the Bronx-Whitestone Bridge and is mostly undeveloped and is underused. However, it is mapped parkland, and prime waterfront property with spectacular views of the Bronx-Whitestone Bridge, the Throgs Neck Bridge, the East River, and Manhattan.

The proposed public recreation facility includes a Jack Nicklaus-designed 18-hole golf course, a state-of-the-art Golden Bear Golf Center (including a driving range, chipping area, putting greens, etc.), a clubhouse building, boathouse grill restaurant, fine dining/banquet facility, waterfront park, community park, and maintenance building. Environmental & Turf Services Inc. (ETS) has been retained to develop a turf management program that has the goal of not significantly adversely affecting the environment (i.e., the turf chemicals will not negatively impact water quality and/or ecology), and a risk assessment whose results will be used to improve the management and/or the course design. Risk assessment is the process of carefully integrating turf chemical toxicity information with site-specific data relevant to exposure to potentially sensitive organisms. Specifically, the objectives of this study are as follows:

- Develop a state-of-the-art Integrated Golf Course Management Plan (IGCMP) for the golf course (see appendix to this attachment);
- Complete a risk assessment to evaluate the potential impacts of the proposed turf chemicals on surface water quality and the environment; and
- Use the results of the risk assessment to incorporate improvements into the management plan and/or the site design to protect water quality. This is the risk management phase. The submitted plans have the flexibility to include any of the future recommendations deriving from the risk assessment.

## B. INTEGRATED GOLF COURSE MANAGEMENT PLAN (IGCMP)

The appendix to this attachment contains the proposed IGCMP. The IGCMP is based on the latest principles of integrated pest management (IPM). Its basic philosophy can be expressed as follows: one minimizes the need for pesticides by growing turf quickly and keeping it healthy; the general focus is on controlling pests rather than eradicating them; and there are a wide range of techniques that can be applied to prevent and minimize pest damage. Following are some key illustrations of this holistic approach toward IPM and the judicious use of pesticides.

First, the IGCMP establishes pest infestation thresholds for application of mechanical, biological, cultural, and chemical methods of pest control (e.g., insecticides are not recommended for control of Japanese beetle grubs in fairways until their density equals or exceeds 8/square foot).

Second, much of the course area will be planted with bluegrass and turf-type fescues. This grass mix should reduce the need for fungicides and—to a more limited extent—insecticides and herbicides relative to many other possible turf varieties.

Third, proper use of fertilizers can reduce the use of pesticides. The nutrient potassium, for example, is used to strengthen the cell walls of the bentgrass in greens and tees, thereby potentially reducing the turf's susceptibility to disease, and the need for pesticides.

The IGCMP identified 46 weeds, 25 diseases, and 16 insect turf pests that are known to occur naturally in the New York/New Jersey metropolitan area. However, only 16 of these pests have been identified as "key" pests. Thirty-five pesticides have been identified for possible use against these pests during the first 5 years of golf course operation in a "worst case" scenario. Twenty-one pesticides will likely be needed sometime during the first 5 years if the proposed IPM program is adequately effective, and the actual number of pesticides used in any one year will likely be less than 12. These lists include several commercially available organic-based products. New organic products demonstrated to be safe and effective on cool season turfgrasses will be incorporated into the program as they become available.

## C. RISK ASSESSMENT AND MANAGEMENT

The risk assessment work is a three step process: the site visit and the gathering of relevant data; the evaluation of potential risks using conservative (protective) methods; and the identification of measures to be implemented if the analysis results reveal contaminants with the potential for significant adverse environmental effects. The plan is described in more detail below.

The site visit included observation of the existing drainage patterns and vegetation covers. Soil was sampled and analyzed for parameters relevant to pesticide and water retention. Other data were gathered and evaluated (e.g., intense rainstorm recurrence data and pesticide sorption properties). Lifetime drinking water Health Advisory Levels and Maximum Allowable Concentrations for aquatic organisms are also calculated during this phase.

The second step is the risk assessment. The procedure to be used is called the "dilution calculations" that have been successfully used in several other states including golf course projects in Pebble Beach, California and Fairfield, Connecticut. For the stormwater runoff risk assessment, the project area watershed will be divided into seven drainage basins (see Attachment I, "Infrastructure," Section 6.0, "Drainage"). The runoff curve number approach will be used to estimate runoff volumes following 2-year, 24-hour, and 10 year-return, 24- hour rain events (3.2 and 5 inches, respectively). Pesticide losses ranging from 0.5 percent to 5.0 percent will be "mixed" into the runoff drainage into the East River after passing through a number of best management practices (BMPs), including wet ponds and storm water detention facilities designed into the golf course. Potential impacts on aquatic organisms and the environment will be assessed.

The potential for pesticides to leach to the subsurface and discharge in interflow above the soil cap will also be assessed. The Attenuation Factor method will be used to estimate the fraction of pesticide lost below the root zone. This mass estimate will be "mixed" with the projected stormwater runoff to assess the overall potential for significant adverse impacts on the East River.

Risk management is the final phase. Any potential turf chemical impacts on environmental quality will be addressed by modifying the draft management plan, and/or the golf course design, as appropriate. The following protective measures/design improvements will be considered for incorporation into the site plan as appropriate. Such measures include:

- Turf Management. Concern about a limited number of pesticides may be addressed by using alternative pesticides and/or by restricting application methods or areas. Concerns about a larger number of pesticides may be addressed by the establishment of special management zones. Any turf management recommendations will be incorporated into the final IGCMP (see the section following this introduction).

- Civil Engineering/Drainage Plan. A comprehensive drainage plan is being developed with wet and dry detention to polish the quality of stormwater runoff before it reaches the East River. Additional areas of the course have also been designated (e.g., areas around the tee complexes) that can be planted with naturalized vegetation and that would receive stormwater runoff if the risk assessment indicates the need.

  If necessary, runoff collected in the numerous shallow drains throughout the course may also be pumped to certain detention ponds to ensure longer treatment. The overall expected average holding times in these areas is approximately 2 days. There are three ways this relatively long detention time can help improve runoff water quality before discharge to the East River. It removes sediments and the nitrogen, phosphorus, and pesticides bound to the sediments, and provides a medium to encourage microbial degradation of pesticides.

  Other options being considered are construction of grassy swales and percolation areas. The latter are locations that would contain a greens-type mix with a vegetated surface. Runoff would be conducted onto the surface. ❖

Executive Summary

## i.1 Tasks and Focus

This document, the Ferry Point Park Integrated Golf Course Management Plan (IGCMP), is a guide for the maintenance and operation of the Ferry Point Park Golf Course, an 18-hole course proposed as part of a mixed recreational development on prime waterfront property in the Borough of the Bronx.

The IGCMP represents a commitment by Ferry Point Partners, its professional golf course staff and its owners, to follow Best Management Practices in order to maintain an environmentally sensitive golf course, with a focus on preserving water quality. It is a guide for maintenance and operations to be followed during "grow-in" and long-term maintenance of the golf course. The IGCMP should be utilized in concurrence with other documents regarding the design, grading and construction of the golf course and appropriate practices for reducing potential environmental impacts.

## i.2 Best Management Practices and Integrated Pest Management

The Best Management Practices (BMPs) and Integrated Pest Management (IPM) strategies described have been shown to greatly reduce the use of fertilizers and pesticides. The primary means of controlling pests is biological, through growing turf under conditions that allow it to withstand pest attacks without chemical intervention. Chemicals are employed only if other cultural practices have failed to provide adequate controls, and then in minimal amounts. Some fungus diseases are ubiquitous and form the exception, requiring routine seasonal treatment irrespective of damage.

The Best Management Practices and Integrated Pest Management strategies described herein have been used successfully by more than 70 golf courses in varying climates around the world to reduce chemical use. A number of strategies contribute to this result:

- Selection of appropriate grasses to create a healthy sod capable of combating most pest infestations through biological means without chemical intervention. The grass types proposed in this report offer excellent adaptability and hardiness and emulate existing vegetation currently found on the site. The turf-type fine fescues offer excellent flexibility for managing turfgrass pests and will perform extremely well under the climate encountered on coastal New York;

- Establishment of tolerance levels for most pests, as opposed to eradication. No action is taken unless an infestation exceeds a stipulated threshold;

- Reliance on environmental and mechanical controls. For example, avoiding aerifier holes during moth egg-laying season can deny entry to armyworm *(Pseudaletia unipuncta)* and black cutworm *(Agrotis ipsilon)* larvae. Avoidance of phosphorus and potassium deficiencies can prevent or minimize the occurrence of take-all patch *(Gaeumannomyces graminis)* fungus disease;

- Understanding pest life cycles so that chemicals are applied when they will have maximum efficacy with minimal applications;

- Spot application of chemicals only as necessary;

- Installation of computerized sprinkler systems managed to replace water only as it evaporates or is absorbed by plants. This is the single most important strategy for reducing water consumption and eliminating surface run-off and leaching of chemicals into groundwater flows, while preventing fungus infections associated with damp conditions. In practice, 80% efficiency in matching evapotranspiration is achievable with advanced irrigation systems.

- Reduction of turf areas requiring a high level of maintenance. The irrigated turfgrass areas in this IGCMP consist of 47 acres of greens, tees and fairways, 11 acres of lakes where water levels will need to be maintained, and 71.3 acres of roughs that will receive irrigation primarily during the grow-in period.

The IGCMP for Ferry Point Park Golf Course voluntarily goes beyond traditional regulatory compliance levels. The New York State Cooperative Extension Service and the New York State Department of Agriculture will be consulted periodically about biological, parasitic or predator controls that could further reduce the use of chemical treatment.

On the strength of these and many other BMPs, the proposed Ferry Point Park Golf Course, even with maximum anticipated chemical usage (the "worst case scenario"), is not expected to have a significant adverse impact on groundwater or surface water.

## i.3 The Environmental Principles for Golf Courses in the United States

The IGCMP describes a set of voluntary principles that seek to produce environmental excellence in golf course planning and siting, design, construction, maintenance and facility operations. This document recognizes that both the principles and guidelines deliver solid environmental and sustainable ecological approaches for the golf course. The guidelines assume the project will go beyond traditional regulatory compliance. Most significantly, the principles promote environmentally sound golf courses as quality golf courses.

The project agrees to abide by and implement the recommendations contained within this IGCMP. The owners are committed to following the principles attached because of the project's goals of maintaining environmental stewardship and quality. Ultimately, this will result in a much improved landscape, more public recreational opportunities, an estimated 345 permanent jobs, and revenues for the Borough of the Bronx .

## i.4 Turf Management

The IGCMP describes how IPM will be used during the grow-in, development, and management periods of the golf course. Existing golf course superintendents were queried about fertilizer and irrigation practices and pest-related problems relative to the differing grass types and micro-climates that exist in and near coastal New York. ETS has identified the key pests and/or specific turf related diseases, weeds, and insects that will occur naturally. The IGCMP identifies 46 weeds, 25 diseases, and

16 insect turf pests that are known to occur in the New York/New Jersey metropolitan area. Seventeen of these are identified as key pests (seven weeds, six diseases, and four insects). Thirty-five pesticides have been identified for possible use against these 87 pests in the first five years of golf course operation in a worst case pest infestation scenario but only 21 pesticides may be needed if the IPM program is reasonably effective. We expect these pests to be the more significant issues facing the project during the early stages of development and we have developed a more likely use scenario of turfgrass chemicals illustrated on Table 29 in section V of this attachment.

## i.5 Pesticide Spill and Response Plan

In the event that a minor pesticide spill or leak resulting from the hoses or nozzles of the turfgrass sprayer is discovered, the equipment will cease to operate immediately. All safety containment valves will be closed and the emergency spill prevention materials (absorbent cloth designed to capture liquid materials) will be utilized to absorb spilled concentrations of pesticides or fertilizers that remain on or near the turfgrass sprayer. In the event that a leak has been discovered within the sprayer or tank itself, an auxiliary tank will be used as a transfer station to collect the remaining concentrations of chemical or fertilizer. For all areas outside of the buffer zones, the amount of spilled material will be allowed to drain in the crown and thatch layers of turfgrass. For those areas inside sensitive zones, should such a spill occur, the golf course staff will apply activated charcoal and detoxifying absorbent materials to neutralize and stabilize the spill.

A written discharge response plan will be part of the training provided to each employee at the golf course. The plan will conform to all applicable sections as defined by law. A copy of this plan will be readily available. The Police and Fire Departments will be notified that this document has been completed. The local Fire Department will be provided with a current copy of all chemicals and pesticides stored in the pesticide storage area. The Material Safety Data Sheets (MSDS) will be provided for each compound in the storage area. In the case of minimal discharge, employees will have the necessary protective equipment and clothing readily available. All hazardous materials will be disposed of through a licensed hazardous waste disposal firm.

## i.6 Maintenance Facility

The maintenance and storage facility will conform to the appropriate City building codes for bulk storage and hazardous waste. The Fire Department will be supplied with a copy of the floorplan and will be provided a copy of the access security code. The facility will be landscaped and designed to conform and blend with the rest of the project. An all-weather access road shall serve the maintenance building and provide emergency and service vehicle access.

In addition to storing golf course equipment, maintenance facilities are designed, developed, and installed as comprehensive integrated systems offering safety in the storage and handling of fertilizer and pesticide materials. Modern golf course facilities prove themselves in several ways, such as increased employee safety, reduced insurance rate growth, eliminated or significantly reduced costs and liability of both storage and disposal of waste residue, and ease and affordability of maintenance. The facility's design will have a significant impact on efficiency, annual maintenance spending and, ultimately, the quality of the golf course.

## i.7 Water Replacement Strategy

Increased irrigation will be necessary during the germination period and to successfully assist with quality control during the reestablishment process. After the establishment period, the proposed grassing plan will allow for a reasonable reduction in supplemental irrigation and provide excellent playing surfaces even in areas grown under droughty conditions. The maximum usage or peak water demand during the grow-in period is estimated at 612,400 gallons/day (gpd). This use rate would only be achieved if all 18 holes are grown-in simultaneously. Once the turf is established, the maximum usage is estimated at 408,267 gpd. This number was derived using the methods that form the basis for Table 31. Irrigation water will be supplied by the New York City water system, as is the case with other New York City Parks Department facilities.

## i.8 Summary

The IGCMP was developed based on the philosophy that the growth and maintenance of healthy turf will minimize the need for pesticides. The IGCMP has been developed for the grow-in, development and management period of the golf course, and offers a maintenance and conservation program suitable for protecting the environmental resources of the project.

It is intended to fulfill several functions:

- Adopt the principles of Golf & The Environment, Environmental Principles for Golf Courses (1996), the first product of a continuous dialogue among environmental and industry leaders managed by the Center for Resource Management, and Golf Course Superintendents' Association of America;

- Illustrate how Best Management Practices (BMPs) can be used during the design, construction and maintenance of the golf course;

- Restrict the planting of inappropriate species on the site and identify applicable Best Management Practices (BMP's) or source controls as Pre-design for Natural Resources Inventory and Evaluation. This is a source control for water quality enhancement through the use of Best Management Practices;

- Understand the differences between managing fertile soils with turf-type grasses and infertile soil complexes with graminoids, native plants and woody species. Identify where and how landscape design elements of the project may be supplemented, modified and/or better-focused to increase wildlife and ecological benefits of the overall project;

- Detail the management techniques and frequency of maintenance required for each of the proposed turfgrass and landscape types;

- Demonstrate a detailed plan for operating and maintaining the Ferry Point Park Golf Course in a safe, effective, and environmentally responsible manner;

- Use natural resources efficiently. Offer site-specific recommendations to the golf course on methods of designing and growing-in the golf course to reduce the need for pesticides and to minimize the impacts of management;

- Present alternative methods using Best Management Practices (BMPs) that will customize the IGCMP near special management zones, thus, reducing traditional forms of turfgrass chemical control;

- Provide a source of information to the golf course superintendent regarding current pest prevention controls and establish base line pest thresholds in accordance with IPM principles;

- Educate the reader on the basic concepts of Integrated Pest Management (IPM) and explain how these concepts will be put into practice within the scope of an Integrated Golf Course Management Plan (IGCMP); and

- Document outstanding development and management practices. Promote the understanding that environmentally sound golf courses are quality golf courses.

Chapter I

Project Overview and Site Description

## 1.1 Project Overview

The objective of the Ferry Point Park project is to transform an underutilized, potentially valuable parcel of property into a recreational development site for the residents of the Bronx Borough. The project proposes to rehabilitate a parcel of property along the East River which has reportedly been used as a sanitary landfill. Extreme caution is being utilized by the project development team to determine the potential hazards associated with the property and fill. Once the soil material is determined acceptable for building, the neglected site will receive a much needed face lift and become a world class public recreational urban park with a Jack Nicklaus design 18 hole golf course, state-of-the-art Golden Bear Golf Center driving range and teaching facility, and a white table cloth restaurant and catering facility, clubhouse, community waterfront park and community park.

This plan is designed to offer site-specific guidance to assist the golf course with a successful grow-in period and to provide sustainable long-term reductions in costs. Protocols are presented for managing existing, created and restored habitats. This document addresses potential risks to ground and surface water quality, and outlines feasible measures for reducing chemical use to levels which will not degrade water quality.

While aspects of the golf course design are conceptual pending final engineering design, the principles and obligations described in this IGCMP represent firm commitments. All final materials and procedures adopted, and final plans and construction drawings produced by the golf course architect and engineers will adhere to the principles presented herein.

This IGCMP adopts the principles from *Golf & The Environment, Environmental Principles for Golf Courses* (1996), the first product of a continuous dialogue among environmental and industry leaders (1995-present). *Golf and the Environment* is managed by the Center for Resource Management, and Golf Course Superintendents' Association of America.

## 1.2 Golf Course Description

The 18 hole golf course is being designed by Jack Nicklaus to accommodate players with varying skill levels. The site has striking views of the Whitestone and Throgs Neck bridges as well as the Manhattan skyline. In addition to architectural views, natural water and vegetation will be interspersed with the golf holes to produce a truly aesthetically pleasing experience for the players. The numerous views of Long Island Sound, the New York City skyline and natural habitats will be emphasized throughout the course in this challenging design. Vegetative buffers will be used to emphasize holes and provide a barrier to adjacent park uses.

Topography varies from low points along the East River and increases about 40 feet with gradual elevation changes. The par 72 course covers approximately 7000 yards from the championship tees and 5500 yards from the forward tees.

A site plan for the overall development is attached. This site plan shows irrigated turfgrass areas, and golf course amenities. Additional golf course details will be provided in the golf course routing plan figure.

## 1.3 Soils

On-site soil sampling was performed for the proposed project. For a more detailed discussion of site soil conditions, see Attachment G, "Hazardous Materials."

## 1.4 Water Use Issues

### 1.4.1 Water Supply and Storage Analysis

Increased irrigation will be necessary during the germination period and to successfully assist with quality control during the reestablishment process. After the establishment period, the proposed grassing plan will allow for a reasonable reduction in supplemental irrigation and provide excellent playing surfaces, even in areas grown under droughty conditions. The maximum usage or peak water demand during the grow-in period is estimated at 612,400 gallons/day (gpd). This use rate would only be achieved if all 18 holes are grown-in simultaneously. Once the turf is established, the maximum usage is estimated at 408,627 gpd. This number was derived using the methods that form the basis for Table 31.

### 1.4.2 Irritation System Specification and Capabilities

The golf course will install a computer controlled irrigation system to minimize over watering. The irrigation system will be a state-of-the-art (Toro® or RainBird® Maxi) linked to a DTN Weather Center Computer and Lightning Prediction System. The system will be engineered to water the entire golf course each night (unless raining) and to supply a minimum of 1" of water per week or as needed to meet turf demand.

The irrigation system will include an on-site weather station (in addition to remote wind, temperature and rain sensors) to track temperature, relative humidity, solar radiation, wind direction and speed, and precipitation. This data is read by the central computer, which computes local evapotranspiration and then adjusts the run time for each individually controlled sprinkler head to exactly match the evapotranspiration loss on a day-to-day basis. Soil moisture probes will be installed as needed to assure proper irrigation of various management areas.

The goal of computerized irrigation is to apply water at a rate which very closely matches evapotranspiration losses of the turf. By not adding water in excess of turf requirements, irrigation runoff or oversaturation and leaching can be avoided. In practice, 80% or higher efficiency in meeting this goal is achievable as opposed to 50% efficiency with conventional quick-couple systems.

The spacing of sprinklers will be designed to minimize surface runoff and avoid inadvertent drift. Field controls will be placed for maximum visibility. Valve-in-head sprinklers will be used with individual control wires linking each of the irrigation heads back to the field controllers. Heads on fairways and roughs can be paired at the controller on an average of two heads per station. Green and tee sprinkler heads will be operated individually. Greens will be irrigated with full and/or part-circle sprinkler heads to allow the superintendent to irrigate in a more efficient manner. This reduces disease potential and results in lower usage of pesticides. Quick coupler snap valves will be installed near native plant restoration areas to provide supplemental water during grow-in.

Irrigation will be limited to tees, greens, fairways, a portion of the driving range, and the primary roughs immediately adjacent to the fairways. Total irrigated area involves 47 acres of managed turf and 71.3 acres of rough. The final estimated water demand for the proposed irrigation uses is 45 million gallons per year.

### 1.4.3 Treated Wastewater

City water will be used for irrigation of the golf course. No reclaimed water will be used for irrigation.

## 1.5 Vegetation and Habitat

Native plant communities including riparian habitat and wetlands will be catalogued and mapped by regional biologists. No records or evidence of endangered, threatened, or sensitive plants have been found in the disturbed areas of the golf course as of this date.

Care has been taken in the design of the golf course to protect wetlands with significant setbacks. The golf course was arranged to improve upon the existing landscape, with significant views of the river, architectural structures and skyline. Wherever possible, the design will leave existing plant communities and vegetation in place and create roughs and buffers that require little or no supplemental water or fertilizer, and which are attractive in unmown conditions.

## 1.6 Wildlife

Designated wildlife habitats will not be altered by construction or normal maintenance. In addition, plant species have been chosen for the restored areas that will provide wildlife benefits such as cover or edible fruits and berries, and that create natural roosting and feeding grounds for birds outside the developed areas.

In order to assist the golf course maintenance department in addressing potential impacts from residential geese populations, we recommend considering the benefits of utilizing border collies to minimize damage that may result from uncontrolled populations. Border collies have proven to be the most efficient way in deterring geese without harm from grazing on the golf course.

## 1.7 Mitigation of Impacts During Construction

Ferry Point Park Golf Course will implement the following provisions prior to and during construction of the golf course:

- Install protective fencing and define areas of existing vegetation that should not be disturbed;
- Establish designated sediment/erosion control infiltration areas to protect surface water features (see drainage plan attached);
- Install temporary seeding or matting, silt fencing, hay bales, and filter fabric as necessary for erosion and sediment control until permanent vegetation is complete;
- Establish shoulders to direct surface runoff into the existing soils and undisturbed portions of the secondary roughs;
- Install fencing and silt barriers (filter fabric or straw bales) to identify construction circulation corridors through otherwise undisturbed areas within the golf course;
- Ensure that contractors comply with regulations and any special requirements outlined in the Final Development Plan;
- Stabilize material not used as fill for topsoil, seeding and sodding;
- Designate construction equipment and employee access entrance(s);
- Designate staging areas that minimally disturb existing vegetation for: employee parking, equipment parking, maintenance and fuel compound, storage of construction materials, (sand, gravel, irrigation materials, etc.), and construction management offices and restrooms; and
- Provide list of equipment to be used on site throughout construction.

## 1.8 Sediment and Erosion Controls

Sediment and erosion control systems will be described as part of the overall application. These drainage safeguards or biofilters are designed to protect water quality and will be engineered as part of a comprehensive erosion control plan. They are easily implemented, affordable and can provide effective filtration for drainage or leachate. Many of the recommendations by the U.S. Department of Agriculture, Natural Resource Conservation Service (NRCS), can be adapted for turfgrass use (Bottcher and Baldwin, 1986). The NRCS defines these areas within the following categories:

Wet Biofilters:

*Regulated runoff impoundment* - Detention with associated filtration through plant material within the basin prior to discharge. This is used to reduce runoff quantity and nutrient and pesticide discharge.

Infiltration Adsorption Areas:

*Land Absorption Areas* - An adequate land absorption area is provided for drainage or runoff of turf and impervious surfaces so that soil and plants absorb nutrients. This is part of the drainage plan, contour plan and water quality protection strategy attached with this IGCMP.

*Subsurface Drainage* - Infiltrated surface water, primarily from greens, will be filtered through existing soils and vegetative material.

Dry Biofilters:

*Supplemental Buffer Planting Area* - Planting vegetation to stabilize the soil and reduce erosion and runoff.

*Grassed Outlets* - A natural or constructed outlet is maintained with vegetative cover in order to prevent soil erosion and filter nutrients. Dry ponds and golf course fairways serve in this capacity.

If runoff occurs, it will be directed away from sensitive areas (the East River, shallow groundwater areas, wetlands, etc.) and into areas where infiltration can occur. The golf course drainage will optimize the removal of runoff from the playing surfaces while not causing a drainage problem on hydrologically connected areas. Slopes will be maintained within an average of 3 to 6 percent to allow the golf course to be playable while maintaining positive drainage.

## 1.9 Drainage

Drainage and Routing Plan maps will be used to detail specific golf course construction and grading documents for the drainage management plan. The drainage management plan will include the topsoil management plan, temporary sediment and erosion control plans, site specific drainage plan typicals, cut and fill plans, and supplemental lake construction details.

## 1.10 Water Features

During the construction phase and as part of the golf course design, Ferry Point Park Golf Course will incorporate approximately 11 acres of lakes and water features into the course layout. Views of Long Island Sound and the city sky-line will be interspersed with lakes and vegetation. A public waterfront park will be developed along the East River frontage and viewable from different areas of the course (Ferry Point Park Partners, 1997).

## 1.11 Golf Course Design

The Ferry Point Park Golf Course and Driving Range will be designed by Jack Nicklaus. The golf course elevation varies from 10 feet above sea level along the East River to 40 feet above sea level at the interior of the site. The 18 hole, par 72 course will offer both accessible golf to novice players and a challenging course for more advanced players. It has been designed to test the skill of the player while

providing stunning views of the architectural structures in the area and the natural beauty of Long Island Sound.

## 1.12 Duration of Project

The Ferry Point Park Golf Course is expected to be built over approximately 30 months in conjunction with the waterfront park, restaurant and other facilities associated with the overall project.

Chapter II

Best Management Practices and Integrated Pest Management

The Integrated Pest Management Strategy was developed by Environmental & Turf Services, Inc. It includes specific tolerance levels for each pest and specific remedies, including types and quantities of all chemical and other mitigation measures to be taken.

Some aspects of the Best Management Practices followed at Ferry Point Park Golf Course and the Integrated Pest Management strategies described in this document may change over time as improved management strategies are developed and new chemical products become available with lower toxicity, greater specificity, less persistence or less mobility. In these cases, the philosophy and goals described in this chapter will govern the adoption of the new methods. No changes will be made in the chemicals presented unless approved by the appropriate state and local agencies.

## 2.1 Legal Requirement of Best Management Practices

In the late 1970's and early 1980's, the U.S. Environmental Protection Agency (EPA) began to recognize the impacts of non-point source pollution on environmental quality. Congress responded by enacting legislation that required implementation of Best Management Practices (BMPs) by States and specific industries throughout the country. As the resulting Clean Water Act (CWA) regulations evolved, the EPA established a set of processes or procedures intended to better address non-point sources of pollution. Non-point source (NPS) pollution was not defined within the CWA; the EPA subsequently adopted regulatory definitions of NPS pollution as contamination caused by diffuse sources that are not regulated as point sources. These sources are typically associated with agricultural or silvicultural activities, runoff from construction activities and/or urban runoff.

Non-point source pollution does not result from a discharge at a specific location such as a single pipe but generally arises from land runoff, precipitation, atmospheric deposition, or percolation (Environmental Law and Policy, 1994). The EPA Office of Water Regulations and Standards' list of primary NPS pollutants includes nutrients, chemical fertilizers and pesticides, man-enhanced sediments, suspended solids, bacteria and microbial pollutants, oil and salts from roadways, and runoff from industrial and commercial sites. Sedimentation and sediment transport of other pollutants has been documented by EPA as the main source of non-point source pollution in the continental United States (1987 Water Quality Act:Section 208 Revised).

The EPA originally required area-wide waste treatment plans (Sect. 208 CWA, 1972) which eventually resulted in the demand for the creation of Best Management Practices to address non-point source pollution. According to EPA's definition, a BMP can be a structural measure, a process-based measure, or a combination of the two. In CWA 319, the states were further required to include methods of identifying BMPs and the inclusion of proposed BMP measures to reduce NPS pollution in assessment reports.

This section added the requirement that BMPs address ground water impacts as well as surface water concerns. Since 1987, EPA has recognized BMPs as an integral component of pollution prevention plans regardless of the environmental media involved.

## 2.2 Integrated Pest Management (IPM)

Integrated Pest Management (IPM) is an interdisciplinary program that considers the merits of predominant pest control tactics and incorporates them into a single system to prevent unacceptable levels of pest damage. The control methods are designed not to eradicate pest populations, but to economically manage them while minimizing possible effects on people, property and the environment caused by the mitigation steps taken.

IPM is a decision-making process for pest prevention and control. It does not eliminate the use of pesticides; rather it limits their use to appropriate amounts and to occasions only after other measures of control have been considered and applied. IPM provides flexibility that enhances environmental and economic factors while reducing the reliance on chemical controls.

IPM focuses attention on conducting and monitoring soil nutrition, making it possible to apply specific fertilizers during periods of maximum plant uptake. Soils analyses and plant tissue sampling results are often compared with the irrigation water quality results, helping to minimize the potential for sodium build-up in soils. This practice helps to reduce reliance on synthetic fertilizers and establishes an effective program for choosing traditional and/or slow release organic fertilizer supplements with low burn or leaching potential.

The IPM system requires the monitoring of pest populations so that when pest pressure exceeds the action level, an appropriate treatment may be implemented. The treatment may be one of a variety of control measures and must be tailored for each tee, green, fairway and rough. This strategic method of pest management provides a form of risk reduction and environmental control.

IPM programs are innovative ways of decreasing management costs and obtaining a more balanced and effective means to control pests. They are secured by management combining new thought processes with existing turfgrass technology. An important point to remember is that an IPM program does not preclude pesticide use, but seeks to reduce dependency on pesticides. The objective of any IPM program is to reduce pest populations while keeping pesticide applications to a minimum (Erusha, 1995).

Effective IPM rests on four basic principles:

- Prevention seeks to keep pests from entering the crops in the first place, thus stopping the problems before they arise;
- Suppression attempts to reduce pests below the level at which they would be economically damaging;
- Tolerance strives to accept certain pests whose presence, however minimal, may prove beneficial; and
- Resistance stresses the effort to develop healthy, vigorous strains of crops that will be resistant to certain pests.

## 2.3 Formation of an IPM Business Plan for Ferry Point Park Golf Course

The golf course offers significant opportunities for managing various plant communities and will feature low maintenance and non-invasive turf-type grasses. The IGCMP has been developed to assist Ferry Point in managing the golf course in an environmentally responsible way. The plan establishes management programs for the finely managed turfgrass and outlines the qualities necessary for managing the riparian environments of the East River. The Golf Course Superintendent and professional staff will be provided with the following resources:

- Expertise to make informed choices for managing and enhancing the vegetative buffers with native plants, and written BMPs that ensure wetland preservation and reduction of river bank erosion;
- Access to consultants, including permaculturist and native plant specialists, who will assist with the IPM program and maximize the results during the grow-in period;
- Availability of local ecologists to help make informed choices concerning native plants and opportunities for wetland creation and riparian enhancement;
- Proper equipment and diagnostic tools for pest identification; and
- Sufficient staff time to consistently monitor each management unit (tee, green, fairway and rough).

## 2.4 Field Monitoring and Control Systems

Field monitoring systems will provide the basis for developing thresholds and determining if action will be necessary to control a pest. The monitoring system should be simple, accurate and part of the daily regimen for turfgrass management, requiring no more than two hours per day. Each member of the monitoring team must thoroughly understand the potential pest species, including its phenology or life cycle.

Before any organism can be identified as a pest, an understanding is necessary of the role that beneficial organisms play. For example, a secondary pathogen may be a pest under certain conditions but might also provide a beneficial role in other turfgrass situations. Examples include *anthracnose-Colletotrichum graminicola* and dollar spot- *Scierotinia homoeocarpa* fungus which may help to eliminate the grass pest *Poa annua* in Kentucky bluegrass turf, and the beneficial microscopic nematode *Steinernema carpocapsae* which attacks turfgrass larval insects.

The importance of the pest will be noted on a scouting form and include the biological, cultural, environmental and physical factors that affect the presence of the species. This documentation will aid in identifying areas prone to repeated outbreaks. For example, an excellent time to observe mycelium is prior to poling the dew from the playing surfaces. The visible detection of sclerotia is a good indication of the potential movement of the pathogen into the host biotic tissue.

Salt content, pH and nutrient levels must also be monitored and properly managed. Healthy turf can resist, outgrow and recover from some pest and disease pressures. For this reason, the observation team will

note any visual reduction in turfgrass quality. The information obtained by thorough turfgrass surface monitoring will provide site-specific history and quantify levels for disease, insect and weed occurrences.

Detailed point sampling (counting the number of insects) will measure the density of the pest population relative to the damage on the area of turfgrass. This information will be used to fine tune the pre-determined threshold action levels for each management unit such as tees or greens (for pest thresholds, see Chapter IV, Section 5).

Because pest presence is so weather dependent, observation of pest populations for several years is necessary to develop a useful history of pest occurrences. It is expected to require at least three years to develop a comprehensive base-line of pest occurrence and thresholds of allowable pest damage. This site specific data base will be correlated with accumulated weather data to create a customized predictive planning tool. To assist the golf course superintendent in developing pest management strategies, the golf course will call upon regional and national turfgrass specialists in Integrated Pest Management as necessary, including the offices of the New York State Cooperative Extension Service and the New York State Department of Agriculture.

## 2.5 The Role of the Golf Course Superintendent

The Golf Course Superintendent has overall responsibility for implementing the IPM and BMP plan developed for Ferry Point Park Golf Course. He or she will see that a step-by-step plan is followed for measuring infestations and applying the most reasonable means to deal with potential pests.

The Golf Course Superintendents Association of America (GCSAA) was founded to professionally prepare future generations of golf course superintendents. The organization has assumed an environmental leadership role by offering Environmental Management continuing education programs. Superintendents who successfully complete the study requirements in a specialization receive a certificate from GCSAA. Ferry Point Park Golf Course will require the golf course superintendent to achieve GCSAA certification and focus on continuing education with IPM standards. Fewer than 25% of all active GCSAA members achieve certification and this requirement is intended to assure that Ferry Point's golf course superintendent is among the top ranked professionals in the field.

The Golf Course Superintendent will be assisted by qualified professional staff as required to maintain the course and equipment. Those who handle chemicals will obtain all certifications required by state or federal regulations. Collectively the Superintendent and staff will be responsible for:

- Definition of thresholds and appropriate responses for each management unit such as greens, tees, fairways, roughs and landscaped areas;
- Information gathering for both reporting purposes and refinement of future treatment regimes;
- Monitoring;
- Record keeping; and
- Treatment evaluation.

## Chapter III

## Turf Management and Non-Turf Areas

Integrated Pest Management starts with preparation of the golf course soils and the selection of grass cultivars optimized for the site. The growth of turf that is disease and pest resistant requires proper seeding and maintenance during the critical grow-in period, and an on-going program of soil testing and plant nutrition designed to meet the minimum needs of the turf while avoiding excessive or ill-timed applications of chemicals that would promote leaching into the water table.

### 3.1 Soils

Soil composition is the starting point for IPM at Ferry Point. Properly structured soil supports healthy turf that can crowd out undesired weeds during grow-in and fend off pest attacks with minimal chemical intervention. Soil composition also greatly influences the risks of ground water contamination from the transport of nutrients and/or pesticides.

Soils are comprised of a wide variety of mineral and organic complexes. Organics derived from decomposition of plant and animal matter are generally classified as humic and fulvic acids, and humin, based on their water solubility in terms of pH (MacCarthy et al., 1990). Both the organic matter and mineral complexes in soils function in cation exchange (CEC), pH buffering, and water retention. Though the organic component seldom is greater than 6% by dry weight of the soil, it contributes the most to each of these functions. A typical mineral fraction will have a CEC of 0.05 to 0.3 mol $kg^{1}$ whereas the organic component will range from 1 to 2 mol $kg^{1}$, depending on the pH buffering.

These and other characteristics contribute to the benefits of organic matter in soils by providing slow-release sources of N, P, and K useful to plants and organisms, as well as buffering soil pH. Microbial activity and heat retention are improved with increasing levels of organic matter compounds. These benefits combine to create healthy root development through improved nutrient availability.

Water quality is enhanced by organics in soils which provide a mechanism of binding, water retention and microbial degradation. These characteristics minimize the risk of leaching (Stevenson and He, 1990). Research also supports the critical role of ambient humidity on the fate of organic pollutants (Chiou, 1990).

### 3.2 Turfgrass Selection

Greens, tees, and fairways are planted with grasses that meet the requirements of the game and that also lend themselves to being managed in an environmentally sensitive manner. These playing surfaces require a high level of maintenance because of the need for the turfgrass to resist and recover from damage incurred during play and from close and frequent mowing. It is important to establish appropriate turfgrass for each playing surface (greens, tees, fairways, roughs).

The following criteria were used for deciding the appropriate turfgrass species for Ferry Point Park Golf Course:

- Climatological and soil conditions of the site
- Desirability for golf in the playing & environmental setting
- Drought tolerance
- Resistance to disease and insects
- Resistance to annual grasses and weeds
- Establishment in sunny and shady environments
- Winter recovery and tolerance to snowmold conditions
- Compatibility with other grasses including forbs and sedges
- Irrigation water quality
- Availability of seed that is clean of harmful pests and grown in accordance with good turf growing practices
- Total dissolvable salts (TDS)
- Tolerance to high salt conditions

### 3.2.1. Turfgrass Options and Characteristics

The golf course will be seeded with the Princeville and PennLinks bentgrass on tees and greens. Bentgrass was chosen as the most resistant to disease, insects and mites. Fairways will consist of a mix of fescues and bluegrass. The turf-types depicted in this report will allow the playing surfaces of the golf course to be managed with programs designed to limit cultivar segregation and reduce the potential for non-natives to become invasive. We believe the turf-types chosen and the open space buffers provided by the primary and secondary turf-types will protect these environments.

Bentgrass (*Agrostis L.)* includes about 125 species, five of which are used as turfgrasses, including creeping bentgrass (*Agrostis palustris, A. stolonifera*), colonial bentgrass (*Agrostis capillaris*), dryland bentgrass (*Agrostis castellana*), velvet bentgrass (*Agrostis canina*), and Redtop (*Agrostis alba, A. gigantea*). All of these are used extensively in turfgrass with the exception of Redtop (Turgeon, 1991). Table 1 describes four potential varieties and the differences that exist with each turf-type listed. It is the intent of Ferry Point Park Golf Course to use the most highly advanced state-of-the-art grass types available and to establish these surfaces with certified seed only. The project will continue to monitor results of the nationwide testing program (NTEP) for turfgrass and will choose the most highly advanced turf-types for establishment and grow-in, including nursery sod production.

Table 1. Characteristics of Bentgrass Turfgrass

| TURFGRASS SPECIES | OPTIMAL MOWING HEIGHTS | WEAR TOLERANCE | CHARACTERISTICS |
|---|---|---|---|
| Creeping bentgrass | 1/8" to ½"<br><br>New cultivars are more upright and require less nitrogen fertilizer.<br><br>Best height for fairways is between 7/16" to 9/16". | Excellent<br><br>May be used as a monostand or blended.<br><br>New varieties are extremely aggressive against *Poa annua*. | Medium to dark green<br><br>Excellent playing characteristics and recovery potential. Responds quickly to cultural practices. |
| Colonial bentgrass<br><br>Introduced from Europe. Highland developed in US. | 0.3" to 0.8"<br><br>Tolerates close mowing heights.<br><br>Similar environmental adaptation as creeping red fescue. | Adapts well in temperate-oceanic climates. | Dark bluish color.<br><br>Adapts to infertile soils and drought conditions. |
| Velvet bentgrass<br><br>Developed in Rhode Island | 0.2"to 0.4"<br><br>Forms very dense turfgrass but high cultural maintenance. | Restricted to temperate-oceanic climates. | High maintenance, limited availability. |
| Redtop | 1.5" to 2"<br><br>Coarse-textured, may be used as a nurse crop. | Does not respond to fertilizer or irrigation practices. | Found in grasslands. |

The re-vegetation of the primary and secondary roughs using non-native fine-leafed fescues are ideally suited on sandy soils and areas grown under droughty conditions. During summer drought, the fine-leafed fescues, even in dormancy, provide an excellent lie for golf balls. Both chewings fescue and red fescue perform best under droughty, sandy soil conditions with minimal nitrogen fertilization levels (Beard, 1982). Most turfgrass species evolved and were introduced from the cool-humid areas around the North Sea in Eurasia. These species include the bentgrass, fescue, bluegrass and orchard grass (Hanson & Juska, 1969). Turfgrass species, like all living things, respond to the environment, each species having a definite tolerance limit for environmental factors. It is climate that largely determines whether a turf species is suitable to the site conditions, but soil factors within a given climatic zone determine the extent of adaptation for specific turfgrass (Ward, 1969). A substantial amount of turfgrass is grown on land that is subject to reconstruction, using soils not native to the site, recycled wastes, or other soil substitutes.

Kentucky Blue and Fescue Turfgrass

Kentucky bluegrass (*Poa pratensis L.)* is a cool-season turfgrass with excellent recovery and wear qualities suitable for climatic conditions along the New York shore. Kentucky bluegrass provides very good pest resistance, contains performance standards that work well under different management programs such as the round management proposed for Ferry Point Park.

The most important characteristic of Kentucky bluegrass is that it produces rhizomes (underground creeping stems). The rhizomes produce a tightly knit sod that binds soil and creates sufficient crown surface area to recuperate from wear and droughty conditions. Thus, with limited thatch build up and proper mowing heights, Kentucky bluegrass will become more tolerant of cold winters and will outperform ryegrass and fescue. Prior to 1970, few Kentucky bluegrass cultivars were adapted to the close mowing height required on golf course fairways. More recently, a number of improved cultivars have been released which can be used in blends for best overall performance (Beard, 1982). Cultivars adapted to moderate cultural intensities include A-20, Adelphi, Baron, Bonnieblue, Cheri, Eclipse, Enmundi, Glade, Majestic, Parade, Rugby and Victa.

There are over 100 different species of fescue grasses. However, only six are commonly used as turfgrass. These are divided into two sub generic types based on leaf texture:

- The coarse fescue (including *Festuca arundinaceae*-tall fescue, *Festuca elatior or pratensis*-meadow fescue); and

- The fine fescue *(Festuca rubrea, trichophylla*-creeping red fescue and slender creeping fescue), (*Festuca rubra commutata*-chewings fescue and *Festuca ovina longifolia, Festuca ovina*-hard fescue and sheep fescue). (Turgeon, 1991).

Many of these low maintenance varieties contain turfgrass endophytes which provide resistance to surface feeding insects (sod webworm, cutworms) and have been linked to improved stress and disease tolerance. Once established these varieties tolerate minimal applications of nitrogen fertility. Fine fescue creates high-quality turf when maintained between 1"-2". Characteristics of Kentucky bluegrass and six fescue turfgrass cultivars are depicted in Table 2. Only three of the varieties are recommended and have potential use for the Ferry Point Park Golf Course: creeping red, chewings, and hard.

Tall fescue is a coarse textured, bunch-type species that has adapted to a wide range of soil and climatic conditions. Tall fescue forms a turf of low shoot density and does not blend well with other cool season grasses including red fescue. Poor quality seed may be contaminated with seed of other hay and pasture species, such as orchard and timothy, and ryegrass (Hanson, et. al., 1969). This fescue has a very aggressive nature that performs better at higher heights of cut and often spreads into areas that were not originally planned for seed. More recent studies have revealed that tall fescue contains the toxic funguses ergotamine and ergovaline. These studies have shown that fungus-infected tall fescue can cause sickness and low conception rates in livestock, rabbits and other small animals. Meadow fescue was used to some extent in pastures that were seeded with poor quality lawn seed. They have little value as a turfgrass. The grass grows satisfactorily on dry, sandy, gravelly or rocky soils. There are no varieties in commercial production. Tall fescue grows in a mat-like structure and does not produce the kind of vegetative structure required by small animals such as songbirds, rabbits, field mice, etc.

Table 2. Characteristics of Kentucky Bluegrass and Fescue Turfgrass

| KENTUCKY BLUEGRASS | OPTIMAL MOWING HEIGHTS | WEAR TOLERANCE | CHARACTERISTICS |
|---|---|---|---|
| pH of 5.0 or higher<br><br>Introduced from Europe during the Colonial Period | New cultivars 0.75 to 1.5"<br><br>Optimum: 1" or higher for most | Most adaptable cool-season turfgrass<br><br>Excellent wear and cold weather hardiness | Research continues to improve both hardiness and pest tolerance<br><br>Numerous cultivars for blending |
| **FESCUE SPECIES** | **OPTIMAL MOWING HEIGHTS** | **WEAR TOLERANCE** | **CHARACTERISTICS** |
| Creeping red pH: 5.5-6.5<br><br>Introduced from Europe during the Colonial Period | 1.5 to 2"<br><br>New cultivars have been sought to improve close mowing tolerances.<br><br>Strong creepers: Durlawn, Novarubra, Ruby<br><br>Weak creepers: Polar and Dawson | Low to Moderate<br><br>Intolerant of wet conditions and high fertility | Pennlawn for close- mowing<br><br>Arctared excellent low temperature hardiness;<br><br>low temperature discoloration results in a distinct reddish color. |
| Chewings pH: 5.5-6.5<br><br>Introduced from Europe during the Colonial Period. First cultivated in New Zealand | .5" to 2"<br><br>Chewings tolerates more closer mowing heights.<br><br>Similar environmental adaptation as creeping red. | Noncreeping, bunch-type grass. | Barfalla, Highlight, Koket and Jade for close mowing.<br><br>Jamestown for resistance to Fusarium patch. |
| Hard pH: 5.0 -6.5<br>Introduced from Europe | 2"-3"<br><br>Less drought tolerant, but more tolerant of moist, fertile soils than sheep fescue. | Noncreeping, bunch-type grass similar to sheep fescue. | Low maintenance |
| Sheep pH: 4.0 -8.5<br>Indigenous in Northern Hemisphere | 2"-3"<br>Well-drained, droughty, sandy or gravelly acid soils of low fertility. | Noncreeping, bunch-type grass with stiff, bluish green leaves. | Very low maintenance,<br><br>Not adapted to intensive culture. |
| Tall pH: 4.7-8.5<br><br>Indigenous to Europe. Introduced to America 1800's. | 1.5"-4"<br>Adapts to a wide range of soil conditions. Heat and drought stress tolerant. | Low to moderate.<br><br>Irrigation for survival and optimum growing quality. | Many fine-leafed provide high-quality turf<br><br>Low to moderate |
| Meadow pH: 4.7-8.5<br>Introduced from Europe during the Colonial Period | Similar to Tall Fescue | Less persistent under drought and heat stresses | Found in grasslands |

Table 3 provides the proposed square footage for each playing surface on the golf course and proposes cultivars for each area of play.

Table 3. Turfgrass and Total Square Foot Estimates for Ferry Point Park

| Area/Use | Grass Type | Acreage | Square Footage |
|---|---|---|---|
| Tee Surface & Practice Tee | Princeville Creeping Bentgrass | 5.88 | 256,133 |
| Fairway Surface & Collars & Practice Range | 10% Shadow Chewings Fescue<br>15% Defiant Hard Fescue<br>25% Wildwood Kentucky Blue<br>25% Shamrock Kentucky Blue<br>25% Challenger Kentucky Blue | 36.60 | 1,594,296 |
| Greens Surface/Practice Green (Includes Aprons) | PennLinks Creeping Bent | 4.52 | 196,891 |

| Total Irrigated Turfgrass | N/A | 118.3 | 5,153,148 |
| Total Property Acreage | N/A | 160.00 | 6,969,600 |

Table 4 lists the proposed cultivars of grasses in each area of play and the recommended seeding rates for the blended turfgrass mix. The fescue and the bluegrass proposed lists several potential available cultivars for use. Only seed certified for use in New York will be sown.

Table 4. Grassing Specifications

| Playing Surface | Turf Types | Recommended Seeding Rates |
|---|---|---|
| Tees | Princeville Creeping Bentgrass | 90 lbs./ac<br><br>4-5 lbs/1,000 $ft^2$ or 170 lbs./ac |
| Fairways | 10% Shadow Chewings Fescue<br>15% Defiant Hard Fescue<br>25% Wildwood Kentucky Blue<br>25% Shamrock Kentucky Blue<br>25% Challenger Kentucky Blue | 4-5 lbs/1,000 $ft^{2f}$ or 170 lbs./ac |
| Primary Roughs | 10% Shadmark Creeping Red Fescue<br>20% Shadow E Chewings Fescue<br>20% Merit Kentucky Blue<br>25% Shamrock Kentucky Blue<br>25% Baron Kentucky Blue | 4 lbs/1,000 $ft^2$<br>170 lbs./ac |
| Secondary Roughs | 10% Shadmark Creeping Red Fescue<br>20% Shadow E Chewings Fescue<br>20% Merit Kentucky Blue<br>25% Shamrock Kentucky Blue<br>25% Baron Kentucky Blue | 4 lbs/1,000 $ft^2$<br>170 lbs./ac |
| Native Areas | Fescue, Forbs/Maritime | 0.10-10.00 lbs/1000$ft^2$ |
| Putting Green | PennLinks Creeping Bentgrass | 90 lbs./ac |

Seed that is purchased shall be labeled in accordance with the United States Department of Agriculture and Regulations under the Federal Seed Act and Association of Official Seed Certification Agencies (AOSCA). The owner or owner's representative will have the right to reject any seed not meeting the design specifications.

## 3.3 Establishment of Playing Surfaces

The grasses for the specific playing areas summarized in the previous tables were chosen for their individual characteristics:

- **Tees and Greens.** Tee surface areas will be seeded with 100% Princeville Creeping bentgrass and greens will be re-established with PennLinks Creeping bentgrass.

- **Fairways.** Fairway re-establishment will consist of a blend of 10% Chewings fescue, 15% Defiant Hard fescue, 25% Wildwood Kentucky bluegrass, 25% Shamrock Kentucky bluegrass, and 25% Challenger Kentucky bluegrass.

- **Primary and Secondary Roughs.** These areas will be re-established with a blend of Creeping red and Chewings fescue (30%) and Merit, Shamrock and Baron Kentucky bluegrasses (70%).

- **Native Areas.** Natural areas altered by construction may be revegetated using local vegetation, depending upon plant quality and design considerations. Otherwise they will be re-established using a combination of native species mixed with other desirable plant communities to enhance the overall quality of the site for aesthetic and wildlife uses. Certain species will be propagated while others will be placed.

## 3.4 Soil Test Results and Plant Nutrient Recommendations

### 3.4.1 Added Nutrients During Pre-Plant or Grow-in

At Ferry Point Park, soil surface pH values are in the range of 7.7 - 8.0. Before seeding, additional site-specific soil tests will be performed to determine the appropriate amount of preplant nutrients. The amount of soil nutrients required assumes the material will be incorporated into the top 6" soil surface prior to seeding. Once the soils have been blended and/or graded, they will need additional tests in order to determine the appropriate amount of elemental sulfur, calcium or limestone.

The golf course will conduct a phosphorus saturation test on the soils after fine grading is complete in order to establish the amount of phosphate-phosphorus ($P_2O_5$) that should be applied within the soil prior to seeding. The intent will be to release 10 lbs/ac of available phosphorus. This will enhance cool season grass germination. The amount of preplant $P_2O_5$/ac will remain the same regardless of the tilled depth of the soils. Phosphorus is relatively immobile when applied to the surface of either soil or turf because it binds to aluminum and iron in the soil.

As with phosphorus, nitrogen is needed during the grow-in phase to help promote rapid turfgrass cover. An initial application of 1.5 lb of N/1,000 $ft^2$ with a 2-to-1 ratio of nitrogen to potassium is proposed. On soils with low organic matter, as much as 2 lbs of N/1000 $ft^2$/yr can be tied up in the soil organic fraction that will initially be unavailable to the plant (Petrovic, 1990). Therefore, more nitrogen must be applied in the grow-in phase than on established golf courses to aid in plant maturation and to compensate for loss (conversion to an unavailable form) to the soil. Frequent, lower rate applications of nitrogen containing fertilizers are important during the grow-in phase to provide optimal levels of plant-available nitrogen without losses to leaching.

In addition to soluble nitrogen, approximately 125 lbs/acre of a water insoluble nitrogen source (i.e., IBDU,) will be applied prior to seeding. This will provide an additional .75 lbs of nitrogen while the cotyledons are taking root. The aim is to allow a readily available source of nitrogen to be absorbed by the plants while they are rooting in order to gain establishment within the first 7-21 day period.

To stimulate rapid establishment and lateral movement of the fescue seedlings, fertilizer feedings should begin the third week following seeding. They should continue during the next 5-7 week period and be timed to match turf uptake capabilities. It is during this time that soils are typically deficient of materials necessary for adequate plant growth.

### 3.4.2 Fertilizing of Putting Green Surfaces

Specific finish grading plans and greens mix material specifications will be provided to the general contractor. All sand materials used in the construction of the greens profile will be sent to a certified USGA greensmix laboratory. Putting green surfaces shall be compacted and smoothed to meet the blending operations and design grades detailed in the construction documents.

The contractor will work 10 lbs/1000 square feet of 19-26-5 fertilizer (N-P-K ratio) into the top three inches of the putting green surfaces, thoroughly mixing by discing or rotovation. This material must be a fine particle, chemically homogeneous product having a minimum of 75 % of the total nitrogen derived from urea and methylene urea plus a minimum of 26% monoammonium phosphate or equal. No lime or sulfur shall be applied to putting surfaces unless directed by the Golf Course Superintendent after the approved greens mix has been tested for existing pH.

Before seeding, the contractor will apply and work into the top two inches of the greens mix, the following biostimulants and nitrogen fertilizers at the specified rate per thousand square feet of putting surface:

- 10 pounds of magnesium sulfate (epsom salts);
- 10 pounds of milorganite fertilizer;
- 11 pounds of POLY-S coated urea;
- 80 pounds of Sand Aid (see 4.7.2 Biostimulant/Stress Management Materials); and
- 20 pounds of Pro Turf STEP manufactured by O.M. Scott & Sons Co. (or an approved micro-nutrient supplement).

The golf course will conduct additional soil audits to evaluate the final soil profiles. The tests will reveal any additional soil nutrients necessary at preplant without exceeding the loading limits or cation exchange capacity of the existing soils. The soil tests will be performed prior to seeding to determine nutritional needs of nitrogen, phosphorus, potassium (N,P,K), base saturation, and extractable minors. These tests and amendments will be performed in order to obtain a soil pH range of 6.5-6.8 for all of the golf course tee, fairway, green, and primary rough playing surfaces.

Additional applications of soluble micro-nutrients (ProTurf STEP or other suitable micronutrients) may be required during establishment and maturation, and shall be applied by the contractor at the direction of the golf course consultant working directly with the golf course superintendent and the designer/architect.

Starting approximately four weeks after germination, fertilization should begin using weekly, alternate applications of Lesco green fertilizer and Lesco starter fertilizer. The minimum rate of application shall be one-half pound of nitrogen per one thousand square feet. This schedule should be seen as flexible and will be adjusted by Mr. David McIntosh of Golfturf and Jack Nicklaus Design, as deemed necessary.

### 3.4.3 Fertilizing Established Turf

Golf courses can be managed so that nitrates from fertilizers do not impact ground water supplies if they avoid over-watering and over-fertilization (Petrovic, 1990). Nearly 50% of the nitrogen fertilizer applied to turfgrass is assimilated by the plant. Much of the remaining fraction is stored in the soil and/or released to the atmosphere. Thus, there is a very limited amount of fertilizer nitrogen remaining that can be leached into ground water or transported as runoff into surface water. Leaf tissue analysis will be conducted annually during the peak growing season to determine the need for nitrogen. The implementation of a precision fertility program as part of the IPM plan helps minimize the risk of increasing nitrate/nitrogen concentrations in ground and surface water.

When research has shown nitrate leaching from turfgrass areas, it also reveals that fortunately, the leaching can be controlled by best management practices (e.g., Cohen, et al., 1990). Excessive leaching most often occurs when excessive amounts of highly water-soluble nutrients are used and/or highly water-soluble nitrogen sources (urea, ammonium nitrate, calcium nitrate, ammonium sulfate, or potassium nitrate) are applied at inappropriate times and rates. The problem is exacerbated when water soluble fertilizers are applied to turf in dormant or semi-dormant states, or when excessive irrigation or unexpected heavy rains follow fertilization. The course's management will avoid these conditions through leaf tissue analysis, timing of applications, and attention to weather forecasts.

Research into high sand content sites, such as golf greens, reveals that properly managed putting surface areas are not prone to heavy nitrate leaching. This is especially true with lower nitrogen application rates and increased use of slow release nitrogen sources. Slow release nitrogen sources require microbial activity or hydrolysis to convert the nitrogen to a form available to the plant. When soluble nitrogen sources are used, the potential for ground water contamination can be eliminated by matching applications to plant uptake. For example, a study done by Morton, et al., 1988 addressed the influence of irrigation and fertilization on nitrogen losses from turf on a sandy loam soil. The authors concluded normal fertilization and irrigation on a mix of cool-season turfgrasses resulted in nitrogen losses no different from the unfertilized controls. Another study (Snyder, et al., 1984) also observed that controlling irrigation reduces the potential for nitrate leaching to very low levels on sand based greens.

Timing fertilizer application to coincide with the period of active plant growth and nutrient uptake will optimize nitrate-absorption and reduce the amount of soluble nitrogen available for leaching. Slow-release fertilizers that do not release excessive nitrogen during heavy rain will be applied during the wet months. When evapotranspiration is closely matched by irrigation during seasonably wet months and periods of active plant growth, water soluble nitrogen can be applied at rates of up to 1.0 lb N/1000 $ft^2$/month without any significant accumulation or leaching. The Ferry Point Park Golf Course proposes soluble nitrogen application rates between .50-. 75 lb N/1000 $ft^2$ per application.

Table 5 projects the range of soluble and insoluble nitrate sources and illustrates recommended

application rates for each formulation. The proportion of highly soluble and slow-release nitrogen fertilizers used on the golf course will vary with management area and time of year. Roughly 50 to 60% of fertilizers applied to greens and tees will be in water soluble forms, while the remaining 40 to 50% will be of the slow-release variety. Typical application rates for greens and tees are approximately 1 lb N/1000 $ft^2$ per growing month.

A higher proportion of nitrogen applications (up to 65%) on fairways will be slow-release or delayed-release formulations. Total nitrogen added per year on fairways after grow-in will be approximately 2-3 lbs/1000 $ft^2$. To maximize utilization of the applied nitrogen sources, each application will be applied between .25 -.75 lbs/1000 $ft^2$. This will allow for a more precise controlled release application and reduce the risk of over fertilization.

Table 5. Nitrogen Fertilizer Annual Usage for Ferry Point Park Golf Course in Bronx, New York.

| I. GROUP (Greens/Tees) Water-Solubles[1] | Single Application | Maximum Yearly |
|---|---|---|
| 1. Lesco 16-32-16 | .10-.20 lb/N/1000 sq. ft. | |
| 2. Lesco Green-Flo 30-0-0 | .25-.50 lb/N/1000 sq. ft. | |
| 3. Lesco 30-0-17 | .10-.20 lb/N/1000 sq. ft. | Greens and Tees[2] |
| 4. Lesco 20-20-20 | .10-.20 lb/N/1000 sq. ft. | will receive |
| 5. Gro More12-62-0 | .10-.20 lb/N/1000 sq. ft. | 5-6 lbs/N/1000 sq. |
| 6. Gro More 20-5-30 | .10-.20 lb/N/1000 sq. ft. | ft./yr of water |
| 7. Gro Power 6-2-8 | .30-.75 lb/N/1000 sq. ft. | soluble products |
| 8. Plant Marvel 20-20-20 | .10-.20 lb/N/1000 sq. ft. | |
| 9. Urea 45-0-0 | .30-.75 lb/N/1000 sq. ft. | |
| 10. Scotts Fluid 20-5-30 | .10-.20 lb/N/1000 sq. ft. | |
| Slow Release (Primarily) | | |
| 1. Scotts 22-0-16 | .50-.75 lb/N/1000 sq. ft. | Greens and Tees |
| 2. Scotts 19-26-5 [3] | .50-.75 lb/N/1000 sq. ft. | will receive |
| 3. Scotts 15-0-30 | .50-.75 lb/N/1000 sq. ft. | 3-4 add'l lbs/N/ |
| 4. STEP (trace elements)[4] | .50-.75 lb/N/1000 sq. ft. | 1000 sq.ft./yr of |
| 5. Lesco 29-0-0 | .50-.75 lb/N/1000 sq. ft. | water insoluble |
| 6. Lesco 21-4-11 | .50-.75 lb/N/1000 sq. ft. | products |
| 7. Lesco 14-2-14 | .50-.75 lb/N/1000 sq. ft. | |
| 8. Lebanon 16-4-8 | .50-.75 lb/N/1000 sq. ft. | |
| 9. Agway 0-0-50 | 1- 2 lb/K/1000 sq. ft. | |
| 10. Alternative Nitrogen Sources[5] | varies, based on product | |
| II. GROUP (Fairways/Roughs) | | |
| Water-Solubles [1] | | |
| 1. Colt 45-T 40-0-15 | .25-.50 lb/N/1000 sq. ft. | |
| 2. Urea 45-0-0 | .50-.75 lb/N/1000 sq. ft. | Fairways and |
| 3. Calcium Nitrate 15-0-0 | .50-.75 lb/N/1000 sq. ft. | Roughs will |
| 4. Ammonium Nitrate 34-0-0 | .50-.75 lb/N/1000 sq. ft. | receive 3-4 lbs/ |
| 5. Turf Royal 21-7-14 | .50-.75 lb/N/1000 sq. ft. | N/1000 sq.ft./yr |
| 6. Lesco 33-0-17 | .50-.75 lb/N/1000 sq. ft. | of water-soluble |
| 7 Lesco 23-0-23 | .50-.75 lb/N/1000 sq. ft. | products[6] |
| 8. Ammonium Sulfate 21-0-0 | .50-.75 lb/N/1000 sq. ft. | |
| Slow Release (Primarily) | | |
| 1. Lesco 28-3-5 mini | .75-2.0 lb N/1000 sq. ft. | |
| 2. Lesco 35-0-0 mini | .75-2.0 lb N/1000 sq. ft. | Fairways and |
| 3. Lesco 24-3-12 mini | .75-2.0 lb N/1000 sq. ft. | Roughs will also |
| 4. Lesco 10-15-15 [3] | .75-2.0 lb N/1000 sq. ft. | receive 4-5 lbs |
| 5. Par Ex 28-3-8 | .75-2.0 lb N/1000 sq. ft. | N/1000 sq.ft./yr |
| 6. Scott 32-3-10 | .75-2.0 lb N/1000 sq. ft. | of water |
| 7. Scott 22-0-22 | .75-2.0 lb N/1000 sq. ft. | insoluble products[4] |
| 8. Alternative Nitrogen Sources[5] | varies, based on product | |

[1] -Formulations will be selected in accordance to field inspection, soil and tissue testing. The above rates include 1-3 lbs during grow-in.
[2] -Tees typically use 20-30% more (N) fertilizer than the greens.
[3] -Starter materials will be used during the first year of construction and for establishment of nursery grasses.
[4] -Trace elements will be added according to soil tests.
[5] -Refer to products on Table 6 for choice in Natural Organic Materials.
[6] -Roughs will receive 35-40% less (N) fertilizer than the fairways.
NOTE: Water-soluble products will be used during periods of active plant growth and during periods of less frequent rains.

3.4.4 Organic Fertilizers

One rapidly emerging field of alternatives is the use of "natural organic" fertilizers to reduce or suppress fungus disease. In laboratory, greenhouse and field studies, it has been shown that the natural organic fertilizers (Ringer®, Sustane®, and All Gro Compost®) can suppress disease development from 50% to 100% (Nelson, 1990). The suppression and the severity was noted on a wide range of diseases including ones projected on this site: brown patch, dollar spot and pythium root rot. These nitrogen sources were not found to leach from cool season golf greens.

Table 6 presents alternative nitrogen sources available and rates of application consistent with those recommended by each manufacturer.

**Table 6. Alternative Nitrogen Sources**

Slow Release Synthetic Material

| Trade name | Manufacturer | Analysis | Release | Formulation |
|---|---|---|---|---|
| Nutralene® | Nor-Am | 40-0-0 | 12-16 weeks | Methylene Urea |
| Once® | Grace Sierra | 24-6-11 | 5-6 months | Resin Coated & Soluble Nitrogen Sources |
| Polyon® | Pursell Ind. | 42-0-0 | 9-12 weeks | Osmotic Polymer Coated Urea |

Natural Organic Material

| | | | | |
|---|---|---|---|---|
| Nature Safe® | Griffen Ind. | 10-2-8 | 5-12 weeks | Hydrolyzed Feather meal |
| Resurge® | Quad Five | 7-7-7 | 12-16 weeks | Feather meal |
| Turf® | Ringer | 12-2-6 | 5-7 weeks | Feed grade animal protein |
| Sustane® | Sustane Corp. | 5-2-4 | 12-16 weeks | Turkey waste composted |

**Table 6 continued**

Recommended Rate of Application

| Product® | lbs.N/1,000 ft 2 | lbs. of Product/1,000 ft 2 | Total lbs./Acre |
|---|---|---|---|
| Nutralene® | 0.75 - 2.00 | 1.90 - 5.00 | 83 - 217 |
| Once® | 1.00 - 2.00 | 4.25 - 8.50 | 185 - 370 |
| Polyon® | 0.75 - 2.00 | 1.80 - 4.80 | 78 - 209 |
| Nature Safe® | 0.50 - 1.00 | 5.00 - 12.0 | 217 - 450 |
| Resurge® | 1.00 - 2.00 | 15.0 - 30.0 | 653 - 1,306 |
| Turf® | 1.00 - 2.00 | 8.50 - 17.0 | 370 - 740 |
| Sustane® | 1.00 - 2.00 | 20.0 - 40.0 | 871 - 1,742 |

Note: Natural organic materials manufactured from wastewater sewage sludge will not be used at the golf course because of potential contamination with heavy metals.

## 3.5 Non-Turf Areas

The secondary roughs or areas restored after construction will be re-vegetated with a mix of grassy species:

- 10% Shadmark Creeping Red fescue
- 20% Shadow E Chewings Fescue
- 20% Merit Kentucky Blue
- 25% Shamrock Kentucky Blue
- 25% Baron Kentucky Blue

### 3.5.1 Naturalized Restoration Plan

A vegetative buffer will enhance a section of the East River and its associated floodplain. This remedial planting plan for the buffer areas will be based on a variety of existing documents, field investigations, agency discussions, and topographic mapping. The enhanced vegetative buffer areas are designed to: 1) enhance habitat and add definition between the golf course and the river park area; 2) reduce floodplain erosion; 3) enhance native tree and shrub communities; 4) improve riparian habitat; and (5) discourage human access to the river outside defined trail areas.

Enhancement of the vegetative buffers of the East River side channels and portions of the floodplain is an important component of long term channel and floodplain stability. This is particularly true for areas that were previously cleared of vegetation or have been disturbed, modified, or altered from sanitation and dump activities.

Planting will include a combination of nursery stock and purchased horticultural material. Selection of the recommended tree and shrubs species within each zone will be based on native status within the general project area and nursery availability, as well as individual species hydrologic tolerances. The grassing and revegetation process will restore low maintenance, coastal native grasses and plants so that once established, they will flourish on their own with minimal human intervention. The species proposed for planting will be discussed in detail in the Habitat Restoration Plan.

## Chapter IV

## Integrated Pest Management for Ferry Point Golf Course

Proper detection and identification of insects and mites in turf, combined with pest tolerance thresholds, is the key to an Integrated Pest Management system that will produce optimum results with minimum undesirable side effects. Numerous IPM strategies have been perfected for this purpose. In an IPM program, the mere presence of an insect in turf is not a valid reason for taking steps for control. Rather, a thorough knowledge of the pest population is needed before the proper response can be formulated. Some potential pests will be more problematic than others. These are rated in a Pest Infestation Index in this chapter, and thresholds for action are provided for each of the anticipated pests.

### 4.1 Pest Sampling Guidelines

The golf course superintendent or a fully trained assistant will monitor each golf hole for indications of reduced turf quality. The superintendent will be responsible for the correct identification and documentation of any fungi, insects or weeds found, and will look first for environmental adjustments that might reduce or eliminate the pest. Improving ventilation, selective removal of vegetative growth, and physical removal of small pest populations are examples of steps to be taken before other intervention is considered. Soil, pH, nutrient content, sodium levels, temperature and moisture content will also be evaluated to determine if they could be contributing to the pest presence.

Samples of unidentified insects, weeds, nematodes or pathogens will be forwarded to a reputable laboratory for assistance in proper identification and procedural control. If the need arises to obtain and determine a control option, the assistance of an appropriate environmental firm, state agency, or New York extension service specialist will be sought.

#### 4.1.1 Visual Inspection

The old-fashioned technique of looking closely at the turf is still the most valuable. If, upon pulling up on the turf, it breaks off easily, the staff will look for the sawdust of billbugs. If frass (insect fecal pellets) are present, a disclosing solution can be used to determine if turf caterpillars are present.

If a pest is detected, it is important to know the extent of the problem. The transect method involves walking in a line across the affected turf, counting the number of damaged areas observed. Square foot samples are often useful if billbugs, mites or scales are suspected. A square-foot flap of turf is cut and the visible grubs in the soil are counted. Alternately, a standard golf course cup cutter may be used to take turf and soil samples. The cup cutter sample is multiplied by 10 to determine the number of insects per $ft^2$.

### 4.1.2 Disclosing Solutions

Many of the turf insects and mites defy easy detection by the human eye. Therefore, a disclosing solution of pyrethrum or soap is used. A disclosing solution of 1.0 oz. of household dish washing detergent (Joy® liquid is known not to cause turf damage) in two gallons of water is effective. The water is applied to a one-square yard area with a common garden sprinkling can. Within 3-5 minutes the caterpillars will come to the surface where they can be easily counted. Occasionally, billbug adults and other insects are also flushed out.

### 4.1.3 Trapping

Some of the turf infesting insects are attracted to lights or chemical attractants (pheromones) and can be easily monitored. Most of the cutworms, sod webworms and many of the night flying white grub adults can be collected in a light trap. Pheromone traps have been developed for the cutworms, sod webworms and armyworms. Other insects, such as billbugs, can be monitored by using simple pitfall traps placed along the side of turf areas.

**Light traps generally use an ultraviolet** (UV) bulb which is attractive to most night flying insects. By running a trap several nights a week and counting the cutworms, sod webworms or armyworm adults, an estimate can be made of when turf damage *could* occur. As an example, black cutworm adults are easily captured in a light trap and larvae can be expected on greens and tees about two weeks after peak adult catches.

**Pheromone traps are even more precise than light** traps because single species can be monitored. Pheromones exist for black cutworms and most of the armyworm complex. The numbers captured can be used in a manner similar to light trap counts.

**A Pitfall trap** used for monitoring billbugs is a 16 oz. cup buried in or next to turf with its rim level with the soil. Billbug adults fall into the trap and can be counted to monitor when activity begins. After two weeks of steady captures, it is time to sample for the larvae in the turf.

### 4.1.4 Disease Immunoassay Kits

Disease immunoassay kits may be used to aid in the identification of turfgrass disease. They may be used to detect and/or rule out the presence of a disease pathogen through positive indication. Currently, the kits are available for the following diseases: Brown patch, Dollar spot, and Pythium. The kits are used to assist in proper disease identification, to determine when it is *not* appropriate to apply a pesticide, and to reduce the potential for the wrong pesticide to be used because of misdiagnosis.

When fungus infestations are not readily identifiable by the golf course superintendent and his or her staff, samples will be sent to a laboratory for analysis. Chemical treatment will not occur until the fungus is properly identified so that the proper product is used. Laboratory results are usually available within 48 to 72 hours.

## 4.2 Environmental Monitoring

Since most pest activity is regulated by weather conditions, several methods have been developed which use weather monitoring to predict pest development. These methods (or models) suggest *when* activity will occur but not *how much* activity is present. When weather conditions are right, the staff is alerted to monitor for pests but other steps already described will be required to determine if pests are actually present in sufficient numbers to cause damage to the turf.

### 4.2.1 Degree-day Models

"Degree-days" provide a method of measuring the degree of maturity an organism has reached due to weather conditions. Insects and mites develop more rapidly as they get warmer. Below a certain temperature threshold, little or no development takes place. There are no degree-day models available for the insects and mites on the Ferry Point Park site. Degree-day models do exist for disease and pre-emergent weeds, however, and can be used to make predictions in conjunction with monitoring models established in the field.

Heating degree-days may be calculated manually if necessary (degree days={daytime high ($F^0$) -- daytime low ($F^0$)} divided by 2 - 50 $F^0$). If a positive number remains, add this to the previous total to amass cumulative degree days. If the total is a negative number, the cumulative degree day is zero since negative heating degree days are non-existent.

### 4.2.2 Plant Phenology

Plant phenology is nature's degree-day model. Since plant development is also dependent on temperature, associating plant activity with insect activity can improve timing of controls.

## 4.3 Anticipated Pests

Pest infestation information from existing golf courses in the New York and New Jersey metropolitan areas was used to determine potential pest problems for Ferry Point Park Golf Course. With input from these courses and other data taken from similar cool season regions of the United States, a list of known and probable weeds, insects and fungus problems that can be expected at the golf course has been compiled. By its nature, the list is not, and cannot be, complete but it provides an adequate starting point that can be adapted and modified through experience. Anticipated pest problems include 46 weed species, 25 turf diseases and 16 insects. However, only 17 key pests were identified and include 7 weeds, 6 diseases and 4 insects.

The pests of greatest concern to the greens and, to a lesser degree the tees, will be leaf contact pathogens. These pests can be identified by a combination of visual inspections and use of turf disease detection kits (Reveal® or Dipstick®).

The following represents a general overview of the pest problems that might be encountered at Ferry Point Park. Pests are divided into three groups: weeds, disease and insects.

### 4.3.1 Weed Occurrence

Turfgrass weeds at existing golf courses in the area are minor in occurrence due to traditional low mowing practices and dense turfgrass competition.

Weed problems associated with golf course turf are divided into two categories: grassy weeds (monocotyledons) and broadleaf weeds (dicotyledons). Mixed with other grassy plants, monocots will be allowed to flourish in the secondary roughs and areas left in a natural state. Handpicking or spot spray will be used in the primary roughs and fairways only. Table 7 is a list of annual monocotyledons turfgrass weeds anticipated and Table 8 is a list of perennial dicot broadleaf weeds. These grass weeds are the most likely to persist on cool season turfgrass in the Ferry Point Park area.

**Table 7. Pest Identification-Annual Grass Weeds**

| | |
|---|---|
| Annual bluegrass | *Poa annua* |
| Barnyardgrass | *Echinochloa crusgalli* |
| Dallisgrass | *Paspalum dilatatum* |
| Goosegrass | *Eleusine indica* |
| Green foxtail | *Setaria viridis* |
| Large crabgrass | *Digitaria sanguinalis* |
| Purple nutsedge | *Cyperus rotundus* |
| Purpletop | *Tridens flavus* |
| Quackgrass | *Agropyron repens* |
| Small crabgrass | *Digitaria ischaemum* |
| Timothy | *Phleum pratense* |
| Yellow foxtail | *Setaria lutescens* |
| Yellow nutsedge | *Cyperus esculentus L.* |

Table 8. Pest Identification-Perennial Broadleaf Weeds

| | |
|---|---|
| Black Medic | *Medicago lupulina* |
| Broad-leaved plantain | *Plantago major* |
| Common chickweed | *Stellaria media* |
| Common speedwell | *Veronica officinalis* |
| Clover | *Trifolium repens* |
| Curly Dock | *Rumex crispus L.* |
| Dandelion | *Taraxacum officinale* |
| Ground Ivy | *Glechoma hederacea* |
| Heal-all | *Prunella vulgaris* |
| Henbit | *Lamium amplexicaule* |
| Knapweed | *Centaurea maculosa* |
| Knotweed | *Polygonum aviculare* |
| Lambsquarter | *Chenopodium album* |
| Mallow | *Malua rotundifolia* |
| Mouse-ear chickweed | *Cerastium vulgatum* |
| Nodding spurge | *Euphorbia maculata* |
| Oxalis | *Oxalis stricta* |
| Pearlwort | *Sagina procumbens* |
| Plantain | *Plantago rugelii* |
| Poison Ivy | *Rhus radicans* |
| Poison Oak | *Toxicodendron diversilobum* |
| Purslane speedwell | *Veronica peregrina* |
| Prostrate spurge | *Euphorbia prostrata* |
| Prostrate pigweed | *Amaranthus blitoides* |
| Ragweed | *Ambrosia sp.* |
| Red clover | *Trifolium pratense* |
| Sheep sorrel | *Rumex acetosella* |
| Shepherd's purse | *Capsella Bursa-pastoris* |
| Spotted spurge | *Euphorbia supina* |
| Stitchwort | *Stellaria graminea* |
| Thistle | *Cirsium sp.* |
| Yarrow | *Achillea millefolium* |
| Yellow wood sorrel | *Oxalis europaea* |

### 4.3.2 Turfgrass Disease

There are six turfgrass diseases potentially posing a problem at Ferry Point Park Golf Course: brown patch, dollar spot, Fusarium patch, summer patch, take all patch and pythium blight. The potential for disease presence points out the need to implement a visual monitoring and sampling control program once sod, seed, and any hydromulching has been completed. Disease under cool, moist, wet conditions will probably remain the more persistent of pathogens to control once the golf course matures and the grow-in is complete. The cool season diseases and controls are presented in Table 9. The most likely turf diseases to be encountered at the Ferry Point Park Golf Course are presented in Table 10. The occurrence and severity will vary, depending on the time of year, weather conditions, fertility, and total dissolvable salts. Cultural practices that promote healthy turf will be employed to minimize weed occurrence.

TABLE 9. METHODS OF DISEASE CONTROL COOL SEASON TURFGRASS

| DISEASE | CULTURAL CONTROL | CHEMICAL CONTROL | RESISTANT SPECIES/VARIETIES |
|---|---|---|---|
| ANTHRACNOSE | Fertilize to maintain vigor, improve drainage aeration, and | Benomyl, chlorothalonil, mancozeb, propiconazole, triadimefon | Bentgrasses are less susceptible than annual bluegrass on putting greens. raise mowing height during periods of heat stress. |
| BROWN PATCH | Avoid excess N in summer, increase air circulation, avoid excessive watering. | Anilazine, benomyl, chlorothalonil, fenarimol, iprodione, mancozeb, propiconazole, thiophanates, thiram, vinclozolin. | Kentucky bluegrass are less susceptible to brown patch than other cool-season turfgrasses. |
| DOLLAR SPOT | Avoid N deficiency, maintain good soil moisture, remove guttation and dew from leaf surfaces, avoid night watering. | Anilazine, benomyl, chlorothalonil, fenarimol, iprodione, mancozeb, propiconazole, thiophanates, thiram, vinclozolin. | Resistant Kentucky bluegrass varieties include Adelphi, America, Aspen, Challenger, Eclipse, Escort, Nassau, Somerset, and Wabash. |
| FAIRY RING | Use clean fill during establishment irrigate, or mask symptoms with fertilizer or iron. | None effective, must fumigate with soil sterilant to eradicate the fungus (this will also kill grass). | No resistant species or varieties are available. |
| LEAF SPOT/ MELTING OUT | Avoid excessive N applications in early spring, mow 2" in height, avoid light, frequent irrigation. Do not use benomyl, thiophanates, triadimefon to control this disease. | Anilazine, chlorothalonil, iprodione, maneb, mancozeb, vinclozolin. | Resistant Kentucky bluegrass include: Adelphi, Bristol, Destiny, Eclipse, Enmundi, Glade, Ikone, Liberty, Majestic, Mona, P-104, Rugby, and Somerset. |
| NECROTIC RING SPOT | Manage turf for maximum root growth, irrigate to maintain good soil moisture, maintain mowing height at 2" or above. | Benomyl, fenarimol, propiconazole. | Perennial ryegrasses are resistant. |
| POWDERY MILDEW | Reduce shade and improve air circulation. | Benomyl, fenarimol, propiconazole, triadimefon, (fungicides usually not required). | Use grasses adapted to shaded areas such as fine fescues and rough bluegrasses. Resistant Kentucky bluegrass include: A-34, Glade Touchdown, & Eclipse. |
| PYTHIUM BLIGHT | Improve drainage, increase air circulation, avoid excess N, reduce irrigation. | Chloroneb, etridiazole, metalaxyl, Fosetyl-Al, propamocarb. | Kentucky bluegrass is less likely to be damaged by Pythium blight than other turfgrasses. |

TABLE 9. (cont'd). METHODS OF DISEASE CONTROL COOL-SEASON TURFGRASS

| DISEASE | CULTURAL CONTROL | CHEMICAL CONTROL | RESISTANT SPECIES/VARIETIES |
|---|---|---|---|
| PYTHIUM ROOT ROT | Increase drainage, aerate and reduce irrigation. | Fosetyl-Al, Subdue as drench. | Unknown |
| RED THREAD/PINK PATCH | Maintain adequate fertility of turf (especially N). | Anilazine, benomyl, chlorothalonil, iprodione, propiconazole, thiophanates, triadimefon, vinclozolin. | Resistant perennial ryegrasses include: Alliare, Commander, Delray, Manhattan II, Palmer, Pennant, Prelude, Regal, Regency, SR 4000, SR 4100, and Yorktown II. |
| RUST DISEASES | Avoid N deficiency and drought-stress (especially in late summer/early fall). | Maneb, mancozeb, fenarimol, propiconazole, triadimefon, (fungicides usually not required). | Some resistant Kentucky bluegrass include: Kenblue, Parade, Rugby, A-34, and Classic. |
| SLIME MOLDS | Remove spores by spraying water on leaves or brushing turf. | None required. | Not applicable since grasses are not infected. |
| SNOW MOLDS: GRAY SNOW MOLD | Avoid excess N in fall before grass goes dormant, mow until top growth ceases in fall, prevent accumulation | Fungicides should be applied in late fall before snow cover. Chloroneb, .fenarimol, iprodione. | Some Kentucky bluegrass include: Adelphi, Aspen, Enmundi, Plush, and Vantage. |
| PINK SNOW MOLD | (Same as gray snow mold) | Benomyl, fenarimol, iprodione, mancozeb, PCNB, thiophanates, thiram. | Most fine fescues and Kentucky bluegrass are moderately resistant to this disease. |
| STRIPE SMUT | Avoid excess N in early spring, avoid drought stress in early summer. | Apply fungicides in early spring or late fall, water-in for good root uptake. Fenarimol, propiconazole, vinclozolin. | Ryegrasses, tall fescues, and the fine fescues are less susceptible to this disease than Kentucky. |
| SUMMER PATCH | Avoid low mowing heights, reduce compaction, avoid over watering in summer, improve drainage. | Fenarimol, propiconazole, thiophanates, triadimefon. | Resistant Kentucky bluegrass include Adelphi, Enmundi, Sydsport, and Touchdown. |
| TAKE-ALL PATCH | Use acidifying fertilizers or sulfur to lower pH, avoid P and K deficiency | Sterol biosynthesis inhibitors may have some benefit if applied prior to root infection. | Annual bluegrass. |

Biotic Agents of Noninfectious Diseases

[1] Develops on the surface of overly wet soils.

[2] Small plants that overgrow and compete with turf when wetness, poor nutrition and soil conditions exist.

Nematode Diseases

[3] May be diverse and are dependent on the population of plant-parasitic and saprophytic density.

### 4.3.3 Turfgrass Insects

The Ferry Point Park Golf Course will experience minor outbreaks of turfgrass insects. Turfgrass insects are not considered major pests on turf in Bronx, New York. The most common insects are Black ataenius and white grubs. Black cutworms may remain fairly persistent in putting green surfaces. The proposed regrassing to newer cultivars of bentgrass includes varieties which provide resistance to surface feeding insects (e.g., sod webworm, cutworms).

A list of probable leaf and stem feeding insects are provided in Table 11. These are the more common turfgrass pathogens which have the ability to destroy healthy areas of turfgrass. Tolerable levels below threshold limits should pose no threat to the desirable playing quality of the golf course. Each insect will be monitored for baseline detection and an established threshold level will be developed.

Table 12 provides a timeline of probable insect activity. Most turfgrass insect pests are cyclical and will typically require some form of treatment even under ideal environmental conditions. There has been a trend common among many golf course superintendents to monitor turfgrass quality and allow the insect to complete its natural life cycle. This concept has been more successful on warm-season grasses than on most cool-season turf.

We anticipate the range of activity to be possibly severe for only two insect pests. Of the two, black ataenious will be easier to detect and control. Generally, large populations of white grubs are necessary before noticeable symptoms of turfgrass decline are evident. Cutworms will be more persistent but will be the easiest to control with either parasitic nematodes or through a biorational approach using natural chemicals or Pheromones.

Table 11. Pest Identification - Turfgrass Insects

| Common Name | Pathogen | Scientific Name | Founder |
|---|---|---|---|
| Annual bluegrass weevil | weevil (beetle) | *Hyperodes anthracinus* | Dietz |
| Ants | ants | *Formicidae* | |
| Black cutworm | moth | *Agrotis ipsilon* | Hufnagel |

## 4.4. Location and Extent of Pest Infestation

In spite of being considered a monoculture, the turfgrass environment is actually quite complex and serves as host to a wide variety of organisms. The turf habitat carries a host of soil microbes involved with nutrient and material recycling. They provide the nutritional basis for soil, thatch, and foliar feeding animals. These herbivores in turn serve as "food" for secondary consumers known as predators and parasites.

There are only a few turfgrass organisms known to be potentially damaging as pathogens. These pathogens can be separated and identified as key, occasional, or potential pests. The extent and locality for each pest may be compared to the preliminary threshold levels along with the suggested methods of control. Although some level of control may be warranted, the object is to provide protection of beneficial turfgrass organisms as well. This may be accomplished by tolerating some level of natural pathogens. Allowing build-up of microorganisms and natural fauna will help to balance the network of non-pests in the turfgrass environment. These pests present little or no chance for injury and comprise a vast majority of the insects and mites found in turfgrass today.

Tables 13, 14, 15, and 16 list the pest problems anticipated on the Ferry Point Park Golf Course. They are listed in the order of weeds, disease, and insects. Each pest listed has been given a Pest Index code that determines the probability of impact. A corresponding Frequency Index to determine the degree of likelihood is also provided. Key pests have been ranked for bentgrass, bluegrass, and turf-type fine leaf fescue and are compared with historical pest problems reported from existing golf courses located in the New York/New Jersey metropolitan areas.

## 4.5 Pest Infestation Thresholds

There will be four major factors, excluding climate, that will determine the thresholds of the anticipated turfgrass pests. They include water quality, soil conditions, pH and the turfgrass species.

Close monitoring of turfgrass during the establishment or grow-in phase will track the existence of potential pathogens. It will be very important to note the baseline information when sufficient crown, leaf stem and thatch layers have developed. During this early stage, an evaluation of turf quality will be necessary. The evaluation should include a cross check for each Preliminary Threshold that has been established in the IGCMP. The evaluation of pest occupancy for the project site should also be completed, and the potential levels of anticipated pest outbreak established.

The Ferry Point Park Golf Course will maintain the greens as a consistent, weed-free turf that is of the highest playing quality, aesthetically appealing, and not impacted by the presence of deleterious pests. "Insect damage to the greens must also be at an absolute minimum but the greens need not be totally free of insects. Allowing limited damage (weeds or insect damage) does carry a risk that the above pathogen may spread which would force the use of a broader control." (Vittum, 1986). To produce high quality turf, it is not necessary to have absolute control over insects and weeds. For example, healthy turf can be sustained with as many as five white grubs per square foot if traffic (wear) is not excessive (Brandenburg, 1989).

A similar level of quality will be required for the tees. Rotation of tee markers is necessary to maintain turf recovery. Therefore, the entire tee must be in a playable condition. Fairways may have a slightly greater amount of pest damage than tees. In the roughs and natural areas outside the fairways, a lower level of maintenance activity, compared to the tees, greens, and fairways, is proposed for insects and fungi.

Once the level of acceptable impairment is defined and the corresponding level of management is instituted, a regular program of inspections is required. The golf course superintendent or assistant golf course superintendent will make daily inspections of the course. This frequency is essential to identify the type and presence of pests early and to keep damage to an insignificant level with the lowest level of response.

### 4.5.1 Preliminary Threshold Guidelines

Site-specific turf pest thresholds identify the standard of management and establish that BMPs are functioning within the golf course operation. Suggested action levels for different golf course areas are presented in this section.

The suggested thresholds and action levels presented will be refined as actual data from the golf course becomes available. Data collection will begin during the grow-in period as soon as sufficient crown, leaf stem and thatch layers have been developed. During this early stage, the level of pest occupancy for the site should be determined, so that future pest outbreaks can be recognized with a degree of confidence. This is an iterative process and it will take approximately three years of data to refine the preliminary threshold guidelines.

Historical pests and related patterns of existing golf courses are often a good indication of pest density and activity. Existing courses generally provide the turf agronomist the necessary confidence that certain levels of pests are natural and acceptable. To assume otherwise might be considered over-managing, disrupt the true causal agent, and lead to misdiagnosed turf problems.

Table 17 provides preliminary thresholds for weed grasses. Preliminary threshold guidelines have been established for the turfgrass pests anticipated to occur on each playing surface relative to the turfgrass cultivar. Grasses are easier to control in the lower heights of tees and greens. Simple hand removal will often prevent further spread of these grasses. Sedges are more difficult to identify and control and grow closer to the thatch canopy. Under well established turfgrass conditions, these pests should pose minimal problems.

Table 18 lists the probable broadleaf weeds and the recorded levels of density in bentgrass and fine leaf fescue turf. Research will be needed to verify that the levels presented are not only tolerable but obtainable when managing these grasses. Many dicot weeds can be easily removed by hand. For those broadleaves difficult to control in groups or clusters, spot treatment with a wick applicator utilizing a post emergent herbicide will provide excellent control.

Tables 19 and 20 present management techniques once preliminary threshold guidelines are reached for weeds.

Table 21 presents timing for management techniques once preliminary threshold guidelines are reached for turfgrass disease.

Table 22 presents threshold guidelines for insect occurrence. Currently, there are no established industry thresholds for insect and mite pests found on this site. The thresholds for insects and mites are established as a preliminary guide. Local experience will also play a role in the refinement of these threshold guidelines.

Table 17. Suggested Action Levels for Grass Weeds in Different Golf Course Areas in New York

| | Number of Weeds per 1,800 sq. ft. | | | |
|---|---|---|---|---|
| Weed Species | Tees | Greens | Fairways | Roughs |
| **Grasses** | | | | |
| Annual bluegrass | 10 | 1 | 10 | 20 |

| Yellow foxtail | 5 | 1 | 10 | 20 |
| **Sedges** | | | | |
| Purple nutsedge | 5 | 1 | 10 | 50 |
| Yellow nutsedge | 5 | 1 | 10 | 50 |

Table 18. Suggested Action Levels for Broadleaf Weeds in Different Golf Course Areas in New York

| | Number of Weeds per 1,800 sq. ft. | | | |
|---|---|---|---|---|
| **Broadleaf** | | | | |
| Black medic | 5 | 1 | 20 | 50 |
| Broad-leaved plantain | 3 | 1 | 10 | 20 |
| Common chickweed | 3 | 1 | 10 | 20 |
| Common speedwell | 5 | 1 | 20 | 50 |
| Clover | 3 | 1 | 10 | 20 |
| Curly dock | 3 | 1 | 10 | 20 |
| Dandelion | 3 | 1 | 10 | 20 |

Note: This table was developed from suggested guidelines by the University of Hawaii and an IPM program written for Lihi Lani by Holtzmann et al., 1991. The IPM plan was later summarized and rewritten by ETS to include this methodology as a means to establish baseline weed threshold counts.

Table 18 (continued). Suggested Action Levels for Broadleaf Weeds in Different Golf Course Areas in NY

| Weed Species | Number of Weeds per 1,800 sq. ft. | | | |
|---|---|---|---|---|
| | Tees | Greens | Fairways | Roughs |
| **Broadleaf** | | | | |
| Ground ivy | 3 | 1 | 10 | 50 |
| Heal-all | 5 | 1 | 10 | 20 |
| Henbit | 5 | 1 | 10 | 20 |
| Knapweed | 1 | 1 | 2 | 5 |
| Knotweed | 5 | 1 | 10 | 20 |
| Lambsquarter | 3 | 1 | 10 | 20 |
| Mallow | 1 | 1 | 5 | 10 |
| Mouse-ear chickweed | 3 | 1 | 10 | 20 |
| Nodding spurge | 3 | 1 | 10 | 20 |
| Oxalis | 5 | 1 | 10 | 50 |
| Pearlwort | 1 | 1 | 5 | 10 |
| Plantain | 3 | 1 | 10 | 15 |
| Poison ivy | 1 | 1 | 1 | 5 |
| Poison oak | 1 | 1 | 1 | 5 |
| Purslane speedwell | 3 | 1 | 10 | 20 |
| Prostrate spurge | 3 | 1 | 10 | 20 |
| Prostrate pigweed | 3 | 1 | 10 | 20 |
| Ragweed | 1 | 1 | 1 | 2 |
| Red clover | 3 | 1 | 10 | 20 |
| Sheep sorrel | 3 | 1 | 15 | 30 |
| Shepherd's purse | 5 | 1 | 10 | 20 |
| Spotted spurge | 3 | 1 | 10 | 20 |
| Stitchwort | 5 | 1 | 10 | 20 |
| Thistle | 1 | 1 | 5 | 5 |
| Yarrow | 3 | 1 | 10 | 20 |
| Yellow wood sorrel | 1 | 1 | 5 | 20 |

Note: Broadleaves in fairway and roughs may be more tolerable and easier to control with higher thresholds counts. Higher levels are unacceptable on tees and greens. Thresholds are much lower for these surfaces but are easily removed by hand at these levels. This table was developed from suggested guidelines by the IPM program written for Lihi Lani by Holtzmann et al., 1991. The plan was later summarized and rewritten by ETS to include this methodology as a means to establish baseline weed threshold counts.

* Currently there are no established industry standards for pest threshold guidelines. The following thresholds for insects, weeds and disease are established as a preliminary guide to assist the golf course superintendent in deciding when to choose the appropriate form of control. We fully expect that local experience will result in the refinement of these threshold guidelines. Hand removal of weeds in fairways and roughs can be accomplished by constructing a tool designed to remove the plant and taproot completely.

Table 22. Preliminary Threshold Guidelines - Turfgrass Insects

### 4.5.2 Nematodes

High populations of certain species of nematodes may indicate that the root system is in danger or has already been debilitated to a significant extent. A simple count of nematodes, however, is not enough to make an informed determination of whether the threshold has been crossed and what, if any, action should be taken. The threshold levels which justify the implementation of control measures are dependent on the depth of the sample, the species of grasses present, depth of the root system, soil texture, symptoms and extent of damage, presence of other stresses to the turf; and potential contamination of the environment by the nematicide chosen if action is taken (Wick, 1994).

Nematode populations are estimated most accurately with a composite sample. A 3/4 to 1 inch diameter soil probe, or something similar, should be used to sample a depth of four inches throughout the site. This depth is a compromise but represents the population distribution of different species well.

*Distribution:* Nematodes are unequally distributed in the soil both vertically and horizontally. For example, if assays were done in a transect across a putting green, a series of high and low counts would result. Populations also vary according to the depth at which the sample was taken. A sample at a two-inch depth may have twice the concentration of stunt nematodes as a sample taken at four inches.

*Time of Year:* During winter months nematode populations decline. As the grass begins to resume growth in the spring, nematodes begin feeding on roots. The reproductive potential of the nematodes increases as the soil temperature rises.

*Assay Procedure:* It is not possible to extract all of the nematodes from the soil sample. The soil (at least ½ pint) should be placed in a container, such as a plastic bag, to prevent desiccation. The sample number should be clearly identified on the outside of the container as paper tags placed in contact with the soil quickly deteriorate. The sample should be refrigerated or delivered as soon as possible after collection.

At this time there is very little experimental data to establish threshold levels for nematodes in turfgrasses in this area. The numbers of nematodes per 100 cc of soil presented in the Table 23 are based on research from other states as well as from case-history information and survey results. They serve only as a guide.

Table 23. Threshold Levels for Nematodes in Turf

| Nematode | Number/100 cc Soil |
|---|---|
| Needle | > 200 |
| Lance | > 400 |
| Stunt | > 800 |
| Spiral | > 3000 |
| Ring | > 3000 |

Cyanobacteria and Chlorophyte microalgae in a Kalonite clay base (Turftech II) and a biological liquid inoculum (Precep/Nemastop) are preferred as alternative control measures when populations of nematodes indicate only one or more species have specific high threshold counts. These products biologically increase root zone mass and dispense an irritant within the root that dislodges feeding nematodes.

Nematicide should not be used where contamination of water may occur and should be used only in accordance with the label and local regulations.

## 4.6 Pest Control Strategies

Once a pest has been located through routine inspection (whether visual, or with aid from disclosing solutions, trapping or disease immunoassay kits) and found to exceed threshold levels, the golf course staff has the information necessary to take action. Even when the infestation is found to be significant, the first corrective action is to evaluate environmental corrections. These include:

- Maintaining balanced nutritional levels;
- Improving microclimates through subsurface drainage, aerification, and increasing air movement and sun penetration;
- Reducing cultural management stresses by limiting scalping of turf, keeping mower blades sharp, and adjusting or raising mowing heights when necessary; and
- Calibrating replacement of water in order to control the build-up of total dissolvable salts in soils and minimize leaching.

If environmental factors have been optimized but infestation(s) still exceed acceptable thresholds, an incremental approach is indicated, starting with measures that have the smallest overall impact on the environment. Simple ideas often achieve desirable results. Hand removal of weeds or spot application with a wick-type applicator are two examples of minimalist response. The golf course superintendent might reexamine fungicide management and develop new IPM strategies as needed to reduce disease pressure. New approaches might also assist in reducing fungicide resistance in turfgrass. Other approaches include maintaining insect populations within tolerable levels through the use of biologically synthesized insect and

mite controls, or establishing populations of natural enemies, including microbial endophytes, insect parasites and other predatory nematodes. Natural enemies such as birds, mammals, and amphibians can also be supported, often through simple means.

### 4.6.1 Biological and Organic Controls

The turfgrass environment usually contains a large number of beneficial biological micro-organisms, insects, mites and spiders. If these organisms are not destroyed by insecticides or other chemicals, they can often control the insects and mites which damage the turf. In some cases, these beneficial insects look like pests and inexperienced managers may actually apply a pesticide. Therefore, it is important that one learn to differentiate the "good" bugs from the "bad" bugs. A number of diseases that attack turf insects can also be useful. These biological controls often take longer to do the job and may provide a reduced level of control. This should be acceptable, however, because of the reduction in the use of pesticides and lack of harm to non-target insects.

The release of parasitic organisms without the proper agency approval is strictly prohibited. The golf course superintendent must obtain the necessary permits and/or authorizations as required by New York State and by the State Department of Agriculture before applying any experimental biological, parasite or predator defenses. The Department of Agriculture will also be consulted about known successes or failures with the use of these products for turfgrass control.

### 4.6.2 Common Predators and Parasites

Ferry Point Park Golf Course's IPM program is designed to preserve native insects that prey on pest populations. Unfortunately, most of these predators and parasites are very susceptible to many conventional pesticides. Caution must therefore be used when applying turf insecticides since these treatments can kill beneficial predators and lead to outbreaks of other pests.

On the Ferry Point site, earwigs, ground beetles, rove beetles and lady beetles are expected to be significant predators.

**Earwigs:** Earwigs nymphs and adults attack sod webworms and cutworms as well as a variety of other soft bodied insects. Earwigs require plant material or other cover in order to hide during the day and can be encouraged through provision of proper shelter.

**Ground Beetles and Rove Beetles:** These voracious predators feed on eggs and any insect they can subdue. Both adults and larvae are predators and are probably the most common natural control for caterpillars that attack turf. The primary means of encouraging beetles is through limiting insecticide applications or using spot treatments of insecticides in lieu of broadcast spraying. Recent studies indicate that these beetles rapidly reestablish into an area after pesticide usage if refuge sites are provided.

**Lady Beetles:** Lady beetles, like green lacewings, commonly inhabit trees and shrubs although they are occasionally found feeding on aphids and mites in turf. Releasing lady beetles is not recommended, however, since the commercially available species do not prefer turf habitat.

### 4.6.3 Common Pathogens

Most turf insect pests have natural diseases which periodically control their populations. A few of these pathogens require some special handling or application technique in order to be fully effective. It is imperative that the instructions for their use are carefully followed.

### 4.6.4 Insect Parasitic Nematodes

Microscopic nematodes which attack grubs have been recognized since the 1930s. Until recently, however, no one had identified an easy method to propagate or apply these parasites. Nematodes are now being produced in large quantities and several strains have been identified which will kill sod webworms and cutworms, billbugs, and the white grubs. These nematodes search out insects and enter their bodies through natural openings or by drilling through the cuticle. Once inside the body, the nematodes release a bacterium which kills the pest within hours. The nematodes then complete their development and produce new infective juvenile nematodes. Fortunately, these biological control agents only infect insects and will not harm the turf or other larger animals, including humans.

Exhibit® is a commercially available source of parasitic nematodes. It should be applied to the greens at a rate of 3.4 gallons per 1,000 square feet. As with all biological controls, care must be exercised to get the best results with parasitic nematodes. The active juveniles are very susceptible to drying and sunlight. Therefore, they should be applied to the turf with considerable water, preferably in the morning or evening and should be immediately soaked into the turf with a heavy irrigation. The strains selected must be the most active against the turf caterpillars, billbugs or white grubs.

## 4.7 Cultural Control Tactics in Turfgrass

Cultural control tactics involve modifying the environment so that it is less suitable for pests. Cultural practices range from the initial selection of the grass cultivar through thatch control, properly balanced soil chemistry, proper nutrient management and efficient water management. All of these elements serve to reduce the need for pesticides.

The cultural practices recommended for this golf course include the following:

- Proper pH and electrolytic balance of soils will be established and maintained to provide optimum growing conditions;
- Air circulation, water relationships, and exposure to sunlight will be analyzed during planning and construction, and improved in areas under stress during normal operations;
- Proper surface and subsurface drainage will be established to reduce excessive water from accumulating

on the playing surface or rootzone;

- Adequate tee and green size will be provided to accommodate traffic wear and reduce areas of compaction from use by the playing public;
- Irrigation water will be applied in an appropriate and timely manner;
- Misting by means of the irrigation system will be used to control the rate of evapotranspiration and heat stress;
- Soil amendments (gypsum, sulfur, sulfuric acid, etc.) will be applied to maintain soil structure and drainage; and
- The golf course management team will inspect the site daily to identify any potential pest problems.

### 4.7.1 Thatch

One cultural effort that will greatly improve the result of other strategies is the control of thatch. Thatch provides a hiding place for many pests. It maintains a humidity zone for sod webworms, cutworms, and chafer beetles, and is partially used as food by billbug larvae and grubs. Thatch also hinders the movement of pesticides or biological controls applied to control grubs. Control of thatch promotes better water movement to the turfgrass roots while allowing the soil to dry more effectively between waterings which eliminates or reduces the chances for the grass to act as a site for algae and fungi growth (Daar, 1982).

Thatch also has beneficial qualities. Some thatch on playing surfaces is desirable because of its cushioning and filtering effects. Its shade helps protect the soil. In addition, the proper amount of thatch enhances the biological active zone. This in turn will help to deactivate undesirable residual chemical and fertilizer products.

Dethatching, vertical mowing, sand topdressing, biologically active enhancers (described on the following page), grooming and brushing are the primary methods used to control and maintain the desired thatch level at Ferry Point Park Golf Course. Vertical mowers and/or groomers will be installed on green and tee mowing equipment allowing the course to be dethatched on a regularly scheduled basis. In addition, aeration of the surface soils will be used to reduce thatch by relieving compaction and helping in the exchange of gases and fluids to the turf. Aerification is a process of opening passageways from the surface of the turf cover through the soil and into the root zone. In turfgrass, it is the equivalent of cultivation (plowing/discing) in agriculture. Since golf courses are subject to traffic (walkers, carts tractors, etc.), the upper soil profile has a tendency to compact and create inadequate soil pore space. Often, this will restrict the passageway of air and water into the root zone.

### 4.7.2 Biostimulant/Stress Management

Biostimulant/stress management products will be considered for use within the Ferry Point Park GCMP on an as-needed basis. Many products are available. Some serve to increase the turfgrass plants' ability to resist disease pressures and environmental stress. Others will be useful for enhancement of soil

microbes and/or drainage. Reducing stress and activating beneficial soil microorganisms, in turn, serve to increase the turfgrass' ability to counter disease, weeds, and insects, reducing the need for pesticides.

The following materials are intended to provide stress-specific assistance in the management of turfgrass, and to assist the golf course superintendent in the reduction of pesticide usage. These alternative materials are particularly useful in the maintenance of high traffic areas such as tees and greens. As time progresses and the soil ages, the use of these modification materials may prove to be particularly beneficial for turfgrass hardiness.

**AquaTreat** is a balanced blend of selected natural bacteria, bacterial enzymes, nutrients and synergists developed specifically to enhance water quality. They use only non-living organic matter as food sources. They have not been genetically altered or manipulated in any manner. The cultures are completely safe, and will not harm humans, plants, animals, birds, or the environment. The product alleviates odors, digests sludge, and keeps water algae free. It is manufactured by TerraBiotics L.P.

**Bovamura** is a liquid organic manure fertilizer that promotes deep root development and encourages tillering. It may be used for root development on newly sodded areas. It supports the development of soil microorganisms and transforms nutrients to usable plant food. It is manufactured by the PBI Gordon Corporation.

**Bio.Trek 22G** with the active ingredient *Trichoderma Harzianum* is the first commercially available biological disease control agent for turfgrass in the United States. The product is registered and suitable as a partial substitute for some turfgrass fungicides. The product is produced by Wilbur-Ekkils in Fresno, California.

**Bio-Safe Organic 3 in 1** attacks insects by plugging their breathing tubes and causing asphyxiation. The product is registered for fleas, ticks, cockroaches, ants, scorpions, aphids, and beetles. The material is produced by American Weilness, Inc. in Carrollton, Georgia.

**Cruiser** is a bioinsecticide containing the host seeking *Heterorhabditis bacteriophora (Hb)* nematodes for effective control of Japanese beetle larvae and other white grubs in turf and flower beds. The product is produced by Ecogen, Inc.

**Eco Soil Systems, Inc.** produces a bioject golf course program for disease management, plant growth enhancement, sodium reduction and nematode suppression. The Bioject BioReactor is rented on an annual basis to inject large quantities of beneficial microbes directly into the golf course irrigation system. A developed strain of *Pseudomonas aureofaceans* plays an important role in the reduction of fungal diseases.

**Tx-1** plays an important role in the reduction of fungal disease. *Azospirillum brasilense* microorganisms are used to incorporate $N_2$ and release ammonia ($NH_4$) and nitrate ($NO_3$). The presence of *Azospirillum* provides for healthier turf through nitrogen fixation, production of plant growth regulators, and colonization on the rhizoplane.

**Epoleon** is an organic deodorizer and neutralizer. This product stabilizes compounds so they are not re-released into the atmosphere. It is manufactured by the Epoleon Corporation of America.

**Essential** contains a high percentage of carbon-rich organic materials and humic acid. The product contains intermediate metabolites, metabolites, simple sugars, peptides, amino acids, enzymes and amides, humate, lignin, organic chealates and cellulose fiber, all found in the natural stages of organic matter decomposition. The product is manufactured by Growth Products®.

**Green-Releaf** produces a group of natural microbes that form a symbiotic relationship with plant roots. Plant performance is enhanced by facilitating the uptake of nutrients and water while simultaneously aiding in pathogen defense. The products assist with reducing traditional fungicide applications.

**GroZone** is a calcined clay soil conditioner for the root zone. The material retains moisture to minimize stress from prolonged droughts and reduces watering requirements. It helps to increase nutrient retention, prevent compaction and creates a strong environment for healthy roots. It is manufactured by the American Colloid Company.

**Isolite** porous ceramic is a root zone modification material designed to improve water conservation and increase capillary porosity. It provides a low cation exchange capacity that will not tie up nutrients and helps to leach salts. It is typically used as a soil amendment during construction or aerification. It is manufactured by the Innova Corporation, an affiliate of Sumitomo Corporation of America.

**Netlon mesh** element may be used to increase macro-pores. The mesh is used to increase strength and provide increased stability on slopes. The filaments also open continuous pore space and may be a potential amendment that may be rototilled into the soil. It is manufactured by Netlon, Ltd. England.

**NoburN** is an organic wetting agent that loosens compacted soils. It helps to alleviate localized dry spots and hydrophobic conditions but does not have to be watered in, unlike synthetic wetting agent materials. It is derived from the desert Yucca plant and is manufactured by Roots Inc.

**Organica, Inc.** produces plant growth activators, insect control agents, humic acids, insecticidal soaps and seaweed and kelp activators. The products are designed to assist turfgrass managers with alternative control agents. The company furnishes substantial information on product evaluation and field trials, with evaluations and test results for agricultural and greenhouse pests. The company is actively seeking expansion within the turfgrass industry and has been working in California for specific pest controls in agriculture and related food crop activity.

**PanaSea and PanaSea Plus** utilize liquefied sea plant extract to stimulate root growth and aid in the reduction of thatch. Natural growth hormones (cytokinin) work to make the turfgrass more resistant to stress. The product works to speed release of the lemma during seed germination. It is manufactured by Emerald Isle Ltd.

**P2** is a synthetic polymer which acts as a water absorbent and retention material. This can be used to help raise the waterholding capacity and help lower the bulk density of the soil. It is distributed by Broadleaf Industries.

**Pro²/Oxygen Plus** provides oxygen to control stress encountered with anaerobic soils. There are several

groups of anaerobic microorganisms which are pathogenic in plants. These organisms thrive in the absence of oxygen. The release of oxygen into the soil environment is a practical method for control. It is manufactured by Plant Research Laboratories.

**Profile** is a ceramic product engineered to solve and prevent soil problems. Profile increases water retention and nutrient holding because of the capillary pores and the cation exchange capacity. The product improves root zones by adding water, nutrient, and air holding capacity. It is designed to be used during construction, after aerification or to improve topdressing blends.

**Sand-Aid** is a natural organic sea plant soil conditioner. It may be used to decrease nutrient leaching and increase fertilizer efficiency. It may be incorporated into the soil mix of new green construction or applied as a topdressing constituent. It is also manufactured by Emerald Isle Ltd.

**Spectrum** is a mix of 24 species of live beneficial micro-organisms containing beneficial acids and amino acids that assist with reducing toxicity levels in soil and allow the plant to create greater resistance to pathogens and pests. The product is produced by Tainio Technology & Technique, Inc. in Cheney, Washington. The company produces a series of biological soil amendment and turf care products.

**Turftech II** utilizes nitrogen fixing bacteria (cyanobacteria) and may contribute as much as one pound of nitrogen per 1,000 square feet over a 60 day period. It may help to suppress disease causing fungi and bacteria and reduce the need to apply additional forms of nitrogen. Normal phosphorous and potassium is still required. It is manufactured by Soil Technologies Corporation.

While each of the products above offers important contributions to biostimulation and stress management, they are useful only within an overall testing and conditioning program. Soil, plant tissue and water quality will be tested at least twice a year to obtain an ongoing evaluation of the nutrient and electrolytic balance. Testing will also provide answers on sodium content, pH, etc. of the soil which will guide the maintenance staff on the use of soil enhancements.

For example, the presence of a pH imbalance can make nutrient supplies unavailable through chemical insolubility or fixation. When this condition is found, the proper answer may be to address the pH level rather than to increase nutrients. Similarly, adequate nitrogen is needed to produce rapid enough growth to recover from traffic associated with play. Too much nitrogen, on the other hand, can increase thatch and create thin cell walls resulting in susceptibility to certain fungus. In the spring and fall, higher quantities of phosphorous are needed to increase root depth and mass. Higher potassium is needed in the summer to increase cell wall thickness. Too little nitrogen, potassium, phosphorous, micronutrients, etc., can lead to disease. All of these factors influence the selection of soil enhancements just as they determine the choice of fertilizers or other management chemicals.

## 4.8 Mechanical Control Program

Mechanical controls are often the most easily instituted and followed techniques for improving the turfgrass environment. Suggested mechanical controls include the use of some or all of the following types of equipment and practices:

- Core aerification
- Shatter-Core aerification (shallow and deep tine with solid tines)
- High pressure water injection aerification
- Spiking/Slicing
- Dethatching (heavy thatch removal)
- Vertical mowing (light thatch removal)
- Grooming
- Brushing
- Proper mowing heights
- Proper mower blade sharpening
- Proper equipment repair

Poor turfgrass growth is often due to imbalances in water, carbon dioxide and oxygen exchanges. Aerification typically remedies this.

Appropriate aerification can alleviate compaction and alter soil bulk density which inhibits root development. Historically, shatter core aerification has been used when persistent compaction problems warranted deeper aerification. With shatter core aerification, the presence of soil/sand on the canopy of the leaf surface must be minimized. The recent advent of high pressure water injection provides an increased safety margin for aerification on greens and tees during summer months. Comparative field testing is currently underway to determine the benefits derived when choosing this form of aerification. One minor disadvantage from hydro-injection aerification is the disturbance of lower profile particle fines or sand or gravel displaced onto the putting green surface. While no form of aerification is trouble free, the machine currently produced by the Toro or Cushman/Ryan Corporation allows aerification to be completed with the least amount of disturbance to the playing surface.

Aerification should be performed in the late spring (April-June), and again in the early fall (September-October) to manage routine problems. This timing is important. If aerification is performed too late in the summer, it can cause heat related stress, resulting in slow recovery which can encourage weed infestation and insect pest pressure. Summer aerification with traditional core aerifiers will increase direct sun exposure along with elevated evapotranspiration values. This may result in desiccation, turf damage, and a plant more susceptible to disease or pest invasion.

Consistent mowing heights and proper bedknife adjustments must be maintained throughout the growing season. No more than one third of the leaf blade should be routinely removed in any single mowing. Alternate mowing equipment will be used during periods of excessive soil wetness to maintain these consistent mowing heights. Mowing frequency will increase during the spring, generally following 7-21 days after fertilizer applications. During cooler conditions and hot and dry periods, mowing frequency may decrease. Mowing frequency will also be reduced during inclement weather to keep mechanical damage to a minimum.

Clippings will not be accumulated adjacent to play areas. This policy will minimize cross contamination of grasses near wetlands and encourage composting of the turfgrass clippings.

The commercial turfgrass equipment purchased for the golf course will be certified to meet the American National Standard Institute's (ANSI) voluntary safety specifications, B71.4-1984 and applicable regulations based thereon. Mowers will be adjusted, sharpened and inspected according to the manufacturer's specification in order to provide optimum cutting performance. The use of Wiehle rollers may be included on equipment used to mow tees, fairways, and greens. This will aid in the control of excessive thatch and promote underground shoots or tillers of the seeded bentgrass. Solid rollers should be used during the grow-in period. All turfgrass will be maintained at a cutting height which produces an optimum playing surface.

The range of heights listed in Table 24 are typically maintained for Kentucky bluegrass, fescue and bentgrass surfaces. A range of optimum heights has been provided to adjust for periods of dormancy and stress.

Table 24. Turfgrass Maintenance for Ferry Point Park Golf Course

| Area | HEIGHT OF CUT | MOWING FREQUENCY | (X) WEEKLY |
|---|---|---|---|
| TEES | 3/8"-5/8" (for bentgrass) (9.53 - 15.88 mm)<br><br>3/4"-1" (for bluegrass) (19.05 - 25.40 mm) | M W TH F | (3-4) with baskets |
| FAIRWAYS | 3/4"-1" (19.05 - 25.40 mm) | M T TH F | (3-4) with baskets |
| GREENS | 7/64"-7/32" (2.78 - 5.56 mm) | (M) T W TH F S S | (6-7) with baskets |
| ROUGH | 1.50"-3.00" (38.10 - 76.20 mm) | M T (W) TH F | (1-2) no baskets use vacuum rotary decks |

It is recommended that Ferry Point Park Golf Course consider the use of electric mowers where they are deemed practical. These newly introduced machines provide operator comfort, improvements in air quality and noise abatement. The Ransome E-Plex is now available for maintaining greens and tee mowing. The Smithco company provides an electric trap rake for projects that are located near residential or urban areas addressing noise abatement issues. Most major turfgrass companies provide electric transportation vehicles for golf course employees including golf carts and golf shuttles convertible for such use.

A variety of mowing equipment will be used to prevent matting, compaction and/or frequency marks. Equipment used to mow tees will be low compaction, light-weight mowers. They will be provided with optional grooming attachments, five to eight blade reels, and grass catchers. A combination of triplex mowers and lightweight five-gang mowers will be used on fairways. High frequency, eight to eleven blade cutting units with hydraulically driven reels will be used to maintain the fairway playing surface. Walk-behind mowers

causes less compaction, improve the quality of cut, and reduce turfgrass stress when compared with continual use of triplex mowers. Clean up passes around the edge of the green will be altered to allow upright growth and prevent what is known as tracking. Two types of mowers (reel-type and rotary) will be used to maintain roughs and general use turf. Ground driven or hydraulic reel mowers will be used to maintain areas adjacent to the secondary roughs. Areas adjacent to bunkers, greens, and tees may require the use of a hydraulic rotary or reel driven mower. The mowers selected will provide a uniform cut with a minimum of wear and compaction damage. They will maintain quality playing conditions and remove a maximum one third of the total leaf blade during each mowing.

The most critical part of the mechanical control section of this IGCMP is proper mowing height adjustment and mower cutting quality. Mowers must be maintained so that leaf blades are cut and not torn off. Mower blades must be sharp. Lacerated leaf ends will increase the possibility of pathogen invasion. Extensive irregular separation of leaf tissue gradually increases a process known as chlorosis. Proper mowing heights are also paramount to the management of healthy turf. Table 25 establishes reel adjustment and the minimum frequency schedule to follow prior to mowing. With the advent of variable clip control reels and reverse reel backlapping features installed on the latest hydraulic lightweight mowers, the following schedule should be part of the normal mechanical and maintenance mowing operations.

Table 25. Turfgrass Mower Reel Adjustment and Tuning Frequency

| Mowers | Periodic Adjustments | Minimum Backlapping | Minimum Grinding |
|---|---|---|---|
| Greens | Daily | As Needed | As Needed |
| Tees | Daily | As Needed | As Needed |
| Fairways | Daily | As Needed | As Needed |
| Roughs | Daily | As Needed | As Needed |

## 4.9 Summary of Cultural/Mechanical Controls

The following will be used as interrelated cultural practices:

- Mechanical spiker will be used to promote root growth, reduce the incidence of water puddling, and provide beneficial oxygen to the crown area;
- Vertical mowers will be used to control excessive areas of thatch (more than 1" or 2.5 cm on fairways/roughs; more than 3/8" or 1.25 cm on tees; more than 1/4" or 1 cm on greens);
- Brushes will be used to provide upright shoot growth and prevent matting;
- Coring machines or an aerifier will be used to eliminate compacted soils and prepare the site for topdressing or overseeding;

- High pressure water injection aerifier will be used in periods of stress or when the practice may help reduce the need to apply a pesticide;

- Mechanical renovator on fairways and roughs will be used to control excessive thatch. Seeding or sodding will be used as a preventive means to control unwanted species of weeds wherever possible;

- Topdressing will be applied periodically to all tees and greens, depending on the growth and thatch conditions of the respective areas. Wear patterns (divots) on tees will be topdressed and seeded. Markers will be moved daily to allow sufficient time for the surfaces to recover. This practice will help to eliminate the establishment of weeds that are the result of continual wear;

- Greens will be topdressed as deemed necessary by the golf course superintendent. The rate of top-dressing will be directly proportional to the need to control thatch or achieve smoothness;

- Topdressing material will be of the same material as indicated in the original specification plan for new construction of golf course greens. The use of identical sand as supplied for original construction is preferred. The lack of an organic matter is permissible as long as the material is of the same particle size distribution; and

- Topdressing will be used to level playing surfaces, improve root structure when coring, and to control thatch and protect new seedlings. Spot topdressing will be the practice for those areas in fairways with exposed native soils.

## Chapter V

## Chemical Controls and Handling at Ferry Point Park Golf Course

The need for pesticides, in most cases, is the direct result of failures from other control measures. However, imbalances may occur from time to time which require the use of chemicals to manage turf pests. Also, some pests and diseases are expected to require the use of fungicides and herbicides, and perhaps insecticides as well, regardless of the success of other control measures. Snow molds *(Typhula incarnata; T ishikariensis)* fusarium blight *(Fusarium spp.)* and pythium blights *(Pythium sphanidermatum; P. ultimum)* are all fungus diseases that require preventative applications of fungicides.

### 5.1 Risk Mitigation

The golf course is designed to ensure that surface runoff will not directly discharge to adjacent surface waters even under intense storm conditions. There will be no direct drainage path to the East River or other surface water features from either the golf course or the lakes. To ensure groundwater protection, infiltration below greens and tees will be filtered through peat/sand filter systems before it reaches the water table.

### 5.2 Methods of Selecting Chemicals

Chemical controls include herbicides, fungicides, insecticides and miticides. Modern pesticides have changed dramatically in recent years and special care must be taken to get the maximum efficacy out of them. At Ferry Point Park Golf Course, only pesticides with short residual activity periods (those which decompose rapidly) have been recommended. Insecticidal soaps and parasitic nematodes are recommended for insect and mite control.

Implementation schedules describing various levels of management are provided in Tables 26 and 27. Table 28 quantifies the specific chemical usage and the probable number of acres to be treated. The chemicals, rates, areas of application, and the pest treated are described as probable worst case situations. A more reasonable set of assumptions for pesticide usage implementing successful IPM is discussed in Section 4 of this chapter: "Anticipated Reduction of Pesticide Use with IPM."

The selection process for each pesticide was based on chemical effectiveness, registration for use in New York, and regional experience. Environmental safety considerations were also important in selecting chemicals for this plan. Sources used to obtain product information include: scientific literature, industry periodicals, environmental fate data, EPA pesticide registration standards, and manufacturers' literature (including technical reports, material safety data sheets, product labels and fact sheets, and communications with manufacturers'representatives). Pertinent information was first taken from primary and secondary scientific literature. The data from current literature and EPA reports were given preference over data provided by manufacturers.

## 5.3 Weather Stations & Computer Models

In addition to the proposed scouting activities, the Ferry Point Park Golf Course will install a weather, news and chemical information system such as the DTN Weather Center System or other similar models. The computer model system software will be integrated into the proposed state-of-the-art turfgrass irrigation system mainframe and will be designed to collect site specific information relative to turfgrass pests and to create an internal database for chemical and nutrient applications.

## 5.4 Other Factors Relative to Chemical Use

### 5.4.1 Influence of Thatch

Matted thatch can become dry and difficult to wet, in some cases causing the surface irrigation to run off. Ferry Point Park Golf Course will use cultural methods to prevent excessive thatch development.

### 5.4.2 Enhanced Degredation

Certain pesticides do not seem to work as well as they originally did. At first, people theorized that the pests had become resistant. Laboratory tests, however, have found that resistance is not a factor. Rather, it appears that most of the modern pesticides are broken down naturally by soil microbes, bacteria and simple fungi which have learned to break down these pesticides and use the by-products as a food source. This problem is called "enhanced degradation." It also appears that microbes may be able to degrade several pesticides after adapting to a particular one, a phenomenon known as "cross degradation."

Enhanced degradation seems to occur most commonly when the same pesticide is used repeatedly, especially during the same season. Reduced use of chemicals through IPM may mitigate the problem. Whenever feasible, the golf course will avoid repeated use of the same chemicals in an effort to limit enhanced degradation. Research by manufacturers and experiences at other golf courses will also be monitored for strategies to minimize this problem.

### 5.4.3 Irrigation

Irrigation after applications of insecticides or miticides to turf is very important to the success or failure of control. Though one must follow the instructions on the current label of the product used, there are some generalizations which can be made. Most surface insecticides designed to control chinch bugs, mites, and sod webworms should be on the leaf surface or in the top layers of thatch. Therefore, applications of insecticides or miticides made to control these pests should *not* be watered in.

Most soil insecticides for control of white grubs or billbugs need to get as far into the thatch layer as possible. Therefore, after application of insecticides for these pests, water will be applied until the top one inch of soil under the thatch layer has been wetted.

Granular formulations are common in turf management and these must be rained on or irrigated before the pesticide becomes active. Granular formulations are often preferred where irrigation is not possible because the active pesticide will remain longer, or at least until a rain activates the granule.

### 5.4.4 pH

Several insecticides and miticides are very sensitive to high or low pH levels. Therefore, knowledge of the pH range of the pesticide is essential. Before mixing, the tank water pH should be adjusted.

### 5.4.5 Timing

As with all pesticide control measures, timing is a critical issue. Most of the modern insecticides and miticides have short residual lives and need to be applied when the pests are in a susceptible stage. For example, the hyperodes or turfgrass weevil has a relatively short window for successful control lasting less than two weeks.

### 5.4.6 Pest Resistance

Several turfgrass insects have been identified with resistance to insecticides. Fortunately, most of this resistance occurred with the use of the older chlorinated hydrocarbon insecticides such as chlordane and dieldrin. However, some insects have demonstrated some resistance to the organophosphate insecticides. Therefore, the Ferry Point Park Golf Course will use a pesticide only when needed and if possible, not use the same product more than once in a season, or from season to season.

## 5.5 Anticipated Reduction of Pesticide Use with IPM

It is not unrealistic to assume that IPM will achieve pesticide reduction. Evidence gathered from existing golf courses using IPM shows that successful implementation of IPM programs does significantly reduce reliance on turfgrass pesticides. It is unrealistic, however, to assume that IPM, even with improvements over time and customization to meet the specific needs at Ferry Point Park Golf Course, will ever fully eliminate the need for pesticides.

Table 29 illustrates the decreased level of pesticide use anticipated on the golf course once the IGCMP has had an opportunity to succeed. A comparison with Table 28 "Projected Maximum Pesticide Usage for Ferry Point Park Golf Course shows large reductions in potential pesticides used during the first five years of operation. Reductions in anticipated usage of pesticides arise from reduced frequency of application, reduced quantities of active ingredients required per acre, and reductions in the management areas and maximum acres treated.

Table 29. Projected Pesticide Use with an Effective IPM Program

## 5.6 Pesticide Use and Storage

The golf course superintendent will be responsible for the administration of the following policies:

- The pest will be properly identified through use, as appropriate, of disease, insect and weed identification guides and diagnostic kits;
- The SUNY Extension Service will be consulted for additional BMPs and/or acceptable and approved IPM approaches;
- The golf course superintendent will identify and document occasions when the agreed upon threshold limit of pest activity has been exceeded;
- Environmental conditions will be reviewed and altered as a preferred option, when available, to reduce pest impact (i.e. reduce shade);
- Cultural controls appropriate to the turf related problem will be used to reduce impact (i.e. fertilizers, leaching of salts, removal of mycelium, etc.);
- Mechanical practices (aerifying, spiking, verticutting, etc.) will be considered to help reduce and improve turf under stress;
- A pesticide application will only be made when there is no alternative measure for control;
- The application of a pesticide will be made under the direction of a certified, licensed applicator;
- The golf course superintendent will be licensed in the proper New York State Department of Agriculture Pesticide Control categories;
- All pesticide applications will be made in accordance with label specifications;
- Material safety data sheets (MSDSs) on all products will be readily available for all personnel and a Hazard Communication Program will be prepared for employees at Ferry Point Park Golf Course;
- Applications will not be made in winds in excess of 10 mph;
- The applicator will adhere to all label specifications for loading, mixing and applying the compound. Protective clothing as specified by the label will be worn by the applicator;
- Liquid application of a pesticide will be made using a low pressure boom type sprayer with a boom height adjusted to minimize drift; and
- Notification of the application of a golf course pesticide will be made in accordance with New York State posting and notification procedures.

### 5.6.1 Spray Equipment

When practical, an ultra low-volume backpack sprayer will be used for spot applications. Low volume application of mist sized spray particles reduces the amount of water and pesticide required, reducing both drying and re-entry times. Ultra low-volume sprayers work well for many broadleaf herbicides that are applied at low dosage and mix easily in water. Pesticides applied as a wetable powder and/or at high applications may not work well in this type of sprayer. Pests that are slightly above threshold levels, but not excessive in population, will be treated with a proportioned droplet or a "wick type" spot applicator. A push-type grounds sprayer called Wheelie, Model #WS-480, with a 6 gallon tank designed for spot treatment applications or in areas less than 6,500 square feet may also be effective at the Ferry Point Park Golf Course.

For larger applications, a dedicated spray system will be used. The system will include a state-of-the-art flow meter with clogged-nozzle indicators and individual electric shut off capability. Enclosed cabs with electric isolation switches will allow instant on/off controls to target precise areas for spraying. The use of a "Windfoil" applicator with spray drift shields will substantially reduce aerosol drift.

Many nozzle sizes are available to control droplet size. These nozzles are generally 200 microns in diameter and must be matched to the gallons-per-minute and pressure rating of the pump control system. Nozzle calibration kits are available for these state-of-the-art sprayers.

To reduce the potential for drift, nozzle screens (50-100 mesh) should be installed to filter foreign material. Nozzles spaced 18" apart should be adjusted to apply material evenly. They should be of sufficient angle so as not to allow the spray material to drift from its target. Four nozzles generally offer the best drift control: extended-range flat spray tip, wide-angle full-cone spray tip, wide-angle flat-spray tip, and a wide-angle hollow-cone spray tip. Electrically controlled droplet applicator nozzles are also available.

State-of-the-art technology should never take the place of simple performance check calibration. The golf course superintendent should calibrate each nozzle size available for use and record the total number of gallons applied. The daily use reports on file in the superintendent's office should include verification that the appropriate amount of active ingredient was applied. These rates must comply with state regulatory procedures and be applied according to label restrictions.

### 5.6.2 Pesticide Containment and Handling

A pesticide containment pad will be constructed to control possible spills and pollution. The containment pad will be designed to meet the Department of Agriculture's provisions for Bulk Storage of Toxic or Hazardous Materials, or other applicable standards. The containment pad will be sufficient to intercept leaks and spills of pesticides that may occur in the dispensing area. The pad will comply with all City and New York State Department of Environmental Conservation codes.

Applicators will receive the appropriate training and will be knowledgeable in the compliance levels set forth within the Golf Course Management Plan. The following standards will be used as procedure for all pesticide applications:

1) The spray equipment will be filled with water from a back siphon-protected hose outlet. The spray tank should initially be filled to within 75% of its holding capacity. The compound chosen for use is then added to the water in the spray tank. Following mixing as specified on the label, the spray apparatus may be topped-off to achieve the proper ratio of diluted material.

2) All packaging materials will be triple-rinsed, with the rinse water poured into the spray tank to reduce the hazardous material entering the waste stream with the empty packaging. Water soluble and water-carried granule products allowing this type of rinsing are designated in Tables 28 and 29 by the term WSP (water soluble packets). All empty packaging will be stored either inside or adjacent to the pesticide containment building in its original shipping cartons until disposal.

3) Upon completion of the spray application, the equipment will be returned to the pesticide containment area and filled with water to within 25-50% of the tank holding capacity. The diluted rinsate is then applied in the areas designated as primary rough. Rinsate may be sprayed immediately adjacent to each hole where an application of a pesticide was applied. The rinsate will be applied with the same ground speed as the actual application. No rinsate will be applied in any areas deemed environmentally sensitive or having potential for surface runoff to such areas. Secondary rinsate or spillage will be collected in the above ground storage tanks for later spray application into the safe rough areas. All rinsate material should be applied to the target site on the same day as the initial application to avoid phytotoxicity.

The area fire station will be provided with a current copy of all chemicals and pesticides stored in the pesticide storage area. The Material Safety Data Sheets (MSDS) will be provided for each compound in the storage area. In the case of minimal discharge, employees will have the necessary protective equipment and clothing readily available and comply with the Pesticide Spill and Response Plan.

All hazardous materials will be disposed of through a licensed hazardous waste disposal firm. Discharge from dry bulk materials stored within the pesticide storage facility will be recovered by the use of a broom and dust pan used solely for the purpose of recovery of these materials. Any material that is not contaminated and suitable for use will be repackaged with an original label affixed to the new packaging. It will be used when the appropriate need arises and for its intended purpose and will not be disposed of unless contaminated.

Employees who apply pesticides at Ferry Point Park Golf Course will be state certified under the pesticide applicator program. Annual usage forms will be submitted to the Department as required and a record of pesticide usage will be kept for at least seven years. Newly proposed federal programs regarding labels, worker protection standards and reentry measures will be implemented when they are adopted by the New York State Department of Agriculture.

## 5.7 Pesticide Spill and Response Plan

A spill response plan will be activated for spills or leaks of management chemicals used on the golf course. This plan will comply with applicable federal, state and city laws. Major provisions of the proposed accidental spill response plan are the following:

Accidental Spill Response Procedure

The following information and materials must be in place and an inventory of these items posted in the chemical storage area:

1 Telephone numbers for emergency assistance, including local law enforcement and fire departments;

2 Sturdy gloves, footwear and aprons that are chemical-resistant to most pesticides (such as foil-laminate gear), and protective eye wear;

3 An appropriate respirator, if any of the spill materials require such during handling activities or for spill cleanup (reference Material Safety Data Sheets on file for each product used);

4 Containment "snakes" or booms to confine the leak or spill to a small area;

5 Absorbent materials, such as spill pillows, absorbent clay, dry peat moss or sawdust to soak up liquid spills;

6 Seeping compound to keep dry spills from drifting or wafting during clean up;

7 A shovel, broom and dustpan made from non-sparking and non-reactive materials;

8 Heavy duty detergent;

9 A fire extinguisher rated for all types of fires;

10 Any other spill clean-up items specified on the labels of any products used; and

11 A sturdy plastic container with tightly closing lid that will hold the volume of material from the largest pesticide container being handled.

Spill Response

1 **Reporting the Spill:** As soon as possible after a spill has been identified, the golf course superintendent will be notified and have responsibility for reporting all spills to the list of responsible parties, the City Emergency Agency responsible for rapid response, and the City's Hazardous Substance Information Office. The following will be reported:

Name and phone number of reporting party
Time and location of spill
Identity and quantity of material released
Status of clean-up and containment

2 **Controlling the Spill:** On-site responders will (a) protect themselves with appropriate protective closing and eye-wear; (b) stop the source of the spill; (c) protect others by warning them of the spill; and (d) stay at the site until the spill is cleaned up.

3 **Containing the Spill:** On-site responders shall (a) confine the spill as quickly as possible; (b) protect water sources and water resources; (c) absorb liquids with absorbent material; and (d) cover dry materials to prevent them from becoming airborne or solubilized.

4 **Cleaning Up the Spill:** On-site responders shall (a) clean up the spill; (b) decontaminate the spill site; (c) neutralize the spill site; (d) decontaminate equipment; and (e) decontaminate themselves.

## 5.8 Proposed Clubhouse and Maintenance Facility

The facility will contain an office, shop building, equipment storage facility, soil and trash bins, equipment wash bays, and above ground fuel storage. The maintenance building will be used for golf course equipment storage and other maintenance operations as well as the safe storage and clean-up of fertilizers, pesticides and other materials, subject to the conditions described in the next section. Sufficient parking will be available for the golf course maintenance employees.

The proposed clubhouse, maintenance and storage facility will conform to the appropriate City building codes for bulk storage of hazardous waste. The local fire station will be supplied a copy of the floorplan and will be provided a copy of the access security code. The facility will be landscaped and designed to blend with the rest of the project. An all-weather access road shall serve the maintenance building and provide emergency and service vehicle access.

Modern golf course facilities prove themselves in several ways, including increased employee safety; reduced insurance rate growth; eliminated or significantly reduced costs and liability of both storage and disposal of waste residue; and ease and affordability of maintenance (Haskett, 1995). The facility's design will have a significant impact on efficiency, annual maintenance spending and, ultimately, the quality of the golf course.

To ensure that operational efficiency and regulatory compliance are achieved, course designers, structural architects and the owners should make an effort to bring the golf course superintendent into the facility design process at its earliest stages. The superintendent is uniquely qualified to lead the team that designs the facility. By tapping the superintendent's expertise in the early stages, the ownership can obtain a more realistic understanding of the functions of a modern maintenance facility--and thereby avoid many of the oversights that often lead to inefficient operations or expensive remodeling.

A more detailed breakdown of proposed square footage requirements is presented in Table 30.

Modern 18-hole golf course maintenance facilities average 4,000-6,500 square feet and require approximately 1.5 acres for circulation. This golf course will install an Enviro-Drain® or equivalent system in the maintenance facility. The fuel island and wash apron will be designed with independent containment filters for fueling equipment and washing turfgrass equipment. A carport roof or canopy will be attached to the station to protect the system from rainfall and/or snow melt. The filter system dislodges phytotoxic contaminants such as grass clippings, oil, grease, and chemicals from the wash water system and provides a secondary back-up that guards against accidental spills. The system also filters residual concentrations of turfgrass chemicals and non-phytotoxic materials such as fertilizers. A back-up overflow system is normally installed to collect potential spills and divert the rinsate onto the wash pad apron and/or collection system. This will reduce the potential for inadvertent pesticide exposure and drift.

Ferry Point Park will install a recycle washwater system for the turfgrass equipment washpad area where the potential concentration of hazardous waste on a daily basis is highest. The recycling wash water system will be capable of capturing grass clippings, oil and grease, and trace organics.

Table 30. Ferry Point Park Proposed Maintenance Facility Program

| **1. Office & Conference Area** | **Square Feet** | **Square Meters** | **Comments** |
|---|---|---|---|
| Secretary/Reception | 200 | 18.58 | |
| General Office | 170 | 15.79 | |
| Superintendent Office | 325 | 30.20 | |
| Computer Room | 170 | 15.79 | |
| Men's Restroom w/ shower | 145 | 13.47 | |
| Women's Restroom w/ shower | 145 | 13.47 | |
| Lockers | 150 | 13.94 | |
| Break Room | 360 | 33.46 | |
| Conference Room | 150 | 13.94 | Includes part storage |
| Assistant Superintendent's Office | 156 | 14.50 | |
| **Subtotal** | **1,971** | **183.14** | |
| **2. Shop/Equipment Storage Area** | **Square Feet** | **Square Meters** | **Comments** |
| Equipment Storage | 4,800 | 446.10 | Large, small equipment Fertilizer & Seed Storage |
| Grinding, Equipment Tech | 300 | 27.88 | |
| Parts | 156 | 14.50 | |
| Repair Shop/Lift Area | 1,080 | 100.37 | |
| Oil Storage | 100 | 9.29 | |
| Chemical Storage | 100 | 9.29 | Located in self-contained structure outside |
| **Subtotal** | **6,536** | **607.43** | |
| **Total of Subtotals** | **8,507** | **790.57** | |
| 10% Circulation, Electrical, Mechanical Walls | 850.7 | 79.06 | |
| **TOTAL** | **9,357.7** | **869.63** | |
| **3. Nursery/Storage/Wash Area (Exterior)** | **Square Feet** | **Square Meters** | **Comments** |
| Turfgrass Nursery | 6,000 | 557.62 | |
| Soil Bins | 1,024 | 95.17 | 4@ 16 x 16 |
| Equipment Washing | 200 | 18.58 | |
| Unloading Dock | 800 | 74.35 | |
| Trash Enclosure | 400 | 37.17 | |
| **Subtotal** | **8,424** | **782.89** | |

Note: This table may be revised according to the final Golden Bear specifications for golf course maintenance facilities.

## 5.9 Pesticide Storage Facility

A separate, stand-alone pesticide storage structure of adequate size will be installed at the end furthermost from offices, break room, mechanic area, and employee eating areas. The structure will be placed in the equipment parking and storage area and will be located next to the fuel island and wash pad apron. A back-up overflow system will be installed to collect potential spills and divert the rinsate onto the wash pad apron and collection system. This will reduce the potential for inadvertent pesticide exposure. The structure will meet and/or exceed the State of New York's requirements for pesticide storage and will easily integrate into the golf course maintenance floorplan.

Four companies specialize in golf course prefabricated pesticide storage units.

Perma Lock Inc.
P.O. Box 770357
Houston, TX 77215-0357
800-288-8873

RGF Environmental Systems, Inc.
3875 Fiscal Court
West Palm Beach, FL 33404
407-848-1826

Safety Storage, Inc.
2301 Bert Drive
Hollister, CA 95023
617-598-8906

Safety Strategy, Inc.
P.O. Box 1579
Manchester, MA 01944
203-651-7522

The pesticide storage building should provide adequate ventilation actuated by an external, explosion-proof light/fan switch. The switch should be protected from vandalism and covered for security. An instruction placard indicating proper entrance and lock-out procedures should be placed in the doorway entrance. The locality of the exhaust fan must be positioned so that vapors will be released to the outside of the building.

The facility will be designated and posted as a pesticide storage area (as required by law), with a list of all chemicals contained in storage on file in the superintendent's office. One copy of this list should be provided to the Fire Station. Additional copies should be located in the clubhouse or in an appropriate file located away from the pesticide storage structure.

Strict discharge limits have been set by EPA for oil, greases, solvents, fuels, grinding compounds, heavy metals, detergents, insecticides, fungicides, herbicides, and nitrates. Simply washing these materials down the drain, into the ground or into a waterway is neither legal nor environmentally responsible. Recycling systems for wash water are designed as closed looped systems and address direct discharge into a sewer or water quality basin. The wash water system functions by utilizing a three-step process:

- Grass clippings are removed from the washwater to minimize the release of hydrocarbons, including potential fertilizer and pesticide residues.
- The washwater is recycled continuously while physically removing oil and solid particles. This process prepares the water for filtration.
- The washwater is filtered with carbon packs prior to discharge into the waste stream.

## 5.10 Storage Facility Check List

The following operating procedures are recommended for the pesticide storage facility:

- The building will be secured and locked at all times;
- An additional key will be placed in the administrative office and in the office of the golf course superintendent in case of emergency;
- Materials will be stored on shelves located high enough to permit cleaning of the floor. No material should be stored above 6 ft from the ground;
- All materials will have legible labels attached. Materials whose packaging has been damaged must be in containers clearly marked and labeled;
- Plastic secondary containers are used to store liquids shipped in quantities of 1 gallon or more for protection against spillage;
- A plastic trash barrel with lid will be located inside the storage facility for cleanup;
- The golf course maintenance department will be trained in the operating procedures regarding this building;
- Appropriate protective clothing and equipment will be provided for use by those who handle pesticides;
- Absorbent materials designed to contain accidental spills will be available within the pesticide storage facility;
- Disposal of pesticide containers shall comply with the instructions on the labeling and other state and federal regulations. Empty containers will not be allowed to accumulate or be stored within this building;
- The building will be inspected at least monthly by the golf course superintendent and a record of each inspection recorded in the records for pesticide use; and
- Obsolete, excess, and mixtures of pesticides shall be disposed of by a licensed hazardous waste firm or according to the statutes and regulations established by New York state law.

## 5.11 Fuel Storage and Waste Oil Dispensing

The maintenance facility will contain a 500 gallon storage tank for gasoline and a 500 gallon storage tank for diesel fuel. Both tanks will be dual walled above ground tanks with monitoring leak detection systems and vehicle barriers for accident prevention. The sump and concrete pad will be designed with a carport roof to protect the tanks from rainfall and snowmelt. The tanks shall consist of a UL listed primary tank, a high density polyethylene secondary compartment, and a six inch reinforced concrete encasement. The concrete vault which provides thermal and corrosion protection can be poured on location or shipped precast. The tanks installed will conform to the Uniform Fire Code and NFPA.30 regulations for above ground tanks. The tanks will be designed to meet or exceed the above ground regulatory storage requirements in the state of New York.

The appropriate signs indicating No Smoking with Fuel Safety Warnings will also be installed. A 250 gallon waste oil and solvent storage tank will be installed at the golf course maintenance facility.

## Chapter VI

## Water Demand and Analysis

### 6.1 Water Replacement Strategy

Irrigation water will be applied to the tees, greens, fairways, and primary and secondary roughs. The project is committed to conserving water and using water resources in an efficient and effective manner. Supplemental irrigation will be necessary during the grow-in period of the golf course and to assist with the restoration of the disturbed areas, including tree and shrub planting projects.

Increased irrigation will be necessary during the germination period to successfully assist with quality control of the naturalized restoration plan. After the establishment period, the proposed grassing plan will allow for a reasonable reduction in supplemental irrigation and provide excellent playing surfaces, even in areas grown under droughty conditions. The maximum usage or peak water demand during the first year of grow-in is estimated at 476,119 - 612,400 gallons/day (gpd).

### 6.2 Water Demand, Supply and Storage Analysis

The replenishment of soil moisture as it is extracted and the leaching of salts that accumulate are vital to the creation of a sound root environment. The amount of water required for leaching is directly proportional to evapotranspiration and the potential concentration of salts in the irrigation water. This is inversely proportional to the salinity tolerance of the turf and explains why evapotranspiration should always be used as the main factor when determining total irrigation water requirements.

The water supply for the golf course will be New York City municipal water, as is the case with other New York City Parks Department facilities.

Table 31 characterizes the average daily water demand, supply and storage analysis for Ferry Point Park Golf Course. For maximum efficiency, irrigation of the turfgrass is proposed during the months of March through November. An analysis of natural rainfall and evapotranspiration has been performed and an estimate of daily and yearly usage has been completed. The figures represent the total water needs for turfgrass in this climate, on average, including rainfall and irrigation sources. The demand averages reflect the projected average daily usage of irrigation water for the golf course during and after the grow-in period. However, both the initial request for peak water demand and the average water demand analysis presented reflect accurate golf course irrigation and water needs. This table represents less than or equal to 140 acres of established turfgrass grown under normal growing conditions using 408,267 gpd with a peak average daily demand of 612,400 gpd during grow-in.

## 6.3 Irrigation Water Quality

An irrigation suitability and water quality analysis will be performed to determine water quality pH, total dissolvable solids, chlorides, bicarbonates, electrical conductivity (ECw) and the sodium adsorption ratio (SAR). During the first year of operation, quarterly testing of the soils prior to preplant and after the grow-in period should be conducted to maintain adequate levels of soil calcium, magnesium and potassium. Modification of the soil pH will be directly proportional to the levels of calcium in soil and the amount of applied irrigation water.

## 6.4 Water System Specification and Capabilities

The golf course will install an automatic irrigation system designed to achieve maximum distribution and uniformity of coverage. The system will be engineered to water the entire golf course each night and apply a minimum of 1" of water per week without over watering. The spacing of sprinklers will be designed to minimize surface runoff and avoid inadvertent drift. Field controls will be placed for maximum visibility. Valve-in-head sprinklers will be used with individual control wires installed for each of the irrigation heads back to the field controllers. Heads on fairways and roughs can be paired at the controller on an average of two heads per station. Green and tee sprinkler heads will be operated individually. Greens will be irrigated with full and/or part-circle sprinkler heads to allow the superintendent to irrigate in a more efficient manner. This reduces disease potential and results in lower usage of pesticides. Quick coupler snap valves will be necessary near the naturalized plant restoration areas in order to provide supplemental water for grow-in purposes.

ETS also recommends the installation of an irrigation water injection system to assist with applying gypsum or acidifying materials designed to manage the level of sodium in soils. The Bioject® and/or EcoSoils Solution System® are easily adapted to the irrigation system and allow for maximum distribution of sodium leaching materials in the least amount of time. The injection system should be included as an optional add-on in the irrigation design bid package.

## Glossary of Terms

**abiotic** – Non-living substance, at one time may have been living.

**aerification** -- A mechanical process used to facilitate soil air/water relationships of the turf without destroying the integrity of the sod.

**a.i.**-- Active ingredient. Chemical agent in the product primarily responsible Ibr the pesticidal effects. Percentage of a. i. is shown on the pesticide label.

**annual** -- Plant that completes its life cycle from seed in one year or season.

**annual bluegrass segregation** -- The introduction of annual bluegrass *(Poa annua)* that has invaded and persistently remains a major component of irrigated turf. Annual bluegrass becomes the dominant species under these conditions and the IPM program is altered to meet the requirements of this species.

**apron** -- Fairway area immediately surrounding the collar of the green. Second cut. (see collar).

**acervuli** -- Plural of acervulus, a microscopic, black structure, embedded in plant tissue, on which fungal spores are produced.

**bacteria** -- Microscopic, single celled organisms having a cell wall but lacking an organized nucleus and incapable of making their own food. All plant pathogenic bacteria can live saprophytically.

**biennial** -- Plant that completes its life cycle from seed in two years or seasons. First year it produces a vegetative plant and stores food; the second year or season it produces flowers and seed.

**biocoenosis** – A community of animal and plant life.

**biotic** -- Living substances.

**blight** - Affecting a large portion of the leaves or the whole plant.

**broadcast application** -- Application over the whole area.

**broadleaf weed** -- Common term for plants in the dicotyledon group (dandelion, plantain, spurge, etc.).

**broad spectrum pesticide** -- Pesticide which is effective against several pests (in contrast with a specific pesticide which controls primarily one pest).

**brushing** -- A mechanical process to aid in grain control whereby horizontal stems are lifted so that they may be cut by the mower.

**causal agent** -- An infectious (viruses, mycoplasmas, bacteria, fungi, and nematodes) or noninfectious (mechanical, temperature, water, gases, pollutants, light) biotic substance which is involved in causing plant damage.

**chlorophyll** -- Green pigment found in structures called chloroplast in plant leaves. Chlorophyll is the material which enables plants to carry out photosynthesis. chlorosis –A process by which plant tissue loses its normal green color and gradually becomes yellowed.

**clippings** -- Leaves, stems and stolons cut off by mowing.]

**collar** -- Area between the putting area and the apron.

**curative pesticide** -- A pesticide that can inhibit or eradicate a disease-causing organism after it has become established in the plant or animal.

**fixation** -- state of being fixed.

**innoxious** -- harmless.

**insolubility** -- incapable of being dissolved.

**insecticide** -- Any chemical used to manage (control) insects.

**internode** -- Part of a stem which lies between two successive nodes.

**irrigation** -- Applying water to turf.

**landing area** -- Part of the fairway where tee shots usually land.

**lapping, mower** -- Part of the process of sharpening a reel mower.

**layering, soil** -- Undesirable stratification of different textured material in the soil.

**localized dry spot** -- Area of the soil which resists wetting,.

**mat** -- See thatch.

**microflora** -- Plants invisible to the naked eye, such as diatoms and algae.

**monocotyledon** -- Botanical group in which monocotyledon (one cotyledon or seed leaf) plants are placed. Leaves are usually longer than broad. Leaf veins are parallel.

**mycelium** (a) --Thread-like body of the fungus generally invisible except during periods of luxuriant growth.

**narrow leaf**-- Common term for plants in the monocot group (all grasses, sedges, etc.)

**necrosis** -- Irreversible decline, death of the tissue. Usually yellow to tan or gray, then brown or black.

**nematode** -- Microscopic round worm which mainly infects the roots of plants. Most plant parasitic nematodes need to feed on a plant in order to get food required for reproduction.

**node** --A stem joint capable of producing buds, leaves and/or roots.

**noninfectious** --Incapable of entering a living plant and causing disease.

**nonselective** – Herbicide which kills plants irrespective of species. Not selective for controlling weeds without injury to turf

**nursery,** turf-- Place where replacement sod or vegetative planting material is grown for Planting elsewhere.

**obligate parasite** -- An organism incapable of completing its life cycle outside a specific host plant.

**osmosis** - The process by which Liquid passes through a semipermeable membrane from a lower concentration to a higher concentration.

**overseedi**
in the wintertime.

**pallete --A** composite grouping or collection of plants that are typically planted to emulate native plant life or habitat.

**panicle** -- Many branched flower head with flowers at the end of each branch. Common in grasses such as annual bluegrass.

**parasite** --Any living organism which is capable of deriving its nutrition from another living organism but may not necessarily cause disease in the host organism. pathogen --Any parasite capable of causing a disease.

**pesticide** --A generic name given to a chemical capable of controlling insects, pathogens and/or weeds.

**perched wa**
textured soil and an underlying coarse texture. The
continuity of water films is disrupted, slowed, or stopped altogether.

**pheromones** - Chemicals produced by insects and other animals to communicate with and influence the behavior of other animals of the same species. (note: Most pheromones used today in pest management are synthetic and are used to monitor insect populations.)

**phenology** -- The scientific study of the changes in biological organisms that
coincide with the yearly seasons, such as the timing of plant emergence and the progression of the fall tree colors from north to south.

**photosynthesis** -- Process by which plants containing chlorophyll are capable of Producing their own Ibod (carbohydrates) from carbon dioxide and water in the

**physiological** - The functioning of plant processes dependent on biochemical actions.

**poling** - Using a limber pole to remove the dew from leaves of grass.

**postemergence** – After germination and emergence from the soil.

**prostrate** -- Growth habit of tendency to lie flat on the ground.

**reel mower** -- Mower that cuts turfgrass by means of a series of curved, rotating blades which pull the grass into a stationary bedknife and cut the grass in a manner similar to a scissor.

**renovation** -- Improving a turf without completely destroying the turf characteristics. May or may not include planting new seed or vegetative material into an existing

**residue** -- That which remains.

**rhizome** -- Below ground stem with nodes and internodes capable of producing a new plant at each of the stem nodes.

**rosette** --A tuft or cluster of closely crowded leaves arising from a very short stem. Caused by the dwarf or compaction of the internodes.

**rotary mower** -- A mower that cuts the grass by means of a single blade, mounted parallel to the surface of the turf and sharpened on each end. The blade revolves at a high rate of speed in a horizontal plane and cuts the leaves of the grass by impact action.

**rough** -- Part of the golf course which borders the tee, fairway and greens. Usually mowed at a higher level and maintained less intensively than other parts of the golf course. Does not usually come into play.

**scald**-- Injury to turf caused by standing water.

**scalping** -- Excessive removal of the green portion of the turf plant, leaving brown stubble exposed.

**sclerotia** - Propagules composed of hardened masses of mycelium which aid the fungus in surviving periods of adversity. Golden brown to black in color and spherical to irregular in shape. Can be the size of a cabbage seed to microscopic.

**selective** -- Type of herbicide which will control one plant species without injury to another. Usually indicates that herbicide will kill weeds without injuring certain species of turfgrasses. Excessive rates of application may reduce or eliminate the selectivity.

**semidormant** -- Turf which is in a quiescent stage because temperatures are below the optimum for normal growth.

**senescent** -- Plant tissue declining after reaching maturity. Old age.

**sheepfooting** -- A method of compacting soil in putting green construction. This may be performed by the use of human feet or mechanically by a soil compactor.

**slicing** -- Method of cultivation or aerification in which a blade cuts through the turf intermittently, perpendicular to the surface.

**sod** --Plug, squares or strips of turf which has some adhering soil. Usually produced in a large controlled area.

**sodic soils** -- May develop as a result of irrigation. The soil solution contains ouly small amounts of calcium and magnesium, but larger quantities of sodium. In some cases potassium salts may also be present.

**soil applied pesticide** -- Pesticide which is applied to the soil where it has its activity. Some may be taken up by root and translocated to other parts of the plants.

**spiking**-- Method of cultivation in which a solid tine or pointed blade penetrates the turf and soil.

**sporulate** -- Process by which a fungus produces spores.

**spot spraying** -- Application of a pesticide to small areas. Contrasted to broadcast application.

**sprig** -- a generic term Ibr a vegetative planting material. May include stems, leaves, roots, stolons, rhizomes, etc.

**sprigging**-- Establishing turf by means of planting sprigs or stolons

**stimpmeter** -- A device to measure the speed of putting greens.

**stringlining** -- The art leveling a soil surface with a marked line using a line with string or the use of a piece of square lumber shuffled across the surface.

**stolon** -- Above ground stem which spreads laterally at the soil surface producing new plants at the nodes.

**suboxidation** -- A condition in which soil oxygen is severely limited. surfactant --Material which reduces the surface tension of a liquid (such as water) and improves the spreading of the liquid on a surface. Usually used with pesticides applied to the foliage to improve coverage.

**syringing** -- Applying a small amount of water, usually in the Ibrm of fine droplets, to cool the plant, prevent wilt, or remove dew.

**systemic** -- Pesticide which is absorbed into a plant through the leaves andlor roots and translocated throughout the plant.

**thatch** --A layer consisting partially of undecomposed organic matter, between the crown of the plant and the soil surface andlor below the soil surface.

**transition zone** -- An irregular east-west zone consistent with isothermal lines between warm season grasses are well adapted. Both may be grown in this zone.

**translocation** -- Movement of materials within the plant from point of entry to other areas, such as leaves to roots or roots to leaves.

**vascular system** -- Conducting or transport avenues in plant tissue, such as veins in leaves.

**vertical mowing** -- Use of a mechanical device with vertical cutting blades to manage grain and thatch.

**verticutting** -- Using a vertical mower.

**viruses** -- Submicroscopic entities consisting of a nucleic acid and a protein sheath. All viruses are obligate parasites as they can only multiply in living plant cells.

**warm season turfgrasses** -- Species of turfgrass which are adapted to the warmer subtropical and tropical regions of the world. Members of the subfamilies Panicoideae and Eragrostideae. On golf courses in warm regions of the world, primarily bentgrasses (Cynodon spp.).

**weak pathogen** -- Organism not capable of infecting vigorously growing tissue. It generally attacks tissue under a biological stress from abiotic or biotic causes. Often referred to as a "secondary pathogen", as it usually attacks tissue previously infected by a primary pathogen.

**wetting agent** -- See surfactant.

**wilt** -- Drooping of turfgrass leaves due to loss of turgor under moisture stress. Wilt may be due to acute and/or chronic lack of soil moisture, a dysfunction of the root system such as from a root rot, excessive salts in the soil water, or from suboxidation which limits the uptake of water as oxygen is essential for the process of water uptake.

## 1.0 INTRODUCTION

TRC Environmental Corporation (TRC) conducted a series of field investigations to assess environmental conditions at the eastern portion of the New York City Department of Parks and Recreation (DPR) Ferry Point Park. Because of the site history of use as a municipal solid waste landfill in the 1950's and 1960's environmental conditions were evaluated to assess current conditions and the potential for significant adverse health impacts under current plans for development of the site as a public recreational facility. In general, the environmental evaluation was conducted in accordance with guidance provided by the City Environmental Quality Review (CEQR) Technical Manual. Specifically, TRC evaluated conditions relative to Chapter 3, Section J: Hazardous Materials.

Three phases of field investigations were conducted, as outlined below:

- A test pit investigation was conducted to determine the thickness of existing soil cover materials and to generally characterize the types of solid waste present in the subsurface;
- A landfill gas investigation was conducted to assess the nature and extent of landfill gas occurrence, including the presence and/or distribution of landfill gas at the surface and in the subsurface of the landfill; and
- A subsurface drilling investigation was conducted to assess the physical and chemical characteristics of subsurface materials, especially in areas of proposed excavation and/or development.

### 1.1 Project Objectives

The objective of the field exploration programs was to provide sufficient data to assess the presence of and potential impacts from hazardous or contaminated materials associated with past landfilling activities on the site on the proposed development of the site.

### 1.2 Report Organization

Section 1.0 provides an introduction to the project and defines project objectives. Section 2.0 provides detailed background information on the environmental setting and conditions at the site, including existing conditions, site history, and surrounding land use. Section 3.0 describes the nature and findings of the environmental investigations conducted

at the site, including the test pits, landfill gas and subsurface investigations. Lastly, Section 4.0 provides information on the potential human health and environmental impacts for both the construction and operational phases of the proposed project, based on the information provided by the site explorations.

4

## 2.0 BACKGROUND INFORMATION

### 2.1 Study Area Existing Conditions

The study area consists of a portion of Ferry Point Park located under and immediately east of the Whitestone Bridge and the Hutchinson River Parkway (U.S. Interstate Route 678) as indicated on Figure 1. The Ferry Point Park site is a former landfill owned by the City of New York and currently administered by DPR. The site is bounded by Schley Avenue and St. Raymond's Cemetery to the north; Balcom, Miles, and Emerson Avenues to the east; the East River to the south, and the I-678 northbound and southbound service roads and the western portion of Ferry Point Park to the west. Available topography for the site shows that its current elevations vary from about 10 to 40 feet above mean sea level, with gentle slopes.

The landfill parcel may be described as consisting of two sections, which can be differentiated in part by topography/landform, and by vegetation. The eastern section is approximately 70 acres in size, has a covering of low grasses and a few small trees (estimated to be 5 to 10 years old), and varies in elevation from approximately 3 to slightly over 40 feet above the National Geodetic Vertical Datum of 1929 (NGVD) (based on the United States Geological Survey (USGS) 7.5 Minute Flushing Quadrangle, photorevised 1979). The western portion of the landfill, which slopes down to the East River waterfront, is approximately 140 acres in size and covered with tall (6-foot) heavy grasses and vegetation with a few trees (larger than those observed on the eastern section). The western portion of the landfill varies in elevation from sea level to slightly over 40 feet NGVD. Both sections of the landfill are criss-crossed by informal unpaved dirt-bike trails.

In general, the majority of the site is currently inactive. However, DPR operates an organic recycling facility in a fenced-in area along the western side of the landfill, and a composting operation which is located along the access road on the west side of the landfill. An informal model airplane runway and sitting area is located east of the DPR operation. Other existing land uses for the site appear to consist of the use of dirt bikes and four-wheel-drive vehicles on informally developed trails that criss-cross the site. Other than these areas of current activity, the remainder of the site is covered with vegetation that was either planted

or has developed naturally over the past 15 to 20 years. During the course of the field activities, light use of the site for walking and motorbiking was also observed. Existing site conditions are illustrated on a 1991 aerial photograph provided as Figure 2.

Proposed golf course facilities, including a waterfront park, clubhouse, restaurant and catering facilities, associated maintenance facilities, and community park, are schematically depicted on a 1991 aerial photograph of the property as illustrated on Figure 3.

The southern portion of the landfill abuts the East River along a rip-rap-covered shoreline and a cemetery is located to the north of the western portion of the landfill. Land use to the north, east, and south of the eastern portion of the landfill is residential. A small playground abuts a portion of the northeastern-most corner of the landfill.

## 2.2 Site History

The site was in operation as a landfill from before 1951 to the 1960's. The landfill reportedly accepted municipal solid waste during its operating period (telephone conversation with Mr. P. Gleason of the New York City Department of Sanitation on July 30, 1998), and was closed and covered in the mid-1960's, with additional closure operations conducted more recently (1980's).

Site use is depicted in historic aerial photographs from the years 1951, 1954, 1959, 1962, 1982, and 1991. This series of aerial photographs spans practically the entire operational period of the landfill, from its initial operations to the present, and provides substantial information about the site's development. Annotated aerial photographs from each of the above referenced years are provided as Figures 4 through 9. The following observations are made:

- The 1951 aerial photograph, provided as Figure 4, depicts a relatively small area of municipal landfill in the northwestern portion of the project site. Elements observed on the photograph include an area of municipal waste disposal, active landfill face, dark colored areas indicative of wet areas, and mounded construction debris. The most evident feature on the 1951 aerial photograph is the reduced size of the active landfill area compared to the future landfill boundary.

- The 1954 aerial photograph, provided as Figure 5, shows the landfill in a transition state. The limits of the 1951 landfill are still evident, but several earthen berms are present within the water to the south and east. These berms define limits of future landfilling. In particular, an apparent dewatering barrier is visible in the central portion of the site with active landfilling occurring to the east. Additional features evident include areas of mounded construction debris, mounds of waste material, and several areas that may represent stockpiles of cover soil.

- The 1959 aerial photograph, provided as Figure 6, shows the landfill boundary to the south approximating the final extent of filling. The areas outlined by berms in the 1954 aerial photograph are now filled in and a vehicle and equipment storage area is visible along the southeastern portion of the site. Numerous sanitation trucks are visible hauling refuse to the active working face of the landfill, and dark areas, indicative of wet low-lying zones are present in the southern portion of the site. Piles of waste and/or cover materials are also visible.

- The 1962 aerial photograph, provided as Figure 7, shows the approximate final extent of landfilling at the property. The dark areas to the south are now absent, likely indicating the placement of additional fill to the south since the 1959 aerial photograph. This photograph shows active use of the majority of the easternmost portion of the property, as indicated by several landfill lifts. A baseball field and support area are now present in the far northeastern portion of the property. Mounds of waste material and several areas of soil cover material are also shown.

- The 1982 aerial photograph, provided as Figure 8, shows the site in its approximate current condition. Vegetation has developed over a large part of the property and numerous trails are visible. Several informal dirt bike trails are evident, as is a "T" shaped paved area presently used as a model airplane landing strip. Along the northern portion of the property, mounds of construction debris and a small area of active landfill is visible.

- The 1991 aerial photograph, provided as Figure 9, shows further growth and development of site vegetation. The paved strip area is still visible, as are the construction debris in the northern portion of the site. However, the previous extent of landfill activity in the northern portion of the site is greatly reduced. Several dirt bike tracks, including at least some portions of the dirt bike tracks shown on the 1982 aerial photograph, are visible. The baseball field and support area in the far northeastern portion of the site are no longer present. However, another baseball field and a basketball court are present to the south.

In summary, aerial photographs from 1951, 1954, 1959, 1962, 1982, and 1991 provide a basis for the following general conclusions regarding the nature of historic operations at the site.

- Historical aerial photographs dating back to 1951 indicate that the fill appears to have been placed in upland areas (possibly previously filled areas) and in areas formerly submerged by the East River and associated inlets.

- In general, the landfilling activities appear to have followed a planned sequence with respect to the geometry of the ultimate site boundaries and utilized internal separations as landfilling progressed.

- The majority of landfilling activity occurred in the late 1950's to the early 1960's, thereby indicating the majority of waste materials to be on the order of 40 to 50 years old. Vegetation has been established over for the site for on the order of 15 to 20 years.

## 2.3 Previous Explorations

Historic information from 10 borings drilled in the vicinity of the DPR organic recycling facility and northwest of the model airplane area in November-December 1990 indicated fill thicknesses of 14 to 23 feet (W. M Walsh Co., Inc., "Boring Location Plan and Logs," dated January 10, 1991, Contract No. C.N.Y.C.-1989). The fill thickness appeared to increase from the borings at the northern edge of the property (14 to 16 feet) to the southwest (22 to 23 feet). The fill was described as 'misc. fill, shot rock'. Underlying the fill at the locations at the northern edge of the property was a layer of gray silt or, depending on location, a ½- to 1-foot layer of meadow mat underlain by gray silt. Each of the borings encountered gray fine to medium sand at a depth of 19 to 23 feet below grade.

## 3.0 SOILS ASSESSMENT

### 3.1 Introduction

TRC conducted three separate field investigation programs to:

- assess the general nature and approximate thickness of cover soils;
- assess the nature and extent of landfill gas occurrence; and
- assess the chemical characteristics of materials present within the landfill in areas of proposed excavation and/or development.

TRC conducted soil boring and soil sampling activities in accordance with a project specific quality control plan. This plan was developed to ensure that sampling and analysis activities provided reliable and representative results. The quality assurance/quality control (QA/QC) program addressed the maintenance of sample integrity from sample collection in the field to analysis in the laboratory. Additionally, TRC personnel followed a Health and Safety Plan (HASP) during field explorations at the sites which described the nature of wastes or contamination suspected and present at the site, the site access and work zones, and the initial level of personnel protection and monitoring anticipated during site investigation activities.

### 3.2 Cover Soil and Preliminary Waste Characterization

TRC completed 38 test pits (TP-01 through TP-38) at various locations across the site between July 21 and 27, 1998 to assess the thickness of landfill cover material and visually characterize the fill/waste materials. The locations of site test pits are shown on Figure 10.

The test pit excavation program was conducted using a track-mounted excavator with an approximate 15-foot reach. The thickness and characteristics of the cover material and fill/waste material, the depth to ground water, and total depth of the excavation were recorded on a test pit log. Test pits were conducted under Permit Number X-12-98NFC issued by DPR. The test pits were located using a Global Positioning System (GPS) receiver. A summary of individual test pit observations is provided as Table 1. The following is a brief summary of findings from the test pit program (TRC, July 1998).

- The excavation program identified municipal wastes at most locations along with varying amounts of wood and metal. The test pit observations indicated that the waste characteristics varied at different locations.

- Depths to ground water varied, based on location, from 3 to over 13 feet below grade.

- The cover material generally consisted of light brown silt and sand with varying minor amounts of brick, rock, metal, and other debris. Inspection of the surface of the landfill indicated the widespread presence of metal, rock, and brick in the cover material and on top of the landfill.

- The thickness of the cover material varied with location across the landfill. The cover material on the western portion of the landfill (test pits TP-1 through TP-14, TP-25, TP-26, TP-28, TP-32, TP-33, TP-37, and TP-38) varied in thickness from non-existent to 6 feet. Of those test pits on the western portion of the landfill, test pits TP-2, TP-37, and TP-38 encountered 5 to 6 feet of cover material. Cover thicknesses in most of the other test pits on the western portion of the landfill averaged approximately 2 feet in thickness. Two test pits along a sloped area approximately located between the western and eastern sections of the landfill (TP-15 and TP-27) encountered 8 and 5 feet of cover material, respectively, above wastes or the water table. Fill was not encountered in test pit TP-27 to the depth excavated (9.5 feet below grade). In general, the wastes observed beneath the western portion of the landfill were dark colored and contained wood, metal, glass, plastic, tires, auto parts, cloth, and other household wastes. A noticeable odor was emitted when the fill was uncovered in many locations. A section of newspaper uncovered in one of the test pits was dated 1959. In some areas, such as test pit TP-26 along the southwestern side of the landfill, construction materials (wood sheets) were identified.

- The cover material on the eastern portion of the landfill (test pits TP-17 through TP-21, TP-23, TP-24, TP-29, TP-30, TP-31, TP-34, and TP-35) varied in thickness from 3 to 7 feet, averaging approximately 4 to 5 feet in thickness. Fill was not encountered in two test pits along the edges of the eastern portion of the landfill (TP-16 and TP-22), where 3 and 11.5 feet, respectively, of relatively waste-free materials were encountered above the water table. The wastes observed beneath the eastern portion of the landfill were similar to those observed in the western portion of the landfill (i.e., containing wood, metal, glass), but in general, contained less household wastes and odors were noticeably less or not apparent. A newspaper uncovered in one of the test pits indicated a date of 1951. These wastes demonstrated comparatively lower odor and generally lesser amounts of

identifiable household wastes as compared to the wastes below the western portion of the landfill, possibly due to age.

Based on the observations made during the test pitting operations, it is estimated that approximately 100,000 cubic yards of excess cover material are present in areas of the site (e.g., areas to be developed as lakes) which would be available for use in contouring the golf course. Any waste materials excavated in the course of construction, such as during the installation of building foundations or utilities, would be disposed of off site in compliance with applicable laws.

## 3.2 Landfill Gas Evaluation

The two principal gases generated in a landfill are carbon dioxide ($CO_2$) and methane ($CH_4$). Carbon dioxide is generated in greater quantities by aerobic decomposition early in the landfill life, while methane production increases due to anaerobic decomposition during the later stages of landfill life. Based on the age of the Ferry Point Park landfill, it is considered to be in the methane generation stage. Additionally, landfill gas generation is strongly correlated with the age of the waste/fill materials, where the gas generation rate drops as the buried waste ages. Due to the fact that the age of the waste materials at the Ferry Point Park site is approaching 30 to 50 years, the landfill gas generation rate is declining.

The greatest concern associated with typical landfill gas is the potential for the methane component to cause flammable or explosive conditions. Methane is lighter than air and will rise until it meets an impermeable barrier. It will then deflect laterally until a vent is found or it will collect in confined spaces. When methane is present at 5 to 15 percent by volume in the air, explosive conditions are possible.

A landfill gas evaluation was conducted to characterize the nature of landfill gas occurrence and to assess the potential for adverse effects of methane gas on the proposed golf course facilities. These objectives were accomplished through the performance of a soil gas survey that included the analysis of landfill gas samples collected at various locations across the site on April 15 and 16, 1999. Monitoring was conducted both at the surface of the landfill (i.e., ambient air monitoring) and in subsurface borings. The locations of soil gas

survey points are shown on Figure 11. The locations of soil gas survey points were located using a Global Positioning System (GPS) receiver.

The soil gas survey was conducted by drilling small-diameter borings at 31 locations (GP-01 through GP-31) on the landfill. Within each borehole, 3/8-inch tubing was placed to a depth of 3 feet. The bottom 1-foot section of the tubing was perforated. The annulus around the tubing was sealed with molding clay. Sampling was conducted directly via the tubing using a Landtec GA-90 Landfill Gas Analyzer (LGA). At each soil gas point, the percentages of methane ($CH_4$), carbon dioxide ($CO_2$) and oxygen ($O_2$) were measured directly by the LGA. Due to variations in the landfill cap thickness, it could not be confirmed that the sample collection depth of 2 to 3 feet totally penetrated the existing cap at each sampling location. Ambient air monitoring in the immediate vicinity of the soil gas survey points was also conducted to determine if landfill gas was detectable at the surface of the landfill.

Methane was not detected in the ambient air during the landfill gas survey, even when measurements were collected at the surface immediately adjacent to the soil gas survey points. These results indicate that the existing cover soils are successful in preventing detectable discharges of landfill gas to the air; therefore, under existing, undisturbed cover conditions, no impacts to the breathing zone are detectable. The development of the site, as discussed in more detail in Section 4.3.1, will result in the presence of an even thicker cover layer over the site, further minimizing the potential for methane to be a problem on the surface of the site.

The results of the landfill gas survey subsurface measurements are presented in Table 2 and subsurface methane concentrations are plotted by survey point location on Figure 11. The concentrations of methane detected at a depth of 2 to 3 feet below the surface of the landfill ranged from non-detectable to as high as 76%, which are not atypical of a landfill of this size and age. The majority of the subsurface methane detections occurred in the central portion of the site. Section 4.0, below, discusses the measures to be utilized during construction and operation to ensure that methane concentrations will not pose a health and/or safety problem for workers or park users.

In addition to the data generated during the soil gas survey, test pits excavated during the borrow potential evaluation were also screened for organic vapors. The test pit screening provides additional information on the subsurface generation of landfill gases. In most cases, the screening was performed using a flame ionization detector (FID) and, in some cases, a photoionization detector (PID). The FID is sensitive to a wide range of organic vapors, including methane. The PID responds to organic vapors other than methane (aromatic hydrocarbons but not chlorinated hydrocarbons) with an ionization potential less than or equal to 10.2 millivolts.

PID measurements were collected at 20 test pit locations; no positive readings were detected. In addition, FID measurements were collected at 27 test pits. In general, organic vapor concentrations based on FID measurements were higher in the western portion of the landfill, with FID readings ranging up to 0.7%, as compared to the eastern portion of the landfill. This corresponds with the more frequent occurrence of odors in the test pits on the western landfill (although methane is odorless, the detection of odors indicates that landfill gases are being emitted). Although FID readings were generally lower in the eastern portion of the landfill, the highest FID reading of >1% was noted in test pit TP-17 in the eastern portion of the landfill. Given the absence of positive PID readings, all or most of the FID responses are believed to be due to methane.

## 3.3 Soil Quality Assessment

### 3.3.1 Objectives and Evaluation Criteria

A soil boring program was conducted to obtain representative samples of site fill/waste materials for chemical analysis in areas of proposed excavation and development (e.g., in areas of proposed buildings and lakes). Secondarily, the borings were also useful in gathering information on:

- The thickness of the cover material;
- The thickness of the fill/waste materials;
- Subsurface soil/fill geotechnical properties; and
- Landfill gases.

These objectives were accomplished through the performance of a soil boring program which included the installation of 16 soil borings (B-1 through B-15, including B-11Alt) at various locations across the site between June 2 and 8, 1999. Soil borings were installed at the site in the vicinity of the proposed clubhouse facilities, restaurant and catering facilities, maintenance facilities, and lakes. The locations of soil borings are shown on Figure 12.

The results of the soil boring program are presented below, followed by discussions of the chemical analyses of soil cover and waste materials. The evaluation of the soil cover and waste material chemical data was conducted to determine whether the concentrations of chemicals in the cover or waste materials pose a risk to park users or workers.

To evaluate the potential human health risks associated with exposures to soil and/or waste materials, technical information prepared by the New York State Department of Environmental Conservation (DEC) and U.S. Environmental Protection Agency (USEPA) for the purposes of screening/evaluating soil was used in the absence of any Federal or New York State 'standards' for evaluating chemical concentrations in in-place soils. The sources of this information are outlined below:

1) DEC's Technical and Administrative Guidance Memorandum HWR-94-4046 (TAGM 4046)
TAGM 4046 provides a basis for determining soil cleanup levels at inactive hazardous waste sites. This document considers both the possibility of contaminants leaching from soils to ground water and direct exposure to soils. The Recommended Soil Cleanup Objectives (RSCOs) presented in the document are based on both of these considerations. Based on the fact that the site is an inactive landfill site with no ground water monitoring requirements, only health-based criteria presented in TAGM 4046 are used in the evaluation of soil and waste results herein. The TAGM 4046 risk-based exposure criteria for soil are developed based on a residential exposure scenario using USEPA's Health Effects Assessment Summary Table (HEAST). Since TAGM 4046 does not include risk-based criteria for heavy metals (the RSCOs in TAGM 4046 are based on site-specific, Eastern USA or New York State soil background levels and not on risk-based criteria), TAGM 4046 inorganic criteria are not considered in the evaluation provided herein. However, for reference purposes, supplemental tables have been included in Appendix A which compare soil and waste sample data to RSCOs and Eastern USA or New York State soil background levels from TAGM 4046.

2) USEPA Region III's Risk-Based Concentration Table (RBCT) (USEPA Region III, 4/12/99) includes criteria based on exposures to soil under 'industrial' exposure conditions. These criteria are useful in evaluating potential direct exposures to soils by workers. This document considers toxicological data from USEPA sources such as HEAST, IRIS and other sources.

3) TAGM 4046 also presents maximum values for groups of contaminants including total volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and pesticides and individual SVOCs (referenced to the States of Washington and Michigan).

4) For certain inorganics (e.g., lead, mercury and cyanide), risk-based criteria are not available under the USEPA Region III's RBCT. For these constituents, risk-based criteria based on direct exposures to soil under commercial/industrial exposure conditions developed under the Connecticut Remediation Standard Regulations (RSRs) (RCSA 22a-133k-1) are used for data evaluation purposes.

It is important to note that this analysis is not as rigorous as a risk assessment, which would consider the possible synergistic effects of the detected analytes. This analysis does, however, serve to identify areas where mitigative measures may be necessary during construction.

Another consideration in the evaluation of soil and waste sample results is that experience indicates that some analytes (specifically lead and polynuclear aromatic hydrocarbons (PAHs) are common in urban areas, and using state-wide averages of the occurrence of metals, do not fully consider the typical concentrations found in urban fill materials. Therefore, consideration of the prevalence of these compounds in urban areas may be appropriate in evaluating the results of the soil cover and waste material samples.

### 3.3.2 Field Investigation and Observations

Soil borings were advanced using hollow-stem auger drilling techniques to depths ranging between 12 and 52 feet below ground surface. In general, soil borings were advanced to a depth of approximately 10 feet beyond the depth of observed fill/waste material. Soil samples were typically collected continuously from ground surface to boring termination

using a 2-inch diameter split spoon sampler advanced using standard penetration test methods defined in ASTM 1586-84. In many cases, the presence of waste materials resulted in little or no recovery. The samples were screened for organic vapors using a PID. Lower explosive limit measurements were also made inside the auger during drilling. Following completion, each boring was backfilled with auger cuttings consistent with the DEC Technical and Administrative Guidance memorandum (TAGM) Disposal of Drill-Cuttings.

Borings B-1 through B-4 were drilled in the western portion of the site, in the area of the proposed clubhouse and waterfront facilities. Boring B-1 was advanced approximately 5 feet below observed fill/waste materials while boring B-2 did not completely penetrate the fill/waste unit and, due to poor recoveries, was terminated at a total depth of 20 feet below ground surface. Depths to ground water in this area ranged from 8 to 9 feet below ground surface. The soil borings encountered a surficial soil cover unit, underlain by a fill/waste material, which was in turn underlain by a soil fill unit. The surficial soil cover was approximately 2 feet thick and was composed either of a dark brown sand or sand and silt material with rounded gravel or crushed rock or a yellowish sand with variable quantities of clay, asphalt and organic (humus) material. The fill/waste material was observed to be composed of a orange-brown to black coarse sand and silt material with variable quantities of wood and glass fragments, metal shards, plastic and paper. This unit ranged in thickness from approximately 8 feet in boring B-1 to 16 feet in boring B-4. The soil fill material underlying the waste/fill unit was composed of grey medium stiff clay or yellow fine to coarse sand and silt. This unit was encountered at depths ranging from 10 to 18 feet below ground surface.

Borings B-5 through B-9 were drilled in the southeastern portion of the site, in the area of the proposed catering facility, maintenance facility and lake. Drilling at B-8 was halted at a depth of 14 feet. Depths to ground water in this area ranged from 5 to 18 feet below ground surface. The soil borings encountered a surficial soil cover unit, underlain by a fill/waste material, which was in turn underlain by soil fill unit. The surficial soil cover ranged from approximately 1 to 6 feet thick and typically consisted of a dark brown silt, consistent with that observed in the western portion of the site. Boring B-9 exhibited a

yellowish silt with traces of sand and mica as the cover material. The fill/waste material was observed to consist of dark brown to black silt with waste materials including ceramic, glass, brick and rock fragments, decomposed newspaper, plastic, nylon and ash materials. The fill/waste unit ranged in thickness between approximately 10 to 14 feet, with the exception of soil boring B-9 in which the fill/waste unit was observed to be approximately 30 feet thick. The soil fill material underlying the waste/fill unit was composed of a yellowish silty sand similar to that encountered in the western portion of the site with the exception of boring B-9, where layers of brown-black sand and light grey silty clay were identified.

Borings B-10, B-12, B-14 and B-15 were drilled in the remaining lake construction areas, in the northern and eastern portions of the site. Depths to ground water in these two areas ranged from 11 to 15 feet below ground surface and 9 to 11 feet below ground surface, respectively. The soil borings encountered a surficial soil cover unit, underlain by a fill/waste material, which was in turn underlain by soil fill unit. The surficial soil cover ranged from approximately 2 to 9 feet thick and typically consisted of a dark brown silt, consistent with that observed in the other portions of the site. The fill/waste material was observed to consist of silt ranging in color from yellow to black with waste materials including glass, brick and rock fragments, newspaper, plastic, nylon, wood and asphalt materials. At boring B-14, much of the fill was described as a black matrix of pulverized coal mixed with other waste materials. The fill/waste units ranged in thickness between approximately 16 to 18 feet in the northern lake area and 10 to 13 feet in the eastern lake area. The soil fill material underlying the waste/fill units in both areas was composed of a grey clay or silt material. The borings in the northern lake area also exhibited lenses of yellow or black sand.

The remaining three borings, B-11, B-11Alt and B-13, were located within the central fill area. Drilling at boring location B-11 was halted at a depth of 12 feet and drilling was re-started at boring location B-11Alt. Depths to ground water at these locations ranged from 8 to 10 feet below the ground surface. A surficial soil cover unit was encountered only at boring B-13. All borings exhibited a fill/waste material, which was in turn underlain by soil fill unit. The surficial soil cover at B-13 consisted of dark brown silt with fine sand and some organic (humus) material. The fill/waste material in borings B-11 and B-11Alt was observed

to consist of a black matrix of sand, wood, rock and glass fragments, metal, plastic, wood, paper and other waste materials. The fill/waste material in boring B-13 consisted of dark brown to black silt with sand, glass, rock and brick fragments, wood and plastic film. The fill/waste units ranged in thickness between approximately 12 to 30 feet. The soil fill material underlying the waste/fill units in was composed of a dark grey clay with little silt.

A single sample of waste/fill material was retained from each boring for chemical analysis, typically from the interval which exhibited the highest PID reading. In some cases, due to poor recovery, sufficient sample was not collected to support the performance of all chemical analyses (e.g., at boring B-2, the sampled interval provided sufficient sample volume to support analysis for volatiles only) or the samples submitted for analysis were collected from different depths within the boring (e.g., at boring B-12, the sample for volatile analysis was collected from the 6- to 8-foot interval while the sample for the remaining analyses was collected from the 18- to 22-foot interval). The waste samples were identified using a system where the boring number is followed by the split spoon interval from which the sample was collected. For example, sample B1-3 was collected from the third split spoon (i.e., from the 4- to 6-foot interval) from boring B-1.

In addition to the waste/fill material samples, a single cover soil sample was retained from each of the investigation areas for laboratory analysis. Cover soil samples were collected from borings B-2, B-7, B-8, B-10, B-11, B-13, and B-14. The samples were typically collected from the 0- to 2-foot interval, with the exception of the sample collected at boring B-14, which was collected from the 2- to 4-foot interval. The cover soil samples were identified using the same system described above for the waste material samples.

With the exception of the portion of the sample to be analyzed for VOCs, each of the soil samples selected for chemical analysis was homogenized in a decontaminated stainless steel bowl prior to transfer to laboratory-supplied sample containers. The fraction of the sample analyzed for VOCs was collected directly from the split spoon soil sample using EPA Method 5035 sampling techniques to minimize the loss of volatile compounds. Each of the samples was analyzed by York Analytical Laboratories, Inc. of Stamford, Connecticut for the

full Target Compound List (TCL) and Target Analyte List (TAL) of chemical constituents. Analytical parameters included:

- TCL VOCs by EPA Method 8260,
- TCL SVOCs by EPA Method 8270,
- TCL Pesticides/PCBs by EPA Methods 8081/8082, and
- TAL Inorganics by EPA Methods 6010 and 7471.

### 3.3.3 Soil Cover Characterization

The results of the chemical analysis of soil cover materials are presented in Table 3, where the results are compared to risk-based criteria (see Section 3.3.1 for a description of the evaluation criteria used herein). Only those constituents which were detected in at least one soil cover sample are listed in the tables; all other analytes were not detected.

The existing soil cover materials exhibit measurable concentrations of VOCs, SVOCs, pesticides, PCBs and metals. VOCs detected in the cover samples included aromatic and chlorinated hydrocarbons, while SVOCs detected in the cover soil samples included phenols, PAHs and phthalates. The pesticides detected in the cover samples included trace amounts (below standard detection levels) of DDE, DDD, DDT and chlordane.

When soil cover results are compared to risk-based criteria, as presented in Table 3, SVOCs and arsenic are the only contaminants detected at levels exceeding the risk-based criteria. The only SVOCs detected at levels exceeding health-based TAGM 4046 criteria were benzo(a)anthracene, benzo(a)pyrene, and dibenz(a,h)-anthracene, all PAHs. Exceedances of these PAH TAGM 4046 criteria were detected at five of seven cover sample locations. Benzo(a)pyrene was the only constituent detected at levels exceeding the EPA Region III RBCT industrial soil criteria, also at five of seven cover sample locations. As noted previously, PAHs are commonly elevated in samples of urban fill materials. Arsenic was detected in only one sample at a level exceeding the EPA Region III RBCT industrial soil criteria. It was detected at a level of 9.1 ppm, which is within the reported range of 3 to 12 ppm for arsenic in New York State background samples (TAGM 4046).

The expectation is that no cover materials will be removed from the site, although on-site movement is expected during construction.

Based on the testing to date and with the exception of PAHs and arsenic, the soil cover does not contain chemicals at concentrations which would be expected to pose a hazard to workers. However, based on the detection of exceedances of risk-based criteria for PAHs and arsenic, preparation of and compliance with a health and safety plan and any associated monitoring requirements will be necessary during construction and utility and maintenance work to ensure the protection of workers during activities requiring exposures to or disturbance of existing cover materials. As discussed in Section 4.2.1, the existing cover materials will be further covered with shaping materials (either excess cover material excavated from other portions of the site or imported materials), as well as final cover layer/topsoil, during development. These cover materials will isolate park users from the subsurface materials.

### 3.3.4 Waste Material Characterization

The results of the chemical analysis of waste materials are presented in Table 4, where the results are compared to risk-based criteria (see Section 3.3.1 for a description of the evaluation criteria used herein). Only those constituents which were detected in at least one waste material sample are listed in the tables; all other analytes were not detected.

The waste materials exhibit VOCs, SVOCs, pesticides, PCBs and metals. VOCs detected in the waste samples included aromatic and chlorinated hydrocarbons, while SVOCs detected in the waste soil samples included phenols, PAHs and phthalates. The pesticides detected in the waste samples included DDE, DDD, and DDT.

Table 4 presents a comparison of waste material results to risk-based criteria. SVOCs, PCBs, arsenic and lead are the only contaminants detected at levels exceeding the risk-based criteria. Exceedances of the TAGM 4046 risk-based criteria for benzo(a)anthracene were detected in 10 waste samples while exceedances of the TAGM 4046 risk-based criteria for benzo(a)pyrene were detected in 12 waste samples. Dibenzofuran, 2-methylnaphthalene, phenanthrene, chrysene, benzo(b)fluoranthene, and benzo(k)fluoranthene were each detected in a single sample at levels exceeding the 50 ppm individual SVOC limit established under TAGM. The total SVOC level in sample B5-6 also exceeded the TAGM 4046 total SVOC

12

standard of 500 ppm. The only SVOCs detected at levels exceeding the EPA Region III RBCT were benzo(a)anthracene (in one sample), benzo(b)fluoranthene (in one sample) and benzo(a)pyrene (in three samples). As noted previously, PAHs are commonly elevated in samples of urban fill materials.

The EPA Region III RBCT industrial soil criterion for the PCB Aroclor 1260 of 2.9 ppm and the TAGM total PCB criterion of 10 ppm were exceeded by one waste sample, where PCBs were detected at a level of 18 ppm. This is below the 50 ppm threshold above which the soils would be considered hazardous.

The EPA Region III RBCT industrial soil criterion for arsenic was exceeded in six waste samples. The Connecticut industrial/commercial risk-based soil criterion for lead was exceeded in three waste samples.

Some excavation of waste materials on site will occur during construction of building foundations, utility installations, and the like. Excavated waste materials will be disposed of off site in accordance with applicable laws.

Based on the testing to date and the detection of exceedances of risk-based criteria for PAHs, PCBs, arsenic and lead, compliance with a health and safety plan and any associated monitoring requirements will be maintained during construction and utility and maintenance work to ensure the protection of workers during activities requiring exposures to or disturbance of waste materials. The cover material (shaping materials and final cover/topsoil) to be placed over the landfill surface will isolate park users from the subsurface waste materials (see Section 4.2.1 for a description of the shaping and final cover materials).

## 4.0 IMPACT ASSESSMENT

The impact assessment examines measures that will be utilized during and after construction of the proposed project to ensure that workers and park users are not exposed to harmful or hazardous materials.

### 4.1 Conditions during Construction

Construction will include activities such as:

1) the removal of excess cover materials from some portions of the site (e.g., areas where lakes will be constructed);

2) the excavation of waste materials from limited areas of the site (e.g., areas where buildings will be constructed and where utilities and drainage lines will be located);

3) management, including TCLP testing if necessary, of any excavated wastes for subsequent off site disposal; and

4) the placement of shaping materials (consisting of excess cover materials moved from other areas of the site and materials imported to the site) and topsoil over the surface of the site to contour the site for the golf course and other park facilities.

During construction, an air monitoring program will be implemented to monitor for the potential presence of dust and methane in and downwind of the work areas, especially during trenching and disturbances of the existing soil cover and/or waste materials. A health and safety plan will be developed and submitted to the New York City Department of Environmental Protection (DEP) for it's approval. That plan will define worker safety training and monitoring procedures, personal protective equipment, air monitoring equipment, action levels and appropriate mitigative and protective measures. The health and safety plan will focus on potential exposures to landfill gas as well as to those constituents detected at levels exceeding risk-based criteria in the soil cover and waste material, as described in Sections 3.3.3 and 3.3.4 and will require continuous monitoring during groundbreaking activities. If action levels established in the health and safety plan are

exceeded, construction activities will be temporarily halted. As necessary, gas venting, dust control, or other mitigative measures will be implemented prior to the reinitiation of the construction activities. A sample Health and Safety Plan outline is presented in Appendix B. All temporary construction facilities will also be monitored for and protected against potential methane buildup.

If extensive reworking of the existing waste materials is required, odor control or excavation limitations (based on wind speed and direction) will be implemented at locations where odors are detected during construction.

To construct the lakes on existing landfill material and minimize water leakage losses, an impermeable liner system that can withstand settlement will be constructed. The liner system will likely consist of a clean sand bedding layer, a non-woven geotextile cushion, an impermeable geomembrane liner, an upper non-woven geotextile cushion and a surface cover layer of fine crushed stone.

If DPR or any licensee proposes to make any significant revisions in the site plans that would result in significant new or additional excavation, then DEP would be consulted and it's approval sought prior to proceeding with any such excavation.

## 4.2 Post-Construction Conditions

Post-construction conditions will be greatly dictated by the physical and chemical nature of the final cover material which will be present over the golf course and parkland areas as well as by landfill gas control systems built into the confined space areas and structures. Another consideration in maintaining safe post-construction facilities at a landfill site is the differential settlement which may occur. Each of these factors is discussed in the following subsections.

### 4.2.1 Cover Materials

Cover materials will consist of two layers: 1) a shaping layer and 2) a final cover or topsoil layer. Details on the requirements for the cover materials in the golf course and parkland areas are provided in the following paragraphs.

The shaping material layer in both the public parks and golf course will consist of existing excess cover materials moved from other areas of the site, such as the proposed lakes and areas of excess cover (greater than 2 feet), and imported uncontaminated construction and demolition (C&D) materials. The materials to be imported for the shaping layer will meet the 6NYCRR Part 360-7 regulations pertaining to uncontaminated construction and demolition debris which is exempt from permit requirements. It is estimated that a total of approximately 500,000 to 600,000 cubic yards of fill will be used as the shaping layer to contour the golf course. Of this fill material, approximately 400,000 to 500,000 cubic yards will be imported to the project site, and the remainder (approximately 100,000 cubic yards) will be excess cover materials from the lakes and other areas on the project site.

The shaping material will be overlain by a final cover layer/topsoil layer consisting of uncontaminated soil materials imported from non-industrial sites which meet background levels. (Background levels will be determined in concert with and subject to the approval of DEP.) The final cover/topsoil layer will require the importation of approximately 200,000 cubic yards of materials to the site. The final cover/topsoil layer will be 12 to 24 inches thick in the two public parks. However, in all cases a minimum of 24 inches of cover meeting such background levels would be placed or retained for the two public parks. A minimum of 12 inches of material meeting such background levels would be placed or retained in the golf course, excluding the rough waste (out-of-bound) area. In the rough waste areas of the golf course, a minimum of 6 inches of material meeting such background would be placed or retained.

### 4.2.2 Landfill Gas Control Systems

The greatest potential for post-construction human health impacts is associated with the vertical and lateral subsurface migration of landfill gas and its subsequent collection in structure-confined spaces and buildings that could, if not properly vented, produce explosive conditions and other health and nuisance impacts. Gas venting through soil cover in open areas of the golf courses will not present explosive, health, or other nuisance impacts that affect user or worker safety.

The golf course and its ancillary facilities will incorporate features, especially with respect to confined space areas and structures, to ensure the safety of site users. Such features include landfill gas interception and venting systems below buildings. High-permeability passive and/or active landfill gas control systems to direct landfill gas away from buildings to controlled release points in areas where user safety is not affected. Other buried structures such as piping systems, manholes, handholes, and vaults require confined space warning markers. A safety plan and training, which will be submitted for approval to DEP, will be implemented to protect workers during both construction and operation.

The design of the golf course has taken into account the potential for landfill gas migration along utility pipes, trench bedding and backfill. Periodic low permeability soil plugs limit gas migration in pipe trenches, especially in the vicinity of buildings, manholes, handholes and vaults. The potential for landfill gas migration through cracks in electrical conduit, storm drain piping and sewer piping exists. Gas migrating through conduit and piping can travel to catch basins, drain inlets, manholes and handholes. Conduit seals in electrical conduit will be installed at handholes and building penetrations to prevent gas migration into these areas. Where feasible, building interior floor drains will be avoided. If building interior floor drains are required, they will include water traps to prevent gas intrusion into the building.

Outside storm drain catch basins and drain inlets have the potential for landfill gas to collect, unless appropriately designed and managed. While the potential for an errant match or lit cigarette to ignite methane inside a catch basin or drain inlets is low, measures will be taken to prevent such occurrences from happening. Where site conditions require storm drain inlets and catch basins, the choice of piping and inlet materials is important. Buried storm drain pipe will be butt fusion welded high density polyethylene (HDPE) pipe that eliminates the potential for joint leakage and provides maximum flexibility due to settlement and live loading. Catch basin and drain inlets are also available in HDPE, making them compatible with the piping material and able to form tight joint connections. Other similar high strength, high flexibility and low leakage piping and inlet systems may be employed, based on engineering considerations and contractor bids. The pipe penetrations

into catch basins or drain inlets will have downturned elbows or hood devices to create a water trap which submerges the pipe end and prevents gas migration into the structure. The golf course irrigation system will be designed to maintain these water levels at all times.

In areas where structures are built, landfill gas venting and appropriate monitoring systems will be provided. Venting systems can consist of passive vents, continuous mechanical venting, or intermittent mechanical venting controlled by a methane monitor. The selection of the venting system will be made during the final building design, based on site-specific gas conditions and details of the structures' design, though it is expected that the clubhouse, boathouse grill, fine dining/banquet facility, structures on the driving range, and managers residence will all utilize active venting systems. A preliminary analysis of venting requirements is presented below.

In order to establish an estimate of the venting requirements for building sub-slab areas, an analysis of the potential methane generation rate at the site was performed. There are no precise methods for estimating the rate at which methane will be generated from the existing waste material underlying the site. Methane generation can vary due to many factors such as waste composition, age, moisture, density and temperature. Daily barometric pressure changes can also affect daily release rates for stored gas within the waste. The recommended method for methane generation estimation is to calculate a rate based upon an accepted formula and apply a factor of safety to account for the variability in gas generation. The method selected for methane generation analysis for this project was selected from the United States Environmental Protection Agency Publication AP-42 Fifth Edition dated January 1995 and entitled "Compilation of Air Pollutant Emission Factors." Equation (1) contained in Section 2.4.4.1 of AP-42 was used. The equation takes into account the age of the waste, the waste acceptance rate during active life and several constants for methane generation potential and rate constant based on conditions at this site.

The methane generation rate calculation is presented in Appendix C. The test borings at the site indicate a maximum waste thickness of 37 feet which was used to conservatively estimate the maximum waste acceptance rate. A waste density of 1,000 lbs per cubic yard was also used to calculate the acceptance rate. Waste deposition was based on the time

period from 1952 to 1962. The methane generation potential constant was set at 125 cubic meters of methane per megagram of refuse and the methane generation constant was set at 0.04 per year. The AP-42 method, which estimates the methane generation rate per square foot of landfill surface area, derived a current generation rate for methane of 0.00004 cubic feet per minute (cfm) of gas per square foot of surface area.

The lower explosive limit (LEL) for methane gas is 5% concentration in air. In order to maintain a safe gas concentration in the air beneath a structure, it is recommended that the methane concentration be maintained at less than 20% of LEL, which translates to a 1% concentration of methane in air. Therefore at a gas generation rate of 0.00004 cfm per sq. ft. of surface area for this site, there would have to be an air exchange rate of at least 0.004 cfm of air per square foot of building surface area to stay below the 1% level. A factor of safety of 2 on the air flow rate is recommended to account for variability and uncertainties in generation rate. The site would therefore require the venting of building sub-slabs at a rate of at least 0.008 cfm of air per square foot. As an example, a building measuring 50 feet by 100 feet (5,000 square feet) would require a blower capacity of at least 40 cfm.

Sub-slab venting systems will be designed with dual blowers at the full air flow capacity to ensure continuous operation and provide additional capacity if needed to handle short term fluctuations in gas generation and gas venting from the waste below.

An alarm system will be installed to alert occupants of a problem before any explosive conditions occur in all structures where methane could collect. Automated monitoring of methane will be provided on the gas venting system and in the building space in potential critical areas where gas has potential to accumulate. The gas sensors will be connected to a central building alarm to alert the site operators of the need to check the venting system operation and monitoring system calibration. Sensors within any interior building space are recommended to be set at a concentration of 10% of LEL for methane and venting system sensors are recommended to be set at 20% of LEL. Routine explosive gas sensor calibration and alarm system testing will be performed to ensure continued safe use of the buildings.

The venting system will prevent the buildup of methane gas concentrations. In addition, during construction, site workers and contractors will be trained and educated in proper procedures regarding landfill gas issues. This training will be part of a site landfill gas Health and Safety Plan that will be utilized during the construction phase. The Health and Safety Plan will also address health and safety issues and their management during site operation. A sample Health and Safety Plan outline is presented in Appendix B.

The effect of landfill gas venting through the vegetative support soil layer over the golf course is anticipated to have limited and isolated overall impact to the health of the turf grasses. The age of the waste material at this site will result in generally lower production rates for landfill gas than a younger landfill having more readily decomposable waste. After 20 years of waste decomposition, only the least decomposable organic waste material remains, which accounts for approximately 30 percent of the total landfill gas produced over the life of the landfill. The decomposition of this material occurs much more slowly, resulting in significantly lower gas production rates in the later years of a landfill. The importance of the gas production rate is that it has a direct impact on the landfill gas concentrations in the shallow vegetative soil cover root zone. At lower production rates, the gas concentrations remain fairly low if the soil does not have the excessive silt and/or clay content that can trap gas within the root zone.

The potential for landfill gas to migrate to the surface and effect vegetation on the fairways is currently being addressed through additional landfill gas sampling focusing on the occurrence of methane in the root zone of the grasses used for the fairways, the top 6 inches of soil. This data will be used to determine if venting of methane in areas other than buildings, greens, water features, and other paved areas is necessary. If this venting is necessary, it will be provided.

For the greens, to prevent contact of landfill gas within the turf root zone, where necessary, the vegetative support and drainage layer of the greens be constructed above an impermeable barrier layer that has a permeable gas venting layer beneath the barrier layer. Gas beneath the barrier layer will be vented by passive means that may include the installation of gravel perforated piping within the gas vent layer to enhance the collection of

gas. The discharge of gas will be via a passive vent that is a safe distance and height from site users. The barrier layer may consist of an impermeable membrane material commonly used in landfill covers or a very low permeability layer of soil that has sufficient clay content and thickness to minimize gas migration to the turf root zone. The need for these measures and details will be evaluated on a green-by-green basis during the final design phase of the project.

Several pond areas will be constructed on the site. The ponds will have impermeable membrane liner systems to retain the water with minimal leakage. Water from the ponds will be available for irrigation of the site. Because landfill gas may collect beneath the pond liners, a gas venting layer will be placed beneath them. The gas venting layer also serves as a suitable cushion for the pond liner. Passive gas collection and venting of the pond liners will be addressed in the same manner as the greens to ensure safety.

As part of the final design process, details of the landfill gas control systems to be utilized will be submitted to DEP for their approval. DEP will provide comments and any recommendations for improvements of the proposed systems in a timely manner (i.e., with 10 days) so that construction can proceed without delays.

### 4.2.3 Differential Settlement

Continuing settlement of landfill waste material across the site requires additional measures to protect building structures, buried utilities and paved areas. Differential settlement in landfills is difficult to control due to extremely variable waste properties and past waste placement practices. Pile- or drilled-pier-supported structures are typically required at landfill construction sites. The design of the foundation support systems requires a complete geotechnical field investigation and testing program. While the support of the buildings on piles or drilled piers eliminates the building settlement, it creates potential differential settlement problems where utility lines enter the buildings and at walkway entries. Fill around the buildings will continue to settle, while the building is fixed. Special measures must be implemented to allow fill settlement without damaging utility lines and settling walkways at entries.

Drainage problems can also be created around structures due to settlement. Adequate surface grades will be provided to account for settlement and minimize potential ponding of surface runoff. Extra storm drain inlets provided around the building foundations also enhance drainage. Paved driveways and parking areas will be designed with adequate slopes to prevent ponding in areas where differential settlement occurs. In addition, the installation of geogrid or geonetting may be required beneath paved areas to reduce the effects of differential settlement on pavement deterioration. Gas venting of large paved areas is not required, especially if frequent vegetated buffer strips are provided.

Buried utility lines will be designed with materials that can withstand forces imposed on the piping systems due to differential settlement and have sufficient flexure to prevent failure or joint separation. Couplings that are designed to deflect due to settlement will be employed. Flexure couplings at pipe penetrations into buildings, structures, manholes and vaults can accommodate the effects of settling. Piping systems requiring slopes to drain by gravity flow, such as sanitary and storm sewers, will be designed with steeper grades than required to allow for settlement and prevent low spots.

### 4.2.4 Hydrologic Conditions

Existing conditions at the site consist of small paved areas, with most of the site covered by tall grasses. Existing cover materials range in thickness but average approximately 2 feet thick over the site. They typically consist of sands and silts. The existing cover material and topography of the majority of the site do not appear to have been designed to limit infiltration of precipitation or to encourage runoff.

An analysis of the effects of irrigation on infiltration due to the development of the site as a golf course was prepared by JWE Engineering (see Appendix D). That analysis indicates two major factors which will affect the infiltration of water through the golf course: the increase in the impervious surface area and the controlled application of irrigation water.

The site development will result in approximately 26 acres of impervious area, a significant increase over the current conditions. Runoff collection associated with these areas and much of the other golf course areas which will also be connected to drainage systems,

will reduce infiltration related to rainfall events. Rainfall will be collected in detention facilities, and excess rainfall will be discharged from the site via a drainage system.

The proposed irrigation system will utilize sophisticated equipment to monitor water needs and control water application. In addition, the additional shaping materials and final cover materials added to the site will provide additional moisture retention capacity above the waste layer. When the golf course is constructed the final cover/topsoil placed over the golf course will likely increase evapotranspiration by supporting a uniform layer of vegetation and will also be graded to encourage runoff.

Based on the considerations described in the preceding paragraphs, irrigation activities are unlikely to increase infiltration.

**TABLE 1**
**SUMMARY OF TEST PIT OBSERVATIONS**
**FERRY POINT PARK SITE, BRONX, NEW YORK**

| Test Pit Number | Total Depth (ftbg) | Depth to Ground Water (ftbg) | Cover Thickness (ft) | Waste Description | Comments (FID*, other observations) |
|---|---|---|---|---|---|
| **Western Portion** | | | | | |
| TP-1 | 12 | 10 | 2 | Wood, metal, glass, newspaper; black | 0.7% |
| TP-2 | 12 | 10 | 6 | Wood, metal, glass, newspaper, tires; black | 0.03% |
| TP-3 | 11.5 | none | 3.5 | Wood, metal, glass, soil, brick/rock, possible ash; black | 0.009% |
| TP-4 | 12.5 | none | 2.5 | Wood, metal, glass, soil, brick/rock | 0.009% |

B = Detected in blank sample
J = Estimated
**BOLD** = criterion exceeded
NA = Not Analyzed
N/A = Not Available
ND = Not Detected

Only TAGM health-based criteria are listed. Where health-based criteria for individual SVOCs are not available under TAGM, the 50 ppm TAGM limit for individual SVOCs is used.

* Due to the presence of methylene chloride and acetone in the blank samples, the reported concentrations of these compounds in the soil cover samples are considered to be attributable to laboratory contamination and are not included in the Total VOC values

B = Detected in blank sample
J = Estimated
BOLD = exceeds screening leve
NA = Not Analyzed
ND = Not Detected
N/A = Not Available

* Due to the presence of methylene chloride and acetone in the blank samples, the reported concentrations of these compounds in the soil cover samples are considered to be attributable to laboratory contamination and are not included in the Total VOC values.

Only TAGM health-based criteria are listed. Where health-based criteria for individual SVOCs are not available under TAGM, the 50 ppm TAGM limit for individual SVOCs is used. In the absence of EPA Region III RBCT values for lead, mercury and zinc, Connecticut risk-based Remediation Standard Regulation values based on industrial/commercial direct contact exposures are used.

B = Detected in blank sample
J = Estimated
**BOLD** = criterion exceeded
NA = Not Analyzed
N/A = Not Available
ND = Not Detected
Where health-based criteria for individual SVOCs are not available under TAGM, the 50 ppm TAGM limit for individual SVOCs is used.

* Due to the presence of methylene chloride and acetone in the blank samples, the reported concentrations of these compounds in the soil cover samples are considered to be attributable to laboratory contamination and are not included in the Total VOC values

2) Compilation of Air Pollutant Emission Factors - Volume I: Stationary Point and Area Sources - AP-42 Fifth Edition. Section 2.4 Office of Air quality Planning and Standards, U.S. EPA Research Triangle Park, North Carolina, January 1995.

**Auxiliary Calculations**

1) Calculation for R

In order to produce the most conservative methane generation rate value (the highest methane generation rate), the largest amount of refuse will be used in the calculation. This will be determined using the maximum refuse thickness found during soil boring at the site.

Given

$R = Th\ (refuse, max) \times rho(refuse) * 0.3048 \times 0.0006/t2$

| | | | Comment |
|---|---|---|---|
| Where: | | | |
| R = the average annual refuse acceptance rate during active life in megagrams per year per square meter of landfill = | | ----- | calculated below |
| Th (refuse, max) = the maximum thickness of refuse within the landfill in feet = | | 37 | see attached spreadsheet |
| rho (refuse) = the density of the refuse in pounds per cubic yard = | | 1000 | |
| 0.3048 = conversion factor to convert from feet to meters = | | 0.3048 | |
| 0.0017 = conversion factor to convert value from pounds per cubic yard to megagrams per cubic meter = | | 0.0006 | .00045 Mg/lb x cubic yard per .076 cubic meter |
| t2 = total time for refuse placement in years | | 10.0000 | duration of landfill operation |
| R = | 0.67 | Mg /m^2/yr | |

Water Balance Analysis

---

The following is a simplified response to the question from the NYCDEP relating to the potential increase in surface water contributing to the groundwater and on this site as a result of the proposed development.

There will be two new influences on the ground water on this site because of the proposed development. The first is the impact the new impervious areas will have on the amount of water reaching the ground water through percolation. The development of this site will produce approximately 26 acres of impervious area, approximately 13.5% of the overall site. Runoff from these areas will be directed to detention facilities where it will be detained and discharged through a closed drainage system either into the Cities combined sewer system or directly to the River. The collection and handling of the runoff from all impervious areas produces a reduction in runoff percolating into the groundwater. This reduction is proportionate to the amount of impervious area being created and produces a reduction in the amount of surface water filtering through the landfill material and into the groundwater.

The second component is the irrigation system. The introduction of irrigation water onto the site could potentially influence the water balance and have an affect on the amount of water percolating into the groundwater. However, "the state of the art" technology utilized in the design and construction of the

irrigation system allows the Golf Course Superintendent to monitor the water needs of the grass and apply only that which is actually required. By applying only the required amount of water, the root structure of the grass absorbs the water with no measurable additional percolation through the root structure into the groundwater. The Golf course Superintendent uses a weather station to determine the water needs of the grass. Using this information and a prescription watering technique, that allows control over each individual sprinkler head, the Superintendent is able to apply only the required amount of water need to sustain the growth of turf grass, with no measurable excess water beyond the root zone. The amount of water used to irrigate the golf course is estimated to be approximately 0.18 inches per day based on a typical summer day demand. In unusual circumstances where an unanticipated rainfall follows soon after irrigation, the additional soil layer added to the existing landfill cover layer would be adequate to prevent any significant increase in groundwater/leachate flows, even without taking credit for the reduced surface runoff described above.

In conclusion, through the use of a highly sophisticated irrigation system and the control of runoff from new impervious areas, it can be concluded that the there should be no significant increase in runoff filtering through the developed site and into the ground water.

**Attachment H:** **Waterfront Revitalization Program**

## NEW YORK CITY WATERFRONT REVITALIZATION PROGRAM

## CONSISTENCY ASSESSMENT FORM

Proposed actions subject to CEQR, ULURP, State or Federal Agency Actions that are situated within the designated boundaries of New York City's Coastal Zone must be accessed for their consistency with the City's Local Waterfront Revitalization Program (LWRP). New York City's LWRP was adopted as a 197-a Plan in coordination with local, State, and Federal laws and regulations, including the State's Coastal Management Program (Executive Law, Article 42) and the Federal Coastal Zone Management Act of 1972 (P.L. 92-583). This form is intended to assist an applicant in certifying that the proposed activity is consistent with the local Waterfront Revitalization Program. It should be completed at the time when the local or state application is prepared. The Department of City Planning will use the completed form and accompanying information in its review of the applicant's certification of consistency. Answering "yes" to a question in section C does not necessarily mean an inconsistency exists but rather is intended to alert the applicant and reviewer that additional information is required.

### A. APPLICANT

1. Name: New York City Department of Parks & Recreation Contact Person: Jane Cleaver
   (please print)

2. Address: The Arsenal, Central Park, New York, New York 10021

3. Telephone: Area Code (212 ) 360-3401

4. Owner: New York City Department of Parks & Recreation

### B. PROPOSED ACTIVITY

1. Brief description of activity: Currently undeveloped parkland would be developed as a golf course and public park with restaurants and parking.

2. Purpose of activity: To provide recreational opportunities and a waterfront park

3. Location of activity:

   Bronx (County)

   The eastern portion of Ferry Point Park, bounded by the Bronx-Whitestone Bridge to the west, Balcom Avenue to the east, Schley Avenue to the north, and the East River to the south. (Street or Site Description)

4. Type of local or state action required: Uniform Land Use Review Procedure (ULURP)

5. If a federal or state permit/license was issued or is required for the proposed activity, identify the agency and provide the application or permit number, if known: No federal or state permits are required.

6. Is federal or state funding being used to finance the project? If so, please identify the funding source.

   No federal or state funds are being used.

**C. COASTAL ASSESSMENT** The following checklist represents in a broad sense, the 44 State Coastal Zone Management Program policies and 12 City LWRP policies. (The numbers and letters in parentheses after each question indicated the policy or policies that are the focus of the question.) A listing and detailed explanation of the Waterfront Revitalization Program policies titled New York City Waterfront Revitalization Program Manual can be obtained from the Department of City Planning Book Store located at 22 Reade Street, Manhattan, (212) 720-3667. Figures listed after various questions can be found in Section 3K of the Manual and are simplified, for information concerning detailed maps please contact the Department of City Planning, Waterfront and Open Space Division, (212) 720-3620.

Check either "Yes" or "No" for each of the following questions.

| | | YES | NO |
|---|---|---|---|
| 1. | Is the site(s) that would be affected by the action located in or near any significant coastal fish and wildlife habitats? (7) (see Figure 3K-2) | | ✔ |
| 2. | Would the action involve any activity in or near a tidal or freshwater wetland? (44) (see Figure 3K-3) | ✔ | |
| 3. | Would the action result in any activities within a Federally designated flood hazard area and/or State-designated erosion hazard area? (11, 12, 17, C, D, E) (see Figure 3K-4) | ✔ | |
| 4. | Would the action involve construction or reconstruction of a flood or erosion control structure? (13, 14, 16, 17, C, D, E) | | ✔ |
| 5. | Would the action involve any new or increased activity on or near any beach, dune, barrier island, or bluff? (12, G) | | ✔ |
| 6. | Would the action involve mining, dredging, or dredge disposal, or placement of dredged or fill materials in coastal waters? (15, 35, B) | | ✔ |
| 7. | Would the action result in any of the following:<br>- Shipping, handling, or storing of solid wastes, hazardous materials, or other pollutants; | | ✔ |
| | - Development of a site that may contain contamination or has a history of underground fuel tanks, oil spills, etc.; | ✔ | |
| | - Construction activities that could lead to erosion . (8, 36, 37, 38, 39) | | ✔ |
| 8. | Would the action result in the discharge of toxins, hazardous substances, or other pollutants, effluent, or waste into any waters? (8, 30, 31, 34, 37, 38, 40) | | ✔ |
| 9. | Would the action result in the draining of storm water runoff or sewer overflows into coastal waters? (8, 32, 33) | | ✔ |
| 10. | Would the project in any way affect the water quality classification of nearby waters or be unable to be consistent with that classification? (31) (see Figure 3K-5) | | ✔ |
| 11. | Would the action cause violations of the National or State air quality standards? (41, 42) | | ✔ |
| 12. | Would the action result in significant amounts of acid rain precursors (nitrates and sulfates)? (43) | | ✔ |
| 13. | Would the action have any effect on commercial or recreational use of fish resources? (9, 10) | | ✔ |
| 14. | Would the action have any effects on surface water or groundwater supplies? (38) | | ✔ |
| 15. | Would the action result in a reduction of existing or required access to or along coastal waters, public access areas, public parks or open spaces? (19, 20, 21, F) | | ✔ |
| | | YES | NO |
| 16. | Would the action result in any development along the shoreline but NOT include new water-enhanced or water-dependent recreation space? (21, 22) | | ✔ |
| 17. | Would the action result in new open space that is not accessible to immobile (handicapped) user groups? (F) | | ✔ |
| 18. | Would the action result in the provision of open space without the provision for its maintenance? (H) | | ✔ |

| | | | |
|---|---|---|---|
| 19. | Would the action affect natural or built resources that contribute to the scenic quality of a coastal area? (25) | | ✔ |
| 20. | Does this site currently include elements that degrade the area's scenic quality or block views to he water? (25) | | ✔ |
| 21. | Would the proposed action have a significant adverse impact on historic or archaeological resources? (23) | | ✔ |
| 22. | Would the action be located in an important maritime and industrial area as shown in the New York City Comprehensive Waterfront Plan? (see Figure 3K-6) | | ✔ |
| | Some of these areas may include portions of the following locations:<br>- Kill Van Kull in Staten Island from Howland Hook to Snug Harbor;<br>- Brooklyn waterfront at Red Hook and Sunset Park (from Pier 6 to Owls Head);<br>- Brooklyn Navy Yard:<br>- Newtown Creek; and<br>- South Bronx (Port Morris and Hunts Point). (2, 3) | | ✔ |
| 23. | Would the action be located in a small harbor area (any area with a unique maritime identity; for example, Sheepshead Bay or City Island)? (4) | | ✔ |
| 24. | Would the action involve the siting or construction of a facility essential to the generation or transmission of energy, or a natural gas facility, or would it develop new energy resources? (27, 29, I) | | ✔ |
| 25. | Would the action involve ice management practices? (28) | | |
| 26. | Would the action affect any sites that have been used as landfills? (J, L) | ✔ | |
| 27. | Is illegal dumping occurring on a site that would be affected by the action? (K) | | ✔ |
| 28. | Would the action affect solid waste management goals and objectives? (L) | | ✔ |
| 29. | Is the site of the action a deteriorated or underutilized waterfront site? (1, A) | ✔ | |
| 30. | Does the site of the action include any waterfront structures (e.g., piers, docks, bulkheads, wharves, or erosion protection devices)? (A) | ✔ | |
| 31. | Would the action result in a change in scale or character of a neighborhood? (1) | | ✔ |
| 32. | If the action would affect a site located on the waterfront, would it facilitate the siting of a use that is NOT water-dependent? (2) | | ✔ |
| | | YES | NO |
| 33. | Would the proposed action require provision of new public services or infrastructure in an undeveloped or sparsely populated section of the coastal area? (5, 6) | | ✔ |
| 34. | Would the action result in a physical alternation to a site along the waterfront, including land along the shoreline, land underwater, or coastal waters? (2, 11, 12, 18, 20-22, 25, 28, 32, 35, 37, 38, 41, 43, 44, A-E) | ✔ | |

D. ADDITIONAL STEPS

If any of the questions in Section C are answered "Yes", then the applicant or agent is advised to consult the local Waterfront Revitalization Program document, available at the Department of City Planning Book Store. The proposed activity must be analyzed in more detail with respect to the applicable state or local coastal policies. On a separate page(s), the applicant or agent shall: (a) identify, by policy numbers, which coastal policies are affected by the activity, (b) briefly assess the effects of the activity upon the policy; and (c) state how the activity is consistent with each policy. Following the completion of this written assessment, the applicant or agency shall complete Section E and submit the documentation required by Section F.

E. CERTIFICATION

The applicant or agent must certify that the information provided is truthful and that the proposed activity is consistent with the New York City Waterfront Revitalization Program or the State Coastal Management Program, as appropriate. If this certification cannot be made, the proposed activity shall not be undertaken as proposed and the applicant should contact the Waterfront and Open Space Division for further instructions. If the certification can be made, complete this Section.

"The proposed activity complies with New York State's approved Coastal Management Program, or with the applicable New York City Waterfront Revitalization Program, and will be conducted in a manner consistent with such program."

Applicant/Agent's Signature: _____ Date: _____

F. SUBMISSION REQUIREMENTS

1. The applicant or agent shall submit the following documents to the New York City Department of City Planning, Waterfront and open space Division, 22 Reade Street, 6W, New York, NY, 10007.

   a. Original signed Waterfront Revitalization Program Assessment Form.
   b. Copy of the completed ULURP, CEQR, or State Permit Application. (If applicable)
   c. Other available information which would support the certification of consistency.

2. If there are any questions regarding the completion or submission of this form, contact the Department of City Planning, Waterfront and Open Space Division at (212) 720-3620.

## ADDITIONAL INFORMATION FOR THE COASTAL ZONE CONSISTENCY DETERMINATION

New York City Department of Parks and Recreation (DPR) plans to issue a license to Ferry Point Partners, LLC, for a major concession. Ferry Point Partners would develop the currently unused eastern portion of Ferry Point Park into a golf course and public waterfront park. Ferry Point Partners would be responsible for the development, construction, operation, management and maintenance of the golf course, park and all appurtenance facilities. The golf course would occupy the majority of the interior of the site with a community park fronting onto Balcom Avenue. A 300-foot wide swath along the East River would be used as the public waterfront park. This park would be physically connected with the existing Ferry Point Park on the west side of the Bronx-Whitestone Bridge.

The following narrative discusses all questions in the Consistency Assessment Form that were answered with a yes in order. Then public access is discussed.

*POLICIES 44, 11, 12, 17, C, D, E*

The waterfront is currently protected with a rip rap slope that is generally in good functional condition. Where necessary, the slope would be repaired in-kind to assure its long term stability and functionality. A small portion along the waters' edge of the site is within the 100-year flood plain. No structures would be built in this area. The restaurants and other buildings would be located in areas outside of the 100-year flood plain.

*POLICIES 8, 36, 37, 38, 39, J, L, K*

Evidence indicates that the land was built out into the water using municipal waste and construction debris. The soil is being sampled, and a detailed discussion of the findings is in Attachment G. Over the whole site with the exception of the proposed lakes, a layer of clean soil would be placed over the current soils. This layer would prevent accidental human contact with the underlying soils. In the lakes, an impervious layer would be placed to hold the water. This layer would also prevent human contact with the existing soils. The materials that are removed to form the lakes would be used to contour the land in the golf course. Any waste materials excavated would be disposed of off-site in accordance with applicable rules and regulations. The development of the golf course and park with their attendant uses would stop the illegal dumping that currently occurs on the site.

*POLICIES 1, A*

The site is currently vacant, except for the organic recycling/composting facility, an informal model airplane facility, and some active recreation facilities. The proposed public recreation facility would bring park activities and users to the area. The deteriorated (but functioning) waterfront rip rap slope would be rebuilt and repaired. The waterfront itself would be used as the park.

*POLICIES 19, 20, 21, 22, F*

Access would be through the current roadway system that is used for the developed portion of Ferry Point Park on the west side of the Bronx-Whitestone Bridge. Because of its proximity to major roadways in the area, with the exception of the community park, the proposed recreation facility would be primarily a regional park. Vehicles, pedestrians, and bicycles would be able to access the golf course, the waterfront park, the boathouse grill restaurant, and the fine dining/banquet facility via the I-678 service road which goes under the Bronx Whitestone Bridge. Vehicular parking and bike racks would be provided at various locations on-site. To provide security, the public recreational facilities would be fenced, and the single access point would allow monitoring of the park and golf course. The new eastern waterfront park would be connected with the existing western portion

of the Ferry Point Park, providing easy circulation between both facilities and providing a continuous waterfront walkway. Access for emergency vehicles will be provided via Emerson Avenue (see Figure A-2, "Site Plan," in Attachment A, "Project Description").

**Attachment I:** **Infrastructure**

## 1.0 INTRODUCTION

The project will utilize the existing sewer water and drainage systems adjacent to and through the project site to service the proposed golf course, parks, restaurant catering facility and other secondary uses. It will consume energy in the form of electricity and natural gas and will generate solid waste. This attachment identifies the existing services available in the area, outlines the demands created by this project and concludes with a description of the project designed to produce no adverse impacts on the existing infrastructure or adjacent users.

## 2.0 WATER SUPPLY

### 2.1 Existing Conditions:

Water mains exist around the perimeter of this site. There is an existing 12-inch water main that runs along the east side of the service road. A 12-inch water mains also runs along the west side of Emerson Avenue, the south side of Miles Avenue and the west side of Balcom Avenue. Hydrants are spaced along these roads at intervals of approximately 250 feet. Fire flow tests were run on the 12-inch main in the south side of Miles Avenue between Emerson Avenue and Robinson Avenue and on the 12-inch main in the east side of the Hutchinson River Parkway between Randall Avenue and Philip Avenue. The test results indicate a flow of 500 gallons per minute (gpm) is available with a static pressure of approximately 42 pounds per square inch (psi) and a residual pressure of 41 psi.

### 2.2 Proposed Conditions - Demand.

The estimated average daily demand on the water system created by this project is estimated as follows:

| | | |
|---|---|---|
| Irrigation System | | 500,000 gpd |
| Golf Club | 216 people x 25 gpd | 5,400 gpd |
| Catering Facility | 1000 seats x 20 gpd | 20,000 gpd |
| Waterfront Park | 500 people x 5 gallons per person (gpp) | 2,500 gpd |
| Maintenance Facility | 30 people x 25 gpd | 4,166 gpd |
| Boathouse Grill | 1200 patrons x 20 gpp | 15,000 gpd |
| **Average Daily Domestic Demand** | | **51,066 gpd** |
| **Average Daily Irrigation Demand** | | **500,000 gpd** |
| **Total Average Daily Demand** | | **551,066 gpd** |

The peak daily demand would be the irrigation flows at 500,000 gpd plus the domestic flows peak at a factor of four, 204,264 gpd, for a total peak daily demand of 704,264 gpd. Because there are no facilities planned at this time in the community park, there will be no impact on the domestic water demand.

The average hourly supply, drawn from the City system to satisfy the average daily demand calculated above is shown in the table below. The average hourly supply is based on a supply duration of 10 hours for a 24-hour period.

| | | |
|---|---|---|
| Irrigation supply | 500,000/10 hours | 833 gpm |
| Domestic supply | 51,066/10 hours | 85 gpm |
| **Average Hourly supply** | | **920 gpm** |

The peak hourly demand using the same supply times and peaking factors outlined above would be approximately 1200 gpm.

Based on the fire flow test results which produced a flow rate of 500 gpm with only 1 psi drop in pressure, the average daily demand will drop the available pressure in the City system by less than 2 psi and the peak hourly demand will reduce pressures by less than 3 psi. Both of these pressure drops are negligible and should not adversely affect the available water supply or pressure in the area.

In addition, these calculations are very conservative in that the supply to the irrigation system will occur between 8 PM and 6 AM—a time that is off peak compared to the demands of other components of this project (predicted to occur from 6 AM to 12 AM) but also off peak from the existing demand in the City system. The peak in this residential area will be early morning, approximately 6-7 AM.

## 2.3 Water Distribution System

The expansion of the water supply system to service this project includes the extension of the water main along Emerson Avenue through the site, interconnecting it with the existing water main along the service road. The proposed loop will include a 12-inch Ductile Iron mainline with fire hydrants spaced at 250 feet on center. In addition, a line will be extended from the main along the service road to serve the maintenance facility and supply the irrigation system. From this looped line services for both fire flows and domestic flows will be extended to the clubhouse, fine dining/banquet facility and boathouse grill. In addition, water will be supplied to the bathroom facilities on the golf course and the facilities planned for the waterfront park.

The additional demand created by this project relative to supply and pressure will not have an adverse impact of the overall existing system.

# 3.0 Sanitary Sewer

## 3.1 Existing Conditions

This area of the Bronx is served by a combined sewer system, which ultimately discharges to and is treated at the Hunts Point Sewage Treatment Plant. There are major combined sewer mains along Miles Avenue, Emerson Avenue, Balcom Avenue and Schley Avenue including that portion of Schley Avenue that crosses this site and is proposed to be demapped. These lines were originally designed to handle the storm and sanitary sewer discharges from this site. These existing sewers vary in size from 3 by 4 feet along Emerson Avenue to 12 by 8 feet along that portion of Schley Avenue that crosses through this site.

## 3.2 Proposed Conditions

Based on the estimated water demand outlined above, the average daily sanitary sewer flows generated by this project are estimated to be approximately 51,066 gpd. These flows will be directed to the existing collection system adjacent to the site and ultimately treated at the Hunts Point Treatment plant. The average daily flow will be approximately 71 gpm based on a flow period of 12 hours. Because there are no facilities planned at this time, no additional sewer flows would be generated from this park.

The existing combined sewer system will be utilized to service this site. The primary sanitary sewer collection system will include a 10-inch gravity sewer line extending from Emerson Avenue along the loop

road. From this main, gravity services will be extended to the clubhouse, fine dining/banquet facility, and the facilities at the waterfront park.

Because of the grade differential, a pump station and forcemain will be required to service the boathouse grill. The pump station will be located behind the restaurant and the forcemain will extend to meet the proposed gravity line. The maintenance facility will be connected to the combines system by gravity and the facilities on the golf course will require small grinder pump stations.

Based on general information provided by the New York City Department of Environmental Protection (DEP), there would be adequate conveyance capacity and plant capacity to handle the flows generated by this project with out adversely affecting the existing systems.

## 4.0 Solid Waste

### 4.1 Existing Conditions

The existing site produces a small amount of solid waste from one existing use, the City's organic recycling and composting facility.

### 4.2 Proposed Conditions

All aspects of this facility will generate solid waste. A private commercial operator will be contracted to handle all waste generated on-site. All facilities will be provided with appropriately sized dumpsters or containers. The recycling/composting facility is proposed to be relocated, and would, therefore, no longer generate solid waste.

It is anticipated that the private operator contracted to handle this facility would have adequate capacity to handle the solid waste generated by this project without adversely affecting their existing operations or the areas adjacent to this project.

## 5.0 Energy

### 5.1 Existing Conditions

The existing site consumes a small amount the energy as a result of the City's recycling/composting operations.

### 5.2 Proposed Conditions:

It is anticipated that this facility will be serviced by both electricity and natural gas. The estimated demands for the proposed uses are summarized in the following table:

| Use | Electrical | Gas (cubic feet/hour) |
|---|---|---|
| Clubhouse | 125 kw | 400 cfh |
| Boathouse Grill | 215 kw | 1,250 cfh |
| Catering Facility | 500 kw | 3,500 cfh |
| Managers Quarters | 60 kw | 400 cfh |
| Service Building | 100 kw | 200 cfh |
| Parking Lighting | 40 kw | |
| Park Facilities | 50 kw | |
| **Total:** | **1090 kw** | **5,750 cfh** |

The electric services to the site will be extended from the existing lines along the east side of the site. Based on the anticipated loads, it appears that this project can be serviced without any adverse affects on the current system and the areas adjacent to this site. Because the recycling/composting facility is proposed to be relocated, it would no longer consume any energy.

## 6.0 DRAINAGE SYSTEM

### 6.1 Existing Drainage

The existing site ultimately drains to the East River. The site is relatively flat with elevations varying from 6 to 35. The site can be divided into three drainage areas generally defined as follows (see Figure I-1):

Area 1 – This area is approximately 40 acres in size and drains to the existing drainage system along the service road and then to the East River.

Area 2 – This area is approximately 75 acres in size and drains to the combined sewer system along Balcom Avenue, Miles Avenue and Emerson Avenue. This combined system has a diversion chamber at the intersection of Schurz Avenue and Emerson Avenue, which under high flow conditions discharges into the East River.

Area 3 – This area is approximately 90 acres in size and drains directly to the East River by overland flow.

A portion of the Bronx-Whitestone Bridge also drains through the project site and into the East River along with a portion of the City park to the west of the bridge. Absent remediation, which is currently not provided, water from the Bronx-Whitestone Bridge collects in low-lying areas on the westerly side of the bridge adjacent to Area 3.

### 6.2 Proposed Conditions

Under the proposed conditions, the site would be divided into seven primary drainage areas (see Figure I-2). All of them would include provisions for water quality treatment prior to discharge of the site. In addition, those areas that discharge into the City's combined sewer system have been designed with detention basins so that the pre-development discharges are not exceeded in the post-development condition for the prescribed rainfall event.

The methodology utilized in this analysis includes TR-20 and TR-55 computer programs designed to model small watersheds and the recommendations included in the New York State Department of Environmental Conservation (DEC) publication entitled "Reducing the Impacts of Stormwater Runoff from New

Figure F-1
Existing Drainage Areas

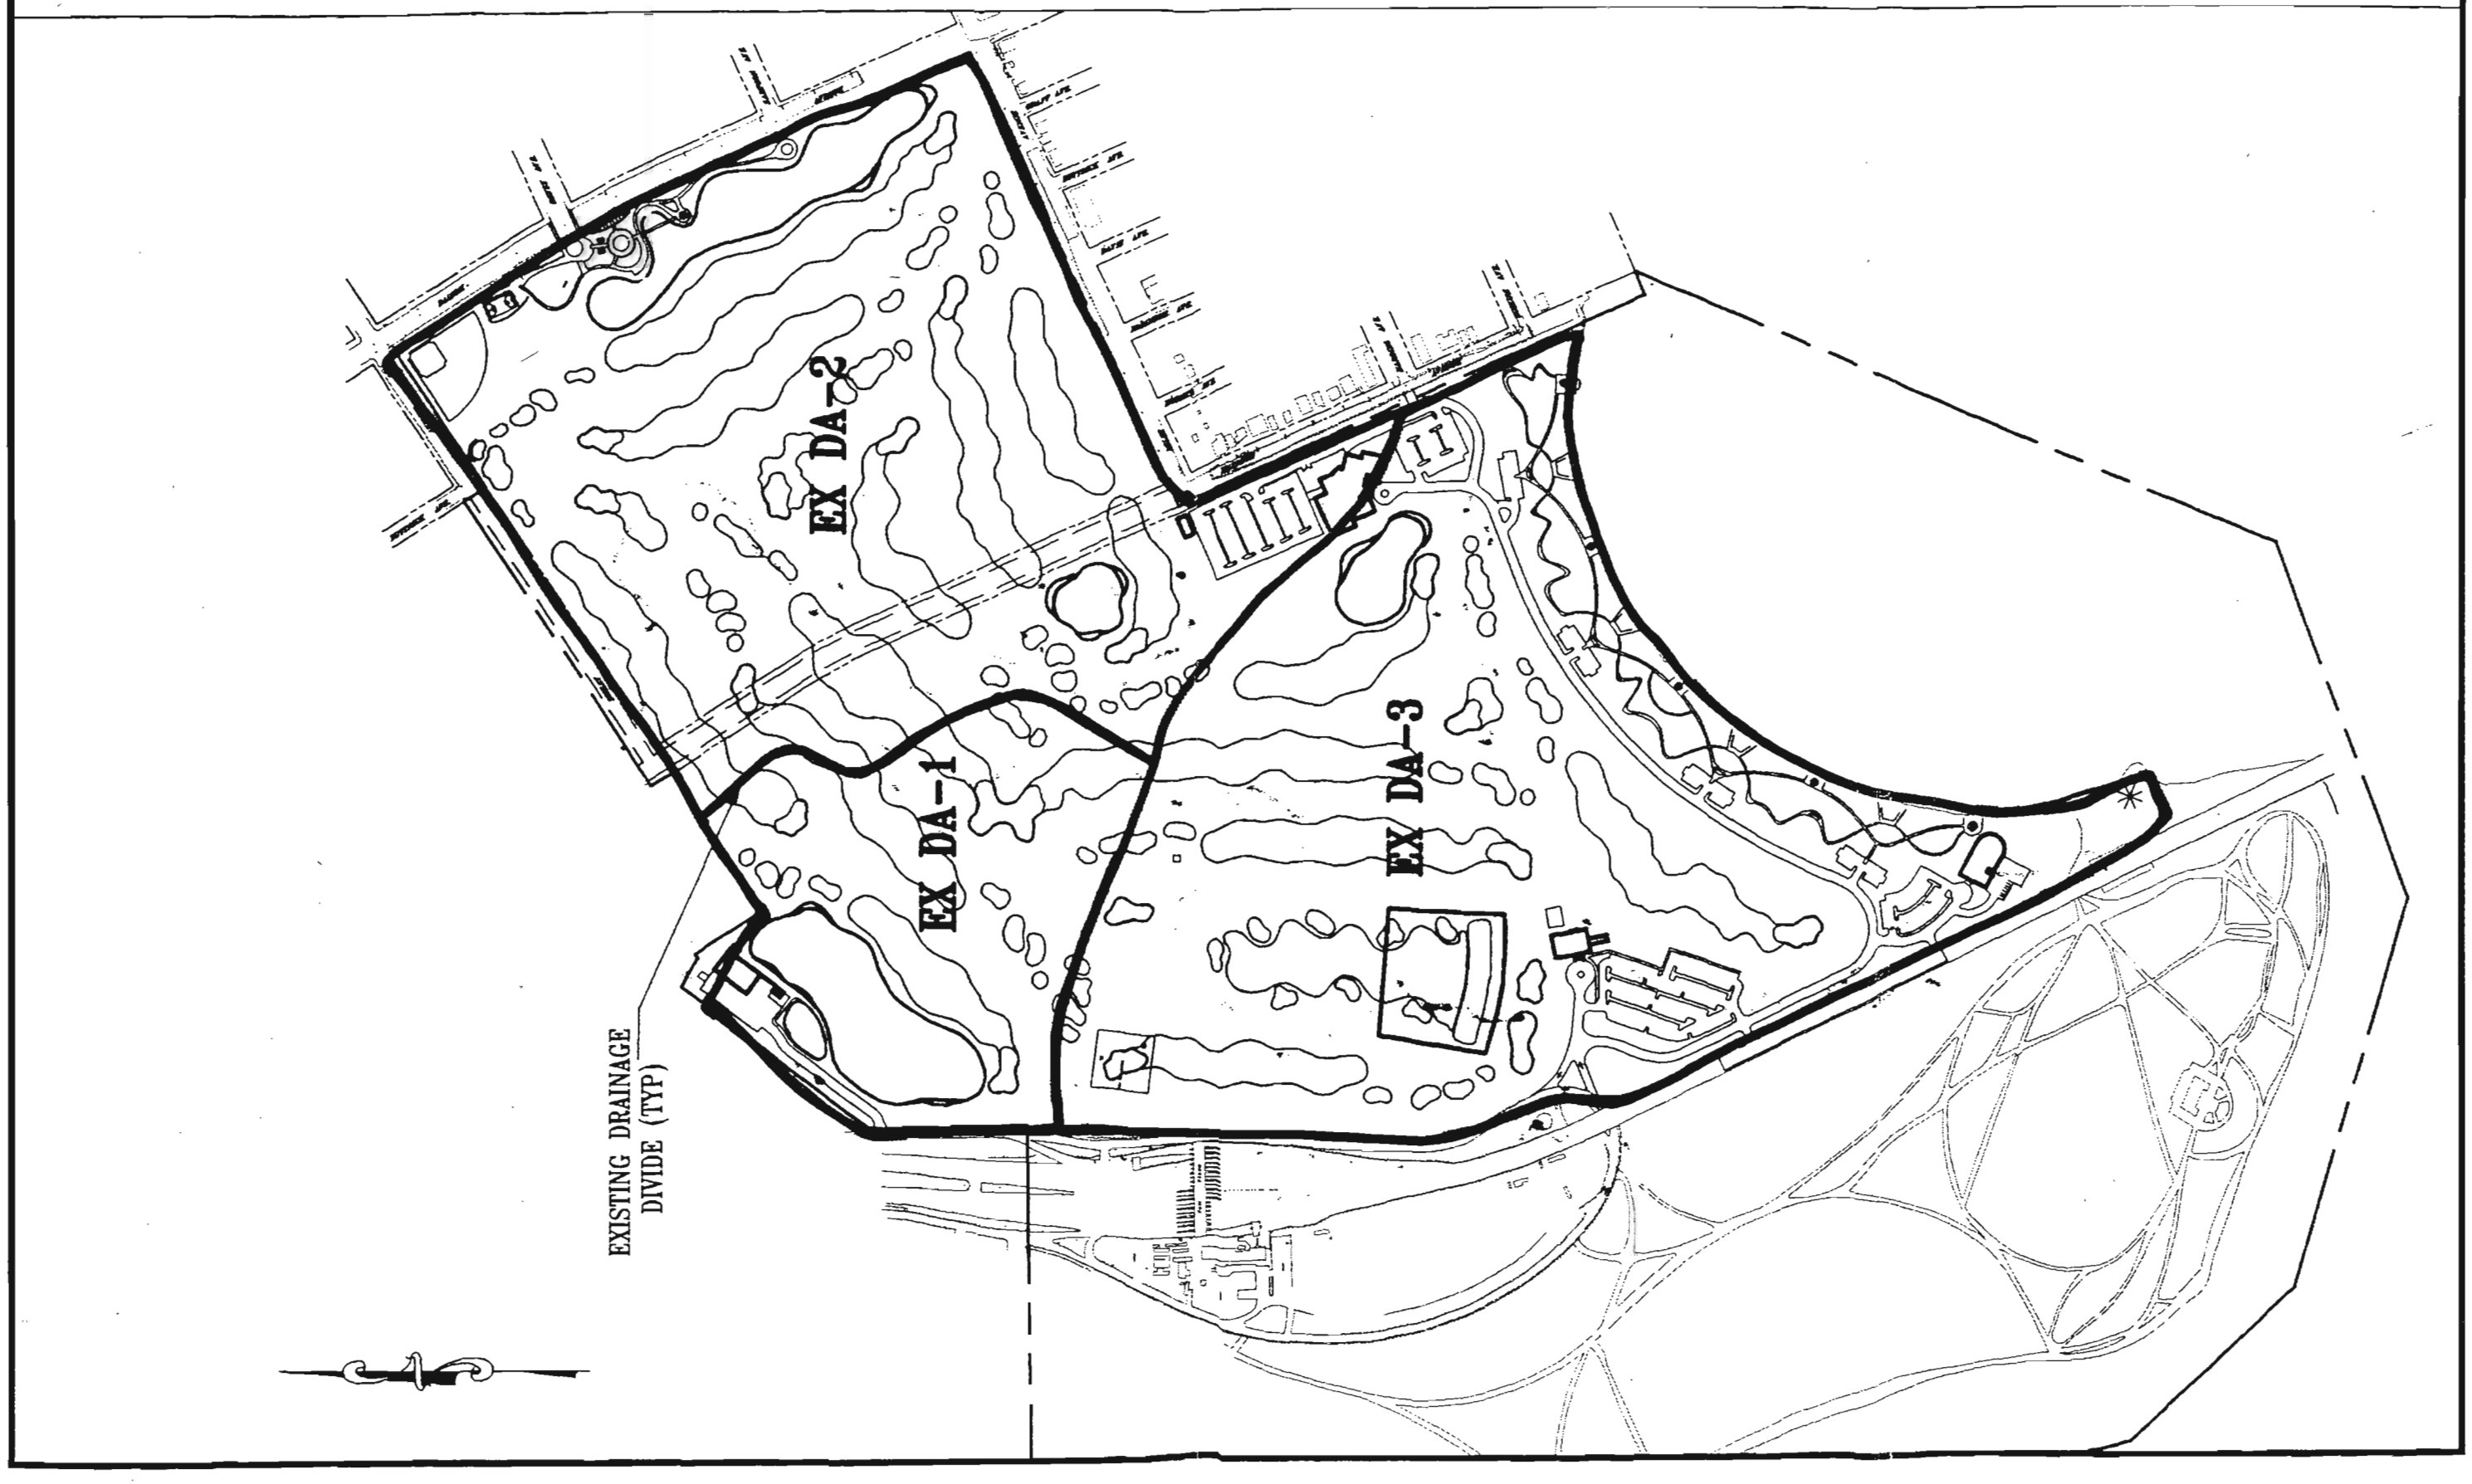

Figure 1-2
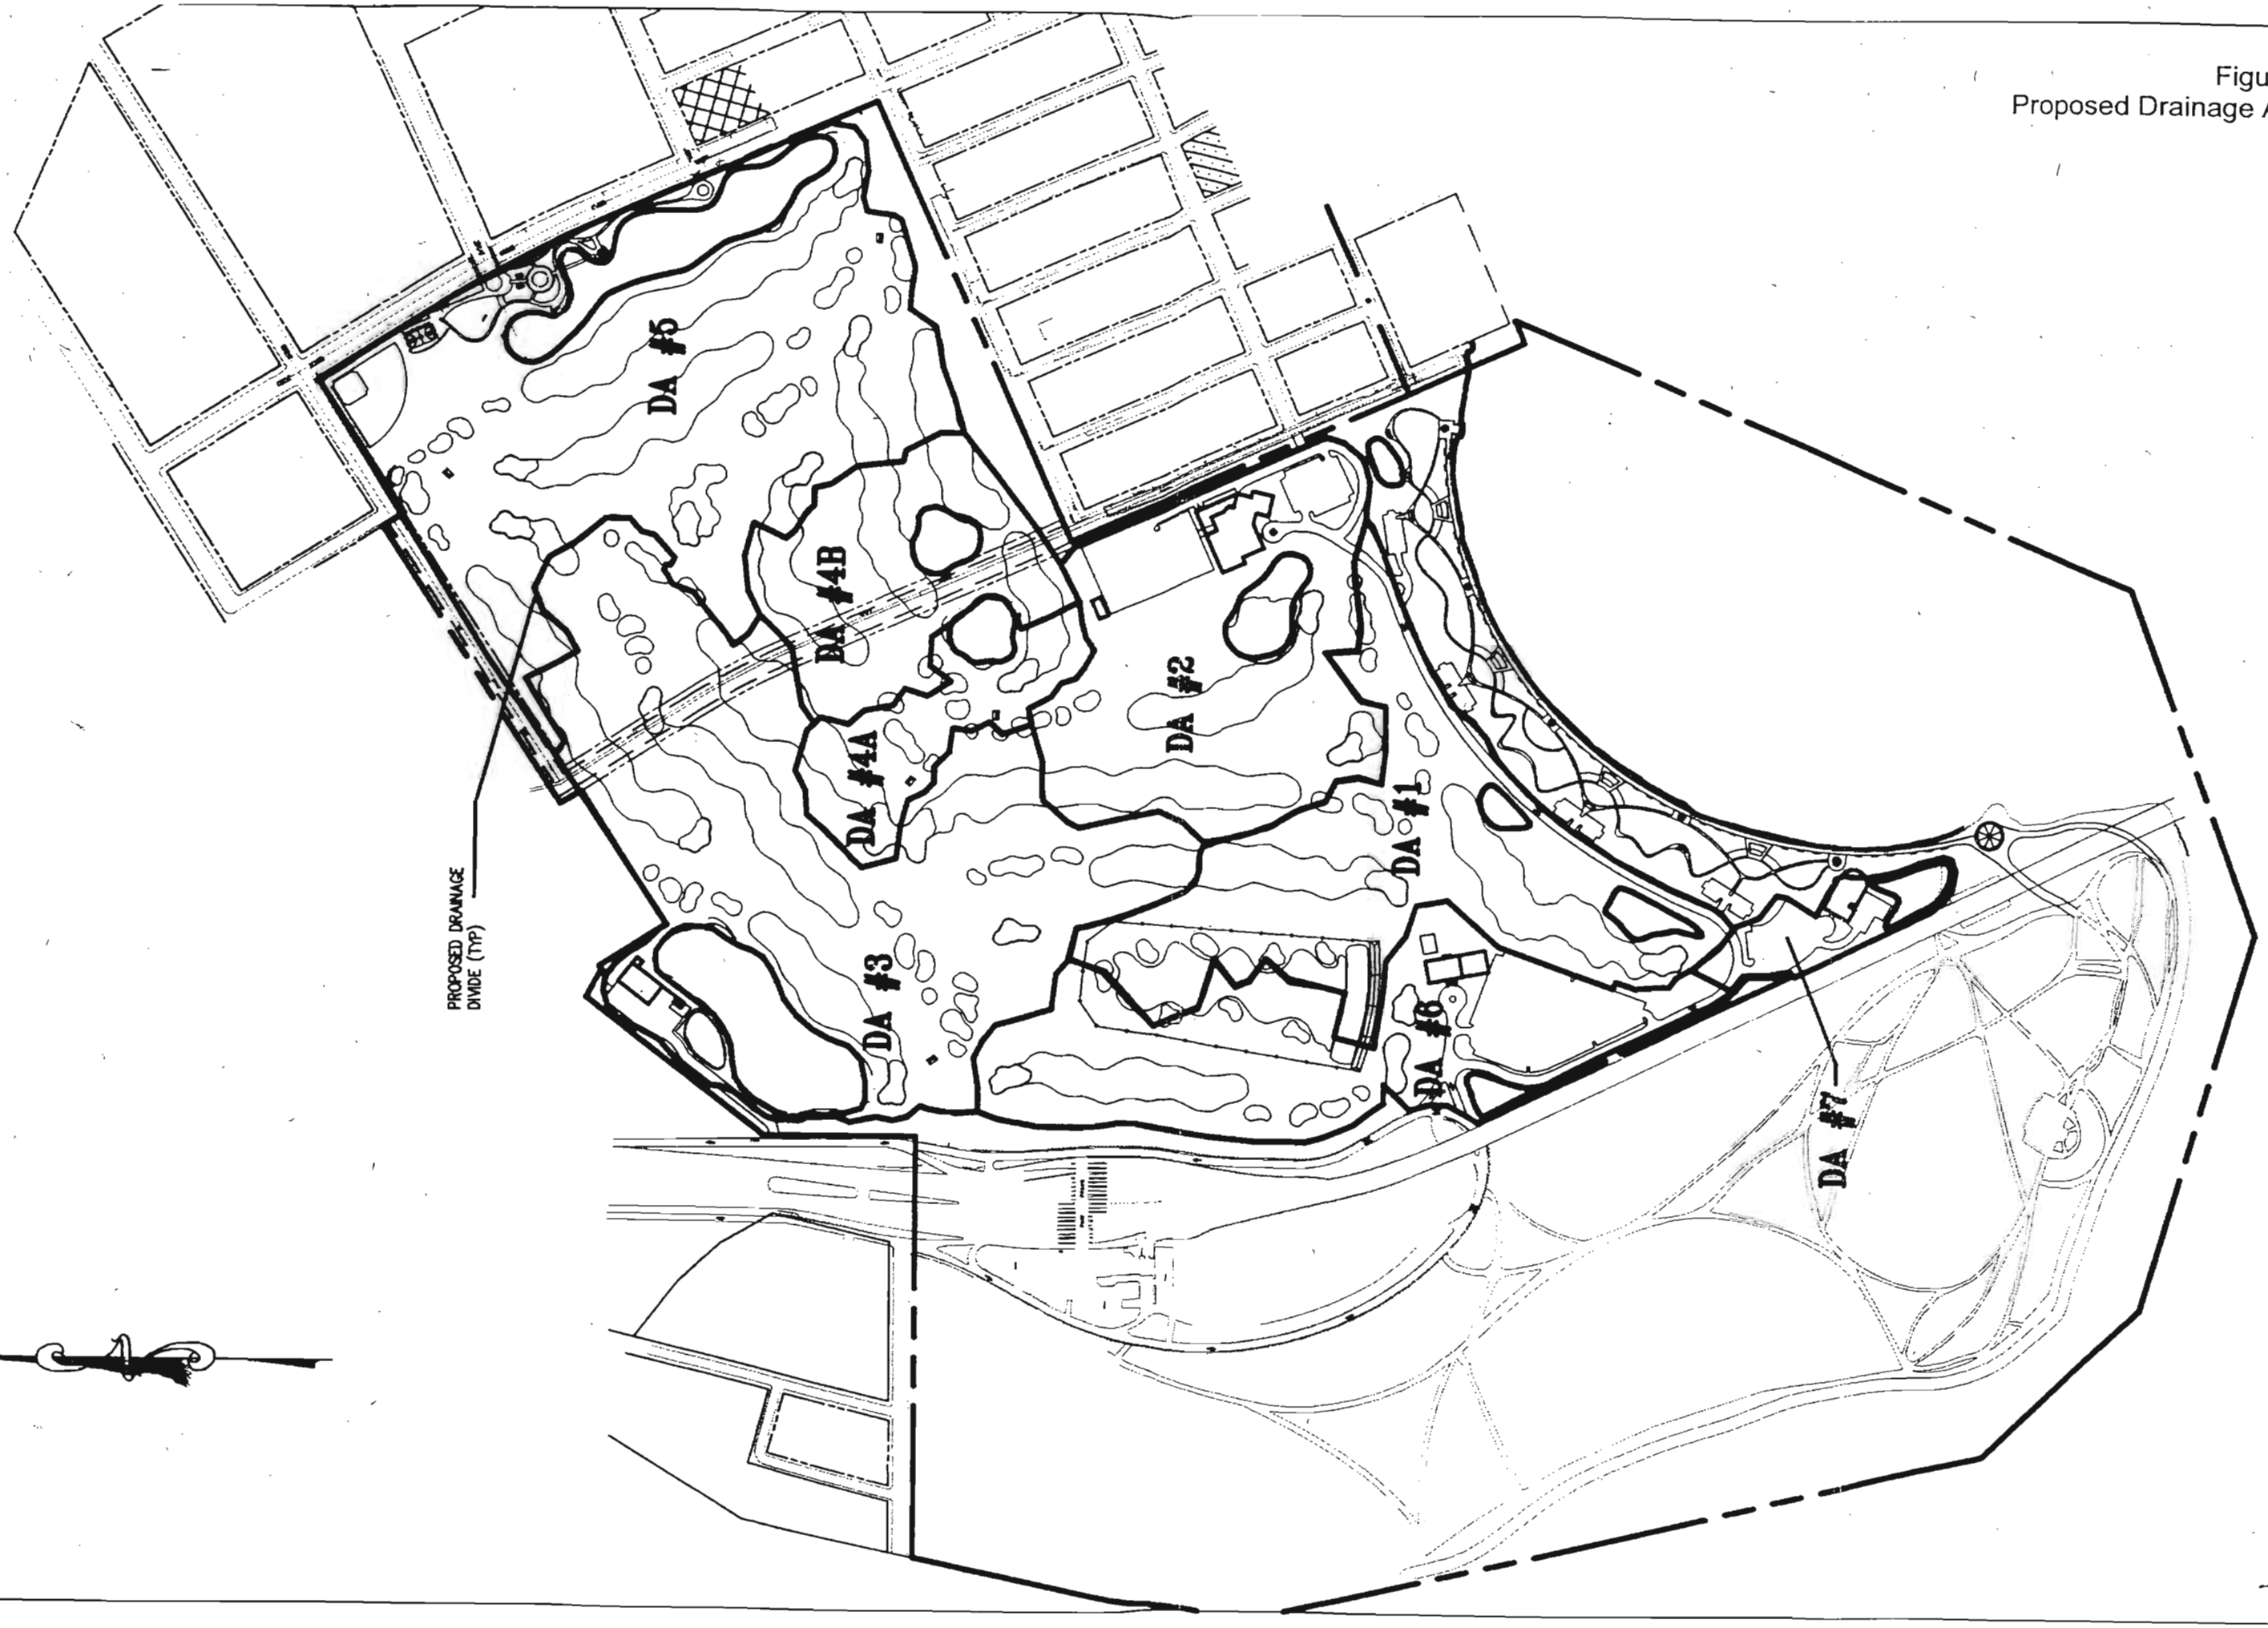
Proposed Drainage Areas



Development," the DEP publication entitled "Criteria for Determination of the Volume of Detention Facilities" and "Applicant's Guide to Stormwater Pollution Prevention Plans," also by DEP.

This system is designed to mitigate runoff contaminates generated by the proposed project, using wet and dry detention basins which include prolonged (in excess of two days) detention of the first flush. The first flush is defined as the first ½-inch of runoff from those areas whose imperviousness has changed, or a 1-year, 24-hour storm event—whichever is greater. For this project, the detention systems are sized to provide extended detention of the 1-year storm event. The performance of this system was evaluated for the 2-year event.

Runoff from all impervious areas and the golf course except the waterfront park is directed to some form of a detention basin. These basins are then designed with an outlet structure that detains for an extended period of time the first flush which contains approximately 90 percent of the pollutants generated by developments similar to the proposed project. Those areas that discharge out of the detention system and into the City's combined sewer system have been designed to include the detention volume necessary to insure that the post-development discharge rates do not exceed the estimated allowable discharge rates based on the estimated design capacity of the existing combined sewer system.

Following is a summary of the drainage areas, their specific land use characteristics, detention facilities, and outlet conditions.

Area 1:

This area is 26.3 acres in size and encompasses the access road and a portion of the golf course. The area includes approximately 54,000 square feet of impervious area; the balance is landscaped and golf course.

The water quality feature designed for this drainage area includes three dry detention areas—two integrated into the golf course design and one along the eastern edge of the waterfront park. The total area of these basins is 1.12 acres with an average depth of approximately three feet. These basins area designed with small (3- and 4-inch) outlets, which control the 1-year storm to provide the required detention time. For greater storms these basins discharge through the cover of a 4-by-4-foot catch basin. The piping system from this outlet structure is interconnected with the discharge piping from Drainage Area 2 and is connected to the City's sewer system below the diversion chamber in Emerson Road. The discharge from these combined areas is 0.34 cubic feet per second (cfs) for the 1-year event. The total runoff volume is 2.7 acre-feet (ac-ft) and the maximum detention time for this area is 3.93 days. The maximum depth of water in the basin during the 1-year storm is approximately 1.3 feet. The maximum depth of water in the basins during the 100 year event is 3.5 feet and the discharge for this storm event is 68 cfs.

Area 2:

This area is 24.60 acres and encompasses the fine dining/banquet facility and a portion of the golf course. The area includes approximately 209,393 square feet of impervious area and a 0.75- acre lake. The balance of the area is landscaped grounds and golf course. The water quality feature designed for this drainage area includes one wet pond and one retention basin. The lake is designed with a 4-inch outlet, which controls the 1-year storm to provide the required detention time. For greater storms, this system discharges through the cover of a 2-by-2-foot catch basin. The piping system from this outlet structure is interconnected with the discharge piping from Drainage Area 1 and is connected to the City's sewer system below the diversion chamber. The discharge from this area is 0.44 cfs for the one-year event. The total runoff volume is 2.62 ac-ft

and the maximum detention time for this area is 3 days. The maximum increase in water elevation in the lake during the 1-year storm is approximately 1.3 feet. The maximum increase in water elevation in the lake during the 100-year event is 2.5 feet.

Area 3:

This area is 47.1 acres and encompasses the maintenance area and a portion of the golf course. The area includes approximately 53,343 square feet of impervious area and 4.98 acres of lake. The balance of the area is landscaped and golf course.

The water quality feature designed for this drainage area includes one lake. The lake is designed with a 4-inch outlet, which control the 1-year storm to provide the required detention time. For greater storms, this system discharges through the cover of a 1.5-by-1.5-foot catch basin. The piping system from this outlet structure is connected to the City's sewer system along the 8-by-6-foot pipe that runs under the portion of Emerson being demapped. The discharge from this area is 0.27 cfs for the 1-year event. The total runoff volume is 4.31 ac-ft and the maximum detention time for this area is 8 days. The maximum increase in water elevation in the lake during the 1-year storm is approximately 0.6 feet. The maximum depth of water in the basins during the 100-year event is 2.4 feet. This system is connected directly to the city's sewer system therefore detention is required. The required detention volume is provided in the lake from elevation 14 to elevation 14.9 and is approximately 0.82 ac-ft of storage. The discharge rate as prorated for this area is 9.9 cfs.

Area 4:

This area is 21.05 acres and encompasses the central portion of the golf course and includes only landscaped areas and golf course. The water quality feature designed for this drainage area includes one lake and one shallow retention area. The lake and detention area discharge through a 4-inch outlet, which controls the 1-year storm to provide the required detention time. For greater storms this system discharges through the cover of a 1-by-1-foot and a 2-by-3-foot catch basin, respectively. The piping system from this outlet structure is connected to the City's sewer system along the 8-by-6-foot pipe that runs under the portion of Emerson being demapped. The discharge from this area is 0.35 cfs for the one-year event. The total runoff volume is 1.75 ac-ft and the maximum detention time for this area is 3.1 days. The maximum increase in water elevation in the lake during the 1-year storm is approximately 0.8 feet. The maximum depth of water in the basins during the 100-year event is 1.9 feet. This system is connected directly to the City's sewer system therefore a detention is required. The required detention volume is provided in the lake from elevation 13 to elevation 14.2 and is approximately 0.37 ac-ft of storage. The discharge rate as prorated for this area is 31.46 cfs.

Area 5:

This area is 46.22 acres and encompasses the eastern portion of the golf course and the community park. This area includes 40,000 square feet of impervious area and 4.52 acres of lake. The balance of the area is landscaped and golf course. The water quality feature designed for this drainage area includes one lake. The lake discharges through a 4-inch outlet, which controls the 1-year storm to provide the required detention time. For greater storms, this system discharges through the cover of a 2-by-3-foot catch basin. The piping system from this outlet structure is connected to the City's sewer system under Miles Avenue. The discharge from this area is 0.28 cfs for the 1-year event. The total runoff volume is 4.2 ac-ft and the maximum detention time for this area is 7.5 days. The maximum increase in water elevation in the lake during the 1-year storm

is approximately 0.6 feet. The maximum increase in water elevation in the lake during the 100-year event is 2 feet. This system is connected directly to the City's sewer system; therefore, a detention is required.

The required detention volume is provided in the lake from elevation 13 to elevation 13.9 and is approximately 0.9 ac-ft of storage. The discharge rate as prorated for this area is 26.65 cfs.

Areas 6 and 7:

These areas are 25.70 acres and encompass the western portion of the golf course, the clubhouse site and the boathouse grill. They include 279,809 square feet of impervious area. The balance of the area is landscaped and golf course. The water quality feature designed for these drainage area include two dry retention basins. Basins 6 and 7 discharge through a 6-inch and 3-inch outlet, respectively. These outlets control the 1-year storm to provide the required detention time. For greater storms these basin discharges over a 5-inch sharp-crested weir and a 2-by-3-foot catch basin. The piping system from these outlet structures is directed to a natural low area adjacent to the East River; it ultimately overflows into the East River. The combined discharge from these areas is 1.42 cfs for the 1-year event. The total runoff volume is 3.6 ac-ft and the maximum detention time for this area is 5.14 days. The depth of water in these basins during the 1-year storm event is approximately 1.5 feet. The depth of water in the basin during the 100-year event is 3.6 feet and the peak discharge is 68.89 cfs.

Bridge Drainage

Under existing conditions, drainage from the bridge and a portion of the western park area drain to a low area along the western side of the bridge adjacent to the site. As this runoff builds, it flows overland along the southern end of the bridge and discharges into the East River. This natural ponding area and undefined sheet flow discharge will be maintained and not impacted by the proposed development. The runoff from this portion of the bridge and park area will bypass the stormwater management systems designed for the project and be allowed to discharge directly into the East River as it does under existing conditions.

New York City Detention Volume Criteria:

There are two areas discharging into the City's Sewer system. Discharge Area 1 includes Drainage Area 5 that discharges into the existing sewer system on Miles Avenue. The allowable discharge from this area is calculated to be 35.2 cfs based on a contributing areas of approximately 20 acres, a composite Cn of 0.44 and a rainfall of 4 inches. The second area Discharge Area 2 includes Drainage Areas 3 and 4. The allowable discharge for this area is calculated to be 44.4 cfs based on a contributing area of 25.25 acres, a composite Cn of 0.44 and a rainfall event of 4.0 inches.

For Discharge Area 1, the required detention volume required to maintain a maximum discharge equal to the allowable discharge of 35.2 cfs is 0.9 ac-ft based on a composite Cn of 0.32 and area of 44.2 acres and a rainfall event of 5.95 acres.

For Discharge Area 2, the required detention volume required to maintain a maximum discharge equal to the allowable discharge of 44.4 cfs is 1.19 ac-ft based on a composite Cn of 0.27 and area of 67.7 acres and a rainfall event of 5.95 acres.

Based on the information outlined above, it can be concluded that the stormwater management system for this site has been designed to adequately control stormwater runoff from this site so as not to adversely affect the receiving system or the adjacent properties.

**Attachment J:** **Traffic**

## A. INTRODUCTION

This attachment assesses the potential traffic impacts of the proposed development of a public recreation facility at Ferry Point Park, to the east of the Bronx-Whitestone Bridge. Vehicles would enter and exit the recreation facility from an entrance road to be constructed as part of the proposed project located off of the Ferry Point Park Access Road. The Ferry Point Park Access Road is currently a lightly traveled two-way roadway, except for the segment between Schley Avenue and the southbound I-678 park ramp, which is one-way southbound. As part of the proposed project, the Ferry Point Park Access Road would become a two-lane, one-way loop functioning as a southbound roadway on the west side of the Bronx-Whitestone Bridge and as a northbound roadway on the east side of the bridge. Currently, the project site is primarily unimproved and undeveloped New York City parkland; existing uses on the site are an organic recycling and composting facility (which would be relocated with development of the proposed project) and one baseball field and basketball court (which would be redeveloped as part of the public recreation facility). The proposed project would provide a total of 965 parking spaces (945 public parking spaces plus 20 parking spaces at the maintenance facility). Currently, there is an existing parking lot which serves users of the developed portion of Ferry Point Park to the west of the Bronx-Whitestone Bridge. This attachment analyzes the existing traffic conditions for the network and assesses potential changes in travel patterns associated with the development of the proposed public recreation facility.

## B. EXISTING CONDITIONS

### ROADWAY NETWORK

To assess the potential traffic impacts associated with the development of the project, seven key intersections were identified as those most likely to be affected by the project-related traffic (see Figure J-1). These include the signalized intersections of Lafayette Avenue with Brush Avenue, the I-678 north- and southbound service roads, and East Tremont Avenue; and Bruckner Boulevard and Brush Avenue. The intersection of the I-678 southbound service road and Schley Avenue is the only unsignalized location included in the study.

The I-678 north- and southbound service roads are major streets in the study area that provide two moving lanes. The service roads range in width from approximately 24 feet to 26 feet. Parking is not permitted along the service roads.

Lafayette Avenue and Bruckner Boulevard are major east-west roadways in the study area, providing access to the I-678 service roads, the Cross-Bronx Expressway and the Hutchinson River Parkway. Lafayette Avenue provides two moving lanes during the peak periods and ranges in width from 67 to 75 feet. Bruckner Boulevard provides two to three lanes in each direction during the peak periods and is approximately 75 feet in width. On-street parking is provided along portions of these streets.

East Tremont Avenue is a major north-south roadway in the study area. East Tremont Avenue provides two moving lanes in each direction during the peak periods. East Tremont Avenue and is approximately 60 feet in width. Two-hour metered parking is permitted along this street between 9:30 AM and 7:30 PM except on Sunday.

Brush and Schley Avenues are lightly traveled local roads in the study area. Brush Avenue operates in the north-south direction with one to two lanes in each direction. This street is approximately 50 feet in width. Parking is not permitted along Brush Avenue. Schley Avenue operates in the east-west direction with one lane in each direction. Schley Avenue is approximately 54 feet in width. There is 90 degree parking along the south side of Schley Avenue.

Currently, the Ferry Point Park Access Road is lightly traveled, and operates with one lane in each direction (north- and southbound), except for the segment between Schley Avenue and the southbound I-678 park ramp, which operates one-way southbound. Vehicles traveling north- and southbound on this access road are primarily park users traveling to and from the existing parking lot located on the west side of the bridge. Additionally, Triborough Bridge and Tunnel Authority (TBTA) vehicles traveling southbound from the eastern side of the bridge access the road from a restricted ramp located near the Bronx-bound toll plaza of the Bronx-Whitestone Bridge.

## ANALYSIS METHODOLOGIES

### *SIGNALIZED INTERSECTIONS*

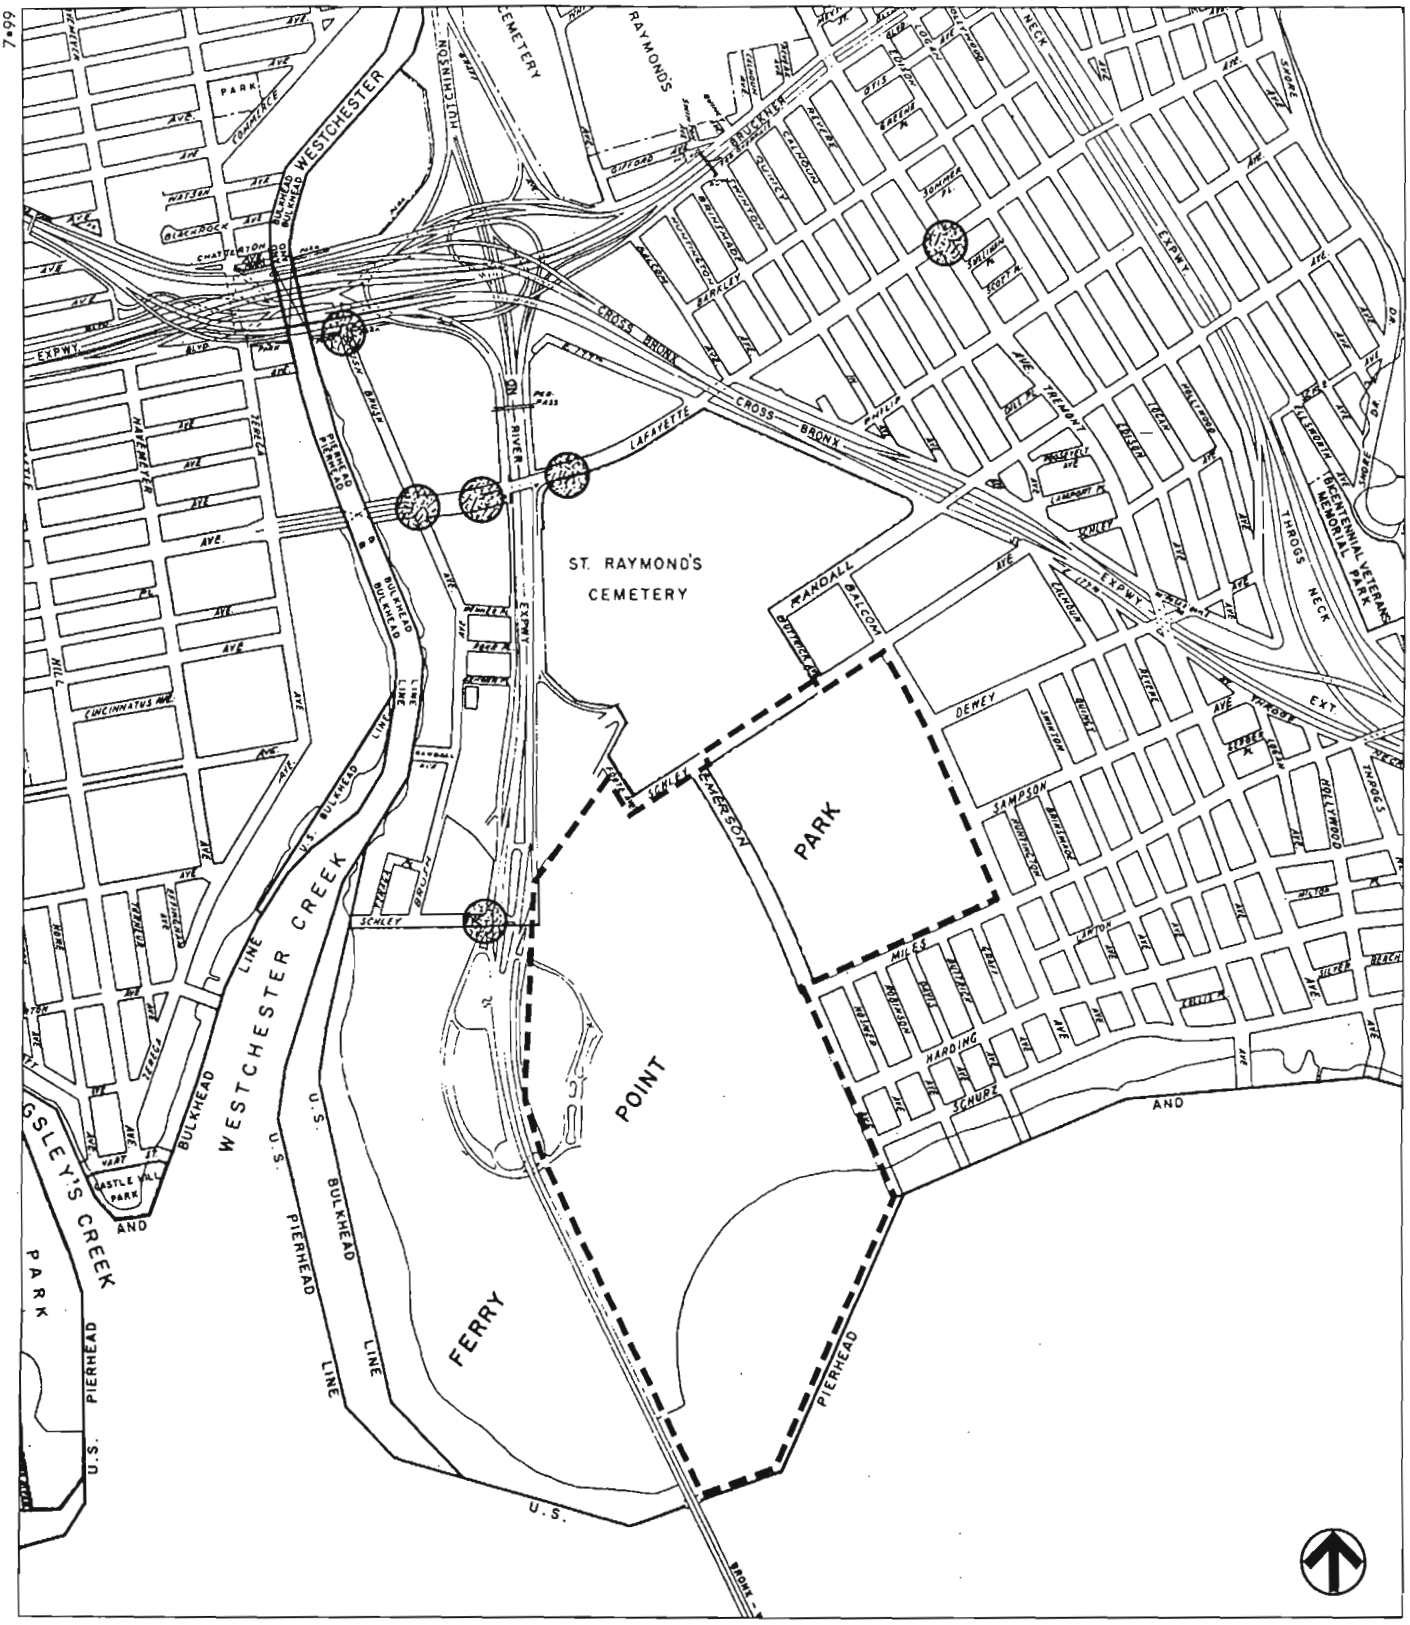
The operation of the signalized intersections in the study area was analyzed applying the methodologies presented in the 1994 *Highway Capacity Manual* (*HCM*). This procedure evaluates signalized intersections for average delay per vehicle and level of service (LOS).

LOS for the signalized intersections is based on the average stopped delay per vehicle for the various lane group movements within the intersection. This delay is the basis for an LOS determination for individual lane groups, the approach as a whole, and the overall intersection.

The delay criteria for the range of service levels (LOS) follows below:

| LOS | Average Delay |
|---|---|
| A | <5.0 seconds |
| B | 5.1-15.0 seconds |
| C | 15.1-25.0 seconds |
| D | 25.1-40.0 seconds |
| E | 40.1-60.0 seconds |
| F | >60.0 seconds |

Although the *HCM* methodology calculates a volume-to-capacity (v/c) ratio, there is no strict relationship between v/c ratios and LOS. A high v/c ratio indicates substantial traffic passing through an intersection, but a high v/c ratio combined with a low average delay actually is the best case in terms of traffic engineering standards, where an approach, or the whole intersection, processes traffic close to its theoretical maximum with a minimum of delay. However, very high v/c ratios—especially those greater than 1.0—are often correlated with a deteriorated LOS. LOS A and B indicate good operating conditions with minimal delay. Other important variables



*Ferry Point Park*

## Traffic Study Area

*Figure J-1*

affecting delay include cycle length, progression, and green time. At LOS C, the number of vehicles stopping is higher, but congestion is still fairly light. LOS D describes a condition where congestion levels are more noticeable and individual cycle failures (a condition where motorists may have to wait for more than one green phase to clear the intersection) can occur. Conditions at LOS E and F reflect poor service levels, and cycle breakdowns are frequent. The methodology provides for a summary of the total intersection operating conditions. The analysis chooses the two the worst-case movements from each roadway and calculates a summary v/c ratio, delay, and LOS for the intersection.

*UNSIGNALIZED INTERSECTIONS*

The LOS criteria are given below. As used here, total delay is defined as the total elapsed time when a vehicle stops at the end of the queue until the vehicle departs from the stop line; this includes the time required for the vehicle to travel from the last-in-queue to the first-in-queue position. The average total delay for any particular minor movement (referred to as a "critical movement") is a function of the service rate or capacity of the approach and the degree of saturation.

| LOS | Average Delay |
|---|---|
| A | ≤5.0 seconds |
| B | >5.1 and ≤10.0 seconds |
| C | >10.0 and ≤20.0 seconds |
| D | >20.0 and ≤30.0 seconds |
| E | >30.0 and ≤45.0 seconds |
| F | >45.0 seconds |

The LOS criteria (number of seconds of delay corresponding to each LOS category) for unsignalized intersections are somewhat different from the criteria used in signalized intersections. The primary reason for this difference is that drivers expect different levels of performance from different kinds of transportation facilities. The expectation is that a signalized intersection is designed to carry higher traffic volumes than an unsignalized intersection. In addition, several driver behavior considerations combine to make delays at signalized intersections less onerous than at unsignalized intersections. For example, drivers at signalized intersections are able to relax during the red interval, whereas drivers on the minor approaches to unsignalized intersections must remain attentive to the task of identifying acceptable gaps and vehicle conflicts. Also, there is often much more variability in the amount of delay experienced by individual drivers at unsignalized than at signalized intersections. For these reasons, it is considered that the total delay threshold for any given LOS is less for an unsignalized than for a signalized intersection.

## EXISTING TRAFFIC CONDITIONS AND LEVELS OF SERVICE

Existing traffic volumes in the study area were based on counts conducted in April and May 1999. These volumes indicate a weekday PM peak hour of 5 to 6 PM, a Saturday midday peak hour of 12 to 1 PM, and a Saturday PM peak hour of 5 to 6 PM. An inventory of the analyzed intersections was performed to determine cycle length, signage, timings, and phasings to be used in the calculation of the street capacities.

As shown in Figures J-2 through J-4, traffic volumes were estimated for the weekday PM, Saturday midday, and Saturday PM peak hours. These hours represent the heaviest network volumes

during the operation of the recreational facility and thus are the most sensitive hours for assessing impacts. Trips generated by the project during the weekday AM peak period would be minimal. Therefore, the weekday AM peak period is not a sensitive peak for assessing potential project impacts. North- and southbound volumes on the I-678 service roads range from 115 to 145 vehicles per hour (vph) and 210 to 430 in each direction, respectively, during the peak hours of analysis. East- and westbound traffic volumes on Lafayette Avenue range from 320 to 820 vph in each direction during the weekday PM, Saturday midday, and Saturday PM peak periods. East- and westbound volumes on Bruckner Boulevard range from 810 to 1,105 vph in each direction during the peak hours of analysis. North- and southbound volumes on the Brush Avenue range from 120 to 335 vph in each direction during the peak periods. North- and southbound volumes on East Tremont Avenue range from 600 to 790 vph in each direction during the weekday PM, Saturday midday, and Saturday PM peak periods. East- and westbound volumes on Schley Avenue range from 75 to 130 vph in each direction during the peak periods.

Tables J-1 and J-2 present the level of service conditions for the study area's signalized and unsignalized intersections, respectively. The capacity analysis indicates that all approaches operate acceptably—at mid-range LOS D or better for the weekday PM, Saturday midday, and Saturday PM peak hours.

*PARKING*

The project site is composed primarily of undeveloped parkland, with the exception of an organic recycling and composting facility operated by the New York City Department of Parks and Recreation (DPR) at the northwestern corner of the site, and a ballfield and basketball court at the northeastern corner of the site. Informal uses on the site include dirt bike trails and a model airplane field. There is a parking lot at the west side of the Bronx-Whitestone Bridge which serves the developed western portion of Ferry Point Park.

*PUBLIC TRANSPORTATION*

As shown in Figure J-5, the study area is served by buses Q44 (operated by New York City Transit [NYCT]) and QBx1 (operated by Queens Surface Corporation). The closest Q44 bus stop to Ferry Point Park is at the intersection of Lafayette Avenue and the I-678 southbound service road (approximately 0.7 miles from the park). The Q44 operates 8, 7, and 8 buses per hour during the weekday PM, Saturday midday peak hours, respectively. The QBx1, an express bus which provides service between Flushing and Co-Op City via the Bronx-Whitestone Bridge, stops at the intersections of Lafayette Avenue and the I-678 north- and southbound service roads, and the intersection of Wenner Place and the I-678 southbound service road (approximately 0.5 miles from the park). Because the existing bus stops are relatively distant from the park, and sidewalks along the I-678 southbound service road are not continuous, few users travel to the park by bus.

*PEDESTRIANS AND BICYCLES*

Existing pedestrian activity in the study area is low. There are lightly used sidewalks along portions of the I-678 north- and southbound service roads and the Ferry Point Park access road. Based on field reconaissance, there are no pedestrian-vehicle conflict locations. There is no existing bicycle lane on the Ferry Point Park access road.

## C. THE FUTURE WITHOUT THE PROJECT

To establish a baseline (the No Build scenario) against which to evaluate the impacts of the proposed project, future year traffic conditions were conservatively analyzed for 2002, when all components of the project would be completed and operational. Future conditions were estimated by applying a growth rate of 2.0 percent (0.67 percent per year, more conservative than the 0.5 percent per year stipulated in the *City Environmental Quality Review Technical Manual*) to the existing network volumes, and by adding these grown volumes to vehicle trips generated by the development of approximately 50 residential units in the vicinity of Balcom Avenue and Huntington Avenue (to the east of the project site) in the study area. The vehicle trip generation for these residential units were based on rates presented in the *Institute of Transportation Engineers' Trip Generation Manual, Sixth Edition* and existing travel patterns. The trip assignment for these residential units were based on existing travel patterns in the area.

Analysis of future conditions also accounts for the TBTA relocation of the southbound on-ramp to the Bronx-Whitestone Bridge near Schley Avenue. This ramp, which is currently south of the intersection of Schley Avenue and the I-678 southbound service road, is being moved north of Schley Avenue, and is planned for completion by 2000. Because of this change, vehicles traveling from Brush Road and Schley Avenue were reassigned to the most logical route to the new southbound on-ramp (i.e., vehicles previously traveling southbound on Brush Road to Schley Avenue to the southbound ramp would instead travel on the I-678 southbound service road to the southbound ramp). This change would reduce queues on the southbound service road and delays at the Queens-bound toll plaza. Furthermore, "No Bridge Re-Entry" signs will be provided to discourage vehicles from bypassing the queue on the mainline via the I-678 southbound service road.

In addition, the TBTA is considering the relocation of the on- and off-ramps on the I-678 northbound service road. This would involve moving the off-ramp toward Lafayette Avenue and the on-ramp toward the Bronx Whitestone Bridge. Currently, vehicles traveling north from the bridge pass the off-ramp to the I-678 northbound service road first, then pass the on-ramp from the service road. If the relocation occurs, this order would be switched. The relocation of the northbound ramps is in the proposal stage and therefore is not included in this analysis of traffic conditions. However, the development of the proposed public recreation facility would not affect plans to relocate the northbound ramps in future conditions.

### TRAFFIC CONDITIONS

The 2002 No Build volumes are shown in Figures J-6 through J-8 for the weekday PM, Saturday midday, and Saturday PM peak hours. Tables J-3 and J-4 present a comparison of the Existing and No Build service conditions for the study area's intersections. There would be no notable changes in LOS at the study area intersections, with the exception of the north- and southbound approaches at the intersection of East Tremont Avenue and Lafayette Avenue, which would drop from mid-range LOS D in existing conditions to upper-range LOS D in No Build conditions, and from LOS C in existing conditions to LOS D in No Build conditions, respectively, during the weekday PM peak hour.

*PARKING*

Parking is expected to remain similar to existing conditions.

*PUBLIC TRANSPORTATION*

Bus service to the study area is expected to remain similar to that in existing conditions.

*PEDESTRIANS AND BICYCLES*

In No Build conditions, pedestrian activity is expected to remain similar to those in existing conditions. In No Build conditions, there would be the potential for development of a greenway along the I-678 north- and southbound service roads, as well as along the Bronx Whitestone Bridge (via bus service), by the NYC DCP in accordance with its *Greenway Plan for New York City.* In addition, NYC DCP's *1999 Draft Greenway Master Plan: Soundview Park to Ferry Point Park* proposes a greenway connection from Brush Avenue and Lafayette Avenue to the I-678 northbound service road. At the present time, these are proposals which may or may not be implemented.

## D. PROBABLE IMPACTS OF THE PROPOSED PROJECT

### TRIP GENERATION

The proposed public recreation facility includes a 7.0-acre community park, 19.5-acre waterfront park, 400-seat boathouse grill restaurant, 1,000-seat banquet facility, and golf facilities, including an 18-hole golf course and 100-stall driving range. As presented in Table J-5, trips generated by the proposed boathouse grill, banquet facility, and golf facilities were based on rates found in the *ITE Trip Generation Manual, Sixth Edition.* Trips generated by the proposed community and waterfront parks were based on existing activity at the currently developed western portion of Ferry Point Park. Estimated trip generation for future conditions are 502 vehicles in and 150 vehicles out during the weekday PM peak, 334 vehicles in and 269 vehicles out during the Saturday midday peak, and 510 vehicles in and 144 vehicles out during the Saturday PM peak. The traffic analysis is conservative because it overlays the peak hour volumes of the proposed facility onto the peak hour of the roadway network. Trips generated by the proposed project would increase traffic on the I-678 mainline by 5 percent or less, which would not significantly impact traffic operating conditions on the parkway. In reality, these two peaks (the generator and base network) do not necessarily overlap. Truck trips generated during construction of the project would be temporary in nature and are not included in this analysis.

### TRIP ASSIGNMENT

Trips were assigned based on existing travel patterns in the study area and knowledge of the customer base for the proposed facility are as follows: 20 percent of trips originating from the northeastern portion of the study area and 15 percent of trips originating from the northwestern portion of the study area would travel on local roadways; 40 percent of trips originating from the north would travel southbound on the Hutchinson River Parkway; and 25 percent of trips from the south would travel over the Bronx-Whitestone Bridge from Queens. Trips generated during construction of the proposed project would utilize New York City truck routes to the site, including the I-678 north- and southbound service roads and Lafayette Avenue. As noted above, construction vehicles are not included in this analysis. Figures J-9 through J-11 show the estimated project-generated vehicle trips for the weekday PM, Saturday midday, and Saturday PM peak hours.

**Notes:**
[1] *ITE Trip Generation Manual Sixth Edition* rate for "Quality Restaurant" (Use 831). Assumes equal trip generation for Saturday afternoon and Saturday evening events.
[2] *ITE Trip Generation Manual Sixth Edition* rate for "Quality Restaurant" (Use 831). Assumes 15 percent linkage from other project uses. The Saturday midday peak hour vehicle trips are assumed to be 50 percent of Saturday evening peak trips.
[3] *ITE Trip Generation Manual Sixth Edition* rate for "Golf Course" (Use 430) and "Golfing Range" (Use 432). Assumes equal trip generation for Saturday afternoon and Saturday evening peak periods. Assumes 25 percent linkage between driving range and golf course.
[4] Surveys conducted at existing Ferry Point Park (west of the Bronx-Whitestone Bridge) May 1999 by Allee King Rosen & Fleming.

## TRAFFIC CONDITIONS

Figures J-12 through J-14 show the Build conditions vehicle trips for the weekday PM, Saturday midday, and Saturday PM peak hours. Tables J-6 and J-7 present a comparison of No Build and Build service conditions for the study area's signalized and unsignalized intersections.

Impacts are considered significant (and require examination of improvement measures) according to the guidelines presented in the *CEQR Technical Manual* if they result in an increase of 5 or more seconds in a lane group if the No Build LOS is D. For No Build LOS E, 4 seconds of delay is considered significant. For No Build LOS F, 3 seconds of delay is considered significant. However, if No Build LOS F condition already has delays in excess of 120 seconds, an increase of more than 1.0 second of delay is considered significant unless the proposed action generates fewer than five vehicle-trips through that intersection in the peak hour. Additionally, if the traffic analyses indicate that future No Build v/c ratios below 0.95 are projected to increase to more than 0.95, or where future No Build v/c ratios above 0.95 are expected to increase by 0.020 or more at locations where acceptable levels of service are projected to occur in the future Build condition, additional analyses should be conducted to determine how close the projected project's increment is to creating a significant impact. These analyses should consist of determining how much additional traffic at that analysis location would cause the LOS to deteriorate from its projected acceptable level of service to unacceptable LOS D. This incremental volume represents the "buffer" available to the New York City Department of Transportation before it may need to consider capacity improvements.

In addition, impacts are also considered significant if levels of service deteriorate from acceptable LOS A, B, or C in the future No Build condition to unacceptable LOS D, E, or F in the Build condition.

With the proposed project improvements, increases in traffic volumes at study area intersections would not generate any significant impacts at the study area intersections (see Tables J-6 and J-7). These project improvements include:

- At the intersection Lafayette Avenue and the I-678 southbound service road, the restriping of the westbound approach from two lanes to three lanes (an exclusive left-turn lane and two through lanes), the addition of an exclusive left turn phase, and coordination of the westbound signal with the intersection of Lafayette Avenue and the I-678 northbound service road. Signal coordination would ensure that left-turn queues can be accommodated within available storage capacity.
- At the intersection of East Tremont Avenue and Lafayette Avenue, daylight (restrict the use of up to three parking spaces) at the northbound approach during the weekday PM peak period.

The study area intersections would operate at LOS C or better in Build conditions.

## SITE ACCESS

Project-generated vehicle trips would access the site from a new entrance road off the Ferry Point Park Access Road. In Build conditions, the two-way segment of the Ferry Point Park Access Road would be changed to a two-lane, one-way loop road operating in the southbound direction west of the Bronx-Whitestone Bridge and in the northbound direction east of the bridge. With the exception of the community park, all access to the proposed recreation facility would be from the west—vehicular, bicycle, and pedestrian access would be from the I-678

service roads under the Bronx-Whitestone Bridge and onto the crescent road. With the exception of the community park, the proposed recreation facilities would be primarily a regional park. Visitors would enter the site at this location, pass by a stone gateway on the entrance road, and choose to either proceed north to the golf clubhouse area, or south to the community park and the boathouse grill, waterfront park, or fine dining/banquet facility. Access for emergency vehicles would be provided via Emerson Avenue. A stop-controlled entrance road with one lane in each direction would provide access to public recreation facility at the southeastern portion of the site. As shown in Table J-7, the proposed project entrance road would operate at LOS A or better during the weekday PM, Saturday midday, and Saturday PM peak periods.

*PARKING*

Parking would be provided throughout the facility to accommodate park users as shown in Table J-8. The project would provide a total of 965 spaces, including 20 self-park spaces for maintenance vehicles only. The balance of the 945 spaces would include 350 spaces near the fine dining/banquet facility, 350 spaces near the clubhouse, 125 spaces near the boathouse grill, and 120 spaces in other parking lots at the site. During peak hours of operation at the banquet facility, the 350 self-park spaces could be utilized as 500 valet parking spaces. There would be sufficient parking on the project site to accommodate project demand.

**Table J-8**

**Parking by Location and Use**

| Parking Location and Use | Number of Spaces |
|---|---|
| Golf facility | 350 self-park |
| Boathouse grill restaurant | 125 self-park |
| Waterfront park | 120 self-park |
| Fine dining/banquet facility | 350 self-park convertible to 500 valet-park |
| Maintenance building | 20 self-park for staff only |
| Total | 965 self-park (1,115 self/valet-park) |

*PUBLIC TRANSPORTATION*

With completion of the proposed project, the addition of a proposed bus stop with a shelter at the intersection of Schley Avenue and the I-678 southbound service road would be proposed to serve park users. This effort will be coordinated with NYCT. The most likely route to serve this stop is the Q44 bus.

*PEDESTRIANS AND BICYCLES*

As part of the proposed project, sidewalks on the Ferry Point Park access road would be improved for pedestrian access and safety to the public recreation facilities. Pedestrian and bicycle connections would connect the proposed waterfront park with the existing Ferry Point Park located to the west of the bridge. In addition, pedestrians and bicyclists would be able to access the project site through the same entrance road as vehicles and continue on to the crescent road. Bicycle racks would be provided in the waterfront park.

## E. CONCLUSIONS

Based on the analysis above, with the proposed improvements, the proposed development of a public recreation facility is not expected to result in any significant impacts to traffic, parking, transit, pedestrian, or bicycle conditions in the study area. ❖

**Attachment K:** **Air Quality**

## A. INTRODUCTION

This section identifies and quantifies all the significant direct and indirect air quality impacts from the proposed public recreation facility at Ferry Point Park in the Bronx. Direct effects stem from emissions generated by stationary sources on the project site, such as emissions from fuel burned on-site for heating, ventilation, and air conditioning (HVAC) systems. Indirect effects are caused by emissions from motor vehicles traveling to and from the project site (mobile sources) after completion.

## B. POLLUTANTS FOR ANALYSIS

In New York City, ambient concentrations of carbon monoxide (CO), ozone ($O_3$), and lead are predominantly influenced by mobile source emissions. Emissions of nitrogen oxides ($NO_x$) come from both mobile and stationary sources, and emissions of respirable particulate matter and sulfur dioxide ($SO_2$) are associated mainly with stationary sources.

While the project site is a former landfill, no detailed air quality studies were performed to model methane concentrations since methane was not detected in the ambient air during a landfill gas survey conducted as part of the project's soil assessment (see Attachment G, "Hazardous Materials," Section 3.2), and more importantly, the proposed project would not change the quantity of this area-wide pollutant emitted from this site..

### CARBON MONOXIDE

Carbon monoxide, a colorless and odorless gas, is produced in the urban environment primarily by the incomplete combustion of gasoline and other fossil fuels. In New York City, approximately 80 to 90 percent of CO emissions are from motor vehicles. CO concentrations can vary greatly over relatively short distances. Elevated concentrations are usually limited to locations near crowded intersections, along heavily traveled and congested roadways. Consequently, CO concentrations must be predicted on a localized or microscale basis. The proposed project would increase traffic volumes on streets near the project site and could therefore result in localized increases in CO levels.

### NITROGEN OXIDES AND OZONE

Nitrogen oxides are of principal concern because of their role as precursors in the formation of photochemical oxidants, such as ozone. There is a standard for average annual concentrations, which is normally examined only for fossil fuel energy sources. Ozone is formed through a series of reactions that take place in the atmosphere in the presence of sunlight. Because the reactions are slow and occur as the pollutants are diffusing downwind, elevated ozone levels are often found many miles from sources of the precursor pollutants. The effects of nitrogen oxide emissions from mobile sources are therefore generally examined on a regional basis. The change in regional mobile source emissions of these pollutants is related to the total number of vehicle

trips and vehicle miles of travel throughout the New York metropolitan area. The proposed action would not have a significant effect on the overall volume of vehicular travel in the metropolitan area. It would not, therefore, have any measurable impact on regional nitrogen oxide emissions or on ozone levels, and an analysis is not warranted.

## LEAD

Lead emissions are principally associated with industrial sources and motor vehicles that use gasoline containing lead additives. Most U.S. vehicles produced since 1975, and all produced after 1980, are designed to use unleaded fuel. As these newer vehicles have replaced the older ones, motor vehicle-related lead emissions have decreased. As a result, ambient concentrations of lead have declined significantly. Nationally, the average measured atmospheric lead level in 1985 was only about one-quarter the level in 1975.

In 1985, the U.S. Environmental Protection Agency (EPA) announced new rules drastically reducing the amount of lead permitted in leaded gasoline. The maximum allowable lead level in leaded gasoline was reduced from the previous limit of 1.1 grams per gallon to 0.5 grams per gallon effective July 1, 1985, and to 0.1 grams per gallon effective January 1, 1986. Monitoring results indicate that this action has been effective in significantly reducing atmospheric lead levels. Even at locations in the New York City area where traffic volumes are very high, atmospheric lead concentrations are far below the national standard of 1.5 micrograms per cubic meter (three-month average). No significant sources of lead are associated with the project.

## RESPIRABLE PARTICULATES—$PM_{10}$ AND $PM_{2.5}$

Particulate matter is emitted into the atmosphere from a variety of sources: industrial facilities, power plants, construction activity, etc. Gasoline-powered vehicles do not produce any significant quantities of particulate emissions. Diesel-powered vehicles, especially heavy trucks and buses, do emit particulates, and respirable particulate concentrations may, therefore, be locally elevated near roadways with high volumes of heavy diesel-powered vehicles. Particulates less than 10 microns (μm) in diameter ($PM_{10}$) have become of primary concern because they are respirable. In addition to $PM_{10}$, EPA has determined that elevated airborne levels of particulate matter less than 2.5 microns ($PM_{2.5}$), show consistent and coherent associations with serious health effects. The project would not be a significant source of increased regional vehicular trips or local diesel vehicle trips, and therefore, an analysis for respirable particulates was not warranted.

## SULFUR DIOXIDE

Sulfur dioxide emissions are primarily associated with the combustion of sulfur-containing fuels: oil and coal. No significant quantities are emitted from mobile sources. Monitored sulfur dioxide concentrations in Bronx are below the national standards. If oil is burned for the on-site HVAC systems, sulfur dioxide would be included in the exhaust from such units.

## CONCLUSIONS

The areas of potentially significant air quality impacts from the proposed project that require an analysis are the following:

- Effects of the proposed project on CO concentrations from increased traffic generated by the proposed project; and

- Potential stationary source impacts from the fuel burned on-site for the project's HVAC systems.

## C. AIR QUALITY STANDARDS

### NATIONAL AND STATE AIR QUALITY STANDARDS

As required by the Clean Air Act, primary and secondary National Ambient Air Quality Standards (NAAQS) have been established for six major air pollutants: carbon monoxide, nitrogen dioxide, ozone, respirable particulate matter, sulfur dioxide, and lead. (Hydrocarbon standards have been rescinded because these pollutants are primarily of concern only in their role as ozone precursors.) EPA has adopted 24-hour and annual standards for respirable particulate matter with an aerodynamic equivalent diameter less than 2.5 μm ($PM_{2.5}$), which became effective September 16, 1997. As recognized by EPA, the adoption of the $PM_{2.5}$ standard is intended to provide increased protection of public health from fossil fuel combustion. At this time, EPA is only requiring states to implement monitoring programs to determine the scope of the problem. It will likely be at least 5 years before any attainment/non-attainment designations are made and a few more years before any implementation plans are required.

Table K-1 shows the standards for these pollutants. These standards have also been adopted as the ambient air quality standards for the State of New York. The primary standards protect the public health, and represent levels at which there are no known significant effects on human health. The secondary standards are intended to protect the nation's welfare, and account for air pollutant effects on soil, water, visibility, materials, vegetation, and other aspects of the environment. For carbon monoxide, nitrogen dioxide, ozone, and respirable particulates, the primary and secondary standards are the same.

### STATE IMPLEMENTATION PLAN (SIP)

The Clean Air Act requires each state to submit to EPA a SIP for attainment of NAAQS. The 1977 and 1990 amendments require comprehensive plan revisions for areas where one or more of the standards have yet to be attained. In the New York City metropolitan area, the standard for ozone continues to be exceeded as New York State Department of Environmental Conservation (DEC) is currently preparing a revision of the SIP. A CO attainment demonstration was submitted to EPA by DEC in November 1992. This submission noted that, with an Enhanced Inspection and Maintenance program in effect, there would be no CO violations in New York City by the December 31, 1995 attainment deadline. No violations of the CO standard have been recorded at DEC monitoring stations over the past few years. Recently, however, EPA designated New York County (Manhattan) non-attainment for respirable particulate matter ($PM_{10}$). In 1995, a SIP revision and Attainment Demonstration was submitted to EPA for the control of $PM_{10}$ concentrations in New York County.

New York City is implementing measures to reduce levels of hydrocarbons as part of its effort to attain the SIP ozone standard. As part of its effort to reduce CO levels and attain the CO standard, New York City is also committed to implementing area-wide and site-specific control measures, should unanticipated localized growth result in elevated CO levels, both before the attainment deadline and into the maintenance period.

Table K-1

## National and New York State Ambient Air Quality Standards

| Pollutant | Primary | | Secondary | |
|---|---|---|---|---|
| | PPM | Micrograms Per Cubic Meter | PPM | Micrograms Per Cubic Meter |
| Carbon Monoxide | | | | |
| Maximum 8-Hour Concentration[1] | 9 | | 9 | |
| Maximum 1-Hour Concentration[1] | 35 | | 35 | |
| Lead | | | | |
| Maximum Arithmetic Mean Averaged Over 3 Consecutive Months | | 1.5 | | 1.5 |
| Nitrogen Dioxide | | | | |
| Annual Arithmetic Average | 0.05 | 100 | 0.05 | 100 |
| Ozone | | | | |
| 1-Hour Average[2] | 0.12 | 235 | 0.12 | 235 |
| 8-Hour Average | 0.08 | 157 | 0.08 | 157 |
| Total Suspended Particulates (TSP)[3] | | | | |
| Annual Mean | | 75 | | |
| Maximum 24-Hour Concentration | | 250 | | |
| Respirable Particulates ($PM_{10}$) | | | | |
| Annual Arithmetic Mean | | 50 | | 50 |
| Maximum 24-Hour Concentration[4] | | 150 | | 150 |
| Respirable Particulates ($PM_{2.5}$) | | | | |
| Annual Arithmetic Mean | | 15 | | 15 |
| Maximum 24-Hour Concentration[5] | | 65 | | 65 |
| Sulfur Dioxide | | | | |
| Annual Arithmetic Mean | 0.03 | 80 | | |
| Maximum 24-Hour Concentration[1] | 0.14 | 365 | | |
| Maximum 3-Hour Concentration[1] | | | 0.50 | 1,300 |

**Notes:**

[1]Not to be exceeded more than once a year.
[2]Applies only to areas that were designated nonattainment when the ozone standard was adopted in July 1997.
[3]TSP levels are regulated by a New York State Standard only.
[4]Not to be exceeded by 99th percentile of 24-hour $PM_{10}$ concentrations in a year (averaged over 3 years).
[5]Not to be exceeded by 98th percentile of 24-hour $PM_{2.5}$ concentrations in a year (averaged over 3 years).
PPM = parts per million

### *DE MINIMIS* CRITERIA

For all pollutants, project-related NAAQS exceedances generally constitute a significant impact. In addition to the NAAQS, New York City has developed *de minimis* criteria to assess the significance of impacts on air quality that would result from a proposed development. These criteria, as detailed in the *City Environmental Quality Review (CEQR) Technical Manual,* set the minimum change in CO concentration that defines a significant environmental impact. Significant increases with respect to CO concentrations in New York City are defined as 1) an increase of 0.5 parts per million (ppm) or more in the maximum 8-hour average CO concentration at a location where the predicted No Build 8-hour concentration is equal to or between 8 ppm and 9 ppm; or 2) an increase of more than half the difference between baseline concentrations and the 8-hour standard, when No Build concentrations are below 8.0 ppm.

## D. METHODOLOGY FOR PREDICTING POLLUTANT CONCENTRATIONS FROM MOBILE SOURCES

### INTRODUCTION

To compare estimated carbon monoxide concentrations with the national and state ambient air quality standards for carbon monoxide (which are based on 1- and 8-hour averages of carbon monoxide concentrations), estimates of maximum concentrations for these same periods must be prepared.

The prediction of motor vehicle-generated carbon monoxide concentrations in an urban environment influenced by meteorological phenomena, traffic conditions, and physical configurations is a challenging problem. Air pollutant dispersion models simulate mathematically how traffic, meteorology, and geometry combine to affect pollutant concentrations. The mathematical expressions and formulations that make up the various models attempt to describe an extremely complex physical phenomenon as closely as possible. However, because all models contain simplifications and approximations of actual conditions and interactions, and because a worst-case condition is of most interest, most of these dispersion models are conservative and tend to overpredict pollutant concentrations, particularly under adverse meteorological conditions.

The CO analysis for the proposed project has employed a modeling approach approved by EPA that has been widely used for evaluating air quality impacts of projects in New York City, New York State, and throughout the country, and has coupled this approach with a series of worst-case assumptions relating to meteorology, traffic, background concentration levels, etc. This combination results in a conservative estimate of expected carbon monoxide concentrations and resulting air quality impacts caused by the project.

### DISPERSION MODELS FOR MICROSCALE ANALYSES

At the site selected for study, a first-level conservative analysis was performed using EPA's CAL3QHC model, version 2.* The CAL3QHC model is based on the CALINE-3 line source dispersion model with an additional algorithm for estimating vehicle queue lengths at signalized

---

* *User's Guide to CAL3QHC, A Modeling Methodology for Predicting Pollutant Concentrations Near Roadway Intersections,* Office of Air Quality, Planning Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina

intersections. The CALINE-3 model is a Gaussian model, which assumes that the dispersion of pollutants downwind of a pollution source follows a Gaussian (or normal) distribution, and is used for predicting CO concentrations along roadway segments. The pollution source is the emissions from motor vehicles operating under free-flow conditions. The refinement that CAL3QHC provides is the inclusion of the contribution of emissions from idling vehicles in the overall concentration. The queuing algorithm requires additional input for site-specific traffic parameters, such as signal timing, and performs delay calculations from the *1994 Highway Capacity Manual* traffic forecasting model to predict the number of idling vehicles. The CAL3QHC model was recently modified to include saturation flow rate, vehicle arrival type, and signal actuation characteristics as input parameters.

For a more refined analysis, the CAL3QHC model has been updated with an extended module, which allows for the incorporation of actual meteorological data into the modeling, instead of worst-case assumptions regarding meteorological parameters. This refined version of the model, CAL3QHCR, is only employed if maximum predicted CO concentrations are greater than the applicable ambient air quality standards or if significant air quality impacts are predicted with the first-level screening CAL3QHC modeling.

## WORST-CASE METEOROLOGICAL CONDITIONS

In general, the transport and concentration of pollutants from vehicular sources are influenced by three principal meteorological factors: wind direction, wind speed, and atmospheric stability.

Wind direction influences the accumulation of pollutants at a particular receptor location. Wind direction was chosen to maximize pollutant concentrations at each of the prediction sites. In applying the CAL3QHC model, the wind angle was varied to determine the worst-case wind direction resulting in the maximum concentrations.

Following the recommendations of EPA and the procedures followed in the recent SIP submissions, carbon monoxide computations were performed using a wind speed of 1 meter/second, and stability class D. A persistence factor of 0.7 for the 8-hour period was selected. This persistence factor takes into account that over 8 hours, vehicle volumes will fluctuate downward from the peak, speeds may vary, and wind directions and speeds will change somewhat as compared with the conservative assumptions used for the single highest hour. A surface roughness of 3.21 meters was chosen, and a 43° Fahrenheit ambient temperature was assumed for the emissions computations. At each receptor location, the wind angle that maximized the pollutant concentrations was used in the analysis, regardless of frequency of occurrence.

## ANALYSIS YEARS

The carbon monoxide microscale analysis was performed for 2001, both the year of completion of the golf course component of the project and the worst-case year with respect to CO emissions (i.e., in later years, emissions would be less due to vehicle turnover). However, the analysis was performed with worst-case traffic conditions, assuming completion of all the components of the project, which is expected to be in 2002. This approach is extremely conservative, since the modeled worst-case scenario is not an actual scenario that will occur as part of the proposed project. The 2001 analysis was performed both without (the No Build) and with the proposed project (Build).

## VEHICLE EMISSIONS DATA

To predict ambient concentrations of pollutants generated by vehicular traffic, emissions from vehicle exhaust systems must be estimated accurately. Vehicular emissions were computed using the EPA-developed Mobile Source Emissions Model, MOBILE5B. Emission estimates were made for six classes of motor vehicles:

- Light-duty, gasoline-powered automobiles;
- Light-duty, gasoline-powered new taxis;
- Light-duty, gasoline-powered used police car taxis;
- Light-duty, gasoline-powered trucks;
- Heavy-duty, gasoline-powered trucks; and
- Heavy-duty, diesel-powered vehicles.

No light-duty diesel-powered vehicles (automobiles and taxis), light-duty diesel-powered trucks, or motorcycles were assumed. In the case of motorcycles, the number of such vehicles on any street is generally small. In the case of diesel-powered vehicles, emissions from a comparable class of gasoline-powered vehicles were included. Carbon monoxide emissions from the gasoline-powered vehicles are higher than the comparable diesel-powered vehicle emissions, and thus yield conservative estimates of total composite CO emissions and concentrations. Oxygenated-fuel credits were taken in the microscale modeling analyses. Emission estimates for oxygenated fuels were based on a gasoline blend with a 2.7 percent oxygen content.

Emission estimates were based on implementation of the New York State auto and light-duty gasoline-powered truck inspection and maintenance (I&M) program begun in January 1982 and the taxi I&M program begun in October 1977. The I&M program requires annual inspections of automobiles and light trucks to determine if carbon monoxide and hydrocarbon emissions from the vehicles' exhaust systems are below emission standards. Vehicles failing the emissions test must undergo maintenance and pass a re-test to be registered in New York State.

Heavy-duty vehicle emission estimates reflect local engine displacement and vehicle loading characteristics. Light-duty truck emissions were based on an assumed 73 percent-27 percent split between trucks weighing less than 6,000 pounds and trucks weighing 6,000 to 8,500 pounds. These data were obtained from the New York City Department of Environmental Protection (DEP) and are based on vehicle registration data.

Recently, New York state has decided to revise its future I&M program. Originally, the future I&M program was envisioned to include centralized facilities that would test vehicles under an "enhanced" program, at a dynamic load instead of at a simple idle. However, New York State has recently decided that, while the future I&M program would still involve an enhanced I&M program, motorists would be allowed to take their vehicles to nearby service stations that would be allowed to both test and repair autos that failed the new I&M test. The new I&M program started last year. Emissions for the future year (2001) analysis were developed using the new I&M program.

For automobiles and light-duty gasoline-powered trucks, emission estimates account for three possible vehicle operating conditions: cold-vehicle operation, hot-start operation, and hot-stabilized operation. It is important to distinguish between these three operating categories, because vehicles emit carbon monoxide at different rates depending on whether they are cold or warmed up. All taxis were assumed to be operating in a hot-stabilized mode; all arriving project-generated autos were assumed to be operating in a hot-stabilized mode; and all departing

project-generated autos were assumed to be operating in a cold mode. Auto operating conditions used in the future No Build emission calculations were obtained from data supplied by DEP, Bureau of Science and Technology *Report No. 34 (Revised)*. Light-duty truck operating conditions for Manhattan were based on data supplied by the former Tri-State Regional Planning Association, now the New York Metropolitan Transportation Coordinating Council (NYMTC). Table K-2 summarizes the thermal state conditions (i.e., *Report No. 34* for autos and NYMTC-supplied values for light-duty trucks) used in the analysis.

**Table K-2**

**Vehicle Operating Conditions**

| | Arterial | Expressway |
|---|---|---|
| **Auto** | | |
| Percentage Cold (Non-Catalytic) | 27.9 | 10.8 |
| Percentage Cold (Catalytic) | 33.8 | 13.3 |
| Percentage Hot (Catalytic) | 9.4 | 3.7 |
| **Light-Duty Gasoline Trucks** | | |
| Percentage Cold (Non Catalytic) | 4.1 | 4.1 |
| Percentage Cold (Catalytic) | 5.4 | 5.4 |
| Percentage Hot (Catalytic) | 50.5 | 50.5 |

## TRAFFIC DATA

Traffic data for the air quality analysis were derived from traffic counts and other information developed as part of the project's traffic analysis (see Attachment J, "Transportation"). For the air quality analysis, traffic conditions on all of the pertinent roadway segments (including the main roadways of I-678) that assume completion of all the components of the project were employed, since volumes and levels of service would be worse. This would result in a conservative estimate of potential air quality impacts associated with the proposed project. The weekday PM (5-6 PM) and Saturday midday (12-1 PM) peak periods were subjected to full-scale microscale analysis. These time periods were selected for the mobile source analysis because they produce the maximum project-generated traffic and therefore have the greatest potential for significant traffic and/or air quality impacts.

## BACKGROUND CONCENTRATIONS

Background concentrations are those pollutant concentrations not directly accounted for through the modeling analysis (which directly accounts for vehicular-generated emissions on the streets within 1,000 to 1,600 feet and line-of-sight of the receptor location). Background concentrations must be added to modeling results to obtain total pollutant concentrations at a prediction site.

The 1-hour average CO background concentration used in this analysis was 5.7 parts per million (ppm), and the 8-hour average background concentration was 2.3 ppm. These values, obtained from DEP, are based on CO concentrations measured at DEC monitoring stations and are adjusted to reflect the reduced vehicular emissions expected in the analysis years. For purposes of this adjustment, based on EPA guidance, it was assumed that 20 percent of the background value is caused by stationary source emissions that have remained relatively unchanged with time and that 80 percent of the background value is caused by mobile sources that decrease with time. This decrease reflects the increasing numbers of federally mandated lower-emission

vehicles that are projected to enter the vehicle fleet as older, higher-polluting vehicles are retired (i.e., vehicle turnover), and the continuing benefits of the New York I&M program. No credits for oxygenated fuels or an enhanced I&M program were taken in the rollback analysis.

### MOBILE SOURCE RECEPTOR LOCATION

One complex air quality receptor site was selected for microscale analysis—the intersections of Lafayette Avenue and the I-678 north- and southbound service roads (see Figure K-1). Multiple receptor sites were modeled at this intersection (i.e., receptors were placed along the approach and departure links at spaced intervals).

This receptor site was selected because it is the key location in the study area where the largest levels of project-generated traffic are expected and overall constrained traffic conditions exist, and, therefore, where the greatest air quality impacts and maximum changes in CO concentrations would be expected.

## E. EXISTING CONDITIONS

### EXISTING MONITORED AIR QUALITY CONDITIONS (1997)

Monitored concentrations of CO, sulfur dioxide, particulates, nitrogen dioxide ($NO_2$), lead, and ozone ambient air quality data for the area are shown in Table K-3. These values are the most recent monitored data available that have been published by DEC for these locations. The nearest monitoring station for lead is in Manhattan. There were no monitored violations of the NAAQS for the pollutants at these sites or any other in New York City (with the exception of ozone, which is a regional pollutant) in 1997.

**Table K-3**

**Representative Monitored Ambient Air Quality Data**

| Pollutant | Location | Units | Period | Concentrations | | | Number of Exceedances of Federal Standard | |
|---|---|---|---|---|---|---|---|---|
| | | | | Mean | Highest | Second Highest | Primary | Secondary |
| CO | Botanical Gardens | ppm | 8-hour | — | 4.6 | 3.5 | 0 | 0 |
| | | | 1-hour | — | 7.4 | 7.3 | 0 | 0 |
| $SO_2$ | Morrisania II | ppm | Annual | 0.012 | — | — | 0 | — |
| | | | 24-hour | — | 0.055 | 0.043 | 0 | — |
| | | | 3-hour | — | 0.090 | 0.089 | — | 0 |
| Respirable Particulates ($PM_{10}$) | Morrisania II | µg/m³ | Annual | 24 | — | — | 0 | 0 |
| | | | 24-hour | — | 58 | 48 | 0 | 0 |
| $NO_2$ | Morrisania II | ppm | Annual | 0.035 | — | — | 0 | 0 |
| Lead | Madison Avenue | µg/m³ | 3-month | — | 0.060 | 0.060 | 0 | 0 |
| $O_3$ | Morrisania II | ppm | 1-hour | — | 0.124 | 0.115 | 0 | 0 |

## F. THE FUTURE WITHOUT THE PROPOSED ACTION

CO concentrations without the proposed project were determined for the 2001 analysis year using the methodology previously described. Table K-4 shows future (2001) maximum predicted 1- and 8-hour average CO concentrations without the proposed project (i.e., 2001 No Build values) at the analysis intersection in the project study area. The values shown are the highest predicted concentrations for the receptor location for the time periods analyzed.

**Table K-4**

**Future (2001) Maximum Predicted 1- and 8-Hour Average Carbon Monoxide No Build Concentrations in the Project Study Area (parts per million)**

| Receptor Site | Location | Time Period | 1-Hour | 8-Hour |
|---|---|---|---|---|
| 1 | Lafayette Avenue and I-678 NB & SB Service Roads | Sat MD | 7.3 | 3.4 |
| **Note:** 1-hour standard is 35 ppm; 8-hour standard is 9 ppm. | | | | |

## G. PROBABLE IMPACTS OF THE PROPOSED ACTION

### INTRODUCTION

Operation of the proposed project would result in increased mobile source emissions in the immediate vicinity of the project. In addition, the proposed project could also affect the surrounding community by emissions from the project's HVAC systems. Both areas of potential impact are examined below.

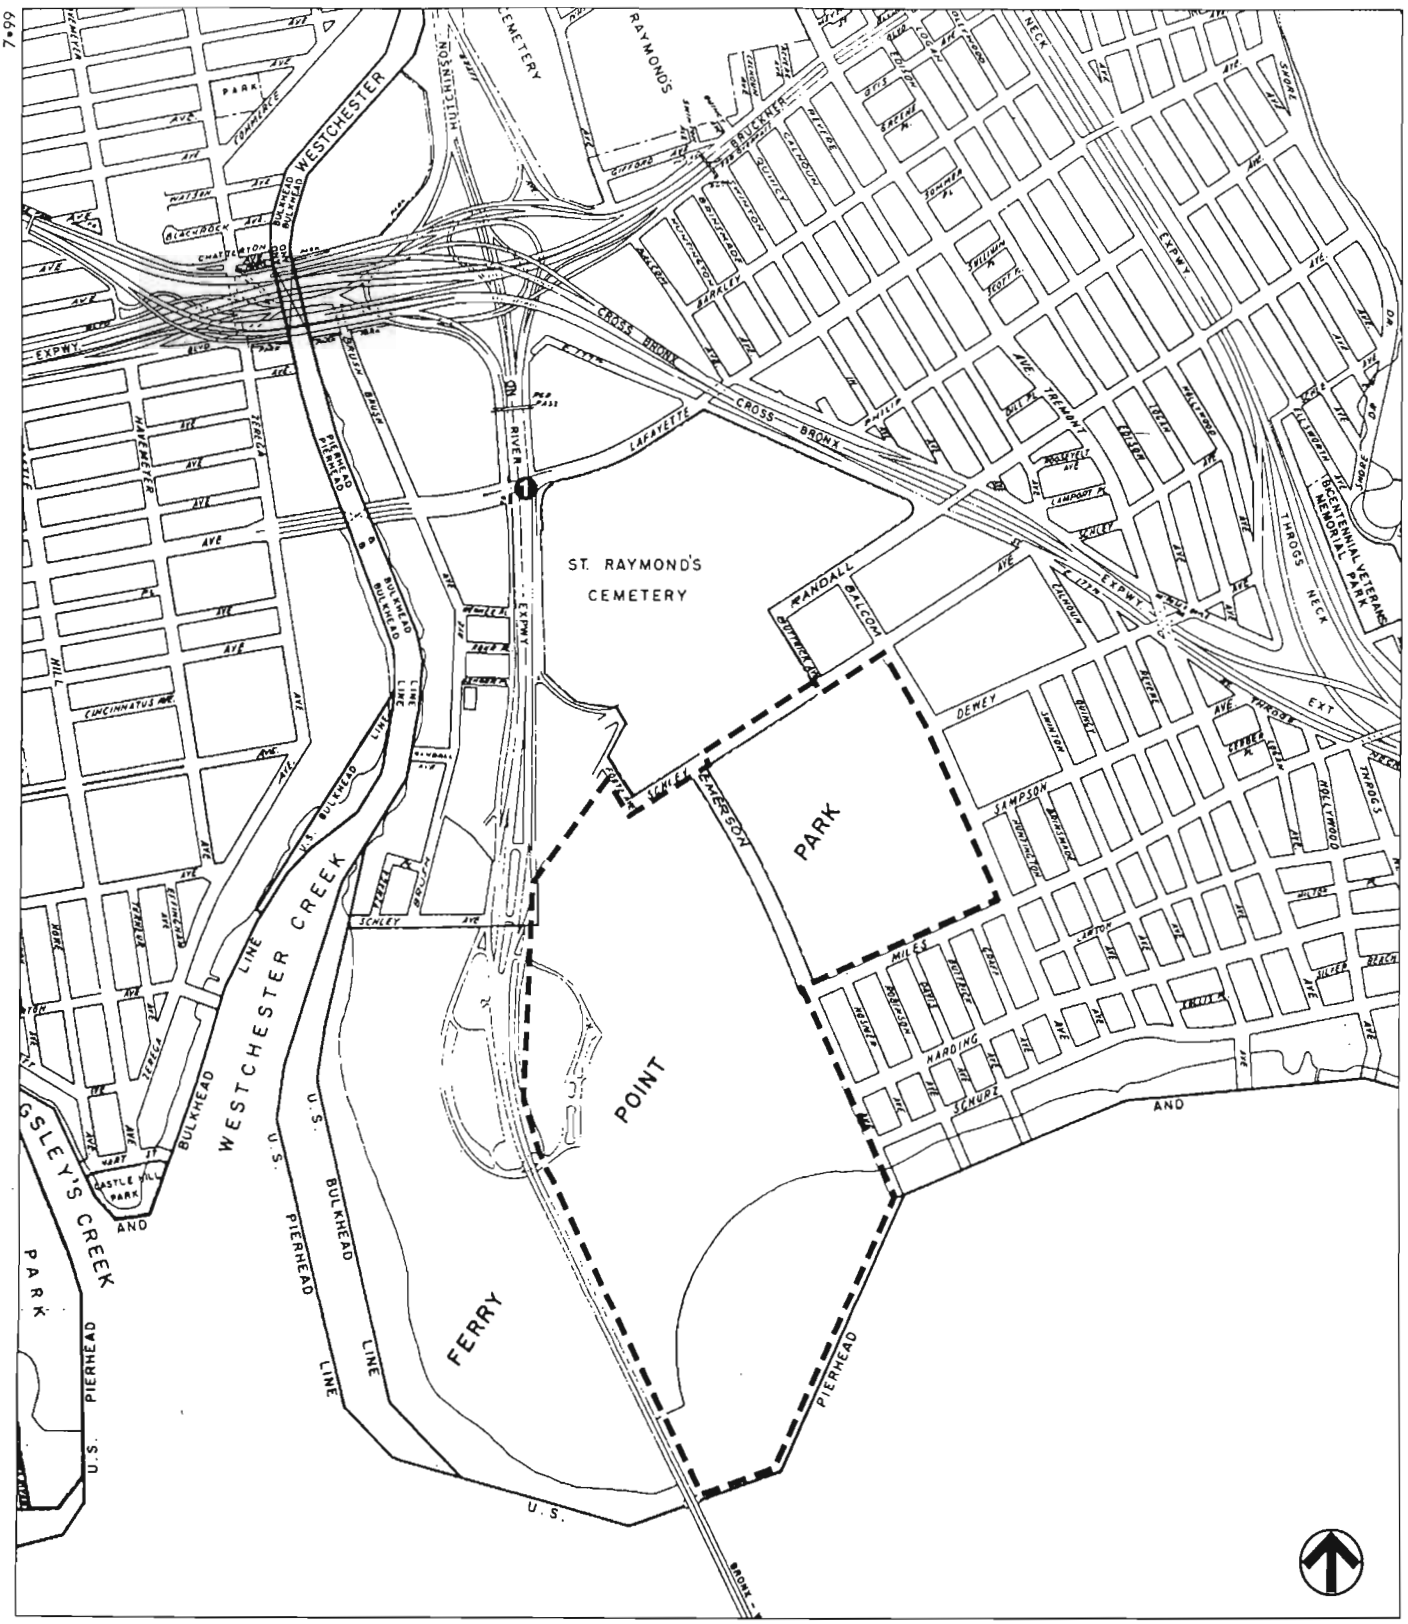
### MOBILE SOURCE ANALYSIS

CO concentrations with the proposed project were determined for the 2001 analysis year using the methodology previously described. Table K-5 shows the maximum predicted future (2001) 8-hour average CO concentrations with the proposed project at the analysis intersection in the study area. (No 1-hour values are shown since no exceedances of the standard would occur and the *de minimis* criteria is only applicable to 8-hour concentrations. Therefore, the 8-hour values are the most critical for impact assessment.) The values shown are the highest predicted concentrations for the receptor location for the time periods analyzed.

**Table K-5**

**Future (2001) Maximum Predicted 8-Hour Average Carbon Monoxide No Build and Build Concentrations (parts per million)**

| Receptor Site | Location | Time Period | No Build | Build |
|---|---|---|---|---|
| 1 | Lafayette Avenue and I-678 NB & SB Service Roads | Sat MD | 3.4 | 3.5 |
| **Note:** 8-hour standard is 9 ppm. | | | | |



Project Site Boundary

1 Air Quality Receptor Location

*Ferry Point Park*

# Air Quality Receptor Location

*Figure K-1*

The 2001 results indicate that the proposed project would not result in exceedances of the CO standards or the *de minimis* criteria at this location. Therefore, the site in the future Build condition would not have a significant mobile source air quality impact.

## STATIONARY SOURCE ANALYSIS

The only stationary source of air pollutants associated with the proposed project would be the emissions from the oil- or gas-fired HVAC systems. The primary pollutant of concern when burning oil is sulfur dioxide, and when burning natural gas is nitrogen dioxide. Based on the methodologies in the *CEQR Technical Manual*, either case would not result in any significant stationary source air quality impacts. Because there would be no tall structures or elevated receptors adjacent to the project site, the results of this analysis show that there would be no significant air quality impacts from the proposed project's HVAC system.

## CONSISTENCY WITH THE NEW YORK STATE AIR QUALITY IMPLEMENTATION PLAN

The mobile source receptor location analyzed under the Build condition predicts that carbon monoxide levels would be less than the corresponding ambient air standard. Therefore, construction of the project would be consistent with the New York State Implementation Plan.

## CONSTRUCTION IMPACTS

Possible impacts on local air quality during construction of the proposed project include:

- Fugitive dust (particulate) emissions from land clearing operations; and
- Mobile source emissions, including hydrocarbons, nitrogen oxide, and carbon monoxide emissions.

(Measures to protect workers during construction from the presence of methane are discussed in Section 4.1 of Attachment G. Construction activities would not be expected to significantly change areawide emission of this pollutant.)

These are described below.

### *FUGITIVE EMISSIONS*

Fugitive dust emissions from land clearing operations can occur from excavation, hauling, dumping, spreading, grading, compaction, wind erosion, and traffic over unpaved areas. Actual quantities of emissions depend on the extent and nature of the clearing operations, the type of equipment employed, the physical characteristics of the underlying soil, the speed at which construction vehicles are operated, and the type of fugitive dust control methods employed. EPA has suggested, in general, an overall emission rate of about 1.2 tons of particulate/acre/month of active construction from all phases of land-clearing operations with no fugitive dust control measures. However, this is a national estimate and actual emissions would vary widely depending on many factors, including the intensity and type of land-clearing operations. Much of the fugitive dust generated by construction activities consists of relatively large-size particles, which are expected to settle within a short distance from the construction site and not significantly affect the buildings or people nearby.

For this project, excavation, and construction would be conducted with the care mandated by the site's proximity to active uses. All appropriate fugitive dust control measures—including

watering of exposed areas and dust covers for trucks—would be employed. In addition, all necessary measures would be implemented to ensure that the New York City Air Pollution Control Code regulating construction-related dust emissions is followed. As a result, no significant air quality impacts from fugitive dust emissions would be anticipated.

*MOBILE SOURCE EMISSIONS*

Mobile source emissions are emissions of air pollutants from motor vehicles, referred to as mobile sources. During construction, such emissions may result from: 1) trucks delivering construction materials, 2) workers' private vehicles, 3) disruptions in traffic near the construction site, and 4) construction equipment.

Localized increases in mobile source emissions would be minimized by incorporating traffic maintenance requirements into the construction contract documents to ensure that:

- Construction requiring temporary street closings for the relocation of utilities and for other purposes in heavily traveled areas would be performed, to the maximum extent possible, during off-peak hours;
- Existing number of traffic lanes would be maintained to the maximum extent possible; and
- Idling of delivery trucks or other equipment would not be permitted during periods when they are being unloaded or are not in active use. ❖

**Attachment L:** **Noise**

## A. INTRODUCTION

Noise pollution in an urban area comes from many sources. Some sources are activities essential to the health, safety, and welfare of the city's inhabitants, such as noise from emergency vehicle sirens, garbage collection operations, and construction and maintenance equipment. Other sources, such as traffic, stem from the movement of people and goods, activities that are essential to the viability of the city as a place to live and do business. Although these and other noise-producing activities are necessary to a city, the noise they produce is undesirable. Urban noise detracts from the quality of the living environment and there is increasing evidence that excessive noise represents a threat to public health.

The proposed public recreation center at Ferry Point Park (i.e., the project) may increase ambient noise levels principally due to: increased automobile and truck traffic generated by the proposed project, including noise from vehicular movements in the parking lots at the fine dining/banquet facility on the eastern side of the project site; noise from maintenance operations, principally gas cutting on the eastern side of the project site adjacent to residences, and; noise from park activities, principally at the ballfield at the community park. In addition, construction of the proposed project will increase noise levels.

### NOISE FUNDAMENTALS

Quantitative information on the effects of airborne noise on people is well documented. If sufficiently loud, noise may adversely affect people in several ways. For example, noise may interfere with human activities, such as sleep, speech communication, and tasks requiring concentration or coordination. It may also cause annoyance, hearing damage, and other physiological problems. Several noise scales and rating methods are used to quantify the effects of noise on people. These scales and methods consider such factors as loudness, duration, time of occurrence, and changes in noise level with time. However, it must be remembered that all the stated effects of noise on people vary greatly with the individual.

#### *"A"-WEIGHTED SOUND LEVEL (dBA)*

Noise is typically measured in units called decibels (dB), which are 10 times the logarithm of the ratio of the sound pressure squared to a standard reference presence squared. Because loudness is important in the assessment of the effects of noise on people, the dependence of loudness on frequency must be taken into account in the noise scale used in environmental assessments. One of the simplified scales that accounts for the dependence of perceived loudness on frequency is the use of a weighting network, known as "A"-weighting, in the measurement system, to simulate the response of the human ear. For most noise assessments, the A-weighted sound pressure level in units of dBA is used in view of its widespread recognition and its close correlation with perception. In the current study, all measured noise levels are reported in dBA or A-weighted decibels. Common noise levels in dBA are shown in Table L-1.

Table L-1
## Common Noise Levels

| Sound Source | (dBA) |
|---|---|
| Military jet, air raid siren | 130 |
| Amplified rock music | 110 |
| Jet takeoff at 500 meters | 100 |
| Freight train at 30 meters | 95 |
| Train horn at 30 meters | 90 |
| Heavy truck at 15 meters | |
| Busy city street, loud shout | 80 |
| Busy traffic intersection | |
| Highway traffic at 15 meters, train | 70 |
| Predominantly industrial area | 60 |
| Light car traffic at 15 meters, city or commercial areas or residential areas close to industry | |
| Background noise in an office | 50 |
| Suburban areas with medium density transportation | |
| Public library | 40 |
| Soft whisper at 5 meters | 30 |
| Threshold of hearing | 0 |

**Note**: A 10 dBA increase in level appears to double the loudness, and a 10 dBA decrease halves the apparent loudness.
**Source**: Allee King Rosen & Fleming, Inc.

*COMMUNITY RESPONSE TO CHANGES IN NOISE LEVELS*

The average ability of an individual to perceive changes in noise levels is well documented (see Table L-2). Generally, changes in noise levels less than three dBA are barely perceptible to most listeners, whereas 10 dBA changes are normally perceived as doublings (or halvings) of noise levels. These guidelines permit direct estimation of an individual's probable perception of changes in noise levels.

It is also possible to characterize the effects of noise on people by studying the aggregate response of people in communities. The rating method used for this purpose is based on a statistical analysis of the fluctuations in noise levels in a community. Typically, the analysis examines the fluctuation in noise levels over one-hour and/or 24-hour periods. Various government and research institutions have proposed criteria that attempt to relate changes in noise levels to community response. One commonly applied criterion for estimating response is incorporated into the community response scale proposed by the International Standards Organization (ISO) of the United Nations (see Table L-3). This scale relates changes in noise level to the degree of

Table L-2
## Average Ability to Perceive Changes in Noise Levels

| Change (dBA) | Human Perception of Sound |
|---|---|
| 2-3 | Barely perceptible |
| 5 | Readily noticeable |
| 10 | A doubling or halving of the loudness of sound |
| 20 | A "dramatic change" |
| 40 | Difference between a faintly audible sound and a very loud sound |

**Source**: Bolt Beranek and Neuman, Inc., *Fundamentals and Abatement of Highway Traffic Noise*, Report No. PB-222-703. Prepared for Federal Highway Administration, June 1973.

Table L-3
## Community Response to Increases in Noise Levels

| Change (dBA) | Category | Description |
|---|---|---|
| 0 | None | No observed reaction |
| 5 | Little | Sporadic complaints |
| 10 | Medium | Widespread complaints |
| 15 | Strong | Threats of community action |
| 20 | Very strong | Vigorous community action |

**Source**: International Standards Organization, *Noise Assessment with Respect to Community Responses*, ISO/TC 43. (New York: United Nations, November 1969).

community response and permits direct estimation of the probable response of a community to a predicted change in noise level.

### NOISE STANDARDS AND CRITERIA

Noise levels associated with the construction and operation of the proposed project are subject to the emission source provisions of the New York City Noise Control Code and to Noise Standards set for the City Environmental Quality Review (CEQR) process. Other standards and guidelines promulgated by federal agencies do not apply to project noise control, but are useful to review in that they establish measures of impacts. Construction equipment is regulated by the Noise Control Act of 1972.

#### *NEW YORK CITY NOISE CODE*

The New York City Noise Control Code promulgates sound-level standards for motor vehicles, air compressors, and paving breakers; requires that all exhausts be muffled; and prohibits all unnecessary noise adjacent to schools, hospitals, and courts. The code further limits construction

activities to weekdays between 7 AM and 6 PM. In 1979, Section 1403.3-6.01 of the code was reenacted as Local Law No. 64. This new law established ambient noise quality criteria and standards based on existing land use zoning designations. Conformance with the noise level values contained in the law is determined by considering noise emitted directly from stationary activities within the boundaries of a project. Construction activities and noise sources outside the boundaries of a project are not included within the provisions of this law.

*NEW YORK CEPO-CEQR NOISE STANDARDS*

The New York City Department of Environmental Protection (DEP), Division of Noise Abatement has set external noise exposure standards and attenuation values. These standards are shown in Tables L-4 and L-5. Noise exposure is classified into four categories—acceptable, marginally acceptable, marginally unacceptable, and clearly unacceptable. The standards for traffic noise are based on maintaining an interior noise level for the worst-case hour $L_{10}$ of less than or equal to 45 A-weighted decibels (dBA). Standards for aircraft and train noise are different, and are derived from the standards of the Federal Department of Housing and Urban Development (HUD). These standards were adopted for use in the CEQR process.

## IMPACT DEFINITION

As recommended in the *CEQR Technical Manual*, this report will utilize the following criteria to define a significant noise impact:

- An increase of 5 dBA, or more, in Build $L_{eq(1)}$ noise levels at sensitive receptors to those calculated for the No Build condition, if the No Build levels are less than 60 dBA $L_{eq(1)}$ and the analysis period is not a nighttime period.
- An increase of 4 dBA, or more, in Build $L_{eq(1)}$ noise levels at sensitive receptors to those calculated for the No Build condition, if the No Build levels are 61 dBA $L_{eq(1)}$ and the analysis period is not a nighttime period.
- An increase of 3 dBA, or more, in Build $L_{eq(1)}$ noise levels at sensitive receptors to those calculated for the No Build condition, if the No Build levels are greater than 62 dBA $L_{eq(1)}$ and the analysis period is not a nighttime period.
- An increase of 3 dBA, or more, in Build $L_{eq(1)}$ noise levels at sensitive receptors to those calculated for the No Build condition, if the analysis period is a nighttime period (defined by the CEPO-CEQR standards as being between 10 PM and 7 AM.).

## NOISE PREDICTION METHODOLOGY

*MOBILE NOISE SOURCES*

A proportional modeling technique was used to determine approximate increases in noise levels due to changes in traffic volumes. Using this technique, the prediction of future traffic noise levels is based on a calculation using measured existing noise levels and predicted changes in traffic volumes to determine No Build and Build levels. No Build traffic volumes were based on applying a growth factor to the existing traffic volumes and adding the traffic volumes from any planned projects. Future Build traffic volumes were obtained by adding project-generated traffic values to No Build conditions. The vehicular traffic volumes were converted into Passenger Car Equivalent (PCE) values, for which one medium-duty truck (having a gross weight between 9,400 and 25,000 pounds) is assumed to generate the noise equivalent of 16 cars, and one

## Table L-4
## CEPO-CEQR Noise Exposure Standards for Use in City Environmental Impact Review[1]

| Receptor Type | Time Period | Acceptable General External Exposure | Airport[3] Environs | Marginally Acceptable General External Exposure | Airport[3] Environs | Marginally Unacceptable General External Exposure | Airport[3] Environs | Clearly Unacceptable General External Exposure | Airport[3] Environs |
|---|---|---|---|---|---|---|---|---|---|
| 1. Outdoor area requiring serenity and quiet[2] | | $L_{10} \leq 55$ dBA | ---------- Ldn ≤ 60 dBA ---------- | | ---------- 60 < $L_{dn}$ ≤ 65 dBA ---------- | | (1) 65 < $L_{dn}$ ≤ 70 dBA, (II) 70 < $L_{dn}$ ≤ | | ---------- $L_{dn}$ > 75 dBA, ---------- |
| 2. Hospital, Nursing Home | | $L_{10} \leq 55$ dBA | | 55 < $L_{10}$ ≤ 65 dBA | | 65 < $L_{10}$ ≤ 80 dBA | | $L_{10}$ > 80 dBA | |
| 3. Residence, residential hotel or motel | 7 AM to 11 PM | $L_{10} \leq 65$ dBA | | 65 < $L_{10}$ ≤ 70 dBA | | 70 < $L_{10}$ ≤ 80 dBA | | $L_{10}$ > 80 dBA | |
| | 11 PM to 7 AM | $L_{10} \leq 55$ dBA | | 55 < $L_{10}$ ≤ 70 dBA | | 70 < $L_{10}$ ≤ 80 dBA | | $L_{10}$ > 80 dBA | |

| 6. Industrial, public areas only[4] | Note 4 | Note 4 | | Note 4 | | Note 4 | | Note 4 | |

**Notes:**

(i) In addition, any new activity shall not increase the ambient noise level by 3 dBA or more; (ii) CEPO-CEQR Noise Standards for train noise are similar to the above aircraft noise standards: the noise category for train noise is found by taking the $L_{dn}$ value for such train noise to be an $L_{dn}^{Y}$ ($L_{dn}$ contour) value (see table on the following page).

1 Measurements and projections of noise exposures are to be made at appropriate heights above site boundaries as given by American National Standards Institute (ANSI) Standards; all values are for the worst hour in the time period.

2 Tracts of land where serenity and quiet are extraordinarily important and serve an important public need and where the preservation of these qualities is essential for the area to serve its intended purpose. Such areas could include amphitheaters, particular parks or portions of parks or open spaces dedicated or recognized by appropriate local officials for activities requiring special qualities of serenity and quiet. Examples are grounds for ambulatory hospital patients and patients and residents of sanitariums and old-age homes.

3 One may use the FAA-approved $L_{dn}$ contours supplied by the Port Authority, or the noise contours may be computed from the federally approved INM Computer Model using flight data supplied by the Port Authority of New York and New Jersey.

4 External Noise Exposure standards for industrial areas of sounds produced by industrial operations other than operating motor vehicles or other transportation facilities are spelled out in the New York City Zoning Resolution, Sections 42-20 and 42-21. The referenced standards apply to M1, M2, and M3 manufacturing districts and to adjoining residence districts (performance standards are octave band standards).

**Source:** New York City Department of Environmental Protection (adopted policy 1983).

Table L-5

## CEPO-CEQR Exterior Noise Standards and Attenuation Values

| Noise Category | Marginally Acceptable | Marginally Unacceptable | | Clearly Unacceptable | | |
|---|---|---|---|---|---|---|
| Vehicular[a, b] | $65 < L_{10} \leq 70$ | $70 < L_{10} \leq 75$ | $75 < L_{10} \leq 80$ | $80 < L_{10} \leq 85$ | $85 < L_{10} \leq 90$ | $90 < L_{10} \leq 95$ |
| Train[a, b] | $60 < L_{dn} \leq 65$ | $65 < L_{dn} \leq 70$ | $70 < L_{dn} \leq 75$ | $75 < L_{dn} \leq 80$ | $80 < L_{dn} \leq 85$ | $85 < L_{dn} \leq 90$ |
| Aircraft[a, b] | $60 < L^{y}_{dn} \leq 65$ | $65 < L^{y}_{dn} \leq 70$ | $70 < L^{y}_{dn} \leq 75$ | $L^{y}_{dn} > 75$ | N/A | N/A |
| Required Attenuation[c] | 25 dB(A) | (I) 30 dB(A) | (II) 35 dB(A) | (I) 40 dB(A) | (II) 45 dB(A) | (III) 50 dB(A) |

**Notes:**

[a] Different descriptors are used for each noise source: $L_{10}$ for vehicular traffic; $L_{dn}$ for train noise; and $L^{y}_{dn}$ ($L_{dn}$ Contour) for aircraft noise.[*,†]

[b] The various noise sources at a receptor location are measured and reported separately in accordance with generally accepted procedures for assessing an overall noise level. Cases where there is not a clearly dominant noise source require a judicious decision based on adequate field experience and analysis to determine the final noise category that is deemed appropriate for the overall noise exposure at each noise receptor site.

[c] The above composite window-wall attenuation values are for residential dwellings. Commercial office spaces and meeting rooms would be 5 dB(A) less in each category. All the above categories require a closed window situation and hence an alternate means of ventilation.

[*] $L_{dn}$ requires a 24-hour measurement or supportive analysis if a shorter period is employed.

[†] $L^{y}_{dn}$ = "$L_{dn}$ Contour" is an annual average of $L_{dn}$ values ("y" indicates "yearly average").

heavy-duty truck (having a gross weight of more than 25,000 pounds) is assumed to generate the noise equivalent of 85 cars. Future noise levels are calculated using the following equation:

$$F\ NL = E\ NL + 10 * \log_{10} (FPCE / EPCE)$$

where:

F NL = Future Noise Level

E NL = Existing Noise Level

F PCE = Future PCEs

E PCE = Existing PCEs

Because sound levels use a logarithmic scale, this model proportions logarithmically with traffic change ratios. For example, assume that traffic is the dominant noise source at a particular location. If the existing traffic volume on a street is 100 PCE and if the future traffic volume were increased by 50 PCE to a total of 150 PCE, the noise level would increase by 1.8 dBA. If the future traffic were increased by 100 PCE, or doubled to a total of 200 PCE, the noise level would increase by 3.0 dBA. The proportional model screening technique was used to examine impacts during operation of the proposed project.

As mentioned previously, the *CEQR Technical Manual* considers a 3.0 dBA or higher increase in daytime noise levels a significant impact when the No Build noise level is equal to or greater than 62 dBA $L_{eq(1)}$, or if the analysis period is a nighttime period. Therefore, a doubling of traffic, where traffic is the dominant source of noise, results in a significant noise impact when daytime No Build noise levels are 62 dBA or greater, or when traffic is doubled during a nighttime hour. For daytime ambient No Build noise levels under 60 dBA, a noise level increase of 5 dBA is considered a significant increase in noise level. Traffic volumes must increase approximately by a factor of three for traffic-generated noise levels to increase by 5 dBA.

*NOISE EFFECTS FROM PARKING LOT NOISE*

Noise levels at locations adjacent to the parking lot for the fine dining/banquet facility were determined based on field measurements made at a location adjacent to comparable facility's parking lot in the area. Measurements were made on Saturday night, June 12, 1999 at the Marina del Rey Catering Facility, a banquet facility on Schurz Avenue at East Tremont Avenue. This Bronx facility is located near the project site, on the water, and in a lightly traffic, relatively quiet residential neighborhood. Measurements made at a distance of approximately 100 feet from the center of the parking lot, during an hour with approximately 110 vehicles departing the facility (i.e., 11:10 PM to 12:10 AM) and 36 vehicles on the adjacent Schurz Avenue, yielded a noise level of 57.7 dBA. This noise level was adjusted to represent conditions at the noise receptor location by assuming a change of 4.5 dBA per doubling (or halving) of distance between the noise source and receptor and proportionally adjusting the noise level based upon the source strength (i.e., the number of vehicles using the parking facility).

## NOISE EFFECTS FROM GRASS MAINTENANCE EQUIPMENT

In terms of grass maintenance, the noisiest operation, once the initial construction is completed, will be grass mowing operations. A wide range of equipment is available from various manufacturers for these purposes, each with somewhat different noise characteristics. This includes not only gasoline and natural gas powered equipment, but electric and battery powered equipment. To minimize noise impacts, the equipment to be used for grass cutting on the eastern part of the course, near the residences, will be selected to not produce more than 70 dBA at 50 feet. There is a variety of equipment which meets this requirement.

## NOISE FROM THE PARK ACTIVITIES

With the exception of noise generated from use of the community park active recreational area, park activities are not expected to generate any significant amount of noise. Noise from golfers is very low, and noise from the passive recreation activities in the waterfront park are also expected to be relatively low. Activities at location adjacent to the ball field at expected to be similar to noise levels measured at school playgrounds and have a worst-case $L_{eq(1)}$ dBA of 71.5 and a worst-case $L_{10(1)}$ of 74.5 dBA at the ball field or park boundary. These values are based on the results of a School Construction Authority (SCA) Playground Noise Study conducted by Allee King Rosen & Fleming, Inc., during October 1992. Geometric spreading and consequent dissipation of sound energy with increasing distance from the ball field would decrease noise levels at varying distances from the boundary. Hourly noise levels can be expected to decrease by the following values at the specified distances from the field boundary: 4.8 dBA at 20 feet, 6.8 dBA at 30 feet, and 9.1 dBA at 40 feet. For all distances between 40 and 300 feet, a 4.5-dBA drop-off per doubling of distances from the boundary should be utilized. For distances greater than 300

feet a general practice of using a 6-dBA drop-off rate per doubling of distance under normal circumstances.

## B. EXISTING CONDITIONS

### SITE DESCRIPTION

The project site is the eastern portion of Ferry Point Park and is bounded by: the Bronx-Whitestone Bridge and Hutchinson River Parkway to the west; Schley Avenue and Saint Raymond's Cemetery to the north; Balcom, Miles, and Emerson Avenues to the east; and the East River to the south. The project site is undeveloped except for an organic recycling and composting facility, which is located on the northwestern portion of the site, and an existing ballfield and basketball court that are located on the northeastern portion of the site. Existing traffic volumes on the Bronx-Whitestone Bridge/Hutchinson River Parkway, on the west of the project site are very high. There are a number of residences along Balcom, Miles, and Emerson Avenues, on the eastern boundary of the project site, and traffic levels in this area are relatively low.

The entire project site and its immediate environs are within the 65 $L_{dn}$ contour of LaGuardia Airport, and the area is subject to frequent aircraft flyovers.

### SELECTION OF NOISE RECEPTOR LOCATIONS

While all of the project-generated vehicular traffic will enter and leave the project site using the Hutchinson River Parkway Service Roads, an initial "worst case"screening analysis utilizing proportional modeling techniques (described above) showed that, because of the heavy traffic volumes on the Hutchinson River Parkway/Bronx-Whitestone Bridge, project-generated traffic would have an insignificant effect on noise levels at locations adjacent to this roadway (i.e., project-generated traffic would increase noise levels by less than 0.2 dBA. Similarly, results were obtained for an initial "worst case" screening analysis of Lafayette Avenue and other major feeder roadways to the project site. In addition, in general, these roadways are truck routes and do not have sensitive receptors on them. Consequently no noise receptor locations were selected at locations along the major feeder streets and roadways to the project site.

Instead, three noise receptor locations adjacent to the eastern side of the project site were selected for analysis. The selected receptor sites are at residences adjacent to the project site, and are located where noise from activities within the project site may directly affect sensitive receptors (i.e., residents). Site 1 is located at the intersection of Emerson and Miles Avenues; Site 2 is located at the intersection of Schurz and Emerson Avenues, and; Site 3 is located on Balcom Avenue between Schley and Dewey Avenues. Traffic volumes at Sites 1 and 2 are very low (less than 40 vehicles per hour). Traffic volumes at Site 3 are moderate (less than 400 vehicles per hour); however, there is approximately 8 buses/hour pass by this site. At all three sites there were frequent overflights by aircraft (i.e., approximately between 12 and 42 per hour).

### NOISE MONITORING

Noise levels at the three receptor sites were measured for 20-minute periods during a weekday midday, PM, and nighttime periods on Wednesday, June 23, 1999, and during Saturday midday, PM, and nighttime periods on Saturday, June 19, 1999.

*EQUIPMENT USED*

The instrumentation used for the 20-minute measurements at the sensitive receptor sites was a Larson Davis Labs (LDL) Model MK224 microphone connected to an LDL preamplifier attached to an LDL Model 700 Type 1 (according to ANSI Standard S1.4-1983) sound level meter. The instrument was mounted at a height of 4 feet above the ground on a tripod. The meter was calibrated before and after readings with a Brüel & Kjær Type 4230 sound level calibrator using the appropriate adaptor. Measurements at each location were made on the A-scale (dBA) for a sampling period of 20 minutes at each site. The data were digitally recorded by the noise analyzer and displayed at the end of the measurement period in units of dBA. The descriptors recorded during the field measurements included $L_{eq}$, $L_1$, $L_{10}$, $L_{50}$, and $L_{90}$. A windscreen was used during all sound measurements except for calibration. All measurement procedures conformed with the requirements of ANSI Standard S1.13-1971 (R1976).

*RESULTS OF MEASUREMENTS*

Existing $L_{eq}$, $L_1$, $L_{10}$, $L_{50}$, and $L_{90}$ noise levels at the three receptor sites are summarized in Table L-6. At Sites 1 and 2 noise levels are due to a combination of general background traffic levels in the area and aircraft flyovers, and at Site 3 traffic on Balcom Avenue, along with noise from aircraft flyovers, are the dominant noise sources. Noise levels excluding aircraft operations are approximately 2-5 dBA less than the values shown in the table.

**Table L-6**
**Existing Noise Levels**

| Site | Location | Time | $L_{eq}$ | $L_1$ | $L_{10}$ | $L_{50}$ | $L_{90}$ |
|---|---|---|---|---|---|---|---|
| 1 | Emerson/Miles Avenues | Weekday MD | 55.1 | 66.5 | 58.5 | 48.5 | 43.0 |
| | | Weekday PM | 54.8 | 61.0 | 58.0 | 52.5 | 49.5 |
| | | Weekday Night | 51.6 | 62.0 | 53.5 | 48.5 | 47.5 |
| | | Saturday MD | 56.3 | 69.5 | 58.0 | 49.0 | 45.0 |
| | | Saturday PM | 61.1 | 73.0 | 65.0 | 54.5 | 50.5 |
| | | Saturday Night | 49.4 | 60.0 | 53.0 | 44.0 | 42.5 |
| 2 | Schurz/Emerson Avenues | Weekday MD | 60.1 | 73.5 | 60.0 | 48.5 | 45.0 |
| | | Weekday PM | 59.9 | 73.0 | 61.5 | 55.0 | 52.0 |
| | | Weekday Night | 54.4 | 66.0 | 55.5 | 51.0 | 49.0 |
| | | Saturday MD | 57.6 | 68.0 | 62.0 | 49.0 | 45.0 |
| | | Saturday PM | 60.2 | 70.5 | 64.5 | 54.0 | 47.5 |
| | | Saturday Night | 51.1 | 62.5 | 53.5 | 46.5 | 45.0 |
| 3 | Balcom Avenue-Schley/Dewey Avenues | Weekday MD | 66.8 | 78.5 | 69.0 | 61.5 | 51.5 |
| | | Weekday PM | 65.6 | 76.5 | 69.0 | 58.0 | 44.5 |
| | | Weekday Night | 66.6 | 76.5 | 69.0 | 61.0 | 54.5 |
| | | Saturday MD | 67.9 | 80.0 | 70.5 | 62.5 | 58.5 |
| | | Saturday PM | 67.9 | 78.5 | 70.5 | 64.0 | 57.5 |
| | | Saturday Night | 63.9 | 73.0 | 66.0 | 58.0 | 52.0 |

**Note:** Based on noise measurements performed by Allee King Rosen & Fleming, Inc. on June 19th and 23rd, 1999.

In terms of the New York City CEPO-CEQR standards, existing noise levels at all three sites are in the "marginally acceptable" category.

In addition, it should be noted that the entire area, including Ferry Point Park, is impacted by aircraft flyovers from LaGuardia Airport, and noise levels in some areas of the park are above the 55 dBA $L_{10}$ levels recommended for park use in the *CEQR Technical Manual* (see Table L-4). $L_{10}$ levels in the park vary from approximately 78-80 dBA on the western edge of the park, adjacent to the Bronx-Whitestone Bridge/Hutchinson River Parkway, to approximately 52-53 dBA on interior, northern, and eastern locations, which do not have any adjacent vehicular traffic.

## C. THE FUTURE WITHOUT THE PROJECT

Traffic volumes for No Build conditions will not change significantly from existing traffic volumes (see Attachment J, "Transportation"). Using the proportional modeling methodology described above, based upon the general growth of traffic in the area which would result in relatively small changes in traffic volumes, $L_{eq(1)}$ noise levels for No Build conditions will change slightly compared with existing noise levels. At all three noise receptor sites, $L_{eq(1)}$ noise levels for No Build conditions would increase by less than 0.1 dBA. Changes of this magnitude would not be perceptible and would not be significant.

## D. POTENTIAL IMPACTS OF THE PROPOSED PROJECT

As discussed in Section B, Existing Conditions, Selection of Receptor Sites, a "worst case" analysis using proportional modeling techniques, indicated that project-generated traffic would increase noise levels on the feeder roadways to the project site by an imperceptible level (i.e., less than 0.2 dBA) and would not result in any significant noise impacts. However, noise generated by the proposed project due to three other sources—grass maintenance including grass mowing operations, operation of the fine dining/banquet facility including noise from their parking lots, and from use of the ballfield at the community park—have the potential for causing significant noise impacts at residents to the east of the project site and the potential for these impacts were examined. Due to the relatively low baseline noise levels at the project area, the likelihood of significant project-related impacts would be increased. The project would be designed so that noise from operation of all mechanical equipment, including HVAC equipment, would meet all applicable codes. Since the proposed project would be creating new parkland, conformance to the CEPO-CEQR guideline levels for outdoor areas potential sensitive to noise is also examined. Finally, impacts during construction are qualitatively discussed.

### GRASS MAINTENANCE AND MOWING OPERATIONS

Site 1 on Miles Avenue is the quietest noise receptor location that potentially would be effected by grass maintenance or cutting operations. As previously mentioned, the specifications for the equipment to be used for grass cutting on the eastern part of the course, near the residences, will require that the equipment produce noise of 70 dBA or less at 50 feet. This equipment will be moving, and would be expected to a $L_{eq(1)}$ of approximately 52.5 dBA. Therefore, using the lowest measured daytime noise levels at this site, an $L_{eq(1)}$ of 54.8 dBA, during the hours when grass mowing operations are taking place, noise levels would increase by 2.0 dBA to 56.8 dBA. An increase of this magnitude would not be perceptible and would not constitute a significant impact.

### OPERATION OF THE FINE DINING/BANQUET FACILITY

The project design includes a 8 to 10 foot noise barrier (with landscaping) along Emerson Avenue, behind the fine dining/banquet facility to shield residents on Emerson Avenue, both

visually and acoustically, and minimize effects of this facility on the adjacent community. Measurements at a distance of approximately 100 feet from the center of a comparable facility yielded 57.7 dBA with 110 vehicles departing from a parking lot. This noise level was adjusted to represent conditions at the noise receptor location by assuming a change of 4.5 dBA per doubling (or halving) of distance between the noise source and receptor and proportionally increasing the noise level based upon the number of vehicles using the parking facility. Parking for a maximum capacity event at the project site would be in two parking lots—a southern lot with approximately 100 car capacity, and a northern lot with approximately 400 car capacity. Site 2, on Emerson Avenue, is representative of locations that potentially may be effected by noise from this source. The noise barrier would reduce noise levels by approximately 8-10 dBA. Therefore, using the lowest measured PM or nighttime noise level at this site, an $L_{eq(1)}$ of 51.1 dBA, when a major event takes place at the banquet facility, during the hour when people arrive and depart, noise levels would increase by approximately 2.9 (2.0) dBA to 54.0 (53.1) dBA. An increase of this magnitude would not be perceptible and would not constitute a significant impact. This barrier would also reduce noise from any truck deliveries or other service area events.

## USE OF THE NEW BALLFIELD IN THE COMMUNITY PARK

Noise levels on Balcom Avenue near the new ballfield in the community park would not increase due to the proposed project for two reasons: First, existing noise levels are already a function of noise from the existing ballfield and traffic in this area; and Second, traffic noise on Balcom Avenue is the dominant noise source. Existing daytime $L_{eq(1)}$ noise levels on Balcom Avenue are currently typically approximately 65-68 dBA. Noise from the ballfield would be expected to be below 60 dBA. Therefore, project-generated noise would not be expected to have a significant impact.

## NOISE LEVELS IN NEWLY CREATED PARKLAND

The proposed action would result in the demapping of two unbuilt and undeveloped streets-Emerson Avenue between Miles and Schley Avenues, and Schley Avenue between Buttrick and Emerson Avenues. The two demapped streets would be remapped as parkland and incorporated into Ferry Point Park. Existing noise levels at these two locations are relatively low, since there is no adjacent vehicular traffic, and it would be expected that noise levels in these areas would be comparable to that in adjacent park areas and would exceed the CEPO-CEQR guideline level of 55 dBA $L_{10}$ for outdoor areas potentially sensitive to noise. Based upon CEQR criteria, noise levels in these new parklands would not cause a significant impact.

## CONSTRUCTION IMPACTS

Impacts on noise levels during construction of the proposed project include noise and vibration from construction equipment operation, and noise from construction and delivery vehicles traveling to and from the construction site. In general, the project site is removed from residents and other sensitive receptors, deliveries of supplies and workers will be via the I-678 service road, which is not adjacent to residents, and deliveries and parking will be accommodated on-site. Consequently noise impacts during construction are expected to be minimal and for relatively short durations.

The level of impact during construction depends on the noise characteristics of the equipment and activities involved, the construction schedule, and the location of potentially sensitive noise

receptors. Noise and vibration levels at a given location are dependent on the kind and number of pieces of construction equipment being operated, as well as the distance from the construction site. The construction site of the proposed project will produce peak noise levels that will be clearly discernable at some nearby residences, and may be considered intrusive. Typical noise levels of construction equipment expected to be employed during the construction process are presented in Table L-7. Noise levels caused by construction activities would vary widely, depending on the phase of construction—land clearing and excavations, foundation and capping, erection of structural steel for any structures, construction of exterior walls, etc.—and the specific task being undertaken.

**Table L-7**

## Typical Noise Emission Levels for Construction Equipment

| Equipment Item | Noise Level at 50 Feet (dBA) |
|---|---|
| Air Compressor | 81 |
| Asphalt Spreader (paver) | 89 |
| Asphalt Truck | 88 |
| Backhoe | 85 |
| Bulldozer | 87 |
| Compactor | 80 |
| Concrete Plant | 83[1] |
| Concrete Spreader | 89 |
| Concrete Mixer | 85 |
| Concrete Vibrator | 76 |
| Crane (derrick) | 76 |
| Delivery Truck | 88 |
| Diamond Saw | 90[2] |
| Dredge | 88 |
| Dump Truck | 88 |
| Front End Loader | 84 |
| Gas-driven Vibro-compactor | 76 |
| Hoist | 76 |
| Jack Hammer (Paving Breaker) | 88 |
| Line Drill | 98 |
| Motor Crane | 93 |
| Pile Driver/Extractor | 101 |
| Pump | 76 |
| Roller | 80 |
| Shovel | 82 |
| Truck | 88 |
| Vibratory Pile Driver/Extractor | 89[3] |

**Source:** Patterson, W.N., R.A. Ely, and S.M. Swanson, *Regulation of Construction Activity Noise*, Bolt Beranek and Newman, Inc., Report 2887, for the Environmental Protection Agency, Washington, D.C., November 1974, except for notated items.

Increased noise levels caused by construction activities can be expected to be most significant during the early phases of construction. The most significant noise source associated with the construction equipment will be the use of pile-drivers for construction of any buildings on-site. A pile-driver will be used periodically for a limited time period during the early phases of construction of the buildings on-site. Most of the buildings are far removed from residences, which are located to the east of the site. Pile-driver noise will be intrusive and would be discernable to residences within several blocks of the project site during the limited time period that pile driving occurs during construction of the fine dining/banquet facility. However, these peak construction noise levels would persist for only a limited time period in the early phase of construction. During the later phases of construction noise levels would be much less severe.

Construction noise is regulated by the New York City Noise Control Code and by EPA noise emission standards for construction equipment. These local and federal requirements mandate that certain classifications of construction equipment and motor vehicles meet specified noise emissions standards; that, except under special circumstances where a variance is issued for a limited number of days, construction activities be limited to weekdays between the hours of 7:00 AM and 6:00 PM; and that construction material be handled and transported in such a manner as not to create unnecessary noise. These regulations would be carefully followed. In addition, appropriate low-noise emission level equipment and operational procedures would be used. Compliance with noise control measures would be ensured by including them in the contract documents as material specification and by directives to the construction contractor. ❖

*Ferry Point Park Recreational Facility*
*Non-point Source Pollutant Loading Analysis*

## *1.0 INTRODUCTION*

The Ferry Point Park recreational facility is a multi-use facility proposed for the eastern portion of Ferry Point Park (the site) in Bronx County, New York. This eastern portion of Ferry Point Park encompasses approximately 222 acres of ruderal vegetation (plant colonizing waste ground) on a former landfill. The comprehensive golf facility is the largest portion of the proposed project and is a primary focus of this evaluation—it will include a driving range, practice range clubhouse and associated parking. Other project components include a waterfront park, a community park, and two restaurant facilities.

The proposed project will modify and the site's existing land use, and land cover, and topography. As a former landfill, the site can best be characterized as an open field that is undergoing early ecological succession. Largely a mixture of grasses and other herbaceous plants, the site has some scattered patches of trees, the majority of which do not provide any substantial canopy cover. Throughout the site there is evidence of past dumping activity. There are small, isolated wetlands present on the site located along the Hutchinson River Parkway along the site's western border. Pockets of disturbed land and some impervious surfaces also occur throughout the site. In general, land cover is reflective of a typical open, urban site. Although the site's post-development condition will provide a much expanded and improved recreational opportunity for the area, the change in land use and vegetative cover has the potential to increase the generation of pollutants. The development of any site affects the generation of pollutants because of an increase in impervious cover, and an increase in the volume of stormwater runoff. Impervious cover, without adequate mitigation, reduces the infiltration of precipitation, leading to a decrease in ground water recharge and increase in surface runoff. The volume and energy associated with this additional runoff can potentially mobilize and transport pollutants. The actual types and availability of pollutants that will be mobilized or transported with runoff will vary with land use. Typically, the more intensely land is developed (i.e., the greater the amount of impervious cover) the greater the variety of potential pollutants. The pollutants most often associated with land development are nutrients (nitrogen and phosphorus), suspended sediments, petroleum hydrocarbons, organic material and heavy metals. Fertilizers are the main source of increased nitrogen and phosphorus loads. Soil erosion and decomposition of vegetation are other nutrient sources. Erosion of exposed, insufficiently vegetated land surfaces leads to increases in suspended sediments. The generation of heavy metals, organic material (reflected in the measurement of biochemical oxygen demand (BOD)) and petroleum hydrocarbons can also increase as land becomes increasingly developed. Many of these pollutants arise as a result of vehicular emissions.

For the Ferry Point project, the evaluation of post-development pollutant loading focused on the quantification of the pollutant load generated by the

comprehensive golf facility (pervious area) and the impervious area consisting of the two proposed restaurants, their associated parking areas, parking areas for the waterfront park, and the internal roadways (including cart paths). As discussed below in the subsequent sections of this report, the analysis utilizes a stormwater modeling technique that enables the comparison of pre- and post-site development pollutant loads. The methodology also allows pollutant reduction best management practices (BMPs) to be accounted for in the analysis. As a result, the data generated are considered to be reflective of the post-development pollutant load that will be discharged to the East River following the completion of construction.

Of the pollutants of concern listed above, emphasis was placed on the control of nutrients, BOD and heavy metals. Minimization of the post-development discharge of these pollutants into the East River is in keeping with the nutrient reduction strategies of the Long Island Sound initiatives and the environmental principles set forth for golf course developments (CRM 1996).

## *2.0 METHODOLOGY*

The objective of the pollutant loading analysis conducted for the Ferry Point project was to accurately quantify differences in pollutant loading between existing and proposed site-development conditions. The analysis was conducted on all areas of the project site, with the exception of the pervious sections of the waterfront park that drain directly to the East River. All impervious elements of the waterfront park (the parking areas) will be treated for water quality and are accounted for in the analysis.

The pollutant load analysis was conducted in accordance with the methodology specified in Schueler (1987). Referred to as the *Simple Method*, this pollutant load quantification technique has been adopted by a number of environmental and planning agencies including the New York State Department of Environmental Conservation (DEC). The *Simple Method* is especially well suited for the assessment of land use and associated pollutant loading changes for suburban/urban settings. The model integrates rainfall, rainfall intensity and impervious cover attributes, and can be used to examine pollutant loading under short-term (storm specific) and long-term (annual) scenarios. This makes the model very adept for analyzing changes in pollutant loading due to even minor changes in land use or land cover. DEC (1993) indicated that this pollutant quantification technique is robust and flexible, yet capable of generating accurate data. In addition, the results of the *Simple Method* can be used to evaluate the feasibility and effectiveness of different pollutant load management strategies or BMPs. Although loading coefficients specifically intended for the analysis of golf course development are not supplied in either Schueler (1987) or DEC (1993), appropriate coefficients are available in the scientific literature. These coefficients were developed as a result of the actual field study and measurement of storm related pollutant loading from turf.

The non-point source pollutant analysis discussed in this report focuses on pollutants that have the greatest potential to impact the water quality of the East

River—nutrients (nitrogen and phosphorus), organic loadings (BOD), and heavy metals. The modeling procedure for these pollutants consisted of three main components.

Delineation of the project site into sub-watershed (catchment) areas based on projected topographic contours, and the proposed stormwater collection and routing system.

Identification of the prevailing land use(s) within each sub-watershed under existing and post-development conditions.

Assignment of pollutant loading coefficients, under existing and post-development conditions. The coefficients selected for use in this study were obtained from Schueler (1987) and DEC (1993), and assessed for their applicability by comparison with data available through Barten (1995) and others. The selected coefficients are reflective of site-specific existing and post-development conditions with regard to imperviousness, slope, soils, and, in particular, land cover.

The characterization of pre-development land use conditions is the result of site inspections, the review and interpretation of aerial photos, and information supplied by other members of the project team. The post-development land use/cover designations were provided by the project engineer and are based on the input parameters of the TR-55 worksheets dated July 1999. Under the post-development scenario, the reported acreage of each land use and land cover reflects the most recent golf course layout. As such, the acreage of each sub-watershed used in this analysis accounts for the clubhouse, restaurants, maintenance facility, parking lots, roadways and other associated impervious surfaces. The selected coefficients were each cross-referenced with a number of sources, particularly Barten (1995) which provides coefficients based on the in-field measurement of runoff from four golf courses.

The comprehensive golf facility will use a combination of BMPs to mitigate the pollutant load generated from the operation of the facility. Thus, the pollutant load analysis conducted herein included the adjustment of the projected post-development pollutant loads to account for the load reductions attributable to BMP implementation. The functional characteristics of the BMPs are based on sizing and stormwater routing information (TR-55) provided by the project engineer (dated 8 July 1999).

It should be noted that the construction of the golf course will alter the existing sub-catchment divides. Reference to the area of each sub-catchment therefore reflects post-development topography. Alteration of the size of each sub-catchment is inconsequential to the overall purpose of the pollutant loading analysis, as all the runoff from the site will continue to be discharged to the East River via the same discharge points that currently convey runoff off-site.

## *3.0 RESULTS*

The Ferry Point Park Recreational Facility encompasses approximately 222 acres. Of this, the comprehensive golf facility covers approximately 190 acres. All of the drainage from the comprehensive golf facility is eventually directed to the East River through a portion of an existing stormwater collection system. In general, the project will result in the conversion of the existing open, urban grassland to a combination of turf/grass surfaces and impervious cover. The turf/grass is associated with the greens, fairways, tees and roughs of the comprehensive golf facility. Of these, only the greens, tees and fairways will be managed (treated with fertilizers and pesticides following initial grow in). The impervious sections of the project include the parking areas, cart paths, internal roadways and buildings (restaurants, clubhouse, and maintenance building). Table 1 summarizes the proposed land use conditions by sub-catchment. Current land use conditions and associated acreages by land use type are discussed in detail in Attachment E - Natural Resources. Most of the existing site (approximately 178 acres) can be characterized as urban meadow. These meadows are covered by plant species that reflect the site's disturbed nature and urban setting. The 19.5-acre waterfront park is not included in Table 1, but runoff from the park's impervious areas will be routed to the vegetated dry basins located nearby. The pervious portions of the waterfront park will be directed largely to the East River. The net change in land cover for these pervious areas is not likely to substantially change pollutant loadings from the existing condition.

***TABLE 1 Ferry Point Comprehensive Golf Facility Post-development Land Use/Cover in Acres***

| 4 | 7.09 | 0.65 | 0 |
| 4b | 13.31 | 0 | 0 |
| 5 | 41.08 | 4.22 | 0.92 |
| 6 | 17.40 | 0 | 4.64 |
| 7 | 1.86 | 0 | 1.79 |
| Total | 166.09 | 10.24 | 14.62 |

The changes from pre- to post-development pollutant loading were calculated for each sub-catchment using Schueler's *Simple Method*. As previously mentioned, DEC (1993) recommends the *Simple Method* for the computation of pollutant loading and the evaluation of the water quality benefits of BMPs. The coefficients for the *Simple Method* are flow weighted mean concentrations (milligrams per liter (mg/L)) derived from actual field measurements of pollutants in stormwater runoff (Reckhow et. al. 1980). The model includes a rainfall depth and rainfall intensity component, and thus allows for some degree of integration of the hydrologic, peak flow modeling data (SCS, TR-55) in the calculation of the pollutant load. That is, the CN (runoff curve number) values and soil

classifications used in the TR-55 analysis can be used to better define the $R_v$ (runoff coefficient) value of the *Simple Method*, thereby increasing the accuracy of the pollutant load analysis on a local scale.

For the pre-development condition, the average NURP (Nationwide Urban Runoff Program) values (Table 1.1 of Schueler 1987) were used. These values are reflective of the average concentration of pollutants measured in stormwater runoff sampled from sites throughout the Mid-Atlantic region. The post-development coefficients were also extracted from Table 1.1 of Schueler (1987) and are reflective of the average concentration of pollutants measured in stormwater runoff sampled from established suburban sites located in the Mid-Atlantic region. These coefficients are derived for landuse activities having a similar degree of imperviousness and a similar degree of use intensity. It should be noted that the selected loading coefficients used to model post-development pollutant loading are conservative, that is they most likely result in an overestimate of the pollutant load. This statement is based on the comparison of the selected coefficients to actual nutrient concentrations measured by Barten (1995) in runoff samples collected from four golf courses.

Table 2 summarizes the results of the *Simple Method* analysis, and provides a comparison of pre-development and post-development pollutant loads. The loadings presented in Table 2 do not reflect any reduction in pollutant loading attributable to the implementation of the golf course's proposed BMPs.

* Loading without pollutant removal attributable to BMPs, IPM, or other pollutant load mitigative strategies.

The comprehensive golf facility will use a combination of structural and non-structural techniques to decrease pollutant loading. The structural measures will include four water quality ponds, five vegetated dry detention basins, and water quality inlets designed to intercept and trap particulate pollutants, oils and heavy metals generated from parking areas and the maintenance area. Where practical, runoff will also be allowed to flow through grassed swales and vegetated buffers prior to its routing to the water quality ponds or vegetated dry detention basins. In addition to these structural techniques, the course will follow a turf management plan (Integrated Pest Management Plan [IPM]) designed to decrease the use of pesticides and fertilizers and control the potential for their off-site migration. Table 3 presents the pollutant removal efficiencies of the structural BMPs. These

values are in keeping with data reported in Schueler (1987), DEC (1993) and NJDEP (1994).

Given that the site's stormwater will be treated by a series of BMPs prior to discharge into the East River, the pollutant loads presented in Table 2 must be adjusted to account for their load-reduction capabilities. For this analysis, load reduction credit was given only to the structural BMPs; i.e., the water quality ponds, vegetated dry detention basins, water quality inlets and the grassed swales and buffers. Table 4 presents the results of the pollutant load calculations following adjustment for the treatment of stormwater runoff by the BMPs.

***Table 3 Ferry Point Comprehensive Golf Facility Pollutant Removal Efficiency of Proposed Structural BMPs***

| Difference (Lbs.) | - 362.3 | - 54.2 | - 267.3 | - 1. |

* Loading adjusted to account for pollutant removal attributable to water quality ponds, vegetated dry basins, water quality inlets, and vegetated swales/buffers.

The results presented in Table 4 indicate that nitrogen, phosphorus, and BOD will decrease from current loads in the post-development condition, while concentrations of heavy metals will remain the same. The differences in the post-development loads presented in Tables 4 is the result of the integrated utilization of the facility's BMPs. This includes the linkage of water quality ponds, vegetated dry detention basins, water quality inlets and vegetated swales/buffers. It should be noted that because of the proposed prolonged detention times, the pollutant removal efficiencies used in this analysis are conservative, and efficiencies of the BMPs may be actually higher than presented in Table 3. Furthermore, no credit

was taken for the pollutant reduction attributable to the proposed turf management plan. Therefore, the reduction in pollutant loading in the post-development condition is likely to be much greater than the values presented in Table 4.

## *4.0 DISCUSSION*

The potential for the increased generation of pollutants is inherent with any form of development. As presented in *Section 1.0*, changes in impervious cover, land use and the intensity of land invariably increases the amount and the types of pollutants. The data presented in Table 2 indicate that this is no different for the case of the proposed Ferry Point project.

However, it has also been repeatedly documented in the scientific literature that the nutrients, pesticides and other pollutants can be greatly reduced through the implementation of well designed BMPs. A highly integrated stormwater quality management system has been designed for the Ferry Point project. Runoff will be directed to a series of BMPs, which will utilize a combination of physical, chemical and/or biological processes to decrease pollutant loading to the East River.

Although the gross, predicted pollutant loads (Table 2) suggest that the off-site export of pollutants will be a greater following redevelopment, these data do not account for the mitigative benefits of the various BMPs and other pollutant management strategies, such as IPM, that will be implemented following the site's development. This approach to the on-site management of potential pollutants is a major tenet of the environmental principles for golf courses developed jointly by the U.S. Golf Association, U.S. Environmental Protection Agency, Golf Course Superintendents Association of America, and American Society of Golf Course Architects (CRM 1996). Under existing conditions, there are no specifically designed water quality enhancement BMPs in place—unstable, erosion prone areas exist, and there is the potential that pollutants associated with the site's past uses can be leached, mobilized and transported into the East River during storm events. Following the development of the site, runoff from the comprehensive golf facility, including all impervious surfaces, will be treated by a number of BMPs.

The runoff from sub-catchments 2, 3, 4 and 5 will be routed into specifically designed water quality ponds. The ponds managing the runoff from sub-catchments 3 and 5 will provide prolonged detention (>72 hours). Water quality ponds that provide prolonged detention times have substantially higher pollutant removal efficiency rates than most other types of BMPs, because they use a combination of physical, chemical and biological processes to reduce pollutants. As with any standing waterbody, the water column concentrations of incoming particulate pollutants (e.g. nutrients, heavy metals) will initially be reduced as a result of the settling of the heavier, course grain particulate matter (i.e. total suspended solids). Studies have shown that the majority of suspended particulate

pollutants will settle out of the water column during the first 6 to 12 hours (NJDEP 1994).

Unlike most conventional structural stormwater measures, water quality ponds can also remove significant amounts of dissolved pollutants, especially soluble nutrients, from the water column. This occurs due to a combination of chemical and biological processes associated with bacterial, algal and aquatic plant uptake of dissolved constituents. In particular, the biological assimilation of dissolved pollutants and soluble nutrients is an important pollutant removal pathway, and will aid in the control of nutrients originating from the application of fertilizers. As such, the combination of the settling of particulate pollutants and the assimilation of soluble pollutants, enables water quality ponds to be very effective in the reduction of stormwater-related pollutants.

The pollutant removal efficiency of water quality ponds varies depending on site specific conditions and the pond's design specifications (NJDEP 1994, Schueler 1987), but are generally high. For example, projected removal efficiencies of water quality ponds are estimated to 50 percent for total phosphorus (TP) and 30 percent for total nitrogen (TN) (Schueler 1996).

Vegetated dry basins will be used to manage the pollutant loading from sub-catchments 1, 2, 4B, 6, and 7. These basins, through filtration, settling and bio-uptake processes, are also very efficient in the removal of particulate and even soluble pollutants. Although they do not have the prolonged detention times of the water quality ponds, the vegetated basins will dampen and detain the first flush of storm events. This promotes the settling of particulates, while passage of runoff through the basin's vegetation promotes biofiltration and the assimilation of dissolved and soluble forms of pollutants.

Runoff from the impervious areas of the site, such as the parking lots and the golf course maintenance facility, will be routed to water quality inlets. Water quality inlets are catch basins with an outlet invert pipe raised approximately 0.6 m (2 ft) from the bottom. Standard catch basins have little, if any, positive impact on water quality. In contrast, water quality inlets can convey stormwater yet provide some degree of pollutant reduction (Schueler 1996). By raising the outlet pipe, and creating a retention sump in the bottom of the basin, sediments and particulate pollutants can be removed from the runoff. This is accomplished because the sump helps to slow storm surges and reduce the velocity of the runoff. This promotes the settling of sediment and the removal of pollutants such as heavy metals, petroleum hydrocarbons and nutrients bound to or adsorbed on the sediment particles. For the Ferry Point site, these inlets will be used as pre-treatment mechanisms for sub-catchments 1, 2, 6 and 7. These specially designed inlets will act to remove the courser sediments, and associated particulate pollutants, from the stormwater prior to its routing to the water quality ponds or the vegetated dry basins.

Additional, albeit minor, treatment of runoff from the grassed sections of the site will be accomplished, where possible and practical, by allowing runoff to sheet flow though vegetative buffers or be transported to the water quality ponds or

vegetated dry basins via vegetated swales. A swale is a natural depression or wide, man-made shallow ditch used to temporarily store, route or filter runoff (Schueler 1995). Although swales have a limited capacity to detain and treat stormwater runoff, when combined with other structural stormwater measures they can measurably decrease stormwater pollutants (Harper 1994). This is accomplished in three ways. First, the vegetation present in the swale reduces runoff velocity. The extent to which this occurs is dependent on the length, depth and gradient of the swale, as well as the density of the vegetation. A reduction in the velocity of runoff will increase the settling of particulate pollutants in much the same way as occurs in water quality ponds and vegetated dry detention basins. Second, a portion of the runoff discharged to a swale infiltrates into the soil, thus decreasing the volume of runoff. The extent to which this occurs is dependent on soil moisture conditions, the gradient of the swale, and the velocity of the runoff. Third, the vegetation present in the swale will filter out particulate pollutants and help retain these pollutants on-site.

Vegetated buffers work in much the same way as vegetated swales, relying on the combination of settling, filtration and infiltration to remove pollutants from runoff. Overall, these swales and buffers are relatively effective in the reduction of particulate pollutants, but are not highly effective in the removal of soluble pollutants such as nutrients. None-the-less, both are useful pre-treatment mechanisms.

For the Ferry Point project, the efficiency of the individual BMPs is further enhanced by the fact that most of the BMPs are linked. That is the site's stormwater routing system hydrologically connects certain BMPs, thereby creating a "pollutant removal train." Each of the inter-linked BMPs work in unison to remove pollutants by either different processes or as a result of repeated processes. For example, in sub-catchments 1, 2, 6 and 7, water quality inlets are utilized in unison with the water quality pond or vegetated dry basin. The water quality inlets serve as a pre-treatment mechanism removing course particulate materials and associated particulate pollutants (primarily by sedimentation) while the pond and vegetated basins remove finer sediments, nutrients and soluble pollutants (primarily by filtration and bio-uptake). When properly integrated, as has been accomplished for the Ferry Point project, the linkage of BMPs increases the overall efficiency of the stormwater management system (Horner et. al. 1994). As illustrated by the differences in projected loading with (Table 4) and without (Table 2) the implementation of the structural BMPs, the proposed combination of BMPs will significantly reduce the generation of pollutants and decrease the pollutant load to the East River.

In conclusion, the data indicate that on a gross scale a post-development increase in pollutant loading is projected for the Ferry Point project. However, with the implementation of the various BMPs, the pollutant load generated after the site's development will in fact be less than under existing conditions. As such, the development of the Ferry Point project is not expected to result in in a significant adverse impact to water quality for the above-identified pollutants.

## Discussion: Archaeological Sensitivity

### *Introduction*

Ferry Point Partners, LLC, has proposed the development of a major recreational facility at Ferry Point Park in the Bronx. The project parcel, approximately 222 acres, is situated on the east side of the approach of the Bronx-Whitestone Bridge and is currently undeveloped except for a NYC organic recycling and composting facility, informal dirt bike paths, an informal model airplane area, a ballfield, and a basketball court. In addition to the existing parkland, the project would encompass two unbuilt and undeveloped streets, parts of both Emerson Avenue and Schley Avenue. A project location map is attached as Figure 1 and a photograph of the site also follows.

An Environmental Assessment Statement [EA] for the Ferry Point Park project was filed by the New York City Department of Parks & Recreation on July 30, 1999 (CEQR # 99DPR006X). In a review of the EA (8/5/99), the Landmarks Preservation Commission [LPC] noted that the project parcel had 'No architectural significance.' It did note, however, that the parcel 'May be archaeologically significant' and they requested additional materials. Subsequent to the original EA filing, the project engineers and various consultants have revised the proposed action. These revisions, as they relate to potential archaeological sensitivity, are critical since they limit the total depth of project impact to within the existing twentieth century landfill overburden. The following review, prepared by Historical Perspectives, Inc., addresses the LPC concerns and establishes archaeological sensitivity in relation to the revised (9/22/99) proposed action for the Ferry Point Park project.

### *Sensitivity Assessment*

The LPC notification stated:

> LPC review of archaeological sensitivity models and historic maps indicates that there is potential for the recovery of remains from Native American occupation and human burials on the project site. Accordingly, the Commission recommends that an archaeological

P.O. Box 3037 • Westport, Connecticut 06880-9998 • 203-226-7654 • Fax 203-226-8376

documentary study be performed for this site to clarify these initial findings and provide the threshold for the next level of review, if such review is necessary (see CEQR Technical Manual 1993).

There is no question that much of the Bronx shoreline is considered archaeologically sensitive and the Ferry Point parcel falls within this general area.[1] LPC's determination is based, in large part, on three factors:

- New York Office of Parks, Recreation, and Historic Preservation and the New York State Museum Sensitivity Model/Evaluation
- New York City Landmarks Preservation *Archaeological Evaluation and Sensitivity Assessment of the Prehistoric and Contact Period Aboriginal History of the Bronx, NY* (Boesch)
- Proximity to St. Raymond's Cemetery

However, none of these factors is specific to the actual landmass within the bounds of the Ferry Point Park project. In order to evaluate the realistic cultural resource potential of the approximately 222 project acres and satisfy the concerns expressed by LPC, the following discussion will address these general evaluation factors in relation to site-specific subsurface conditions.

*New York Office of Parks, Recreation, and Historic Preservation and State Museum Sensitivity Model*

LPC's concerns may, in part, be founded on the sensitivity models established for other development projects in the Bronx, particularly the adjoining property, St. Raymond's cemetery. In 1993, when St. Raymond's Cemetery proposed a southerly expansion of its interment facilities, repositories of the New York Office of Parks, Recreation and Historic Preservation [NYOPRHP] and the New York State Museum were tapped for information relevant to prehistoric and historic sensitivity surrounding the cemetery lands (Boesch 1993). This report is on file at LPC. In standard Museum response policy, a USGS topo map of the St. Raymond's Cemetery area was annotated with information on prehistoric sites in the vicinity. See Figure 2.

Museum-reported archaeological resources are to be used as indicators of potential sites. However, many of these geographical placements are based on extremely vague descriptions and maps that date to the early 1900s. See Figure 3 for a 1922 source for geographical locations. Museum correspondence regarding these specific sites acknowledges this lack of preciseness. Please note the following Museum descriptions, taken from the 1993 study, as they relate to Figure 2 and Arthur C. Parker's 1922 map, Figure 3:

[1] Detailed archaeological analysis of this area of the Bronx, presenting both the prehistoric and historic resource history and potential, is on file at LPC and not duplicated in this discussion. See Boesch 1993, Historical Perspectives, Inc. 1986, 1987, and 1994, Greenhouse Consultants, Inc. 1988

|---|---|---|---|---|---|
| *7146* | *ACP Bronx no #* | *village* | *On Parker's Map, it is near his Bronx #3 (NYSM # 2825), but not described in #3* | *Flushing* | *A. C. Parker, 1922* |
| *2825* | *ACP Bronx # 3* | *early* | *extensive shell heaps; M. R. Harrington [MNH] believed [ca. 1915] it to be one of oldest along sound; on Parker map, site is just to east of a bay that does not appear on present USGS map.* | *Flushing* | *A. C. Parker, 1922* |

These vague descriptions and tentative placements make it impossible to precisely locate the prehistoric shell heaps and villages identified more than 75 years ago on a vastly different landscape. In fact, as can be seen on Figure 4, an earlier Museum-generated annotated map (1987) of the same Bronx shoreline based on the same reported data from the 1920s provides both a different scale and geographical placement for these early sites.

In addition, as the author of the 1993 report stated, the NYSM # 713 is placed erroneously on the USGS quad, indicating more sensitivity to a specific section of the Ferry Point Park land mass than is appropriate.

*LPC Sensitivity Model*

LPC's concerns may, in part, be founded on the sensitivity model established by their consultant, Eugene Boesch, in *Archaeological Evaluation and Sensitivity Assessment of the Prehistoric and Contact Period Aboriginal History of the Bronx, NY*. Boesch's research into the myriad of reports and maps that relate to archaeological discoveries resulted in a sensitivity assessment that more realistically interprets historic discoveries and places them on today's landscape. Boesch's model, based on the state files and LPC's files and on file at LPC, is also superimposed on the 1:24000 scale USGS Flushing quad map. (See Figure 5.)

This latest evaluation does not necessarily indicate the absolute presence of archaeological resources in Ferris Point Park; rather, it establishes those areas that might be sensitive for Native American resources if subsequent activities have not obliterated the earlier living surfaces. The LPC data base clearly places two prehistoric sites within the northwest edge of the project parcel and establishes sensitivity along the northwest edge of the project parcel. The LPC #s 8 and 10 are based on the early twentieth century reportings discussed above. They are also presented in detail in the

1993 Boesch study of St. Raymond's Cemetery [represented by #s 4 and 5 on Figure 5].

This sensitivity guide was not established on specific details from every discrete parcel along the shore but it does note through its cartographic conventions that a major portion of Ferry Point Park is a former marsh and that former streams, now filled, ran through the eastern sections of the park parcel.

*Proximity to St. Raymond's Cemetery*

LPC's concerns may, in part, be founded on the proximity to St. Raymond's cemetery. Numerous high-profile archaeological excavations over the past decade have clearly indicated the possibility of locating early cemetery interments outside extant cemetery fence lines. Although the more northerly St. Raymond's Cemetery plots [north of the Bruckner Expressway and removed from the project site] date to an earlier period, the LPC must have assurances that there are no historic interments outside the current limits of St. Raymond's that would be affected by the Ferry Point Park project actions.

The possibility of unidentified St. Raymond's interments within the Ferry Point Park property has already been field investigated and found to be non existent. In 1993, St. Raymond's expansion proposal necessitated an archaeological field investigation of the lands that abut the northwest limits of the park parcel. Also, land that abuts a section of Schley Avenue that is proposed for de-mapping was field tested and no historic-era burials were recovered.

It should be noted that the 1993 trench excavations to determine presence/absence of culture-bearing deposits did not proceed beneath the impact of St. Raymond's proposed interments, approximately 12 to 14 feet below current grade. Archaeological testing of Zones 3 and 4, immediately north of the proposed park, identified landfill at between 8.3 and 14 feet below grade.

Zone 3
Foote and Schley Avenue easements: landfill, 13 - 14 ft below grade; Ground water at 7.5 - 13 ft below grade

Zone 4
Abuts Hutchinson River Parkway: landfill, 8.3 - 13.2 ft below grade/over marsh deposits in some locations; Ground water at 5.5 - 11.1 ft below grade

The 1993 study did not recommend further testing for Zones 3 and 4.

[Note: Prehistoric burials have also been associated with St. Raymond's Cemetery. However, the 1922 notations on [Native American] burials and "shell-pits" in association with St. Raymond's Cemetery refer to the older St. Raymond's Cemetery grounds more than a mile north of Ferry Point Park.]

## Depth of Existing Landfill

As the LPC sensitivity model indicates, the vast majority of the Ferry Point Project is former marshland. The EA included a series of twentieth century aerial photographs (1951, 1954, 1959, 1962, 1982, and 1991) that graphically illustrate the former marsh landscape as it disappeared under a massive city-operated landfilling process. A copy of the 1951 aerial is attached as Figure 6.

Two series of soil borings have been conducted at Ferry Point Park, providing a subsurface profile of the depth of landfill and ground water below current grade. These combined results, from more than 15 landfill soil boring tests [B] and 36 hazardous materials tests [TP] conducted by TRC Environmental Corporation of Windsor, CT, provide the following profile.

- Fill depth below current grade is approximately 8 to 47 feet, with an average of approximately 18 feet. TP25, in the western edge of the parcel may have the most shallow landfill overburden at slightly over 7 feet below grade.
- Fill is deeper than the current water table[2] with two exceptions (the fill in test # B5 stops approximately 2 feet above water table and the fill in B1 is one foot above the water table); There does not seem to be any correlation between depth of fill and water table/ test # B6 has fill and water both at 18 ft.
- Water table ranges from 5 to 30 feet below grade, average is about 10 -12 feet below grade; the deepest water table at test # B9 was 30 feet below grade and the most shallow, test # B7, at 5 feet below grade.
- Five borings indicate yellow sand subsoil at approximate termination of fill; these are all located in areas of possible highest elevation prior to landfilling.
- No shellfish material noted. Pther materials founds: brick, nylon, glass, wood, ceramic, vinyl, plastic, etc.
- Only one boring # B1 has a distinct two foot layer of silty clay with organic materials, but at 4 ft below landfill and 3 feet below water table.
- Clay occurs often in substrata.

## *Project Impact*

Prehistoric archaeological sites have been discovered in this general area of the Bronx within the last 12 years. However, sites such as the Pugsley Avenue

[2] The lack of consistency in landfill depths is, in part, due to undifferentiated fill material and a fluctuating water table. However, it is also a reflection of the pre-twentieth century knoll-dotted landscape that was a result of the Pleistocene era. During the Pleistocene, contact stratified drift was deposited during the retreat of glacial ice. The sediment was laid down as the ice remained stationary for a while or from a large piece that broke off and eventually wasted away. The small hillocks were formed as the ice- covered sediment melted and the sediment collapsed around it.

"workshop" reported by Cohn (1988) are removed from the regulated shoreline and not deeply buried under landfill deposits. It is critical to approach the potential of the Ferry Point Park parcel within the limits of the proposed depth of disturbance.

As stated in the project EA of 7/3/99:

> The proposed public recreation center would include a waterfront park of approximately 19.5 acres (including a waterfront esplanade, walkways, kiosks, and a boathouse grill restaurant); a community park of approximately 7 acres (including active and passive recreational areas such as a ballfield, basketball court, and children's recreation area); and a comprehensive golf facility, and fine dining/banquet facility on approximately 195.5 acres.

The existing topography of the proposed recreational facility, including the golf course and community park, is virtually flat. In order to create interesting vistas, contours for the golf course, and usable lounging lawns, additional soils would be brought to the site and, in conjunction with site soils, contoured into a new topography.

Possible below-grade intrusions include landscaping, road constructions, infrastructure systems, an irrigation system, pilings for foundation supports, and artificial lakes. In addition, two buildings - the clubhouse and the banquet facilities hall - may have lower level rooms that would be partially below grade.

Current plans (9/22/99) are for all construction excavation activities, including buildings and contouring for lakes and the golf course, to occur within six feet of the current grade. Based on TRC. Inc.'s Hazardous Materials Study for the EA [Attachment G, Secton 4.0: Impact Assessment, 7/30/99], Chuck Utschig, of JWE Engineering (9/22/99), has stated that none of the proposed construction excavations and removal of soil would be allowed to reach below the existing "waste layer," which is the relatively shallow stratum of "garbage" within the landfill. The landfill overburden will not be penetrated and the even deeper interface of possible undisturbed, buried soil horizons and the landfill will not be disturbed.

### *Recommendations*

As proposed, the Ferry Point Park project would not impact any deeply buried potentially sensitive prehistoric soil levels. Unless project design plans are revised to include excavation impacts to depths below the interface of the landfill and natural soils, no further archaeological consideration is warranted.

Re: DEC No. 2-6006-00014/000013 (2-6006-00014/00016)
Permit Issuance - Solid Waste Management Facility (Tidal Wetlands)
Ferry Point Park Golf Course, Bronx, NY

Dear Ms Zias:

Enclosed are permits for the referenced facility. Please read all conditions carefully. Please provide a copy of the permit and all attachments to the document repository established for this project.

Special Conditions 28, 29, 32, 37, 38 and 39, among others, specify post permit submittals, please make a note of the submission deadlines. To assist the development of a deed restriction for the project site, Attachment A, to this notice contains draft language of the conditions to be specified in the restrictive covenant.

If you have questions on the specific solid waste management conditions, please contact Sam Arakhan at 718-482- 4894. If you have questions regarding marine resources issues and the development of the waterfront park contact Susan Maresca at 718-482-6464. If you have any other questions regarding the administration of this permit, please contact Michelle Moore at 718-4982-4967.

Sincerely,

John F. Cryan
Regional Permit Administrator

## DECLARATION OF COVENANTS AND RESTRICTIONS

**THIS COVENANT** made this __ day of _____, 2014, by the City of New York ("City"), a municipal corporation organized and existing under the laws of the State of New York, acting by and through the New York City Department of Parks and Recreation ("DPR") and having an office for the transaction of business 830 Fifth Avenue, New York, New York, 10021, and the New York City Department of Citywide Administrative Services ("DCAS"), having an office for the transaction of business at 1 Centre Street, New York, New York, 10007, in favor of the New York State Department of Environmental Conservation ("Department"), an agency of the State of New York, with offices at 625 Broadway, Albany, New York, 12233;

**WHEREAS,** DPR has jurisdiction pursuant to the New York City Charter over certain municipal parkland in the Borough and County of the Bronx, New York, known as "Ferry Point Park", which was the site of a former municipal landfill;

**WHEREAS**, pursuant to the New York State Environmental Conservation Law, Article 27, Title 7 and regulations promulgated pursuant thereto at 6 NYCRR Part 360, the Department has issued DPR a Solid Waste Management Permit (DEC Permit No. 2-6006-00014/00013-0)(the "Permit"), annexed hereto as Attachment A, to construct a Golf Course, Community Park and Waterfront Park (hereinafter "the Project") on the eastern portion of Ferry Point Park, a 222 acre parcel bounded by Bronx-Whitestone Bridge to the West, Balcom, Miles and Emerson Avenues to the East, Schley Avenue and St. Raymond's Cemetery to the North and the East River to the South (the "Site"), said parcel comprising Block 5583, Lot 100 and a portion Block 6522, Lot 1, as shown on the Bronx County Tax Map and more particularly depicted on the map attached hereto as Attachment B;

**WHEREAS,** the Permittee is authorized to import a total of 2,514,000 cubic yards of in-place fill material to the Site, which fill material shall consist of approximately 2,120,000 cubic yards of select exempt construction and demolition (C&D) debris for the shaping layer, and approximately 394,000 cubic yards of cover material, to be used in constructing the Project;

**WHEREAS,** Special Condition 17 requires the Permittee to implement a Groundwater Monitoring Program as described in section 4.5 of the Supplemental Engineering Report, Volume 1, dated October 15, 2013 (hereinafter the "Supplemental Engineering Report");

**WHEREAS,** Special Condition 26 requires the Permittee to perform monthly monitoring of the Landfill Gas Passive Venting Trenches for the duration of the Permit, and, thereafter, to monitor the Landfill Gas Passive Venting Trenches as described in the Supplemental Engineering Report, Volume 3, Appendix F;

**WHEREAS,** Special Condition 28 requires the Permittee, during the duration of the Permit, to inspect the Landfill Gas Passive Venting Trenches monthly to verify the integrity of the venting trenches and their mulch cover, and, thereafter, to maintain the Landfill Gas Passive Venting Trenches after the completion of construction of the Project, in the manner described in the Supplemental Engineering Report, Volume 3, Appendix F;

**WHEREAS,** Special Condition 29 requires the Permittee, until the completion of the Project, to conduct monthly monitoring of the depth of ground water in each piezometer installed at the gas venting trenches, and, thereafter, such piezometer monitoring shall be performed in accordance with the Supplemental Engineering Report, Volume 3, Appendix F, Section 6;

**WHEREAS,** Special Condition 32 requires the Permittee to execute and file a Department approved deed restriction, which shall run with the land in perpetuity, and shall recite and require compliance with the Permit's provisions as regards to the custodial care requirements described in the Supplemental Engineering Report, Volume 3, Appendix I;

**WHEREAS,** Special Condition 33 requires the Permittee to conduct bi-weekly monitoring of the On and Off-site Gas Monitoring Networks;

**WHEREAS,** Special Condition 34 requires the Permittee to maintain, and upgrade if required, the On and Off-site Gas Monitoring Networks during facility construction and after completion of the Project;

**WHEREAS,** Special Condition 35 requires the Permittee, upon Department approval of the Permittee's written post-construction certification report, to implement the custodial care plan described in the Supplemental Engineering Report, Volume 3, Appendix I;

**WHEREAS,** Special Condition 36 requires Permittee, should the Project be abandoned, to close, monitor and maintain after closure the entire 222 acre Site, in accordance with 6 NYCRR Sect. 360-2.15 as a landfill in operation since 2000;

**WHEREAS,** Special Conditions 17, 26, 28, 29, 33 and 34, require the installation, maintenance and operation of the Groundwater Monitoring Program, the Landfill Gas Passive Venting Trenches, the piezometers, and the On and Off-site Gas Monitoring Networks, on the perimeter of the site and off-site, for the purposes of monitoring groundwater and Landfill Gas and/or preventing Landfill Gas from migrating from the Site (hereinafter "Engineering Controls") said Engineering Controls being more particularly depicted on the map attached hereto as Attachment C.

**WHEREAS,** Special Condition 32 of the Permit requires the City of New York to execute and file a deed restriction for the real property beneath the site to run with the land in perpetuity, and that the deed restriction recites and requires compliance with the Permit's provisions as regards to Groundwater monitoring, the maintenance of Landfill Gas venting trenches, the piezometers, the On-site Landfill Gas Monitoring Network, including perimeter monitoring wells, the Off-site Landfill Gas Monitoring Network, and the criteria for abandonment of the site as specified in Special Condition 36 of the Permit;

**NOW THEREFORE**, pursuant to its terms, this covenant runs with the land and:

(1) requires the maintenance and operation of the Engineering Controls as set forth in Special Conditions 17, 26, 28, 29, 33 and 34 of the Permit;

(2) prevents modification or alteration of the Engineering Controls except as otherwise set forth in Special Conditions 17, 26, 28, 29, 33 and 34 of the Permit or in any subsequent written authorization by the Department or its successor agency;

(3) unless prior written approval by the Department or its successor agency is first obtained, there shall be no construction, use or occupancy of the Site that results in the disturbance or excavation of the Site which threatens the integrity of the Engineering Controls, or which results in unacceptable human exposure to contaminated soils;

(4) the owner of the Site shall not disturb, remove, or otherwise interfere with the installation, use, operation, and maintenance of Engineering Controls required by the Permit and the Supplemental Engineering Report, unless in each instance the owner first obtains a written waiver of such prohibition from the Department or its successor agency;

(5) the owner of the Site shall prohibit the Site from ever being used for purposes other than for the Project described in the Permit, without the express written waiver of such prohibition by the Department or its successor agency;

(6) the owner of the Site shall provide a periodic certification, prepared and submitted by a professional engineer or other environmental professional acceptable to the Department or its successor agency, which will certify that the Engineering Controls put in place are unchanged from the previous certification, comply with the Permit and the Supplemental Engineering Report, and have not been impaired;

(7) this Declaration is and shall be a covenant that shall run with the land and shall be binding upon all future owners of the Site, and shall provide that the owner and its successors and assigns consent to enforcement by the Department or its successor agency of the prohibitions and restrictions that the Permit requires be recorded, and hereby covenant not to contest the authority of the Department or its successor agency to seek enforcement;

(8) any deed of conveyance of the Site, or any portion thereof, shall recite, unless the Department or its successor agency has consented to the termination of such covenants and restrictions, that said conveyance is subject to this Declaration of Covenants and Restrictions;

(9) in the event that the Project is abandoned, requires closure, monitoring and maintenance of the Site as a landfill in operation since 2000, in accordance with 6 NYCRR Part 360-2.15 and Special Condition 36 of the Permit; and

(10) may be modified by mutual agreement of the City or its successors and the Department or its successor agency.

**IN WITNESS WHEREOF**, the undersigned have executed this instrument on the day(s) written below.

**PROJECT/FACILITY NAME:** Ferry Point Park Golf Course Construction

**PROJECT/FACILITY ADDRESS:** Eastern portion of Ferry Point Park, bounded by the Bronx Whitestone Bridge, Balcom, Miles and Emerson Avenues, Schley Avenue and the East River, Bronx County. Block 5583, Lot 100, Block 5622, Lot 1

**DESCRIPTION OF AUTHORIZED ACTIVITY:**

Construction of a Golf Course, Community Park and Waterfront Park on 222 acres of Ferry Point Park, requiring a total of approximately 2,514,000 cubic yards of material in-place volume. This material will be imported to the Site by truck and consist exclusively of: 1) recognizable and uncontaminated concrete or concrete products (including steel or fiberglass reinforcing rods that are embedded in the concrete), brick, soil, sand, gravel, and rock (hereafter referred to in this permit as select exempt construction and demolition debris) totaling approximately 2,120,000 in-place cubic yards for the shaping layer, and 2) approximately 394,000 in-place cubic yards of cover material. The imported material will be used to attain the final approved grades and contours.

All work associated with the authorized activity described above shall comply with all of the applicable provisions of 6 NYCRR Part 360 (Solid Waste Management Regulations), effective 29 September 1997. By acceptance of this permit, the Permittee agrees that this permit is contingent upon strict compliance with the ECL, all applicable regulations, and the General Conditions and Special Conditions included herein.

| **REGIONAL PERMIT ADMINISTRATOR:** John F. Cryan | **ADDRESS:** NYS Department of Environmental Conservation<br>47-40 21st Street, Long Island City, NY 11101 | |
|---|---|---|
| **AUTHORIZED SIGNATURE:** John F. Cryan | **DATE** May 21, 2014 | Page 1 of 17 |

**NOTIFICATION OF OTHER PERMITTEE OBLIGATIONS**

**Item A: Permittee Accepts Legal Responsibility and Agrees to Indemnification**

The Permittee has accepted expressly, by the execution of its application for the subject work, the full legal responsibility for all damages and costs, direct or indirect, of whatever nature and by whomever suffered, for liability it incurs resulting from activity conducted pursuant to this permit or in noncompliance with this permit and has agreed to indemnify and save harmless the State from suits, actions, damages, and costs of every name and description resulting from such activity.

**Item B: No Right to Trespass or Interfere with Riparian Rights**

This permit does not convey to the Permittee any right to trespass upon the lands or interfere with the riparian rights of others in order to perform the subject work nor does it authorize the impairment of any rights, title, or interest in real or personal property held or vested in a person not a party to the permit.

**GENERAL CONDITIONS**

**General Condition 1: Facility Inspection by the Department**

The subject facility, including relevant records, is subject to inspection at reasonable hours and intervals by an authorized representative of the Department of Environmental Conservation (the Department) to determine whether the Permittee is complying with this permit and the ECL. Such representative may order the subject work suspended pursuant to ECL 71-0301 and SAPA 401(3).

The Permittee must provide a person to accompany the Department's representative during an inspection of the subject facility when the Department provides written or verbal notification to the Permittee at least 24 hours prior to such inspection.

A copy of this permit, including all general and special conditions therein, all amendments thereto, and all documents referenced therein must be available for inspection by the Department at the project site at all times that activity associated with the subject work is occurring. Failure to produce a copy of such permit, conditions, amendments, or documents upon request by a Department representative is a violation of this permit.

Any sign provided by the Department with this permit must be protected from the weather and posted in a conspicuous location at the subject work site throughout the period during which any of the subject work occurs.

**General Condition 2: Relationship of this Permit to Other Department Orders and Determinations**

Unless expressly provided for by the Department, this permit does not modify, supersede, or rescind any order or determination previously issued by the Department or any of the terms, conditions, or requirements contained in such order or determination.

**General Condition 3: Applications for Permit Renewals or Modifications**

The Permittee must submit a separate written application to the Department for renewal, modification, or transfer of this permit, including but not limited to a change in facility operator. Such application must include any forms or supplemental information the Department requires. Any renewal, modification, or transfer granted by the Department must be in writing. The Permittee must submit a renewal application at least:

a) 180 days before expiration of permits for State Pollutant Discharge Elimination System (SPDES), Hazardous Waste Management Facilities, major Air Pollution Control (APC) and Solid Waste Management Facilities; and
b) 30 days before the expiration of all other permit types.

Submission of applications for permit renewal, modification, or transfer are to be submitted to:
NYSDEC Regional Permit Administrator, Region 2, 47-40 21 Street, Long Island City, NY 11101 (tel. 718/482-4997).

**General Condition 4: Permit Modifications, Suspensions, and Revocations by the Department**

The Department reserves the right to modify, suspend, or revoke this permit when:

a) the scope of the permitted activity is exceeded or a violation of any condition of the permit or provisions of the ECL and pertinent regulations is found;
b) the permit was obtained by misrepresentation or failure to disclose relevant facts;
c) new material information is discovered; or
d) environmental conditions, relevant technology, or applicable law or regulation have materially changed since the permit was issued.

**General Condition 5: Compliance with Other Regulatory Requirements**

The Permittee is responsible for obtaining any other permits, approvals, lands, easements, and rights-of-way that may be required for the subject work. The Permittee and its independent contractors, employees, agents, and assigns must comply with all applicable local, State, and federal regulatory requirements.

**General Condition 6: Permittee to Ensure that its Contractors to Comply with Permit**

The Permittee must ensure that its independent contractors, employees, agents, and assigns read, understand, and comply with this permit, including all General and Special Conditions herein, in general, and General Condition No. 5, above, in particular. Such persons must be subject to the same sanctions for violations of this permit as those prescribed for the Permittee.

**ADDITIONAL GENERAL CONDITIONS FOR ARTICLE 27 and 6 NYCRR Part 360 (Solid Waste Management Facilities)**

7. That if future operations by the State of New York require an alteration in the position of the structure or work herein authorized, or if, in the opinion of the Department it shall cause unreasonable obstruction to the free navigation of said waters or flood flows or endanger the health, safety or welfare of the people of the State, or cause loss or destruction of the natural resources of the State, the owner may be ordered by the Department to remove or alter the structural work, obstructions, or hazards caused thereby without expense to the State, and if, upon the expiration or revocation of this permit, the structure, fill, excavation, or other modification of the watercourse hereby authorized must not be completed, the owners, must, without expense to the State, and to such extent and in such time and manner as the Department may require, remove all or any portion of the uncompleted structure or fill and restore to its former condition the navigable and flood capacity of the watercourse. No claim shall be made against the State of New York on account of any such removal or alteration.
8. The State of New York must in no case be liable for any damage or injury to the structure or work herein authorized which may be caused by or result from future operations undertaken by the State for the conservation or improvement of navigation, or for other purposes, and no claim or right to compensation shall accrue from any such damage.
9. All necessary precautions must be taken to preclude contamination of any wetland or waterway by suspended solids, sediments, fuels, solvents, lubricants, epoxy coatings, paints, concrete, leachate, or any other environmentally deleterious materials associated with the project. Any creosote-treated lumber must be weathered for at least six months before it is brought to the subject work site.
10. Any material dredged in association with the work herein permitted must be removed evenly, without leaving large refuse piles, ridges across the bed of a waterway or flood plain, or deep holes that may have a tendency to cause damage to navigable channels, the banks of a waterway, water quality, sediment quality, or benthic habitat.
11. There must be no unreasonable interference with navigation by the work herein authorized.
12. If upon the expiration or revocation of this permit, the project hereby authorized has not been completed, the Permittee must, without expense to the State, and to such extent and in such time and manner as the Department may require, remove all or any portion of the uncompleted structure or fill and restore the site to its former condition. No claim shall be made against the State of New York on account of any such removal or alteration.
13. If granted under Article 36, this permit does not signify in any way that the project will be free from flooding.
14. If granted under 6 NYCRR Part 608, the Department hereby certifies that the subject project will not contravene effluent limitations or other limitations or standards under Sections 301, 302, 303, 306, and 307 of the Clean Water Act of 1977 (PL 95-217) provided that all of the conditions listed herein are met.
15. In accordance with Title 19, Part 600.4 (c) of the New York Code of Rules and Regulations, the Department hereby certifies that the action described and approved in this permit, if located within the Coastal Zone, is consistent to the maximum extent practicable with the policies and purposes of the New York City Waterfront Revitalization Program.

## SPECIAL CONDITIONS

### Site Work

1. All activities authorized by this permit shall conform to all documents supporting the original permit, DEC No. 2-6006-00014/00011, dated July 17, 2000 ,and modified October 18, 2002 , November 18, 2005 and December 27, 2005 as modified by the following:

- Technical Environmental Assessment for the Ferry Point Park Recreation Facility prepared by Allee, King, Rosen and Fleming dated February 11, 2002 and amended September 29, 2004;
- Geotechnical Engineering Study prepared by Langan Engineering and Environmental Services, Inc. dated July 2, 2002;
- Response to Request for Additional Information prepared by TRC Raymond Keyes Associates dated July 2, 2002;
- Fill Procurement Protocol shall be as per the Department letters dated May 21, 2001 and May 23, 2001 from John Nehila to Steve Kass;
- Ferry Point Park: Offsite Methane Monitoring-Bronx, New York prepared by AKRF, Inc., October 12, 2001;
- Landfill Gas (LFG) Passive Vent Trench Along Miles And Emerson Avenues Plan and Detail, V-1, Sheet 1 of 4 prepared by TRC with checked date 02/04/02 ;
- Landfill Gas (LFG) Passive Vent Trench Along Balcom, Miles And Schley Avenues Plan and Detail, V-2, Sheet 2 of 4 prepared by TRC with checked date 02/04/02 ;
- Landfill Gas (LFG) Passive Vent Trench Along Northern Property Boundary Plan and Detail, V-3, Sheet 3 of 4 prepared by TRC with checked date 02/04/02;

**SPECIAL CONDITIONS**
**ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities)**

- LFG Vent Trench and Piezometer Network Profile, V-4, Sheet 4 of 4 prepared by TRC with checked date 02/04/02;
- Landfill Gas (LFG) Passive Vent Trench Along Balcom, And Schley Avenues Plan and Detail, C-2, Sheet 1 of 1 prepared by TRC with checked date 07/20/01;
- Landfill Gas (LFG) Passive Vent Trench Along Balcom between Sampson & Dewey Avenues Plan and Detail, C-1, Sheet 1 of 1 prepared by TRC with checked date 03/09/01;
- Volume#1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associates, dated June 30, 2005. (revised)
- Volume #2, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associates, dated June 30, 2005.
- Settlement Evaluation and Long Term Monitoring Plan, Ferry Point Golf Course, Ferry Point Park, Bronx, NY, prepared by Langan Engineering and Environmental Services, Inc., dated January 26, 2005.
- Response to Department Comments prepared by TRC Raymond Keyes Associates, dated August 2, 2005 and by Langan Engineering and Environmental Services, Inc., dated June 30, 2005.
- Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, "Second Supplement to Engineering Report," prepared by TRC Raymond Keyes Associates, dated August 23, 2004.
- Site plans labeled "Ferry Point Park Public Recreational Facility Bulk Earthwork, Ferry Point Park Public Recreation Facility, Ferry Point Park, Bronx, New York" prepared by TRC Raymond Keyes Associates, dated April 22, 2005 (revised) consisting of drawings:

    - GC-2, G1 and G-2 dated 7/01/05 (last revised);
    - G-3, and G-4 dated 1/21/05 (last revised);
    - D-1 dated 7/1/04 (last revised);
    - D-2 dated 7/1/05 (last revised);
    - V-1, V-2, V-3 and V-4 dated 02/04/04 (last revised);
    - C-1 dated 3/09/01 (last revised);
    - C-2 dated 7/20/01;
    - SW-1.00 dated 4/13/04;
    - SW 1A.01 dated 2/18/04;
    - SW 1B.01 and SW 1b.02 dated 4/13/04;
    - Irrigation Design Phase 1 Ferry Point Park Approval Set, labeled "Ferry Point Park 0514-AS-R04-060704, Phase 1 Approval Set" dated 06/07/04 (last revised), sheets numbered 1, 2, 3 and 4 dated 5/22/03 and sheets numbered I, II and III dated 5/22/03

- Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, NY, Vol. 1 - 3 dated May 31, 2012 and last revised October 15, 2013.

**SPECIAL CONDITIONS**
**ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )**

2. Activities authorized by this permit include development of a golf course and parks, as well as the construction of associated structures, utility lines, gas venting and control systems. All aspects of the project must be constructed in accordance with the Department approved design plans, specifications and documents noted in Special Condition # 1. All physical aspects of the project including project location referenced in this permit shall be referred to as the "Site." All construction aspects of the permitted activities referenced in this permit shall be referred to as the "Project."

3. In accordance with "Item A" of the Notification of Other Permittee Obligations" found on page 2 of this permit, the Department in general accepts no liability for the structural integrity and/or the adequacy of the buildings and/or foundation designs of the proposed buildings or other structures associated with the development of the golf course. In addition, the Department specifically does not guarantee nor accept liability in regards to the measures proposed to prevent the subsidence of any buildings, foundations and other structures built on or adjacent to the Site, or to prevent the migration of explosive gas.

4. All operations at the Site shall occur Monday through Saturday during daylight hours, between sunrise and sunset, unless otherwise authorized by the Department.

5. All truck traffic entering and leaving the Site shall use only authorized truck traffic routes, and conform to the construction traffic management plans noted in Exhibit K of Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, New York, Engineering Report, prepared by TRC Raymond Keyes Associates, dated June 30, 2005 (revised).

a) All truckers shall receive written instruction on the truck access routes to and from the Site.

b) All trucks entering the site shall be tarped or sufficiently covered to comply with local and state highway regulations. The Site access and exit routes shall be maintained so that they are free from dust, dirt and debris resulting from the truck traffic.

6. Short-term settlement monitoring must strictly conform to the recommendations listed in the Settlement Evaluation and Long Term Monitoring Plan, Ferry Point Golf Course Ferry Point Park, Bronx, NY, prepared by Langan Engineering and Environmental Services, Inc., dated January 26, 2005. As construction progresses and long term plates are installed, short term plates do not need to be re-installed.

7. The long-term settlement monitoring must strictly conform to the recommendations listed in the Settlement Evaluation and Long Term Monitoring Plan, Ferry Point Golf Course Ferry Point Park, Bronx, NY, prepared by Langan Engineering and Environmental Services, Inc., dated January 26, 2005.

a) The long-term monitoring shall be performed for locations shown in Appendix H of the October 15, 2013 supplemental engineering report as described in Appendix I of the October 15, 2013 supplemental engineering report.

b) All monitoring points must be maintained in proper working condition. If any points are unable to be sampled for any reason, they must be repaired within two weeks of such detection and re-tested.

## Fill Importation

8. The Permittees are authorized to import a total of 2,514,000 cubic yards of in-place fill material to the Site. The fill material shall consist of approximately 2,120,000 cubic yards of select exempt construction and demolition (C&D) debris for the shaping layer, and approximately 394,000 cubic yards of cover material. The imported material shall be used on Site to attain the final approved grades and contours approved by the Department, and referenced on plans made a part of this permit.

a) The use of asphalt as fill material on the Site is prohibited.

b) The use of dredge spoils as fill material on the Site is prohibited.

c) There shall be no mechanical separation of steel and fiberglass reinforcing rods from concrete and concrete products at the Site.

d) No size reduction or material processing may occur on Site, except with earth moving equipment in the course of placement. However, the breakdown and removal of stumps and wood previously left on Site by the New York City Department of Sanitation (DOS) is permitted.

e) All solid waste material excavated from the Site shall be properly secured immediately, and then removed from the Site and legally disposed of within seven (7) days.

f) All unauthorized solid waste or fill material found on the Site shall be properly secured immediately, and then removed and legally disposed of within five (5) days of its discovery by Permittees.

g) All select exempt construction and demolition (C&D) debris for the shaping layer and the cover layer material must be free of all non-exempt C&D recognizable debris.

9. The quantification of all imported fill material shall be continuously tracked by both truck volume, and periodic topographic survey of the imported in-place fill volume. Since compacted in-place fill volumes will not equal truck volumes of fill, a 41.7 percent (41.7%) correction factor shall be applied for shaping layer material and a correction factor of 18 percent (18%) shall be applied for cover material. The correction factor for converting truck volume into in-place volume may be modified by the Department.

10. The Permittees must cease the importation of fill material if:

a) The final approved grades are attained prior to the permitted amount of fill material being imported;

b) 2,120,000 cubic yards of select exempt construction and demolition debris for the shaping layer, as measured by in-place fill volume determined through topographic survey, are accepted. All material imported to the Site is considered shaping layer material, unless testing determines otherwise; or

c) 394,000 cubic yards of cover layer material, as measured by in-place volume, are accepted.

**SPECIAL CONDITIONS**

**ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )**

11. Use of fill material from DEC registered construction and demolition debris processing facilities (DEC registered C&D facilities or registration facilities) requires written Departmental approval. Such requests must be submitted to the Department for approval not less than ten (10) business days prior to any proposed date for importation from the new locations. No fill material may be received from unapproved facilities or locations. DEC registered construction and demolition debris processing facilities (DEC registered C&D facilities or registration facilities) may be used to obtain select exempt construction and demolition debris for fill material to the Department for its approval prior to use. The subsequent transportation and use of fill material from other additional registration facilities requires written Departmental approval. Such requests must be submitted to the Department for approval not less than ten (10) business days prior to any proposed date for importation from the new locations. No fill material may be received from unapproved facilities or locations.

12. Select exempt construction and demolition debris to be used as fill material at the Site may be accepted from DEC registered C&D facilities as approved pursuant to Special Condition #11, provided that the facilities segregate and clearly mark each stockpile with a specific identification number, the date each stockpile was started and the date when it was sampled by the Permittees. The Department shall be notified by Permittees at least 24 hours before any sampling event at a DEC registered C&D facility. All sampling reports shall be transmitted to the Department or the IEM directly from the certified testing laboratory.

13. The Permittee shall be responsible for ensuring that cover layer material is procured from a DEC approved source, and it meets all permit specifications.

a) If cover layer material is manufactured, the soil used in its manufacture must not originate from any industrial sites, brownfield site, historical fill site or DEC registered C&D facilities.

14. The Permittee shall be responsible for ensuring that the shaping and cover layer materials meet sections 4.2.1 and section 4.3 of the October 15, 2013 Supplemental Engineering Report, Volume 1, as well as the following:

a) In order for select exempt construction and demolition debris material to be used on Site, it must be sampled both prior to acceptance and after the importation of each additional 10,000 cubic yards (in truck volumes). Each soil sample is to be analyzed for Toxicity Characteristic Leachate Procedure (TCLP), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and metals (including Resource Conservation and Recovery Act (RCRA) metals).

b) Cover layer material must be sampled prior to acceptance and after the importation of each additional 2,000 cubic yards (in truck volumes). Each soil sample is to be analyzed for the entire analyte list in the NYSDEC Technical and Administrative Guidance Memorandum (TAGM) 4046, total volatile organic compounds (VOCs), total semi- volatile organic compounds (SVOCs), pesticides and herbicides, polychlorinated biphenyls (PCBs), and metals (including Resource Conservation and Recovery Act (RCRA) metals).

c) The shaping layer must meet the following chemical limits:

i. Total carcinogenic SVOC levels (weighted average as calculated by formula provided in 10/25/06 letter from NYSDEC) must be less than 3 ppm by completion of construction; maximum carcinogenic SVOCs level from individual source must be 10 ppm or less. The following are the list of carcinogenic SVOCs that are subject to this 3 ppm limit: Benzo(a)pyrene, Dibenzo(a,h)anthracene, Benzo(a)anthracene, Benzo(b)fluoranthene, Indeno(1,2,3-cd)pyrene, Benzo(k)fluoranthene, and Chrysene.

ii. Total SVOCs must be less than 500 ppm

iii. Metals:

- Arsenic less than 28 ppm;
- Barium less than 2,000 ppm;
- Cadmium less than 20 ppm;
- Chromium less than 1,000 ppm;
- Copper less than 1000 ppm;
- Lead less than 400 ppm;
- Mercury less than 0.57 ppm
- Selenium less than 11 ppm
- Silver less than 100 ppm

iv. Asbestos for all layers must be 0.5% or less

v. Total sulfur for all layers must be 0.5% or less

vi. Total PCBs less than 10 ppm

vii. Total Pesticides less than 10 ppm

viii. VOCs (all individual analytes less than TAGM 4046)

d) The final placement of shaping and cover layer materials is subject to installation of a demarcation layer at locations where combined shaping and cover layers thickness are less than five (5) feet.

e) All shaping and cover layer material placed after the final placement of shaping and cover layer must meet the 6NYCRR Part 375 protection of public health restricted residential Part 375-6.8(b) SCOs.

15. The major components (greens, contours, heights and top soil) of the cover layer shall meet the Nicklaus Design Technical Specification, as noted in Exhibit C of the June 30, 2005 Engineering Report, and as follows:

- Greens - Greens mix imported to the site shall be tested as per material testing requirements. Fertilizer and soil amendments may be applied on the greens mix after spreading to construction specifications and finally grassed, as per the specifications provided by the agronomist.
- Topsoil - Topsoil imported shall be consistent with native topsoil, and shall be free of rock and debris greater than three quarters of an inch, as per Exhibit C of the Engineering Report. Soil amendments, fertilizer applications and seed may be applied to tee, fairway and rough areas, as per Exhibit C of the June 30, 2005 Engineering Report.

16. The Department may conduct joint sampling or take split samples as necessary for verification purposes.

**Groundwater**

17. The Permittee shall implement a groundwater monitoring program as described in section 4.5 of the Supplemental Engineering Report, Volume 1, dated October 15, 2013.

**Fill Progression Monitoring**

18. The Permittee shall place grade stakes indicating elevations for proposed final grades of fill and cover material.

19. The Permittee shall place benchmarks throughout the Site, in a manner acceptable to the Department, for the purpose of periodically measuring and surveying fill elevations. Benchmarks are to be maintained at all times. If it becomes necessary, they shall be repaired promptly.

**Project Completion Schedule**

20. The project shall progress according to the Construction Schedule provided in Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associates, dated June 30, 2005 (as revised), Exhibit A, and as updated in section 3.1 of the Supplemental Engineering Report dated October 15, 2013. The effective date for implementation of the construction schedule is the effective date of this permit.

21. In accordance with the approved plan in Special Condition #1, placement of fill material in each section of the Site shall not exceed the designed and approved final contours for each section.

22. Only cover material may be stockpiled in a section upon completion of the placement of fill material for the shaping layer in that section as per design calculations. In addition, cover material may be stockpiled in a section where the completion of fill placement has not occurred, if such stockpile is segregated and secured from construction and demolition debris used for the shaping layer.

23. Upon completion of filling operations to approved grades in a section, the Permittees shall commence the rough shaping and placement of cover material, and the installation of drainage, irrigation and utilities, as per Construction Schedule noted in Special Condition # 20. Prior to placement of this cover material, Permittee must comply with the requirements of Special Condition # 15(d).

**Independent Environmental Monitor**

24. An Independent Environmental Monitor (IEM), accountable to the Department, shall be retained by the Permittee to provide environmental oversight of all activities authorized by this permit for the duration of its permitted term, including, but not limited to, the quantification, importation and placement of fill, and the monitoring of the Site.

SPECIAL CONDITIONS

ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )

a) It shall be the IEM"s responsibility to provide notice of any deviation from the activities authorized by this permit and any deviation from New York State Environmental Regulations (6NYCRR Part 360) to the Department immediately, but in no event later than 24 hours after such deviation is detected. This notification must include the date and time of the potential non-compliance, the nature of the non-compliance, any corrective action, and any additional measures the IEM will be undertaking to track the issue until corrected. Should the IEM be uncertain as to whether such a deviation has occurred, the matter shall be promptly reported to the Department for a determination. For the purposes of this permit, a deviation(s) shall mean any of the following:

   i. An apparent violation of any condition of this permit;

   ii. An apparent violation of Federal, State or Local Law;

   iii. A material difference between construction or monitoring data obtained by the Permittees or their consultants, and that obtained by the IEM;

   iv. Any receipt of fill that does not meet the specifications authorized in this permit;

   v. Any receipt of fill from a site not authorized under the permit or by the Department.

   vi. Any condition, activity or occurrence that may endanger or pose a threat to public health, safety or the environment.

b) Notwithstanding any other reporting this permit requires, the IEM shall submit a detailed written report to the Department no less frequently than every three months detailing the IEM"s activities at the Site, the estimated total volume of fill material (including cover material) received during the reporting period based on truck volume, the total volume of fill in place at the Site, the percentage of filling to final grades, and the number(s) of trucks prohibited from entering the Site. The report also shall summarize any site meetings amongst the Permittee, its consultants or others, verify that all samples taken and monitoring done at the Site by the Permittee or consultants conform to this permit, detail any substantive change in the condition of the Site or project, fully explain any deviations occurring during the reporting period and their disposition, and describe any other occurrence, circumstance or condition that may have a bearing upon the safe and environmentally sound operation of the Project or Site.

c) The IEM must be approved by the Department prior to the finalization of any contractual agreement with the Permittee, and the initial receipt of any fill material at the Site.

d) The continued retention, discharge, or replacement of the IEM shall be at the sole discretion of the Department. The Permittee waive any right to seek judicial review of the Department's exercise of that discretion. The Permittees must fully pay all invoices and bills from the IEM within sixty days of submission. The IEM or its Department approved representative shall be present on Site whenever it is open. Under no circumstances shall Project activities, including the receipt or management of fill, take place while the IEM or its designated representative is absent from the Site.

**SPECIAL CONDITIONS**
**ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )**

e) The Department shall have access to any information obtained by the IEM at any time. The IEM shall keep all information including, but not limited to, fill records, inspection reports, field notes, monitoring data, graphics, databases, financial records, minutes of meetings and other information in a form approved by the Department

f) The IEM, if an individual, shall possess a New York State Professional Engineer license. If an engineering firm serves as the IEM, the firm must provide an employee of that firm who is a New York State licensed professional engineer to perform all functions and certifications noted in Section 1.1 of the Engineering Report referenced in Special Condition No. 1 above. In addition, the IEM shall:

i. monitor all aspects of the Permittees" fill operations at the Ferry Point Park ("FPP") facility;

ii. have unrestricted access to all personnel employed by the Permittee at the FPP facility, and to all files and records maintained by the Permittees at the FPP facility pursuant to this permit;

iii. inspect the proposed sources of fill, review the documentation about the sources of the material, including without limitation, any off-site sampling, and certify as to the acceptability of the material for use at the Site, in accordance with the criteria specified in the Engineering Report, Section 2. The IEM shall notify the Department at least 24 hours before any on-site sampling;

iv. visually inspect each truckload of imported fill material at the Site, and undertake reasonable verification activities including directing, where appropriate, verification sampling, analysis and certification by the IEM on a Project specific tracking form that it meets criteria for acceptable fill at the Site;

v. inspect each truckload of material upon its dumping on Site with a Photo-Ionization Detector (PID).

vi. prohibit any truck from leaving the dumping area before the load has been inspected, and the manifest signed by the IEM. If any load is rejected, the rejected fill material shall be reloaded onto the same truck immediately and legally transported off-site. However, if the rejected fill material is a DEC regulated solid waste or hazardous waste, it must be segregated immediately and secured on-site, until it is removed by a DEC permitted hauler for appropriate disposal. Such regulated or hazardous waste must be removed from the Site within 3 days of its discovery;

vii. monitor the off loading of all material at the unloading station. No truck shall be allowed to off load unless the IEM is present. Such truck shall only be allowed to leave the station after the load is tested and found acceptable.

viii. certify that the sampling of material at the project Site conforms to the permit requirements, and review the results of all laboratory tests;

ix. notify the Department daily about the receipt of unacceptable material or any violations of conditions set forth in this permit;

x. maintain files on Site of fill sampling data, site histories, and internal manifest (tracking) forms;

xi. report and certify to the Department that the on-site gas well monitoring has been conducted as required by this permit. Notify the Department immediately if levels exceed 25% of the lower explosive limit (LEL) in any gas monitoring well;

xii. certify that: (a) all grades of the shaping layer of a section are correct prior to the placement of cover material on that section; (b) a minimum of two feet of fill material covers the existing municipal solid waste layer; and (c) the final cover layer meets the appropriate specifications of the Engineering Report noted in Special Condition #1;

xiii. during fill delivery and earthwork, submit bi-weekly reports to the Department summarizing all Site activities set forth by this permit. Each report shall provide details of all rejected fill material, quantify the amount of material imported onto the Site using truck volumes, and the results of all on-site gas monitoring for that period;

xiv. review the final post-construction report and provide comments to the Department on whether the fill operation was performed in accordance with the permit documents and including any deviations thereof. These comments must be submitted by the IEM to the Department within sixty (60) calendar days of the receipt of the final post construction report, certify that the fill operation was performed in accordance with the permit documents. The certified post-construction report must be submitted by the IEM to the Department within sixty (60) calendar days after the completion of the earthwork portion of the Project;

xv. report all operational upsets, emergencies, unusual circumstances (including, but not limited to, unauthorized entries, security breaches, equipment breakdowns, fires, thefts, acts of vandalism, and on-site accidents) to the Regional Solid Waste Engineer by telephone (at 718/482-4996) within 24 hours of the occurrence, and in writing within 3 business days advising the engineer of the nature of the event, and providing a description of how the event was handled.

**Gas Venting Trench**

25. During the duration of this permit, the Permittee shall inspect the gas venting trench monthly to verify the integrity of the venting trench and its mulch cover. The Permittee shall maintain the gas venting trench at all times, and promptly repair any soil washouts of the mulch cover, as necessary. If any portion of the venting trench or mulch cover is found in need of repair, this fact must be reported to the IEM immediately and all necessary repairs must be made within two weeks of discovery.

**SPECIAL CONDITIONS**

**ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )**

(SC 25 continued) In addition, the mulch cover shall be replaced, at a minimum, every spring to maintain the effectiveness of the gas venting trench. The Permittee shall maintain the gas venting trench after the completion of construction of the golf course in the manner described in the Supplemental Engineering Report, Volume 3, Appendix F.

26. Monthly monitoring of the gas venting trench shall continue for the duration of the permit.

27. **As required by the Custodial Care Plan**: Gas venting trench inspection reports shall include the inspection date, the name of inspector, and a description of repairs, monitoring results and maintenance performed. A log of these self-inspections must be maintained including the dates, times and results of the inspections.

**Piezometers**

28. The Permittee shall conduct monthly monitoring of the depth of ground water in each piezometer installed at the gas venting trench, until the completion of the construction of the golf course. All readings shall be submitted to the Department in a monthly report.

a) **As required by the Custodial Care Plan**: Post-construction piezometers monitoring shall be performed in accordance with the Supplemental Engineering Report dated October 15, 2013, Volume 3, Appendix F, Section 6.

29. Within sixty (60) days of receipt of this permit, the Permittee shall submit a Response Action Plan to the Department. This Plan shall set forth the measures to be implemented by the Permittee, if the piezometer readings indicate that the groundwater table has dropped below the depth of the gas venting trench during the post construction monitoring period.

30. The Permittee shall sample the perimeter gas monitoring wells #0, #1A, #1 to #3, #5 to #12, and #14 to #18, and the on-site monitoring wells #13 and #19 on a bi-weekly basis to detect any explosive gas migration. Copies of the bi-weekly monitoring field notes shall be electronically mailed to the Department within 24 hours after the sampling event and a copy of this report shall be submitted to the Department within 3 business days and reported to the IEM immediately and all necessary repairs must be made within two weeks of discovery.

31. All perimeter gas monitoring wells should be tested at least on a bi-weekly basis. However, if any individual monitoring point has a bi-weekly reading that equals or exceeds 100% LEL or three consecutive bi-weekly reading are greater than 25% LEL, a modified methane gas action plan shall be implemented by the Permittee. Such plan shall require, at minimum, weekly testing of the individual monitoring point(s) with the elevated readings. The Department also may require any additional measures it deems necessary. Any individual point under the modified methane gas action plan may return to the regular bi-weekly monitoring schedule, when three (3) consecutive weekly readings are all less than the 25% LEL action level.

SPECIAL CONDITIONS

ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )

**Deed Restriction**

32. Within thirty (30) days of the date of the issuance of this permit, the Permittee shall submit a draft Deed Restriction to the Regional Permit Administrator. The deed restriction, which shall run with the land in perpetuity, shall recite and require compliance with this permit's provisions as regards to the custodial care requirements described in the Supplemental Engineering Report dated October 15, 2013, Volume 3, Appendix I. The deed restriction must be filed within six (6) months of the issuance date of this permit.

**Off-site Gas Monitoring Network**

33. The Permittee shall conduct bi-weekly monitoring of the Off-site Gas Monitoring Network. A copy of the bi-weekly monitoring field notes shall be electronically mailed to the Department within 24 hours, and a copy of the monitoring report shall be submitted to the Department within 3 days of the completion of each round of monitoring.

a) **As required by the Custodial Care Plan**. Each bi-weekly monitoring report shall include the geoprobe monitoring point(s) installed on or near Buttrick, Schley, Balcom, Miles and Emerson Avenues, as described in the methane monitoring reports referenced in Special Condition #1 of this permit.

34. The Permittee shall maintain, and upgrade if required, the Off-site Gas Monitoring Network during facility construction and after completion of the golf course.

a) The Permittees may request Departmental approval to substitute for all, or part of, the Off-site Gas Monitoring Network by installing geoprobe soil gas monitoring points of a placement and design suitable to the Department. Such points must be at linear intervals no greater than 50 feet (on 50-foot centers) along either segments of the perimeter boundary of the gas venting trench or the drainage ditch.

b) If any point used for off-site gas monitoring is found to require repairs, this fact must be reported to the IEM immediately and all necessary repairs must be made within two weeks of discovery. A copy of the off-site gas monitoring well results also must be sent to the New York City Housing Authority.

c) All off-site gas monitoring points shall be tested on a bi-weekly basis. If any individual monitoring point has a bi-weekly reading that equals or exceeds 100% LEL, or three consecutive bi-weekly readings that are greater than 25% LEL, sampling of that point shall be done weekly. Any individual point under the later modified methane gas action plan may return to the regular bi-weekly monitoring schedule, if there are three (3) consecutive weekly readings all less than the 25% LEL action level.

d) None of the requirements specified in Special Conditions Nos. 26 through 34, 36 (a) through (c) may be terminated without written approval from the Department.

SPECIAL CONDITIONS

ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )

**Ferry Point Park East Post Construction Custodial Care Plan ( Custodial Care Plan)**

35. Upon Department approval of the Permittee's written post construction certification report, Permittee shall implement the Custodial Care Plan described in Supplemental Engineering Report dated October 15, 2013, Volume 3, Appendix I, as referenced in Special Condition No. 1.

**Project Abandonment and Environmentally Sound Closure**

36. Should the Project be abandoned, the entire 222 acre Site must be closed, monitored and maintained after closure in accordance with 6 NYCRR Sect. 360-2.15 as a landfill in operation since 2000.

a) Within one hundred and twenty (120) days after notice from the Department that the Site has been deemed abandoned, the Permittee shall implement the custodial care plan contained in the Supplemental Engineering Report dated October 15, 2013, Volume 3, Appendix I, as referenced in Special Condition No. 1.
b) For the purpose of this permit, abandonment shall mean any of the following:
    i. Filling operations authorized under this permit cease for a period of 12 consecutive months, as provided in 6NYCRR sect 360-1.11(f);
    ii. Failure to complete the Project within 12 months of the issuance of this permit, as determined by the Department, by the expiration date of this permit; or
    iii. Termination of this Project as a result of enforcement action by the Department or another government agency for non compliance with this permit, or with applicable Federal, State or Local Law.
c) The terms of this Special Provision shall govern, if in conflict with the terms of General Condition No. 12.

**Waterfront Park**

37. Within one hundred and eighty (180) days of the effective date of this permit, provide three hard copies and one copy on CD of revised design plans for the Waterfront Park, to the Regional Permit Administrator. Include in this submission details on the extent of adjacent area and tidal wetlands encroachment, water balance, proposed mitigation (including mitigation for the pool barge), implementation plans and staging.

SPECIAL CONDITIONS

ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )

## Submittals

38. Within sixty (60) days of completion of the filling operation on the Site and construction of the earthwork portion of the Project, the Permittees shall provide:

a) as-built drawings of the Project, signed by a professional engineer licensed in New York State for DEC's approval. The post construction as built drawings shall, at a minimum, include detailed cross-sections illustrating the depth of fill placed and location of all utilities and associated structures, road ways, demarcation layer and storm water drainage control structures for the Project. The as-built plans also shall include the location of all monitoring and control systems and devices (including gas control and monitoring, water quality and elevation monitoring and settlement monitoring).

b) a written post-construction certification report for review and approval by the Department and certification by the Independent Environmental Monitor. This report shall include approved "as-built" drawings demonstrating that the earthwork and filling operation was accomplished in accordance with the Department approved plans and this permit. If as-built drawings are not approved by DEC within 120 days of the completion of the filling operation, the Site is deemed abandoned, as per Special Condition No. 36. This report and the as-built drawings cannot be done or submitted by the IEM.

39. Within ninety (90) days of approval of the post construction certification report, the Permittee shall submit an amended subsurface operations plan which includes relevant post construction storm water pollution prevention maintenance documentation as per the State Pollution Discharge Elimination System (SPDES) general permit for storm water discharges from construction activity.

40. Within sixty (60) days of the effective date of the permit, the Permittee shall submit a full size (24 inches by 36 inches) scaled, signed and sealed drawing showing construction of the irrigation lake passive venting system.

41. Thirty (30) days after approval of the construction certification report, the Permittee must provide to the Regional Solid Waste Engineer, a revised Table 6-1 (noted in the engineering report referenced in Special Condition #1 above).

42. Prior to the installation of any sub slab depressurization systems for onsite buildings, the Permittee must secure written approval of these systems from the NYS Department of Environmental Conservation and the NYS Department of Health.

43. All reports and written submissions shall be sent in duplicate to the regional office of the DEC, with an additional copy to DEC Central Office, and another copy to the document repository as noted below. Each submission shall have a transmittal page, which references the DEC permit number and the relevant Special Condition number.

SPECIAL CONDITIONS

ADDITIONAL SPECIAL CONDITIONS FOR ARTICLES 27 and 6 NYCRR Part 360 ( Solid Waste Management Facilities )

1-1 Ferry Point Park Project Area Map..... 1-3

# 1 Introduction and Purpose

The Ferry Point Park East Post Construction Custodial Care Plan (FPCCCP) has been prepared to comply with the requirements of the New York State Department of Conservation (DEC) 6NYCRR Part 360 Permit No 2-6006-00014/00013-0 (see attached) (hereafter referred to as the "2013 Permit") and applicable regulations and conditions as previously discussed and agreed upon between DEC and the New York City Department of Parks and Recreation (DPR). See the attached Figure 1-1 of Ferry Point Park. The purpose of this document is to define the post construction criteria applicable to the operation, monitoring and maintenance of the environmental protection systems installed as part of site wide development of Ferry Point Park East. DPR agrees to a 5-year rolling schedule whereby, at the end of a five year term, DPR may demonstrate that the routine operation and maintenance for the end use of the site, i.e., the golf course, meets the performance criteria established in the 2013 Permit, and petition to modify or terminate the FPCCCP. The general procedures for the termination of monitoring activities or abandonment of infrastructure are detailed further in the FPCCCP.

As built drawings and a written post-construction certification report for NYSDEC review and approval and certification by the IEM will be prepared within 60 days of completion of the filling operation on the Site and construction of the Earthwork portion of the Project. Therefore the as-built drawings and post construction certification report have not been provided in this FPCCCP.

As construction activities are on-going, relevant changes and additions associated with final construction will be incorporated into an amended Sub-Surface Operations Plan. As part of this addendum, DPR will also submit the relevant post construction Storm Water Pollution Prevention maintenance documentation as per the SPDES (State Pollution Discharge Elimination System) General Permit for Stormwater Discharges from Construction Activity. These amendments to the FPCCCP will be submitted to DEC within 90 days of the approval of the post construction certification report by DEC.

Post construction monitoring and maintenance of the Golf Course, Community Park and Waterfront Park will be the responsibility of DPR. At this time DPR has entered into a contract with a golf course concessionaire, Trump Ferry Point LLC, to implement post-construction care necessary to maintain the golf course for operational purposes. Golf course maintenance and operations exclude those requirements specific to post construction monitoring and maintenance of existing

environmental conditions and infrastructure as installed by DPR and specifically defined in this plan as being Landfill Gas systems, Groundwater monitoring and Long Term Settlement Plates. DPR's Maintenance & Operations division or an appointed representative will also implement the operational and maintenance post construction requirements associated with the Community and Waterfront Parks.

## 1.1 Document Organization

This FPCCCP provides descriptions – either within the document or by reference – of systems, facility management, maintenance operations, environmental monitoring and the construction schedule.

This FPCCCP is organized into three sections summarized below:

The first section provides the document overview, organization, scope and applicable permitting basis.

The second section provides the post closure operational details for the relevant site-wide compliance systems and components. This includes site background, information regarding the specific systems and components related to the specific closure parameters and relevant regulatory processes necessary to facilitate the FPCCCP.

The third section addresses various closure and post closure issues including end use, construction schedules, and the post construction custodial care plan.

## 1.2 Scope of Document

As part of the overall permit submittal, the FPCCCP provides an overview of the systems within Ferry Point Park East as they will exist following the conclusion of construction at the site. In order to avoid duplication, design drawings and details, discussed within the FPCCCP that are referenced and included within the overall permit submittal are noted as such within the document. These drawings, bound separately under the permit application and referenced herein, have been compiled from various source documents.

The respective drawings serve as a basis for management of the site during the post-construction period. However, as per the 2013 Permit, these drawings do not represent actual as-built conditions. In addition, the terms used within the FPCCCP are consistent with the list of preferred terms contained in the overall permit application.

**SOURCE**: ESRI 2012; Ecology and Environment, Inc. 2013; Ferry Point 2013.

## 1.3 Compliance Basis

As described in Section 2, Ferry Point Park East has an anticipated short operating life, as it has been designed and operated not for the purpose of disposal, but as a golf course and public park. Therefore, the scope of the FPCCCP is not congruous with facilities that have been operating as solid waste facilities.

The FPCCCP is prepared in accordance with the applicable regulatory requirements as they specifically relate to the Permit. The FPCCCP has been developed in conformance with applicable regulatory requirements of Article 27, Title 7, 6NYCRR Part 360 pertaining to construction and demolition material transfer operations as they relate to the infrastructure developed at Ferry Point Park East.

During 2010, fill material from one particular source was brought on-site and placed in seven different stockpiles. The material was believed to be in conformance with permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. On January 10, 2011, DPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to this fill material.

Specific requirements within the Consent Order as they pertain to post construction operations are as follows:

**Consent Order No R2-20100521-172 (Appendix I.1)**
" *Attachment "A" Proposed Handling of Ferry Point Park Soil Stockpile, Item 6, Once the asphalt top course is installed, the asphalt surfaces of the clubhouse and maintenance facility parking lots will be inspected during April and October every year by a licensed professional engineer ("engineer") who is registered to practice in New York State. Within thirty days (30) days of such inspections, the engineer will submit to the Department a stamped and certified written detail report, including photo documentation, regarding the condition of the asphalt surfaces and their adequacy, including photo documentation, regarding the condition of the asphalt surfaces and their adequacy to effectively function as covers. A description of any needed repairs will be included in the engineer's report.*

*Item 7, Any repairs deemed necessary by the engineer must be completed by New York City Department of Parks and Recreation ("NYC Parks") within fifteen (15) days of the notification by the Department to NYCDPR to begin such repairs. A certification, including supporting written and photo documentation must be submitted by NYC Parks within fifteen (15) days after completion of repairs."*

# 2 Overview of Site Wide Systems and Components

Ferry Point Park East is bound by the Bronx-Whitestone Bridge to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south.

The Site, which comprises the eastern portion of Ferry Point Park, historically was largely unused and undeveloped. The project site is a former landfill that accepted municipal solid waste from before 1951 to the 1960's, and was closed and covered in the mid-1960's, with additional closure operations conducted in the late 1980's. The project site contained an organic recycling and composting facility (operated by DPR) that was located in the northwestern portion of the project site, informal dirt bike paths, an informal model airplane area in the western portion of the project site, and a ballfield and basketball court located on the northeastern portion of the project site.

The proposed Project includes three major elements (Waterfront Park, Community Park, and comprehensive golf facility) that together constitute a new regional park. The site map is attached as Figure 2-1 of the October 2013 Supplemental Engineering Report (pg 2-5).

Numerous systems have been constructed and installed at Ferry Point Park East that will continue to serve operational and environmental functions during the site closure and post closure period. Each of these systems has specific components, activities and controls. The purpose of this section is to describe the primary function intended to be served by each system and the components that comprise the system as they relate to closure and post closure activities.

Each of the relevant systems listed below have a specific compliance aspect which includes the following:

- **Final Cover and Drainage System (as applicable)**
- **Landfill Gas Control System**
- **Long Term Settlement Monitoring System**
- **Groundwater Characterization System**

## 2.1 Final Cover System

The overall function of the final cover system is to provide a clean barrier of one foot of uncontaminated soil (cover material) over a minimum of one foot of shaping material in designated passive recreation areas and a minimum of two feet of cover material over shaping material in designated active recreation areas. In areas where an impermeable cover system (e.g. asphalt) is in place no cover material or demarcation layer is present. The final cover system is dependent on the park design typology and use defined further below. Final cover design and construction for Ferry Point Park East are composed of the following common components in accordance with the 2013 Permit.

1. The Topmost Layer consists primarily of vegetated cover material throughout the park may also consist of impermeable asphalt or gravel materials, concrete or paver systems. Within the context of this FPCCCP, the topmost cover system is defined as that system which is used to stabilize the Barrier Protection Material (BPM).

2. The BPM layer or cover material consists of clean soil meeting permit requirements for cover material at a depth of one foot for passive recreation areas and two feet for active recreation areas.

3. The Surface Water Drainage System, where applicable, is constructed to protect the final cover system from the peak discharge based on a rainfall intensity of a 24-hour, 25 year storm event.

4. The Demarcation Layer, where applicable, is placed to provide a physical visual separation between the BPM which is underlain by select exempt Construction and Demolition (C&D) fill material and existing landfill and cover material. This item provides a visual warning against unintended penetration into the underlying C&D material layer. The Demarcation layer will be Guardian Safety Fence, as manufactured by Tenax ® Corporation, Baltimore, Maryland, or the 3T Product T820A as manufactured by 3T Products, LLC, Dalmatia, Pennsylvania, or approved equal.

Infiltration into the BPM is minimized by means of final grading. Infiltration that does enter the BPM is either released back into the air through evapo-transpiration or collected and diverted through the drainage layer (if used) and discharged to a system of catch basins or detention ponds located throughout the site.

As defined in the 2013 Permit documentation, minimum and maximum slopes combined with drainage elements are used to prevent ponding and ensure slope stability.

The BPM is placed in a manner that produces a well graded mass. The material is and will be constructed in a horizontal layer of twelve (12”) inches or (24”) in depth extending across the entire area of fill. The material is and will be placed

and distributed so that there will be no pockets of uniform size solid material. Hollows and depressions which develop during the process of rolling and compacting are filled with acceptable material and the subgrade is compacted again. This process of filling and compacting is repeated until no depressions develop. After compacting, the area must be in a uniformly compacted, smooth, dense, true, firm, satisfactory, and evenly finished condition, free of compaction planes, irregularities, voids, ridges, or loose material.

### 2.1.1 Final Cover Systems by Park Typology

#### 2.1.1.1 Community Park

The Community Park is classified as an active recreational facility and therefore requires a minimum of twenty four (24) inches of BPM per the New York State Department of Health (NYSDOH) determination regarding Ferry Point Park on August 2, 2006 and a further determination by NYSDEC staff on July 28, 2009.

*Excerpt from NYSDOH August 2, 2006 determination:*
*"Additionally, areas that are considered "Active Recreation" pursuant to New York State Brownfield Cleanup Program Technical Support Document, Section 3.0, will contain a minimum of twenty four-(24) inches of cover material that meets or exceeds NYSDEC TAGM 4046 guidelines for soil. In addition to cover material, a demarcation barrier will be used to divide the final cover fill from the existing landfill capping material."*

*Excerpt from July 28, 2009 NYSDEC Correspondence:*
*"…All other areas, that are not covered with a building or other acceptable impermeable cover system, including the …"Community Park" area are deemed active recreational areas that must be covered with at least two feet of soil over a demarcation layer."*

Community Park Final Cover System

1. Topmost Layer: Vegetated cover material or impermeable cover system.
2. BPM layer or cover material: 24" of topsoil meeting permit requirements for cover material at a depth of two feet in areas not covered with a building or impermeable material.
3. Demarcation Layer: The Demarcation layer utilized is a Guardian Safety Fence, as manufactured by Tenax ® Corporation, Baltimore, Maryland, or the 3T Product T820A as manufactured by 3T Products, LLC, Dalmatia, Pennsylvania, or approved equal.

### 2.1.1.2 Waterfront Park

1. Topmost Layer: Vegetated cover material or impermeable cover system. This topmost cover system throughout the park is primarily vegetative but may also consist of asphalt or gravel materials, concrete or paver systems.
2. BPM layer or cover material: consists of clean soil meeting permit requirements for cover material at a depth of one foot for passive areas and two feet for active areas.
3. Demarcation Layer: where applicable as determined by NYSDOH, the Demarcation layer will be Guardian Safety Fence, as manufactured by Tenax ® Corporation, Baltimore, Maryland, or the 3T Product T820A as manufactured by 3T Products, LLC, Dalmatia, Pennsylvania, or approved equal.

### 2.1.1.3 Golf Course

The Golf Course is classified as a passive recreational facility and therefore requires a minimum of twelve (12) inches of BPM per the New York State Department of Health (NYSDOH) determination regarding Ferry Point Park on August 2, 2006 and a further clarification by NYSDEC staff on July 28, 2009.

*Excerpt from NYSDEC July 28, 2009 correspondence:*
*"For the purpose of the permit, only the golf course is deemed a "passive recreational area" and is required to have a one foot thick cover layer over a demarcation layer."*

NYSDEC directed that the placement of the demarcation layer, per a March 9, 2011 correspondence, is required for the golf course in areas containing less than 5 feet of combined cover and shaping material thickness.

*Excerpt from a NYSDEC March 9, 2011 correspondence specific to the installation of a demarcation layer on the Golf Course:*
*"The Department and NYSDOH informed NYCDPR that a demarcation barrier would not be required at areas of the golf course having five feet or more of shaping and cover layer."*

Areas exempted from demarcation, structures, paved areas, and lakes are lined with an impermeable barrier. The preliminary Demarcation Layer Plan is shown on Figure 3 located in Section C.4 of the October 2013 Supplemental Engineering Report Drawing number S-H22.

The surface water drainage components are integrated into the final cover and function to control stormwater flow into the shaping layer material. Maintenance and inspection procedures for the surface water drainage system are provided in Section 3.3.2.2 Final Cover System Inspections and Maintenance. Additional maintenance and inspection criteria regarding these systems will be amended to the FPCCCP pursuant to the relevant post construction Storm Water Pollution

Prevention maintenance documentation as per the SPDES General Permit for Stormwater Discharges from Construction Activity.

The surface water drainage system includes a "tile drainage system" installed underneath the fairways, tees, greens and inner roughs that connects to the overall drainage system. The capacity of the drainage pipes was reviewed to make sure there is sufficient capacity for additional flow.

The surface water drainage system consists of the following that connect to catchbasins and manholes adjacent to the tile drainage system:

*"Golf course surface drainage pipe will be A.D.S. N12-or Approved Equivalent. Typically the golf course Grading Plans show the locations of the catch basins throughout the golf course. In these locations, there should be a 12 to 18-inch A.D.S. N12-or Approved Equivalent perforated riser, extending above grade 2 to 3-feet. Washed pea-gravel 1/4 to 3/8-inch in size, is mounded up around the base of the pipe, so that it functions throughout the construction process. Upon establishment of finish grade, the pipe is cut off flush with the grade. Soil is then removed 12-inches around and 12-inches deep and backfilled with clean, washed 1/4 to 3/8-inch pea-gravel. A cast iron or approved plastic grate is then inserted into the pipe and attached according to the manufacturer's specifications.*

*All golf course drainage pipe will have a 1.628 millimeter-14 gauge direct bury copper locator wire placed on top of the pipe prior to backfilling the pipe. This includes all sizes of perforated and solid pipe."*

1. Topmost Layer: Vegetated cover material or impermeable cover system. This topmost cover system throughout the park is primarily vegetative but may also consist of asphalt or gravel materials, concrete or paver systems.
2. BPM layer or cover material: consists of one foot of permit requirements for cover material at a depth of one foot for passive areas and two feet for active areas.
3. Surface Water Drainage System: where applicable, constructed to protect the final cover system from the peak discharge based on a rainfall intensity of a 24-hour, 25 year storm event.
4. Demarcation Layer: where applicable, the demarcation layer is placed to provide a physical visual separation between the BPM which is underlain by select exempt Construction and Demolition (C&D) fill material and existing landfill and cover material. This item provides a visual warning against unintended penetration into the underlying C&D material layer. The Demarcation layer will be Guardian Safety Fence, as manufactured by Tenax ® Corporation, Baltimore, Maryland, or the 3T Product T820A as manufactured by 3T Products, LLC, Dalmatia, Pennsylvania, or approved equal.

## 2.2 Landfill Gas Control

The generation of landfill gas (LFG) is a natural process resulting from the decomposition of organic material in municipal solid waste. LFG is comprised mainly of methane and carbon dioxide, along with traces of other gases.

LFG at the Ferry Point Park East site is present within the waste layer of the landfill. The waste at the Site consists of widely varying amounts of MSW and construction debris intermixed with soil. LFG is currently being generated at a very low rate, approximately 1 cfm/acre or less which correlated well with the modeling conducted in 1999 by DPR's consultant TRC Engineers (AP-42 modeling). Very little to no LFG was measured at the landfill surface during the flux box testing (Ferry Point Landfill Gas Report EEEPC 2011, Appendix F.1 Supplemental Engineering Report).

LFG that is generated accumulates in more pervious portions of the waste layer and/or migrates laterally to the east and northeast and is vented out the perimeter vent trenches. As shown on the graphs depicted on design drawings (S-H6.01 and S-H6.02 contained Ferry Point Landfill Gas Report EEEPC 2011, Appendix F.1 Supplemental Engineering Report).

The remaining Landfill gas at Ferry Point Park East is managed to control emissions of LFG and to prevent off site migration through a passive vent trench. Post construction care operations and maintenance of the landfill gas emissions management systems are detailed in Section 3.3 of the Post Construction Custodial Care Plan.

### 2.2.1 Passive Venting System

Passive venting systems have been and are being installed to vent LFG. The following are the design components of the passive control of LFG at the Ferry Point Park East site as further detailed in Appendix F.1 LFG Management Plan:

- Wet and dry utility pipe bedding corridors: contain low permeability soil plugs and gas vents at periodic intervals and terminations into structures. These include as applicable and approved by NYSDEC:
  1. Passive surface vents located adjacent to the plugs on the up gradient side to allow venting of built up gas;
  2. Plugs and passive vents prior to every potentially occupied structure at a suitable interval;
  3. Air vents on vault and manhole covers; and
  4. Explosion proof conduit seals and electrical connection.
- Vertical passive gas vent wells are located within the rough and other non-playing areas of the golf course. The vent locations were based on the following criteria:

1. Areas of significant waste thickness;
2. Areas of significant cover soil thickness;
3. Areas of historic high LFG concentrations; and areas in apparent lateral migration pathways.
4. A passive vent trench is located at the eastern perimeter of the Community Park. Vertical passive gas vents are additionally located within the passive LFG vent trench that has been installed at Community Park.

### 2.2.2 Landfill Gas Migration System

Ferry Point Park East utilizes a passive perimeter LFG interceptor venting system or LFG vent trench as an engineered control against the migration of LFG off site. The vent trench is installed along the edge of the East River near the foot of Emerson Avenue, along the length of the Balcolm Avenue Site boundary, along Schley Avenue, and continues approximately 1,050 feet west past the intersection of Schley and Buttrick Avenues as shown in Figure 5 (located in Appendix F.1 of the October 2013 Supplemental Engineering Report).

A review of the historic field data associated with the perimeter LFG vent trench monitoring program from 2001 to present was conducted to evaluate LFG trends at the Site relative to the perimeter passive LFG control.

The following key findings were noted:

1. After the installation of the vent trench in 2001, methane levels in the vicinity of the LFG vent trench tended to decrease significantly within a year in most monitoring wells;
2. Methane levels remained relatively low and below regulatory limits for the next three years (2002 thru 2004), except for a few wells that sporadically exceeded the regulatory limit;
3. In 2005, the measured methane levels tended to increase, likely due to the installation of more reliable monitoring points (new monitoring points and repaired wells); and,
4. Results from 2008-2011 generally indicate relatively consistent levels of methane, with certain limited sporadic increases above regulatory limits.

The vent trench is extended below the seasonal low groundwater table to form a barrier to off-site migration of LFG generated within the site and to allow the LFG to vent passively. Where underground utilities may act as conduits for the LFG migration, utility seals and low permeability soil collars are used to cut off the LFG from migrating along the utility corridors.

To remain consistent with the design intent of the LFG vent trench, monitoring of the groundwater is done by utilizing installed piezometers in accordance with the 2013 Permit.

To evaluate the effectiveness of the engineered controls monitoring at the vent trench has been ongoing since it became operational in 2002 at a frequency of bi-weekly monitoring with a contingency of weekly monitoring if the lower explosive limit is greater than 25%.

To meet the requirements of the 2013 Permit, a monitoring program and contingency procedures have been developed and are referenced (to the Landfill Gas Management Plan Appendix F.1 of the October 2013 Supplemental Engineering Report) in Section 3.3 of this report.

### 2.2.3 Interior Active Collection Systems

The intent of the interior active collection systems is to control LFG emissions such that safe levels are maintained in all potential occupied interior spaces. This is achieved by including active removal systems beneath all enclosed buildings within the site.

The interior active collection system is comprised of a sub slab depressurization system (SSD) designed to protect LFG from migrating into confined spaces and monitor those spaces. The interior LFG venting system is designed to prevent the accumulation of gas at greater than 25% of the lower explosive limit in structures on site. The system is designed to achieve lower sub slab air pressure relative to indoor air pressure by use of a fan powered vent drawing air from beneath the slab. The system prevents the migration of LFG into the interior of on-site buildings. Further, the system is designed to achieve depressurization during winter conditions when ventilation is limited.

To meet the requirements of the 2013 Permit, a monitoring program and contingency procedures have been developed and are referenced (to the Landfill Gas Management Plan Appendix F.1 of the October 2013 Supplemental Engineering Report) in Section 6.3.4.1 of the LFG Management Plan.

## 2.3 Long Term Settlement

In accordance with Special Condition #9 of the 2005 Permit, a settlement monitoring program was developed and a report issued. The report made recommendations with respect to the impact of potential long-term settlements of C&D fill and cover material on the construction and operation of the Ferry Point Golf Course (Settlement Evaluation and Long-Term Monitoring Plan Ferry Point Golf Course January 2005 Appendix I.2).

Settlement monitoring began on site in December 2002 and consisted of the construction of 7 instrumented test fills and installation of 6 settlement plates

throughout the site. The test fills ranged in height between 10ft and 18ft and were located in areas where significant thicknesses of fill were required, in areas where thick compressible layers existed and in future green areas. Additional, short and long term settlement monitoring has been on-going on the site since the original monitoring program began.

Further evaluation was completed in the Settlement Evaluation and Long-Term Monitoring Plan regarding Slope Stability; this evaluation indicated that the factors of safety exceeded the minimum acceptable factor of safety for a circular global slope failure, and thus that the steepest slopes of the proposed grades for the project are stable and will not require any reinforcement for construction or maintenance purposes.

As part of the report, a Long Term Settlement Monitoring plan was developed to be implemented after the final grading of the golf course and during the golf course operation. The Settlement Plate Location Plan (Figure 2) is located in Section H.1 of the October 2013 Supplemental Engineering Report.

The plan consists of the construction of nine (9) settlement monitoring plates to be placed throughout the golf course. As per the Long Term Settlement Monitoring plan, final locations of the monitoring plates were coordinated with the golf course architect and approved by NYSDEC staff. The locations were chosen to be adjacent to the water and sewer mains and/or adjacent to green areas, where differential settlements are potentially critical. The settlement points are located in variable subsurface conditions, but generally in the highest fill areas and thickest compressible layers.

The settlement plates will be placed as close to the defined area as possible without interrupting play or compromising the viability of the plate. The settlement monitoring points will be installed to within 1 foot of the final grade. The work consists of installing settlement plates consisting of a base plate, steel riser pipe sections, and any additional hardware and couplers which may be required that is consistent with the 2005 Settlement and Long Term Monitoring Plan.

The work consists of installing settlement plates consisting of a base plate, steel riser pipe sections, and any additional hardware and couplers which may be required that is consistent with the 2005 Settlement and Long Term Monitoring Plan.

1. Initial Installation: The base plate will be installed at least 12 inches (150 mm) below natural ground, firmly seated on a level surface.
2. Adding Extensions: Riser pipe extensions and couplers will be added, as necessary, in 5 foot increments as construction of the embankment progresses. The Contractor will install extensions in a plumb line.

The monitoring requirements associated with the long term settlement plates are discussed in Section 3.3.

## 2.4 Groundwater Monitoring

Characterization of the on-site groundwater was not initially contemplated as part of the 2005 permit by DEC. As per a 2011 DEC directive, DPR installed 11 groundwater monitoring wells on site in February of 2012, reference Figure 4 located in Appendix G.2 of the October 2013 Supplemental Engineering Report.

The purpose of the well installation was to obtain baseline chemical data on groundwater constituents at the Ferry Point site. Basic site hydrogeological information was also characterized during this effort, including direction of flow, groundwater elevation gradients, and flow velocity.

At the time of installation, construction activities were 80% complete. The baseline characterization is expected to capture conditions representing 80% of the potential measurable impacts to groundwater. Future monitoring is expected to capture less than 20% of the potential post-construction impacts.

Groundwater characterization monitoring has been performed for an initial three quarterly rounds of sampling and the data has been compared to data from landfills of similar age and type. DPR will continue to conduct annual groundwater sampling after the golf course is operational.

Trend analysis was used to develop an understanding of the effectiveness of an implemented remedy in addressing the exposures presented at the site and to begin to identify any trend(s) with regard to the achievement of remedial objectives (DER-10 6.2.2.c.6). However, the current redevelopment project is not intended as a 'remedy' for the site, and there are no remedial action objectives for groundwater at Ferry Point Park East. Therefore activities usually associated with monitoring for the effectiveness or performance of a remedy, such as trend analysis, are not appropriate for Ferry Point Park East.

Exposure to groundwater upon completion of the project will be managed by engineering controls (DER-10 6.1 Site Management).

Engineering controls to limit exposure to groundwater/leachate include:

- The placement of fill material ranging from 1 to 12 feet in depth above the original soil cover placed following termination of landfill activities in the 1960s.
- A demarcation layer to be placed in areas of the site where the combined cover and shaping material is less than 5 feet thick.

# 3 Post Construction Custodial Care Operations

This section addresses the compliance items as necessary to provide for the proper post construction custodial care for the site. The specific components of this section consist of a description of the sites' end use, the construction schedule, the environmental monitoring requirements, post construction custodial care operations and maintenance plan, consent order maintenance and the implementation of the site wide health and safety plan and emergency contact information.

## 3.1 End Use

DPR agrees that any proposed change of end use that significantly alters the intended recreational character or that impacts the integrity or operation of the environmental control and monitoring systems will require DEC approval. The End use of the site during the term of the FPCCCP will be in accordance with the 2013 Permit.

The end use for Ferry Point Park East will be a public passive and active recreational facility owned by DPR. There are three distinct areas or "Parks" within the project site.

- Community Park: Approximately 10 acres of active and passive recreation are replaces and expands an existing recreational facility. The project includes a walking path, detention area, ballfields, basketball courts, tot-lot, comfort station and seating areas.
- Golf Course: Approximately 180 acres, contains an 18-hole tournament quality golf course, driving range and practice areas for chipping and putting, a clubhouse, maintenance building, comfort station and rain shelter.
- The Waterfront Park: Approximately 19.5 acres of passive park land, the Waterfront Park design includes a small parking lot and comfort station, a beach and picnic area, salt marsh, and grassed and landscaped features with a continuous path that crosses the park.

## 3.2 Construction Schedule

The various components of the three distinct Parks have been and are being installed in various stages. Construction completion for each of the Parks is defined as placement of the final cover system, specifically the vegetated cover material or impermeable cover material. Final stabilization of the golf course, parks and ancillary facilities will be in accordance with the approved design specifications and the final plans of the Waterfront and Community Parks as approved by DPR.

Attached as Appendix I.3 is the construction schedule for the Golf Course project, upon completion of filling operations for the shaping layer, the Contractor will commence the rough shaping, placement of cover material and installation of drainage, irrigation and other utilities as per the construction schedule and construction sequence, for the purposes of this FPCCCP referred to as the Closure Construction Schedule.

The Community Park is substantially complete except for the proposed Comfort Station at Community Park which is contemplated for final completion in fall 2013.

The Waterfront Park, currently in design, is anticipated to begin construction in fall 2013, once a construction schedule is completed for this project it will be submitted to NYSDEC as an addendum to the FPCCCP.

Upon completion of the fill delivery and construction of the earthwork portion of the project, DPR agrees that its engineer will prepare the post construction certification report and the IEM will certify that the fill operation was performed in accordance with the 2013 Permit. Any deviations from the permit will be noted. This report will include approved "as-built" drawings demonstrating that the earthwork and filling operation were accomplished in accordance with the Department approved plans and the permit.

## 3.3 Post Construction Custodial Care Plan

The Post Closure Care Monitoring and Maintenance Operations Plan provides a description of overall management of the Site during the post construction period and sets the performance standards and requirements under which the actual monitoring, maintenance and reporting practices are to be carried out. Contingency procedures are discussed within the specific document as applicable.

This Plan consists of these components:

1. Environmental Monitoring Requirements
2. Health and Safety Plan Emergency Contact
3. Post Construction Custodial Care Inspections and Maintenance

Unless otherwise noted, compliance actions governed by the FCCCP will commence within 60 days of the NYSDEC's approval of the construction certification report. The compliance documentation, in the form of either or both:

1. Monitoring Data and Summary Report
2. Inspection Report

Compliance reports will be submitted within 30 days of the initial monitoring or inspection. Concurrent reports will be submitted within 30 days of the submittal of the initial report unless otherwise noted.

### 3.3.1 Environmental Monitoring Requirements

Environmental monitoring, maintenance and reporting will be performed at Ferry Point Park East during the post-construction period. The plans are specific to groundwater characterization, landfill gas monitoring and long term settlement monitoring. Record keeping and reporting requirements and contingency action levels and procedures are also addressed.

Maintenance of the systems associated with Ferry Point Park East monitoring will be performed:

1. Based on the result of inspections performed during monitoring events; or
2. If an issue is identified during general site wide operations; or
3. Specifically determined by contingencies for applicable systems.

Maintenance, monitoring, and reporting for activities associated with the LFG systems, long term settlement plates, final cover system and groundwater monitoring infrastructure will be performed by a DPR approved representative.

As necessary, changes may be made to the FPCCCP to reflect monitoring results and address relevant site conditions. Modifications to the environmental monitoring program will be implemented in compliance with the FPCCCP or by written request to the NYSDEC. Revisions to the FPCCCP monitoring program may be made through issuance of addenda, submittal of a partially or fully revised document, submittal of revised supporting documentation or other approved vehicle to NYSDEC.

#### 3.3.1.1 Groundwater Characterization Monitoring

Groundwater monitoring will be performed at the eleven well locations located within the golf course. Upon commencement of operation of the golf course, groundwater sampling will take place annually with samples being analyzed for constituents listed in 6 NYCRR Subpart Part 360-2.11 routine parameters. The groundwater monitoring report and summary will be submitted to NYSDEC as a part of the annual monitoring and inspection report. Monitoring and inspection

will commence concurrently within 60 days of the approval of the construction certification report for a period of three years.

Upon completion of 3 years of post-operation annual routine groundwater sampling DPR may submit documentation to NYSDEC in furtherance of a request to reduce or cease groundwater sampling at the FPP golf course. DPR agrees to perform operational groundwater sampling, data analysis and reporting for a minimum of three years after construction, with the goal of demonstrating whether operation of the Park adversely impacts on water quality with respect to leachate quality or quantity, and whether operation of the park meets the performance criteria established in the 2013 Permit. .

When the request for cessation is accepted, the groundwater monitoring wells will be evaluated for either abandonment or removal within the first year of the cessation of monitoring. The abandonment or removal documentation, signed and certified by a licensed NYS Engineer will be provided to DEC within the concurrent post closure reporting period after the completion of the work.

#### 3.3.1.2 Long Term Settlement Monitoring

Long term settlement monitoring will be performed at the 9 installed settlement monitoring plates throughout the golf course for a period of thirty years after completion of construction.

The long term settlement monitoring report and summary will be submitted to NYSDEC as a part of the annual monitoring and inspection report and will be certified by a licensed NYS professional engineer. The report will include:

1. Commencing within 60 days of the approval of the construction certification report, for a period of five years, the quarterly monitoring results collated and summarized for the year.
2. Commencing at the fifth year, for a period of five years, bi-annual monitoring results collated and summarized for the year.
3. Commencing at the 10th year, for a period of twenty years, yearly monitoring results and summary.

Monitoring will commence concurrently within 60 days of the approval of the construction certification report for a period of three years. Based on the results of the initial five years of monitoring, DPR may petition for decreased monitoring or a cessation in frequencies.

When the request for cessation is accepted, the long term settlement plates will be evaluated for either abandonment or removal within the first year of the cessation of monitoring and inspection. The abandonment or removal documentation signed and certified by a licensed NYS Engineer, will be provided to DEC within the concurrent post closure reporting period after the completion of the work.

#### 3.3.1.3 Landfill Gas Monitoring Program

The LFG monitoring program, in accordance with the 2013 Permit will support compliance with the following requirements: (1) the concentration of explosive gases will not exceed 25% of the lower explosive limit (LEL) in on-site structures; and (2) the concentration of explosive gases must not exceed the LEL at the property boundary as defined by the Landfill Gas Management Plan (LFGMP).

Operations, monitoring and maintenance (OM&M) for the Site's LFG management system will take place on an ongoing, routine schedule with additional inspections to address maintenance concerns and potential alarm call-outs, and to provide contingency monitoring and actions as needed. The OM&M plan for the Site is presented in Section 6 of the LFGMP (located in Appendix F.1 of the October 2013 Supplemental Engineering Report).

OM&M of the piezometer network is also incorporated into Section 6 of the LFGMP (see Appendix F.1). OM&M operations regarding landfill gas are to be in compliance with the LFGMP. The abandonment or removal documentation signed and certified by a licensed NYS Engineer, will be provided to DEC within the concurrent post closure reporting period after the completion of the work as documented in the OM&M plan.

The LFG monitoring report and summary will be submitted to NYSDEC as a part of the annual monitoring and inspection report unless otherwise noted within the OM&M plan. Monitoring and inspection will commence concurrently within 60 days of the approval of the construction certification report unless otherwise noted within the OM&M plan. Adjustments to monitoring frequencies will be requested of NYSDEC upon meeting the performance criteria thresholds identified in Section 6.3.4.2 of the LFG Management Plan. DPR will submit a request with supporting documentation to NYSDEC 30 days prior to the desired date of the proposed change in monitoring. DPR will not change monitoring frequencies until the request has been approved.

### 3.3.2 Post Construction Custodial Care Inspections and Maintenance

The site will be operated as part of the New York City Department of Parks and Recreation system. The Community Park and Waterfront Park will be operated and maintained by the DPR Borough of the Bronx Operations and Maintenance division or an appointed representative. The golf course site will be operated and maintained, unless otherwise noted within the FPCCCP by a Concessionaire, identified as Trump Ferry Point, LLC. DPR remains responsible for all inspection monitoring, reporting and oversight of operations and maintenance of the applicable site wide components as identified within the FPCCCP.

Inspection and maintenance will be conducted in coordination with monitoring events unless otherwise noted or as directed by DEC in response to a specific

monitoring condition or violation. If a contingency action or maintenance is warranted based on the inspection it will be noted in the inspection report to be provided as explained below. The inspection report will be submitted annually for the first ten years and then every five years unless noted; the first report will be submitted within 30 days of the initial monitoring and inspection operations. Subsequent reports will be submitted within 30 days of the submittal of the initial report unless otherwise noted or as directed by DEC in response to a specific monitoring condition or violation. Reports will be certified by a New York State licensed engineer.

The inspection reports will include:

1. Brief Summary
2. Site Inspection Documentation
3. As noted, photographs documenting site conditions.

The content and scope of the inspection reports may be subject to change based on the termination or reduction in frequency of monitoring and maintenance activities. DPR will advise through a transmittal letter included with the inspection report of any changes within the inspection report. Inspection reports will be sent to:

NYSDEC Region 2 Office
C/O Division of Materials Management
1 Hunters Point Plaza
47-40 21st Street
Long Island City, NY 11101

As relevant and in accordance with specific component plans, DPR may consult with DEC for guidance regarding the appropriate data to demonstrate whether or not DPR has achieved the performance goals that would provide the basis for modifying or terminating any or all components of the plan.

| Component | Frequency | Duration |
|---|---|---|
| Final Cover System | Quarterly | 5 years |
| LFG System | Quarterly | 5 years |
| Infrastructure | Bi-Annually<br>Annually | 10 years<br>15 years |
| Groundwater Monitoring | Annually | 3 years* |
| Long Term Settlement Plates | Quarterly | 5 years* |
| Parking Lot Asphalt Cover (April & October) | Bi-Annually<br>Annually | 5 years*<br>20 years* |

*Denotes Dependent on Cessation of Activity

### 3.3.2.1 Final Cover System

The integrity of the final cover system will be inspected by DPR quarterly and will report to DEC on an annual basis during the post-closure period to observe and document changes as they occur to the cover system.

Inspection frequencies, procedures and documentation are applicable to erosion damage, vegetative cover condition, settlement and the cover drainage system. Those systems that may specifically impact the integrity of the final cover system.

Final Cover System inspections are performed routinely as part of the Golf Course Operations and Management Manual, as the integrity of the cover system is paramount to the success of the Golf Course. The maintenance of the golf course will be performed by Trump Ferry Point LLC with inspections performed by a duly appointed DPR representative. Please refer to Appendix I.5 of this plan for further information regarding the Golf Course management operations..

DPR agrees to a rolling five-year plan, whereby DPR may petition to modify or terminate the final cover inspection requirements by demonstrating that the integrity of the final cover system has been maintained in accordance with performance criteria established in the 2013 Permit. DPR may consult with DEC to ensure that DPR is collecting and reporting the appropriate data for this purpose. For the purpose of reporting a yearly inspection report will be submitted verifying the integrity of the final cover system for a period of thirty years, unless otherwise approved by DEC for the Ferry Point Park East Site. The report will be certified by a New York State licensed engineer. The inspections will be performed by an appointed DPR representative. Commencing within 60 days of the submittal of the post construction certification report and then undertaken annually within 30 days of the submittal of the initial report.

As part of the inspection, DPR or their duly appointed representative will:

(a) verify the cover systems are being maintained as per routine visual inspections observing and noting any significant diversions from the final cover system. Any findings will be recorded in the inspection report.

(b) DPR will inspect the surface of the cover for evidence of erosion within one week of a storm event with precipitation amounts greater than a 100 year storm event or as otherwise directed by DEC for any precipitation event. If erosion damage greater than eight inches in depth has occurred, or if an area greater than one quarter of an acre of vegetative cover has been destroyed due to erosion, corrective action will be initiated within 30 days of the incident.

(c) in the unlikely event that a large unexplained settlement problem, or vegetative die-off occurs, examine the subsurface conditions beneath the distressed areas. Non-destructive techniques will be utilized at the location of the problem where there is significant contrast from surrounding areas and evidence of large scale settlement. Excavation of test pits will not be conducted due to the

complexity of the designs. If the exploratory operation penetrates the areas where a demarcation layer is placed, then it will be excavated and patched according to the sub surface plan. Backfill for exploratory operations above the demarcation layer will be of a material compatible with the final cover system plan. The exploratory operations will be backfilled with suitable material from their total depth to the ground surface. Photographic documentation of these operations will be included with the inspection report.

(d) note any bare areas susceptible to erosion and the presence of deteriorated or dead vegetation.

(e) during each of the inspections, observe the cover drainage system and note any presence of debris in the discharge pipes or waterlogged soil condition which may indicate that the drains are not functioning. If debris is found in discharge pipes that will be initiated within 14 days to clear the pipes.

Documentation: DPR or their duly appointed representative will submit to NYSDEC, Department of Materials Management correspondence that contains the information noted above as well as provides for an explanation of any contingency actions.

Contingency Action: If significant maintenance is required as a result of the inspections, unless otherwise noted, DPR has 60 days to remedy the issue. If it is determined that the issue cannot be resolved within the 60 days, DPR will immediately inform NYSDEC and request an extension of time based on the scope of work necessary to bring the issue to closure. A report will be submitted to NYSDEC within 60 days of completion of work that documents the specific close-out of the action item. DPR agrees to notify DEC within 7 days of detecting any significant issue found during inspection, and to provide a schedule and plan for remedying the condition. DPR will take steps to stabilize the condition within 60 days unless directed by DEC to expedite the remedial work, or, if the remedial action will take longer than 60 days to implement, and DEC has agreed to an extended schedule.

#### 3.3.2.2 Landfill Gas Management

Operations, monitoring and maintenance (OM&M) for the Site's LFG management system will take place on an ongoing, routine schedule with additional inspections to address maintenance concerns and potential alarm call-outs, and to provide contingency monitoring and actions as needed. The OM&M plan for the Site is presented in Section 6 of the LFGMP (located in Appendix F.1 of the October 2013 Supplemental Engineering Report).

OM&M of the piezometer network is also incorporated into Section 6 of the LFGMP (see Appendix F.1). OM&M operations regarding landfill gas are to be in compliance with the LFGMP.

The LFG inspection report will be submitted to NYSDEC as a part of the annual monitoring and inspection report unless otherwise noted within the OM&M plan. Monitoring and inspection will commence concurrently within 60 days of the approval of the construction certification report unless otherwise noted within the OM&M plan.

#### 3.3.2.3 Groundwater Characterization Monitoring

Groundwater characterization monitoring infrastructure inspections will be performed 30 days prior to the sampling events to ensure that infrastructure necessary to successfully perform the sampling event is in adequate working condition.

Upon commencement of operation of the golf course, groundwater infrastructure inspections will take place annually.

DPR agrees to perform operational groundwater sampling and reporting for a minimum of three years after construction, with the goal of demonstrating whether or not operation of the Park adversely impacts on water quality with respect to leachate quality or quantity, and whether or not operation of the park meets the performance criteria established in the permit modification. DPR may consult with DEC to ensure that DPR is collecting the appropriate data to achieve the performance goals that would provide the basis for a cessation of groundwater sampling or a reduction in sampling frequency. Commencing within 60 days of the submittal of the post construction certification report and then undertaken annually within 30 days of the submittal of the initial report. Inspections will continue annually past the eight year term of inspections only if the petition to discontinue monitoring is denied. At that time a revised inspection timeline will be submitted to NYSDEC as an addendum to this plan.

As part of this inspection, DPR or their duly appointed representative will:

(a) inspect the monitoring wells to confirm the area surrounding the well is free of debris and vegetation that may affect the ability to accurately sample the wells. If the area is not free of debris or vegetation all materials that hinder the ability to sample will be removed 72 hours prior to the sampling event.

(b) confirm that all components and parts of the well are working correctly and free of defect or damage that affects the ability to accurately sample the wells. If all the components and parts of the well are not functional, all repairs must be completed 24 hours prior to the sampling event.

Documentation: DPR or their duly appointed representative will submit to NYSDEC, Department of Materials Management correspondence that contains the information noted above as well as provides for an explanation of any contingency actions.

Contingency Action: If it is determined that the issue cannot be resolved within the 30 days, DPR will immediately inform NYSDEC and request an extension of

time based on the scope of work necessary to bring the issue to closure. And a revised monitoring date will be included with the request. A report will be submitted to NYSDEC within 60 days of completion of work that documents the specific close-out of the action item.

#### 3.3.2.4 Long Term Settlement Plates

Long term settlement plate inspections will be performed 30 days prior to the settlement plate monitoring event on an annual basis commencing within 60 days of the submittal of the post construction certification report and then undertaken annually within 30 days of the submittal of the initial report. As DPR may petition for decreased monitoring frequencies if data supports the request at year five, inspections of the settlement plate locations will terminate based on the NYSDEC decision. Consistent with the rolling five-year schedule DPR agrees to monitor the long term settlement plates in accordance with the performance goals established in the 2013 permit until DPR has demonstrated to DEC that continued monitoring is no longer necessary. If additional monitoring is required inspections will continue on an annual basis until otherwise approved by DEC.

As part of this inspection, DPR or their duly appointed representative will:

(a) verify that the settlement plate location is being maintained to allow for the proper monitoring of the settlement . If the area is not properly maintained, the area will be properly cleared 48 hours prior to the monitoring event.

(b) visually inspect the monitoring apparatus, if the apparatus is not fully functional via the visual inspection, DPR will remedy the settlement plate apparatus 48 hours prior to the monitoring event.

Documentation: DPR or their duly appointed representative will submit to NYSDEC, Department of Materials Management correspondence that contains the information noted above as well as provides for an explanation of any contingency actions.

Contingency Action: If it is determined that the issue cannot be resolved within the 30 days, DPR will immediately inform NYSDEC and request an extension of time based on the scope of work necessary to bring the issue to closure. And a revised monitoring date will be included with the request. A report will be submitted to NYSDEC within 60 days of completion of work that documents the specific close-out of the action item.

### 3.3.3 Sub-Surface Operations Plan

The Sub Surface Operations plan reviews those appropriate controls to protect worker health and safety and assure that soils meeting the cover layer materials requirements are restored. As previously stated, DPR contemplates an amendment to this plan once construction operations on the site are finalized based on final construction information.

The amendment will be submitted within 90 days of the approval of the certification report.

1. The Plan will apply to disturbances of material below the cover layer (i.e. soils at a depth below the finished grade of greater than one foot or two feet) or for areas where the demarcation layer is required to be breached.

2. For purposes of the Plan, sub surface activities will be characterized as either routine or non-routine as described below:

   A. Routine Disturbances

   Routine disturbances are those generally associated with the operations and maintenance of the project. Examples include localized pipeline or electrical replacement/repairs, drainage system repairs, building or pond system repairs. These disturbances will always encompass less than one acre in area.

   B. Non-Routine Disturbances

   Non-routine disturbances are those not generally associated with the operations and maintenance of the project and larger projects. Examples include pipeline excavation and replacement, course upgrade involving re-grading. All disturbances of greater than one acre in area will be considered non-routine. Based on the nature of the disturbance and applicable regulatory guidance, inspection certification by a qualified environmental professional may be required and will be vetted with the advance notification to DEC. The below table presents the various plan elements to be prescribed and initiated for both routine and non-routine disturbances. As necessary additional information is provided below the table:

| Management Element | Routine Disturbances | Non-Routine Disturbances |
|---|---|---|
| Advanced Notification to NYSDEC | No | Yes |
| Initiation of Worker Health and Safety Plan | Yes | Yes |
| Inspections certification by Environmental Professional | No | Yes |
| Dust Control | No | Yes |
| Stockpile Protection | Yes | Yes |
| Stormwater Pollution Prevention | No | Yes, if greater than 1 acre of disturbance |
| Segregation of existing cover material for reuse | Yes | Yes |
| New cover layer material option | Yes | Yes |
| Excess Soil Material Disposal | Yes | Yes |
| MSW Segregation & Disposal | Yes, but not anticipated | Yes, to the extent excavated |

In all areas where the demarcation layer is breached, the layer must be re-installed to include the original area of coverage removed during operations. Once the de-

marcation layer is re-installed backfilling of compatible materials to those removed may occur.

When stockpiling occurs, all material above the demarcation layer or material within one or two feet (as applicable by the recreational designation) will be segregated for re-use. Material will be visually inspected upon excavation to ensure comingling does not occur.

The material designated for re-use will be segregated from other excavated materials and placed in a location proximate to the excavated area. The stockpiles will be visibly marked for re-use via placards or other similar methods. Material stockpiles will consist of approximately 500 cubic yards. These piles will generally have a 60 ft by 60 ft footprint and be approximately 6 ft in height. The material stockpiled will be covered with plastic sheets at end of each day. Plastic sheet covers will be weighted down with sand bags or equal at the end of the day to avoid a sailing effect.

Material that is not designated for re-use will be removed from the site and transported to a facility compatible to the disposal requirements. The material will be characterized to ensure proper disposal prior to leaving the site. A report of the material characterization and the identification of the disposal location will be submitted as part of the routine and non-routine reporting requirements.

At times, additional cover layer material may be required to be imported to the site to supplement that material identified for re-use. This material will meet the performance requirements for each component of the Ferry Point Park East project as subject to the Permit. However, one chemical analytical test will be performed per 10,000 cubic yards of cover material to be imported if the material is specifically of the nature of non-exempt construction debris as under the jurisdiction of the permit. If the material to be used is commercially available and purchased for the purpose of replacing or supplementing the cover layer this material is exempt from analytical testing. The analytical report will be included as part of the post event reporting.

Documentation: DPR or their duly appointed representative will submit to NYSDEC, Department of Materials Management correspondence that contains the following information as it relates to routine or non-routine actions:

1. Routine Actions: These actions will be reported as part of the annual inspection report. The report will include proper documentation including a written summary of the event, photographic documentation and a location plan of the routine action.
2. Non-Routine Actions: These actions will be reported to NYSDEC 60 days prior to an event. This notification will include summary documentation regarding the scope of the action and a schedule for the commencement and conclusion of the action and any designs or details as deemed applicable by DPR. Within 90 days of completion, DPR will provide NYSDEC a report

documenting close-out of the action and provide updated as-built drawings as necessary.

If non-routine actions are imminently required due to site safety or operational risks, DPR will immediately inform NYSDEC of the action and commence operations as necessary.

Within 10 days of the commencement of these operations DPR will provide NYSDEC with a draft schedule of completion.

Within 90 days of completion, DPR will provide NYSDEC a report documenting close-out of the action and provide updated as-built drawings as necessary.

### 3.3.4 Health and Safety Plan and Emergency Contact

A Site-Wide Health and Safety Plans (HASP) was developed for construction operations at Ferry Point Park East and approved by DPR in 2009. Based on sub surface post construction operations and maintenance certain portions or the plan in its entirety will be instituted. The HASP is attached as Appendix I.1.

The DPR appointed emergency contact personnel for the site will be submitted with the amended sub surface operations plan. If there are personnel changes this will be noted via an e-mail correspondence to NYSDEC upon identification of the new personnel and noted in the annual report.

## 3.4 Consent Order Maintenance

As per the Order of Consent the following inspection schedule attached as Appendix I.1 specific to "Attachment "A" Proposed Handling of Ferry Point Park Soil Stockpile, Item 6 will be followed:

"*Once the asphalt top course is installed, the asphalt surfaces of the clubhouse and maintenance facility parking lots will be inspected during April and October every year by a licensed professional engineer ("engineer") who is registered to practice in New York State. Within thirty days (30) days of such inspections, the engineer will submit to the Department a stamped and certified written detail report, including photo documentation, regarding the condition of the asphalt surfaces and their adequacy, including photo documentation, regarding the condition of the asphalt surfaces and their adequacy to effectively function as covers. A description of any needed repairs will be included in the engineer's report.*

*Item 7, Any repairs deemed necessary by the engineer must be completed by New York City Department of Parks and Recreation ("NYC Parks") within fifteen (15) days of the notification by the Department to NYCDPR to begin such repairs. A certification, including supporting written and photo documentation must be submitted by NYC Parks within fifteen (15) days after completion of repairs."*

## 3.5 Golf Course Maintenance Guidelines

The **Maintenance Guidelines for Trump Golf Links at Ferry Point Park** attached as Appendix I.5 provides for the operations and maintenance of the golf course by the Concessionaire for a period of 25 years commencing once the golf course is operational. The manual describes those operations and maintenance activities contemplated as part of the day to day operations of the golf course facility. The maintenance guidelines are subject to amendment and revision based on site conditions over time.

# Certification

I, Gary Rozmus, P.E., am currently a registered professional engineer licensed by the State of New York. On behalf of New York City Department of Parks & Recreation (NYCDPR) and acting as its consultant, I hereby certify to the best of my knowledge, and based on all of the information made available to me, that the post-closure activities summarized in this report and performed at the Ferry Point Park Golf Course project site in Bronx, New York, were completed in general accordance with the Post-Closure Custodial Care Plan (PCCCP), originally included in the Supplemental Engineering Report dated October 15, 2013 (Volume 3, Appendix I), and as stated in Special Condition No. 35 of the New York State Department of Environmental Conservation (NYSDEC) Part 360 Permit No. 2-6006-00014/00013 (2-6006-00014/00016), effective May 21, 2014.

To the best of my knowledge, the statements included in this 2023 Semi-Annual Post-Closure Certification Report are accurate based on the information available. GEI Consultants has not knowingly falsified any of the information presented in this document. The post-closure monitoring activities and deliverables included in this report were performed by GEI Consultants, subcontractors, and field personnel under my supervision.

This statement does not apply to the Waterfront Park. It is our understanding that the originally developed plans for the Waterfront Park were revised to reflect a passive open space with multiuse paths, lookout points and a constructed wetland. The Waterfront Project was removed from the New York Codes, Rules and Regulations (6 NYCRR) Part 360 Permit No. 2-6006-00014/00013 and NYSDEC and United States Army Corps of Engineers (USACE) issued Tidal Wetlands permits to the revised Waterfront.

Date signed and sealed:

10/04/2023

Gary Rozmus, P.E.
NY License #056744

# 1. Introduction

This Semi-Annual Post-Closure Certification Report documents the work performed by New York City Department of Parks & Recreation (NYCDPR) and its contractors to complete the post-closure activities conducted from January 2023 through June 2023 at the Ferry Point Park (Site), located at 500 Hutchinson River Parkway, Bronx, New York. Post-closure activities were conducted in accordance with the Post-Closure Custodial Care Plan (PCCCP), originally included in the Supplemental Engineering Report dated October 15, 2013 (Volume 3, Appendix I), as stated in Special Condition No. 35 of the New York State Department of Environmental Conservation (NYSDEC) Part 360 Permit No. 2-6006-00014/00013 (2-6006-00014/00016). Post-closure monitoring activities include piezometer monitoring, landfill gas (LFG) monitoring, sub-slab depressurization system (SSDS) monitoring, cover system and infrastructure inspections, settlement plate monitoring, groundwater sampling, and infrastructure repairs and upgrades (if needed).

In accordance with the PCCCP, piezometer monitoring was conducted monthly. On a quarterly basis, SSDS and LFG monitoring were performed, as well as cover system and infrastructure inspections. Settlement plate monitoring was conducted annually, however, as of June 15, 2023, NYSDEC has approved the cessation of all future annual settlement plate monitoring. Biennial groundwater sampling was conducted in April 2023. Copies of the post-closure monitoring activity reports conducted between January 2023 and June 2023 are provided as appendices to this report.

## 1.1 Site History

Historically, Ferry Point Park operated as a municipal solid waste landfill from 1951 to the 1960s. The landfill was operated by the New York City Department of Sanitation (NYCDOS), with operations ceasing in the 1960s. The entire site was capped thereafter with a soil cover of varying thickness. In the late 1990s, NYCDPR entered into an agreement to develop and operate a new public recreation facility including a 10-acre community park, 180-acre golf course, 19.5-acre waterfront park, as well as related facilities (referred to collectively as "Ferry Point Park"). Ferry Point Park is bounded by the East River to the south, Schley Avenue and St. Raymond's Cemetery to the north, Miles, Balcom, and Emerson Avenues to the east, and Hutchinson River Parkway and the Whitestone Bridge to the west.

The Site is operated as a part of the NYCDPR system; the Community Park and Waterfront Park are operated and maintained by the NYCDPR Borough of the Bronx Operations and Maintenance division (or an appointed representative), the Golf Course was operated and maintained by a Concessionaire identified as Trump Ferry Point, LLC, which has since been transferred to the Bally's Corporation as of September 13, 2023. NYCDPR remains responsible for all inspection monitoring, reporting, and oversight of operations and maintenance of the

pertinent Site-wide components identified in the PCCCP. While the 19.5-acre Waterfront Park is included as a portion of "Ferry Point Park," the Waterfront Park area is not included in the scope of post-closure monitoring or within this report. The originally developed plans for the Waterfront Park were revised to reflect a passive open space with multiuse paths, lookout points and a constructed wetland. The Waterfront Project was removed from the New York Codes, Rules and Regulations (6 NYCRR) Part 360 Permit (2-6006-00014/00013) and NYSDEC and United States Army Corps of Engineers (USACE) issued Tidal Wetlands permits to NYCDPR for the revised Waterfront.

# 2. Post-Closure Monitoring Program

## 2.1 Cover System and Infrastructure Inspection

In accordance with Section 3.3.2.1 of the PCCCP, quarterly monitoring of the final cover system is required during the post-closure period to observe and document vegetative cover conditions, settlement, erosion damage, and cover drainage systems. Additionally, as stated in Section 3.3.2 of the PCCCP, biannual infrastructure inspections of the LFG vents are required; the LFG system included 25 individual passive vents and 12 passive utility collar vents located within the golf course, 12 passive vents located within the community park, as well as additional passive vents through the Site corresponding to features such as the water quality pond liners. Cover system and/or infrastructure inspections were conducted on the following dates:

- March 30, 2023
- June 26 and 27, 2023

In addition, an inspection of the asphalt pavement of the Clubhouse parking lot was conducted on the following date:

- June 27, 2023

Cover inspection and parking lot pavement inspection reports for the referenced events are provided in Appendix A. Overall, the cover system remains in good condition with some areas that required re-seeding and mulching, clearing of clogged drains, and some areas of washout into cart paths. These minor deficiencies were communicated to and are closely addressed/monitored by the Concessionaire. Additionally, the asphalt surface of the parking lot continues to function as a suitable landfill cover system, providing an exposure barrier between the public and subsurface materials. Any observed cracks are surficial and do not penetrate through the full asphalt cap.

## 2.2 Groundwater Monitoring

In accordance with the NYSDEC Part 360 Permit No. 2-6006-00014/00013 and the NYSDEC letter dated January 7, 2020, groundwater sampling requirements have been modified to be conducted on a biennial basis. The preceding groundwater sampling event was completed in April 2021. Therefore, the biennial groundwater sampling event was conducted on April 25 to 26, 2023.

Results from the groundwater sampling event indicate that groundwater flow direction and elevation have remained consistent across the Site. The analytical results for samples collected during the April 2023 event indicate that the groundwater in certain locations beneath Site

contains volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, ammonia, sulfate, and cyanide above NYSDEC Ambient Water Quality Standards (AWQS). With the exception of cyanide, the April 2023 event detections of VOCs, SVOCs, metals, and phenolics are generally consistent in location and/or concentration with previous sampling events. The presence of cyanide is generally consistent with other previous post-closure monitoring events, however, exceedances of the AWQS were only reported during the 2023 sampling event at two sampling locations (PZ-15 and GMW-10).

The report summarizing sampling methodology and locations, analytical results, conclusions and recommendations is included in Appendix B.

## 2.3 Landfill Gas Monitoring

In accordance with NYSDEC Part 360 Permit No. 2-6006-00014/00013, the PCCCP, and the Landfill Gas Management Plan dated 2013, annual and quarterly monitoring is required for offsite and perimeter LFG monitoring points during the post-closure period. In addition to the LFG monitoring wells located within the interior and exterior of the golf course, passive LFG vents stationed in the interior of the golf course were also monitored. LFG monitoring included the collection of oxygen ($O_2$), carbon monoxide (CO), methane (percent lower explosive limit [LEL], percent methane by volume), hydrogen sulfide ($H_2S$), VOCs, well pressure, humidity, air flow, vacuum pressure, and/or temperature measurements. LFG data was collected utilizing a Landtek GEM 5000 Plus with temperature probe, photoionization detector (PID), and a TSI Velocicalc. All equipment was calibrated prior to commencing the monitoring events.

LFG monitoring was conducted on the following dates:

- March 28 to 30, 2023
- June 27 to 28, 2023

The Q1 and Q2 2023 monitoring reports are provided in Appendix C. In general, the LFG monitoring results are consistent with previous post-closure monitoring events and suggests that LFG conditions are stable.

## 2.4 Piezometer Monitoring

In accordance with the October 2013 Landfill Gas Management Plan and the October 2013 PCCCP, monthly monitoring of piezometers is required. During each monitoring event, groundwater levels were measured using an electronic groundwater level meter. Piezometer monitoring was conducted on the following dates:

- January 31, 2023
- February 24, 2023

- March 29, 2023
- April 24, 2023
- May 22, 2023
- June 27, 2023

The Piezometer Monitoring Reports for the aforementioned dates are provided in Appendix D. The piezometer monitoring results indicate that all of the piezometers are in functional condition and there was sufficient groundwater elevation to inhibit methane migration beyond the landfill boundaries.

## 2.5 Settlement Plate Monitoring

Settlement plate monitoring was performed to detect and monitor the rate of settlement that may occur due to solid waste decomposition and was first conducted in 2013. Settlement plate monitoring was performed by GEI on March 29, 2023, in accordance with NYSDEC Part 360 Permit No. 2-6006-00014/00013, the PCCCP, and NYSDEC letter dated January 7, 2020, providing approval to modify the monitoring frequency from quarterly to annually.

The nine settlement plates were surveyed by New York State Licensed Land Surveyor Contractors Line and Grade South (Elmsford, NY). The following data was recorded for each settlement plate:

- Riser elevation
- Settlement
- Cumulative settlement (feet and inches)

Following performance and review of the March 2023 results, GEI recommended terminating all future settlement plate monitoring. Since 2013, the cumulative settlement was negligible, ranging from 0.00 ft to -0.30 ft across all nine plates. Based on these minor fluctuations in elevation, NYSDEC approved to terminate all future monitoring on June 15, 2023, as long as the former landfill continues to be utilized and maintained in its current condition as a golf course.

The March 2023 Annual Settlement Plate Monitoring Report, which includes the results of all previous settlement plate monitoring events, is provided in Appendix E. The NYSDEC letter approving termination of annual settlement plate monitoring is also included in Appendix E.

## 2.6 Sub-Slab Depressurization System Monitoring

In accordance with the October 2013 PCCCP, NYSDEC Part 360 Permit No. 2-6006-00014/00013, and the Landfill Gas Management Plan dated 2013, routine monitoring, operations, and maintenance of the sub-slab depressurization and combustible gas

(CG) monitoring systems is required to be performed on a quarterly basis during the post-closure monitoring period. A site-specific Operations, Maintenance, and Monitoring (OM&M) Manual was developed to address the requirements of the 2013 LFG Management Plan, including a comprehensive review and inventory of SSD and CG system design and construction. SSD and CG system OM&M is conducted on a quarterly basis in the Community Park Comfort Station, Golf Course Maintenance Building, Golf Course Comfort Station, the Cart Storage Barn, and the Golf Course Clubhouse.

SSD and CG system monitoring was conducted on the following dates:

- March 28, 2023
- June 26, 2023

Reports from the SSD and CG system monitoring events on the aforementioned dates are provided in Appendix F. Occasional readings from few SSDS points have detected a positive pressure gradient, which is believed to be associated with seasonal variations such as rise and fall of the water table. With the exception of these discrete anomalous pressure readings, the SSD systems are operating as intended and are overall maintaining negative pressure conditions beneath the building slabs, and thus no methane and very low levels of VOCs have been detected in the ambient air of the buildings.

All CG sensors were communicating with their respective control panels and registered ambient methane readings of 0.0% LEL. No elevated readings or alarm conditions were observed during the post-closure monitoring period.

# 3. Incidental Infrastructure Maintenance and Repairs

There were no infrastructure maintenance or repair activities conducted during this post-closure monitoring period related to the SSD and CG systems located in the Community Park Comfort Station, Golf Course Maintenance Building, Golf Course Comfort Station, the Cart Storage Barn, or the Golf Course Clubhouse.

The monitoring ports for certain LFG monitoring wells were noted to be damaged. The extent of damage is minimal and is primarily from cracked tubing leading out of the J-plugs for collecting measurements. In order to minimize future interference of ambient air during LFG monitoring, GEI will replace the cracked tubing containing holes with a more flexible tubing. These damaged monitoring ports are intended to be replaced during the Q3 2023 Landfill Gas Monitoring event.

Additionally, during the Q1 cover system inspection, two sections of fencing located along the fence line bounding the park and golf course were noted to be damaged. The damaged fencing along the northern portion of the fence was repaired by the Concessionaire by the time of the Q2 inspection. The damaged area along the southern fence line currently contains a temporary fence panel, however, a permanent repair is still required to be addressed by the Concessionaire.

Dear Ms. Catalanotto:

**Re: Quarterly Final Cover System & Infrastructure Inspection - Quarter 1, 2023 (Report No. 28)**
**Ferry Point Park Golf Course**
**NYSDEC Permit No. 2-6006-00014/00013**
**Bronx, NY**

GEI Consultants, Inc. (GEI) has prepared the following report on behalf of the New York City Department of Parks & Recreation (NYCDPR) to document the final cover system monitoring event conducted on March 30, 2023, at the Ferry Point Park Golf Course. Quarterly final cover system monitoring is conducted to observe and report vegetative cover conditions, cover drainage system, erosion damage, and settlement, in compliance with Section 3.3.2.1 of the October 2013 *Post Construction Custodial Care Plan*

During this inspection event, no cover system settlement was observed, and the cover drainage system appeared to be in good condition, with the exception of two area drains, across the Site.

Below is a summary of the observations denoted during the cover system inspection, with observed areas illustrated on **Figure 1**. A photo log documenting observed Quarter 1, 2023 cover system site conditions is attached:

- The Concessionaire was in the process of conducting annual vent trench maintenance at Hole 6 during the inspection (Photo 1). New mulch is expected to be delivered in the coming week, per the Concessionaire.

- Small animal burrows were noted in two locations (Photo 2). The Concessionaire was aware of these burrow locations and is set to address

GEI Consultants, Inc.
530 7th Avenue, Suite 2007, New York, NY 10018
212.687.8282

these locations by replacing the cover material and seed or sod the areas. Sod is made available from the onsite sod-farm.

- Areas of sparse vegetation and bare soil were observed in multiple locations throughout the Site, including the area where the Grandstands and media platforms were previously erected (Photo 3). These areas require vegetative stabilization; the Concessionaire was notified and will be addressing the noted locations.

- Walking and maintenance cart sand paths were observed throughout the golf course, with few requiring maintenance due to washout and erosion (Photo 4). The Concessionaire has been made aware of these washouts and understand they are responsible for preventing and correcting any sand erosion and washout in these sand paths.

- Two area drains were noted to be clogged with topsoil near Hole 1 and 15 (Photo 5). The Concessionaire stated that clogged area drains are addressed on a weekly basis.

- Previously reseeded areas in the spring and winter area showing vegetative regeneration (Photo 6).

- The outfall along the East River, adjacent to the Whitestone Bridge, was inspected during high tide. Debris and sediment were noted in the area around the structure (Photo 7 and 8).

- In the Ferry Point Community Park, along the fence line that bounds the park and golf course, a section of temporary fence is still present after being previously vandalized (Photo 9). Another area of the black fence is partially downed and requires repair (Photo 10). The Concessionaire was made aware and is to repair these areas of fencing.

Much of the vegetation is dormant due to the season, therefore new areas of limited, dormant, or no vegetation were noted by GEI during the cover system inspection. Please refer to previous reports which document areas with continued limited, dormant, or no vegetation.

Per the direction of previous reports, GEI communicated all field observations to the Concessionaire. The Concessionaire assured they will continue to monitor vegetative conditions on Site. Areas outside of the Concessionaire's maintenance responsibility shall be addressed by New York City Department of Parks & Recreation Maintenance and Operations (NYCDPR M&O).

If you have any questions, please feel free to contact me at (347) 514–3861.

**Re: Quarterly Final Cover System & Infrastructure Inspection - Quarter 2, 2023 (Report No. 29)**
**Ferry Point Park Golf Course**
**NYSDEC Permit No. 2-6006-00014/00013**
**Bronx, NY**

Dear Ms. Catalanotto:

GEI Consultants, Inc. (GEI) has prepared the following report on behalf of the New York City Department of Parks & Recreation (NYCDPR) to document the final cover system monitoring event conducted on June 26 and 27, 2023, at the Ferry Point Park Golf Course. Quarterly final cover system monitoring is conducted to observe and report vegetative cover conditions, cover drainage system conditions, erosion damage, and settlement, in compliance with Section 3.3.2.1 of the October 2013 *Post Construction Custodial Care Plan.*

During this inspection event, no cover system settlement was observed, and the cover drainage system appeared to be in good condition, with the exception of six (6) area drains across the Site.

Below is a summary of the observations denoted during the cover system inspection, with observed areas illustrated on **Figure 1**. A photo log documenting observed Quarter 2, 2023 cover system site conditions is attached:

- Since the Quarter 1 inspection, the vent trench along Hole 6 was observed with new mulch (Photo 1). The Concessionaire stated new mulch was added in April of 2023.

- No animal burrows were noted during this inspection event. However, the Concessionaire addresses animal burrows on an as-need basis by replacing

GEI Consultants, Inc.
530 7th Avenue, Suite 2007, New York, NY 10018
212.687.8282

the cover material and seed or sod the areas. Sod is made available from the onsite sod-farm.

- Areas of sparse vegetation and bare soil were observed in few locations throughout the Site, including the area near the Clubhouse and driving range (Photo 3). These areas require vegetative stabilization; the Concessionaire was notified and will be addressing the noted locations.

- Walking and maintenance cart sand paths were observed throughout the golf course, with few requiring maintenance due to washout and erosion (Photo 4). The Concessionaire has been made aware of these washouts and understand they are responsible for preventing and correcting any sand erosion and washout in these sand paths.

- Six (6) area drains were noted to be clogged with topsoil in various locations around the golf course, illustrated on Figure 1 (Photo 5). The Concessionaire stated that clogged area drains are addressed on a weekly basis.

- Previously re-seeded areas in the spring are showing vegetative regeneration (Photo 6).

- The outfall along the East River, adjacent to the Whitestone Bridge, was inspected during low and high tide. Debris and sediment were noted in the area around the structure (Photo 7 and 8).

- In the Ferry Point Community Park, along the fence line that bounds the park and golf course, a section of temporary fence is still present after being previously vandalized (Photo 9). A previously downed area of fence has been repaired (Photo 10). The Concessionaire was made aware and is to repair these areas of fencing.

Per the direction of previous reports, GEI communicated all field observations to the Concessionaire. The Concessionaire assured they will continue to monitor drainage and vegetative conditions on Site. Areas outside of the Concessionaire's maintenance responsibility shall be addressed by New York City Department of Parks & Recreation Maintenance and Operations (NYCDPR M&O).

If you have any questions, please feel free to contact me at (347) 514–3861.

**Re: First (1 of 2) Semi-Annual 2023 Parking Lot Pavement Inspection Report**
**Ferry Point Park Golf Course**
**NYSDEC Permit No. 2-6006-00014/00013**
**Bronx, NY**

Dear Ms. Catalanotto:

GEI Consultants, Inc. (GEI) has prepared the following report on behalf of the New York City Department of Parks & Recreation (NYCDPR) to document the parking lot asphalt inspection event conducted in June 2023 at the Ferry Point Park Golf Course. Semi-annual parking lot inspections assess the condition of the asphalt surface in the Ferry Point Park Golf Course (Golf Course) Clubhouse parking lot and determine if the asphalt surface is functioning as an effective landfill cover system. Inspections are conducted in compliance with Sections 3.3.2 and 3.4 of the October 2013 *Post Construction Custodial Care Plan* and Paragraph 6, Appendix A of NYSDEC Order of Consent, Case No. R2-20100521-172 dated January 10, 2011.

On June 27, 2023, GEI mobilized to Site to conduct the first (1 of 2) 2023 semi-annual asphalt inspection of the Clubhouse parking lot. The last semi-annual asphalt inspection was completed in December 2022. Observations noted during the June 2023 inspection event are included below:

- The majority of the Golf Course Clubhouse Parking Lot was accessible and visible, except for Location 22. Location 22 was inaccessible due to the placement of storage units. This observation is consistent with the asphalt cover inspections dating back to June 2019.

- Longitudinal cracking was observed in the asphalt surface in the locations noted on Figure 2. The majority of crack depths ranged between 0.25 and

GEI Consultants, Inc.
530 7th Avenue, Suite 2007, New York, NY 10018
212.687.8282

4.00 inches, and the majority of crack widths ranged between 0.125 and 1.50 inches.

Based on observations from the June 2023 inspection, GEI concludes that the Clubhouse Parking Lot asphalt surface is functioning as a suitable landfill cover system, providing an exposure barrier between the public and subsurface materials. The observed crack depths and widths appear to be surficial in nature and do not penetrate through the full asphalt cap. Additionally, a minimum of two (2) feet of clean material is located underneath the asphalt surface and above the landfill surface in the northern portion of the Clubhouse Parking Lot where the cracks were observed.

If you have any questions, please feel free to contact me at (347) 514–3861.

Sincerely,

GEI CONSULTANTS, INC.

Stacey Ng, P.G
Project Manager

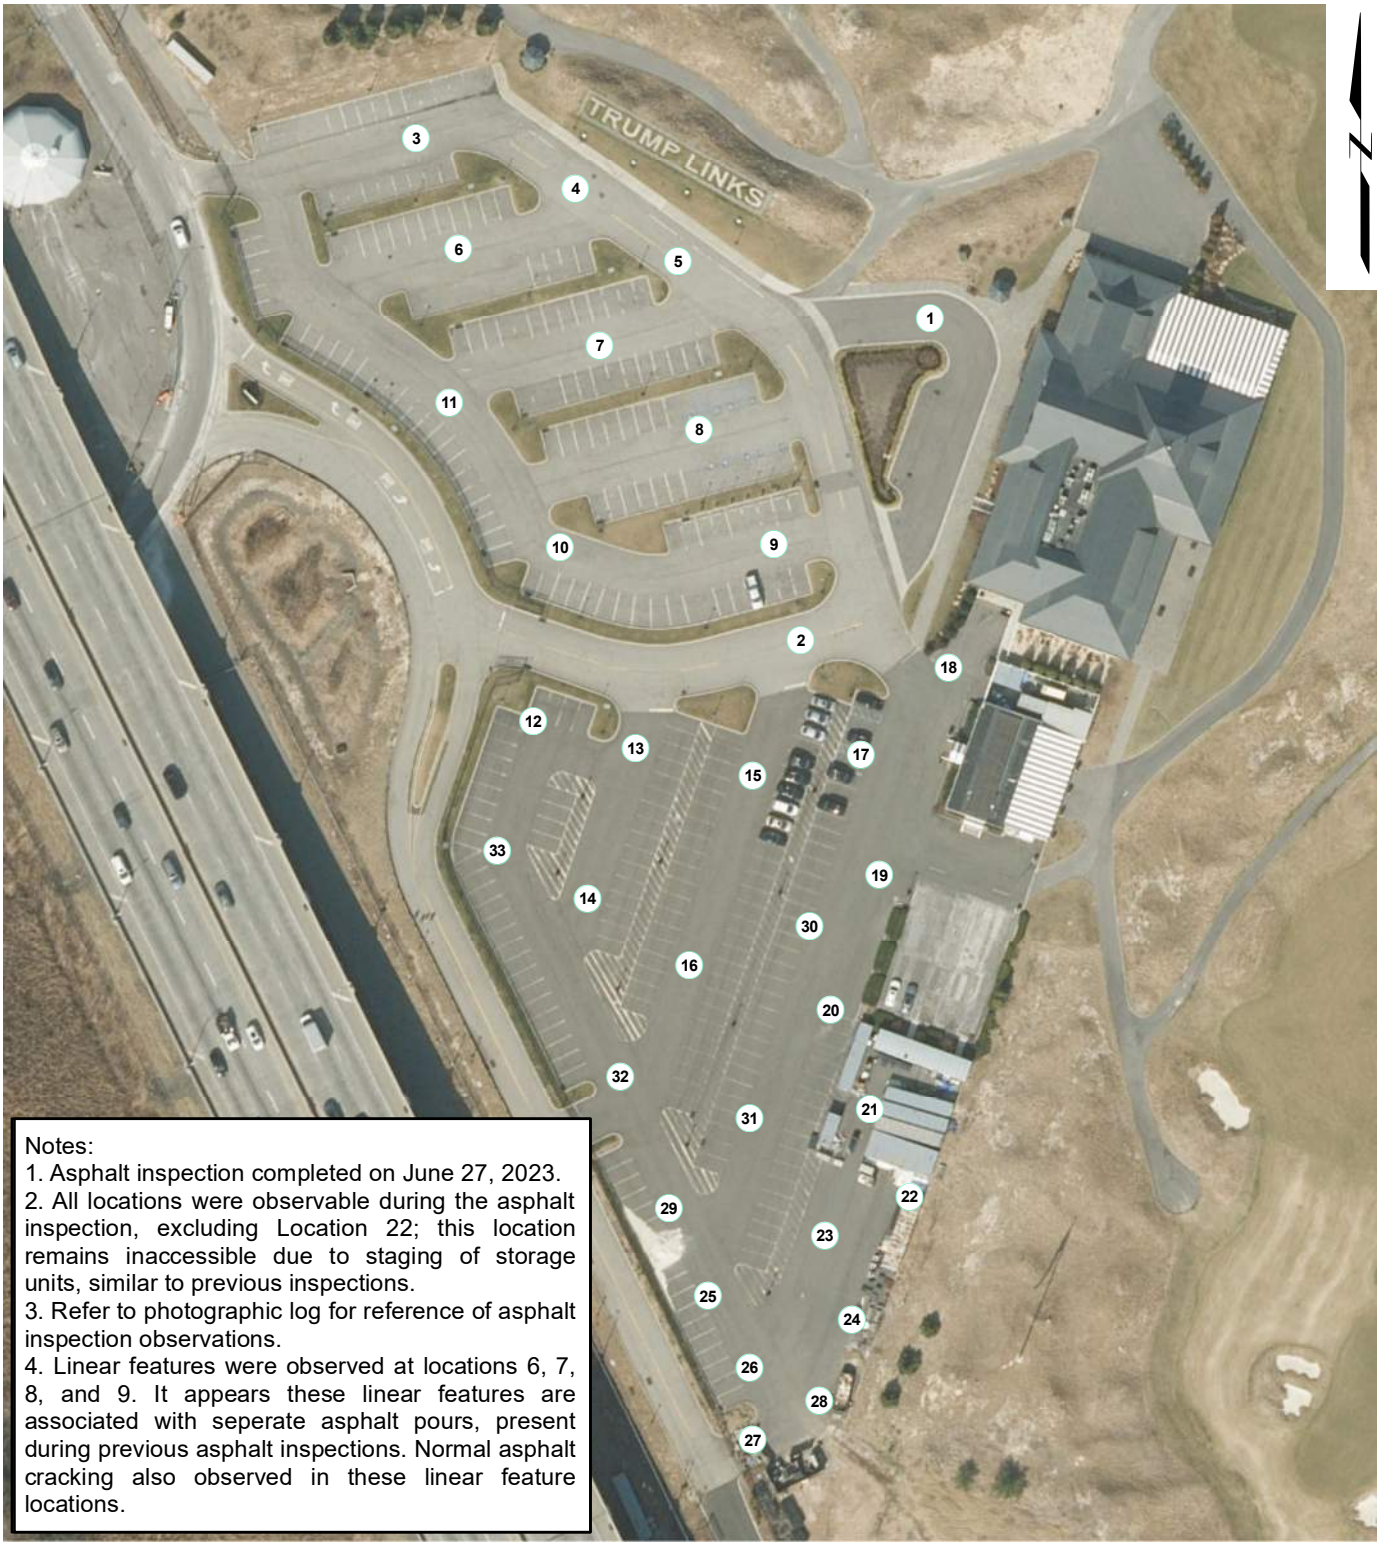
B:\Working\NYCDPR\2204594 Ferry Point Park Environmental Engineering\Reports\Asphalt Inspections\GEI Inspections\First Half 2023\Figure 1 - Site Location.mxd



Notes:
1. Asphalt inspection completed on June 27, 2023.
2. All locations were observable during the asphalt inspection, excluding Location 22; this location remains inaccessible due to staging of storage units, similar to previous inspections.
3. Refer to photographic log for reference of asphalt inspection observations.
4. Linear features were observed at locations 6, 7, 8, and 9. It appears these linear features are associated with seperate asphalt pours, present during previous asphalt inspections. Normal asphalt cracking also observed in these linear feature locations.

Corona, NY 11368

Dear Ms. Catalanotto:

**Re: Groundwater Sampling Summary Report – 2023 Sampling Event**
**Ferry Point Park Golf Course**
**NYSDEC Permit No. 2-6006-00014/00013**
**Bronx, NY**

GEI Consultants, Inc. (GEI) has prepared the following report on behalf of the New York City Department of Parks & Recreation (NYCDPR) to document the groundwater sampling event conducted on April 25 - 26, 2023, at the Ferry Point Park Golf Course. Groundwater sampling was performed in compliance with the New York State Department of Environmental Conservation (NYSDEC) Permit No. 2-6006-00014/00013, the October 2013 *Post Construction Custodial Care Plan*, and the NYSDEC letter dated January 7, 2020, in which the groundwater monitoring frequency was approved to be reduced from annually to biennially.

## Groundwater Sampling Methodology

GEI mobilized to the Ferry Point Golf Course on April 25 – 26, 2023 to collect groundwater samples from three (3) piezometers and five (5) groundwater monitoring wells (**Figure 1**). Consistent with previous monitoring events, PZ-01 and PZ-02 were sampled in place of historic monitoring wells GMW-3 and GMW-4 due to their abandonment during golf course construction activities. Additionally, PZ-15 was sampled in place of GMW-6 due to heavily overgrown vegetation and the inability to locate the historic monitoring well. These piezometers were previously chosen and sampled by Woodard & Curran during the 2018, 2019 and 2021 sampling events after confirmation that the piezometers are screened at similar intervals and elevations that the former groundwater monitoring wells were. GEI was also unable to locate GMW-8 and GMW-9, which were previously reported to be dry and unable to be sampled by Woodard & Curran during the 2018, 2019 and 2021 sampling events.

GEI Consultants, Inc.
530 7th Avenue, Suite 2007, New York, NY 10018
212.687.8282

Prior to collecting groundwater samples at the accessible piezometers and monitoring wells, the depth to groundwater and the total well depths were measured at each of the locations using an interface probe attached to a measuring tape, accurate to 0.01 foot. A groundwater contour map is included as **Figure 2** and the groundwater elevation readings are provided on **Table 1**.

Following gauging, the groundwater monitoring wells and piezometers were sampled in accordance with the September 19, 2011 "Field Sampling Procedures for Ferry Point Site" Technical Memorandum prepared by Ecology & Environment Inc. Prior to sample collection, three (3) to five (5) well volumes were purged from the wells using a dedicated polyethylene bailer, with the purged water being stored in a 55-gallon drum staged on Site. Field parameter readings were monitored during purging activities and included measurements for temperature, pH, oxidation reduction potential (ORP), specific conductivity, dissolved oxygen (DO), and turbidity. Groundwater purge and sampling logs are included in **Appendix B**. The drum was disposed of off-site on June 27, 2023, at Dale Transfer Corporation in West Babylon, NY via AARCO Environmental Services. Drum disposal documentation is included in **Appendix C**.

Groundwater samples collected during the sampling event were properly transported to CHEMTECH, a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP)-certified laboratory under chain-of-custody procedures and analyzed for the following:

- Total (unfiltered) and dissolved (lab-filtered) Target Analyte List (TAL) metals;
- Target Compound List (TCL) Semi-Volatile Organic Compounds (SVOCs);
- TCL Volatile Organic Compounds (VOCs);
- Alkalinity;
- Biological Oxygen Demand (BOD);
- Total Dissolved Solids (TDS);
- Chloride, bromide, sulfate, nitrate, nitrite;
- Color;
- Phenolics;
- Cyanide;
- Chemical Oxygen Demand (COD);
- pH;
- Hardness;
- Total Kjeldahl Nitrogen (TKN);
- Ammonia; and
- Total Organic Carbon (TOC).

In addition to the groundwater samples, quality assurance/quality control (QA/QC) samples including trip blanks, a field blank, a field duplicate, and a matrix spike/matrix spike duplicate (MS/MSD) were collected during the sampling event.

**Groundwater Analytical Results**

Groundwater analytical data is provided in **Table 2**, and the laboratory reports are included in **Appendix D**. Groundwater analytical results were compared to NYSDEC Technical and Operational Guidance Series (TOGS) Ambient Water Quality Standards (AWQS) for Class GA. The analytical results of groundwater samples are summarized below:

*Volatile Organic Compounds (VOCs)*

- Common laboratory contaminants, acetone, 2-Butanone, methylene chloride, and carbon disulfide, were detected in multiple groundwater samples (GMW-1, GMW-11, PZ-15, GMW-10, GMW-7, PZ-01, PZ-02, GMW-X [the duplicate sample of GMW-11], GMW-5, trip blank and field blank) but mostly at concentrations below their respective NYSDEC AWQS. Acetone was detected in exceedance of its AWQS in GMW-1.

- Numerous VOCs typical of landfill operations, including cis-1,2-Dichloroethene, 1,4-Dichlorobenzene, isopropylbenzene (cumene), and benzene were detected in groundwater samples collected from PZ-01, GMW-1, PZ-15, GMW-10, GMW-X (the duplicate sample of GMW-11), and at concentrations well below their respective NYSDEC AWQS.

- Trichloroethene was detected in PZ-01 and GMW-5 well below its NYSDEC AWQS. However, trichloroethene was also detected in the trip blank at similar levels to those reported at PZ-01 and GMW-5, indicating potential cross-contamination during the shipping and/or handling process. Trichloroethene has not been detected in any samples during the 2018, 2019 or 2021 sampling events.

- Chlorobenzene, a common waste byproduct from the production of chlorinated solvents and pesticides, was detected above the NYSDEC AWQS in PZ-15. Chlorobenzene was also detected in GMW-1 and GMW-10, but below the NYSDEC AWQS. This is consistent with previous sampling events.

*Semi-Volatile Organic Compounds (SVOCs)*

- Naphthalene, a contaminant typically found at or around landfills, was detected at GMW-11 and its duplicate, GMW-X, at levels in exceedance of

its NYSDEC AWQS. This is consistent with concentrations detected at this location during post-closure sampling events.

- Carbazole, generally released into the environment from sources such as waste incineration and/or rubber, petroleum, coal and wood combustion, was detected in GMW-11 and its duplicate, GMW-X, however, there is no NYSDEC AWQS criteria to be met for this compound.

*Metals – Total (unfiltered) and Dissolved (lab-filtered)*

- Total heavy metals including arsenic, cobalt, silver, and zinc were detected in various samples below their respective NYSDEC AWQS.
- Total antimony was detected above the NYSDEC AWQS in samples collected from PZ-01 and PZ-02. Antimony was also detected in GMW-11, GMW-1, GMW-10, and GMW-7 below the AWQS. Antimony was not detected in the dissolved phase.
- Barium was detected above its NYSDEC AWQS in PZ-02 (total), GMW-1 (total and dissolved) and PZ-15 (total). Barium (total and dissolved) was also detected in all other collected samples at concentrations below the AWQS.
- Total cadmium was detected above the NYSDEC AWQS in the sample collected from PZ-15. Cadmium was also detected in other locations both in the total and dissolved phase, but below its AWQS.
- The sample collected form PZ-15 had reported exceedances of total chromium above the NYSDEC AWQS. PZ-01, PZ-02, GMW-11, GMW-X (the duplicate sample of GMW-11), GMW-5, GMW-1, GMW-10, and GMW-7 all had chromium reported below its AWQS. Chromium in the dissolved phase was either non-detect or present in low levels.
- Total copper exceedances of the AWQS were detected in PZ-01 and PZ-15 samples and below the AWQS in the dissolved phase. Copper was also detected in other samples below the AWQS (total and dissolved).
- Total iron was detected above its NYSDEC AWQS in all groundwater samples. Dissolved iron was only present in PZ-01 and GMW-1 in exceedance of its respective AWQS.
- Total lead was reported above its AWQS in all samples except GMW-5, however dissolved lead was non-detect in all collected samples.
- Samples collected from PZ-01, PZ-02, GMW-11, GMW-X (the duplicate sample of GMW-11), PZ-15 and GMW-10 detected total manganese above its AWQS, but only in exceedance in the dissolved phase in PZ-01 and GMW-10.

- Total mercury was detected above its NYSDEC AWQS in PZ-02 and PZ-15, with detections below the AWQS in several other samples. Dissolved mercury was non-detect in all collected samples.
- PZ-15 reported a concentration for total nickel above the AWQS but non-detect in the dissolved phase.
- Sodium was reported above its respective NYSDEC AWQS (total and dissolved) for all groundwater samples excluding GMW-5 and GMW-10.

*Phenolics*

- Phenolics were detected in GMW-11 and its duplicate sample, GMW-X, however there is no NYSDEC AWQS to be met. Phenolics were non-detect in all other groundwater samples.

*Cyanide*

- Cyanide was detected above its NYSDEC AWQS in PZ-15 and GMW-10. In prior sampling events, cyanide concentrations were either non-detect or less than 10 ug/l in the aforementioned locations. Cyanide was also present in all other groundwater samples below the AWQS. The presence of cyanide is generally consistent with other previous post-closure monitoring events, however, exceedances of the AWQS were only reported during the 2023 sampling event.

*Anions*

- Bromide was detected in PZ-02, GMW-1 and PZ-15 at concentrations below its respective AWQS.
- Chloride was detected in all samples collected at concentrations below its respective AWQS.
- Nitrate was detected in PZ-01, GMW-11, PZ-15 and GMW-7 at concentrations below its respective AWQS.
- Sulfate was detected in GMW-11 and its duplicate (GMW-X) at concentrations exceeding its AWQS. Sulfate was also detected in all other samples at concentrations below the AWQS.

## Conclusions

Results from the groundwater sampling event conducted on April 25-26, 2023, indicate that groundwater flow direction and elevation have remained consistent across the Site. A review of the groundwater contours included in Figure 4 from the 2021 sampling event indicate that the groundwater elevation and flow are consistent with 2023 data.

The analytical results for samples collected during the April 2023 sampling event indicate that the groundwater in certain locations beneath Site contains VOCs, SVOCs, metals, ammonia, sulfate and cyanide above NYSDEC AWQS. With the exception of cyanide, the April 2023 event detections of VOCs, SVOCs, metals, and phenolics are generally consistent in location and/or concentration with previous sampling events. GEI suggests continued monitoring of cyanide concentrations for exceedances during future sampling events.

Similar to the 2021 sampling event, chlorobenzene was detected in PZ-15 at a concentration exceeding the NYSDEC AWQS. The concentration of chlorobenzene detected at this location during the April 2023 event is overall consistent with the previous sampling events conducted in 2021 and 2019. Other VOCs such as acetone, 2-Butanone, methylene chloride, and carbon disulfide were also detected, however, these compounds are known to be laboratory contaminants.

One or more metals (total [unfiltered] and dissolved [lab-filtered]) were detected in exceedance of their respective NYSDEC AWQS in all samples collected across the Site. The reported elevated metal concentrations for the 2023 event are consistent with locations and concentrations with previous post-closure sampling events.

Certain SVOCs (including Dimethylphthalate, Di-n-butylphthalate, Acenaphthene) were detected during the 2021 sample event but are now non-detect.

The results of samples collected from PZ-01, PZ-02, and PZ-15 during the 2023 sampling event are consistent with the results reported for the 2021 and 2019 sample events, suggesting they are still acceptable sample location substitutions for missing/abandoned ground water monitoring wells GMW-3, GMW-4, and GMW-6.

Based on the results of the most recent groundwater sampling event and review of previous events, GEI recommends to NYCDPR that the following requests be made to NYSDEC for future post-closure groundwater quality monitoring events:

1. Terminate VOC monitoring from all sampling locations except PZ-15 where chlorobenzene continues to be detected at concentrations in exceedance of its respective AWQS of 5 ug/l. All other locations have either been reported as non-detect or below the AWQS during the 2019, 2021 and 2023 sampling events.

2. Terminate SVOC monitoring from all sampling locations except GMW-11 where naphthalene continues to be detected at concentrations either just below or in exceedance of its respective AWQS of 10 ug/l. All other locations have either been reported as non-detect or below the AWQS during the 2019, 2021 and 2023 sampling events.

GEI Consultants, Inc.
530 7th Avenue, Suite 2007, New York, NY 10018
212.687.8282

3. Terminate total (unfiltered) metals monitoring from all sampling locations. It is suspected that the total metals concentrations are likely associated with high turbidity (as noted in the sampling logs) and particulates in the monitoring wells/piezometers and does not reflect accurate groundwater concentrations.

4. Continue groundwater analysis of dissolved (lab-filtered) metals, general chemistry, phenolics, anions, and cyanide for all sampling locations.

If you have any questions, please feel free to contact me at (347) 514–3861.

Sincerely,

GEI CONSULTANTS, INC.

**Notes**

**--** - Not analyzed

N (Organics) - Presumptive Evidence of a Compound

N (Inorganics) - The matrix spike recovery was outside control limits

NS - No Standard

**Bold** - Indicates a detected concentration

**Bold and shaded** - Indicates an exceedance of TOGS GA Ambient Water Quality Standards

U - The compound was not detected at the indicated concentration.

J - Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than MDL. The concentration given is an approximate value.

B - The analyte was found in the laboratory blank as well as the sample. This indicates possible laboratory contamination of the environmental sample.

P - For dual column analysis, the percent difference between the quantitated concentrations on the two columns is greater than 40%.

Q - Indicates LCS control criteria did not meet requirements.

Re: Ferry Point Park Golf Course
Permit No. 2-6006-00014/00013
Post-Closure Groundwater Monitoring
Request for Cessation for Groundwater Monitoring

Dear Mr. Rowland,

New York State Department of Environmental Conservation (Department) staff have reviewed your November 20, 2019 request to terminate the Ferry Point Golf Course post-closure groundwater monitoring program This request is based on the relatively consistent ground water elevation and flow direction, the laboratory results from ground water samples collected during both pre-closure and post closure monitoring over an eight-year period of monitoring events, and the lack of any potential direct receptors or routes of exposure associated with ground water at Ferry Point Park.

After careful review of the post-closure groundwater monitoring program, the laboratory results from ground water samples collected during both pre-closure and post closure monitoring over an eight-year period of monitoring events and specific circumstances and history of this site, the Department cannot grant this request but rather the following frequency reduction to the Ferry Point Golf Course groundwater monitoring program can be implemented:

1) Starting immediately, the Ferry Point Golf Course groundwater monitoring frequency can be reduced from annual to once every two years through 2030.

2) After 2030, the Ferry Point Golf Course groundwater monitoring frequency can be modified from once every two years to once every five years indefinitely as custodial care consistent with Part 363-9.6(b).

If you have any questions you may contact me at 718-482-4996.

Sincerely,

Kenneth B. Brezner

Kenneth B. Brezner, P.E.

Groundwater Sampling Forms

## Low-Flow Groundwater Sampling Form

Project number and name: Ferry Point | Sampling personnel: S.M & E.S. (Proffered) | Sample date: 4/25/23 | Well ID: PZ-01

Well location description: _____

**Well Construction**

Well diameter: 2"
Well measurement point: _____
Roadbox condition: _____
Well screen interval: _____
Well depth: 22.54

**Sampling Information**

Initial depth to water: 21.12 Time: 08:03
Sample intake depth: 22
Pump type and ID: Bailer
Stabilized flow rate: _____

Stabilized flow rate = flow rate with no further drawdown

VOl = 0.22 gal
0.0 ppm outer
0.0 ppm inner

**Samples Collected**

| | |
|---|---|
| VOCs 8260 SIM | X |
| SVOCs 8270 SIM | X |
| Metals | X |
| M/E/E | |
| Nitrate/Sulfate | X |

Temp. +/- 10%
Turb. <10 NTU

**Guidance:**

1 Position tubing at midpoint of saturated screened interval
2 Minimize drop in water level and purge until parameters are stable
3 Disconnect flow thru cell during sampling
4 Call Project Manager if issues arise (e.g. stabilization takes more than 2 hrs, well goes dry, odd data).
5 For VPH and VOC samples, if stabilization flow rate is less than 200 ml/min, contact PM

| 6 | 1.50 |

well volume =
3.14 x (r)^2 x 7.48 gal/ft
where r = 1/2 diameter in ft

Stabilization Criteria:
Sp.Cond. +/- 10%
DO +/- 10%
ORP +/- 10 mV
pH +/- 10%
Temp. +/- 10%
Turb. <10 NTU

**Guidance:**

1 Position tubing at midpoint of saturated screened interval
2 Minimize drop in water level and purge until parameters are stable
3 Disconnect flow thru cell during sampling
4 Call Project Manager if issues arise (e.g. stabilization takes more than 2 hrs, well goes dry, odd data).
5 For VPH and VOC samples, if stabilization flow rate is less than 200 ml/min, contact PM

**WASTE DESCRIPTION:**

Purged groundwater from wells installed on current golf course (previously landfill)

**MANUFACTURING/PROCESS DESCRIPTION:**

**TYPE OF CONTAMINATION:**

Gasoline ☐ Diesel ☐ Fuel Oil (2,4,6) ☐ Hydraulic Oil ☐ Other: Landfill (low level
Kerosene ☐ Jet Fuel ☐ Motor Oil ☐ Used Oil ☐ VOC,SVOC, metals)

**CONTAMINATION SOURCE:**

UST ☐ Historic ☐ Other: Former landfill
AST ☐ Spill ☐

**SITE USAGE HISTORY:**

Industrial ☐ Residential ☐
Commercial ☐ Other: Former landfill, current golf cc

**PHYSICAL PROPERTIES:**

COLOR: cloudy, brown-grey
ODOR: ☐ None ☑ Mild ☐ Strong
Describe:

**PHYSICAL STATE:**

| | | | |
|---|---|---|---|
| Liquid | ☑ | Multi-layerd | ☐ |
| Semi-Solid | ☐ | Bi-layered | ☐ |
| Solid | ☐ | Singe Phase | ☐ |
| Powder | ☐ | Gas/Aerosol | ☐ |

**REACTIVITY:**

| | | |
|---|---|---|
| Total Cyanides | | ☑ None |
| Amenable Cyanides | | ☑ None |
| Reactive Sulfidies | | ☑ None |
| Shock Sensative | ☐ Yes | ☑ No |
| Generates Toxic fumes when mixed w/water, acid, or base | ☐ Yes | ☑ No |

**FLASH POINT:**

| | |
|---|---|
| < 100 | ☐ |
| ≥ 100 ≤ 140 | ☐ |
| > 140 ≤ 200 | ☐ |
| > 200 | ☐ |

**CORROSITIVITY:**

| | |
|---|---|
| ≤ 2.0 | ☐ |
| 2.01 - 5.0 | ☐ |
| 5.01 - 9.0 | ☑ |
| 9.01 - 12.49 | ☑ |
| ≥ 12.50 | ☐ |

**SHIPPING INFORMATION:**

Vactor ☐ Vac Truck ☐ Drums ☑
Other:
Anticipated Volume (Gallons/Tons) 55 gallons
One Time ☑ Week ☐ Month ☐
Quarter ☐ Year ☐ Other:

**CHEMICAL COMPOSITION/CHARACTERISTICS:**

| | |
|---|---|
| Groundwater | % 100 |
| | % |
| | % |

**REGULATORY INFORMATION:**

Proper Shipping Name: Non-hazardous well purge water

Analytical Attached: Yes ☑ No ☐ Lab: Chemtec

Disposition: Landfill ☐ Recycling ☑ Other: Disposal Facility

**Generator's Certification: I certify the material described above on this profile are Non-Hazardous therefore not subject to federal regulations for reporting disposal of hazardous waste.**

**Notes**

**-- -** Not analyzed

N (Organics) - Presumptive Evidence of a Compound

N (Inorganics) - The matrix spike recovery was outside control limits

NS - No Standard

**Bold** - Indicates a detected concentration

**Bold and shaded** - Indicates an exceedance of TOGS GA Ambient Water Quality Standards

U - The compound was not detected at the indicated concentration.

J - Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than MDL. The concentration given is an approximate value.

B - The analyte was found in the laboratory blank as well as the sample. This indicates possible laboratory contamination of the environmental sample.

P - For dual column analysis, the percent difference between the quantitated concentrations on the two columns is greater than 40%.

Q - Indicates LCS control criteria did not meet requirements.

Please print or type.
(Form designed for use on elite (12-pitch) typewriter.)

# CASE NARRATIVE

**GEI Consultants, Inc., P.C.**
**Project Name: Ferry Point**
**Project # N/A**
**Chemtech Project # O2495**
**Test Name: VOC-TCLVOA-10**

**A. Number of Samples and Date of Receipt:**
11 Water samples were received on 04/25/2023.

**B. Parameters**
According to the Chain of Custody document, the following analyses were requested: Alkalinity, Ammonia, Anions Group1, BOD5, COD, Cyanide, Dissolved ICP-TAL Metals, Dissolved Mercury, DISSOLVED METALS-TAL, Hardness, Total, Mercury, Metals ICP-TAL, METALS-TAL, pH, Phenolics, SVOC-TCL BNA -20, TDS, TKN, TOC and VOC-TCLVOA-10. This data package contains results for VOC-TCLVOA-10.

**C. Analytical Techniques:**
The analysis performed on instrument MSVOA_X were done using GC column DB-624UI 20m 0.18mm 1.0 um. Cat#121-1324UIThe analysis of VOC-TCLVOA-10 was based on method 8260D.

**D. QA/ QC Samples:**
The Holding Times were met for all analysis.
The Surrogate recoveries met the acceptable criteria.
The Internal Standards Areas met the acceptable requirements.
The Retention Times were acceptable for all samples.
The RPD met criteria .
The Blank Spike met requirements for all samples .
The Blank Spike Duplicate met requirements for all samples .
The Blank analysis did not indicate the presence of lab contamination.
The Initial Calibration met the requirements .

The Continuous Calibration File ID VX035415.D met the requirements except for 2-Butanone is failing marginally Low therefore no corrective action taken.

The Tuning criteria met requirements.

**E. Additional Comments:**
Samples for MS/MSD for VOC analysis were not provided with this set of samples. The Blank Spike Duplicate is reported with the data.

CHEMTECH
284 Sheffield Street, Mountainside, NJ 07092 Phone: 908 789 8900 Fax: 908 789 8922
Please use %D calculated based on Avg RF and CCRF for all compounds using Average Response Factor when the %RSD value for a compound is <20% for the Initial Calibration curve and use %D calculated based on Amount added and Calculated amount for all compounds using Linear Regression when the %RSD value for a compound is > 20% for the Initial Calibration curve for SW-846 analysis.

**F. Manual Integration Comments:**
Please refer to the Manual integration Report included with the Run Logs for information on the manual integrations performed.

---

I certify that the data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. The laboratory manager or his designee, as verified by the following signature has authorized release of the data contained in this hard copy data package.

# CASE NARRATIVE

**GEI Consultants, Inc., P.C.**
**Project Name: Ferry Point**
**Project # N/A**
**Chemtech Project # O2495**
**Test Name: SVOC-TCL BNA -20**

**A. Number of Samples and Date of Receipt:**
11 Water samples were received on 04/25/2023.

**B. Parameters**
According to the Chain of Custody document, the following analyses were requested: Alkalinity, Ammonia, Anions Group1, BOD5, COD, Cyanide, Dissolved ICP-TAL Metals, Dissolved Mercury, DISSOLVED METALS-TAL, Hardness, Total, Mercury, Metals ICP-TAL, METALS-TAL, pH, Phenolics, SVOC-TCL BNA -20, TDS, TKN, TOC and VOC-TCLVOA-10. This data package contains results for SVOC-TCL BNA -20.

**C. Analytical Techniques:**
The samples were analyzed on instrument BNA_F using GC Column DB-UI 8270D which is 20 meters, 0.18 mm ID, 0.36 um dfThe analysis of SVOC-TCL BNA -20 was based on method 8270E and extraction was done based on method 3510.

**D. QA/ QC Samples:**
The Holding Times were met for all analysis.
The Surrogate recoveries met the acceptable criteria.
The Internal Standards Areas met the acceptable requirements.
The Retention Times were acceptable for all samples.
The RPD met criteria .
The Blank Spike met requirements for all samples .
The Blank Spike Duplicate met requirements for all samples .
The Blank analysis did not indicate the presence of lab contamination.

The % RSD is greater than 20% in the Initial Calibration method (Method 8270-BF042123.M) for Benzaldehyde,this compound is passing on Quadratic regression.

The Continuous Calibration met the requirements .
The Tuning criteria met requirements.

**E. Additional Comments:**
The Form 6 is not included in the data package because the Initial Calibration was performed using 8 points.

CHEMTECH
284 Sheffield Street, Mountainside, NJ 07092 Phone: 908 789 8900 Fax: 908 789 8922

Please use %D calculated based on Avg RF and CCRF for all compounds using Average Response Factor when the %RSD value for a compound is <15% for the Initial Calibration curve and use %D calculated based on Amount added and Calculated amount for all compounds using Linear Regression when the %RSD value for a compound is > 15% for the Initial Calibration curve for SW-846 analysis.

**F. Manual Integration Comments:**
Please refer to the Manual integration Report included with the Run Logs for information on the manual integrations performed.

# CASE NARRATIVE

**GEI Consultants, Inc., P.C.**
**Project Name: Ferry Point**
**Project # N/A**
**Chemtech Project # O2495**
**Test Name: Dissolved ICP-TAL Metals,Metals ICP-TAL,Dissolved Mercury,Mercury**

**A. Number of Samples and Date of Receipt:**
11 Water samples were received on 04/25/2023.

**B. Parameters:**
According to the Chain of Custody document, the following analyses were requested: Alkalinity, Ammonia, Anions Group1, BOD5, COD, Cyanide, Dissolved ICP-TAL Metals, Dissolved Mercury, DISSOLVED METALS-TAL, Hardness, Total, Mercury, Metals ICP-TAL, METALS-TAL, pH, Phenolics, SVOC-TCL BNA -20, TDS, TKN, TOC and VOC-TCLVOA-10. This data package contains results for Dissolved ICP-TAL Metals,Metals ICP-TAL,Dissolved Mercury,Mercury.

**C. Analytical Techniques:**
The analysis of Dissolved ICP-TAL Metals,Metals ICP-TAL was based on method 6010D, digestion based on method 3010 (waters). The analysis and digestion of Dissolved Mercury,Mercury was based on method 7470A.

**D. QA/ QC Samples:**
The Holding Times were met for all analysis.
The Blank Spike met requirements for all samples.
The Duplicate analysis met criteria for all samples.
The Matrix Spike (GMW-5MS) analysis met criteria for all samples except for Sodium due to both chemicals interference during digestion and unknow sample matrix interference.
The Matrix Spike Duplicate (GMW-5MSD) analysis met criteria for all samples except for Iron, Sodium due to both chemicals interference during digestion and unknow sample matrix interference.
The Blank analysis did not indicate the presence of lab contamination.
The Calibration met the requirements.
The Serial Dilution met the acceptable requirements.

**E. Additional Comments:**
In analytical sequence LB125255, The % recovery was outside of acceptance limit for Vanadium of CCV05 and for Barium, Vanadium of CCV06 but, no any samples associated under these CCVs.
Sample -O2495-01, O2495-03, O2495-05, O2495-07, O2495-09 were analyzed as Total Metal and sample -O2495-02, O2495-04, O2495-06, O2495-08, O2495-10 were analyzed as Dissolve Metal.

I certify that the data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. # CASE NARRATIVE

**GEI Consultants, Inc., P.C.**
**Project Name: Ferry Point**
**Project # N/A**
**Chemtech Project # O2495**
**Test Name:**
**pH,Alkalinity,Cyanide,TOC,Phenolics,TKN,Ammonia,TDS,COD,BOD5,Anions Group1**

**A. Number of Samples and Date of Receipt:**
11 Water samples were received on 04/25/2023.

**B. Parameters:**
According to the Chain of Custody document, the following analyses were requested: Alkalinity, Ammonia, Anions Group1, BOD5, COD, Cyanide, Dissolved ICP-TAL Metals, Dissolved Mercury, DISSOLVED METALS-TAL, Hardness, Total, Mercury, Metals ICP-TAL, METALS-TAL, pH, Phenolics, SVOC-TCL BNA -20, TDS, TKN, TOC and VOC-TCLVOA-10. This data package contains results for pH, Alkalinity, Cyanide, TOC, Phenolics, TKN, Ammonia, TDS, COD, BOD5, Anions Group1.

**C. Analytical Techniques:**
The analysis of Anions Group1 was based on method 300.0, The analysis of Phenolics was based on method 420.1, The analysis of Cyanide was based on method 9012B, The analysis of pH was based on method 9040C, The analysis of TOC was based on method 9060A, The analysis of Alkalinity was based on method SM2320 B, The analysis of TDS was based on method SM2540 C, The analysis of TKN was based on method SM4500 N Org B or C, The analysis of Ammonia was based on method SM4500-NH3, The analysis of BOD5 was based on method SM5210 B and The analysis of COD was based on method SM5220 D.

**D. QA/ QC Samples:**
The Holding Times were met for all samples except for GMW-11 of pH, for GMW-5 of pH.for GMW-X of pH.for PZ-01 of pH.for PZ-02 of pH as samples were receive out of hold.
Sample PZ-01 was diluted due to high concentrations for Ammonia as N,Chloride & Sample PZ-02 was diluted due to high concentrations for Ammonia as N,TKN,Chloride & Sample GMW-11 was diluted due to high concentrations for Chloride,Sulfate & Sample GMW-X was diluted due to high concentrations for Chloride,Sulfate.
The Blank Spike met requirements for all samples.
The Duplicate analysis met criteria for all samples.
The Matrix Spike (GMW-7MS) analysis met criteria for all samples except for Ammonia as N and Phenolics due to matrix interferences.
The Matrix Spike Duplicate (GMW-7MSD) analysis met criteria for all samples except for Ammonia as N and Phenolics due to matrix interferences.
The Blank analysis did not indicate the presence of lab contamination.

**E. Additional Comments:**

# DATA REPORTING QUALIFIERS- INORGANIC

For reporting results, the following " Results Qualifiers" are used:

| | |
|---|---|
| **J** | Indicates the reported value was obtained from a reading that was less than the Contract Required Detection Limit (CRDL), but greater than or equal to the Instrument Detection Limit (IDL). |
| **U** | Indicates the analyte was analyzed for, but not detected. |
| **ND** | Indicates the analyte was analyzed for, but not detected |
| **E** | Indicates the reported value is estimated because of the presence of interference |
| **M** | Indicates Duplicate injection precision not met. |
| **N** | Indicates the spiked sample recovery is not within control limits. |
| **S** | Indicates the reported value was determined by the Method of Standard Addition (MSA). |
| * | Indicates that the duplicate analysis is not within control limits. |
| + | Indicates the correlation coefficient for the MSA is less than 0.995. |
| **D** | Indicates the reported value is from a secondary analysis with a dilution factor. The original analysis exceeded the calibration range. |
| **M** | Method qualifiers<br>**"P"** for ICP instrument<br>**"PM"** for ICP when Microwave Digestion is used<br>**"CV"** for Manual Cold Vapor AA<br>**"AV"** for automated Cold Vapor AA<br>**"CA"** for MIDI-Distillation Spectrophotometric<br>**"AS"** for Semi –Automated Spectrophotometric<br>**"C"** for Manual Spectrophotometric<br>**"T"** for Titrimetric<br>**"NR"** for analyte not required to be analyzed |
| **OR** | Indicates the analyte's concentration exceeds the calibrated range of the instrument for that specific analysis. |
| **Q** | Indicates the LCS did not meet the control limits requirements |
| H | Sample Analysis Out Of Hold Time |

## DATA REPORTING QUALIFIERS- ORGANIC

For reporting results, the following " Results Qualifiers" are used:

| | |
|---|---|
| Value | If the result is a value greater than or equal to the detection limit, report the value |
| **U** | Indicates the compound was analyzed for but was not detected. Report the minimum detection limit for the sample with the U, i.e. "10 U". This is not necessarily the instrument detection limit attainable for this particular sample based on any concentration or dilution that may have been required. |
| **ND** | Indicates the analyte was analyzed for, but not detected |
| **J** | Indicates an estimated value**.** This flag is used:<br>(1) When estimating a concentration for a tentatively identified compound (library search hits, where a 1:1 response is assumed.)<br>(2) When the mass spectral data indicated the identification, however the result was less than the specified detection limit greater than zero. If the detection limit was 10ug/L and a concentration of 3 ug/L was calculated report as 3 J. This is flag is used when similar situation arise on any organic parameter i.e. Pest, PCB and others. |
| **B** | Indicates the analyte was found in the blank as well as the sample report as "12 B". |
| **E** | Indicates the analyte 's concentration exceeds the calibrated range of the instrument for that specific analysis. |
| **D** | This flag identifies all compounds identified in an analysis at a secondary dilution factor. |
| **P** | This flag is used for Pesticide/PCB target analyte when there is >25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form 1 and flagged with a "P". |
| **N** | This flag indicates presumptive evidence of a compound. This is only used for tentatively identified compounds (TICs), where the identification is based on a mass spectral library search. It applies to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the flag is not used. |
| **A** | This flag indicates that a Tentatively Identified Compound is a suspected aldol-condensation product. |
| **Q** | Indicates the LCS did not meet the control limits requirements |

## APPENDIX A

## QA REVIEW GENERAL DOCUMENTATION

**Project #:** O2495

| | Completed |
|---|---|
| **For thorough review, the report must have the following:** | |
| **GENERAL:** | |
| **Are all original paperwork present (chain of custody, record of communication,airbill, sample management lab chronicle, login page)** | ✓ |
| **Check chain-of-custody for proper relinquish/return of samples** | ✓ |
| **Is the chain of custody signed and complete** | ✓ |
| **Check internal chain-of-custody for proper relinquish/return of samples /sample extracts** | ✓ |
| **Collect information for each project id from server. Were all requirements followed** | ✓ |
| **COVER PAGE:** | |
| **Do numbers of samples correspond to the number of samples in the Chain of Custody on login page** | ✓ |
| **Do lab numbers and client Ids on cover page agree with the Chain of Custody** | ✓ |
| **CHAIN OF CUSTODY:** | |
| **Do requested analyses on Chain of Custody agree with form I results** | ✓ |
| **Do requested analyses on Chain of Custody agree with the log-in page** | ✓ |
| **Were the correct method log-in for analysis according to the Analytical Request and Chain of Castody** | ✓ |
| **Were the samples received within hold time** | ✓ |
| **Were any problems found with the samples at arrival recorded in the Sample Management Laboratory Chronicle** | ✓ |
| **ANALYTICAL:** | |
| **Was method requirement followed?** | ✓ |
| **Was client requirement followed?** | ✓ |
| **Does the case narrative summarize all QC failure?** | ✓ |
| **All runlogs and manual integration are reviewed for requirements** | ✓ |
| **All manual calculations and /or hand notations verified** | ✓ |

| Sulfate | 292 | D | 20 | 11.0 | 60.0 | mg/L | | 04/27/23 13:26 | 300.0 |

Comments:

U = Not Detected
LOQ = Limit of Quantitation
MDL = Method Detection Limit
LOD = Limit of Detection
D = Dilution
Q = indicates LCS control criteria did not meet requirements
H = Sample Analysis Out Of Hold Time

J = Estimated Value
B = Analyte Found in Associated Method Blank
* = indicates the duplicate analysis is not within control limits.
E = Indicates the reported value is estimated because of the presence of interference.
OR = Over Range
N =Spiked sample recovery not within control limits

# CASE NARRATIVE

**GEI Consultants, Inc., P.C.**
**Project Name: Ferry Point**
**Project # N/A**
**Chemtech Project # O2495**
**Test Name: VOC-TCLVOA-10**

**A. Number of Samples and Date of Receipt:**
11 Water samples were received on 04/25/2023.

**B. Parameters**
According to the Chain of Custody document, the following analyses were requested: Alkalinity, Ammonia, Anions Group1, BOD5, COD, Cyanide, Dissolved ICP-TAL Metals, Dissolved Mercury, DISSOLVED METALS-TAL, Hardness, Total, Mercury, Metals ICP-TAL, METALS-TAL, pH, Phenolics, SVOC-TCL BNA -20, TDS, TKN, TOC and VOC-TCLVOA-10. This data package contains results for VOC-TCLVOA-10.

**C. Analytical Techniques:**
The analysis performed on instrument MSVOA_X were done using GC column DB-624UI 20m 0.18mm 1.0 um. Cat#121-1324UIThe analysis of VOC-TCLVOA-10 was based on method 8260D.

**D. QA/ QC Samples:**
The Holding Times were met for all analysis.
The Surrogate recoveries met the acceptable criteria.
The Internal Standards Areas met the acceptable requirements.
The Retention Times were acceptable for all samples.
The RPD met criteria .
The Blank Spike met requirements for all samples .
The Blank Spike Duplicate met requirements for all samples .
The Blank analysis did not indicate the presence of lab contamination.
The Initial Calibration met the requirements .

The Continuous Calibration File ID VX035415.D met the requirements except for 2-Butanone is failing marginally Low therefore no corrective action taken.

The Tuning criteria met requirements.

**E. Additional Comments:**
Samples for MS/MSD for VOC analysis were not provided with this set of samples. The Blank Spike Duplicate is reported with the data.

CHEMTECH
284 Sheffield Street, Mountainside, NJ 07092 Phone: 908 789 8900 Fax: 908 789 8922
Please use %D calculated based on Avg RF and CCRF for all compounds using Average Response Factor when the %RSD value for a compound is <20% for the Initial Calibration curve and use %D calculated based on Amount added and Calculated amount for all compounds using Linear Regression when the %RSD value for a compound is > 20% for the Initial Calibration curve for SW-846 analysis.

**F. Manual Integration Comments:**
Please refer to the Manual integration Report included with the Run Logs for information on the manual integrations performed.

---

I certify that the data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. The laboratory manager or his designee, as verified by the following signature has authorized release of the data contained in this hard copy data package.

# CASE NARRATIVE

**GEI Consultants, Inc., P.C.**
**Project Name: Ferry Point**
**Project # N/A**
**Chemtech Project # O2521**
**Test Name: SVOC-TCL BNA -20**

**A. Number of Samples and Date of Receipt:**
15 Water samples were received on 04/26/2023.

**B. Parameters**
According to the Chain of Custody document, the following analyses were requested: Alkalinity, Ammonia, Anions Group1, BOD5, COD, Cyanide, Dissolved ICP-TAL Metals, Dissolved Mercury, DISSOLVED METALS-TAL, Hardness, Total, Mercury, Metals ICP-TAL, METALS-TAL, pH, Phenolics, SVOC-TCL BNA -20, TDS, TKN, TOC and VOC-TCLVOA-10. This data package contains results for SVOC-TCL BNA -20.

**C. Analytical Techniques:**
The samples were analyzed on instrument BNA_F using GC Column DB-UI 8270D which is 20 meters, 0.18 mm ID, 0.36 um dfThe analysis of SVOC-TCL BNA -20 was based on method 8270E and extraction was done based on method 3510.

**D. QA/ QC Samples:**
The Holding Times were met for all analysis.
The Surrogate recoveries met the acceptable criteria.
The Internal Standards Areas met the acceptable requirements.
The Retention Times were acceptable for all samples.

The MS {O2521-09MS} with File ID: BF133152.D recoveries met the requirements for all compounds except for 1,2,4,5-Tetrachlorobenzene[73%], 1,4-Dioxane[32%] and 2,3,4,6-Tetrachlorophenol[79%] due to matrix interference.
The MSD {O2521-10MSD} with File ID: BF133153.D recoveries met the acceptable requirements except for 1,2,4,5-Tetrachlorobenzene[72%], 1,4-Dioxane[31%] and 2,3,4,6-Tetrachlorophenol[79%] due to matrix interference.
The RPD met criteria .

The Blank Spike met requirements for all samples .
The Blank analysis did not indicate the presence of lab contamination.

The % RSD is greater than 20% in the Initial Calibration method (Method 8270-BF042123.M) for Benzaldehyde,this compound is passing on Quadratic regression.

The Continuous Calibration met the requirements .

CHEMTECH
284 Sheffield Street, Mountainside, NJ 07092 Phone: 908 789 8900 Fax: 908 789 8922

The Tuning criteria met requirements.

**E. Additional Comments:**
The Form 6 is not included in the data package because the Initial Calibration was performed using 7 points.
Please use %D calculated based on Avg RF and CCRF for all compounds using Average Response Factor when the %RSD value for a compound is <20% for the Initial Calibration curve and use %D calculated based on Amount added and Calculated amount for all compounds using Linear Regression when the %RSD value for a compound is > 20% for the Initial Calibration curve for SW-846 analysis.

**F. Manual Integration Comments:**
Please refer to the Manual integration Report included with the Run Logs for information on the manual integrations performed.

**Project Name: Ferry Point**
**Project # N/A**
**Chemtech Project # O2521**
**Test Name: Dissolved ICP-TAL Metals,Metals ICP-TAL,Dissolved Mercury,Mercury**

**A. Number of Samples and Date of Receipt:**
15 Water samples were received on 04/26/2023.

**B. Parameters:**
According to the Chain of Custody document, the following analyses were requested: Alkalinity, Ammonia, Anions Group1, BOD5, COD, Cyanide, Dissolved ICP-TAL Metals, Dissolved Mercury, DISSOLVED METALS-TAL, Hardness, Total, Mercury, Metals ICP-TAL, METALS-TAL, pH, Phenolics, SVOC-TCL BNA -20, TDS, TKN, TOC and VOC-TCLVOA-10. This data package contains results for Dissolved ICP-TAL Metals,Metals ICP-TAL,Dissolved Mercury,Mercury.

**C. Analytical Techniques:**
The analysis of Dissolved ICP-TAL Metals,Metals ICP-TAL was based on method 6010D, digestion based on method 3010 (waters). The analysis and digestion of Dissolved Mercury,Mercury was based on method 7470A.

**D. QA/ QC Samples:**
The Holding Times were met for all analysis.
The Blank Spike met requirements for all samples.
The Duplicate analysis met criteria for all samples.

The Matrix Spike (GMW-7MS-for Total sample) analysis met criteria for all samples except for Aluminum, Barium, Iron, Manganese, Zinc due to chemical interference during digestion process.

The Matrix Spike (GMW-7MS-for Dissolved sample) analysis met criteria for all samples except for Barium, Manganese, Zinc due to chemical interference during digestion process.

The Matrix Spike Duplicate(GMW-7MSD-for Total sample) analysis met criteria for all samples except for Aluminum, Barium, Iron, Manganese, Zinc due to chemical interference during digestion process.

The Matrix Spike Duplicate(GMW-7MSD-for Dissolved sample) analysis met criteria for all samples except for Barium, Manganese, Zinc due to chemical interference during digestion process.

The Blank analysis did not indicate the presence of lab contamination.
The Calibration met the requirements.
The Serial Dilution met the acceptable requirements.

**E. Additional Comments:**
Samples O2521-01, O2521-03, O2521-05, O2521-07 and O2521-14 were analyzed as Total Metals while Samples O2521-02, O2521-04, O2521-06, O2521-08 and O2521-15 were analyzed as Dissolved Metals.

**Project # N/A**
**Chemtech Project # O2521**
**Test Name:**
**pH,Alkalinity,Cyanide,TOC,Phenolics,TKN,Ammonia,TDS,COD,BOD5,Anions Group1**

**A. Number of Samples and Date of Receipt:**
15 Water samples were received on 04/26/2023.

**B. Parameters:**
According to the Chain of Custody document, the following analyses were requested: Alkalinity, Ammonia, Anions Group1, BOD5, COD, Cyanide, Dissolved ICP-TAL Metals, Dissolved Mercury, DISSOLVED METALS-TAL, Hardness, Total, Mercury, Metals ICP-TAL, METALS-TAL, pH, Phenolics, SVOC-TCL BNA -20, TDS, TKN, TOC and VOC-TCLVOA-10. This data package contains results for pH, Alkalinity, Cyanide, TOC, Phenolics, TKN, Ammonia, TDS, COD, BOD5, Anions Group1.

**C. Analytical Techniques:**
The analysis of Anions Group1 was based on method 300.0, The analysis of Phenolics was based on method 420.1, The analysis of Cyanide was based on method 9012B, The analysis of pH was based on method 9040C, The analysis of TOC was based on method 9060A, The analysis of Alkalinity was based on method SM2320 B, The analysis of TDS was based on method SM2540 C, The analysis of TKN was based on method SM4500 N Org B or C, The analysis of Ammonia was based on method SM4500-NH3, The analysis of BOD5 was based on method SM5210 B and The analysis of COD was based on method SM5220 D.

**D. QA/ QC Samples:**
The Holding Times were met for all samples except for FB of pH, for GMW-1 of pH.for GMW-10 of pH.for GMW-7 of pH.for PZ-15 of pH as samples were receive out of hold.
Sample GMW-1 was diluted due to high concentrations for Ammonia as N, TKN, TOC, Chloride & Sample PZ-15 was diluted due to high concentrations for Ammonia as N, TKN, TOC, Chloride & Sample GMW-10 was diluted due to high concentrations for TOC, Chloride, Sulfate & Sample GMW-7 was diluted due to high concentrations for Chloride, Sulfate.
The Blank Spike met requirements for all samples.
The Duplicate analysis met criteria for all samples.
The Matrix Spike (MW-4MS) analysis met criteria for all samples except for Chloride due to matrix interferences. The Matrix Spike (GMW-7MS) analysis met criteria for all samples except for Nitrite, Ammonia as N and Phenolics due to matrix interferences.
The Matrix Spike Duplicate (MW-4MSD) analysis met criteria for all samples except for Chloride due to matrix interferences. The Matrix Spike Duplicate (GMW-7MSD)

analysis met criteria for all samples except for Nitrite, Ammonia as N and Phenolics due to matrix interferences.
The Blank analysis did not indicate the presence of lab contamination.
The Calibration met the requirements.

**E. Additional Comments:**
Sample O2521-01 and O2521-01 were analyzed Straight 10X Dilution for COD because the original samples were reading over range, only 10X has been reported.

# DATA REPORTING QUALIFIERS- INORGANIC

For reporting results, the following " Results Qualifiers" are used:

| | |
|---|---|
| **J** | Indicates the reported value was obtained from a reading that was less than the Contract Required Detection Limit (CRDL), but greater than or equal to the Instrument Detection Limit (IDL). |
| **U** | Indicates the analyte was analyzed for, but not detected. |
| **ND** | Indicates the analyte was analyzed for, but not detected |
| **E** | Indicates the reported value is estimated because of the presence of interference |
| **M** | Indicates Duplicate injection precision not met. |
| **N** | Indicates the spiked sample recovery is not within control limits. |
| **S** | Indicates the reported value was determined by the Method of Standard Addition (MSA). |
| * | Indicates that the duplicate analysis is not within control limits. |
| + | Indicates the correlation coefficient for the MSA is less than 0.995. |
| **D** | Indicates the reported value is from a secondary analysis with a dilution factor. The original analysis exceeded the calibration range. |
| **M** | Method qualifiers<br>**"P"** for ICP instrument<br>**"PM"** for ICP when Microwave Digestion is used<br>**"CV"** for Manual Cold Vapor AA<br>**"AV"** for automated Cold Vapor AA<br>**"CA"** for MIDI-Distillation Spectrophotometric<br>**"AS"** for Semi –Automated Spectrophotometric<br>**"C"** for Manual Spectrophotometric<br>**"T"** for Titrimetric<br>**"NR"** for analyte not required to be analyzed |
| **OR** | Indicates the analyte's concentration exceeds the calibrated range of the instrument for that specific analysis. |
| **Q** | Indicates the LCS did not meet the control limits requirements |
| H | Sample Analysis Out Of Hold Time |

## DATA REPORTING QUALIFIERS- ORGANIC

For reporting results, the following " Results Qualifiers" are used:

| | |
|---|---|
| Value | If the result is a value greater than or equal to the detection limit, report the value |
| **U** | Indicates the compound was analyzed for but was not detected. Report the minimum detection limit for the sample with the U, i.e. "10 U". This is not necessarily the instrument detection limit attainable for this particular sample based on any concentration or dilution that may have been required. |
| **ND** | Indicates the analyte was analyzed for, but not detected |
| **J** | Indicates an estimated value**.** This flag is used:<br>(1) When estimating a concentration for a tentatively identified compound (library search hits, where a 1:1 response is assumed.)<br>(2) When the mass spectral data indicated the identification, however the result was less than the specified detection limit greater than zero. If the detection limit was 10ug/L and a concentration of 3 ug/L was calculated report as 3 J. This is flag is used when similar situation arise on any organic parameter i.e. Pest, PCB and others. |
| **B** | Indicates the analyte was found in the blank as well as the sample report as "12 B". |
| **E** | Indicates the analyte 's concentration exceeds the calibrated range of the instrument for that specific analysis. |
| **D** | This flag identifies all compounds identified in an analysis at a secondary dilution factor. |
| **P** | This flag is used for Pesticide/PCB target analyte when there is >25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form 1 and flagged with a "P". |
| **N** | This flag indicates presumptive evidence of a compound. This is only used for tentatively identified compounds (TICs), where the identification is based on a mass spectral library search. It applies to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the flag is not used. |
| **A** | This flag indicates that a Tentatively Identified Compound is a suspected aldol-condensation product. |
| **Q** | Indicates the LCS did not meet the control limits requirements |

## APPENDIX A

## QA REVIEW GENERAL DOCUMENTATION

**Project #:** O2521

| | Completed |
|---|---|
| **For thorough review, the report must have the following:** | |
| **GENERAL:** | |
| **Are all original paperwork present (chain of custody, record of communication,airbill, sample management lab chronicle, login page)** | ✓ |
| **Check chain-of-custody for proper relinquish/return of samples** | ✓ |
| **Is the chain of custody signed and complete** | ✓ |
| **Check internal chain-of-custody for proper relinquish/return of samples /sample extracts** | ✓ |
| **Collect information for each project id from server. Were all requirements followed** | ✓ |
| **COVER PAGE:** | |
| **Do numbers of samples correspond to the number of samples in the Chain of Custody on login page** | ✓ |
| **Do lab numbers and client Ids on cover page agree with the Chain of Custody** | ✓ |
| **CHAIN OF CUSTODY:** | |
| **Do requested analyses on Chain of Custody agree with form I results** | ✓ |
| **Do requested analyses on Chain of Custody agree with the log-in page** | ✓ |
| **Were the correct method log-in for analysis according to the Analytical Request and Chain of Castody** | ✓ |
| **Were the samples received within hold time** | ✓ |
| **Were any problems found with the samples at arrival recorded in the Sample Management Laboratory Chronicle** | ✓ |
| **ANALYTICAL:** | |
| **Was method requirement followed?** | ✓ |
| **Was client requirement followed?** | ✓ |
| **Does the case narrative summarize all QC failure?** | ✓ |
| **All runlogs and manual integration are reviewed for requirements** | ✓ |
| **All manual calculations and /or hand notations verified** | ✓ |

U = Not Detected
LOQ = Limit of Quantitation
MDL = Method Detection Limit
LOD = Limit of Detection
E = Value Exceeds Calibration Range
Q = indicates LCS control criteria did not meet requirements
M = MS/MSD acceptance criteria did not meet requirements
J = Estimated Value
B = Analyte Found in Associated Method Blank
N = Presumptive Evidence of a Compound
* = Values outside of QC limits
D = Dilution
() = Laboratory InHouse Limit
A = Aldol-Condensation Reaction Products
