| DEC Memo: | 10/18/05: This spill was originally closed by Anthony Sigona as part of a consolidation effort. The spill was reassigned to Tibbe. The investigation (approved by Sigona)that was performed was inadequate to identify the existance of contamination. The spill has been re-opened and further investigation is necessary. 11/12/10 - spill re-assigned from Tibbe to Joe O'Connell 11/16/11 - Raphael Ketani. I tried to contact Colleen Channer of the Triborough Bridge and Tunnel Authority (TBTA) (212) 878-1035, but I could only leave a message with her secretary. Her mailing address is: MTA Legal Department, 347 Madison Avenue, 9th Floor, NY, 10017. The |

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

TBTA is part of the MTA.
11/17/11 - Raphael Ketani. I spoke to Ms. Channer. I told her that the DEC still had two open spill
cases, #0100477 and #9801266, and that we were seeking documentation for these cases. I told her
that the spills may involve tanks 1 to 4 on the west side of the northern approach to the bridge.
She said that she will look for the documentation and get back to me. 1/13/12 - Raphael Ketani. Ms.
Channer (212) 878-1035 called me. She said that she had found some documentation for cases #0100477
and #9801266. We went over the documents that she had and that the DEC had. Some were the same. I
told her that #0100477 was open because the consultant used the TCLP method to process the samples,
rather than methods 8260 and 8270, and because not enough samples were taken and no groundwater
samples were taken in the vicinity of tanks 1 and 2. I added that #9801266 was open because the
source of the free floating product that had entered a utility vault was never found. Tanks 3, 4,
and 7 had been removed in the nineteen nineties. However a full soil and groundwater investigation,
and transmission lines investigation for product had never been done. Ms. Channer asked that I send
the MTA a letter indicating the work that needs to be done and which documents the DEC still needs.
Her address is: Senior Environmental Counsel, MTA,347 Madison Avenue, 9th Floor, NY, 10017. 1/17/12
- Raphael Ketani. I sent a letter to Ms. Channer requesting that the MTA submit a work plan to
conduct a soil and groundwater investigation in the vicinity of the former locations of USTs #1 and
#2. I also put in the letter a request for a work plan to conduct an investigation of the former
vicinity of USTs #3, #4 and #7 (spill #9801266). 1/19/12 - Raphael Ketani. I was notified that
Peter Bass, Director of the Environmental Policy and Compliance group at the MTA, should also
receive a copy of the letter to Ms. Channer. So I sent the letter to him. His address is also 347
Madison Avenue. 1/30/12 - Raphael Ketani. Ms. Channer and the MTA environmental engineer, George
Bassil, called me today to request an extension for submitting the work plan as their consultant
was heavily involved with another MTA project and could not devote much attention to the Whitestone
Bridge projects. I granted the MTA a two month extension of the deadline for submitting the work
plan. This set a deadline of April 16. Mr. Bassil's contact information is: MTA, 2 Broadway, 23rd
Floor, NY, 10004, (646) 252-7020. 4/25/12 - Raphael Ketani. Today I received 4/16/12 Environmental
Site Investigation Work Plan from LiRo Engineers. I began my review. 5/15/12 - Raphael Ketani. I
finished my review of the ESIWP. LiRo proposed to perform 6 soil borings. Three in the vicinity of

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

the grave for the former tank #3 and its general spill area, and three in the vicinity of the grave
for the former tank #2 and its general spill area. Soil and groundwater samples will be collected.
The soil sample with the highest PID reading will be submitted for analysis and one groundwater
sample from each boring. Samples will be analyzed for STARS list VOCs by method 8260 and for STARS
list SVOCs by method 8270. The results will be compared to CP-51 standards. I disapproved the
ESIWP. First, the list of analytes to be tested should be the expanded lists for VOCs and SVOCs.
Secondly, there were not enough borings planned to properly cover each spill area. Lastly, the
areas affected by the spills need to be delineated. I drafted a disapproval letter for the review
of Hassan Hussein, EE III and head of the Hazardous Materials Unit. I set a deadline of June 22 for
the submission of a revised SIWP. Mr. Hussein approved the letter and it was sent out today.
5/18/12 - Raphael Ketani. Mr. Wesolowski of LiRo Engineering (718) 321-3136, ext 242 called me
today regarding my 5/15/12 response letter for the ESIWP. He said that the area of tanks 4 and 7
has a building over it. The building was constructed in 1998 after the tanks were removed. The
building is an office for their security group and there are many utilities under the floor.
Therefore, it would be very difficult to do any borings there. I told him that LiRo and the MTA
should go ahead and do the work for tanks 1 to 3 anyway. He said that this will be done, but he was
concerned about the request to do borings around tanks 4 and 7. I told him that horizontal borings
may be the only way to sample around the tank graves for these former tanks. I added that we need
some information in order to tell us whether elevated levels of contaminants are still at these
locations. I told him to go ahead with the work around the other tanks and to talk to the MTA and
see what can be done. He said that he will do this. With that, the conversation ended. 6/27/12 -
Raphael Ketani. Mr. Wesolowski sent me a response letter to the DEC ESIWP review letter dated
5/15/12. Attached to the LiRo Engineering response letter was a revised ESIWP dated 6/22/12. I
reviewed both documents. LiRo proposes to do many more borings around tanks #1, #2 and #3.
Additional borings around tanks #4 and #7 will be performed only if contamination appears to be
emanating from them. However, as these two tanks are under the building, the tone of the letter
suggested that the idea of boring around these tanks will be open for discussion. Mr. Wesolowski
also wrote that all environmental samples will be tested for the expanded lists of VOCs and SVOCs.
Also, drilling will proceed deeper than the 20 feet down that was

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

originally planned if
contamination is found at that level. Work will start within 60 days of the approval of the revised
ESIWP. I drafted a response letter approving the revised ESIWP and stating that indoor air PID
surveying should be done in the areas of the building which are above tanks #4 and #7. The letter
was submitted to Mr. Hussein for his approval. Mr. Hussein approved the letter and it was sent out.
8/3/12 - Raphael Ketani. Mr. Wesolowski sent me a letter dated 7/18/12. This letter was LiRo's
response to the DEC 6/7/12 letter approving the June 22 ESIWP. In the letter, Mr. Wesolowski
described the methodology for doing the indoor air sampling with the PID meter. Specifically, if
elevated readings are detected that are not attributed to materials stored in the building, then
air sampling will take place for 1 hour at each location of concern. If there are no elevated
detections, then air sampling will take place at a minimum of 8 sampling stations for a period of
30 minutes each using the PID meter. These 8 or more stations will be over the former locations of
USTs #4 and #7. I found the letter plan to be acceptable and submitted a draft letter to Mr.
Hussein for his review. The letter approved the methodology and also requested that the sampling
take place during a period when air exchange (due to people opening doors to rooms or ventilation)
is not taking place. I stated that this is in order to have stable conditions for the air sampling.
I also added that if the indoor air detections are above 500 ppb or 0.5 ppm, then the NYC DEP
Hotline should be contacted and a work plan must be submitted for a more extensive air
investigation. 8/7/12 - Raphael Ketani. Mr. Hussein approved the letter and it was sent out today.
11/17/12 - Raphael Ketani. I received the 11/13/12 Site Investigation Summary Report from Li Ro.
Soil borings, groundwater sampling and indoor air sampling were conducted on September 12, 13 and
17. Fourteen borings were performed down to 20 feet bgs. Temporary 1 inch monitoring wells were
installed. After the sampling was completed, the borings were filled in and the wells were
abandoned. Soil samples were recovered from LSB-01, 03, 04, 06 to 09, 13, and 15 to 17. Borings
could not be performed at LSB-02, 05, 10 to 12 and 14 due to refusal - it was believed that the
foundations were encountered at these locations. If no visual evidence or PID detections were
encountered in a boring, then soil samples were collected at the water table interface and at 20
feet bgs. The water table was encountered at 3 to 9 feet bgs. Flow was expected to be to the
southwest to the East River. The indoor air results were obtained by sampling at each station for

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

30 minutes, except for the entrance area which was sampled for 15 minutes. There were no
detections. Soil samples were collected from 5.5 feet to 20 feet below grade. The VOC results were
either non-detect or well below the CP-51 standards. The SVOC results were either non-detect, well
below the standards or just above the standards. For total results, the most contaminated soil
horizon at LSB-01 was at 7 feet bgs and LSB-03 was worst at 20 feet bgs. The groundwater samples
from LSB-01, LSB-03 and LSB-17 had 280 ppb, 260 ppb and 210 ppb of naphthalene, respectively. The
rest of the VOC results and the SVOC results were either non-detect or slightly above the GW
standards to two digits. From the data in the report, it appears that there is a source of
groundwater contamination. I drafted a letter to Mr. Bassil and to Mr. Wesolowski approving the
SISR and requesting that groundwater contamination delineation take place. The draft letter was
submitted to Mr. Hussein for his approval. 12/4/12 - Raphael Ketani. The letter was approved by Mr.
Hussein and was sent out with a deadline of January 4, 2013 for submission of a work plan for
delineating the groundwater contamination. 1/9/2013 - Raphael Ketani. I reviewed the LiRo 1/4/13
Supplemental Environmental Site Investigation Work Plan. LiRo plans to install 3 wells. One well
will be upgradient of LSB-17, one well will be downgradient of LSB-17 and one well will be
downgradient of locations LSB-1 and LSB-3. A maximum of 2 soil samples and 1 groundwater sample
will be taken from each proposed well location (MW-1 to MW-3). If no contamination is found at a
location, then one soil sample will be taken from just above the water table. The water table is
believed to be at about 8 feet bgs. I found the work plan to be acceptable and drafted a letter for
the review of Mr. Hussein approving the work plan and requesting that each well be surveyed and a
groundwater flow map be constructed. 1/11/13 - Raphael Ketani. Mr. Hussein approved the letter and
it was sent out today. 12/23/13 - Raphael Ketani. As there has been no correspondence from Martin
Wesolowski of LiRo Engineering (718) 321-3136, ext 242 regarding conducting the work that was
described in the 1/4/13 SESIWP, I sent an e-mail to Colleen Channer (legal division Triborough
Bridge and Tunnel Authority (TBTA) (212) 878-1035), Peter Bass (Director of Environmental Policy
and Compliance) and George Bassil (MTA environmental engineer (646) 252-7020) requesting that the
work start by February 3, 2014, or else the spill cases will be referred to the Office of General
Counsel for legal action. Later, Mr. Wesolowski responded by e-mail and stated that the TBTA was
obtaining the funding to do the approved work. The work is scheduled

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

to take place during early
January 2014. 1/7/14 - Raphael Ketani. Mr. Wesolowski sent me an e-mail stating that the agreed
upon work will take place on 1/21/14. 1/21/14 - Raphael Ketani. Mr. Wesolowski sent me an e-mail
stating that they had completed locating the utilities and doing the markouts for the 3 planned
wells. Due to the snowy weather, the actual work will not start until 1/23/14. 1/23/14 - Raphael
Ketani. Mr. Wesolowski sent me an e-mail stating that the wells were installed today and that
groundwater sampling will take place in two weeks. A report will be sent to the DEC in February
2014. 3/7/14 - Raphael Ketani. I reviewed the 3/6/14 LiRo Engineers, Inc. Supplemental
Environmental Site Investigation Report. The supplemental investigation took place in order to
further delineate the extent of the groundwater contamination at 3 specific locations. Borings SB-1
to SB-3 were installed on 1/23/14. None of the samples had odors or PID hits. These borings were
turned into wells MW-1 to MW-3 and developed on 1/29/14. The wells were sampled on 2/12/14. All of
the soil and groundwater samples were analyzed via methods 8260B and 8270C. The soil samples were
almost entirely non-detect for VOCs. The SVOC hits were also almost entirely non-detect with hits
that were well below the CP-51 unrestricted soil standards. The groundwater results for all of the
samples were almost entirely non-detect for the VOCs and the SVOCs. I sent an e-mail to Mr. Bassil
and Mr. Wesolowski stating that the Supplemental Environmental SIR had been approved, but the
Department was a little concerned about some past naphthalene results which had been from samples
taken from wells LSB-1, LSB-3 and LSB-17. Later, Mr. Wesolowski responded by e-mail that after the
September 2012 sampling event, these temporary wells had been removed. So no additional groundwater
samples could be taken. 3/18/14 - Raphael Ketani. The spill case was presented to Mr. Hussein for
closure. Mr. Hussein reviewed the data and determined that the spill case could be closed. Based
upon the documentation and the data in the case file, it has been determined that the oil spill has
been remediated and that any residual contamination is not a threat to the public or the
environment. Additionally, from the PID screening data, it has been determined that there are no
threats from the vapors of volatile chemicals in the MTA owned and maintained building. Therefore,
the spill case has been closed effective today.

Remarks: Petroleum Contaminated Soils reported as Gasoline was found during Tank Excataion work at the Site.

| DEC Memo: | 09/04/07: Transferred from Sigona to Tibbe. Spill reopened due to lack of documentation of proper remediation of contamination identified around tanks 5&6, as well as 3, 4 and 7. 11/12/10 - spill re-assigned from Tibbe to Joe O'Connell 11/10/11 - Raphael Ketani. Kevin O'Connor of Action Remediation (516) 781-3000/cell (516) 236-7468 called regarding this spill case and cases #9601373, #9801266 and #0100477. He mentioned that an attempt was made to combine the 4 cases into one by the DEC, but this added to the confusion. The areas of concern are to the |

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

west and to the east of the
north end approach to the Whitestone Bridge. He said that many years back, the tanks were taken
out, but the contaminated soil wasn't. I told him that there were almost no documents in the e-docs
and no case notes. He said that he would like to give the DEC all of the documents pertaining to
this site. I asked him to put them on disk. He said that he will. Mr. O'Connor said that he would
like to meet in person to discuss the site. I told him that would be fine. The PBS is #2-481645.
There are at least 6 tanks, according to some notes I saw. 11/16/11 - Raphael Ketani. A meeting
took place with Mr. O'Connor of Action Remediation and Tom O'Brien of Active Environmental
Techologies Inc. (609) 702-1500. Mr. O'Connor did most of the talking for the two consultants. He
explained that Action and Active were originally
sub-sub-sub-contractors for a very large
construction project to widen the northern approach to to the Whitestone Bridge. They were involved
in removing tanks and excavating contaminated soil. The work was done in two weeks. He said that
PBS case #2-481645 lists only four tanks that are still active. These are tank #11 (20,000 gal. UST
with biodiesel), tank #12 (1,000 gal. UST with gasoline), tank #13 (2,500 gal. UST with biodiesel)
and tank #15 (900 gal. UST with biodiesel). Mr. O'Connor added that their companies removed tanks
#10 (north part west side) and #5 and #6 (south part west side). However, tanks #8 and #9 on the
east side had already been removed. So all they did there was soil removal. Mr. O'Brien stated that
when they started digging, they discovered that the upper layer was made of cobbles and the rest
was native marsh clay. Lots of water came out of the layer of cobbles and this proved costly to
handle. The Triborough Bridge and Tunnel Authority refused to pay them for the cost of handling all
of the water from the cobble zone. So the remediation reports were never sent to the TBTA. Steel
sheet pilings were used to keep the holes open at all of the tank excavation locations. Soil end
point samples were taken by boring holes through the sheet piling. Mr. O'Brien showed me some
pictures of the work at the various locatoins. Mr. O'Connor had sent me e-mail pdf files containing
the soil analytical results, groundwater analytical results and some diagrams showing where the
samples had been taken. He also gave me copies of the manifests for the soil that was removed from
all of the locations. However, he said that the manifests were not in any particular order and were
for all of the excavation locations. Mr. O'Connor showed me PBS printouts for tanks #5 and #6. The
closure dates were 12/16/1993. He added that tank #10 was pulled by his company and it was a steel

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

tank with a fiberglass wrapping. It was in very good condition. After the meeting, I reviewed the
Long Island Analytical Labs 4/7/09 and 4/14/09 soil and groundwater analytical results reports.
They were almost entirely non-detect. The few hits that were present were almost entirely below
TAGM limits. I also reviewed the Action Remediation 5/6/09 Closeout Package for tank #10 (2,000
gal. UST in the northern part of the area on the west side) and the Action Remediation 6/1/09 soil
profile and sampling letter for all of the sampling locations. I also reviewed the manifests, other
documents and pictures concerning tanks #5, #6 and #10. Based upon my data in the documents in the
case file, I determined that the great majority of the contamination had been removed and that the
residual contamination was not a threat to the public or the environment. Also, as the groundwater
that had entered the site is part of the groundwater table that is under the landfill which is
Ferry Point Park, I determined that any impacts are not due conditions at the former tank removal
areas. So I closed the spill case. 11/17/11 - Raphael Ketani. I sent Mr. O'Connor and Mr. O'Brien a
spill closure letter for this spill case and case number 9601373.

Remarks: TWO 550'S (# 5 & 6) TAKEN OUT OF SERVICE & EMPTIED.

| DEC Memo: | Prior to Sept, 2004 data translation this spill Lead_DEC Field was ROMMEL This spill site investigation has been consolidated under Spill No. 9801266. A site investigation work plan was submitted to DEC for review and approval on November 7, 2003. Investigation was approved on 6/21/2004. The remaining spill case is under 9801266. DEC's comments regarding a proposed Work Plan for Site Investigation by BEM Systems, Inc., dated November 5, 2003. Based on the results of our site visit and PBS inspection on June 25, 2003, and evaluation of the proposal by BEM, the DEC accepts MTA Bridges and Tunnel's Work Plan to perform further investigatory actions to address any of the DEC's concerns related to the prior spill investigations for |

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

this spill number referenced at
this site. MTA Bridges & Tunnels must now complete the implementation of the BEM's Work Plan
according to the proposed schedule 7/19/04 - AUSTIN - TRANSFERRED FROM SIGONA TO ROMMEL DUE TO THE
OTHER TBTA SITES BEING UNDER HER JURISDICTION - END 03/29/05: Transfer from Rommel to Tibbe.
11/12/10 - spill re-assigned from Tibbe to Joe O'Connell 11/16/11 - Raphael Ketani. I tried to
contact Colleen Channer of the Triborough Bridge and Tunnel Authority (TBTA) (212) 878-1035, but I
could only leave a message with her secretary. Her mailing address is: MTA Legal Department, 347
Madison Avenue, 9th Floor, NY, 10017. The TBTA is part of the MTA. 11/17/11 - Raphael Ketani. I
spoke to Ms. Channer. I told her that the DEC still had two open spill cases, #0100477 and
#9801266, and that we were seeking documentation for these cases. I told her that the spills may
involve tanks 1 to 4 on the west side of the northern approach to the bridge. She said that she
will look for the documentation and get back to me. 1/13/12 - Raphael Ketani. Ms. Channer (212)
878-1035 called me. She said that she had found some documentation for cases #0100477 and #9801266.
We went over the documents that she had and that the DEC had. Some were the same. I told her that
#0100477 was open because the consultant used the TCLP method to process the samples, rather than
methods 8260 and 8270, and because not enough samples were taken and no groundwater samples were
taken in the vicinity of tanks 1 and 2. I added that #9801266 was open because the source of the
free floating product that had entered a utility vault was never found. Tanks 3, 4, and 7 had been
removed in the nineteen nineties. However a full soil and groundwater investigation, and
transmission lines investigation for product had never been done. Ms. Channer asked that I send the
MTA a letter indicating the work that needs to be done and which documents the DEC still needs. Her
address is: Senior Environmental Counsel, MTA,347 Madison Avenue, 9th Floor, NY, 10017. 1/17/12 -
Raphael Ketani. I sent a letter to Ms. Channer requesting that the MTA submit a work plan to
conduct a soil and groundwater investigation in the vicinity of the former locations of USTs #3, #4
and #7. I also put in the letter a request for a work plan to conduct an investigation of the
former vicinity of USTs #1 and #2 (spill #0100477). 1/19/12 - Raphael Ketani. I was notified that
Peter Bass, Director of the Environmental Policy and Compliance group at the MTA, should also
receive a copy of the letter to Ms. Channer. So I sent the letter to him. His address is also 347
Madison Avenue. 1/30/12 - Raphael Ketani. Ms. Channer and the MTA environmental engineer, George

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

Bassil, called me today to request an extension for submitting the work plan as their consultant
was heavily involved with another MTA project and could not devote much attention to the Whitestone
Bridge projects. I granted the MTA a two month extension of the deadline for submitting the work
plan. This set the deadline at April 16. Mr. Bassil's contact information is: MTA, 2 Broadway, 23rd
Floor, NY, 10004, (646) 252-7020. 4/25/12 - Raphael Ketani. Today I received 4/16/12 Environmental
Site Investigation Work Plan from LiRo Engineers. I began my review. 5/15/12 - Raphael Ketani. I
finished my review of the ESIWP. LiRo proposed to perform 6 soil borings. Three in the vicinity of
the grave for the former tank #3 and its general spill area, and three in the vicinity of the grave
for the former tank #2 and its general spill area. Soil and groundwater samples will be collected.
The soil sample with the highest PID reading will be submitted for analysis and one groundwater
sample from each boring. Samples will be analyzed for STARS list VOCs by method 8260 and for STARS
list SVOCs by method 8270. The results will be compared to CP-51 standards. I disapproved the
ESIWP. First, the list of analytes to be tested should be the expanded lists for VOCs and SVOCs.
Secondly, there were not enough borings planned to properly cover each spill area. Lastly, the
areas affected by the spills need to be delineated. I drafted a disapproval letter for the review
of Hassan Hussein, EE III and head of the Hazardous Materials Unit. I set a deadline of June 22 for
the submission of a revised SIWP. Mr. Hussein approved the letter and it was sent out today.
5/18/12 - Raphael Ketani. Mr. Wesolowski of LiRo Engineering (718) 321-3136, ext 242 called me
today regarding my 5/15/12 response letter for the ESIWP. He said that the area of tanks 4 and 7
has a building over it. The building was constructed in 1998 after the tanks were removed. The
building is an office for their security group and there are many utilities under the floor.
Therefore, it would be very difficult to do any borings there. I told him that LiRo and the MTA
should go ahead and do the work for tanks 1 to 3 anyway. He said that this will be done, but he was
concerned about the request to do borings around tanks 4 and 7. I told him that horizontal borings
may be the only way to sample around the tank graves for these former tanks. I added that we need
some information in order to tell us whether elevated levels of contaminants are still at these
locations. I told him to go ahead with the work around the other tanks and to talk to the MTA and
see what can be done. He said that he will do this. With that, the conversation ended. 6/27/12 -
Raphael Ketani. Mr. Wesolowski sent me a response letter to the DEC

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

ESIWP review letter dated
5/15/12. Attached to the LiRo Engineering response letter was a revised ESIWP dated 6/22/12. I
reviewed both documents. LiRo proposes to do many more borings around tanks #1, #2 and #3.
Additional borings around tanks #4 and #7 will be performed only if contamination appears to be
emanating from them. However, as these two tanks are under the building, the tone of the letter
suggested that the idea of boring around these tanks will be open for discussion. Mr. Wesolowski
also wrote that all environmental samples will be tested for the expanded lists of VOCs and SVOCs.
Also, drilling will proceed deeper than the 20 feet down that was originally planned if
contamination is found at that level. Work will start within 60 days of the approval of the revised
ESIWP. I drafted a response letter approving the revised ESIWP and stating that indoor air PID
surveying should be done in the areas of the building which are above tanks #4 and #7. The letter
was submitted to Mr. Hussein for his approval. Mr. Hussein approved the letter and it was sent out.
8/3/12 - Raphael Ketani. Mr. Wesolowski sent me a letter dated 7/18/12. This letter was LiRo's
response to the DEC 6/7/12 letter approving the June 22 ESIWP. In the letter, Mr. Wesolowski
described the methodology for doing the indoor air sampling with the PID meter. Specifically, if
elevated readings are detected that are not attributed to materials stored in the building, then
air sampling will take place for 1 hour at each location of concern. If there are no elevated
detections, then air sampling will take place at a minimum of 8 sampling stations for a period of
30 minutes each using the PID meter. These 8 or more stations will be over the former locations of
USTs #4 and #7. I found the letter plan to be acceptable and submitted a draft letter to Mr.
Hussein for his review. The letter approved the methodology and also requested that the sampling
take place during a period when air exchange (due to people opening doors to rooms or ventilation)
is not taking place. I stated that this is in order to have stable conditions for the air sampling.
I also added that if the indoor air detections are above 500 ppb or 0.5 ppm, then the NYC DEP
Hotline should be contacted and a work plan must be submitted for a more extensive air
investigation. 8/7/12 - Raphael Ketani. Mr. Hussein approved the letter and it was sent out today.
11/17/12 - Raphael Ketani. I received the 11/13/12 Site Investigation Summary Report from Li Ro.
Soil borings, groundwater sampling and indoor air sampling were conducted on September 12, 13 and
17. Fourteen borings were performed down to 20 feet bgs. Temporary 1 inch monitoring wells were

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

installed. After the sampling was completed, the borings were filled in and the wells were abandoned. Soil samples were recovered from LSB-01, 03, 04, 06 to 09, 13, and 15 to 17. Borings could not be performed at LSB-02, 05, 10 to 12 and 14 due to refusal - it was believed that the foundations were encountered at these locations. When no visual evidence or PID detections were encountered in a boring, then soil samples were collected at the water table interface and at 20 feet bgs. The water table was encountered at 3 to 9 feet bgs. Flow was expected to be to the southwest to the East River. The indoor air results were obtained by sampling at each station for 30 minutes, except for the entrance area which was sampled for 15 minutes. There were no detections. Soil samples were collected from 5.5 feet to 20 feet below grade. The VOC results were either non-detect or well below the CP-51 standards. The SVOC results were either non-detect, well below the standards or just above the standards. For total results, the most contaminated soil horizon at LSB-01 was at 7 feet bgs and LSB-03 was worst at 20 feet bgs. The groundwater samples from LSB-01, LSB-03 and LSB-17 had 280 ppb, 260 ppb and 210 ppb of naphthalene, respectively. The rest of the VOC results and the SVOC results were either non-detect or slightly above the GW standards to two digits. From the data in the report, it appears that there is a source of groundwater contamination. I drafted a letter to Mr. Bassil and to Mr. Wesolowski approving the SISR and requesting that groundwater contamination delineation take place. The draft letter was submitted to Mr. Hussein for his approval. 12/4/12 - Raphael Ketani. The letter was approved by Mr. Hussein and was sent out with a deadline of January 4, 2013 for submission of a work plan for delineating the groundwater contamination. 1/9/2013 - Raphael Ketani. I reviewed the LiRo 1/4/13 Supplemental Environmental Site Investigation Work Plan. LiRo plans to install 3 wells. One well will be upgradient of LSB-17, one well will be downgradient of LSB-17 and one well will be downgradient of locations LSB-1 and LSB-3. A maximum of 2 soil samples and 1 groundwater sample will be taken from each proposed well location (MW-1 to MW-3). If no contamination is found at a location, then one soil sample will be taken from just above the water table. The water table is believed to be at about 8 feet bgs. I found the work plan to be acceptable and drafted a letter for the review of Mr. Hussein approving the work plan and requesting that each well be surveyed and a groundwater flow map be constructed. 1/11/13 - Raphael Ketani. Mr. Hussein found the letter to be acceptable and it was sent out today. 12/23/13 - Raphael Ketani. As

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

there has been no
correspondence from Martin Wesolowski of LiRo Engineering (718) 321-3136, ext 242 regarding
conducting the work that was described in the 1/4/13 SESIWP, I sent an e-mail to Colleen Channer
(legal division Triborough Bridge and Tunnel Authority (TBTA) (212) 878-1035), Peter Bass (Director
of Environmental Policy and Compliance) and George Bassil (MTA environmental engineer (646)
252-7020) requesting that the work start by February 3, 2014, or else the spill cases will be
referred to the Office of General Counsel for legal action. Later, Mr. Wesolowski responded by
e-mail and stated that the TBTA was obtaining the funding to do the approved work. The work is
scheduled to take place during early January 2014. 1/7/14 - Raphael Ketani. Mr. Wesolowski sent me
an e-mail stating that the agreed upon work will take place on 1/21/14. 1/21/14 - Raphael Ketani.
Mr. Wesolowski sent me an e-mail stating that they had completed locating the utilities and doing
the markouts for the 3 planned wells. Due to the snowy weather, the actual work will not start
until 1/23/14. 1/23/14 - Raphael Ketani. Mr. Wesolowski sent me an e-mail stating that the wells
were installed today and that groundwater sampling will take place in two weeks. A report will be
sent to the DEC in February 2014. 3/7/14 - Raphael Ketani. I reviewed the 3/6/14 LiRo Engineers,
Inc. Supplemental Environmental Site Investigation Report. The supplemental investigation took
place in order to further delineate the extent of the groundwater contamination at 3 specific
locations. Borings SB-1 to SB-3 were installed on 1/23/14. None of the samples had odors or PID
hits. These borings were turned into wells MW-1 to MW-3 and developed on 1/29/14. The wells were
sampled on 2/12/14. All of the soil and groundwater samples were analyzed via methods 8260B and
8270C. The soil samples were almost entirely non-detect for VOCs. The SVOC hits were also almost
entirely non-detect with hits that were well below the CP-51 unrestricted soil standards. The
groundwater results for all of the samples were almost entirely non-detect for the VOCs and the
SVOCs. I sent an e-mail to Mr. Bassil and Mr. Wesolowski stating that the Supplemental
Environmental SIR had been approved, but the Department was a little concerned about some past
naphthalene results which had been from samples taken from wells LSB-1, LSB-3 and LSB-17. Later,
Mr. Wesolowski responded by e-mail that after the September 2012 sampling event, these temporary
wells had been removed. So no additional groundwater samples could be taken. 3/18/14 - Raphael
Ketani. The spill case was presented to Mr. Hussein for closure. Mr. Hussein reviewed the data and

**MTA BRIDGES & TUNNELS WHITESTONE BRIDGE FACILITY (Continued)** **S102150368**

determined that the spill case could be closed. Based upon the documentation and the data in the
case file, it has been determined that the oil spill has been remediated and that any residual
contamination is not a threat to the public or the environment. Additionally, from the PID
screening data, it has been determined that there are no threats from the vapors of volatile
chemicals in the MTA owned and maintained building. Therefore, the spill case has been closed
effective today.

Remarks: DEC Sigona was performing a site inspection and contamination was found.

Tank Info:

Tank Number: 001
Tank Id: 247593
Material Code: 2712
Common Name of Substance: Gasoline/Ethanol

Equipment Records:

G01 - Tank Secondary Containment - Diking (Aboveground)
J06 - Dispenser - Tank Mounted Dispenser
F00 - Pipe External Protection - None
I02 - Overfill - High Level Alarm
K01 - Spill Prevention - Catch Basin

**FERRY POINT PARK GOLF COURSE (Continued)** **A100366170**

L09 - Piping Leak Detection - Exempt Suction Piping
E00 - Piping Secondary Containment - None
C01 - Pipe Location - Aboveground
G12 - Tank Secondary Containment - Double-Walled (AG only)
I03 - Overfill - Automatic Shut-Off
D01 - Pipe Type - Steel/Carbon Steel/Iron
H01 - Tank Leak Detection - Interstitial - Electronic Monitoring
A00 - Tank Internal Protection - None
B01 - Tank External Protection - Painted/Asphalt Coating

Tank Location: Aboveground - on saddles, legs, racks, etc.... Tank bottom is elevated above grade or tank pad, allowing visual inspection.
Tank Type: Steel Tank in Concrete
Tank Status: In Service
Pipe Model: Not reported
Install Date: 02/15/2013
Capacity Gallons: 1000
Tightness Test Method: -
Date Test: Not reported
Next Test Date: Not reported
Date Tank Closed: Not reported
Register: True

| Waste Code: | D035 |
| Waste Description: | Methyl Ethyl Ketone |

**UNITED PARCEL SERVICE (Continued)** **1000398442**

Waste Code: D039
Waste Description: Tetrachloroethylene

Waste Code: NONE
Waste Description: Not Defined

Waste Code: P075
Waste Description: Nicotine, & Salts (Or) Pyridine, 3-(1-Methyl-2-Pyrrolidinyl)-,(S)-, & Salts

Waste Code: U080
Waste Description: Methane, Dichloro- (Or) Methylene Chloride

Waste Code: U112
Waste Description: Acetic Acid, Ethyl Ester (I) (Or) Ethyl Acetate (I)

Waste Code: U122
Waste Description: Formaldehyde

Waste Code: U134
Waste Description: Hydrofluoric Acid (C,T) (Or) Hydrogen Fluoride (C,T)

Waste Code: U154
Waste Description: Methanol (I) (Or) Methyl Alcohol (I)

Waste Code: U162
Waste Description: 2-Propenoic Acid, 2-Methyl-, Methyl Ester (I,T) (Or) Methyl Methacrylate (I,T)

Waste Code: U213
Waste Description: Furan, Tetrahydro-(I) (Or) Tetrahydrofuran (I)

Waste Code: U220
Waste Description: Benzene, Methyl- (Or) Toluene

Waste Code: U239
Waste Description: Benzene, Dimethyl- (I,T) (Or) Xylene (I)

Waste Code: U240
Waste Description: 2,4-D, Salts & Esters (Or) Acetic Acid, (2,4-Dichlorophenoxy)-, Salts & Esters (Or) Dichlorophenoxyacetic Acid 2,4-D

| DEC Memo: | 12/21/22 - Ye - DDO - Spoke with the caller, who is from Haz-Mat One. UPS, one of their clients, reported a punctured saddle tank that spilled 20 gallons of diesel. Miller Environmental is currently performing clean-up. Miller PM: Michael (631) 603-2564. Spoke with Michael. The spill is halfway cleaned up. They are first focusing the cleanup on the main part of the road, where there's a lot of traffic. They arrived in time to put sausage booms to prevent oil entering the soil and are using speedy dry and citrus cleaner. There are no drain impacts. They will send photos and the fully executed manifest. |
| Remarks: | punctured saddle tank, MILLER Env for clean up |

| DEC Memo: | Prior to Sept, 2004 data translation this spill Lead_DEC Field was M TIBBE TRANSFERED FROM SIGONA TO TIBBE. 7/15/2005 JAA (Jack Aversa) file review. Reviewed UST closure report (Jan 1996) - requested by Mike Haggerty and faxed by LBG on 6/17/2005, Report Appendix- faxed by LBG on 6/27/2005, and Disposal receipts (faxed by LBG on 7/15/2005). Leggette, Brashears, and Graham, Inc (LBG) retained by UPS to observe and document the removal of tanks and piping. Two 550 gallon used oil USTs (1 steel, 1 fiberglass) and one 4,000 gallon (double wall steel, fiberglass coated) UST were removed from 2 separate excavations on Sept 5,12 and 13, 1995. Approx 20 feet of 1 inch diameter steel piping connected to a 10k gallon heating oil UST were replaced. UST remvoal and piping replacement conducted by Gas Installations Inc (GI), of Inwood NY. Steel tanks transported by GI to Broxn Iron and Metal works for recycling (receipt provided). FRP tank crushed and disposed by GI at a sanitary landfill. PID readings showed non-detect for used oil ust soil samples. 4 excavation samples were sent to the lab and were non-detect for BTEX. amd VOCs, non-detect for RCRA metals. UG piping confirmatory samples - 2 PAH’s slightly exceeded STARS. Gasoline UST removal - soil screened with PID and separated into 2 piles(clean and gasoline impacted). Approx 100 yards stockpiled and later shipped off site for disposal/recycling (receipt included - soil remediation |

**UPS (Continued)** **S102180041**

of Philadelphia). 6 post excavation samples indicated minor exceedances for total BTEX and MTBE.
Receipts provided for tank bottoms. PBS # 2-601299 - tanks shown as closed. No further action
required. File closed.

Remarks: FOUND CONTAMINATED SOIL AND SOME SHEEN ON GROUND WATER

| DEC Region: | 2 |
| DER Facility ID: | 324195 |
| DEC Memo: | Prior to Sept, 2004 data translation this spill Lead_DEC Field was MULQUEEN 11/8/04 - Austin - received Site assessment/tank closure report from Ira Conklin and sons for H.O. Penn on 8/5/04 - report dated 5/12/97 - end This was NOT transferred to CO 11/16/06 - Austin - Reassigned from Austin to Ketani for followup/review - end 12/6/06 - Raphael Ketani. The site is owned and occupied by H O Penn Machinery Co., Inc., 699 Brush Avenue, Bronx, 10465. The NYC Property Tax database and Property Shark do not list 699 Brush Avenue. The parent company is H O Penn Machinery Co., Inc., 122 Noxon Road, Poughkeepsie, NY, 12603, (845) 452-1200. The site in the Bronx is (718) 863-3800. The PBS case is #2-064084 and there are 2 tanks that were closed 1/1/97 and 6 active tanks. The active tanks are: 2-2000 gal. with lube oil and 1-2000 gal. with waste oil; 1-500 gal. with lube oil; 1-3000 gal. with diesel; 1-6000 gal. with #2 oil. These 6 tanks were installed 2/1/97. There was a tank test failure on 1/8/97 and the finding of contaminated soil around the tank. The caller was Stacey Pettine of Ira D. Conklin & Sons (914) 561-1512. I called H O Penn Machinery Co at (718) 863-3800, but could only leave a voice mail for Jeff Baumann of the Service Department. I sent a CSL. 12/8/06 - Raphael Ketani. Donna Eagan of H O Penn's Poughkeepsie office (845) 437-4069 left a voice mail yesterday stating that she will be working with DEC as Mr. Baumann is out. She asked me to call her to discuss what DEC needs in the way of documentation. I tried calling her, but could only leave a message. 12/11/06 - Raphael Ketani. Ms. Eagan called me. She said that she had a copy of the cleanup closure report for the Bronx site. I asked her to send me a copy. She said she would. 12/13/06 - Raphael Ketani. I received the closure report from Donna Egan. The report contained a short narative section, tables of PID readings for each excavation area - there was only a detection of 149.7 ppm for only the floor of excavation #1, a tank location diagram, a set of end-point soil analytical results for each excavation site - there were no detections, a tank cleaning certificat, a soil manifest, bills of lading for the tank bottoms, and soil tracking forms. Based on the documentation in the closure report, I am closing the case. |
| Remarks: | contaminated soil around tank |

| DEC Memo: | 06/08/17 - Lakhani The property is a Caterpillar dealership. The dealership has one Caterpillar in operation in the shop bay. During a normal procedure at the dealership, the Caterpillar's fuel line ruptured releasing 25 gallons of diesel onto the concrete. No drains or catch basins were affected. Miller Environmental was hired to complete the cleanup and provide DEC with a report. Contact for H.O. Penn Machinery Company, the dealership, is Markus Wesaw (Cell: 845-416-7173, Ph: 845-437-4069) 06/15/17 File Review: Spill Report (Miller Environmental, 06/14/17) - Miller was contacted by H.O. Penn Machinery Company, Inc. on 06/08/17 with a report of a hydraulic oil leak at the location. Upon inspection of the impacted area, it appeared that while working on payloader a hydraulic oil line was cut and hydraulic oil was released onto the concrete pavement. HO Penn personnel applied absorbents. Miller applied additional speedy dry to all impacted areas to contain and recover the discharged product. The speedy dry was swept up and containerized prior to offsite disposal. Miller reports that all impacted material has been recovered and disposed of an it appears that no further action is warranted regarding the spill. Spill is closed. |

# GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

**Number of Days to Update:** Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

**STANDARD ENVIRONMENTAL RECORDS**

***Lists of Federal NPL (Superfund) sites***

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

***Lists of Federal Delisted NPL sites***

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 05/22/2024

***Lists of Federal sites subject to CERCLA removals and CERCLA orders***

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 03/25/2024

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

***Lists of Federal CERCLA sites with NFRAP***

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Date of Government Version: 04/22/2024

***Lists of Federal RCRA TSD facilities***

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

***Lists of Federal RCRA generators***

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

***Lists of state and tribal voluntary cleanup sites***

VCP: Voluntary Cleanup Agreements
New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing
In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

**ADDITIONAL ENVIRONMENTAL RECORDS**

***Local Brownfield lists***

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

HIST SPILLS: SPILLS Database

This database contains records of chemical and petroleum spill incidents. Under State law, petroleum and hazardous chemical spills that can impact the waters of the state must be reported by the spiller (and, in some cases, by anyone who has knowledge of the spills). In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY SPILLS database. Department of Environmental Conservation.

EPA WATCH LIST: EPA Watch List

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines
An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS RCRA MANIFEST: PFAS Transfers Identified In the RCRA Database Listing

To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: PFAS, PFOA, PFOS, PERFL, AFFF, GENX, GEN-X (plus the VT waste codes). These keywords were searched for in the following text fields: Manifest handling instructions (MANIFEST_HANDLING_INSTR), Non-hazardous waste description (NON_HAZ_WASTE_DESCRIPTION), DOT printed information (DOT_PRINTED_INFORMATION), Waste line handling instructions (WASTE_LINE_HANDLING_INSTR), Waste residue comments (WASTE_RESIDUE_COMMENTS).

PFAS NPDES: Clean Water Act Discharge Monitoring Information

Any discharger of pollutants to waters of the United States from a point source must have a National Pollutant Discharge Elimination System (NPDES) permit. The process for obtaining limits involves the regulated entity (permittee) disclosing releases in a NPDES permit application and the permitting authority (typically the state but sometimes EPA) deciding whether to require monitoring or monitoring with limits. Caveats and Limitations: Less than half of states have required PFAS monitoring for at least one of their permittees and fewer states have established PFAS effluent limits for permittees. New rulemakings have been initiated that may increase the number of facilities monitoring for PFAS in the future.

PFAS ECHO FIRE TRAIN: Facilities in Industries that May Be Handling PFAS Listing

A list of fire training sites was added to the Industry Sectors dataset using a keyword search on the permitted facilitys name to identify sites where fire-fighting foam may have been used in training exercises. Additionally, you may view an example spreadsheet of the subset of fire training facility data, as well as the keywords used in selecting or deselecting a facility for the subset. as well as the keywords used in selecting or deselecting a facility for the subset. These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PT 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

PFAS: PFAS Contamination Site Location Listing

DEC surveyed select businesses, fire departments, fire training centers, bulk storage facilities, airports, and Department of Defense (DoD) facilities. The responses to the survey have helped to determine if these entities used or stored materials containing PFOA/PFOS including AFFF and dispersants used in Teflon coating operations. The results of this survey will be updated periodically as additional responses are received..

E DESIGNATION: E DESIGNATION SITE LISTING

The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

NYC LEAD 2: Recent Lead Paint Violations

Pursuant to New York City?s Housing Maintenance Code, the Department of Housing Preservation and Development (HPD) issues violations against conditions in rental dwelling units that have been verified to violate the New York City Housing Maintenance Code (HMC) or the New York State Multiple Dwelling Law (MDL). Violations are issued when an inspection verifies that a violation of the HMC or MDL exists. It is closed when the violation is corrected, as observed/verified by HPD or as certified by the landlord.

SPDES: State Pollutant Discharge Elimination System

New York State has a state program which has been approved by the United States Environmental Protection Agency for the control of wastewater and stormwater discharges in accordance with the Clean Water Act. Under New York State law the program is known as the State Pollutant Discharge Elimination System (SPDES) and is broader in scope than that required by the Clean Water Act in that it controls point source discharges to groundwaters as well as surface waters.

**EDR HIGH RISK HISTORICAL RECORDS**

***EDR Exclusive Records***

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

**OTHER DATABASE(S)**

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

**USGS TOPOGRAPHIC MAP**

| | |
|---|---|
| Target Property Map: | 14115946 FLUSHING, NY |
| Version Date: | 2019 |

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

# GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

**GROUNDWATER FLOW DIRECTION INFORMATION**

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

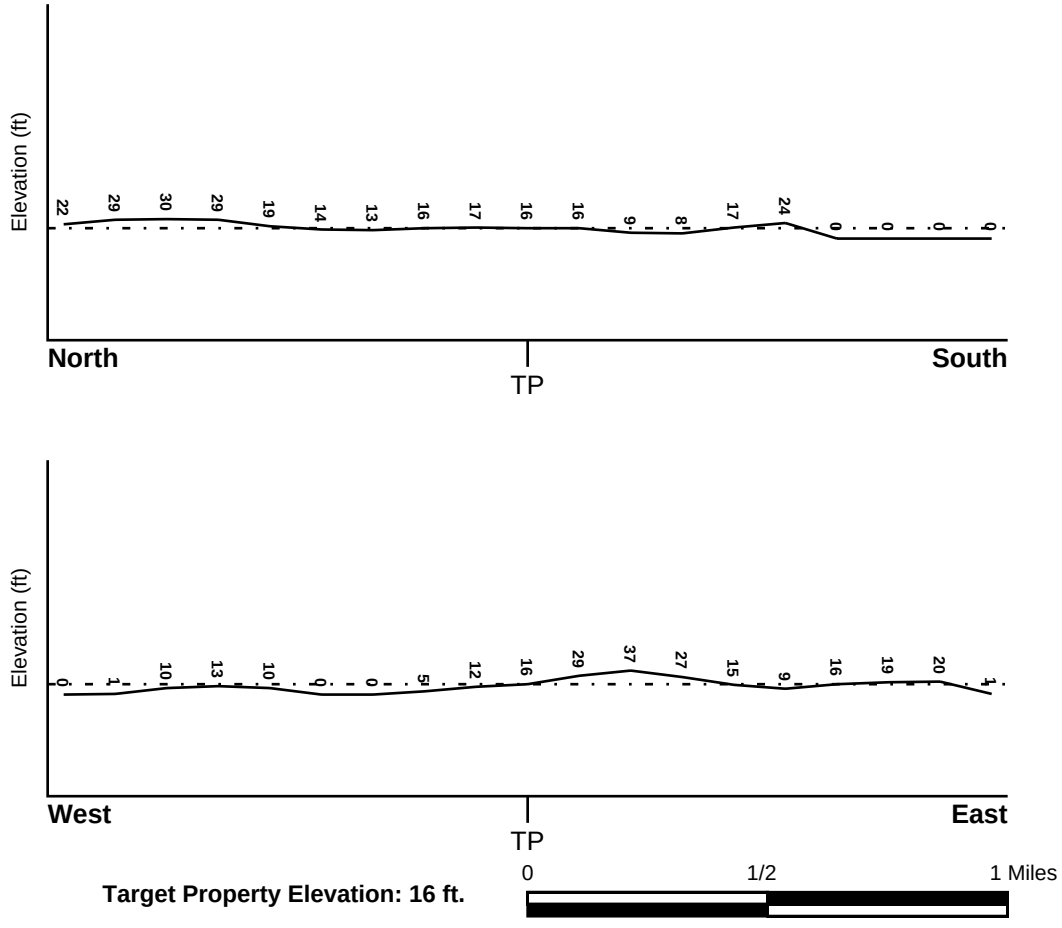
**TOPOGRAPHIC INFORMATION**

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

**TARGET PROPERTY TOPOGRAPHY**

General Topographic Gradient: General West

**SURROUNDING TOPOGRAPHY: ELEVATION PROFILES**



**Target Property Elevation: 16 ft.**

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

# GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

## HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

### FEMA FLOOD ZONE

| Flood Plain Panel at Target Property | FEMA Source Type |
|---|---|
| 3604970104F | FEMA FIRM Flood data |

| Additional Panels in search area: | FEMA Source Type |
|---|---|
| 3604970103F | FEMA FIRM Flood data |
| 3604970111F | FEMA FIRM Flood data |
| 3604970112F | FEMA FIRM Flood data |

### NATIONAL WETLAND INVENTORY

| NWI Quad at Target Property | NWI Electronic Data Coverage |
|---|---|
| FLUSHING | YES - refer to the Overview Map and Detail Map |

## HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

***Site-Specific Hydrogeological Data*:***

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

# GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

**GROUNDWATER FLOW VELOCITY INFORMATION**

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

**GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY**

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

**ROCK STRATIGRAPHIC UNIT** **GEOLOGIC AGE IDENTIFICATION**

| | | | |
|---|---|---|---|
| Era: | Paleozoic | Category: | Stratified Sequence |
| System: | Ordovician | | |
| Series: | Middle Ordovician (Mohawkian) | | |
| Code: | O2 *(decoded above as Era, System & Series)* | | |

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

**DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY**

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

# GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

| Soil Layer Information | | | | | | | |
|---|---|---|---|---|---|---|---|
| | Boundary | | | Classification | | | |
| Layer | Upper | Lower | Soil Texture Class | AASHTO Group | Unified Soil | Permeability Rate (in/hr) | Soil Reaction (pH) |
| 1 | 0 inches | 6 inches | variable | Not reported | Not reported | Max: 0.00<br>Min: 0.00 | Max: 0.00<br>Min: 0.00 |

**OTHER SOIL TYPES IN AREA**

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: fine sandy loam

Surficial Soil Types: fine sandy loam

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: unweathered bedrock
gravelly - fine sandy loam
stratified
fine sandy loam

**LOCAL / REGIONAL WATER AGENCY RECORDS**

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

## TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

## HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005, 2010 and 2015 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Freshwater Wetlands
Source: Department of Environmental Conservation
Telephone: 518-402-8961

## HYDROGEOLOGIC INFORMATION

AQUIFLOW$^{R}$ Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

## GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Sanborn® Library search results

Certification #: F7D1-4C79-AF79

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

*The Sanborn Library LLC Since 1866™*

### Limited Permission To Make Copies

Langan Engineering, Inc. (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

**Disclaimer - Copyright and Trademark Notice**

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, LLC. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. This Report is provided on an "AS IS", "AS AVAILABLE" basis. NO WARRANTY EXPRESS OR IMPLIED IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, LLC AND ITS SUBSIDIARIES, AFFILIATES AND THIRD PARTY SUPPLIERS DISCLAIM ALL WARRANTIES, OF ANY KIND OR NATURE, EXPRESS OR IMPLIED, ARISING OUT OF OR RELATED TO THIS REPORT OR ANY OF THE DATA AND INFORMATION PROVIDED IN THIS REPORT, INCLUDING WITHOUT LIMITATION, ANY WARRANTIES REGARDING ACCURACY, QUALITY, CORRECTNESS, COMPLETENESS, COMPREHENSIVENESS, SUITABILITY, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE, NON-INFRINGEMENT, MISAPPROPRIATION, OR OTHERWISE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, LLC OR ITS SUBSIDIARIES, AFFILIATES OR THIRD PARTY SUPPLIERS BE LIABLE TO ANYONE FOR ANY DIRECT, INCIDENTAL, INDIRECT, SPECIAL, CONSEQUENTIAL OR OTHER DAMAGES OF ANY TYPE OR KIND (INCLUDING BUT NOT LIMITED TO LOSS OF PROFITS, LOSS OF USE, OR LOSS OF DATA), ARISING OUT OF OR IN ANY WAY CONNECTED WITH THIS REPORT OR ANY OF THE DATA AND INFORMATION PROVIDED IN THIS REPORT. Any analyses, estimates, ratings, environmental risk levels, or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only an assessment performed by a qualified environmental professional can provide findings, opinions or conclusions regarding the environmental risk or conditions in, on or at any property.

Contact: Kaitlyn Gioia

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Langan Engineering, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Sanborn® Library search results

Certification #: F7D1-4C79-AF79

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

*The Sanborn Library LLC Since 1866™*

### Limited Permission To Make Copies

Langan Engineering, Inc. (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

**Disclaimer - Copyright and Trademark Notice**

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, LLC. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. This Report is provided on an "AS IS", "AS AVAILABLE" basis. NO WARRANTY EXPRESS OR IMPLIED IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, LLC AND ITS SUBSIDIARIES, AFFILIATES AND THIRD PARTY SUPPLIERS DISCLAIM ALL WARRANTIES, OF ANY KIND OR NATURE, EXPRESS OR IMPLIED, ARISING OUT OF OR RELATED TO THIS REPORT OR ANY OF THE DATA AND INFORMATION PROVIDED IN THIS REPORT, INCLUDING WITHOUT LIMITATION, ANY WARRANTIES REGARDING ACCURACY, QUALITY, CORRECTNESS, COMPLETENESS, COMPREHENSIVENESS, SUITABILITY, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE, NON-INFRINGEMENT, MISAPPROPRIATION, OR OTHERWISE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, LLC OR ITS SUBSIDIARIES, AFFILIATES OR THIRD PARTY SUPPLIERS BE LIABLE TO ANYONE FOR ANY DIRECT, INCIDENTAL, INDIRECT, SPECIAL, CONSEQUENTIAL OR OTHER DAMAGES OF ANY TYPE OR KIND (INCLUDING BUT NOT LIMITED TO LOSS OF PROFITS, LOSS OF USE, OR LOSS OF DATA), ARISING OUT OF OR IN ANY WAY CONNECTED WITH THIS REPORT OR ANY OF THE DATA AND INFORMATION PROVIDED IN THIS REPORT. Any analyses, estimates, ratings, environmental risk levels, or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only an assessment performed by a qualified environmental professional can provide findings, opinions or conclusions regarding the environmental risk or conditions in, on or at any property.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Langan Engineering, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Contact: Kaitlyn Gioia

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Langan Engineering, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Langan Engineering, Inc. were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

# EXECUTIVE SUMMARY

## DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at approximately five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1927 through current. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 2640 feet of the target property.

Summary information obtained is provided in the text of this report.

## RECORD SOURCES

The EDR City Directory Report accesses a variety of business directory sources, including Haines, InfoUSA, Polk, Cole, Bresser, and Stewart. Listings marked as EDR Digital Archive access Cole and InfoUSA records. The various directory sources enhance and complement each other to provide a more thorough and accurate report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer.

## RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

***Search Results:***

# Appendix G Resumes of Environmental Professionals

# BRIAN GOCHENAUR, QEP

## ASSOCIATE PRINCIPAL

## ENVIRONMENTAL SCIENTIST

Mr. Gochenaur is an environmental project manager with 20 years of experience in environmental due diligence, site investigation and remediation, fuel oil storage tank investigation and removal, soil vapor intrusion assessments, in-situ remedial technology, spill closure, vapor barrier and sub-slab depressurization system design and construction, emergency response, environmental and geotechnical site investigations, and health and safety monitoring. He has extensive experience with the New York State Department of Environmental Conservation (NYSDEC) Brownfield Cleanup, Voluntary Cleanup and Spill Programs and New York City Department of Environmental Protection (NYCDEP) "E" Designated and New York City Voluntary Cleanup Program (BCP) sites. His areas of expertise include Phase I Environmental Site Assessments, Phase II Site Investigations, and environmental consulting and oversight on large scale construction projects.

**EDUCATION**

B.S., Environmental Science
University of Florida

**PROFESSIONAL REGISTRATION**

Qualified Environmental Professional (QEP) certified by the Institute of Professional Environmental Practice

40-Hour OSHA (HAZWOPER)

# LAMEES ESMAIL, EIT

## PROJECT ENGINEER

## ENVIRONMENTAL ENGINEERING

Ms. Esmail is a civil and environmental engineer with four years of experience supporting environmental oversight and remediation projects in New York City. She has performed environmental field work including preparing daily inspection reports, photo documentation of work, and reviewing contractor submittals. She currently performs site research, manages field oversight, reviews/approves contractor submittals, prepares reports, and is involved with remedial design, implementation and project management.

Prior to joining Langan, Ms. Esmail gained three years of experience supporting environmental permitting and erosion and sedimentation control primarily for linear overhead transmission line projects. Types of permits included state land disturbance approvals and Army Corps of Engineers Section 10 Pre-Construction Notifications. Ms. Esmail also has experience aiding with the siting of new substation properties, using ArcGIS and AutoCAD to compile data for potential sites.

**EDUCATION**

B.S., Civil Engineering (Environmental Concentration)
George Washington University

**PROFESSIONAL REGISTRATION**

Engineer in Training (EIT) in NC

**SELECTED PROJECTS**

- Con Edison Partial Replacement of 345KV Feeders M51 & M52 Feasibility Study, New York, NY
- 220 Eleventh Avenue, Hudson Arts Building, New York, NY
- 50 Hudson Yards, Supertall Office Building, New York, NY
- 215 North 10th Street, Brooklyn, NY
- 320 West 135th Street, New York, NY
- 163 Varick Street, New York, NY
- 39 West 23rd Street, New York, NY

# KAITLYN GIOIA

## SENIOR STAFF SCIENTIST

## ENVIRONMENTAL ENGINEERING

Ms. Gioia is an Environmental Scientist with the New York City team. Ms. Gioia graduated in 2016 from Adelphi University with a B.A. in Environmental Studies. Ms. Gioia's experiences include project management, leading field work, exposure to an assortment of environmental pollutants, remedial action procedures, & Phase I and Phase II Environmental Assessments. Ms. Gioia has performed Asbestos Hazard and Emergency Response Act (AHERA) inspections and evaluations in schools and State Pollutant Discharge Elimination System (SPDES) sampling for power plants and commercial facilities.

### SELECTED PROJECTS

# 1.0 INTRODUCTION

## 1.1 General

This HEALTH AND SAFETY PLAN (HASP) was developed to address disturbance of known and reasonably anticipated subsurface contaminants and comply with Occupational Safety and Health Administration (OSHA) Standard 29 Code of Federal Regulation (CFR) 1910.120(b)(4), Hazardous Waste Operations and Emergency Response during anticipated site work for the property consisting of an approximately 19-acre portion of Ferry Point Park (FPP) that is part of Bronx Block 5622, Lot 1 (the "Site").

This HASP provides the minimum requirements for implementing site operations during future remedial measures. All contractors performing work on this site must implement their own HASP that, at a minimum, adheres to this HASP. The contractor is responsible for their own health and safety and that of their subcontractors. Langan personnel will implement this HASP while onsite.

The content of this HASP may change or undergo revision based upon additional information made available to health and safety personnel, monitoring results, or changes in the work plan.

## 1.2 Site Location and Background

The site is an approximately 9.85-acre, U-shaped section of Ferry Point Park that primarily serves as a park thoroughfare and public recreation space, and is identified on the New York City Bronx Borough Tax Map as part of Block 5622, Lot 1. The site is improved with an uninterrupted, circular roadway, referred to as Ring Road. Ring Road is a one-lane, one-way, asphalt-paved roadway and is bordered on either side by concrete curbing, metal guardrails, and grass shoulders. The remainder of the site includes vegetated areas and footpaths associated with Ferry Point Park. The section of Ring Road comprising the site totals about 1 mile.

The majority of the site was part of Westchester Creek and the Baxter Creek Inlet (now the East River) before infilling and development of Ferry Point Park in the 1940s. By 1947, the site and surrounding area had been infilled to create new land, and Ring Road had been constructed. Improvements to the site continued through 2015, when adjoining park and golf course construction were completed, and the subject property appeared as it does today. A site location map is provided as Figure 1.

## 1.3 Summary of Work Tasks

### 1.3.1 Geophysical Investigation - Underground Utility Clearance Policy

Prior to the commencement of intrusive field activities (i.e., soil borings); Langan will follow the Langan Underground Utility Clearance Policy including retaining a geophysical consultant to conduct a geophysical survey using ground penetrating radar (GPR) and electromagnetic detection equipment. The objective of the survey will be to identify any underground storage tank (UST) structures, drains, underground utilities, and other subsurface anomalies that may be encountered during the investigation. During this time Langan personnel will inspect the site and confirm investigation locations are both accessible and free of potential utility or other known or suspected subsurface structures.

### 1.3.2 "Soft-Dig" Clearance of Borehole Locations

If there is no geophysical survey for utility clearance or the results of the geophysical survey are inconclusive at specific locations subject to intrusive work, or otherwise in compliance with Langan's Underground Utility Clearance Policy, the drilling contractor may "soft-dig" each proposed drilling location or a separate contractor may be retained to "soft-dig" the locations to confirm they are free of utilities or other known or suspected subsurface structures. The dimensions of each location should extend to a depth of 5-feet and be about 1.5 times the anticipated diameter of the borehole when drilled. Langan personnel will confirm that the "soft dig" activities are completed to these specifications.

### 1.3.3 Day Lighting Excavation and Soil Screening

Langan may retain an excavation contractor to daylight buried unidentified structures. The purpose of the daylighting is to confirm if these structures are subsurface structures of concern (USTs, utilities sewer lines, storm water drains, electrical, gas or other utility line as well as other artifacts pertinent to the work plan). The excavation contractor will contact the appropriate utility mark-out authority and make available to their staff the verification number and effective dates.

The excavation contractor will employ "soft dig" methods in accordance with the Langan Underground Utility Clearance Policy when excavating. Langan may screen excavated soil for visual, olfactory, and instrumental indicators suggestive of a potential chemical or petroleum release. Instrument screening for the presence of volatile organic compounds (VOC) may be performed with a duly calibrated photoionization detector (PID). Contractors will notify Langan personnel if they identify indications suggestive of a potential chemical or petroleum release. Contaminated material shall be handled, and property disposed in accordance with federal, state and city regulations, criteria, and guidelines.

### 1.3.4 Soil Investigation and Sampling

Langan will retain a drilling contractor to advance soil borings to a depth below grade surface (bgs) specified in the work plan. Borings will be installed at the approximate locations indicated in Langan's work plan but may be moved in the field based on utility clearance and accessibility. The drilling contractor will contact the appropriate utility mark-out authority and make available to their drilling staff the verification number and effective dates. Langan will record the verification number and effective dates from the drillers. Langan will also note the location of marked out utilities on the site plan and scan the data into the project folder.

Langan personnel will screen soil for visual, olfactory, and instrumental indicators suggestive of a potential petroleum release. Instrument screening for the presence of VOC may be performed with a duly field calibrated PID (or equivalent). Langan personnel will collect soil samples from the proposed soil boring locations following the sampling plan outlined in the work plan. The borings will be filled with clean soil cuttings, clean sand or bentonite grout and capped at grade to match the surrounding surface after samples are collected.

Soil samples will be submitted to a specific lab per the work plan or to a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP)-certified laboratory and analyzed in accordance with work plan specifications.

### 1.3.5 Groundwater Investigation and Sampling

Selected soil borings will be converted into groundwater monitoring wells and sampled to evaluate groundwater quality. Groundwater samples will be collected from one or more of the new and if available, pre-existing monitoring wells in accordance with the Langan Low Flow Groundwater Sampling SOP (SOP #12). Groundwater samples will be submitted to an approved laboratory and analyzed for constituents as specified in the work plan. Temporary monitoring wells will be plugged and abandoned during the investigation in the manner defined in Section 1.3.2 for soil boring. Permanent monitoring wells will be completed with a road box set in concrete. Permanent monitoring wells will be eventually backfilled and abandoned in accordance with State and Local regulations.

Groundwater samples will be submitted to a NYSDOH ELAP-certified laboratory and analyzed in accordance with work plan specifications.

### 1.3.6 Groundwater/Product Gauging

Langan may gauge one or more of the observation/monitoring wells to collect synoptic head data or determine the presence of product. When gauging, Langan may also survey head

space VOCs within the well using a duly calibrated PID. When collected, gauging data will be based on the northernmost point at top of casing (TOC) using an interface probe (IP) capable of determining the presence of free product in the monitoring well as light non-aqueous phase liquid (LNAPL) at the top of the water column. If gauging for dense non-aqueous phase liquid (DNAPL) at the base of the monitoring well, the IP may not be appropriate. The field engineer will coordinate with the project team to devise an alternative method to gauge the thickness of DNAPL at base of the well. Langan will decontaminate gauging equipment between wells as required by the work plan.

### 1.3.7 Product Bailing

Langan may remove free product from on-site monitoring wells as part of this HASP or subsequent SMP activities. Langan will may use a bailer, peristaltic pump or submersible as determined by the work plan. Langan will record the volume of product and groundwater recovered. Recovered product and groundwater will be drummed in accordance with procedures outlined in the work plan.

### 1.3.8 Sub Slab or Soil Vapor Point Installation and Sampling

Langan (or its contractor) will install one or more sub-slab or soil vapor points at selected locations. If installed, the sub-slab points will be set at or just below the bottom of the slab in accordance with the work plan. The sub-slab points may be installed using an electric hammer drill to advance small diameter borings through the concrete (or equivalent) slab as defined in the work plan. The borings will terminate in and sample from the gravel substrate below the slab. Conditions in the field may require adjustment of sampling locations.

Langan personnel (or contractor) may install VaporPin® vapor points (or equivalent) in accordance with the manufacturer's instructions. If no point is used, Langan (or contractor) will set a sampling tube defined as an open-ended Teflon™-lined polyethylene tubing (or equivalent tubing as approved by the project manager [PM]). The sampling tube will be set either within the base of the concrete slab or within the support gravel underlying the slab.

When using the VaporPin® or equivalent, the installation sleeve will provide the necessary annulus seal required for subsequent sampling. However, if a sampling tube as defined above is use, the annulus at the top of the concrete slab will be filled with bentonite or food grade clay to seal the slab. A sand pack is not required for sub-slab vapor sampling. Unless specified by the work plan, the sub slab points are temporary and will be pulled after the sampling event and the hole will be patched at grade with material similar to the surrounding surface.

Langan personnel will confirm that the soil vapor points (implants) are 2-inches in length

constructed of polyethylene material and are connected to the surface by Teflon™-line polyethylene material (equivalent materials for the point and tubing are acceptable as approved by the PM). The annulus around the implant will be filled with clean sand to 6-inches above the implant. A 1-foot bentonite slurry will be applied to the top of the sand up to seal the sampling points. The remaining soil vapor point annulus may be backfilled with clean cuttings are sand to grade. Unless specified by the work plan, the vapor points are temporary and will be pulled after the sampling event and the hole will be patched at grade with material similar to the surrounding surface.

Vapor samples will be collected in accordance with following guidance including Final Guidance for Evaluating Soil Vapor Intrusion published by the New York State Department of Health (NYSDOH) in October 2006, Langan's Sub-Slab Vapor Sampling SOP (SOP #14) and as specified in the work plan. In addition, ambient air and indoor air samples may be collected for use as a comparison sample. As part of the indoor air sampling program, Langan personnel may complete a building inventory inspection. The inspection may take place prior to the commencement of actual field sampling. Vapor samples may be submitted to a NYSDOH ELAP-certified laboratory and analyzed in accordance with work plan specifications.

### 1.3.9 Test Pits

Langan may retain an excavation contractor to advance test pits to a depth below grade surface (bgs) specified in the work plan. Locations will be based on the results of the geophysical survey, the site inspection and document review. The excavation contractor is responsible for all permits and will contact the appropriate utility mark-out authority and make available to their staff the verification number and effective dates.

The excavation contractor may be required to use a bladed equipped excavation bucket. Langan personnel will confirm this and observe the test pit excavation noting foundation and soil attributes as required by the work plan. Langan personnel may collect soil samples for geotechnical evaluation. The excavation will be filled with soil cuttings after the observations are completed and samples are collected.

Soil samples, if collected, will be submitted to a geotechnical laboratory to be analyzed in accordance with work plan specifications.

### 1.3.10 Geotechnical Soil Boring

Langan may retain a geotechnical drilling contractor to advance geotechnical soil borings to a depth bgs specified in the work plan. Borehole locations may on shore or advanced from a barge. The locations may be based on the results of the geophysical investigation, site inspection and

document review. The drilling contractor will contact the appropriate utility mark-out authority and make available to their drilling staff the verification number and effective dates.

Langan will observe the borehole advancement and record appropriate geotechnical data including the results of Standard Penetration Tests (SPT), soil and stratigraphic identification and other data as required by the work plan. One or more borings may be completed as observation wells to be completed as specified in the work plan. All soil borings will be filled with clean soil cuttings after the subsurface exploration is completed.

Langan personnel may collect soil samples for geotechnical evaluation. Soil samples may be submitted to a geotechnical laboratory to be analyzed in accordance with work plan specifications.

### 1.3.11 Waste Characterization - Soil Investigation and Sampling

Langan will undertake a waste characterization investigation in accordance with the work plan. Langan may retain a drilling contractor to complete to advancing soil borings to a depth below grade surface (bgs) as specified in the work plan. If advanced, borings will be installed at the approximate locations indicated in Langan's work plan but may be moved in the field based on utility clearance and accessibility. The drilling contractor, or Langan is no contractor is retained, will contact the appropriate utility mark-out authority, and make available to their drilling staff the verification number and effective dates. Langan will record the verification number and effective dates from the drillers. Langan will also note the location of marked out utilities on the site plan and scan the data into the project folder.

Langan personnel will screen soil for visual, olfactory, and instrumental indicators suggestive of a potential petroleum release. Instrument screening for the presence of VOCs may be performed with a duly field calibrated PID. Langan personnel will collect soil samples from following the waste classification sampling plan outlined in the work plan. If advanced, borings will be filled with clean soil cuttings, clean sand or bentonite grout and capped at grade to match the surrounding surface after samples are collected.

Soil samples will be submitted to a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP)-certified laboratory and analyzed in accordance with work plan specifications.

Vapor samples will be collected in accordance with following guidance including Final Guidance for Evaluating Soil Vapor Intrusion published by the New York State Department of Health (NYSDOH) in October 2006, Langan's Sub-Slab Vapor Sampling SOP (SOP #14) and as specified in the work plan. In addition, ambient air and indoor air samples may be collected for use as a

comparison sample. As part of the indoor air sampling program, Langan personnel may complete a building inventory inspection. The inspection may take place prior to the commencement of actual field sampling. Vapor samples may be submitted to a NYSDOH ELAP-certified laboratory and analyzed in accordance with work plan specifications.

### 1.3.12 Demolition of Current Site Features

Langan will observe the demolition and removal of current site features as defined in the work plan. All soils and debris excavated or disturbed at the site will be either transported off site for disposal at an approved facility or reused on the site. Personnel conducting activities will report to Langan when encountering impacted historic fill, petroleum impacted material or impacted groundwater and shall abide to the provisions of this HASP.

### 1.3.13 Storm water Pollution Prevention Inspection

If required and in accordance with the work plan, Langan personnel with Storm Water Pollution Prevention (SWPPP) inspection credentials will conduct SWPPP inspections. Langan will observe the stormwater pollution prevention system install to document that the install is in accordance with the work plan and take appropriate measures if impacted soil is observed during excavation.

### 1.3.14 Excavation

Langan personnel will screen excavated material for visual, olfactory, and instrumental indicators suggestive of a potential chemical or petroleum release. Instrument screening for the presence of volatile organic compounds (VOC) may be performed with a duly calibrated Photoionization detector (PID). Contractors will excavate for utilities, foundation components and potential grading using heavy equipment and hand tools. Contractors will notify Langan personnel if they identify indications of a potential chemical or petroleum release. Contaminated material must be handled, and property disposed in accordance with federal, state and city regulations, criteria, and guidelines.

### 1.3.15 Soil Screening

As part of future excavation activities, the Langan personnel will report when they have observed visual and olfactory indications of possible soil impact. Langan personnel will also report concentrations of VOCs or methane above background when using a properly calibrated handheld PID and flame ionization detector (FID), or equivalent.

### 1.3.16 Soil Sampling

Soil samples (waste characterization, excavation endpoint, delineation, or quality assurance/quality control [QA/QC]) may be collected during construction, as required. Langan personnel will coordinate with the contractor in sampling soil (in accordance with the Site Management Plan [SMP], where applicable). If stockpile soil sampling is required from above ground level, suitable excavation equipment (i.e., excavator, front end loader) should be used to collect the sample.

Soil samples will be submitted to a NYSDOH ELAP-certified laboratory and analyzed in accordance with work plan specifications.

### 1.3.17 Stockpiling

As part of future excavation activities, potentially impacted soil may be stockpiled pending laboratory analysis and determining proper off-site disposal. Visibly contaminated soil, if encountered, must be segregated, and stockpiled on at least 10 millimeters of plastic sheeting; reusable soil and fill must be segregated and stockpiled separately from unusable fill, concrete and other debris; the stockpiles must be kept covered with 6 millimeters thick plastic sheeting; the plastic sheeting covering the stockpiles must be anchored firmly in place by weights, stakes, or both; the Contractor must maintain the plastic sheeting.

### 1.3.18 Characterization of Excavated Material

When required by the work plan, Langan personnel will characterize excavated soil or clean backfill in accordance with Langan standards.

### 1.3.19 Construction Activity Inspections and Observations

Langan will observe construction activities including the general oversight, observation of landscaping activities, and other select observation, project management, and supervision as specified in the work plan or in accordance with the construction documents, or special inspection requirements administered by the New York City Department of Buildings. Materials used for construction will be inspected by Langan for conformance to the design documents.

### 1.3.20 Support of Excavation (SOE)

Langan personnel will perform observational and inspection activities in support of excavation. These activities include drilling of soil pilings and tiebacks and other activities specified in the work plan.

### 1.3.21 Observation/Monitoring Well Plugging and Abandonment

At an unspecified future date, the observation/monitoring wells will be abandoned. Plugging and abandonment will be in accordance with federal and state requirements. Langan may retain a drilling contractor to complete the plugging and abandonment activities. The contractor will contact the appropriate utility mark-out authority and make available to their field staff the verification number and effective dates. Langan may observe the plugging and abandonment of one or more observation/monitoring wells to document that the plugging and abandonment activities were completed in accordance with the work plan and regulations.

### 1.3.22 QA/QC Sampling

Samples for quality assurance/quality control [QA/QC] may also be collected and submitted to an approved laboratory and analyzed in accordance with work plan specifications. Information regarding the QA/QC samples including required method of analysis may be included in the same COC as the soil samples unless otherwise instructed by the work plan.

### 1.3.23 Excavation Backfill

Areas of the site that were over-excavated may be backfilled to development grade (i.e., the grade required to complete construction of the foundation and sidewalk extension). Imported material should meet specifications defined in the work plan or consist of clean fill that meets the 6 New York Codes, Rules and Regulations (NYCRR) Part 375-6.8(a) Unrestricted Use Soil Cleanup Objectives (UU SCOs) or other acceptable fill material such as virgin stone from a permitted mine or quarry or recycled concrete aggregate (RCA), from a New York State Department of Environmental Conservation (NYSDEC)-registered facility in compliance with 6 NYCRR Part 360 registration and permitting requirements for the period of RCA acquisition. Imported RCA must be derived from recognizable and uncontaminated concrete.

### 1.3.24 Decommissioning and Removal of Underground Storage Tank

If an underground storage tank (UST) is encountered, a UST decommissioning and removal contractor shall furnish all labor and materials, equipment and incidentals required for the proper decontamination, removal, and closure of any UST in accordance with federal, state and local regulations. Langan personnel will monitor VOCs with a calibrated PID downwind from the UST excavation and record the PID readings.

### 1.3.25 Construction Dewatering

Construction dewatering may be required, the dewatering contractor shall be responsible for handling contaminated dewatering fluids in accordance with federal, state and local regulations.

Dewatering fluids are likely to be discharged to the local sanitary sewer system after treatment and under approved regulatory permit. Alternatively, the contractor may provide containerized storage to allow for testing of groundwater prior to, and after, treatment and before disposal. If required, Langan field personnel may sample dewatering treatment system liquids from either a discharge standpipe or a storage tank. Dewatering samples will be submitted to an ELAP-certified laboratory for analysis.

### 1.3.26 Installation of Vapor/Moisture Barrier

Langan will observe and document the installation of a vapor and/or moisture barrier as defined by the work plan. The installation of the vapor/moisture barrier is to be completed by a properly licensed contractor as specified in the work plan. Langan will inspect the vapor barrier installation to assess whether the installation is in accordance with specifications in the work plan.

### 1.3.27 Communication Pilot Test Oversight

Langan will oversee the contractor installation of sub-slab monitoring points, the assembling of the vapor manifold with blower and the start-up of the pilot test for the sub-slab vapor remediation system. These activities are to be done in accordance with the work plan. The installation and assembly activities are to be performed by the contractor in accordance with the construction documents. Materials used for construction will be inspected by Langan for conformance to the design documents.

### 1.3.28 Concrete Coring & Excavation

Langan may retain a contractor to excavate the concrete slab at selected locations for installing the remedial system. Prior to the commencement of intrusive field activities; the contractor will contact the appropriate utility mark-out authority and make available to their staff the verification number and effective dates. The contractor may be required to undertake minimal excavation to meet the design criteria of the work plan.

Langan will observe excavated soil for visual, olfactory, and instrumental indicators suggestive of a potential petroleum release. Instrument screening for the presence of volatile organic compounds (VOCs) may be performed with PID. Langan may collect soil samples if directed by the project manager or as part of the work plan. Soil samples will be submitted to a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP)-certified laboratory and analyzed in accordance with work plan specifications.

### 1.3.29 Installation of Sub-Slab Depressurization (SSD) System

Langan will retain contractors to install the components of the proposed SSD system.

Components include:

- Sub-slab piping;
- Above-ground piping; and
- Roof Mounted Blower.

As well electrical and structural components that will provide power or brace/support the SSD system components.

### 1.3.30 Sub-Slab Depressurization System Inspection

Once active, Langan will perform periodic inspections of the SSD system in accordance with work plan or site management plan (SMP) or as directed by the PM. Inspections will include:

- An assessment of the condition of the SSD system including the four roof-mounted components;
- Collection of vacuum and VOC readings at each of the permanent vapor monitoring points; and
- Collection of flow rate and VOC readings at the effluent at designated points sampling ports in the system.

All work will be duly documented in the O&M work logs and included as required in the O&M reports.

### 1.3.31 Equipment Decontamination

Before the start of the day's sampling and after sampling each run, sampling equipment will be decontaminated by the decontamination process outlined Attachment B - Decontamination Procedures. Decontamination wastes and purge water will be temporarily stored on site pending analytical results.

### 1.3.32 Management of Investigative-Derived Waste

The investigative-derived waste (IDW) generated during this investigation will be contained in DOT-approved 55-gallon drums. The drums will be temporarily stored on the site or as directed by the client representative. All drums will be filled between to two-thirds full to allow easy maneuvering during drum pickup and disposal. Drum labels are to be provided by Langan (Environmental Closet). All drums will be labeled as "IDW Pending Analysis" until sample data are reported from the laboratory. Drum labels will include date filled and locations where waste was generated along with the standard information required by the labels in accordance with the

Langan SOP09, Drum Labeling.

Closed top drums are to be used to store liquids. Debris, including plastic sheeting, polyethylene tubing, personal protection equipment (PPE), decontamination debris, etc. will be segregated from and disposed in large heavy duty garbage bags and disposed of at the site. Excess unused glassware should be returned to the lab along with the last day of collection samples.

### 1.3.33 Drum Sampling

Langan personnel may collect drum samples, as required, prior to off-site drum disposal. Samples will be placed into laboratory-supplied batch-certified clean glassware and submitted to an approved laboratory and analyzed in accordance with work plan specifications, if required.

### 1.3.34 Surveying

Surveying activities may be completed by Langan. Surveying will be conducted by licensed surveyors.

## 2.0 IDENTIFICATION OF KEY PERSONNEL/HEALTH AND SAFETY PERSONNEL

The following briefly describes the health and safety (H&S) designations and general responsibilities that may be employed for this site. The titles have been established to accommodate the project needs and requirements and ensure the safe conduct of site activities. The H&S personnel requirements for a given work location are based on the proposed site activities.

### 2.1 Langan Project Manager

The Langan Environmental Project Manager (PM) is Brian Gochenaur, the Langan Geotechnical PM is Art Alzamora, and the Langan Site/Civil PM is Chris Vitolano, their responsibilities include:

- Ensuring that this HASP is developed, current, and approved prior to on-site activities.
- Ensuring that the tasks in the project are performed in a manner consistent with Langan's comprehensive *Construction Health and Safety Program for Hazardous Waste Operations* and this HASP.

### 2.2 Langan Corporate Construction Health and Safety Manager

The Langan Corporate Construction Health and Safety Manager is Tony Moffa. His responsibilities include:

- Updating the *Construction Health and Safety Program for Hazardous Waste Operations*.
- Assisting the site Construction Health and Safety Officer (HSO) with the development of the HASP, updating HASP as dictated by changing conditions, job site inspection results, etc., and approving changes to this HASP.
- Assisting the HSO in the implementation of this HASP and conducting Jobsite Safety Inspections and assisting with communication of results and correction of shortcomings found.
- Maintaining records on personnel (medical evaluation results, training and certifications, accident investigation results, etc.).

## 2.3 Langan Site Health & Safety Officer

The Langan site HSO is William Bohrer. His responsibilities include:

- Participating in the development and implementation of this HASP.
- When on-site, assisting the Langan Field Team Leader in conducting Tailgate Safety Meetings and Jobsite Safety Inspections and correcting any shortcomings in a timely manner.
- Ensuring that proper PPE is available, worn by employees, and properly stored and maintained.
- Controlling entry into and exit from the site contaminated areas or zones.
- Monitoring employees for signs of stress, such as heat stress, fatigue, and cold exposure.
- Monitoring site hazards and conditions.
- Knowing (and ensuring that all site personnel also know) emergency procedures, evacuation routes, and the telephone numbers of the ambulance, local hospital, poison control center, fire department, and police department.
- Resolving conflicts that may arise concerning safety requirements and working conditions.
- Reporting all incidents, injuries, and near misses to the Langan Incident/Injury Hotline immediately and the client representative.

## 2.4 Langan Field Team Leader Responsibilities

The Langan Field Team Leader (FTL) is to be determined prior to the start of field activities. The Field Team Leader's responsibilities include:

- The management of the day-to-day site activities and implementation of this HASP in the field.
- Participating in and/or conducting Tailgate Safety Meetings and Jobsite Safety Inspections and correcting any shortcomings in a timely manner.

- When a Community Air Monitoring Operating Program (CAMP) is part of the scope, the FTL will set up and maintain community air monitoring activities and instruct the responsible contractor to implement organic vapor or dust mitigation when necessary.
- Overseeing the implementation of activities specified in the IRMWP.

### 2.5 Contractor Responsibilities

The contractor must develop and implement their own HASP for their employees, their subcontractors, and consultants. The contractor is responsible for their own health and safety and that of their subcontractors. Contractors operating on the site must designate their own FTL, HSO, and Construction Health and Safety Manager (HSM). The contractor's HASP will be at least as stringent as this HASP. The contractor must be familiar with and abide by the requirements outlined in their own HASP. A contractor may elect to adopt Langan's HASP as its own provided that it has given written notification to Langan, but where Langan's HASP excludes provisions pertinent to the contractor's work (i.e., confined space entry); the contractor must provide written addendums to this HASP. Additionally, the contractor must:

- Ensure their employees are trained in the use of all appropriate PPE for the tasks involved.
- Notify Langan of any hazardous material brought onto the job site or site-related area, the hazards associated with the material, and must provide a material safety data sheet (MSDS) or safety data sheet (SDS) for the material.
- Have knowledge of, understand, and abide by all current federal, state, and local health and safety regulations pertaining to the work.
- Ensure their employees handling hazardous materials, if identified at the Site, have received current training in the appropriate levels of 29 CFR 1910.120, *Hazardous Waste Operations and Emergency Response* (HAZWOPER) if hazardous waste is identified at the Site.
- Ensure their employees handling hazardous materials, if identified at the Site, have been fit-tested within the year on the type of respirator they will wear; and
- Ensure all air monitoring is in place pertaining to the health and safety of their employees as required by OSHA 1910.120; and
- All contractors must adhere to all federal, state, and local regulatory requirements.

## 3.0 TASK/OPERATION SAFETY AND HEALTH RISK ANALYSES

A Task-Hazard Analysis (Table 1) was completed for general construction hazards that may be encountered at the Site. The potential contaminants that might be encountered during the field activities and the exposure limits are listed in Table 2 complete inventory of MSDS/SDS for chemical products used on site is included in Attachment E.

## 3.1 Specific Task Safety Analysis

### 3.1.1 Geophysical Survey

Langan personnel are not permitted to operate or otherwise handle the geophysical equipment including any downhole geophysical equipment subsequently used to survey boreholes. When boring locations are surveyed with surface geophysical equipment, the locations of the borings as well as utilities and other artifacts that may interfere with the subsurface investigation are to be marked with indelible paint, flags, or color tape (when marking indoor locations that the client has specifically requested not be marked with indelible paint). This information must also be added to the site map. When applying paint, proper PPE including at a minimum hand protection should be used.

### 3.1.2 "Soft Dig" Clearance of Borehole Locations

"Soft-Dig" clearance will be completed by the contractor. Langan personnel are not permitted to operate or otherwise handle the contractor's equipment. Langan will update the site map to include the locations of the cleared borehole locations as well as utilities and other artifacts that may interfere with the subsurface investigation.

### 3.1.3 Daylighting Test Pit

Excavation daylighting must abide by OSHA excavation standards (Part 1926.651) and conform to the Langan Underground Utility Clearance Policy. Daily inspections of excavations, the adjacent areas, and protective systems shall be made by a competent person for evidence of a situation that could result in cave-ins, indications of failure of protective systems, hazardous atmospheres, or other hazardous conditions. An inspection shall be conducted by the competent person prior to the start of work and as needed throughout the shift. Inspections shall also be made after every rainstorm or other hazard increasing occurrence. Sampling the soil requires the donning of chemical resistant gloves in addition to the standard PPE. Langan personnel are not to operate excavation equipment. This task is to be completed by the excavation contractor.

### 3.1.4 Indoor Drilling and Excavation

The work scope may require indoor excavation where there may not be adequate ventilation sufficient to safely operate any rig or excavation equipment powered by an internal combustion engine. Where possible, all such work should be done by equipment powered by electricity. If such equipment is used and must be directly wired to the buildings electrical system or to an independent system, this work must be completed by a licensed electrician in accordance with all electrical codes applicable to the work.

Indoor work which is to be completed with equipment powered by an internal combustion engine must incorporate air monitoring of carbon monoxide (CO) using calibrated air monitoring equipment (MultiRAE or equivalent). In addition, the work plan should incorporate mitigation for venting engine exhaust fumes directly to the outdoors and for circulating fresh air into the work area.

The OSHA Time Weighted Average (TWA) Permissible Exposure Limit (PEL) for CO from 50 to 35 parts per million (ppm). Langan will monitor CO with a suitable monitoring device. If CO levels exceed 5 ppm, Langan will instruct contractors to begin mitigation measures. These measures are at a minimum:

- Increase air circulation using industrial size fans to bring additional fresh air into the building or vent exhaust to the outside.
- Modify the passive exhaust method being used to increase venting circulation by using wider diameter tubing or sealing tubing connections; or
- Modify the work schedule where the rig is turned off to allow time for CO levels to fall back to background.

All work must cease if CO levels reach 35 ppm. The Langan engineer is to report to the PM and H&S officer when an action level is reached.

### 3.1.5 Outdoor Air Monitoring

Langan and its contractors will continuously self-monitor for the lower explosion limit (LEL) using, at a minimum, a personal LEL single gas monitor. When excavating in an enclosed space such as a trench or similar excavation, Langan and its contractors will monitor ambient air in the excavation using a four-gas meter including oxygen, hydrogen sulfide, carbon monoxide and LEL or a five-gas meter having an additional sensor for VOCs.

When any alarm is sounded, Langan and its contractors are to evacuate to the designated muster point and Langan is to notify the site's designated incident commander or foreman.

### 3.1.6 Soil Investigation and Sampling

Sampling the soil requires the donning of chemical resistant gloves in addition to the standard PPE. Langan personnel are not to operate drilling or excavation equipment nor open sampling devices (acetate liners, sonic sample bags, etc.). These tasks are to be completed by the driller or excavation contractor.

### 3.1.7 Groundwater Investigation and Sampling

Sampling groundwater requires the donning of chemical resistant gloves in addition to the standard PPE and cut resistant gloves when cutting sampling-tubing to length. Langan personnel are not to operate drilling equipment nor assemble or install monitoring well equipment. These tasks are to be completed by the driller contractor.

### 1.3.8 Groundwater/Product Gauging

Gauging product requires additional safety considerations including the presence of VOCs and protection of both field cloths and property. Langan will monitor air for VOCs using a duly calibrated PID. Langan will don protective clothing including Tyvek® over-cloths, as necessary. To protect property, Langan will work set a plastic barrier to protect floors or protect landscaping and use absorbent pads as necessary to collect pooled product. If sampling for PFAS from the same well, Langan will complete the product check first, if the well can be sampled without including product, Langan will remove the Tyvek® material from the well head vicinity.

### 3.1.9 Product Recovery Well Bailing

Langan may bail free product from monitoring wells. Free product bailing requires the donning of Tyvek™ suits, Tyvek™ boots and chemical resistant gloves in addition to the standard PPE and cut resistant gloves when cutting sampling-tubing to length. In addition, Langan will place plastic sheeting around the recovery well head to control spillage during product recovery. Langan will also keep on hand and readily available product absorbing pads to use as needed.

### 3.1.10 Electrical Pumps

Langan may use an electric pump to collect product from the recovery wells or to sample groundwater. Langan will inspect the electric pump and control box prior to use and specifically note the condition of the electrical connectors, pump, control box and the electrical cord. The electrical connection must be a grounded and connect to the power source using a functional three prong grounded plug. The power source must be a Ground Fault Circuit Interrupter (GFI or GFCI) receptacle.

### 3.1.11 Vapor Investigation and Sampling

Sampling vapor requires the donning of work gloves in addition to the standard PPE when assembling the Summa™ canister with the regulator and cut resistant gloves when cutting sampling- or silicone-tubing to length. Langan personnel are not to operate contractor equipment

nor assemble or install the contractor vapor point sampling equipment unless instructed by the work plan. When not instructed by the work plan, these tasks are to be completed by the contractor.

### 3.1.12 Additional Vapor Screening

Langan personnel may prescreen vapor samples for volatile organic compounds (VOCs), methane, hydrogen sulfide and lower explosion limit (LEL) conditions using duly calibrated devices design to screen vapor for these parameters. Langan personnel may also perform atmospheric screening for LEL. Results of the screening may be used in determining which soil vapor samples will be submitted for analysis.

Work activities will immediately cease, and the work area is to be evacuated if the MultiRAE returns a reading of 10% of the LEL (an alarm will sound). Langan personnel will contact the Langan PM. Instrument action levels for monitored gases are provided in Table 4.

### 3.1.13 Waste Characterization – Soil Investigation and Sampling

Sampling the soil requires the donning of chemical resistant gloves in addition to the standard PPE. Langan personnel are not to operate drilling or excavation equipment nor open sampling devices (acetate liners, sonic sample bags, etc.). These tasks are to be completed by the driller or excavation contractor.

### 3.1.14 Test Pit

Excavation test pits must abide by OSHA excavation standards (Part 1926.651). Daily inspections of excavations, the adjacent areas, and protective systems shall be made by a competent person for evidence of a situation that could result in possible cave-ins, indications of failure of protective systems, hazardous atmospheres, or other hazardous conditions. An inspection shall be conducted by the competent person prior to the start of work and as needed throughout the shift. Inspections shall also be made after every rainstorm or other hazard increasing occurrence. Sampling the soil requires the donning of chemical resistant gloves in addition to the standard PPE. Langan personnel are not to operate excavation equipment. This task is to be completed by the excavation contractor.

### 3.1.15 Geotechnical Soil Boring Investigation

Handling soil requires the donning of chemical resistant gloves in addition to the standard PPE. Langan personnel are not to operate drilling equipment nor open sampling devices (split spoons, acetate liners, sonic sample bags, etc.). These tasks are to be completed by the drilling

contractor.

### 3.1.16 Storm Water Pollution Prevention Inspection

When performing SWPPP inspections, Langan personnel will don all required PPE and maintain awareness to site traffic and site activities. If using a cell phone or tablet application to record the pertinent data, the engineer will do so in an area protected from site traffic and activities. Certain types of inspections may require additional PPE and safety training including fall protection and open water hazards.

### 3.1.17 Building Demolition

Langan will not be entering demolition areas nor perform any monitoring activities. The contractor will perform all work and monitoring under their own HASP following their own work plan.

### 3.1.18 Soil Investigation and Sampling

Sampling the soil requires the donning of chemical resistant gloves in addition to the standard PPE. Langan personnel are not to operate drilling or excavation equipment nor open sampling devices (acetate liners, sonic sample bags, etc.). These tasks are to be completed by the driller or excavation contractor.

### 3.1.19 Excavation and Soil Screening

Langan personnel will observe excavation and SOE activities including the general oversight, observation of landscaping activities, and other select observation project management and supervision as specified in the work plan or in accordance with the construction documents, or special inspection requirements administered by the DOB. Materials used for construction may be inspected by Langan personnel for conformance to the design documents. Prior to entering excavation, Langan personnel will ensure that excavation shoring conforms to proper shoring/benching/sloping techniques, at a minimum that soil and equipment is kept at least 2 feet from the edge of the excavation, that there is no water in the excavation, and that a competent person has inspected excavation prior to allow persons to enter. When entering excavation via a ladder, Langan personnel will only use ladders that are properly situated in accordance with the Ladder section of the HASP.

### 3.1.20 Soil Sampling

Sampling the soil requires the donning of chemical resistant gloves in addition to the standard PPE. Langan personnel are not to operate drilling or excavation equipment nor open sampling

devices (acetate liners, sonic sample bags, etc.). These tasks are to be completed by the driller or excavation contractor.

### 3.1.21 Stockpile Sampling

The Langan personnel are not to scale or climb stockpiles. If the soil sampling plan requires sampling from the stockpile above ground level, samples are to be obtained using suitable excavation equipment operated by the contractor (i.e., front end loader).

### 3.1.22 Construction Dewatering

If required, Langan may sample dewatering treatment system liquids from either the direct discharge standpipe or from a sample port or valve built into the storage tank, Langan will don the necessary PPE including nitrile gloves and if necessary, facial splash guard. Sample ports and valves may only be sampled if they are accessible at ground level. Sampling from heights over 6 feet is prohibited unless Langan field personnel are fully accredited in fall protection and is wearing approved fall protection safety apparatus. The discharge samples will be submitted to an ELAP-certified laboratory for analysis in accordance with the work plan.

### 3.1.23 Construction Activity Inspection

Langan personnel will conduct inspections as specified in the work plan. Langan may record the data the work plan requires. All future repair work to the engineering controls will be done exclusively by the contractor following their own health and safety specifications outlined in their HASPs. Other activities assigned to Langan as part of work activities are limited to inspection and observations as specified in the SMP or future work pans. Langan personnel are not to operate or assist in the operation of equipment used in construction activities unless defined as part of an inspection or observation in the work plan.

### 3.1.24 Removal of Underground Storage Tank

If UST excavation and removal activity is initiated, Langan personnel will conduct air monitoring for lower explosion limit (LEL) conditions within the UST excavation itself. This task is to be performed using calibrated air monitoring equipment designed to sound an audible alarm when atmospheric concentrations of VOCs are within 10% of the LEL. In normal atmospheric oxygen concentrations, the LEL monitoring may be done with a Wheatstone bridge/catalytic bead type sensor (i.e., MultiRAE). However, in oxygen depleted atmospheres (confined space), only an LEL designed to work in low oxygen environments may be used. Best practices require that the LEL monitoring unit be equipped with a long sniffer tube to allow the LEL unit to remain outside the UST excavation. Langan personnel are not to enter the UST excavation nor enter an excavated UST.

In addition to monitoring LEL, Langan personnel will monitor atmospheric VOC concentrations directly downwind of the UST excavation in accordance with standard CAMP procedures using calibrated air monitoring equipment.

### 3.1.25 Installation of the Vapor/Moisture Barrier

Specifically trained contractors are to install the vapor/moisture barrier. Langan personnel are there only to observe and record the data required in the work plan. Installation and assemblage of the vapor barrier is to be done exclusively by the contractor following their own health and safety specific HASP.

### 3.1.26 Concrete Coring & Excavation

Langan personnel are not permitted to operate or otherwise handle the contractor equipment. All electrical equipment and cords must be visually inspected. If the equipment housing appears damage or the electrical cords worn, they must be removed from use and replaced before the designated task continues. The contractor will use a Ground Fault Interrupter Circuit (GFIC) as a safety precaution.

### 3.1.27 Installation of Sub-Slab Depressurization (SSD) System

Unless specifically permitted by the work plan, Langan will not assist the contractor in installing components of the SSD system. Langan will observe and record pertinent information as required by the work plan. Langan employees are required to have completed fall protection training before completing any work from heights including roof work.

### 3.1.28 Operations and Maintenance

Langan will don standard PPE including hand and hearing protection when performing remedial system operations and maintenance activities. When and where necessary, Langan will implement lock-out/tag-out protocols. Waste generated during operations and maintenance will be contained as specified in this HASP and in the work plan. As required, Langan may sample drums generated as specified in this HASP and the work plan. Specific Safety Data Sheets (SDS) for chemical and consumables related to the operations and maintenance of the SSD system will be kept in the HASP Attachment I with the Operations and Maintenance manual (on-site).

### 3.1.29 Backfilling of Excavated Areas to Development Grade

The backfilling contractor will provide their employees with equivalent PPE to protect them from the specific hazards likely to be encountered on-site. Selection of the appropriate PPE must take into consideration: (1) identification of the hazards or suspected hazards; (2) potential exposure

routes; and (3) the performance of the PPE construction (materials and seams) in providing a barrier to these hazards. Langan personnel may survey backfilling material with a calibrated PID; however, as they are not permitted to climb the material delivery truck, the contractor must provide samples from each truck as required.

### 3.1.30 Support of Excavation

Langan personnel will inspect elements of the SOE including tiebacks in accordance with specification in the work plan and record the data the work plan and/or contract documents require. The installation of the soil pilings, tiebacks and other SOE activities are to be done exclusively by the contractor following their own health and safety specifications outlined in their HASPs. Other activities assigned to Langan as part of the SOE are limited to inspection and observations as specified in the work plan and/or contract documents. Langan personnel are not to operate or assist in the operation of equipment used in the SOE unless defined as part of an inspection or observation in the work plan and/or contract documents.

### 3.1.31 Drum Sampling

Drilling fluid, rinse water, grossly contaminated soil samples, and cuttings will be containerized in 55-gallon drums for disposal off-site. Each drum must be labeled in accordance with the Langan Drum Labeling Standard Operating Procedure (SOP09). Sampling drums requires the donning of work gloves when opening the drums and chemical resistant gloves when sampling in addition to standard PPE.

## 3.2 Radiation Hazards

No radiation hazards are known or expected at the site.

## 3.3 Physical Hazards

Physical hazards, which may be encountered during site operations for this project, are detailed in Table 1.

### 3.3.1 Explosion

No explosion hazards are expected for the scope of work at this site.

### 3.3.2 Heat Stress

The use of Level C protective equipment, or greater, may create heat stress. Monitoring of personnel wearing personal protective clothing should commence when the ambient

temperature is 72°F or above. Table 6 presents the suggested frequency for such monitoring. Monitoring frequency should increase as ambient temperature increases or as slow recovery rates are observed. Refer to Table 7 to assist in assessing when the risk for heat-related illness is likely. To use this table, the ambient temperature and relative humidity must be obtained (a regional weather report should suffice). Heat stress monitoring should be performed by the HSO or the FTL, who must be able to recognize symptoms related to heat stress.

To monitor the workers, be familiar with the following heat-related disorders and their symptoms:

- **Heat Cramps:** Painful spasms of arm, leg, or abdominal muscles, during or after work
- **Heat Exhaustion:** Headache, nausea, dizziness; cool, clammy, moist skin; heavy sweating; weak, fast pulse; shallow respiration, normal temperature
- **Heat Stroke**: Headache, nausea, weakness, hot dry skin, fever, rapid strong pulse, rapid deep respirations, loss of consciousness, convulsions, coma. *This is a life-threatening condition***.**

Do not permit a worker to wear a semi-permeable or impermeable garment when they are showing signs or symptoms of heat-related illness.

To monitor the worker, measure:

- **Heart rate:** Count the radial pulse during a 30-second period as early as possible in the rest period. If the heart rate exceeds 100 beats per minute at the beginning of the rest period, shorten the next work cycle by one-third and keep the rest period the same. If the heart rate still exceeds 100 beats per minute at the next rest period, shorten the following work cycle by one-third. A worker cannot return to work after a rest period until their heart rate is below 100 beats per minute.
- **Oral temperature:** Use a clinical thermometer (3 minutes under the tongue) or a similar device to measure the oral temperature at the end of the work period (before drinking). If oral temperature exceeds 99.6°F (37.6°C), shorten the next work cycle by one-third without changing the rest period. A worker cannot return to work after a rest period until their oral temperature is below 99.6°F. If oral temperature still exceeds 99.6°F (37.6°C) at the beginning of the next rest period, shorten the following cycle by one-third. Do not permit a worker to wear a semi-permeable or impermeable garment when oral temperature exceeds 100.6°F (38.1°C).

Prevention of Heat Stress - Proper training and preventative measures will aid in averting loss of worker productivity and serious illness. Heat stress prevention is particularly important because once a person suffers from heat stroke or heat exhaustion, that person may be predisposed to additional heat-related illnesses. To avoid heat-stress the following steps should be taken:

- Adjust work schedules.
- Mandate work slowdowns as needed.
- Perform work during cooler hours of the day if possible or at night if adequate lighting can be provided.
- Provide shelter (air-conditioned, if possible) or shaded areas to protect personnel during rest periods.
- Maintain worker's body fluids at normal levels. This is necessary to ensure that the cardiovascular system functions adequately. Daily fluid intake must equal the amount of water lost in sweat, i.e., eight fluid ounces (0.23 liters) of water must be ingested for every eight ounces (0.23 kilograms [kg]) of weight lost. The normal thirst mechanism is not sensitive enough to ensure that enough water will be drunk to replace lost sweat. When heavy sweating occurs, encourage the worker to drink more. The following strategies may be useful:
    - Maintain water temperature 50$^{O}$ to 60$^{O}$F (10$^{O}$ to 16.6$^{O}$C).
    - Provide small disposal cups that hold about four ounces (0.1 liters).
    - Have workers drink 16 ounces (0.5 liters) of fluid (preferably water or dilute drinks) before beginning work.
    - Urge workers to drink a cup or two every 15 to 20 minutes, or at each monitoring break. A total of 1 to 1.6 gallons (4 to 6 liters) of fluid per day are recommended, but more may be necessary to maintain body weight.
    - Train workers to recognize the symptoms of heat-related illness.

### 3.3.3 Cold-Related Illness

If work on this project begins in the winter months, thermal injury due to cold exposure can become a problem for field personnel. Systemic cold exposure is referred to as hypothermia. Local cold exposure is called frostbite.

- **Hypothermia -** Hypothermia is defined as a decrease in the patient core temperature below 96$^{O}$F. The body temperature is normally maintained by a combination of central (brain and spinal cord) and peripheral (skin and muscle) activity. Interference with any of these mechanisms can result in hypothermia, even in the absence of what normally is considered a "cold" ambient temperature. Symptoms of hypothermia include shivering, apathy, listlessness, sleepiness, and unconsciousness.
- **Frostbite -** Frostbite is both a general and medical term given to areas of local cold injury. Unlike systemic hypothermia, frostbite rarely occurs unless the ambient temperatures are less than freezing and usually less than 20$^{O}$F. Symptoms of frostbite are a sudden blanching or whitening of the skin; the skin has a waxy or white appearance and is firm to the touch; tissues are cold, pale, and solid.

Prevention of Cold-Related Illness - To prevent cold-related illness:

- Educate workers to recognize the symptoms of frostbite and hypothermia.
- Identify and limit known risk factors:
- Assure the availability of an enclosed, heated environment on or adjacent to the site.
- Assure the availability of dry changes of clothing.
- Assure the availability of warm drinks.
- Start (oral) temperature recording at the job site:
- At the FSO or Field Team Leader's discretion when suspicion is based on changes in a worker's performance or mental status.
- At a worker's request.
- As a screening measure, two times per shift, under unusually hazardous conditions (e.g., wind-chill less than 20$^{O}$F, or wind-chill less than 30$^{O}$F with precipitation).
- As a screening measure whenever anyone worker on the site develops hypothermia.

Any person developing moderate hypothermia (a core temperature of 92$^{O}$F) cannot return to work for 48 hours.

### 3.3.4 Noise

Work during the proposed activities may be conducted at locations with high noise levels from the operation of equipment. Hearing protection will be used, as necessary.

### 3.3.5 Hand and Power Tools

The use of hand and power tools can present a variety of hazards, including physical harm from being struck by flying objects, being cut, or struck by the tool, fire, and electrocution. All hand and power tools should be inspected for health and safety hazards prior to use. If deemed unserviceable/un-operable, notify the supervisor and tag equipment out of service. Ground Fault Circuit Interrupters (GFCIs) are required for all power tools requiring direct electrical service.

### 3.3.6 Slips, Trips, and Fall Hazards

Care should be exercised when walking at the site, especially when carrying equipment. The presence of surface debris, uneven surfaces, pits, facility equipment, and soil piles contribute to tripping hazards and fall hazards. To the extent possible, all hazards should be identified and marked on the site, with hazards communicated to all workers in the area.

### 3.3.7 Utilities (Electrocution and Fire Hazards)

*3.3.7.1 Utility Clearance*

The possibility of encountering underground utilities poses fire, explosion, and electrocution hazards. All excavation work will be preceded by a review of available utility drawings and by notification of the subsurface work to N.Y. One –Call--Center.

*3.3.7.2 Lockout-Tagout*

The potential adverse effects of electrical hazards include burns, arc flashes, and electrocution, which could result in serious injury including death. Therefore, there is a procedure that establishes the requirements for the lockout/tag out (LOTO) of energy isolating devices in accordance with the OSHA electrical lockout and tagging requirements as specified in 29CFR1910.147 and 29 CFR 1926.417. This procedure will be used to ensure that all machines and equipment are isolated from potentially hazardous energy. If possible, equipment that could cause injury due to unexpected energizing, start-up, or release of stored energy will be locked/tagged, before field personnel performs work activities.

The facility owner/operator/representative is to be the authorized person that will initiate and perform the LOTO in accordance with applicable rules and practices. Inerting of electrical power sources is to be completed by an authorized and licensed electrician. Langan personnel will follow LOTO protocols and practices including adding a separate lock/signature to the LOTO chain in accordance with said protocols and practices.

**SPECIAL NOTE:** Project personnel will assume that all electrical equipment at the surface, subsurface, and overhead locations are energized until equipment has been designated and confirmed as de-energized by a utility company representative. Langan will notify the designated utility representative prior to working adjacent to this equipment and will verify that the equipment is energized or de-energized in the vicinity of the work location. No project work shall be performed by Langan personnel or subcontractors near energized electrical lines or equipment.

The FTL shall accompany the designated facility owner/operator/representative or authorized/licensed electrician in surveying to locate and identify all energy-isolating devices. Langan will note which switches, valves or other isolating devices are used for inerting the equipment and how they are set assuring LOTO. The lockout/tagout procedure involves, but is not limited to, electricity, motors, steam, natural gas, compressed air, hydraulic systems, digesters, sewers, etc.

### 3.3.8 Adequate Lighting

Indoor or night activities must be done under adequate lighting conditions. The Langan field engineer must be able to clearly see the equipment, all controls and have sufficient lighting to detail color labels. Battery operated lights are sufficient provided they cast a wide enough field to provide the required lighting and there are back-up batteries and emergency flashlights available. Electrically powered lights are suitable provided the electrical source is equipped with a ground fault interrupt circuit (GFIC) and the extensions cords are visually inspected and not used if they show cracked or missing insulation. If a generator is supplying the electricity, it must be outdoors and properly vented.

### 3.3.9 Physical Hazard Considerations for Material Handling

There are moderate to severe risks associated with moving heavy objects at the Site. The following physical hazards should be considered when handling materials at the Site:

- Heavy objects will be lifted and moved by mechanical devices rather than manual effort whenever possible.
- The mechanical devices will be appropriate for the lifting of moving tasks and will be operated only by trained and authorized personnel.
- Objects that require special handling or rigging will only be moved under the guidance of a person who has been specifically trained to move such objects.
- Lifting devices will be inspected, certified, and labeled to confirm their weight capacities. Defective equipment will be taken out of service immediately and repaired or destroyed.
- The wheels of any trucks being loaded or unloaded will be choked to prevent movement. Outriggers will be fully extended on a flat, firm surface during operation.
- Personnel will not pass under a raised load, nor will a suspended load be left unattended.
- Personnel will not be carried on lifting equipment unless it is specifically designed to carry passengers.
- All reciprocating, rotating, or other moving parts will be guarded at all times.
- Accessible fire extinguishers, currently (monthly) inspected, will be available in all mechanical lifting devices.
- Verify all loads/materials are secure before transportation.

Material handling tasks that are unusual or require specific guidance will need a written addendum to this HASP. The addendum must identify the lifting protocols before the tasks are performed. Upon approval, the plan must be reviewed with all affected employees and documented. Any deviation from a written plan will require approval by the Langan HSM.

### 3.3.10 Hearing Conservation

Under the construction industry standard, the maximum permissible occupational noise exposure is 90 A-weighted decibels (dbA) (8-hour TWA), and noise levels in excess of 90 dbA must be reduced through feasible administrative and engineering controls (20 CFR 1926.52). Hearing protection is required when working within 15 feet of vacuum extraction equipment and drill rigs.

### 3.3.11 Open Water

Employees working over or near water, where the danger of drowning exists, must be provided with U.S. Coast Guard-approved life jackets or buoyant work vests. Prior to and after each use, the buoyant work vests or life preservers must be inspected for defects that would alter their strength or buoyancy. Defective units must not be used.

And should a worker fall into the water, OSHA requires (29 CFR 1926.106(c)) that ring buoys with at least 90 feet of the line must be provided and readily available for emergency rescue operations. The distance between ring buoys must not exceed 200 feet. Another remedial action required by OSHA (29 CFR 1926.106(d)) is the use of lifesaving skiffs.

OSHA requires that at least one lifesaving skiff must be immediately available at locations where employees are working over or adjacent to water and must include the following provisions.

- The skiff must be in the water or capable of being quickly launched by one person.
- At least one person must be present and specifically designated to respond to water emergencies and operate the skiff at all times when there are employees above water.
- When the operator is on break another operator must be designated to provide requisite coverage when there are employees above water.
- The designated operator must either have the skiff staffed at all times or have someone remain in the immediate area such that the operator can quickly reach the skiff and perform rescue services.
- The skiff operator may be assigned other tasks provided the tasks do not interfere with the operator's ability to quickly reach the skiff.
- A communication system, such as a walkie-talkie, must be used to inform the skiff operator of an emergency and to inform the skiff operator where the skiff is needed.
- The skiff must be equipped with both a motor and oars.

With regard to the number of skiffs required and the appropriate maximum response time, the following factors must be evaluated:

- The number of work locations where there is a danger of falling into water.
- The distance to each of those locations.

- Water temperature and currents.
- Other hazards such as, but not limited to, rapids, dams, and water intakes.

Other regulations that present H&S practices and PPE for work on or near water include: 29 CFR 1910, Subpart T (401 – 440)

## 3.4 Biological Hazards

### 3.4.1 Animals

There is a possibility of encountering wildlife including reptiles, rodents, and other small and medium-size mammals. Langan personnel are to avoid interacting with any wildlife.

### 3.4.2 Insects

Ticks and other biting or stinging insects may be encountered during site operations. Langan personnel should take necessary precautions including donning long sleeve shirts and insecticide to prevent bites and stings. After fieldwork, Langan personnel should perform a complete visual inspection of their clothing to insure they are not inadvertently harboring ticks. If they do observe a tick bite, they are to contact the HSM or HSO and report the event.

### 3.4.3 Plants

Poisonous plants may be encountered during site operations. Langan personnel should take necessary precautions including donning long sleeve shirts and applying preventative poison Ivy/Sumac lotion to prevent or limit the effects of exposure. If after fieldwork, Langan employees do observe a reaction to poisonous plant exposure, they are to contact the HSM or HSO and report the event.

### 3.4.4 Mold

This section is restricted to subsurface investigations where sampling soil, groundwater, soil or sub-slab vapor or ambient air in an indoor environment with slight to moderate mold impact. Mold exposure symptoms include nasal stuffiness, eye irritation, or wheezing.

The Langan field engineer is required to don a ½ face respirator with a minimum p-100 particulate filter and Tyvek™ type overclothing before entering mold impacted indoor work area. The Langan field engineer must be medically cleared and have been properly fitted for a respirator before donning one.

## 3.5 Additional Safety Analysis

### 3.5.1 Presence of Non-Aqueous Phase Liquids (NAPL)

Special care and PPE should be considered when NAPL is observed as NAPL is a typically flammable fluid and releases VOCs known to be toxic and/or carcinogenic. If NAPL is present in a monitoring well, vapors from the well casing may contaminate the work area breathing zone with concentrations of VOCs potentially exceeding health and safety action levels. In addition, all equipment used to monitor or sample NAPL (or ground water from wells containing NAPL) must be intrinsically safe. Equipment that directly contacts NAPL must also be resistant to organic solvents.

At a minimum, a PID should be used to monitor for VOCs when NAPL is observed. If NAPL is expected to be observed in an excavation or enclosed area, air monitoring must be started using calibrated air monitoring equipment designed to sound an audio alarm when atmospheric concentrations of VOC are within 10% of the LEL. In normal atmospheric oxygen concentrations, the LEL monitoring may be done with a Wheatstone bridge/catalytic bead type sensor (i.e., MultiRAE). However, in oxygen-depleted atmospheres (confined space), only an LEL designed to work in low-oxygen environments may be used. Best practices require that the LEL monitoring unit be equipped with a long sniffer tube to allow the LEL unit to remain outside the UST excavation.

When NAPL is present, Langan personnel are required to use disposable nitrile gloves at all times to prevent skin contact with contaminated materials. They should also consider having available a respirator and protective clothing (Tyvek® overalls), especially if NAPL is in abundance and there are high concentrations of VOCs.

All contaminated disposables including PPE and sampling equipment must be properly disposed of in labeled 55-gallon drums.

## 3.6 Job Safety Analysis

A Job Safety Analysis (JSA) is a process to identify existing and potential hazards associated with each job or task so these hazards can be eliminated, controlled, or minimized. A JSA will be performed at the beginning of each workday, and additionally whenever an employee begins a new task or moves to a new location. All JSAs must be developed and reviewed by all parties involved. A blank JSA form and documentation of completed JSAs are in Attachment G.

# 4.0 PERSONNEL TRAINING

## 4.1 Basic Training

Completion of an initial 40-hour HAZWOPER training program as detailed in OSHA's 29 CFR 1910.120(e) is required for all employees working on a site engaged in hazardous substance removal or other activities which expose or potentially expose workers to hazardous substances, health hazards, or safety hazards as defined by 29 CFR 1910.120(a). Annual 8-hour refresher training is also required to maintain competencies to ensure a safe work environment. In addition to these training requirements, all employees must complete the OSHA 10-hour Construction Safety and Health training and supervisory personnel must also receive eight additional hours of specialized management training. Training records are maintained by the HSM.

## 4.2 Initial Site-Specific Training

Training will be provided to specifically address the activities, procedures, monitoring, and equipment for site operations at the beginning of each field mobilization and the beginning of each discrete phase of work. The training will include the site and facility layout, hazards, and emergency services at the site, and will detail all the provisions contained within this HASP. For a HAZWOPER operation, training on the site must be for a minimum of 3 days. Specific issues that will be addressed include the hazards described in Section 3.0.

## 4.3 Tailgate Safety Briefings

Before starting work each day or as needed, the Langan HSO will conduct a brief tailgate safety meeting to assist site personnel in conducting their activities safely. Tailgate meetings will be documented in Attachment H. Briefings will include the following:

- Work plan for the day.
- Review of safety information relevant to planned tasks and environmental conditions.
- New activities/tasks being conducted.
- Results of Jobsite Safety Inspection Checklist.
- Changes in work practices.
- Safe work practices; and
- Discussion and remedies for noted or observed deficiencies.

# 5.0 MEDICAL SURVEILLANCE

All personnel who will be performing fieldwork involving potential exposure to toxic and hazardous substances (defined by 29 CFR 1910.120(a)) will be required to have passed an initial baseline medical examination, with follow-up medical exams thereafter, consistent with 29 CFR

1910.120(f). Medical evaluations will be performed by, or under the direction of, a physician board-certified in occupational medicine.

Additionally, personnel who may be required to perform work while wearing a respirator must receive medical clearance as required under CFR 1910.134(e), *Respiratory Protection*. Medical evaluations will be performed by, or under the direction of, a physician board-certified in occupational medicine. Results of medical evaluations are maintained by the HSM.

## 5.1 Mercury Monitoring

Langan includes medical monitoring for mercury during the initial baseline and annual physical.

## 5.2 Coronavirus

**General Preventative Measures**

Field personnel must follow general proper hygiene measures while in the field including:

- Avoid touching eyes, nose, and mouth.
- Cover coughs or sneezes with tissue and throw in the trash.
- Wash hands often with soap and water for 20 seconds after going to the bathroom, before eating, after blowing nose, coughing, or sneezing.
- Use hand sanitizer with at least 60% alcohol if soap and water are not available.
- Avoid physical contact with other people (e.g., no handshakes).
- Maintain a safe distance of at least six feet from other people (social distancing).
- Wear face coverings when around other workers to minimize the spread of COVID-19. (May be required in certain states or locations.)

**Construction Trailers**

Employees should avoid the use of shared construction trailers or where employees cannot maintain a safe distance (minimum 6 feet) from other workers. If trailer use is needed, areas such as desks, phones, chairs, and other common areas, should be cleaned and disinfected before and after use. Protocols should be developed to minimize trailer use to essential personnel, restrict use from any workers who are ill or showing symptoms of being ill, use face coverings and ensure a safe distance of six feet can be established between workers.

**Communication**

Include Coronavirus topics and prevention topics in daily tailgate meetings to ensure Coronavirus awareness is communicated daily. Discussions can focus on general topics including social

distancing, prevention measures for field personnel, signs and symptoms, and recent news on the Coronavirus. Site-specific topics should include minimizing face-to-face contact, disinfecting/sterilizing field equipment, use of PPE to reduce exposure, site security, use of face coverings, and other potential exposure issues/concerns.

**Sick/Ill Workers**

No Langan employee is permitted to be onsite when ill and/or showing potential symptoms of the Coronavirus. Symptoms of the Coronavirus may appear 2-14 days after exposure and can range from mild to severe. The most common symptoms include fever, fatigue, dry cough, shortness of breath chills, repeated shaking with chills, muscle pain, headache, sore throat, or new loss of taste or smell. If an employee or subcontractor is observed being ill or exhibiting symptoms of Coronavirus, employees must immediately utilize their Stop Work Authority and contact their project manager to address the situation. If an employee observes another worker onsite exhibiting symptoms of Coronavirus, immediately utilize Stop Work Authority, notify their project manager, and site construction manager or safety officer. Work should resume when the safety and health of Langan and subcontractors is adequately addressed.

## 6.0 PERSONAL PROTECTIVE EQUIPMENT

### 6.1 Levels of Protection

Langan will provide PPE to Langan employees to protect them from the specific hazards they are likely to encounter on-site. Directly hired contractors will provide their employees with equivalent PPE to protect them from the specific hazards likely to be encountered on-site. Selection of the appropriate PPE must take into consideration: (1) identification of the hazards or suspected hazards; (2) potential exposure routes; and (3) the performance of the PPE construction (materials and seams) in providing a barrier to these hazards.

Human exposure to contaminants found in the subsurface can occur through three primary routes:

- Inhalation of gases, vapors, dust, or mists is a common route of exposure. Chemicals can enter and irritate the airways and the lungs. They can become deposited in the airways or can be absorbed through the lungs into the bloodstream.
- Direct contact of contaminants with the skin or eyes is a common route of exposure. Some substances are absorbed through the skin and can enter the bloodstream. Broken, cut, or cracked skin will allow substances to enter the body more easily.
- Ingestion or swallowing of food, drink, or other substances is the third route of exposure. Chemicals that get in or on food, utensils, or hands can be ingested. Substances can be

absorbed into the blood.

Based on anticipated site conditions and the proposed work activities to be performed at the site, Level D protection will be used. The upgrading/downgrading of the level of protection will be based on continuous air monitoring results as described in Section 6.0 (when applicable). The decision to modify standard PPE will be made by the site HSO or FTL after conferring with the PM. The levels of protection are described below.

**Level D Protection (as needed)**

- Safety glasses with side shields or chemical splash goggles
- Safety boots/shoes
- Coveralls (Tyvek® or equivalent)
- Hard hat
- Long sleeve work shirt and work pants
- Nitrile gloves
- Hearing protection
- Reflective safety vest

**Level D Protection (Modified, as needed)**

- Safety glasses with side shields or chemical splash goggles
- Safety boots/shoes (toe-protected)
- Disposable chemical-resistant boot covers.
- Coveralls (poly-coated Tyvek or equivalent to be worn when contact with wet contaminated soil, groundwater, or non-aqueous phase liquids is anticipated)
- Hard hat
- Long sleeve work shirt and work pants
- Nitrile gloves
- Hearing protection (as needed)
- Personal floatation device (for work within 5 ft of the water)
- Reflective traffic vest

**Level C Protection (as needed)**

- Full or Half face, air-purifying respirator, with NIOSH approved High-Efficiency Particulate Air (HEPA) filter.
- Inner (latex) and outer (nitrile) chemical-resistant gloves
- Safety glasses with side shields or chemical splash goggles
- Chemical-resistant safety boots/shoes

- Hard hat
- Long sleeve work shirt and work pants
- Coveralls (Tyvek® or equivalent)
- Hearing protection (as needed)
- Reflective safety vest

The action levels used in determining the necessary levels of respiratory protection and upgrading to Level C are summarized in Table 4. The written Respiratory Protection Program is maintained by the HSM and is available if needed. The monitoring procedures and equipment are outlined in Section 6.0 (when applicable).

### 6.2 Respirator Fit-Test.

All Langan employees who may be exposed to hazardous substances at the work site must be in possession of a full or half face piece air-purifying respirator and have been successfully fit-tested within the past year. Fit-test records are maintained by the HSM.

### 6.3 Respirator Cartridge Change-Out Schedule

Respiratory protection is required to be worn when certain action levels (Table 2) are reached. A respirator cartridge change-out schedule has been developed to comply with 29 CFR 1910.134. The respirator cartridge change-out schedule for this project is as follows:

- Cartridges must be removed and disposed of at the end of each shift when cartridges become wet or the wearer experiences a breakthrough, whichever occurs first.
- If the humidity exceeds 85%, then cartridges must be removed and disposed of after 4 hours of use.

Respirators must not be stored at the end of the shift with contaminated cartridges left on. Cartridges must not be worn on the second day, no matter how short the time period was the previous day they were used.

## 7.0 AIR QUALITY MONITORING AND ACTIONS LEVELS

### 7.1 Monitoring During Site Operations

Atmospheric air monitoring results may be collected and used to provide data to determine when exclusion zones need to be established and when certain levels of personal protective equipment are required. For all instruments, there are Site-specific action-level criteria that are used in making field health and safety determinations. Other data, such as the visible presence of contamination or the steady state nature of air contaminant concentration, are also used in making field health and safety decisions. Therefore, the HSO may establish an exclusion zone

or require a person to wear a respirator even though atmospheric air contaminant concentrations are below established HASP action levels.

During site work involving disturbance of petroleum-impacted or fill material, real-time air monitoring may be conducted for methane and VOCs. A MultiRAE LEL/Oxygen (O2) meter and FID will be used to monitor the LEL of methane, and a PID and/or FID will be used to monitor concentrations of VOCs at personnel breathing-zone height. Air monitoring will be the responsibility of the HSO or designee. Air monitoring may be conducted during intrusive activities associated with the completion of excavation, debris removal, and soil grading. All manufacturers' instructions for instrumentation and calibration will be available onsite.

Subcontractors' air monitoring plans must be equal to or more stringent than the Langan plan.

An air monitoring calibration log is provided in Attachment D of this HASP.

### 7.1.1 Volatile Organic Compounds

Monitoring with a PID, such as a MiniRAE 2000 (10.6v) or equivalent may occur during intrusive work in the Areas of Concern (AOCs). Colorimetric Indicator Tubes for benzene may be used as a backup for the PID if measurements remain above background monitor every 2 hours. The HSO will monitor the employee's breathing zone at least every 30 minutes, or whenever there is any indication that concentrations may have changed (odors, visible gases, etc.) since the last measurement. If VOC levels are observed above 5 ppm for longer than 5 minutes or if the site PPE is upgraded to Level C, the HSO will begin monitoring the site perimeter at a location downwind of the AOC every 30 minutes in addition to the employee breathing zone. Instrument action levels for monitored gases are provided in Table 4.

### 7.1.2 Metals

Based upon the site historical fill, there is a potential for the soils to contain Polycyclic Aromatic Hydrocarbons (PAHs) and metals. During invasive procedures which have the potential for creating airborne dust, such as excavation of dry soils, a real-time airborne dust monitor such as a Mini-Ram may be used to monitor for air particulates. The HSO will monitor the employee's breathing zone at least every 30 minutes, or whenever there is any indication that concentrations may have changed (appearance of visible dust) since the last measurement. If dust levels are observed to be greater than 0.100 milligrams per cubic meter ($mg/m^3$) or visible dust is observed for longer than 15 minutes or if the site PPE is upgraded to Level C, the HSO will begin monitoring the site perimeter at a location downwind of the AOC every 30 minutes in addition to the employee breathing zone. Instrument action levels for dust monitoring are provided in Table 4.

### 7.1.3 Methane

During soil excavation or other intrusive activities, direct reading air monitoring may be performed in the excavation area to determine exposure to workers. Monitoring with an LEL/O2 meter and FID may occur during intrusive work in the AOCs. The HSO will monitor the employee's breathing zone at least hourly during intrusive activities. If LEL levels are observed above 20% the professional engineer (PE) or their designee will stop work and evacuate the area; warn others; and determine source of readings and take corrective actions. The Contractor will be responsible for mitigating explosive gas levels.

## 7.2 Monitoring Equipment Calibration and Maintenance

Instrument calibration must be documented and included in a dedicated safety and health logbook or on separate calibration pages of the field book. All instruments must be calibrated before and after each shift. Calibration checks may be used during the day to confirm instrument accuracy. Duplicate readings may be taken to confirm individual instrument responses.

All instruments must be operated in accordance with the manufacturers' specifications. Manufacturers' literature, including an operation manual for each piece of monitoring equipment, will be maintained on-site by the HSO for reference.

## 7.3 Determination of Background Levels

Background (BKD) levels for VOCs, dust, and methane will be established prior to intrusive activities within the AOC at an upwind location. A notation of BKD levels will be referenced in the daily monitoring log. BKD levels are a function of prevailing conditions. BKD levels will be taken in an appropriate upwind location as determined by the HSO.

Table 4 lists the instrument action levels.

# 8.0 COMMUNITY AIR MONITORING PROGRAM

Community air monitoring may be conducted in compliance with local standards. If conducted, Langan will implement the generic CAMP outlined below amended to comply with local conditions or standards:

Monitoring for dust and odors will be conducted during all ground intrusive activities by the FTL. Continuous monitoring of the perimeter of the work zones for odor, VOCs, and dust may be required for all ground intrusive activities such as soil excavation and handling activities. The work zone is defined as the general area in which machinery is operating in support of remediation activities. A portable PID will be used to monitor the work zone and for periodic monitoring for VOCs during activities such as soil and groundwater sampling and soil excavation.

The site perimeter will be monitored for fugitive dust emissions by visual observations as well as instrumentation measurements (if required). When required, particulate or dust will be monitored continuously with real-time field instrumentation that will meet, at a minimum, the local standards or, default to the performance standards below:

If VOC monitoring is required, the following actions will be taken based on VOC levels measured:

- If total VOC levels exceed 5 ppm above background for the 15-minute average at the perimeter, work activities will be temporarily halted and monitoring continued. If levels readily decrease (per instantaneous readings) below 5 ppm above background, work activities will resume with continued monitoring.
- If total VOC levels at the downwind perimeter of the hot zone persist at levels in excess of 5 ppm above background but less than 25 ppm, work activities will be halted, the source of vapors identified, corrective actions taken to abate emissions, and monitoring continued. After these steps work activities will resume provided that the total organic vapor level is 200 feet downwind of the hot zone or half the distance to the nearest potential receptor or residential/commercial structure, whichever is less – but in no case less than 20 feet, is below 5 ppm above background for the 15-minute average.
- If the total VOC level is above 25 ppm at the perimeter of the hot zone, activities will be shut down.

If dust monitoring with field instrumentation is required, the following actions will be taken based on instrumentation measurements:

- If the downwind particulate level is 100 micrograms per cubic meter (µg/m$^3$) greater than background (upwind perimeter) for the 15-minute period or if airborne dust is observed leaving the work area, then dust suppression must be employed. Work may continue with dust suppression techniques provided that downwind particulate matter less than 10 microns (PM10) levels do not exceed 150 µg/m$^3$ above the background level and provided that no visible dust is migrating from the work area.
- If, after implementation of dust suppression techniques, downwind PM10 levels are greater than 150 µg/m$^3$ above the background level, work must be stopped, and a re-evaluation of activities initiated. Work can resume provided that dust suppression measures and other controls are successful in reducing the downwind PM10 concentration to within 150 µg/m$^3$ of the upwind level and in preventing visible dust migration.

## 8.1 Dust Suppression Techniques

Preventative measures for dust generation may include wetting site fill and soil, construction of

an engineered construction entrance with a gravel pad, a truck wash area, covering soils with tarps, and limiting vehicle speeds to five miles per hour.

Work practices to minimize odors and vapors include limiting the time that the excavations remain open, minimizing stockpiling of contaminated-source soil, and minimizing the handling of contaminated material. Offending odor and organic vapor controls may include the application of foam suppressants or tarps over the odor or VOC source areas. Foam suppressants may include biodegradable foams applied over the source material for short-term control of the odor and VOCs.

If odors develop and cannot be otherwise controlled, additional means to eliminate odor nuisances will include direct load-out of soils to trucks for off-site disposal; use of chemical odorants in spray or misting systems; and use of staff to monitor odors in surrounding neighborhoods.

Where odor nuisances have developed during remedial work and cannot be corrected, or where the release of nuisance odors cannot otherwise be avoided due to on-site conditions or proximity to sensitive receptors, odor control will be achieved by sheltering excavation and handling areas under tented containment structures equipped with appropriate air venting/filtering systems.

## 9.0 WORK ZONES AND DECONTAMINATION

### 9.1 Site Control

Work zones are intended to control the potential spread of contamination throughout the site and to assure that only authorized individuals are permitted into potentially hazardous areas.

Any person working in an area where the potential for exposure to site contaminants exists will only be allowed access after providing the HSO with proper training and medical documentation.

**Exclusion Zone (EZ)** - All activities which may involve exposure to site contaminants, hazardous materials, and/or conditions should be considered an EZ. Decontamination of field equipment will also be conducted in the Contaminant Reduction Zone (CRZ) which will be located on the perimeter of the EZ. The EZ and the CRZ will be delineated by cones, tapes, or other means. The HSO may establish more than one EZ where different levels of protection may be employed, or different hazards exist. The size of the EZ must be determined by the HSO allowing adequate space for the activity to be completed, field members, and emergency equipment.

## 9.2 Contamination Zone

### 9.2.1 Personnel Decontamination Station

Personal hygiene, coupled with diligent decontamination, will significantly reduce the potential for exposure.

### 9.2.2 Minimization of Contact with Contaminants

During the completion of all site activities, personnel should attempt to minimize the chance of contact with contaminated materials. This involves a conscientious effort to keep "clean" during site activities. All personnel should minimize kneeling, splash generation, and another physical contact with contamination as PPE is intended to minimize accidental contact. This may minimize the degree of decontamination required and the generation of waste materials from site operations.

Field procedures will be developed to control spray and runoff and to ensure that unprotected personnel working nearby are not affected.

### 9.2.3 Personnel Decontamination Sequence

Decontamination may be performed by removing all PPE used in EZ and placing it in drums/trash cans at the CRZ. Baby wipes should be available for wiping hands and face. Drums/trash cans will be labeled by the field crews in accordance with all local, state, and federal requirements. Management plans for contaminated PPE, and tools are provided below.

### 9.2.4 Emergency Decontamination

If circumstances dictate that contaminated clothing cannot be readily removed, then remove gross contamination and wrap injured personnel with clean garments/blankets to avoid contaminating other personnel or transporting equipment. If the injured person can be moved, he/she will be decontaminated by site personnel as described above before emergency responders handle the victim. If the person cannot be moved because of the extent of the injury (a back or neck injury), provisions must be made to ensure that emergency response personnel will be able to respond to the victim without being exposed to potentially hazardous atmospheric conditions. If the potential for inhalation hazards exists, such as with open excavation, this area will be covered with polyethylene sheeting to eliminate any potential inhalation hazards. All emergency personnel should be immediately informed of the injured person's condition, and potential contaminants, and provided with all pertinent data.

### 9.2.5 Hand-Held Equipment Decontamination

Hand-held equipment includes all monitoring instruments as stated earlier, samples, hand tools, and notebooks. The hand-held equipment is dropped at the first decontamination station to be decontaminated by one of the decontamination team members. These items must be decontaminated or discarded as waste prior to removal from the CRZ.

To aid in decontamination, monitoring instruments can be sealed in plastic bags or wrapped in polyethylene. This will also protect the instruments against contaminants. The instruments will be wiped clean using wipes or paper towels if contamination is visually evident. Sampling equipment, hand tools, etc. will be cleaned with non-phosphorous soap to remove any potentially contaminated soil and rinsed with deionized water. All decontamination fluids will be containerized and stored on-site pending waste characterization sampling and appropriate off-site disposal.

### 9.2.6 Heavy Equipment Decontamination

All heavy equipment and vehicles arriving at the work site will be free from contamination from offsite sources. Any vehicles arriving to work that are suspected of being impacted will not be permitted on the work site. Potentially contaminated heavy equipment will not be permitted to leave the EZ unless it has been thoroughly decontaminated and visually inspected by the HSO or his designee.

## 9.3 Support Zone

The support zone or cold zone will include the remaining areas of the job site. Break areas and support facilities (including equipment storage and maintenance areas) will be located in this zone. No equipment or personnel will be permitted to enter the cold zone from the hot zone without passing through the decontamination station in the warm zone (if necessitated). Eating, smoking, and drinking will be allowed only in this area.

## 9.4 Communications

The following communications equipment will be utilized as appropriate.

- Telephones - A cellular telephone will be located with the HSO for communication with the HSM and emergency support services/facilities.

- Hand Signals - Hand signals must be used by field teams, along with the buddy system. The entire field team must know them before operations commence and their use covered during site-specific training. Typical hand signals are the following:

| Hand Signal | Meaning |
|---|---|
| Hand gripping throat | Out of air, cannot breathe |
| Grip your partner's wrists or place both hands around the waist | Leave immediately without debate |
| Hands on top of head | Need assistance |
| Thumbs up | OK; I am all right; I understand |
| Thumbs down | No; negative |
| Simulated "stick" break with fists | Take a break; stop work |

### 9.5 The Buddy System

When working in teams of two or more, workers will use the "buddy system" for all work activities to ensure that rapid assistance can be provided in the event of an emergency. This requires work groups to be organized such that workers can remain close together and maintain visual contact with one another. Workers using the "buddy system" have the following responsibilities:

- Provide his/her partner with assistance.
- Observe his/her partner for signs of chemical or heat exposure.
- Periodically check the integrity of his/her partner's PPE.
- Notify the HSO or other site personnel if emergency service is needed.

## 10.0 NEAREST MEDICAL ASSISTANCE

The address and telephone number of the nearest hospital:

Montefiore Jack D. Weller Hospital/Einstein Campus
1825 Eastchester Road
Bronx, New York
718-904-2800

A map with directions to the hospital is shown in Figure 2. This information will either be posted prominently at the site or will be available to all personnel all of the time. Further, all field personnel, including the HSO & FTL, will know the directions to the hospital.

## 11.0 STANDING ORDERS/SAFE WORK PRACTICES

The standing orders, which consist of a description of safe work practices that must always be followed while on-site by Langan employees and contractors, are shown in Attachment A. The site HSO and FTL each have the responsibility for enforcing these practices. The standing orders

will be posted prominently at the site or are made available to all personnel at all times. Those who do not abide by these safe work practices will be removed from the site.

## 12.0 SITE SECURITY

No unauthorized personnel must be permitted access to the work areas.

## 13.0 UNDERGROUND UTILITIES

As provided in Langan's Underground Utility Clearance Guidelines, the following safe work practices should be followed by Langan personnel and the contractor before and during subsurface work in accordance with federal, state, and local regulations:

- Obtain available utility drawings from the property owner/client or operator.
- Provide utility drawings to the project team.
- In the field, mark the proposed area of subsurface disturbance (when possible).
- Ensure that the utility clearance system has been notified.
- Ensure that utilities are marked before beginning subsurface work.
- Discuss subsurface work locations with the owner/client and contractors.
- Obtain approval from the owner/client and operators for proposed subsurface work locations.
- Use safe digging procedures when applicable.
- Stay at least 10 feet from all equipment performing subsurface work.

## 14.0 SITE SAFETY INSPECTION

The Langan HSO or alternate will check the work area daily, at the beginning and end of each work shift, or more frequently to ensure safe work conditions. The HSO or alternate must complete the Jobsite Safety Inspection Checklist, found in Attachment F. Any deficiencies must be shared with the FTL, HSM, and PM and will be discussed at the daily tailgate meeting.

## 15.0 HAND AND POWER TOOLS

All hand- and electric-power tools and similar equipment must be maintained in a safe operating condition. All electric-power tools must be inspected before initial use. Damaged tools must be removed immediately from service or repaired. Tools must be used only for the purpose for which they were designed. All users must be properly trained in their safe operation.

# 16.0 EMERGENCY RESPONSE

## 16.1 General

This section establishes procedures and provides information for use during a project emergency. Emergencies happen unexpectedly and quickly, and require an immediate response; therefore, contingency planning and advanced training of staff is essential. Specific elements of emergency support procedures that are addressed in the following subsections include communications, local emergency support units, and preparation for medical emergencies, first aid for injuries incurred on site, record keeping, and emergency site evacuation procedures. In case of emergency, in addition to 911, call *WorkCare - Incident Intervention®* at 1-888-479-7787 to report their injuries. For all other communications, contact the Langan Incident Hotline at **973-560-4699** as soon as possible.

Should outside assistance be needed for accidents, fire, or release of hazardous substances, the emergency numbers will be available and posted at the site (Table 5) where a readily accessible telephone is made available for emergency use.

Also, in the event of an incident where a team member becomes exposed or suffers from an acute symptom from contact with site materials and has to be taken to a hospital, a short medical data sheet (Attachment C) for that individual will be made available to the attending physician. The medical data sheet will include the following:

- Name, address, home phone
- Age, height, weight
- Name of person to be notified in case of an accident.
- Allergies
- Particular sensitivities
- Does he/she wear contact lenses?
- Short checklist of previous illness
- Name of personal physician and phone
- Name of company physician and phone
- Prescription and non-prescription medications currently used.

An incident reporting form is included in Attachment C.

## 16.2 Responsibilities

### 16.2.1 Construction Health and Safety Officer (HSO)

The HSO is responsible for ensuring that all personnel are evacuated safely, and that machinery and processes are shut down or stabilized in the event of a stop work order or evacuation. The

HSO is responsible for ensuring the HSM is notified of all incidents, all injuries, near misses, fires, spills, releases, or equipment damage. The HSO is required to immediately notify the HSM of any fatalities or catastrophes (three or more workers injured and hospitalized) so that the HSM can notify OSHA within the required time limit.

### 16.2.2 Emergency Coordinator

The HSO or their designated alternate will serve as the Emergency Coordinator. The Emergency Coordinator is responsible for ensuring that all personnel are evacuated safely, and that machinery and processes are shut down or stabilized in the event of a stop work order or evacuation. They are also responsible for ensuring the HSM is notified of all incidents, all injuries, near misses, fires, spills, releases, or equipment damage. The Emergency Coordinator is required to immediately notify the HSM of any fatalities or catastrophes (three or more workers injured and hospitalized.

The Emergency Coordinator must locate emergency phone numbers and identify hospital routes prior to beginning work on the sites. The Emergency Coordinator must make necessary arrangements to be prepared for any emergencies that could occur.

The Emergency Coordinator is responsible for implementing the Emergency Response Plan.

### 16.2.3 Site Personnel

Project site personnel are responsible for knowing the Emergency Response Plan and the procedures contained herein. All personnel are expected to notify the Emergency Coordinator of situations that could constitute a site emergency. Project site personnel, including all subcontractors, will be trained in the Emergency Response Plan.

## 16.3 Communications

Once an emergency situation has been stabilized, the injured Langan personnel should contact *WorkCare - Incident Intervention®* at 1-888-479-7787 to report their injuries. For all other communications, contact the Langan Incident Hotline at **973-560-4699** as soon as possible.

## 16.4 Local Emergency Support Units

In order to be able to deal with any emergency that might occur during investigative activities at the site, the Emergency Notification Numbers (Table 5) will be posted and provided to all personnel conducting work within the EZ.

Figure 2 shows the hospital route map. Outside emergency number 911 and local ambulance should be relied on for response to medical emergencies and transport to emergency rooms. Always contact first responders when there are serious or life-threatening emergencies on the

site. Project personnel are instructed not to drive injured personnel to the Hospital. In the event of an injury, provide first aid and keep the injured party calm and protected from the elements, and treat for shock when necessary.

### 16.5 Pre-Emergency Planning

Langan will communicate directly with administrative personnel from the emergency room at the hospital to determine whether the hospital has the facilities and personnel needed to treat cases of trauma resulting from any of the contaminants expected to be found on the site. Instructions for finding the hospital will be posted conspicuously in the site office and each site vehicle.

### 16.6 Emergency Medical Treatment

The procedures and rules in this HASP are designed to prevent employee injury. However, if an injury occurs, no matter how slight, it will be reported to the HSO immediately. First-aid equipment will be available on-site at the following locations:

- First Aid Kit: Contractor Vehicles
- Emergency Eye Wash: Contractor Vehicles

During the site safety briefing, project personnel will be informed of the location of the first aid station(s) that has been set up. Some injuries, such as severe cuts and lacerations or burns, may require immediate treatment. First-aid instructions provided from off-site doctors or paramedics, before an emergency-response squad arrives at the site or before the injured person can be transported to the hospital, will be followed closely. Only in non-emergency situations may an injured person be transported to an urgent care facility. Due to hazards that may be present at the site and the conditions under which operations are conducted, an emergency may develop. Emergencies can be characterized as injury or acute chemical exposure to personnel, fire or explosion, environmental release, or hazardous weather conditions.

### 16.8 Emergency Site Evacuation Routes and Procedures

All project personnel will be instructed on proper emergency response procedures and locations of emergency telephone numbers during the initial site safety meeting. If an emergency occurs as a result of the site investigation activities, including but not limited to fire, explosion, or significant release of toxic gas into the atmosphere, the Langan Project Manager will be verbally notified immediately. All heavy equipment will be shut down and all personnel will evacuate the work areas and assemble at the nearest intersection to be accounted for and to receive further instructions.

If an emergency arises, the FTL will implement an immediate evacuation of all project personnel due to immediate or impending danger. The FTL will also immediately communicate with the contractor to coordinate any needed evacuation of the property.

The FTL or Site Supervisor will give necessary instructions until the Designated Incident Commander (IC) assumes control. After the emergency has been resolved, the FTL or Site Supervisor will coordinate with the IC and indicate when staff should resume their normal duties. If dangers are present for those at the designated assembly point, another designated location of assembly will be established.

It will be the responsibility of the FTL or Site Supervisor to report a fire or emergency, assess the seriousness of the situation, and initiate emergency measures until the arrival of the local fire fighters or other first responders, should they be necessary. The FTL, working with emergency responders, may also order the closure of the Site for an indefinite period as long as it is deemed necessary.

Under no circumstances will incoming visitors be allowed to proceed to the area of concern once an emergency evacuation has been implemented. Visitors or other persons present in the area of the emergency must be instructed to evacuate the area. The FTL will ensure that access roads are not obstructed and will remain on-site to provide stand-by assistance upon the arrival of emergency personnel.

If it is necessary to temporarily control traffic in the event of an emergency, those persons controlling traffic will wear proper reflection warning vests until the arrival of police or fire personnel.

### 16.8.1 Designated Assembly Locations

All personnel will evacuate the site and assemble at a designated assembly location. The assembly location will be designated by Langan personnel and discussed during each shift's pre-job safety briefing.

### 16.8.2 Accounting for Personnel

All contractor and subcontractor supervisors are responsible for the accounting of all personnel assembled at the designed assembly area. The Designated Incident Commander must be notified if personnel are not found.

## 16.9 Fire Prevention and Protection

In the event of a fire or explosion, procedures will include immediately evacuating the site and notification of the Langan Project Manager of the investigation activities. Portable fire

extinguishers will be provided at the work zone. The extinguishers located in the various locations should also be identified prior to the start of work. No personnel will fight a fire beyond the stage where it can be put out with a portable extinguisher (incipient stage).

### 16.9.1 Fire Prevention

Fires will be prevented by adhering to the following precautions:

- Good housekeeping and storage of materials.
- Storage of flammable liquids and gases away from oxidizers.
- Shutting off engines to refuel.
- Grounding and bonding metal containers during transfer of flammable liquids.
- Use of UL approved flammable storage cans.
- Fire extinguishers rated at least 10 pounds ABC located on all heavy equipment, in all trailers and near all hot work activities.

The person responsible for the control of fuel source hazards and the maintenance of fire prevention and/or control equipment is the HSO.

## 16.10 Significant Vapor Release

Based on the proposed tasks, the potential for a significant vapor release is low. However, if a release occurs, the following steps will be taken:

- Move all personnel to an upwind location. All non-essential personnel must evacuate.
- Upgrade to Level C Respiratory Protection.
- Downwind perimeter locations must be monitored for volatile organics.
- If the release poses a potential threat to human health or the environment in the community, the Emergency Coordinator must notify the Langan Project Manager.
- Local emergency response coordinators will be notified.

## 16.11 Overt Chemical Exposure

The following are standard procedures to treat chemical exposures. Other, specific procedures detailed on the Material Safety Data Sheet (MSDS) will be followed, when necessary.

**SKIN AND EYE**: Use copious amounts of soap and water from eye-wash kits and portable hand-wash stations.

**CONTACT**: Wash/rinse affected areas thoroughly, then provide appropriate medical attention. Skin must also be rinsed for 15 minutes if contact with caustics, acids, or hydrogen peroxide occurs. Affected items of clothing must also be removed from contact with skin.

Providing wash water and soap will be the responsibility of each individual contractor or subcontractor on-site.

### 16.12 Decontamination during Medical Emergencies

If emergency lifesaving first aid and/or medical treatment is required, normal decontamination procedures may need to be abbreviated or omitted. The HSO or designee will accompany contaminated victims to the medical facility to advice on matters involving decontamination when necessary. The outer garments can be removed if they do not cause delays, interfere with treatment, or aggravate the problem. Respiratory equipment must always be removed. Protective clothing can be cut away. If the outer contaminated garments cannot be safely removed on site, a plastic barrier placed between the injured individual and clean surfaces should be used to help prevent contamination of the inside of ambulances and/or medical personnel. Outer garments may then be removed at the medical facility. No attempt will be made to wash or rinse the victim if his/her injuries are life threatening unless it is known that the individual has been contaminated with an extremely toxic or corrosive material which could also cause severe injury or loss of life to emergency response personnel. For minor medical problems or injuries, normal decontamination procedures will be followed.

### 16.13 Adverse Weather Conditions

In the event of adverse weather conditions, the HSO will determine if work will continue without potentially risking the safety of all field workers. Some of the items to be considered prior to determining if work should continue are:

- Potential for heat stress and heat-related injuries.
- Potential for cold stress and cold-related injuries.
- Treacherous weather-related working conditions (hail, rain, snow, ice, high winds).
- Limited visibility (fog).
- Potential for electrical storms.
- Earthquakes.
- Other major incidents.

Site activities will be limited to daylight hours, or when suitable artificial light is provided, and acceptable weather conditions prevail. The HSO will determine the need to cease field operations or observe daily weather reports and evacuate, if necessary, in case of severe inclement weather conditions.

## 16.14 Spill Control and Response

All small spills/environmental releases must be contained as close to the source as possible. Whenever possible, the MSDS will be consulted to assist in determining proper waste characterization and the best means of containment and cleanup. For small spills, sorbent materials such as sand, sawdust, or commercial sorbents should be placed directly on the substance to contain the spill and aid recovery. Any acid spills should be diluted or neutralized carefully prior to attempting recovery. Berms of earthen or sorbent materials can be used to contain the leading edge of the spills. All spill containment materials will be properly disposed of. An exclusion zone of 50 to 100 feet around the spill area should be established depending on the size of the spill.

All contractor vehicles must have spill kits on them with enough material to contain and absorb the worst-case spill from that vehicle. All vehicles and equipment must be inspected prior to being admitted on-site. Any vehicle or piece of equipment that develops a leak will be taken out of service and removed from the job site.

The following seven steps must be taken by the Emergency Coordinator:

1. Determine the nature, identity, and amounts of major spills.
2. Make sure all unnecessary persons are removed from the spill area.
3. Notify the HSO immediately.
4. Use proper PPE in consultation with the HSO.
5. If a flammable liquid, gas, or vapor is involved, remove all ignition sources, and use non-sparking and/or explosion-proof equipment to contain or clean up the spill (diesel-only vehicles, air-operated pumps, etc.)
6. If possible, try to stop the leak with the appropriate material.
7. Remove all surrounding materials that can react or compound with the spill.

In addition to the spill control and response procedures described in this HASP, Langan personnel will coordinate with the designated project manager relative to spill response and control actions. Notification to the Project Manager must be immediate and, to the extent possible, include the following information:

- Time and location of the spill.
- Type and nature of the material spilled.
- Amount spilled.
- Whether the spill has affected or has a potential to affect a waterway or sewer.
- A brief description of affected areas/equipment.
- Whether the spill has been contained.

- Expected time of cleanup completion. If spill cleanup cannot be handled by Langan's on-site personnel alone, such fact must be conveyed to the Project Manager immediately.

Langan field personnel must notify the project manager when they observe a spill or encounter conditions suggesting one might have occurred.

### 16.15 Emergency Equipment

The following minimum emergency equipment must be kept and maintained on site:

- Industrial first aid kit.
- Fire extinguishers (one per site).

### 16.16 Restoration and Salvage

After an emergency, prompt restoration of utilities, fire protection equipment, medical supplies, and other equipment will reduce the possibility of further losses. Some of the items that may need to be addressed are:

- Refilling fire extinguishers.
- Refilling medical supplies.
- Recharging eyewashes and/or showers.
- Replenishing spill control supplies.

### 16.17 Documentation

Immediately following an incident or near miss, unless emergency medical treatment is required, either the employee or a coworker must contact the Langan Incident/Injury Hotline at 1-(800)-9-LANGAN (extension 4699) and the client representative to report the incident or near miss. For emergencies involving personnel injury and/or exposure, the HSO and affected employee will complete and submit an Employee Exposure/Injury Incident Report (Attachment C) to the Langan Corporate Construction Health and Safety Manager as soon as possible following the incident.

## 17.0 SPECIAL CONDITIONS

This guideline contains information and requirements for special conditions that may not be routinely encountered.

### 17.1 Scope

The guideline applies to the specific projects identified within this document. Additional provisions will be addressed in each Site-Specific Health and Safety Plan (HASP), as needed.

## 17.2 Responsibilities

Site Personnel - All site personnel must be alert to safety hazards on work sites and take action to minimize such hazards. Personnel must utilize the buddy system, watch for inappropriate behavior, and be alerted to changes in site conditions.

Construction Health and Safety Officer (HSO) - The HSO is responsible for considering these procedures in the development of site-specific HASPs. The HSO must schedule frequent "tail gate" safety briefings to enhance safety awareness and discuss potential problems.

## 17.3 Procedures

The procedures outlined below must be followed when such conditions are encountered.

### 17.3.1 Ladders

Langan safety procedures must be used to ensure employee safety when using ladders in the office or work sites. All ladders must be coated or repaired to prevent injury to the employee from punctures or lacerations and to prevent snagging or clothing. Any wood ladders used must have an opaque covering except for identification or warning labels, which may be placed on one face only of a side rail.

#### *17.3.1.1 Ladder Use*

Employees must only use ladders for the purposes they were designed for and must not be used as scaffolding. Ladders will be maintained and inspected prior to use for slip hazards including oil and grease. Employees must use ladders only on stable and level surfaces unless the ladder is secured to prevent displacement. Ladders should not be used on slippery surfaces unless secured or provided with slip-resistant feet to prevent accidental displacement. Ladders should not be used in locations where they could be displaced by workplace activities or traffic. Ladder rungs, cleats and steps must be parallel, level and uniformly spaced when the ladder is in the use position.

Employees should not be carrying anything including equipment that could cause injury if there was a fall while utilizing the ladder. The top and bottom of the ladder area must remain clear while in use. When ascending and descending the ladder, employees must face the ladder.

Ladders must not be loaded beyond the maximum intended load for which they were built or the manufacturer's rated capacity.

*17.3.1.2 Portable Ladders*

Rungs, cleats, and steps for portable ladders and fixed ladders must be spaced not less than 10 inches apart, nor more than 14 inches apart, as measured between center lines of the rungs, cleats, and steps. When used to access an upper landing surface, the ladder side rails must extend at least three feet above the upper landing surface to which the ladder is used to gain access. If this is not possible, due to the length of the ladder, then the top of the ladder must be secured at its top to a rigid support.

*17.3.1.3 Step Stools*

Rungs, cleats, and steps of step stools must not be less than 8 inches apart, nor more than 12 inches apart, as measured between center lines of the rungs, cleats, and steps.

*17.3.1.4 Extension Ladders*

Rungs, cleats, and steps of the base section of extension trestle ladders must be spaced not less than 8 inches apart, nor more than 18 inches apart, as measured between center lines of the rungs, cleats, and steps. The rung spacing on the extension section of the extension trestle ladder must not be less than 6 inches nor more than 12 inches, as measured between the center lines of the rungs, cleats and steps. Ladders must be used at an angle such that the horizontal distance from the top support to the foot of the ladder is approximately one-quarter of the working length of the ladder (the distance along the ladder between the foot and the top support).

*17.3.1.5 Inspection*

Ladders will be inspected for visible detects periodically, prior to utilization or after any occurrence that could have negatively affected the ladder. Portable ladders with defects including broken or missing rungs, cleats, or steps, broken or split rails, corroded components, or other faulty components must not be used. The ladder will be immediately marked as defective, tagged as "Do Not Use" or blocked from being used and removed from service until repaired.

### 17.3.2 First Aid/Cardiopulmonary Resuscitation (CPR)

Langan field and office personnel will be encouraged to be trained in First Aid and Cardiopulmonary Resuscitation (CPR). Training will be provided free of charge by Langan to all employees. Employees will receive a training certificate that will be kept on file with the Health & Safety Coordinator (HSC). Training and certification will be provided by a credited provider such as American Red Cross or equivalent.

#### *17.3.2.1 Emergency Procedures*

Prior to site work, the Langan employees certified in first aid and CPR will be identified in the site-specific HASP. Langan will endear to have at least one employee at a job site trained and able to render first aid and CPR. The site-specific HASP will contain first aid information on both potential chemical and physical hazards. Emergency procedures to be followed in case of injury or illnesses are provided in the HASP. The HASP will include emergency contact information including local police and fire departments, hospital emergency rooms, ambulance services, on-site medical personnel, and physicians. The HASP will also include directions and contact information for the nearest emergency facility in case immediate medical attention is required. The emergency contact information will be conspicuously posted at the worksite. Employees that are injured and require immediate medical attention must call either 911 or the local posted emergency contacts. Employees should use ambulatory services to transport injured workers to the nearest facility for emergency medical care. In areas where 911 is not available, the telephone numbers of physicians, hospitals, or ambulances must be conspicuously posted.

#### *17.3.2.2 First Aid Supplies*

First aid supplies are readily available to all Langan employees when required. First aid kits are located in each Langan office. Portable first aid kits are available for employees to use at work sites. First aid kits should consist of items needed to treat employees for potential chemical and physical injuries. At a minimum, first aid kits should contain items to allow basic first aid to be rendered. Where the eyes or body of an employee may be exposed to corrosive materials, suitable facilities for quick drenching or flushing of the eyes and body must be provided within the work area for immediate emergency use including eye wash.

First aid kits will be weatherproof with individually sealed packages of each item. All portable first aid kits must be inspected by Langan employees before and after use to ensure all used items are replaced. When out in the field, employees must check first aid kits weekly to ensure used items are replaced.

### 17.3.3 Hydrogen Sulfide

Langan employees with the potential to be exposed to hydrogen sulfide while at work sites must have training in hydrogen sulfide awareness. The training will include the identification of areas where employees could be exposed to hydrogen sulfide, health effects, permissible exposure limits, first aid procedures, and personnel protective equipment. Langan employees could be exposed to hydrogen sulfide while at job sites including petroleum refineries, hazardous waste treatment, storage and disposal facilities, uncontrolled hazardous waste sites, and remediation projects.

#### *17.3.3.1 Characteristics*

Hydrogen sulfide is a colorless gas with a strong odor of rotten eggs that is soluble in water. Hydrogen sulfide is used to test and make other chemicals. It is also found as a by-product of chemical reactions, such as in sewer treatment. It is a highly flammable gas and a dangerous fire hazard. Poisonous gases are produced in fires including sulfur oxides. Hydrogen sulfide is not listed as a carcinogen.

#### *17.3.3.2 Health Effects*

Hydrogen Sulfide can affect employees if inhaled or through contact with skin or eyes. Acute (or short-term) health effects of hydrogen sulfide exposure include irritation of the nose and throat, dizziness, confusion, headache, and trouble sleeping. Inhalation of hydrogen sulfide can irritate the lungs causing coughing and/or shortness of breath. Higher levels of exposure can cause a build-up of fluid in the lungs (pulmonary edema), a medical emergency, with severe shortness of breath.

Chronic (or long-term) health effects of low levels of exposure to hydrogen sulfide can cause pain and redness of the eyes with blurred vision. Repeated exposure may cause bronchitis with cough, phlegm, and shortness of breath.

#### *17.3.3.3 Protective Clothing and Equipment*

Respirators are required for those operations in which employees will be exposed to hydrogen sulfide above OSHA permissible exposure level. The maximum OSHA permissible exposure limit (PEL) for hydrogen sulfide is 20 parts of hydrogen sulfide vapor per million parts of air (20 ppm) for an 8-hour workday and the maximum short-term exposure limit (STEL) is 10 ppm for any 10-minute period.

Where employees are exposed to levels up to 100 parts of hydrogen sulfide vapor per million parts of air (100 ppm), the following types of respiratory protection are allowed:

- Any powered, air-purifying respirator with cartridge(s).
- Any air-purifying, full-facepiece respirator (gas mask) with a chin style, front- or back-mounted canister.
- Any supplied air system with escape self-contained breathing apparatus, if applicable; and,
- Any self-contained breathing apparatus with a full facepiece.

Respirators used by employees must have joint Mine Safety and Health Administration and the National Institute for Occupational Safety and Health (NIOSH) seal of approval. Cartridges or canisters must be replaced before the end of their service life, or the end of the shift, whichever

occurs first. Langan employees that have the potential to be exposed to hydrogen sulfide will be trained in the proper use of respirators. Respirator training is discussed under– Langan's Respiratory Protection Program.

Employees with potential exposure to hydrogen sulfide, or when required by the client, will wear a portable hydrogen sulfide gas detector. The detector should have an audible, visual, and vibrating alarm. The detector may also provide detection for carbon monoxide, sulfur dioxide, and oxygen-deficient atmospheres. The hydrogen sulfide monitor will, at a minimum, be calibrated to detect hydrogen sulfide at a level of 20 parts of hydrogen sulfide vapor per million parts of air (20 ppm). Many portable gas detectors will have factory defaults with a low-level alarm at 10 ppm and a high-level alarm at 15 ppm. Langan employees must consult clients to determine if any site-specific threshold levels exist.

If the hydrogen sulfide gas detector sounds and employees are not wearing appropriate respiratory protection, employees must immediately vacate the area and meet at the assigned emergency location. Langan employees may not re- enter the site without proper respiratory protection and approval from the client or property owner if needed.

Employees must wear PPE to prevent eye and skin contact with hydrogen sulfide. Employees must wear appropriate protective clothing including boots, gloves, sleeves, and aprons, over any parts of their body that could be exposed to hydrogen sulfide. Non-vented, impact-resistant goggles should be worn when working with or exposed to hydrogen sulfide.

*17.3.3.4 Emergency and First Aid Procedures*

**Eye and Face Exposure**

If hydrogen sulfide comes in contact with eyes, it should be washed out immediately with large amounts of water for 30 minutes, occasionally lifting the lower and upper eye lids. Seek medical attention immediately.

**Skin Exposure**

If hydrogen sulfide contaminates clothing or skin, remove the contaminated clothing immediately and wash the exposed skin with large amounts of water and soap. Seek medical attention immediately. Contaminated clothing should either be disposed of or washed before wearing again.

**Breathing**

If a Langan employee or other personnel breathe in hydrogen sulfide, immediately get the exposed person to fresh air. If breathing has stopped, artificial respiration should be started. Call for medical assistance or a doctor as soon as possible.

**Safety Precautions**

Hydrogen sulfide is a highly flammable gas and a dangerous fire hazard. Containers of hydrogen sulfide may explode in a fire situation. Poisonous gases are produced during fires.

Langan employees should contact property owners and operators prior to conducting work onsite to be aware of any site-specific contingency plans, identify where hydrogen sulfide is used at the facility, and be informed about additional safety rules or procedures.

### 17.3.4 Fire Protection/Extinguishers

Langan field personnel that have been provided with portable fire extinguishers for use at worksites will be trained to familiarize employees with general principles of fire extinguisher use and hazards associated with the incipient stage of firefighting. Training will be provided prior to the initial assignment for field work and annually thereafter.

Portable fire extinguishers must be visually inspected monthly and subjected to an annual maintenance check. Langan will retain records of the annual maintenance date.

### 17.3.5 Overhead lines

When field work is performed near overhead lines, the lines must be de-energized and grounded, or other protective measures must be provided before the work commences. If overhead lines are to be de-energized, arrangements must be made with the client, property owner, or organization that operates or controls the electric circuits involved to de-energize and ground them. If protective measures, such as guarding, isolating, or insulating, are provided, these precautions must prevent employees from contacting such lines directly with any part of their body or indirectly through conductive materials, tools, or equipment.

When unqualified Langan personnel are working in an elevated position near overhead lines, the location must be such that the person and the longest conductive object they may contact cannot come closer to any unguarded, energized overhead line than the following distances:

1. For voltages to ground 50 kilovolts (kV) or below - 10 feet; and
2. For voltages to ground over 50kV - 10 feet, plus 4 inches for every 10kV over 50kV.

As previously indicated, Langan does not retain qualified employees to perform work on energized equipment.

*17.3.5.1 Vehicle and Equipment Clearance*

Any vehicle or mechanical equipment capable of having parts of its structure elevated near energized overhead lines must be operated so that a clearance of 10 feet is maintained. If the voltage of the overhead lines is higher than 50kV, the clearance must be increased by 4 inches for every 10kV over that voltage.

If any of the following discussed conditions occur, the clearance may be reduced.

- If the vehicle is in transit with its structure lowered, the clearance may be reduced to 4 ft. If the voltage is higher than 50kV, the clearance must be increased to 4 inches for every 10 kV over that voltage.
- If insulating barriers are installed to prevent contact with the lines, and if the barriers are rated for the voltage of the line being guarded and are not a part of or an attachment to the vehicle or its raised structure, the clearance may be reduced to a distance within the designed working dimensions of the insulating barrier.

Employees standing on the ground may not contact the vehicle or mechanical equipment or any of its attachments unless the employee is using protective equipment rated for the voltage, or the equipment is located so that no uninsulated part of its structure (that portion of the structure that provides a conductive path to employees on the ground) can come closer to the overhead line than permitted.

If any vehicle or mechanical equipment capable of having parts of its structure elevated near energized overhead lines is intentionally grounded, employees working on the ground near the point of grounding may not stand at the grounding location whenever there is a possibility of overhead line contact. Additional precautions, such as the use of barricades or insulation, must be taken to protect employees from hazardous ground potentials, depending on earth resistivity and fault currents, which can develop within the first few feet or more outward from the grounding point.

### 17.3.6 Trade Secret

Langan employees could potentially be provided trade secret information by the client or property owner when site-specific information is provided about highly hazardous chemicals. Trade secret means any confidential formula, pattern, process, device, information, or compilation of information that is used in an employer's business, and that allows the employer to obtain an advantage over competitors who do not know or use it. Langan employees understand that this

information should be kept confident and if required, may enter into a confidentiality agreement with the client.

### 17.3.7 Bloodborne Pathogens

Langan employees that can anticipate exposure to blood or other potentially infectious material while at work sites must have training in bloodborne pathogens. Applicable employees would include those trained in first aid and serving a designated role as an emergency medical care provider. Bloodborne pathogens are pathogenic microorganisms that are present in human blood and can cause disease in humans. These pathogens include but are not limited to, hepatitis B virus and human immunodeficiency virus.

#### *17.3.7.1 Training*

Langan employees with potential occupational exposure to blood or other potentially infectious material must participate in a training program. Training must be conducted prior to the initial assignment where there would be potential for exposure and annually thereafter within one year of previous training. The training program will be provided to Langan employees at no cost to them and during working hours.

Langan will ensure the training program must consist of the following:

- An accessible copy of the regulatory text of 29 CFR 1910.1030 and an explanation of its contents.
- A general explanation of the epidemiology and symptoms of bloodborne diseases.
- An explanation of the modes of transmission of bloodborne pathogens.
- An explanation of Langan's exposure control plan and how the employee can obtain a copy of the written plan.
- An explanation of the appropriate methods for recognizing tasks and other activities that may involve exposure to blood and other potentially infectious materials.
- An explanation of the use and limitations of personal protective equipment (PPE) to prevent and reduce exposure.
- Information on the types, proper use, location, removal, handling, and disposal of PPE.
- An explanation of the basis for the selection of PPE.
- Information on the hepatitis B vaccine, including information on its efficacy, safety, method of administration, the benefits of being vaccinated, and that the vaccine and vaccination will be offered free of charge.
- Information on the appropriate actions to take and persons to contact in an emergency involving blood or other potentially infectious materials.
- An explanation of the procedure to follow if an exposure incident occurs, including the method of reporting the incident and the medical follow-up that will be made available.

- Information on the post-exposure evaluation and determining whether the employer is required to provide for the employee following an exposure incident.
- An explanation of the signs and labels and/or color coding required by paragraph 29 CFR 1910.1030(g)(1); and
- An opportunity for interactive questions and answers with the person conducting the training session.

Langan will develop and implement a written Exposure Control Plan, which will be designed to eliminate or minimize employee exposure to bloodborne pathogens. The Exposure Control Plan will contain the following elements:

- An exposure determination for employees.
- The schedule and method of implementation for Methods of Compliance (29 CFR 191.1030(d)), Hepatitis B Vaccination and Post-Exposure Evaluation and Follow-up (29 CFR 1910.1030(f)), Communication of Hazards to Employees (29 CFR 1910.1030(g)) and (h) Recordkeeping (29 CFR 1910.1030(h)).
- The procedure for the evaluation of circumstances surrounding exposure incidents.
- Ensure a copy of the Exposure Control Plan will be accessible to employees; and,
- The Exposure Control Plan must be reviewed and updated at least annually.

Langan employees with occupational exposure to bloodborne pathogens include any employees trained in first aid that would be expected to provide emergency medical care. This determination is made without regard to the use of PPE, which could eliminate or minimize exposure.

Universal precautions must be observed to prevent contact with blood or other potentially infectious materials. According to the concept of Universal Precautions, all human blood and certain human body fluids are treated as if known to be infectious for bloodborne pathogens. Under circumstances in which differentiation between body fluid types is difficult or impossible, all body fluids must be considered potentially infectious materials.

Work practice controls must be used to eliminate or minimize employee exposure, if applicable. Since Langan employees will have occupational exposure only during the rendering of first aid, personnel protective equipment will be utilized to reduce or minimize exposure. PPE that could be available to Langan personnel when administering first aid includes safety glasses, gloves, and Tyvek suits or sleeves. PPE and first aid kits will be provided to employees at no cost to them.

Langan employees that render first aid in office areas will have access to hand-washing facilities or restrooms. For first aid rendered at field locations, first aid kits will contain an appropriate antiseptic hand cleanser and clean cloth/paper towels or antiseptic towelettes. After using

antiseptic hand cleansers or towelettes, employees must wash their hands with soap and running water as soon as feasible.

After administering first aid, potentially infectious materials, including towels, personnel protective equipment, clothes, and bandages, must be placed in a container, which prevents leakage during collection, handling, processing, storage, transport, or shipping. All PPE will be disposed of after use. Any equipment or working surfaces which was been exposed to blood or potentially infectious materials due to an injury will be decontaminated prior to reuse.

Langan will make available the hepatitis B vaccine and vaccination series to all employees who have occupational exposure, and post-exposure evaluation and follow-up to all employees who have had an exposure incident. These services will be available to the employee at no cost to them through a medical provider.

#### *17.3.7.2 Recordkeeping*

Langan will maintain training and medical records for each employee with occupational exposure to blood or potentially infectious materials. Medical and training records will be maintained by Langan's H&S Department.

Training records will include the following:

- Dates of the training sessions.
- Contents or a summary of the training sessions.
- Names and qualifications of persons conducting the training; and
- Names and job titles of all persons attending the training sessions.

Training records must be maintained for 3 years from the date on which the training occurred. Medical records will be preserved and maintained for the duration of employment plus 30 years.

All records will be made available upon request to employees, the Assistant Secretary of Labor for Occupational Safety and Health, and the Director of the National Institute for Occupational Safety and Health Director of OSHA for examination and copying. Medical records must have written consent from the employee before releasing.

If Langan ceases to do business, all records must be transferred to the successor employer. The successor employer must receive and maintain these records.

If there will not be a successor, Langan will notify current employees of their rights to access records at least three months prior to the cessation of business.

## 18.0 RECORDKEEPING

The following is a summary of required health and safety logs, reports, and recordkeeping.

### 18.1 Field Change Authorization Request

Any changes to the work to be performed that are not included in the HASP will require an addendum that is approved by the Langan project manager and Langan HSM to be prepared. Approved changes will be reviewed with all field personnel at a safety briefing.

### 18.2 Medical and Training Records

Copies or verification of training (40-hour, 8-hour, supervisor, site-specific training, documentation of three-day on-the-job training (OJT)), and respirator fit-test records) and medical clearance for site work and respirator use will be maintained in the office and available upon request. Records for all subcontractor employees must also be available upon request. All employee medical records will be maintained by the HSM.

### 18.3 Onsite Log

A log of personnel on-site each day will be kept by the HSO or designee.

### 18.4 Daily Safety Meetings ("Tailgate Talks")

Completed safety briefing forms will be maintained by the HSO.

### 18.5 Exposure Records

All personal monitoring results, laboratory reports, calculations, and air sampling data sheets are part of an employee exposure record. These records will be maintained by the HSO during site work. At the end of the project, they will be maintained according to 29 CFR 1910.1020.

### 18.6 Hazard Communication Program/MSDS-SDS

Material safety data sheets (MSDS) Safety Data Sheets (SDS) have been obtained for applicable substances and are included in this HASP (Attachment D). Langan's written hazard communication program, in compliance with 29 CFR 1910.1200, is maintained by the HSM.

### 18.7 Documentation

Immediately following an incident or near miss, unless emergency medical treatment is required, either the employee or a coworker must contact the Langan incident/injury hotline at 1-800-952-6426, extension 4699, and the Project Manager to report the incident or near miss. The Project Manager will contact the client or client representative. A written report must be completed and

submitted HSM within 24 hours of the incident. For emergencies involving personnel injury and/or exposure, the employee will complete and submit the Langan incident/injury report to the Langan corporate health and safety manager as soon as possible following the incident. Accidents will be investigated in-depth to identify all causes and to recommend hazard control measures.

### 18.7.1 Accident and Injury Report Forms

#### *18.7.1.1 Accident/Incident Report*

All injuries, no matter how slight, must be reported to the FTL and the PM immediately. The accident/incident report forms, attached in Attachment C, will be filled out on all accidents by the applicable contractor supervision personnel, the FTL, or the HSO. Copies of all accident/incident reports must be kept on-site and available for review. Project personnel will be instructed on the location of the first aid station, hospital, and doctor and ambulance service near the job. The emergency telephone numbers will be conspicuously posted in site vehicles near the work zone. First aid supplies will be centrally located and conspicuously posted between restricted and nonrestricted areas to be readily accessible to all on the site.

#### *18.7.1.2 First Aid Treatment Record*

The forms will be used for recording all non-lost time injuries treated by the project first-aid attendant, the local physician or hospital will be entered in detail on this record. "Minor" treatment of scratches, cuts, etc. will receive the same recording attention as treatment of more severe injuries.

#### *18.7.1.3 OSHA Form 300*

An OSHA Form 300 will be kept at the Langan Corporate Office in Parsippany, New Jersey. All recordable injuries or illnesses will be recorded on this form. Subcontractor employers must also meet the requirements of maintaining an OSHA 300 form. The Incident Report form used to capture the details of work-related injuries/illnesses meets the requirements of the OSHA Form 301 (supplemental record) and must be maintained with the OSHA Form 300 for all recordable injuries or illnesses. Forms for recording OSHA work-related injuries and illnesses are included in Attachment C.

## 19.0 CONFINED SPACE ENTRY

Confined spaces are not anticipated at the Site during planned construction activities. If confined spaces are identified, the contractor must implement their own confined space program that all

applicable federal, state, and local regulations. Confined spaces **will not** be entered by Langan personnel.

## 20.0 HASP ACKNOWLEDGEMENT FORM

All Langan personnel and contractors will sign this HASP Compliance Agreement indicating that they have become familiar with this HASP and that they understand it and agree to abide by it.

# TABLES

# TABLE 1
# TASK HAZARD ANALYSES

| Task | Hazard | Description | Control Measures | First Aid |
|---|---|---|---|---|
| 1.3.1 – 1.3.34 | Contaminated Soil or Groundwater-Dermal Contact | Contaminated water spills on skin, splashes in eyes; contact with contaminated soil/fill during construction activities or sampling. | Wear proper PPE; follow safe practices, maintain safe distance from construction activities | See Table 2, seek medical attention as required |
| 1.3.1 – 1.3.34 | Lacerations, abrasions, punctures | Cutting bailer twine, pump tubing, acetate liners, etc. with knife; cuts from sharp site objects or previously cut piles, tanks, etc.; Using tools in tight spaces | Wear proper PPE; follow safe practices | Clean wound, apply pressure and/or bandages; seek medical attention as required. |
| 1.3.1 – 1.3.34 | Contaminated Media Inhalation | Opening drums, tanks, wells; vapors for non-aqueous phase liquids or other contaminated site media; dust inhalation during excavation; vapor accumulation in excavation | Follow air monitoring plan; have quick access to respirator, do not move or open unlabeled drums found at the site, maintain safe distance from construction activities | See Table 2, seek medical attention as required |
| 1.3.1 – 1.3.34 | Lifting | Improper lifting/carrying of equipment and materials causing strains | Follow safe lifting techniques.<br>Langan employees are not to carry contractor equipment or materials | Rest, ice, compression, elevation; seek medical attention as required |
| 1.3.1 – 1.3.34 | Slips, trips, and falls | Slips, trips, and falls due to uneven surfaces, cords, steep slopes, debris, and equipment in work areas | Good housekeeping at site; constant awareness and focus on the task; avoid climbing on stockpiles; maintain safe distance from construction activities and excavations; avoid elevated areas over six feet unless fully accredited in fall protection and wearing an approved fall protection safety apparatus | Rest, ice, compression, elevation; seek medical attention as required |
| 1.3.1 – 1.3.34 | Noise | Excavation equipment, hand tools, drilling equipment. | Wear hearing protection; maintain safe distance from construction activities | Seek medical attention as required |
| 1.3.1 – 1.3.34 | Falling objects | Soil material, tools, etc. dropping from drill rigs, front-end loaders, etc. | Hard hats to be worn at all times while in work zones; maintain safe distance from construction activities and excavations | Seek medical attention as required |
| 1.3.1 – 1.3.34 | Underground/ overhead utilities | Excavation equipment, drill rig auger contacts underground object; boom touches overhead utility | "One Call" before dig; follow safe practices; confirm utility locations with contractor; wear proper PPE; maintain safe distance from construction activities and excavations | Seek medical attention as required |
| 1.3.1 – 1.3.34 | Insects (bees, wasps, hornet, mosquitoes, and spider) | Sings, bites | Insect Repellent; wear proper protective clothing (work boots, socks, and light-colored pants); field personnel who may have insect allergies (e.g., bee sting) should provide this information to the HSO or FSO prior to commencing work and will have allergy medication on site. | Seek medical attention as required |
| 1.3.1 – 1.3.34 | Vehicle traffic / Heavy Equipment Operation | Vehicles unable to see workers on site, operation of heavy equipment in tight spaces, equipment failure, malfunctioning alarms | Wear proper PPE, especially visibility vest; use a buddy system to look for traffic; rope off area of work with cones and caution tape or devices at points of hazard, maintain safe distance from construction activities and equipment | Seek medical attention as required |

# TABLE 2
# CONTAMINANT HAZARDS OF CONCERN

| Task | Contaminant | CAS Number | Monitoring Device | PEL/ IDLH | Source of Concentration on Site | Route of Exposure | Symptoms | First Aid |

**EXPLANATION OF ABBREVIATIONS**

PID = Photoionization Detector

PEL = Permissible Exposure Limit (8-hour Time Weighted Average)

IDLH = Immediately Dangerous to Life and Health
ppm = part per million
$mg/m^3$ = milligrams per cubic meter
500 $mg/m^3$

# TABLE 3
# SUMMARY OF MONITORING EQUIPMENT

| Instrument | Operation Parameters |
|---|---|
| Photoionization Detector (PID) | **Hazard Monitored:** Many organic and some inorganic gases and vapors.<br>**Application:** Detects total concentration of many organic and some inorganic gases and vapors. Some identification of compounds is possible if more than one probe is measured.<br>**Detection Method:** Ionizes molecules using UV radiation; produces a current that is proportional to the number of ions.<br>**General Care/Maintenance:** Recharge or replace battery. Regularly clean lamp window. Regularly clean and maintain the instrument and accessories.<br>**Typical Operating Time:** 10 hours. 5 hours with strip chart recorder. |
| Oxygen Meter | **Hazard Monitored:** Oxygen ($O_2$).<br>**Application:** Measures the percentage of $O_2$ in the air.<br>**Detection Method:** Uses an electrochemical sensor to measure the partial pressure of $O_2$ in the air and converts the reading to $O_2$ concentration.<br>**General Care/Maintenance:** Replace detector cell according to manufacturer's recommendations. Recharge or replace batteries prior to explanation of the specified interval. If the ambient air is less than 0.5% C $O_2$, replace the detector cell frequently.<br>**Typical Operating Time:** 8 – 12 hours. |
| Additional equipment (if needed, based on site conditions) | |
| Combustible Gas Indicator (CGI) | **Hazard Monitored:** Combustible gases and vapors.<br>**Application:** Measures the concentration of combustible gas or vapor.<br>**Detection Method:** A filament, usually made of platinum, is heated by burning the combustible gas or vapor. The increase in heat is measured. Gases and vapors are ionized in a flame. A current is produced in proportion to the number of carbon atoms present.<br>**General Care/Maintenance:** Recharge or replace battery. Calibrate immediately before use.<br>**Typical Operating Time:** Can be used for as long as the battery lasts, or for the recommended interval between calibrations, whichever is less. |
| Flame Ionization Detector (FID) with Gas Chromatography Option *(i.e., Foxboro Organic Vapor Analyzer (OVA))* | **Hazard Monitored:** Many organic gases and vapors (approved areas only).<br>**Application:** In survey mode, detects the concentration of many organic gases and vapors. In gas chromatography (GC) mode, identifies and measures specific compounds. In survey mode, all the organic compounds are ionized and detected at the same time. In GC mode, volatile species are separated.<br>**General Care/Maintenance:** Recharge or replace battery. Monitor fuel and/or combustion air supply gauges. Perform routine maintenance as described in the manual. Check for leaks.<br>**Typical Operating Time:** 8 hours; 3 hours with strip chart recorder. |
| Potable Infrared (IR) Spectrophotometer | **Hazard Monitored:** Many gases and vapors.<br>**Application:** Measures concentration of many gases and vapors in air. Designed to quantify one or two component mixtures.<br>**Detection Method:** Passes different frequencies of IR through the sample. The frequencies absorbed are specific for each compound.<br>**General Care/Maintenance:** As specified by the manufacturer. |

| Instrument | Operation Parameters |
|---|---|
| Direct Reading Colorimetric Indicator Tube | **Hazard Monitored:** Specific gas and vapors.<br>**Application:** Measures concentration of specific gases and vapors.<br>**Detection Method:** The compound reacts with the indicator chemical in the tube, producing a stain whose length or color change is proportional to the compound's concentration.<br>**General Care/Maintenance:** Do not use a previously opened tube even if the indicator chemical is not stained. Check pump for leaks before and after use. Refrigerate before use to maintain a shelf life of about 2 years. Check expiration dates of tubes. Calibrate pump volume at least quarterly. Avoid rough handling which may cause channeling. |
| Aerosol Monitor | **Hazard Monitored:** Airborne particulate (dust, mist, fume) concentrations.<br>**Application:** Measures total concentration of semi-volatile organic compounds, PCBs, and metals.<br>**Detection Method:** Based on light-scattering properties of particulate matter. Using an internal pump, air sample is drawn into the sensing volume where near infrared light scattering is used to detect particles.<br>**General Care/Maintenance:** As specified by the mfr. Also, the instrument must be calibrated with particulates of a size and refractive index similar to those to be measured in the ambient air. |
| Monitox | **Hazard Monitored:** Gases and vapors.<br>**Application:** Measures specific gases and vapors.<br>**Detection Method:** Electrochemical sensor specific for the chemical species in question.<br>**General Care/Maintenance:** Moisten sponge before use; check the function switch; change the battery when needed. |
| Gamma Radiation Survey Instrument | **Hazard Monitored:** Gamma Radiation.<br>**Application:** Environmental radiation monitor.<br>**Detection Method:** Scintillation detector.<br>**General Care/Maintenance:** Must be calibrated annually at a specialized facility.<br>**Typical Operating Time:** Can be used for as long as the battery lasts, or for the recommended interval between calibrations, whichever is less. |

# TABLE 4
# INSTRUMENTATION ACTION LEVELS

| **Photoionization Detector Action Levels** | **Action Required** |
|---|---|
| Background to 5 parts per million (ppm)[1] | No respirator needed; no further action |
| >5ppm but </= 15 ppm at the perimeter of the work area | • Work temporarily halted and monitoring continues.<br>• If instantaneous readings decrease below 5 ppm above background, work activities will resume with continued monitoring |
| >5ppm but </= 25 ppm at the downwind perimeter of the hot zone | • Work activities will be halted.<br>• Source of vapors identified.<br>• Corrective actions taken to abate emissions.<br>• Continued monitoring.<br>• Workers will don appropriate respirators and work can resume if vapor levels 200 feet downwind or the hot zone or half the distance to the nearest potential receptor or residential or commercial structure, whichever is less – but in no case less than 20 feet – is below 5 ppm above background for the 15-minute average |
| >25ppm at the parameter of the hot zone | Activities will shut down |

| **Particulate Monitoring Action Levels** | **Action Required** |
|---|---|
| Background to 100 micrograms per cubic meter (µg/m³)[2], no dust observed | No further action |
| Background to 100 µg/m³, dust observed leaving the work area | Dust suppression must be employed. |
| 100 to 150 µg/m³ at the downwind parameter of the hot zone | • Work activities will be halted.<br>• Source of dust identified.<br>• Dust suppression activities initiated.<br>• Corrective actions taken to abate emissions.<br>• Continued monitoring.<br>• Workers will don appropriate respirators.<br>• Work can resume provided that dust suppression measures and other controls are successful in reducing the downwind PM10 concentration to within 150 µg/m³ of the upwind level and in preventing visible dust migration. |
| >150 µg/m³ at the parameter of the hot zone | Activities will shut down |

[1] VOC concentrations are 15-minute averages above site background (upwind parameter)
[2] Particulate concentrations are 15-minute averages above site background (upwind parameter)

For all other incidents or near misses, unless emergency response is required, either the employee or a coworker must contact the Langan Incident Hotline at 973-560-4699.***

# TABLE 6
# SUGGESTED FREQUENCY OF PHYSIOLOGICAL MONITORINGFOR FIT AND ACCLIMATED WORKERS[A]

| Adjusted Temperature[b] | Normal Work Ensemble[c] | Impermeable Ensemble |
|---|---|---|
| 90°F or above (32.2°C) or above | After each 45 min. of work | After each 15 min. of work |
| 87.5°F (30.8°-32.2°C) | After each 60 min. of work | After each 30 min. of work |
| 82.5°-87.5°F (28.1°-30.8°C) | After each 90 min. of work | After each 60 min. of work |
| 77.5°-82.5°F (25.3°-28.1°C) | After each 120 min. of work | After each 90 min. of work |
| 72.5°-77.5°F (22.5°-25.3°C) | After each 150 min. of work | After each 120 min. of work |

a For work levels of 250 kilocalories/hour.

b Calculate the adjusted air temperature (ta adj) by using this equation: ta adj $^{o}$F = ta $^{o}$F + (13 x % sunshine). Measure air temperature (ta) with a standard mercury-in-glass thermometer, with the bulb shielded from radiant heat. Estimate percent sunshine by judging what percent time the sun is not covered by clouds that are thick enough to produce a shadow. (100 percent sunshine = no cloud cover and a sharp, distinct shadow; 0 percent sunshine = no shadows.)

c A normal work ensemble consists of cotton coveralls or other cotton clothing with long sleeves and pants.

# TABLE 7

# HEAT INDEX

**ENVIRONMENTAL TEMPERATURE (Fahrenheit)**

| RELATIVE HUMIDITY | 70 | 75 | 80 | 85 | 90 | 95 | 100 | 105 | 110 | 115 | 120 |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | APPARENT TEMPERATURE* | | | | | | | | | | |
| **0%** | 64 | 69 | 73 | 78 | 83 | 87 | 91 | 95 | 99 | 103 | 107 |
| **10%** | 65 | 70 | 75 | 80 | 85 | 90 | 95 | 100 | 105 | 111 | 116 |
| **20%** | 66 | 72 | 77 | 82 | 87 | 93 | 99 | 105 | 112 | 120 | **130** |
| **30%** | 67 | 73 | 78 | 84 | 90 | 96 | 104 | 113 | 123 | **135** | **148** |

| **90%** | 71 | 79 | 88 | 102 | 122 | | | | | | |
| **100%** | 72 | 80 | 91 | 108 | | | | | | | |

*Combined Index of Heat and Humidity...what it "feels like" to the body
Source: National Oceanic and Atmospheric Administration

How to use Heat Index:
1. Across top locate Environmental Temperature
2. Down left side locate Relative Humidity
3. Follow across and down to find Apparent Temperature
4. Determine Heat Stress Risk on chart at right

Note: Exposure to full sunshine can increase Heat Index values by up to 15 degrees F.

| Apparent Temperature | Heat Stress Risk with Physical Activity and/or Prolonged Exposure |
|---|---|
| 90-105 | Heat Cramps or Heat Exhaustion Possible |
| 105-130 | Heat Cramps or Heat Exhaustion Likely, Heat Stroke Possible |
| **>130** | Heatstroke Highly Likely |

# HOSPITAL ROUTE PLAN

**Hospital Location:** **Montefiore Jack D. Weller Hospital/Einstein Campus**
**1825 Eastchester Road**
**Bronx, New York**
**718-904-2800**

***START: 450 Hutchinson Parkway, Bronx, NY***

1. Turn right onto Hutchinson River Pkwy
2. Take the I-678 N/Hutchinson River Pkwy ramp on the left to I-95/I-278
3. Merge onto I-678
4. Take exit 18 for E Tremont Ave toward Westchester Ave
5. Continue onto Ericson Pl
6. Turn left onto E Tremont Ave
7. Turn right onto Blondell Ave
8. Stay on Blondell Ave to turn right onto Eastchester Rd
9. Turn left onto Sackett Ave, destination will be on the right.

***END: Montefiore Jack D. Weller Hospital/Einstein Campus, 1825 Eastchester Road, Bronx, NY***

# ATTACHMENTS

# ATTACHMENT A

# STANDING ORDERS

# STANDING ORDERS

## GENERAL

- No smoking, eating, or drinking in this work zone.
- Upon leaving the work zone, personnel will thoroughly wash their hands and face.
- Minimize contact with contaminated materials through proper planning of work areas and decontamination areas, and by following proper procedures. Do not place equipment on the ground. Do not sit on contaminated materials.
- No open flames in the work zone.
- Only properly trained and equipped personnel are permitted to work in potentially contaminated areas.
- Always use the appropriate level of personal protective equipment (PPE).
- Maintain close contact with your buddy in the work zone.
- Contaminated material will be contained in the Exclusion Zone (EZ).
- Report any unusual conditions.
- Work areas will be kept clear and uncluttered. Debris and other slip, trip, and fall hazards will be removed as frequently as possible.
- The number of personnel and equipment in the work zone will be kept to an essential minimum.
- Be alert to the symptoms of fatigue and heat/cold stress, and their effects on the normal caution and judgment of personnel.
- Conflicting situations which may arise concerning safety requirements and working conditions must be addressed and resolved quickly by the site HSO.

## TOOLS AND HEAVY EQUIPMENT

- Do not, under any circumstances, enter or ride in or on any backhoe bucket, materials hoist, or any other device not specifically designed to carry passengers.
- Loose-fitting clothing or loose long hair is prohibited around moving machinery.
- Ensure that heavy equipment operators and all other personnel in the work zone are using the same hand signals to communicate.
- Drilling/excavating within 10 feet in any direction of overhead power lines is prohibited.
- The locations of all underground utilities must be identified and marked out prior to initiating any subsurface activities.
- Check to ensure that the equipment operator has lowered all blades and buckets to the ground before shutting off the vehicle.
- If the equipment has an emergency stop device, have the operator show all personnel its location and how to activate it.
- Help the operator ensure adequate clearances when the equipment must negotiate in tight quarters; serve as a signal operator to direct backing, as necessary.
- Ensure that all heavy equipment that is used in the Exclusion Zone is kept in that zone until the job is done and that such equipment is completely decontaminated before moving it into the clean area of the work zone.
- Samplers must not reach into or get near rotating equipment such as the drill rig. If personnel must work near any tools that could rotate, the equipment operator must completely shut down the rig prior to initiating such work. It may be necessary to use a remote sampling device.

# DECONTAMINATION PROCEDURES

# PERSONNEL DECONTAMINATION

## LEVEL C DECONTAMINATION

| | | |
|---|---|---|
| Station 1: | Equipment Drop | 1. Deposit equipment used on-site (tools, sampling devices and containers, monitoring instruments, radios, clipboards, etc.) on plastic drop cloths. Segregation at the drop reduces the probability of cross-contamination. During hot weather operations, cool down stations may be set up within this area. |
| Station 2: | Outer Garment, Boots, and Gloves Wash and Rinse | 2. Scrub outer boots, outer gloves, and chemical-resistant splash suit with decon solution or detergent and water. Rinse off using copious amounts of water. |
| Station 3: | Outer Boot and Glove Removal | 3. Remove outer boots and gloves. Deposit in container with plastic liner. |
| Station 4: | Canister or Mask Change | 4. If worker leaves Exclusion Zone to change canister (or mask), this is the last step in the decontamination procedure. Worker's canister is exchanged, new outer gloves and boot covers donned, joints taped, and worker returns to duty. |
| Station 5: | Boot, Gloves and Outer Garment Removal | 5. Boots, chemical-resistant splash suit, inner gloves removed and deposited in separate containers lined with plastic. |
| Station 6: | Face piece Removal | 6. Face piece is removed (avoid touching face with fingers). Face piece deposited on plastic sheets. |
| Station 7: | Field Wash | 7. Hands and face are thoroughly washed. Shower as soon as possible. |

## LEVEL D DECONTAMINATION

| | | |
|---|---|---|
| Station 1: | Equipment Drop | 1. Deposit equipment used on-site (tools, sampling devices and containers, monitoring instruments, radios, clipboards, etc.) on plastic drop cloths. Segregation at the drop reduces the probability of cross contamination. During hot weather operations, cool down stations may be set up within this area. |
| Station 2: | Outer Garment, Boots, and Gloves Wash and Rinse | 2. Scrub outer boots, outer gloves and chemical-resistant splash suit with decon solution or detergent and water. Rinse off using copious amounts of water. |
| Station 3: | Outer Boot and Glove Removal | 3. Remove outer boots and gloves. Deposit in container with plastic liner. |
| Station 4: | Boot, Gloves and Outer Garment Removal | 4. Boots, chemical-resistant splash suit, inner gloves removed and deposited in separate containers lined with plastic. |
| Station 5: | Field Wash | 5. Hands and face are thoroughly washed. Shower as soon as possible. |

# EQUIPMENT DECONTAMINATION

## GENERAL:

Equipment to be decontaminated during the project may include tools, monitoring equipment, respirators, sampling containers, laboratory equipment, and drilling equipment.

All decontamination will be done by personnel in protective gear, appropriate for the level of decontamination, as determined by the site HSO. The decontamination work tasks will be split or rotated among support and work crews.

Depending on site conditions, backhoes and pumps may be decontaminated over a portable decontamination pad to contain wash water; or wash water may be allowed to run off into a storm sewer system. Equipment needed may include a steam generator with high-pressure water, empty drums, screens, screen support structures, and shovels. Drums will be used to hold contaminated wash water pumped from the lined pit. These drums will be labeled as such.

Miscellaneous tools and equipment will be dropped into a plastic bucket, tub, or other containers. They will be brushed off and rinsed with a detergent solution, and finally rinsed with clean water.

## MONITORING EQUIPMENT:

Monitoring equipment will be protected as much as possible from contamination by draping, masking, or otherwise covering as many of the instruments as possible with plastic without hindering the operation of the unit. The PID, HNu, or OVA meter, for example, can be placed in a clear plastic bag, which allows reading of the scale and operation of knobs. The probes can be partially wrapped keeping the sensor tip and discharge port clear.

The contaminated equipment will be taken from the drop area and the protective coverings removed and disposed of in the appropriate containers. Any dirt or obvious contamination will be brushed or wiped with a disposable paper wipe.

## RESPIRATORS:

Respirators will be cleaned and disinfected after every use. Taken from the drop area, the masks (with the cartridges removed and disposed of with other used disposable gear) will be immersed in a cleaning solution and scrubbed gently with a soft brush, followed by a rinse in plain warm water, and then allowed to air dry. In the morning, new cartridges will be installed. Personnel will inspect their own masks for serviceability prior to donning them. And, once the mask is on, the wearer will check the respirator for leakage using the negative and positive pressure fit check techniques.

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 1. All Activities | 1. Transmittal/exposure of COVID-19 | 1. Ask yourself and your managers – is this work essential? Can this be done remotely?<br>2. Stay home if sick or showing symptoms of COVID-19 (e.g., fever, cough, etc.).<br>3. Carry nitrile gloves, alcohol-based hand sanitizer, face coverings and disinfectant wipes/spray during field work.<br>4. Check federal, state, and/or local travel restrictions **prior** to travel. Many states, counties, and cities are passing strict "shelter-in-place" or business restrictions in response to COVID-19.<br>5. Immediately notify Beverly Williams or Rory Johnston (Supervisor if employee chooses) if you display symptoms of COVID-19. Symptoms include fever (over 100.4 F), cough, and shortness of breath.<br>6. Notify Beverly Williams or Rory Johnston, Supervisor and Coronavirus Task Force if you had close contact with an individual who tested positive or displayed symptoms of COVID-19.<br>7. Do not touch your face, to the extent possible.<br>8. Wear face coverings when around other worker to minimize spread of COVID-19. (May be required in certain states or locations.) |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| | | 9. Practice social distancing, maintaining at least 6 feet of distance between yourself and others. Avoid gatherings of more than 10 people. Limit, to the extent possible, contact with public items/objects.<br>10. Clean your hands frequently with soap and water for at least 20 seconds especially after you have been in a public place, or after blowing your nose, coughing, sneezing, or using the rest room.<br>11. If soap and water are not readily available, use a hand sanitizer that contains at least 60% alcohol. Cover all surfaces of your hands and rub them together until they feel dry.<br>12. Cover your mouth and nose with a tissue when you cough or sneeze or use the inside of your elbow.<br>13. Clean and disinfect frequently touched surfaces daily, for example, cell phones, computer equipment, headsets, tables, doorknobs, light switches, countertops, handles, desks, toilets, faucets, and sinks. |
| 2. Travel to Jobsite | 1. Transmittal/exposure of COVID-19 between passengers<br>2. Transmittal/exposure of COVID-19 from previous occupants (rental and fleet vehicles)<br>3. Transmittal/exposure of COVID-19 while refueling | 1. Limit the number of occupants to each vehicle to 2 people. Employees should sit as far away from each other as possible.<br>2. Disinfect high “hand-traffic” areas of the vehicle: Door handles, steering wheel, turn signal and control rods, dashboard controls, seatbelts, armrests, etc. To the extent possible, do not use recycled air for heat/AC and travel with the windows open.<br>3. Use hand sanitizer before and after pumping gas and only return to the inside of the vehicle after refueling is complete.<br>4. Wear nitrile gloves if available or disinfect the keypad, pump handle, and fuel grade button prior to use.<br>5. Recommend face coverings are worn to minimize spread of COVID-19. |
| 3. Conduct Tailgate Safety Meeting & Complete H&S Paperwork | 1. Transmittal/exposure of COVID-19 between meeting participants | 1. Practice social distancing, maintaining at least 6 feet of distance between yourself and others.<br>2. Recommend face coverings are worn when around other workers to minimize spread of COVID-19,<br>3. Hold meetings outside and keep in mind wind direction. To the extent possible, remain crosswind from other people.<br>4. Designate a single person to maintain sign-in sheets/permits throughout the day to limit the passing of pens/clipboards between people.<br>5. Each person should complete their own JSA, even if they are completing similar tasks as others in order to limit the passing of paper/pens/clipboards between people.<br>6. Include COVID-19 topics and prevention measures in safety meetings. |
| 4. Conduct Site Work | 1. Transmittal/exposure of COVID-19 between site workers and public. | 1. Practice social distancing maintaining 6 feet of distance between yourself and others.<br>2. Recommend face coverings are worn when around other workers to minimize spread of COVID-19,<br>3. To the extent possible, do not interact with the public. If it is necessary, politely explain you are practicing social distance and request they stay at least 6 feet away and they do not attempt to pass objects to you.<br>4. Wear nitrile gloves during site work underneath the appropriate gloves for your task. Utilize appropriate decontamination procedures, securely bag all waste (including nitrile gloves) generated during site work and dispose of. |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| | | 5. Do not share tools. Each person should be equipped with the tools to complete their task or tasks should be divided to remove the need to share tools. If tools must be shared, surfaces should be disinfected.<br>6. Clean and disinfect surfaces of rental tools and equipment upon receipt. To the extent possible rent equipment from Langan's internal equipment reservation center, where cleaning/disinfecting procedures can be verified. |
| 5. Use of Construction Trailers | 1. Transmittal/exposure of COVID-19 between site workers and others. | 1. Avoid use of shared trailers, if possible. Minimize trailer use to essential personnel.<br>2. Practice social distancing; maintaining 6 feet of distance between yourself and others in trailer.<br>3. Clean and disinfect areas including desks, phones, chairs, and other common areas, before and after use. |
| 6. Purchasing Food from a Restaurant | 1. Transmittal/exposure of COVID-19 from other customers, staff, surfaces. | 1. To the extent possible, bring your own food.<br>2. If you must visit a restaurant, call ahead for take-out or "contactless delivery." Do not dine in. When picking up food, follow guidelines for Job Step #8: Purchasing Supplies at Retail/Shipping Centers.<br>3. Wash hands before and after eating. |
| 7. Smoking Cigarettes | 1. Transmittal/exposure of COVID-19 by touching mouth with hands | 1. Cigarette smokers are at greater risk of complications arising from COVID-19. Nicotine patches/lozenges/gum, smoking cessation programs, and prescription medications may aid in "kicking the habit" if you decide to quit.<br>2. Wash hands thoroughly before and after smoking.<br>3. Discard cigarette butts properly. Do not light cigarettes from others and do not give cigarettes to others. |
| 8. Hotel Stay | 1. Transmittal/exposure of COVID-19 from previous occupants, hotel staff, common areas. | 1. Verify the hotel chain/brand has modified cleaning procedures to reflect risk of COVID-19. Most hotel companies have issued statements on their websites and in email blasts reflecting these new procedures.<br>2. Use the front door, and not peripheral entrances. Front doors of hotels are usually automatic.<br>3. Request ground floor room to avoid elevator use and a room that has not be utilized in 48-72 hours.<br>4. If elevator use is required, do not directly touch elevator buttons with your hands. Do not ride elevators with other people, to the extent possible.<br>5. Bring disinfecting wipes or sanitizing spray. Upon arrival, disinfect high "hand-traffic" areas of the hotel room: Door handles, light switches, shower/sink faucet handles, TV remote, curtain/blind handles. Clean these surfaces daily.<br>6. Place the "Do Not Disturb" Sign on your door to prevent people (housekeeping) from entering your room.<br>7. Avoid common spaces and hotel sponsored events where crowds will be present.<br>8. Confirm hotel cleaning procedures have been modified to address COVID-19. Confirm no COVID-19 cases have occurred in hotel |
| 9. Purchasing Supplies at Retail/Shipping Centers | 1. Transmittal/exposure of COVID-19 from other customers, staff, surfaces. | 1. Plan your travel to limit the need to visit retail/shipping centers.<br>2. Practice social distancing, maintaining at least 6 feet of distance between yourself and others. If the store is too crowded/small, consider visiting another store or returning at a different time.<br>3. Avoid high "hand-traffic" items/areas like door handles (i.e. use your shoulder, hip/butt, or open with a disposable napkin/paper towel), credit cards terminals (i.e. use Apple/Android pay if available), shopping carts/baskets (i.e. bring your own shopping |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| | | bags), counter tops (i.e. ask clerk if you can hold the items while they are scanned) and bulk/buffet items (i.e. just avoid them).<br>4. Disinfect your hands before and after visiting a retail/shipping center. |

**Job Safety Analysis (JSA)**
**Construction Health and Safety**

**JSA Title:** **Environmental Sampling**
**JSA Number:** **JSA021-01**

**A Job Safety Analysis (JSA) must identify all job steps required to complete the task, the potential hazards employees could be exposed to while performing the job step and the preventative/corrective actions required to reduce/mitigate the identified potential hazards. Employees must certify that they have either prepared the JSA or have reviewed the JSA and are aware of the potential hazards associated with this task and will follow the provided preventive/corrective actions. Prior to the start of any work "TAKE 5" and conduct a Last-Minute Risk Assessment.**

**S – *Stop,* what has changed?**
**T – *Think* about the task**
**E – *Evaluate* potential hazards**
**P – *Plan* safe approach**
**S - *Start* task / *Stop* & regroup**

| **PERSONAL PROTECTIVE EQUIPMENT (Required or to be worn as needed):** | | | | |
|---|---|---|---|---|
| ☒ Safety Shoes | ☒ Long Sleeves | ☒ Safety Vest (Class 2) | ☒ Hard Hat | ☐ Hearing Protection |
| ☒ Safety Glasses | ☐ Safety Goggles | ☐ Face Shield | ☒ Nitrile Gloves | ☐ PVC Gloves |
| ☐ Leather Gloves | ☐ Cut Resist. Gloves | ☐ Fall Protection | ☒ Fire Resistant Clothing | ☐ Rubber Boots |
| ☒ Insect/Animal Repellent | ☒ Ivy Blocker/Cleaner | ☐ Traffic Cones/Signs | ☐ Life Vest/Jacket | |
| ☒ Other: Tyvek Sleeves | | | | |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 1. Drive to sample location | 1. Rough/Off Road terrain | 1. Pay attention to road conditions such as road erosion, unprotected embankments, and soft road conditions. |
| 2. Sample Collection (Walking) | 1. Slip/Trips/Falls<br>2. Back strains<br>3. Wildlife (Insects, Stray animals, rodents)<br>4. Poisonous vegetation | 1. Minimize distance to sample area/ Plan route and check surface prior to carrying heavy equipment/ Locate safest access point/ Follow good housekeeping procedures/ Mark significant below grade hazards (holes, trenches) with spray paint or cones/ Wear foot protection with ankle support and gripping soles.<br>2. Use proper lifting techniques/ Use wheeled transport/ Obtain assistance where and when needed/ Consider load weight when evaluating what is safe and unsafe to carry.<br>3. Be aware of surroundings for the presence of wildlife. Do not approach stray animals. Carry and use animal repellant when needed/ Use bug spray when needed.<br>4. Keep skin covered/ Identify and avoid poisonous vegetation/ Clean areas after contact with suspected vegetation. |
| 3. Sample Collection (Water) | 1. Drowning Hazards<br>2. Chemical burns (when adding acid preservative to sample)<br>3. Back Strains<br>4. Ergonomic issues<br>5. Slip/Trips/Falls | 1. Use buddy system/ Wear flotation vest if water is deeper than 2 feet or swift moving/ Select working area with stable footing. Do not attempt to cross or stand in swift moving water.<br>2. Wear proper PPE (Nitrile gloves, Tyvek Sleeves)<br>3. Use proper lifting techniques/ Use wheeled transport/ Obtain assistance where and when needed/ Consider load weight when evaluating what is safe or unsafe to carry.<br>4. When possible, avoid bending over for long periods of time/ Use a small stool for sitting or knee pad for kneeling. |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| | | 5. Minimize distance to sample area/ Plan route and check surface prior to carrying heavy equipment/ Locate safest access point/ Follow good housekeeping procedures/ Mark significant below grade hazards (holes, trenches) with spray paint or cones/ Wear foot protection with ankle support and gripping soles/ Avoid standing water or slippery terrain. |
| 4. All activities | 1. Slips/ Trips/ Falls<br>2. Hand injuries, cuts, or lacerations during manual handling of materials<br>3. Foot injuries<br>4. Back injuries<br>5. Traffic<br>6. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.)<br>7. High Noise levels<br>8. Overhead hazards<br>9. Heat Stress/ Cold Stress<br>10. Eye Injuries | 1. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards<br>2. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves<br>3. Wear Langan approved safety shoes<br>4. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible<br>5. Wear high visibility clothing & vest / Use cones or signs to designate work area<br>6. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed<br>7. Wear hearing protection<br>8. Wear hard hat / Avoid areas where overhead hazards exist.<br>9. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress<br>10. Wear safety glasses |

| ☒ Other: All Drums are required to be labeled. Langan employees do not open or move undocumented drums or unlabeled drums without proper project manager authorization. | | | | |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 20. Unpack/Transport equipment to work area. | 16. Back Strains<br>17. Slip/Trips/Falls<br>18. Cuts/Abrasions from equipment<br>4. Contusions from dropped equipment | 10. Use proper lifting techniques/Use wheeled transport.<br>11. Minimize distance to work area/Unobstructed path to work area/follow good housekeeping procedures. Mark slip/trip/fall hazards with orange safety cones.<br>12. Wear proper PPE (leather gloves, long sleeves).<br>4. Wear proper PPE (Langan approved safety shoes). |
| 21. Open Drums | 1. Hand Injuries, cuts or lacerations when untightening drum locking bolt, removing drum lid strap, or removing lid.<br>2. Pressure from drums. | 1. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves. Use non-metallic mallet and non-sparking tools/wrenches.<br>2. Open drum slowly to relieve pressure. Wear proper PPE: face shield and goggles; correct gloves; and over garments. |
| 22. Collecting Soil/Fluid Sample | 8. Irritation to eye from vapor, soil dust, or splashing.<br>9. Irritation to exposed skin | 6. Wear proper eye protection including safety glasses/ face shield/googles and when necessary, splash guard. If dust or vapor phase is present, wear appropriate safety breathing gear (1/2 mask or full face mask with correct filter)<br>7. Wear proper skin protection including nitrile gloves. |
| 23. Closing Drums | 1. Hand Injuries, cuts or lacerations when untightening drum locking bolt, removing drum lid strap, or removing lid. | 7. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves. Use non-metallic mallet and non-sparking tools/wrenches. |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 24. Moving Drums | 2. Hand Injuries, cuts or lacerations when untightening drum locking bolt, removing drum lid strap, or removing lid.<br>3. Back Strains | 2. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves. Use non-metallic mallet and non-sparking tools/wrenches.<br>3. Use proper lifting techniques/Use wheeled transport. |
| 25. All activities | 31. Slips/ Trips/ Falls<br>32. Hand injuries, cuts, or lacerations during manual handling of materials<br>33. Foot injuries<br>34. Back injuries<br>35. Traffic<br>36. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.)<br>37. High Noise levels<br>38. Overhead hazards<br>39. Heat Stress/ Cold Stress<br>40. Eye Injuries | 37. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards.<br>38. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves.<br>39. Wear Langan approved safety shoes.<br>40. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible.<br>41. Wear high visibility clothing & vest / Use cones or signs to designate work area.<br>42. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed.<br>43. Wear hearing protection<br>44. Wear hard hat / Avoid areas where overhead hazards exist.<br>45. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress.<br>46. Wear safety glasses |

**Job Safety Analysis (JSA)**
**Construction Health and Safety**

**JSA Title:** Direct-Push Soil Borings
**JSA Number:** JSA004-01

**A Job Safety Analysis (JSA) must identify all job steps required to complete the task, the potential hazards employees could be exposed to while performing the job step and the preventative/corrective actions required to reduce/mitigate the identified potential hazards. Employees must certify that they have either prepared the JSA or have reviewed the JSA and are aware of the potential hazards associated with this task and will follow the provided preventive/corrective actions. Prior to the start of any work "TAKE 5" and conduct a Last-Minute Risk Assessment.**

**S – *Stop,* what has changed?**
**T – *Think* about the task**
**E – *Evaluate* potential hazards**
**P – *Plan* safe approach**
**S - *Start* task / *Stop* & regroup**

| PERSONAL PROTECTIVE EQUIPMENT REQUIRED: | | | | |
|---|---|---|---|---|
| ☒ Safety Shoes | ☒ Long Sleeves | ☒ Safety Vest (Class 2) | ☒ Hard Hat | ☒ Hearing Protection |
| ☒ Safety Glasses | ☐ Safety Goggles | ☐ Face Shield | ☒ Nitrile Gloves | ☐ PVC Gloves |
| ☒ Leather Gloves | ☒ Cut Resist. Gloves | ☐ Fall Protection | ☐ Fire Resistant Clothing | ☐ Rubber Boots |
| ☐ Insect/Animal Repellent | ☐ Ivy Blocker/Cleaner | ☐ Traffic Cones/Signs | ☐ Life Vest/Jacket | |
| ☒ Other: Half-face respirator, dust cartridges, PID (if applicable) | | | | |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 26. Move equipment to work site | 19. Back strain when lifting equipment.<br>20. Slips/ Trips/ Falls while moving equipment.<br>21. Traffic (if applicable)<br>22. Pinched fingers or running over toes during GeoProbe set-up.<br>23. Overturn drilling rig while transporting to loading dock on flat-bed tow truck | 13. Use proper lifting technique (use legs for bending and lifting and not the back)/ Use wheeled transport for heavy equipment / Get assistance when handling loads greater than 50 lbs. / Minimize distance to vehicle<br>14. Use proper lifting technique (use legs for bending and lifting and not the back) / Use wheeled transport for heavy equipment / Get assistance when handling loads greater than 50 lbs. / Minimize distance to vehicle / Have unobstructed path to vehicle or collection point / Do not lift/walk with boxes that are heavy/difficult to lift<br>15. Wear high visibility safety vests or clothing / Exercise caution<br>16. Wear proper PPE (cut-resistant gloves) / Stay alert, be aware of geoprobe rig at all times<br>17. Drill rig should be parked in center of flat-bed tow truck / Emergency brake shall be used at all times during transport on the flat-bed truck/ All unnecessary personnel should stay away from the flat-bed truck during moving activities |
| 27. Calibration of monitoring equipment | 10. Skin or eye contact with calibration chemicals<br>11. Pinch fingers in monitoring equipment | 8. Wear proper PPE (safety glasses/ goggles)<br>9. Wear proper PPE (leather gloves) |
| 28. Set-up GeoProbe rig | 10. Geoprobe rig movement | 8. All field personnel should stay clear of the GeoProbe rig while moving / Use a spotter when backing up the GeoProbe |
| 29. Advance GeoProbe rods below ground surface to desired depth | 4. Underground utilities<br>5. High noise levels | 4. Clean all subsurface soil borings to a minimum of 5 feet below grade.<br>5. Wear proper PPE (hearing protection) |
| 30. Remove and open acetate liner. | 41. Pinched fingers while removing macrocore. | 1. Wear proper PPE (nitrile gloves, cut-resistant or leather gloves<br>2. Wear proper PPE (cut-resistant or leather gloves) |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 5. Remove and open acetate liner (cont'd) | 42. Cuts/lacerations when cutting acetate liner open.<br>43. Exposure to hazardous vapors<br>44. Skin contacts with contaminated soil | 3. Do not place face over acetate liner when opening / Monitor hazardous vapors in air with PID / Upgrade PPE as necessary based on levels contained in the Health and Safety Plan<br>4. Wear proper PPE (nitrile gloves) |
| 31. Sample Collections<br>a) Monitor parameters.<br>b) Prepare sample containers and labels | 1. Contact with potentially contaminated soil.<br>2. Lacerations from broken sample bottles<br>3. Back strain while transporting full coolers.<br>4. Internal exposure to contaminants and metals through inhalation of dust<br>5. Slips/ Trips/ Falls | 1. Use monitoring devices / Wear proper PPE (safety glasses, nitrile gloves)<br>2. Do not over-tighten bottle caps / Handle bottles safely to prevent breakage.<br>6. Use proper lifting techniques / Do not lift heavy loads without assistance.<br>7. Avoid creating dust / If necessary, wear a half mask respirator with applicable dust cartridge / Inspect respirator for damage and cleanliness prior to use / Clean respirator after each use and store in a clean, secure location.<br>8. Be alert / Follow good housekeeping procedures |
| 32. Remove excess soil from acetate liner and place in 55-gallon drum (IF NOT PERFORMED BY LANGAN, REMOVE!) | 1. Cuts/lacerations from acetate liner<br>2. Pinched fingers/hand while opening/closing drum.<br>3. Skin contacts with contaminated soil<br>4. Soil debris in eyes | 1. Wear proper PPE (cut-resistant or leather gloves)<br>2. Wear proper PPE (cut-resistant or leather gloves)<br>3. Wear proper PPE (nitrile gloves)<br>4. Wear proper PPE (safety glasses) |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 8. Transport drums to central staging location (IF NOT PERFORMED BY LANGAN, REMOVE!) | 1. Back, arm or shoulder strain from moving drums.<br>2. Pinch fingers/hand in drum cart when moving drums.<br>3. Pinch fingers/hand when operating lift-gate on vehicle.<br>4. Contact with potentially contaminated groundwater when moving improperly sealed drums.<br>5. Slips when moving drums.<br>6. Drop drum on feet/toes | 47. Use drum cart for moving drums / Use proper lifting techniques / Do not lift heavy loads without assistance.<br>48. Wear proper PPE (cut-resistant or leather gloves)<br>49. Wear proper PPE (cut-resistant or leather gloves)<br>50. Wear proper PPE (nitrile gloves underneath work gloves)<br>51. Follow good housekeeping procedures / Ensure route to move drum and storage space is free from obstructions.<br>52. Wear proper PPE (safety shoes) / Work in a safe manner to prevent dropped drum |
| 9. All activities<br><br>9. All activities (cont'd) | 1. Slips/ Trips/ Falls<br>2. Hand injuries, cuts, or lacerations during manual handling of materials<br>3. Foot injuries<br>4. Back injuries<br>5. Traffic<br>6. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.)<br>7. High Noise levels<br>8. Overhead hazards<br>9. Heat Stress/ Cold Stress<br>10. Eye Injuries | 1. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards.<br>2. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves.<br>3. Wear Langan approved safety shoes.<br>4. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible.<br>5. Wear high visibility clothing & vest / Use cones or signs to designate work area.<br>6. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed.<br>7. Wear hearing protection<br>8. Wear hard hat / Avoid areas where overhead hazards exist.<br>9. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress.<br>10. | JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 45. Use of Ladders and Inspection of Ladders Before Use | 1. Ladders (portable, fixed)<br>2. Rolling or pinching objects<br>3. Sharp objects | 26. Inspect all ladders for structural defects prior to each use. Decals, weight restrictions, non painted surfaces.<br>27. Use the correct type and size of ladder to safely work.<br>28. . Do not use metal or wooden ladders |
| 46. Use of Ladder(s) | 26. Ladders (portable, fixed)<br>27.Elevated work platform or stairs<br>28.Slippery surfaces (water, ice, snow)<br>29.Rolling or pinching objects<br>30.Sharp objects<br>31.Poor Housekeeping<br>32.Repetitive motion or other ergonomic concerns<br>33.Airborne dust | 25. Maintain three points of contact when ascending and descending ladders.<br>26. Insure area at bottom of ladder is free of obstructions and tripping hazards.<br>27. Never carry tools in your hands while ascending or descending a ladder.<br>28. Utilize rope buckets to pull tools up to you or tool belts. Extension ladders will extend up to 36 inches above the landing that is being accessed and be tied off and secured to prevent them from moving or falling.<br>29. A spotter must hold the ladder if the employee needs to climb the ladder to tie the ladder off. When using an extension ladder, for every 4' of rise, the base must come out 1' (4 to 1 ratio)<br>30. If working from a ladder 6 ft. or higher, fall protection is required. Fall protection is not required for climbing ladders less than 20 ft. in height. |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| | | 31. Use the proper ladder for the job at all times.<br><br>32. The belt buckle may never extend past either rail on the side of the ladder.<br><br>33. Do not climb higher than the second tread from the top on a stepladder or the third rung<br><br>34. Before ascending or descending a ladder, wait until other workers have completely cleared the ladder. Do not stand directly below a person who is climbing or descending a ladder to avoid falling objects. |
| 47. All activities | 75. Slips/ Trips/ Falls<br>76. Hand injuries, cuts or lacerations during manual handling of materials<br>77. Foot injuries<br>78. Back injuries<br>79. Eye Injuries | 83. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards<br>84. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery or dirty objects before handling / Wear leather/ cut-resistant gloves<br>85. Wear proper PPE (Langan approved safety shoes)<br>86. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible<br>87. Wear high visibility clothing & vest / Use cones or signs to designate work area<br>88. Wear hard hat / Avoid areas were overhead hazards exist.<br>89. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress<br>90. Wear safety glasses |

| ☐ Other: | | | | |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 51. Drive to site and/or sample location. | 42. Rough/Off-Road terrain;<br>43. Low-light or other hazardous environmental conditions. | 1. Pay attention to road conditions such as road erosion, unprotected embankments, and soft road conditions;<br>2. Ensure vehicle is properly equipped and outfitted for the terrain and all environmental conditions. |
| 52. Initial Site Arrival Site Assessment. | 1. Unsafe driving conditions including personnel walking within driving areas, open excavation or pits, steep slopes etc.;<br>2. Biological hazards (snakes, poison oak, bees). | 1. Maintain situational awareness upon arriving to the work site (be alert of your surroundings). Secure the work area from through traffic. |
| 53. Unpack and transport equipment to work area. | 1. Back Strains;<br>2. Slip/Trips/Falls;<br>3. Cuts/Abrasions from equipment;<br>4. Contusions from dropped equipment. | 1. Use proper lifting techniques and use wheeled transport;<br>2. Minimize distance to work area and create unobstructed path to work area. Follow good housekeeping procedures. Mark slip/trip/fall hazards with orange safety cones and/or caution tape;<br>3. Wear proper PPE (gloves, long sleeves, etc.);<br>4. Wear proper PPE (Langan-approved safety shoes, hardhat, etc.). |
| 54. Earth Moving Equipment. | 1. Equipment striking, crushing, running over employee etc. | 1. Place traffic cones and use caution tape to clearly delineate the excavators front and rear swing radius. Do not enter the excavators or other heavy equipment swing radius/travel paths while in operation;<br>2. Ensure all employees working in the vicinity of the excavator/heavy equipment maintain direct line of sight with the operator at all times; don't walk behind equipment or within the operators blind spots; maintain a safe distance away from the equipment;<br>3. Designate one employee as the "spotter" to communicate with the excavator operator, and establish a shut-down signal that, when |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| | | sounded, instructs the excavator operator to freeze/stop all movement of the equipment;<br>4. Direct operator to completely power down the excavator before approaching (i.e. breaking the swing radius plane) the excavator bucket to collect a sample;<br>5. Direct the operator keep the equipment completely powered-down until all employees are at a safe distance, and it is safe to continue work. The designated spotter should be the only person directing the operator to power the equipment back on.<br>6. Conduct a planned pause anytime there is a change in procedure or before beginning a new task;<br>7. Wear proper PPE (high vis vest/clothing). |
| 55. Icing of Samples & Transporting coolers/equipment from work area. | 1. Back Strains<br>2. Slips/Trips/Falls<br>3. Cuts/Abrasions from equipment<br>4. Pinch/Crushing Hazards. | 1. Drain coolers of water. Use proper lifting techniques. Use wheeled transport whenever possible;<br>2. Plan for and utilize a safe and unobstructed path of travel to and from work area. Maintain situational awareness when traveling to and from work area;<br>3. Wear proper PPE (Leather gloves, long sleeves);<br>4. Wear proper PPE (Leather gloves, long sleeves, hard hat, Langan approved safety shoes). |
| 56. Excavated soil. | 1. Hazardous substances. | 1. Use proper equipment to monitor excavated soil for contaminates;<br>2. Ensure levels do not exceed PEL's for contaminates;<br>3. Wear proper PPE. |
| 57. Changing site conditions. | 1. Stockpiles and/or excavations/trenches/pits creating unsafe paths of travel.<br>2. Unforeseen conditions | 1. Take time to plan out stockpile, excavation, trench, and/or test pit locations, ensuring that the planned work will not create unsafe conditions or paths of travel once performed;<br>2. Maintain situational awareness throughout the work day (be alert of the evolving site conditions);<br>3. If stockpile, excavation, trench, and/or test pit locations create pinch points, site constraints, or unsafe paths of travel or other unsafe site conditions, stop work immediately and direct the excavator operator to correct the unsafe conditions by moving stockpiles, backfilling excavations, trenches, and/or test pits etc.;<br>4. Use stop work and conduct a planned pause to address changed site conditions. |
| 58. All activities. | 1. Slips/ Trips/ Falls;<br>2. Hand injuries, cuts or lacerations during manual handling of materials;<br>3. Foot injuries;<br>4. Back injuries;<br>5. Traffic;<br>6. Wildlife: Stray dogs, Mice/rats, Vectors (i.e. mosquitoes, bees, etc.);<br>7. High Noise levels;<br>8. Overhead hazards;<br>9. Heat Stress/ Cold Stress;<br>10. Eye Injuries. | 1. Be aware of potential trip hazards. Follow good housekeeping procedures. Mark significant hazards;<br>2. Inspect for jagged/sharp edges, and rough or slippery surfaces. Keep fingers away from pinch points. Wipe off greasy, wet, slippery or dirty objects before handling. Wear proper PPE (leather/ cut-resistant gloves);<br>3. Wear proper PPE (Langan approved safety shoes);<br>4. Use proper lifting techniques. Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift. Obtain assistance when possible;<br>5. Wear high visibility clothing & vest / Use cones or signs to designate work area; |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| | | 6. Be aware of surroundings at all times, including the presence of wildlife. Do not approach stray dogs. Carry/use dog/animal repellant. Use bug spray when needed;<br>7. Wear hearing protection;<br>8. Wear hard hat / Avoid areas were overhead hazards exist;<br>9. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather). Drink plenty of fluids to avoid dehydration. Take breaks as necessary to avoid heat/cold stress;<br>10. Wear safety glasses |

| PERSONAL PROTECTIVE EQUIPMENT (Required or to be worn as needed): | | | | |
|---|---|---|---|---|
| ☒ Safety Shoes | ☒ Long Sleeves | ☒ Safety Vest (Class 2) | ☒ Hard Hat | ☒ Hearing Protection |
| ☒ Safety Glasses | ☐ Safety Goggles | ☐ Face Shield | ☒ Nitrile Gloves | ☐ PVC Gloves |
| ☒ Leather Gloves | ☐ Cut Resist. Gloves | ☒ Fall Protection | ☐ Fire Resistant Clothing | ☐ Rubber Boots |
| ☐ Insect/Animal Repellent | ☐ Ivy Blocker/Cleaner | ☐ Traffic Cones/Signs | ☐ Life Vest/Jacket | |
| ☒ Other: Tyvek sleeves, Dermal Protection, PID | | | | |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 60. Transport equipment to work area | 1. Back Strain<br>2. Slips/ Trips/ Falls<br>3. Traffic<br>4. Cuts/abrasions from equipment<br>5. Contusions from dropped equipment | 1. Use proper lifting techniques / Use wheeled transport.<br>2. Minimize distance to work area / Have unobstructed path to work area / Follow good housekeeping procedures.<br>3. Wear proper PPE (high visibility vest or clothing)<br>4. Wear proper PPE (leather gloves, long sleeves)<br>5. Wear proper PPE (safety shoes) |
| 61. Remove well cover | 34. Scrape knuckles/hand<br>35. Strain wrist/bruise palm<br>36. Pinch fingers or hand | 6. Wear proper PPE (leather gloves)<br>7. Using a hammer, tap the end of the wrench to loosen grip of bolts.<br>8. Wear proper PPE (leather gloves) |
| 62. Remove well cap and lock | 17. Well can pops from pressure.<br>18. Exposure to hazardous substances through inhalation or dermal exposure<br>19. Scrape knuckles/hand<br>20. Strain write/bruise palm | 8. Remove cap slowly to relieve pressure / Do not place face over well when opening / Wear proper PPE (safety glasses)<br>9. Use direct air monitoring/reading instrument (i.e., PID) / Be familiar with and follow actions prescribed in the HASP / Wear proper PPE (nitrile gloves)<br>10. Wear proper PPE (leather gloves)<br>11. Using hammer, tap the end of the wrench to loosen grip |
| 63. Measure head-space vapor levels | 1. Exposure to hazardous substances through inhalation | 1. Do not place face over well when collecting measurement |
| 64. Remove dedicated tubing (if necessary) | 1. Exposure to hazardous substances through inhalation or dermal exposure<br>2. Tubing swings around after removal | 1. Wear proper PPE (nitrile gloves, Tyvek sleeves)<br>2. Wear proper PPE (safety glasses) |
| 65. Set-up plastic sheeting for work site around the well | 1. Lacerations when cutting plastic sheeting. | 1. Use scissors to cut plastic sheeting / Cut motions should always be away from body and body parts |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 66. Measure depth to water | 1. Exposure to hazardous substances through inhalation or dermal exposure<br>2. Pinch fingers or hand in water level instrument | 1. Wear proper PPE (nitrile gloves)<br>2. Wear proper PPE (leather gloves) |
| 67. Calibrate monitoring equipment | 1. Skin or eye contact with calibration chemicals<br>2. Pinch fingers or hand in monitoring equipment | 1. Wear proper PPE (safety glasses, nitrile gloves)<br>2. Wear proper PPE (leather gloves) / Avoid pinch points |
| 68. Install sampling pump in well | 1. Hand injuries during installation of pump<br>2. Lacerations when cutting tubing.<br>3. Back strain during installation of pump<br>4. Physical hazards associated with manual lifting of heavy equipment.<br>5. Back strain from starting generator.<br>6. Burns from hot exhaust from generator.<br>7. Electrical shock from improper use of generator and pump<br>8. Contaminated water spray from loose connections | 1. Wear proper PPE (leather gloves, nitrile gloves)<br>2. Use safety tubing cutter.<br>3. Use proper lifting techniques.<br>4. Use proper lifting techniques / Use wheeled transport for heavy equipment.<br>5. Use arm when starting generator / Do not over-strain if generator does not start.<br>6. Do not touch generator near exhaust / Use proper handle to carry / Allow generator to cool down before moving.<br>7. Properly plug in pump to generator / Do not allow the pump or generator to contact water / Check for breaks in the cord.<br>8. Check all tubing connections to ensure they are tight and secure |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 10. Purge water | 1. Contact with potentially contaminated groundwater.<br>2. Back strain from lifting buckets of water<br>3. Tripping potential on sample discharge lines and pump electric lines | 1. Wear proper PPE (safety glasses, nitrile gloves)<br>2. Use proper lifting techniques / Use wheeled transport.<br>3. Organize discharge of electric line to keep out of way as much as possible / Mark potential tripping hazards with caution tape or safety cones |
| 11. Sample water collection | 1. Contact with potentially contaminated groundwater through dermal exposure.<br>2. Contact with and burns from acid used for sample preservation.<br>3. Tripping potential on sample discharge lines and pump electric lines<br>4. Lacerations from broken sample bottles<br>5. Back strain when transporting coolers full of collected samples.<br>6. Slips/ Trips/ Falls | 1. Wear proper PPE (safety glasses, nitrile gloves)<br>2. Wear proper PPE (safety glasses, nitrile gloves) / Ensure sample bottle lids are secure before use and after sample collection.<br>3. Organize line to keep out of the way as much as possible / Mark potential tripping hazards with caution tape or safety cones.<br>4. Do not over-tighten bottle caps / Handle bottles safely to prevent breakage / Wrap glass bottles in bubble wrap, if possible<br>5. Use proper lifting techniques / Use wheeled transport / Seek assistance if coolers weight exceeds 50lbs. / Minimize distance to vehicle.<br>6. Have unobstructed path to vehicle or collection point / Follow good housekeeping procedures / Do not lift/walk with coolers that are too heavy/difficult to lift |
| 12. Remove pump and pack up equipment | 1. Back strain when removing pump or lifting heavy equipment | 1. Use proper lifting technique / Use wheeled transport for heavy equipment |
| 13. Replace well cap and lock | 1. Scrape fingers/hand<br>2. Strain wrist/bruise palm | 1. Wear proper PPE (leather gloves)<br>2. Using hammer, tap the end of the well cap to tighten grip |
| 14. Replace well cover | 1. Scrape knuckles/hand<br>2. Strain write/bruise palm.<br>3. Pinch fingers or hand | 1. Wear proper PPE (leather gloves)<br>2. Using hammer, tap the end of the wrench to tighten the grip of the bolts.<br>3. Wear proper PPE (leather gloves) |
| 15. Transport drums to disposal staging location | 1. Back, arm or shoulder strain from moving drums.<br>2. Pinch hazard<br>3. Contact with potentially contaminated groundwater when moving improperly sealed drums.<br>4. Slips/ Trips/ Falls when moving drum.<br>5. Drop drum on feet/toes | 1. Use drum cart for moving drums / Use proper lifting techniques / Obtain assistance, if needed<br>2. Wear proper PPE (leather gloves)<br>3. Wear proper PPE (nitrile gloves under leather gloves) / Properly seal drum to prevent leak.<br>4. Ensure route to move drum to storage space is dry and free from obstructions.<br>5. Wear proper PPE (safety shoes) |
| 16. Place used PPE in designated disposal drum | 1. Pressure build-up inside drum<br>2. Pinch hazard | 1. Remove cap from bung hole in drum to relieve pressure.<br>2. Wear proper PPE (leather gloves) |
| 17. Decontaminate equipment | 1. Splashing water/soap from decontamination<br>2. Contact with potentially contaminated groundwater through dermal exposure.<br>3. Electrical shock from broken electric cords | 1. Wear proper PPE (safety glasses)<br>2. Wear proper PPE (safety glasses, dermal protection)<br>3. Properly plug in pump to generator / Do not allow the pump or generator to contact water / Check for breaks in the cord |
| 18. All activities | 100. Slips/ Trips/ Falls<br>101. Hand injuries, cuts, or lacerations during manual handling of materials<br>102. Foot injuries<br>103. Back injuries<br>104. Traffic<br>105. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.) | 111. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards.<br>112. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves.<br>113. Wear Langan approved safety shoes. |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| | 106. High Noise levels<br>107. Overhead hazards<br>108. Heat Stress/ Cold Stress<br>109. Eye Injuries | 114. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible.<br>115. Wear high visibility clothing & vest / Use cones or signs to designate work area.<br>116. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed.<br>117. Wear hearing protection<br>118. Wear hard hat / Avoid areas where overhead hazards exist.<br>119. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress.<br>120. | LANGAN | Job Safety Analysis (JSA)<br>Health and Safety |
|---|---|
| **JSA Title: Well Installation**<br>**JSA Number: JSA019-01** |  <br>**S** – ***Stop,*** *what has changed?*<br>**T** – ***Think*** *about the task*<br>**E** – ***Evaluate*** *potential hazards*<br>**P** – ***Plan*** *safe approach*<br>**S** - ***Start*** *task /* ***Stop*** *& regroup* |
| **A Job Safety Analysis (JSA) must identify all job steps required to complete the task, the potential hazards employees could be exposed to while performing the job step and the preventative/corrective actions required to reduce/mitigate the identified potential hazards. Employees must certify that they have either prepared the JSA or have reviewed the JSA and are aware of the potential hazards associated with this task and will follow the provided preventive/corrective actions. Prior to the start of any work "TAKE 5" and conduct a Last-Minute Risk Assessment.** | |

| **PERSONAL PROTECTIVE EQUIPMENT REQUIRED:** | | | | |
|---|---|---|---|---|
| ☒ Safety Shoes | ☒ Long Sleeves | ☒ Safety Vest (Class 2) | ☒ Hard Hat | ☒ Hearing Protection |
| ☒ Safety Glasses | ☐ Safety Goggles | ☐ Face Shield | ☒ Nitrile Gloves | ☐ PVC Gloves |
| ☒ Leather Gloves | ☐ Cut Resist. Gloves | ☐ Fall Protection | ☐ Fire Resistant Clothing | ☐ Rubber Boots |
| ☐ Insect/Animal Repellent | ☐ Ivy Blocker/Cleaner | ☐ Traffic Cones/Signs | ☐ Life Vest/Jacket | |
| ☒ Other: PID, Tyvek sleeves | | | | |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 69. Move equipment to work site | 45. Back strain when lifting equipment.<br>46. Slips/ Trips/ Falls while moving equipment.<br>47. Traffic (if applicable)<br>48. Pinched fingers or running over toes during GeoProbe set-up.<br>49. Overturn drilling rig while transporting to loading dock on flat-bed tow truck | 30. Use proper lifting technique (use legs for bending and lifting and not the back)/ Use wheeled transport for heavy equipment / Get assistance when handling loads greater than 50 lbs. / Minimize distance to vehicle<br>31. Use proper lifting technique (use legs for bending and lifting and not the back) / Use wheeled transport for heavy equipment / Get assistance when handling loads greater than 50 lbs. / Minimize distance to vehicle / Have unobstructed path to vehicle or collection point / Do not lift/walk with boxes that are heavy/difficult to lift<br>32. Wear high visibility safety vests or clothing / Exercise caution<br>33. Wear proper PPE (cut-resistant gloves) / Stay alert, be aware of geoprobe rig at all times<br>34. Drill rig should be parked in center of flat-bed tow truck / Emergency brake shall be used at all times during transport on the flat-bed truck/ All unnecessary personnel should stay away from the flat-bed truck during moving activities |
| 70. Calibration of monitoring equipment | 37. Skin or eye contact with calibration chemicals<br>38. Pinch fingers in monitoring equipment | 35. Wear proper PPE (safety glasses/ goggles)<br>36. Wear proper PPE (leather gloves) |
| 37. Set-up GeoProbe rig | 21. Geoprobe rig movement | 12. All field personnel should stay clear of the GeoProbe rig while moving / Use a spotter when backing up the GeoProbe |
| 38. Advance GeoProbe rods below ground surface to desired depth | 16. Underground utilities<br>17. High noise levels | 12. Clean all subsurface soil borings to a minimum of 5 feet below grade.<br>13. Wear proper PPE (hearing protection) |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 39. Remove and open acetate liner.<br><br>5. Remove and open acetate liner (cont'd) | 110. Pinched fingers while removing macrocore.<br>111. Cuts/lacerations when cutting acetate liner open.<br>112. Exposure to hazardous vapors<br>113. Skin contacts with contaminated soil | 5. Wear proper PPE (nitrile gloves, cut-resistant or leather gloves<br>6. Wear proper PPE (cut-resistant or leather gloves)<br>7. Do not place face over acetate liner when opening / Monitor hazardous vapors in air with PID / Upgrade PPE as necessary based on levels contained in the Health and Safety Plan<br>8. Wear proper PPE (nitrile gloves) |
| 6. Remove excess soil from acetate liner and place in 55-gallon drum (IF NOT PERFORMED BY LANGAN, REMOVE!) | 5. Cuts/lacerations from acetate liner<br>6. Pinched fingers/hand while opening/closing drum.<br>7. Skin contacts with contaminated soil<br>8. Soil debris in eyes | 5. Wear proper PPE (cut-resistant or leather gloves)<br>6. Wear proper PPE (cut-resistant or leather gloves)<br>7. Wear proper PPE (nitrile gloves)<br>8. Wear proper PPE (safety glasses) |
| 7. Attach hollow-stem augers to the GeoProbe rig; Advance augers and attach. additional augers until desired depth is reached | 1. Strain wrist/bruise palm<br>2. Pinched fingers<br>3. Back Strain<br>4. Clothing entanglement<br>5. Carbon monoxide poisoning<br>6. Bruise toes/foot<br>7. High noise levels<br>8. Skin contacts with contaminated soil | 1. Wear proper PPE (cut-resistant or leather gloves)<br>2. Wear proper PPE (cut-resistant or leather gloves)<br>3. Use proper lifting techniques.<br>4. Wear proper work attire(no loose clothing/strings)<br>5. Properly ventilate work area<br>6. Wear proper PPE (safety shoes)<br>7. Wear proper PPE (hearing protection)<br>8. Wear proper PPE (Tyvek sleeves, nitrile gloves) |
| 8. Install monitoring well | 1. Pinched fingers<br>2. Lacerations/abrasions<br>3. Back Strain | 1. Wear proper PPE (cut-resistant or leather gloves)<br>2. Wear proper PPE (cut-resistant or leather gloves)<br>3. Use proper lifting techniques |
| 9. Tremie-grout annulus space above bentonite seal | 1. Back strain<br>2. Pinched fingers | 1. Use proper lifting techniques.<br>2. Wear proper PPE (cut-resistant or leather gloves) |
| 10. Install flush-mount monitoring well pad | 1. Splashed concrete.<br>2. Pinched fingers<br>3. Cuts/lacerations | 1. Wear proper PPE (safety glasses)<br>2. Wear proper PPE (cut-resistant or leather gloves)<br>3. Wear proper PPE (cut-resistant or leather gloves) |
| 11. Decontaminate equipment | 1. Splashing water/soap<br>2. Contact with potentially contaminated groundwater/soil through dermal exposure.<br>3. Electrical shock from broken electric cords | 1. Wear proper PPE (safety glasses)<br>2. Wear proper PPE (safety glasses, dermal protection)<br>3. Properly plug in pump to generator / Do not allow the pump or generator to contact water / Check for breaks in the cord |
| 12. Transport drums to central staging location (IF NOT PERFORMED BY LANGAN, REMOVE!) | 7. Back, arm or shoulder strain from moving drums.<br>8. Pinch fingers/hand in drum cart when moving drums.<br>9. Pinch fingers/hand when operating lift-gate on vehicle.<br>10. Contact with potentially contaminated groundwater when moving improperly sealed drums.<br>11. Slips when moving drums.<br>12. Drop drum on feet/toes | 121. Use drum cart for moving drums / Use proper lifting techniques / Do not lift heavy loads without assistance.<br>122. Wear proper PPE (cut-resistant or leather gloves)<br><br>123. Wear proper PPE (cut-resistant or leather gloves)<br><br>124. Wear proper PPE (nitrile gloves underneath work gloves)<br><br>125. Follow good housekeeping procedures / Ensure route to move drum and storage space is free from obstructions.<br>126. Wear proper PPE (safety shoes) / Work in a safe manner to prevent dropped drum |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 13. All activities<br><br>13. All activities (cont'd) | 11. Slips/ Trips/ Falls<br>12. Hand injuries, cuts, or lacerations during manual handling of materials<br>13. Foot injuries<br>14. Back injuries<br>15. Traffic<br>16. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.)<br>17. High Noise levels<br>18. Overhead hazards<br>19. Heat Stress/ Cold Stress<br>20. Eye Injuries | 11. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards.<br>12. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves.<br>13. Wear Langan approved safety shoes.<br>14. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible.<br>15. Wear high visibility clothing & vest / Use cones or signs to designate work area.<br>16. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed.<br>17. Wear hearing protection<br>18. Wear hard hat / Avoid areas where overhead hazards exist.<br>19. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress.<br>20. Wear safety glasses |

**T – *Think* about the task**
**E – *Evaluate* potential hazards**
**P – *Plan* safe approach**
**S - *Start* task / *Stop* & regroup**

| **PERSONAL PROTECTIVE EQUIPMENT (Required or to be worn as needed):** | | | | |
|---|---|---|---|---|
| ☒ Safety Shoes | ☒ Long Sleeves | ☒ Safety Vest (Class 2) | ☒ Hard Hat | ☐ Hearing Protection |
| ☒ Safety Glasses | ☐ Safety Goggles | ☒ Face Shield | ☒ Nitrile Gloves | ☐ PVC Gloves |
| ☒ Leather Gloves | ☒ Cut Resist. Gloves | ☐ Fall Protection | ☐ Fire Resistant Clothing | ☐ Rubber Boots |
| ☐ Insect/Animal Repellent | ☐ Ivy Blocker/Cleaner | ☐ Traffic Cones/Signs | ☐ Life Vest/Jacket | |
| ☒ Other: Tyvek Sleeves | | | | |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 71. Transport equipment to work area | 50. Back Strains<br>51. Slips/Trips/Falls<br>52. Traffic<br>53. Cuts/Abrasions/Contusions from equipment | 35. Use proper lifting techniques/ Use wheeled transport/ use buddy system when lifting equipment.<br>36. Minimize distance from work area/ unobstructed path to collection points and vehicle/ Follow good housekeeping procedures.<br>37. Wear high-visibility vest or clothing/Exercise caution/ Use traffic cones or signage if needed.<br>38. Wear proper PPE (leather gloves, long sleeves, Langan approved safety shoes). |
| 72. Measure depth of water | 39. Exposure to hazardous substances<br>40. Pinched fingers | 40. Wear proper PPE (Nitrile gloves, Safety glasses/Face shield).<br>41. Wear proper PPE (cut-resistant gloves). |
| 73. Install Tremie pipe in the monitoring well and connect to water source. | 22. Hand injuries during installation (pinched fingers/hands).<br>23. Back strain from holding Tremie pipe.<br>24. High pressure water spray. | 13. Wear proper PPE (Nitrile gloves/cut-resistant gloves).<br>14. Use proper lifting techniques/ Use two personnel when lowering pump greater than 80 feet.<br>15. Ensure all those connections are tight and secure/ Use proper PPE (face shield and safety glasses). |
| 74. Install pump in to well.<br>a. Connect pump to sample tubing.<br>b. Lower pump to desired depth in well.<br>c. Connect sample tubing to flow cell.<br>d. Connect pump to power source | 18. Hand injuries during pump installation and sample tubing cutting.<br>19. Back strain<br>20. Electric shock<br>21. Exhaust gases from generator<br>22. Burns from hot equipment | 14. Wear proper PPE when installing pump and cutting sample tubing (Nitrile and cut-resistant gloves)/ Use tubing cutter.<br>15. Proper lifting techniques/ Two personnel when installing pump at depths greater than 80 feet/ Use buddy when lifting heavy loads (pump, generator)/Use wheeled transport.<br>16. Ensure equipment is (LO/TO: locked out/tagged out) prior to preforming any electrical connections/ Inspect wires for frays or cuts/Ensure generator is properly grounded prior to starting. |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| (generator)<br>e. Turn on power source (generator) | | 17. Position generator so that exhaust is flowing away from work area.<br>18. Do not touch exhaust or any hot part of generator/ Allow equipment time to cool down prior to carrying/ Use proper PPE (long sleeves, leather gloves) |
| 75. Develop monitoring well.<br>a. Jet water into well using Tremie pipe.<br>b. Turn pump on and adjust to desired flow rate.<br>c. Surge pump up and down well to remove sediment from screen.<br>d. Containerize all purge water from well. | 114. Hand injuries<br>115. Face injuries<br>116. Contaminated spray from water | 127. Wear proper PPE (cut-resistant gloves and nitrile gloves).<br>128. Wear proper PPE (face shield and safety glasses)/do not stand over well opening.<br>129. Wear proper PPE (Face shield and safety goggles)/Tyvek over garments/ Ensure all connections are secure and tight/ Tubing outlet is contained in an overflow container. |
| 76. Drum staging area. | 1. Back, Arm, and shoulder strain.<br>2. Pinch points<br>3. Cross contamination<br>4. Slip/Trips/Falls | 1. Use proper lifting techniques/ Use drum carts when moving drums/ use buddy system for moving of drums if needed/Move drums shortest distance needed.<br>2. Keep fingers and feet away from pinch points/ Use proper PPE (cut-resistant gloves, Langan approved safety shoes)<br>3. Use proper PPE (Nitrile gloves, Tyvek sleeves)<br>4. Ensure pathway is clear prior to moving equipment/ Mark all hazards/ Use additional person as a spotter if needed. |
| 77. Equipment pack-up | 1. Back Strains<br>2. Slips/Trips/Falls<br>3. Traffic<br>4. Cuts/Abrasions/Contusions from equipment. | 1. Use proper lifting techniques/ Use wheeled transport/ use buddy system when lifting equipment.<br>2. Minimize distance from work area/ Unobstructed path to collection points and vehicle/ Follow good housekeeping procedures.<br>3. Wear high-visibility vest or clothing/Exercise caution/ Use traffic cones or signage if needed.<br>130. Wear proper PPE (leather gloves, long sleeves, Langan approved safety shoes). |
| 78. All activities | 1. Slips/ Trips/ Falls<br>2. Hand injuries, cuts, or lacerations during manual handling of materials<br>3. Foot injuries<br>117. Back injuries<br>118. Traffic<br>119. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.)<br>120. High Noise levels<br>121. Overhead hazards<br>122. Heat Stress/ Cold Stress<br>123. Eye Injuries | 1. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards<br>2. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves<br>3. Wear Langan approved safety shoes<br>4. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible<br>5. Wear high visibility clothing & vest / Use cones or signs to designate work area<br>6. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed<br>7. Wear hearing protection<br>8. Wear hard hat / Avoid areas where overhead hazards exist.<br>9. Wear proper attire for weather conditions (sunscreen or protective clothing |

| **PERSONAL PROTECTIVE EQUIPMENT (Required or to be worn as needed):** | | | | |
|---|---|---|---|---|
| ☒ Safety Shoes | ☒ Long Sleeves | ☒ Safety Vest (Class 2) | ☒ Hard Hat | ☒ Hearing Protection |
| ☒ Safety Glasses | ☒ Safety Goggles | ☒ Face Shield | ☒ Nitrile Gloves | ☒ PVC Gloves |
| ☒ Leather Gloves | ☐ Cut Resist. Gloves | ☐ Fall Protection | ☒ Fire Resistant Clothing | ☐ Rubber Boots |
| ☐ Insect/Animal Repellent | ☐ Ivy Blocker/Cleaner | ☒ Traffic Cones/Signs | ☐ Life Vest/Jacket | |
| ☒ Other: Tyvek sleeves, Dermal Protection, PID, absorbent pads | | | | |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 79. Transport equipment to work area | 6. Back Strain<br>7. Slips/ Trips/ Falls<br>8. Traffic<br>9. Cuts/abrasions from equipment<br>10. Contusions from dropped equipment | 6. Use proper lifting techniques / Use wheeled transport.<br>7. Minimize distance to work area / Have unobstructed path to work area / Follow good housekeeping procedures.<br>8. Wear proper PPE (high visibility vest or clothing)<br>9. Wear proper PPE (leather gloves, long sleeves)<br>10. Wear proper PPE (safety shoes) |
| 80. Remove well cover | 41. Scrape knuckles/hand<br>42. Strain wrist/bruise plan<br>43. Pinch fingers or hand | 9. Wear proper PPE (leather gloves)<br>10. Using a hammer, tap the end of the wrench to loosen grip of bolts.<br>11. Wear proper PPE (leather gloves) |
| 81. Remove well cap and lock | 25. Well can pops from pressure.<br>26. Exposure to hazardous substances through inhalation or dermal exposure<br>27. Scrape knuckles/hand<br>28. Pinch points<br>29. Strain write/bruise palm | 12. Remove cap slowly to relieve pressure / Do not place face over well when opening / Wear proper PPE (safety glasses, face shield, hand protection)<br>13. Use direct air monitoring/reading instrument (i.e., PID) / Be familiar with and follow actions prescribed in the HASP / Wear proper PPE (nitrile gloves)<br>14. Wear proper PPE (leather gloves)<br>15. Using hammer, tap the end of the wrench to loosen grip |
| 82. Measure head-space vapor levels | 2. Exposure to hazardous substances through inhalation | 2. Do not place face over well when collecting measurement |
| 83. Set-up plastic sheeting/absorbent pads | 2. Lacerations when cutting plastic sheeting/absorbent pads. | 2. Use scissors to cut plastic sheeting/absorbent pads / Cut motions should always be away from body and body parts |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| for work site around the well | | |
| 84. Lower Bailer sleeve into well | 7. Repetitive motion injury (pulled arm/back muscles)<br>8. Dehydration | 7. Take breaks while lowering bailer into well/ Use a mechanical device to lower bailer into well/ Rotate employees (take turns conducting the manual labor portion)<br>8. Take breaks and drink water. |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 7. Purge/Sample water/product collection | 1. Contact with potentially contaminated groundwater or product through dermal exposure<br>2. Contact with and burns from acid used for sample preservation<br>9. Tripping potential on sampling lanyard<br>10. Lacerations from broken sample bottles<br>11. Back strain when transporting coolers full of collected samples.<br>12. Slips/ Trips/ Falls | 1. Wear proper PPE (safety glasses, nitrile gloves, safety shield, Tyvek)<br>2. Ensure sample bottle lids are secure before use and after sample collection<br>3. Organize lanyard to keep out of the way as much as possible / Mark potential tripping hazards with caution tape or safety cones<br>9. Do not over-tighten bottle caps / Handle bottles safely to prevent breakage / Wrap glass bottles in bubble wrap, if possible<br>10. Use proper lifting techniques / Use wheeled transport / Seek assistance if coolers weight exceeds 50lbs. / Minimize distance to vehicle.<br>11. Have unobstructed path to vehicle or collection point / Follow good housekeeping procedures / Do not lift/walk with coolers that are too heavy/difficult to lift |
| 8. Retrieval of bailer | 9. Repetitive motion injury (pulled arm/back muscles)<br>10. Dehydration | 9. Take breaks while retrieving bailer out of the well/ Use a mechanical device to raise bailer out of well/ Rotate employees (take turns conducting the manual labor portion)<br>10. Take breaks and drink water. |
| 9. Pack-up equipment | 2. Back strain when removing or lifting heavy equipment | 2. Use proper lifting technique / Use wheeled transport for heavy equipment |
| 10. Replace well cap and lock | 3. Scrape fingers/hand<br>4. Strain wrist/bruise palm | 3. Wear proper PPE (leather gloves)<br>4. Using hammer, tap the end of the well cap to tighten grip |
| 11. Replace well cover | 4. Scrape knuckles/hand<br>5. Strain write/bruise palm.<br>6. Pinch fingers or hand | 4. Wear proper PPE (leather gloves)<br>5. Using hammer, tap the end of the wrench to tighten the grip of the bolts.<br>6. Wear proper PPE (leather gloves) |
| 12. Place used PPE in designated disposal drum | 3. Pressure build-up inside drum<br>4. Pinch hazard | 3. Remove cap from bung hole in drum to relieve pressure.<br>4. Wear proper PPE (leather gloves)<br>5. Product drums may require additional spill protection/electrical grounding, check local regulations |
| 13. Decontaminate equipment | 4. Splashing water/soap from decontamination<br>5. Contact with potentially contaminated groundwater through dermal exposure. | 4. Wear proper PPE (safety glasses)<br>5. Wear proper PPE (safety glasses, dermal protection) |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 14. All activities | 124. Slips/ Trips/ Falls<br>125. Hand injuries, cuts, or lacerations during manual handling of materials<br>126. Foot injuries<br>127. Back injuries<br>128. Traffic<br>129. Wildlife: Stray dogs, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.)<br>130. High Noise levels<br>131. Overhead hazards<br>132. Heat Stress/ Cold Stress<br>133. Eye Injuries | 131. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards.<br>132. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery, or dirty objects before handling / Wear leather/ cut-resistant gloves.<br>133. Wear Langan approved safety shoes.<br>134. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible.<br>135. Wear high visibility clothing & vest / Use cones or signs to designate work area.<br>136. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed.<br>137. Wear hearing protection<br>138. Wear hard hat / Avoid areas where overhead hazards exist.<br>139. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress.<br>140. |---|---|---|
| 85. Transport equipment to work site | 54. Back injuries<br>55. Slips/Trips/Falls<br>56. Traffic<br>57. Hand injuries | 39. Use proper lifting techniques/ Use wheeled transport/ Get assistance when need with moving equipment/ Minimize distance from vehicle<br>40. Minimize distance from vehicle/ Have unobstructed pathway to vehicle and collection points/ Mark tripping hazards with spray paint, cones, or caution tape/ Observe good housekeeping procedures.<br>41. Wear proper PPE (High Visibility vest and clothing)/ Exercise caution (stay alert-stay alive)<br>42. Wear proper PPE (leather gloves)/ Keep finger and hands clear of pinch points. |
| 86. Mark area for drilling | 44. Slips/Trips/Falls | 42. Minimize distance from vehicle/ Have unobstructed pathway to vehicle and collection points/ Mark tripping hazards with spray paint, cones, or caution tape/ Observe good housekeeping procedures |
| 87. Drill sampling points with hammer drill | 30. Eye injuries<br>31. Dust exposure<br>32. Hand injuries<br>33. Catch items (clothing)<br>34. Electric shock<br>35. Chemical atmosphere hazard (vapor)<br>36. Slips/Trips/Falls | 16. Wear proper PPE (safety glasses)<br>17. Wear proper PPE (dust mask)<br>18. Wear proper PPE (leather gloves)/ Keep hands and fingers out of pinch points/ Avoid drill catching on ground and twisting wrist or hand/ Release drill grip if drill becomes caught/ Ensure drill is unplugged prior to inserting bit.<br>19. Tie up or tuck-in all loose clothing/ Maintain distance from drill.<br>20. Inspect power cable for cuts or nicks before use/ Use GFCI outlet on power cord/ Do not use in wet conditions.<br>21. Monitor air, vapors with Photo-ionization detector (PID) |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| | | 22. Minimize distance from vehicle/ Have unobstructed pathway to vehicle and collection points/ Mark tripping hazards with spray paint, cones, or caution tape/ Observe good housekeeping procedures |
| 88. Measure vapor content and depth to bottom of hole | 1. Chemical atmosphere hazard (vapors) | 1. Monitor air, vapors with Photo-ionization detector (PID)/ Keep face away from opening of hole while collecting measurements |
| 89. Set-up of shroud and sampling canister system | 1. Hand injuries<br>2. Chemical atmosphere hazard (vapors)<br>3. Slips/Trips/Falls | 1. Wear proper PPE (leather gloves, nitrile gloves)/ Keep fingers away from pinch points when installing pump/ Do not use open blades, use tubing cutter<br>2. Monitor air, vapors with Photo-ionization detector (PID)/ Keep face away from opening of hole while collecting measurements<br>3. Minimize distance from vehicle/ Have unobstructed pathway to vehicle and collection points/ Mark tripping hazards with spray paint, cones, or caution tape/ Observe good housekeeping procedures |
| 90. Purge soil gas | 1. Chemical atmosphere hazard (vapors) | 1. Monitor air, vapors with Photo-ionization detector (PID)/ Keep face away from exhaust port of pump |
| 91. Sample collection (opening and closing valves) | 1. Hand injuries | 1. Wear proper PPE (leather gloves)/ Keep fingers away from pinch points |
| 92. Sealing sampling holes | 1. Back injuries<br>2. Concrete dust<br>3. Eye injuries | 1. Use proper lifting techniques for lifting of cement bags<br>2. Wear proper PPE (dust mask)<br>3. Wear proper PPE ( safety glasses) |
| 93. All activities | 134. Slips/ Trips/ Falls<br>135. Hand injuries, cuts, or lacerations during manual handling of materials<br>136. Foot injuries<br>137. Back injuries<br>138. Traffic<br>139. Wildlife: Stray animals, Mice/rats, Vectors (i.e., mosquitoes, bees, etc.)<br>140. High Noise levels<br>141. Overhead hazards<br>142. Heat or cold injuries<br>143. Eye Injuries | 141. Be aware of potential trip hazards/ Follow good housekeeping procedures/ Mark significant hazards.<br>142. Inspect for jagged/sharp edges, and rough or slippery surfaces/ Keep fingers away from pinch points/ Wipe off greasy, wet, slippery, or dirty objects before handling/ Wear leather/ cut-resistant gloves. Wear proper PPE (Langan approved safety shoes)<br>143. Use proper lifting techniques/ Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift/ Obtain assistance when possible.<br>144. Wear high visibility clothing & vest/ Use cones or signs to designate work area.<br>145. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray animals/ Carry and use animal repellant when needed/ Use bug spray when needed.<br>146. Wear hearing protection<br>147. Wear hard hat/ Avoid areas where overhead hazards exist.<br>148. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather)/ Drink plenty of fluids to avoid dehydration/ Takes breaks as necessary to avoid heat/cold stress.<br>149. Wear safety glasses |

**Job Safety Analysis (JSA)**
**Health and Safety**

**JSA Title:** Geotechnical Drilling
**JSA Number:** JSA014-01

**A Job Safety Analysis (JSA) must identify all job steps required to complete the task, the potential hazards employees could be exposed to while performing the job step and the preventative/corrective actions required to reduce/mitigate the identified potential hazards. Employees must certify that they have either prepared the JSA or have reviewed the JSA and are aware of the potential hazards associated with this task and will follow the provided preventive/corrective actions. Prior to the start of any work "TAKE 5" and conduct a Last Minute Risk Assessment.**

S – ***Stop,*** *what has changed?*
T – ***Think*** *about the task*
E – ***Evaluate*** *potential hazards*
P – ***Plan*** *safe approach*
S - ***Start*** *task / **Stop** & regroup*

| PERSONAL PROTECTIVE EQUIPMENT (Required or to be worn as needed): | | | | |
|---|---|---|---|---|
| ☒ Safety Shoes | ☒ Long Sleeves | ☒ Safety Vest (Class 2) | ☒ Hard Hat | ☒ Hearing Protection |
| ☒ Safety Glasses | ☐ Safety Goggles | ☒ Face Shield | ☒ Nitrile Gloves | ☐ PVC Gloves |
| ☒ Leather Gloves | ☐ Cut Resist. Gloves | ☐ Fall Protection | ☐ Fire Resistant Clothing | ☐ Rubber Boots |
| ☐ Insect/Animal Repellent | ☐ Ivy Blocker/Cleaner | ☐ Traffic Cones/Signs | ☐ Life Vest/Jacket | |
| ☒ Other: NomeX (as needed) | | | | |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 120. Transport equipment to work area | 77. Back Strain<br>78. Slips/ Trips/ Falls<br>79. Traffic<br>80. Cuts/abrasions from equipment<br>81. Contusions from dropped equipment | 33. Use proper lifting techniques / Use wheeled transport<br>34. Minimize distance to work area / Have unobstructed path to work area / Follow good housekeeping procedures<br>35. Wear proper PPE (high visibility vest or clothing)<br>36. Wear proper PPE (leather gloves, long sleeves)<br>37. Wear proper PPE (safety shoes) |
| 121. Set-up HSA/SPT rig | 58. Slips/ Trips/ Falls<br>59. Pinch Hazards<br>60. High noise levels<br>61. Clothing entanglement<br>62. Electrocution/falling equipment and debris from raising HSA/SPT rig mast<br>63. Carbon monoxide poisoning<br>64. HSA/SPT rig roll-over<br>65. HSA/SPT rig movement | 23. Be aware of potential trip hazards / Follow good housekeeping procedures / Mark significant below-grade hazards (i.e. holes, trenches) with safety cones or spray paint<br>24. Wear proper PPE (leather gloves)<br>25. Wear proper PPE (hearing protection)<br>26. Wear proper attire for HSA/SPT rig (no loose clothing, strings, etc.)<br>27. Wear proper PPE (hard hats) / Be aware of locations at all times / Look up, down and around before raising mast / Check HSA/SPT drill rig mast for loose objects/debris before raising<br>28. Stand upwind of rig engine<br>29. Do not move rig with mast raised / Set stabilizers prior to raising mast / Inspect work area / If area appears unstable, the boring locations should be moved.<br>30. All field personnel should stay clear of rig while moving / Use a spotter when backing up the rig |
| 122. Advance HSA/SPT rods, augers and casing below ground surface | 40. Strain wrist/bruise palm<br>41. Pinched fingers<br>42. Back strain | 18. Wear proper PPE (leather gloves) / Use proper technique for preparing rods / Use second person, if necessary<br>19. Wear proper PPE (leather gloves) |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| 123. Advance HSA/SPT rods, augers and casing below ground surface (cont'd) | 43. Clothing entanglement<br>44. Carbon monoxide poisoning<br>45. Bruised/Broken toes/feet<br>46. High noise levels | 20. Use proper lifting techniques / Obtain assistance if needed<br>21. Wear proper attire for HSA/SPT rig (no loose clothing, strings, etc.)<br>22. Stand upwind of the rig<br>23. Wear proper PPE (safety shoes)<br>24. Wear proper PPE (hearing protection) |
| 124. Remove and open split spoon | 28. Pinched fingers<br>29. Cuts/lacerations<br>30. Skin contact with contaminated soil and groundwater | 1. Wear proper PPE (nitrile and leather gloves)<br>2. Wear proper PPE (leather gloves)<br>3. Wear proper PPE (nitrile gloves, safety glasses) |
| 125. Repeat steps 3 and 4 until desired depth is reached | 5. See steps 3 and 4 | 1. See steps 3 and 4 |
| 126. Remove HSA/SPT rods, augers and casing and place in storage rack | 1. Clothing entanglement<br>2. Back strain<br>3. Pinched fingers<br>4. Carbon monoxide poisoning<br>5. High noise levels | 1. Wear proper attire for HSA/SPT rig (no loose clothing, strings, etc.)<br>2. Use proper lifting techniques / Obtain assistance if needed<br>3. Wear proper PPE (leather gloves)<br>4. Stand upwind of rig engine<br>5. Wear proper PPE (hearing protection) |
| 127. Tremie-grout borehole with a cement-bentonite grout mixture | 1. Splash cement/bentonite grout on face/eyes<br>2. Back strain<br>3. Pinched fingers | 1. Wear proper PPE (safety glasses)<br>2. Use proper lifting techniques / Obtain assistance if needed<br>3. Wear proper PPE (nitrile gloves, leather gloves) |
| 128. Decontaminate equipment | 1. Contact with potentially impacted material<br>2. Contact with sharp pieces of equipment | 1. Wear proper PPE (safety glasses, nitrile gloves)<br>2. Wear proper PPE (leather gloves) |
| 129. Patch soil boring location to return to pre-existing conditions (i.e. concrete, asphalt, grass) | 1. Cuts/lacerations<br>2. Splashed concrete on face/eyes<br>3. Hammer fingers/hands when patching asphalt | 1. Wear proper PPE (leather gloves) / Use scissors for cutting<br>2. Use proper PPE (safety glasses)<br>3. Be aware of hands/fingers during hammering / Wear proper PPE (leather gloves) |
| 130. All activities | 186. Slips/ Trips/ Falls<br>187. Hand injuries, cuts or lacerations during manual handling of materials<br>188. Foot injuries<br>189. Back injuries<br>190. Traffic<br>191. Wildlife: Stray dogs, Mice/rats, Vectors (i.e. mosquitoes, bees, etc.)<br>192. High Noise levels<br>193. Overhead hazards<br>194. Heat Stress/ Cold Stress<br>195. Eye Injuries | 192. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards<br>193. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery or dirty objects before handling / Wear leather/ cut-resistant gloves<br>194. Wear Langan approved safety shoes<br>195. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible<br>196. Wear high visibility clothing & vest / Use cones or signs to designate work area<br>197. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed<br>198. Wear hearing protection<br>199. Wear hard hat / Avoid areas were overhead hazards exist. |

| JOB STEPS | POTENTIAL HAZARDS | PREVENTATIVE / CORRECTIVE ACTION |
|---|---|---|
| | | 200. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress<br>201. Wear safety glasses |

# 1 Purpose and Scope

## 1.1 Document Overview

New York City Department of Parks and Recreation (DPR) is submitting this Supplemental Engineering Report ("the Report") in support of its updated application package for the Ferry Point Park East 6NYCRR Part 360 Solid Waste Management Permit ("the 2005 Permit"), No. 2-6006-00014/00013.

This Report presents the studies, modeling, investigations, and design work that were performed to resolve outstanding comments that have been received by DPR since the April 8, 2009, Notice of Incomplete Application and the November 25, 2009, permit application submittal to the New York State Department of Environmental Conservation (NYSDEC).

This Report and the supporting documentation provide sufficient data and analysis to demonstrate how outstanding comments and requests have been addressed and complete the permit application.

## 1.2 Document Organization

This report is organized as follows:

- Section 2 – Presents the history and scope of the project, and past permitting benchmark dates,
- Section 3 – Provides construction status and a permit compliance summary,
- Section 4 – Discusses each previously unresolved NYSDEC issue,
- Appendices – Provide supporting documentation for the additional studies, modeling, and investigations for the Site that were completed at the request of NYSDEC.

# 2 Introduction

## 2.1 Project History

Ferry Point Park East in the Bronx (the "Site") is a former landfill that is bounded by the Bronx-Whitestone Bridge and Hutchinson River Parkway to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south.

In the late 1990s, the New York City Department of Parks & Recreation (DPR) entered into a license agreement with Ferry Point Partners, LLC (FPP) to develop, construct, and operate a new public recreation facility (the "Project") at the Site. The new facility would include a golf course, a Community Park, a waterfront park, and related facilities. At that time all required reviews for the Project were completed under the City Environmental Quality Review (CEQR), State Environmental Quality Review Act (SEQRA), and the City's Uniform Land Use Review Procedure (ULURP).

On July 17, 2000, NYSDEC issued a Part 360 Solid Waste Management Permit (No. 2-6006-00014-000110) (the "2000 Permit") jointly to FPP and DPR (collectively, the "Historic Permittee") for a non-specific "facility" under Part 360-1.9(b) at the Site. The 2000 Permit allowed the Historic Permittee to import and place a total of 1,000,000 cubic yards (CY) of fill necessary to construct the golf course on the Site. In February 2002 and November 2005, the Part 360 Permit was modified to allow additional fill volume and changes in design features. On November 18, 2005, NYSDEC issued the modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013) to place a total of 2,543,729 CY of in-place fill on the Site. This action was followed by a December 27, 2005, revision (No. 2-6006-00014/00013) that amended the total in-place fill volume to 2,370,000 CY (the "2005 Permit").

In 2007, DPR terminated the license agreement with FPP and took over Site development responsibilities, including redevelopment of the Community Park and construction of the waterfront park and golf course portions of the Site.

## 2.2 Project Scope

Consistent with the 2005 Permit, the project scope includes the construction of three major elements (a golf course, Community Park, and waterfront park) over the 222-acre Site (see Figure 2-1) as follows:

- An 18-hole golf course with practice facility, driving range, clubhouse, maintenance facility, irrigation lake, stormwater retention ponds, and a parking lot (192.5 acres);
- A passive recreation waterfront park with walkways and a comfort station (19.5 acres); and
- A Community Park with baseball fields, basketball court, walkways, comfort station, and landscaped stormwater retention area (10 acres).

## 2.3 Permitting Benchmarks

The following bullets chronicle significant permit-related correspondence and actions since the 2005 Permit was issued:

- **July 25, 2008:** A permit renewal application package to the 2005 Permit was submitted by DPR. This submittal requested a modification of the 2005 Permit to allow the use of dredge and processed dredge material (PDM) as fill and the barge delivery of such fill material to the Site.
- **October 24, 2008:** NYSDEC issued a Notice of Incomplete Application and comments to the July 25, 2008 submittal.
- **December 2, 2008:** NYSDEC issued a letter to advise DPR that the 2005 Part 360 Permit (with the corresponding November 30, 2008, expiration date) remains in full force and effect until NYSDEC approves the permit renewal application, as per Section 401(2) of the State Administrative Procedure Act (SAPA). See Appendix A for a copy of the SAPA letter.
- **December 26, 2008:** A response to NYSDEC's comments of October 24, 2008 was submitted by DPR with a supplemental permit application package to the 2005 Permit.
- **April 8, 2009:** NYSDEC issued comments to the December 26, 2008, permit application submittal.
- **April 9, 2009:** DPR withdrew its request for a permit modification to allow the use of PDM as fill.
- **November 25, 2009:** A response to NYSDEC's comments of April 8, 2009, was submitted by DPR with a second supplemental permit application package to the 2005 Permit. This submittal withdrew the request to allow the use of dredge material and PDM as fill and the barge delivery of such fill material

to the Site. This submittal also proposed a design modification for a Site-wide active landfill gas control system. The 2005 Permit included passive venting systems for the Site, with active systems proposed only in enclosed structures.

- **June 25, 2010:** NYSDEC issued a Notice of Incomplete Application and comments on the November 25, 2009, permit application submittal.

- **August 6, 2010:** NYSDEC issued additional comments on the November 25, 2009, permit application submittal.

- **September 29, 2010:** A response to NYSDEC's comments of June 25 and August 6, 2010, was submitted by DPR with a third supplemental permit application package for the 2005 Permit. This submittal withdrew the proposed design modification of a Site-wide active landfill gas control system and proposed a system consistent with the 2005 Permit.

- **October 7, 2010:** A supplemental response to NYSDEC's comments of June 25 and August 6, 2010, was submitted by DPR to accompany the September 29, 2010, permit renewal application submittal.

**Figure 2-1 Ferry Point Park Site Layout**

# 3 Project Status

## 3.1 Construction Status

Construction activities are proceeding with the following scheduled milestones.

### Community Park

- **As of December 31, 2011:** Stormwater retention pond, passive landfill gas (LFG) vents, and recreation facilities were complete.
- **December 31, 2014:** Comfort station completion is anticipated.

### Golf Course

- **As of May 17, 2012:** Construction of the golf course is 73% complete.
- **December 31, 2014:** Golf course completion is anticipated, and opens with a temporary clubhouse.
- **December 31, 2017:** Completion of the permanent clubhouse is anticipated.

### Waterfront Park

- **November 30, 2012:** Final design completion is anticipated.
- **December 31, 2015:** Construction completion is anticipated.

## 3.2 Permit Compliance Monitoring and Reporting since November 18, 2005

In accordance with the 2005 Permit and as required under Special Condition 25, an Independent Environmental Monitor (IEM) has been retained by the Permittee (DPR) to provide environmental oversight of all activities authorized by the permit. The 2005 Permit states that the IEM may be an individual or engineering firm, and must be or provide a New York State-licensed professional engineer. The firm of Woodard & Curran is currently performing the IEM responsibilities for the project.

The IEM monitoring is conducted daily and reported to NYSDEC on a bi-weekly basis. These reports are available at the DPR Bronx Borough Headquarters (Ranaqua) document repository and are part of the public record. The address of the repository is 1 Bronx River Parkway, Bronx, NY 10462; telephone: (718) 430-1800. As these reports continue to be issued, DPR responds to and resolves issues as they develop. An email received from NYSDEC on Thursday, May 24, 2012 (see Appendix B), verified that there is "*no outstanding enforcement action"* for the Site.

# 4 Supplemental Engineering Work

## 4.1 Fill Volumes

DPR is conforming to the fill volume conditions of the 2005 Permit. Under Special Condition No. 9, a total of 2,370,000 CY of in-place fill is allowed to be imported to the Site by truck: 2,120,000 CY of shaping fill material is being imported and placed on-site for the base layer, and approximately, 250,000 CY of cover fill material is being imported to be placed on top of the base layer. The imported fill materials are being used to attain the final design grades and contours of the golf course.

In accordance with Special Condition No. 10 of the 2005 Permit, imported fill brought to the Site is tracked according to "in-truck" volumes and reported by the Site's IEM to NYSDEC. A compaction factor is used to calculate the difference between the volume of in-truck fill and the volume of compacted in-place fill that achieves the design grades and contours of the Site. A compaction factor of 41.7% is being used in the IEM reports to calculate the in-place fill volume.

As of April 20, 2012, the IEM reported that a total of 1,525,436 CY of in-place fill volume has been reported at the Site since October 18, 2002. This volume includes 1,450,858 CY of in-place shaping material and 74,578 CY of in-place cover material.

During 2010, fill material from one particular source was brought on-site and placed in seven different stockpiles. The material was believed to be in conformance with permit conditions. However, it was found that the material did not meet the requirements of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. On January 10, 2011, DPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to this fill material. In accordance with the Consent Order, NYSDEC and DPR "*agreed … the material specified in this Order as shaping material on this Site, provided that it is covered by asphalt*." The IEM reported that 64,230 CY of in-truck volume was designated as shaping material under this Order. This fill material was covered by asphalt in 2012.

## 4.2 Fill Material Chemical Criteria

In light of evolving soil criteria and standards for public use, NYSDEC has provided comments and other clarifications to DPR with respect to the chemical parameters for each soil layer. DPR has complied with the 2005 Permit require-

ments and the additional clarifications provided by NYSDEC, which has been verified by the IEM.

This section reviews DPR's compliance with the 2005 Permit conditions and NYSDEC clarifications. In addition, it provides responses to NYSDEC comments related to imported fill material.

### 4.2.1 Fill Material Characterization

As required under the 2005 Permit, all fill material imported to the Site is analyzed for the chemical contaminants identified in Special Conditions 15(a) through 15(d). The additional criteria set forth in NYSDEC correspondence since the 2005 Permit, described below must also be met. Only those soils that satisfy the requirements of these criteria are allowed to be used on the Site.

#### 4.2.1.1 Shaping Layer Chemical Criteria

Fill material imported to the Site and used for the shaping layer is analyzed for the following parameters, per Special Condition 15(c) of the 2005 Permit:

*"The shaping layer must meet the following chemical limits:*

*i. Total carcinogenic SVOC levels must be less than 3ppm if any one of the carcinogenic SVOCs exceed Technical and Administrative Guidance Memorandum (TAGM) 4046. The following are the list of carcinogenic SVOCs that are subject to this 3ppm limit: Benzo(a)pyrene, Dibenzo(a,h) anthracene, Benzo(a)anthracene, Benzo(b)fluoranthene, Indeno(1,2,3-cd)pyrene, Benzo(k)fluoranthene, and Chrysene.*

*ii. Total SVOCs must be less than 500ppm*

*iii. Metals*

- *Arsenic less than 28ppm;*
- *Barium less than 2,000ppm;*
- *Cadmium less than 20ppm;*
- *Chromium less than 1,000ppm;*
- *Copper less than 1,000ppm;*
- *Lead less than 400ppm;*
- *Mercury less than 0.57ppm;*
- *Selenium less than 11ppm;*
- *Silver less than 100ppm*

*iv. Asbestos for all layers must be 0.5% or less*

*v. Total sulfur for all layers must be 0.5% or less*

*vi. Total PCBs less than 10ppm*

*vii. Total Pesticides less than 10ppm*

*viii. VOCs (all individual analytes less than TAGM 4046)"*

In a letter dated October 25, 2006 (see Appendix C.1), NYSDEC provided a clarification of Special Condition 15(c)(i) adding that a carcinogenic SVOC limit of 10 ppm or lower is allowable from individual fill material sources, provided that a weighted average of equal or less than 3 ppm is achieved by the end of the permit.

A formula for the weighted average was included in the correspondence for use by the IEM.

#### 4.2.1.2 Cover Layer Chemical Criteria

Fill material imported to the Site and used for the cover layer is subject to the following requirements, per Special Condition 15(b) of the 2005 Permit:

*"In order for topsoil material to be used on Site for the cover layer, it must be sampled prior to acceptance and after the importation of each additional 2,000 cubic yards (in truck volumes). Each soil sample is to be analyzed for the entire analyte list in the NYSDEC Technical and Administrative Guidance Memorandum (TAGM) 4046, total volatile organic compounds (VOCs), total semi-volatile organic compounds (SVOCs), pesticides and herbicides, polychlorinated biphenyls (PCBs), and metals (including Resource Conservation and Recovery Act (RCRA) metals)."*

As required by the 2005 Permit, the cover layer must meet the following chemical limits:

- TAGM 4046 Table 1 – Volatile Organic Compounds (VOCs)
- TAGM 4046 Table 2 – Semi-Volatile Organic Compounds (SVOCs)
- TAGM 4046 Table 3 – Pesticides/Herbicides and Polychlorinated Biphenyls (PCBs)
- TAGM 4046 Table 4 – Metals
- Total Asbestos 0.5% or less
- Total Sulfur 0.5% or less

The following additional criteria were directed in NYSDEC correspondence since the 2005 Permit. DPR has been following NYSDEC's directives since receipt of each one.

- **April 30, 2009** – Directs DPR not to accept or place on the Site any cover layer materials with arsenic concentrations greater than 16 ppm or lead concentrations greater than 400 ppm.
- **July 28, 2009** – Provides a table to DPR listing modified heavy metal chemical limits for the cover layer at the Site.
- **September 25, 2009** - Revises and clarifies the chromium chemical limits for the cover layer previously presented in the July 28, 2009, letter.

A complete list of the 2005 Permit criteria is provided along with the additional criteria correspondence in Appendix C.2.

#### 4.2.1.3 Demarcation Layer Requirements

Special Condition 15(d) of the 2005 Permit requires the following:

*"The final placement (including top soil), location, thickness, and detailed chemical limits of the final cover layers on the Site, including the community park and waterfront park, are subject to the specifications, directions and requirements determined by the NYS Department of Health (NYSDOH) to be applicable. It is the responsibility of the Permittees to obtain a written determination from NYSDOH. The Permittees must provide the Department with a copy of NYSDOH's determination. No cover layer material may be placed on the Site, until the Department acknowledges receipt of NYSDOH's determination."*

As required by Special Condition 15(d), DPR obtained such written determination from NYSDOH in a letter dated, August 2, 2006 (see Appendix C.3).

In accordance with this communication, two different recreational classifications, active and passive, were proposed by DPR for incorporation into the overall design compliance objectives for the Site. This letter also included that a *"demarcation barrier be used to divide the final cover fill from the existing landfill capping material."* The demarcation barrier (layer) at Ferry Point Park East provides a visual warning that will be easily recognizable during future excavation work beneath the cover layer. (Refer to Section 4.2.1.4 for further discussion of the demarcation layer.)

In a letter dated July 9, 2009 (see Appendix C.3), DPR requested a further review of the heavy metal chemical criteria for the cover layer at Ferry Point Park East. A response received from NYSDEC on July 28, 2009, provided additional clarification regarding what are considered active and passive recreational areas. As per this letter:

Active Recreation – *"…all other areas that are not covered with a building or other impermeable cover system… are deemed active recreational areas."*

In compliance with this active recreational determination, DPR installed 2 feet of cover material and a demarcation layer throughout the Community Park.

Passive Recreation – *"…the golf course is deemed a "passive recreational area" and is required to have a one foot thick cover layer over a demarcation layer."*

Following this directive, DPR requested clarification from NYSDEC regarding the demarcation layer requirement for the extent of the golf course. The request for clarification was based on the need for further specificity regarding the use of a demarcation layer on the golf course.

In response, NYSDEC and NYSDOH reviewed a summary of the analytical data for all the shaping material imported to the Site to date. Upon review of the data set, confirmatory analytical sampling of the in-place shaping material was requested by NYSDEC and NYSDOH. DPR conducted test-pit sampling and analysis under an approved work plan and submitted the data to NYSDEC on February 16, 2011.

In their letter dated March 9, 2011, NYSDEC stated that "*NYSDOH reviewed the shaping layer test pit data and determined that it confirmed existing shaping layer data."* NYSDEC and NYSDOH agreed that a demarcation layer would not be required at areas of the golf course having a fill thickness of 5 or more feet of combined shaping and cover layer materials. Communications related to this determination are provided in Appendix C.3.

#### 4.2.1.4 Demarcation Layer Plan

At the Ferry Point East Site, "demarcation layer" means a brightly colored, permeable plastic material placed beneath the Site's final cover layer that is easily recognizable during an excavation. The request was made for the protection of Site workers during any future excavation work beneath the cover layer.

The demarcation layer plan was based on a comparison of final design grades and the top of waste elevations extrapolated from soil boring data. Appendix C.4 provides the Demarcation Layer Plan for the Site. Field verification that demarcation requirements are being met is performed continuously and routinely reported by the IEM to confirm permit compliance.

### 4.2.2 Dioxin and Furan Analytical Methods

In a letter dated May 26, 2011 (see Appendix C.5), DPR requested confirmation that the use of United States Environmental Protection Agency (EPA) Analytical Method 625/8270 is an acceptable alternative method for the analysis of dioxin and furan constituents. On April 12, 2011, NYSDEC provided verbal confirmation to DPR that this method may be used. Accordingly, EPA Analytical Method 625/8270 is now being used where appropriate for the analysis of dioxin and furan constituents on sources of incoming fill material.

## 4.3 Final Cover Material Physical Characteristics

In accordance with the 2005 Permit, and as written in the June 30, 2005, Engineering Report (TRC 2005), *"The upper portion of the cover layer will consist of topsoil and/or sand capping material in accordance with the Nicklaus Design Technical Specifications (see 2005 Fill Report) to support the growth of the golf course turf and the grassed areas of the adjacent parks*."

Special Condition 16 states that "*the major components (greens, contours, heights, and topsoil) shall meet the Nicklaus Design Technical Specification, as noted in … the 2005 Engineering Report.*

The golf course construction specifications are consistent with these regulatory requirements.

### 4.3.1 Site-wide Water Balance Model

In their August 6, 2010, letter of additional comments to the November 25, 2009, permit application submittal, NYSDEC requested DPR *"demonstrate that the soil to be used at the site as final cover material — not necessarily as the uppermost planting material — will have a sufficiently low coefficient of permeability and percentage of organic material to minimize the infiltration of water into the lower layers of material to the greatest extent practicable."*

In response to this request, DPR performed a site-wide water balance to predict post-construction infiltration rates. The EPA's Hydrologic Evaluation of Landfill Performance (HELP) computer model was used for this purpose.

As requested by NYSDEC, DPR used a modeling scenario that compared a typical one-foot thick soil landfill cover with the proposed Site cover material as designed.

Model results were presented to NYSDEC in a May 13, 2011, Memorandum (see Appendix D.1). The water balance accounted for impermeable areas of the Site, irrigation of the golf course, drainage system stormwater capture, and the lining of on-site ponds (for a specific discussion of Site ponds, see Section 4.3.1.2). Using a cover soil permeability of 14 inches per hour, the model results indicated that post-construction conditions would result in a reduction in the infiltration rate over the entire Site by approximately 9,700 gallons per day. This estimate effectively showed there will be a lower volume of water infiltrating through the surface of the Site following completion of construction.

A subsequent water balance memorandum was submitted by DPR to NYSDEC on August 10, 2011 (see Appendix D.2). These water balance results indicated that a higher cover soil permeability of 30 inches per hour would also result in a lower volume of water infiltrating through the surface of the Site following completion of construction. Prior to approving this subsequent request to use a cover soil permeability of 30 inches per hour, NYSDEC asked that DPR review and verify the adequacy of the Site's drainage capacity. The purpose of this review was to determine whether the Site's drainage system as designed would be adequate if lined ponds and a cover soil permeability of 30 inches per hour were incorporated into the Site design. A description of the pond liners and drainage capacity review are provided in Sections 4.3.1.2 and 4.3.1.3.

Based on the model results and the drainage capacity review discussed in Section 4.3.1.3, NYSDEC approved a maximum permeability of 30 inches per hour for cover material used at the Site. As cover material is imported to the Site, it is sampled and tested to confirm it meets the water balance (permeability) requirements approved by NYSDEC. The results of the permeability testing are provided in bi-weekly IEM reports.

In a letter dated January 26, 2012 (see Appendix D.3), NYSDEC clarified that the average percolation rate from all samples collected within one cover material stockpile can be used as the representative percolation rate of that stockpile. The average percolation rate *"is justified because the loading, unloading, transporting, stockpiling, and spreading of the cover material will provide a homogenous mixture of the sand"* (material) from the stockpile. *"…the sand will be tested every 2,000 CY per the permit requirements moving forward."*

#### 4.3.1.1 Pond Liner Designs

A single irrigation pond has already been constructed at the Site. The purpose of this pond is to collect and store stormwater runoff and reuse it later for irrigation and maintenance of the golf course vegetative cover. This pond is fully lined to maximize the retention of irrigation water. The irrigation pond design documents were included in the November 25, 2009, permit application package.

In addition, there are five smaller water quality ponds designed to provide active stormwater retention and limit the off-site migration of sediment. The geometry and grading (engineering design) of these ponds were also provided in the November 25, 2009, permit application package.

DPR considered various methods to meet NYSDEC's request of August 6, 2010, to minimize the infiltration of water through *"the lower layers of material to the maximum extent possible."* Based on this consideration, DPR is implementing a recommendation contained in the November 16, 2010, memorandum (see Appendix D.1) to line the five on-site water quality ponds to limit water exfiltration.

Supplemental drawings and specifications for the lining of these ponds are provided in Appendix D.4. The pond liner designs are consistent with the previously approved geometry and grading (engineering design) presented in the November 25, 2009, permit application package.

#### 4.3.1.2 Drainage Capacity Review

Following submittal of the Site-wide water balance and the decision to line the water quality ponds, a review of the Site's existing Stormwater Pollution Prevention Plan (SWPPP) (TRC 2009c) was performed by DPR.

NYSDEC requested this review to determine whether additional flow into the Site's drainage system (as a result of lining the water quality ponds and the higher permeability cover soil) would exceed the storm drainage system capacity.

The review indicated that additional flow to the drainage system would not exceed the previously permitted design discharge rates in the SWPPP. The review also concluded that the system's drainage capacity is adequate. The technical memorandum summarizing the drainage review was submitted to NYSDEC on October 18, 2011 (see Appendix D.5). In an October 21, 2011, email response (see Appendix D.5), NYSDEC indicated that they *"…conditionally approve cover*

*material at the FPP [Ferry Point Park] golf course having permeability up to 30 inches per hour."*

The conditional approval was based on a request for DPR to *"submit for approval an amendment to the Stormwater Pollution Prevention Plan (SWPPP) dated November 13, 2009, with plans and computations that reflect the partial lining of the stormwater basins."* DPR provided this in a technical memorandum to NYSDEC dated November 16, 2011 (see Appendix D.6, pond liner design in Appendix D.4). The memorandum presented a formal submittal of the pond liner design to NYSDEC and included excerpts of calculations from the November 13, 2009, SWPPP. This memorandum showed that the original calculations in the 2009 SWPPP remain adequate since they included conditions for lined ponds. An email approval of "*DPR's SWPPP Amendment"* was given by NYSDEC on December 2, 2011 (see Appendix D.6).

## 4.4 Landfill Gas Management

The Site's Landfill Gas (LFG) Management system is designed to prevent harmful effects on workers or recreational users of the Site. Therefore, and as requested by NYSDEC in their August 6, 2010, comments, landfill gas data gathered for the Site in 2009 and 2010 were used to model surface methane emissions, LFG generation rates, and the emissions of hazardous air pollutants (HAPs) across the Site. The data were also used to conduct a health impact analysis for users of the Site. Supporting documents on LFG evaluations and design are included in Appendices E and F of this report.

### 4.4.1 LFG Emission Generation Rates, Hazardous Air Pollutant Concentrations, and Health Impacts Analysis

LFG generation rates for the Site were first estimated in 1999 (AKRF 1999) using the EPA's 1995 "Compilation of Air Pollutant Emission Factors." The generation rates were estimated using a newer mathematical model in 2010, EPA's LandGEM model Version 3.02 (see Appendix E.1). The 2010 LandGEM model results predicted LFG generation rates similar to those of the 1999 modeling. The 1999 and 2010 analyses both indicate that LFG emissions and generation rates are consistent with a municipal solid waste landfill of the age of the Ferry Point Site.

The 2010 analyses also predicted the emissions of HAPs and other air pollutants from the Ferry Point Site. The results predicted that pollutant concentrations in the breathing zones are well below the applicable annual guideline concentrations (AGCs) and short-term guideline concentrations (SGCs). This indicates that there are no expected health impacts on users of the golf course due to these emissions.

The results of these efforts are presented in the Ferry Point Landfill Gas Report (EEEPC 2010, Appendix E.1). A supplemental letter of December 17, 2010, presented in Appendix E.2, provided follow-up responses to NYSDEC comments on the Landfill Gas Report.

In response to an additional comment from NYSDEC received on August 6, 2010, DPR performed emissions monitoring at 12 passive vertical vents installed at Community Park. This monitoring was performed in June 2011.

The monitoring results were used to calculate the emission rates of LFG constituents from the passive vents. Hourly and annual emission rates were predicted. In a July 1, 2011, email, the NYSDEC review of these results concluded that *"there is no ambient air impacts due to the emissions from the twelve vents at the Community Park… which poses no health impact to the public using the park."* Therefore, DPR concludes that no further monitoring is necessary beyond routine maintenance of the 12 passive vents.

Appendix E.3 contains the sampling and analysis report for vent monitoring at Community Park, and the July 1, 2011, email from NYSDEC.

### 4.4.2 LFG Management System

#### 4.4.2.1 Sitewide Passive Venting System

The LFG management system as redesigned for the Site (since the November 25, 2009, permit application submittal) is an update of prior conceptual passive LFG designs and includes a passive system for the venting of LFG in all areas not covered by enclosed facilities. The primary goals for the design of the Site's LFG management system are to provide safe operating conditions and protect human health.

The proposed passive system is consistent with the plans presented in the 1999 EAS (AKRF 1999), the 2002 Technical Environmental Assessment (AKRF 2002), and the 2005 Engineering Reports (TRC 2005a, b) and was approved under the 2005 Part 360 Permit. It deviates from the 2009 permit renewal application prepared by TRC Engineers (TRC), which recommended an active system. An active system uses blowers or fans to extract gas through vents from the landfills subsurface, whereas a passive system uses vents without blowers or fans. Supplemental Site investigations and extraction testing performed by TRC Engineers at the Site in 2009 and 2010 were reviewed by Walsh Environmental Scientists and Engineers, LLC (Walsh) in 2010. Emissions modeling was also performed by EEEPC in 2010, as discussed in Section 4.4.1.

Based on these evaluations and modeling of Site conditions, a Landfill Gas Management Plan (LFGMP) was prepared (see Appendix F.1). The plan concluded that a passive venting system is sufficient to achieve safe operating conditions for users and workers of the golf course and parks. A description and details of the Site's LFG management system are presented in the LFGMP. The LFG management system as currently designed is consistent with the proposed venting system described in the 2005 Permit.

#### 4.4.2.2 LFG Management of Irrigation Lake and Water Quality Ponds

As described in Section 4.3.1.2, the design of the golf course includes one lake to be used for the collection and storage of rain water for irrigation, and five smaller

water quality ponds to provide active stormwater retention and limit the off-site migration of sediment. Design of the irrigation lake and water quality ponds includes the installation of impermeable liners to prevent exfiltration. The liner component impedes surface venting of LFG from the underlying soils.

The lined irrigation lake has been constructed in the northwestern area of the golf course. A gas transmission layer was constructed underneath the liner and is connected to perforated piping around the perimeter of the lake as shown on Contract Drawings H2.1, H2.2, and H2.13, which were submitted with the November 25, 2009, permit application. This perforated pipe will be used for the passive venting of LFG from beneath the liner of the irrigation lake.

Passive venting has been included in the design of all water quality ponds at the Site. Passive venting of the ponds includes a permeable gravel layer and perforated collection piping from areas underneath the ponds and exiting the top of vent stack above the breathing zone. Engineering drawings and technical specifications for the water quality pond liners and passive venting design are provided in Appendix D.5.

#### 4.4.2.3 LFG Management for Enclosed Structures

Due to its potentially explosive nature, LFG shall not be allowed to accumulate within any enclosed structure at the Site. To protect the occupants, an underslab vent system for each enclosed building shall be installed and continuously operated.

The LFGMP (see Appendix F.1) describes the active sub-slab depressurization systems (SSDS) that have been designed for the underslab of each enclosed building at the Site. These systems will have continuous explosive gas monitoring with local and remote alarm capabilities. The SSDS engineering drawings for the golf course facilities (maintenance building and comfort station) are provided in Appendix F.3. The Community Park comfort station design was provided in the November 25, 2009, permit application. The Waterfront Park comfort station has not been designed.

Maintenance of the SSDS and their monitoring equipment will be performed in accordance with the operations, monitoring, and maintenance (OM&M) program for the Site's Landfill Gas management system (see Section 4.4.4).

The design of any additional structures at the Site will be completed in accordance with New York City Department of Buildings requirements. The need for LFG mitigation systems for any future Site structures will be evaluated as part of their design.

#### 4.4.2.4 LFG Venting for Subsurface Utilities

Low-permeability soil/bentonite collars ("soil collars") will be installed for all utility trenches that contain permeable bedding in order to prevent the migration of LFG into enclosed buildings at the Site. The soil collars will be installed

around the water and sewer pipelines, within the trenches at the subsurface location where the pipeline crosses above the building foundation (the building line). Each soil collar will be passively vented as described in the LFGMP (see Appendix F.1) and as shown on the engineering design drawings in Appendix F.2.

Similarly, conduit seals will be used for electrical conduits that are installed in trenches using permeable bedding materials. The conduit seals will be installed at the building lines.

Other utility LFG controls include the underslab passive venting for the aboveground double-check valve (DCV) enclosure. The DCV enclosure is for the potable water supply line as it enters the golf course site. Detailed design drawings for the venting the DCV enclosures are provided in Appendix F.4.

The need for LFG venting for any future Site subsurface vaults will be evaluated as part of their design.

### 4.4.3 Landfill Gas Management Operations, Monitoring & Maintenance Program

The NYCRR Part 360 "Solid Waste Management Facilities" regulations, Section 2.17(f) concerning LFG, were used as guidance in developing the Site's LFG monitoring program. In accordance with this section: (1) the concentration of explosive gases must not exceed 25% of the lower explosive limit (LEL) in on-site and off-site structures; and (2) the concentration of explosive gases must not exceed the LEL at the property boundary.

Because of the planned future uses of the site as a golf course, banquet facility, and public park, the LFG monitoring plan provides a comprehensive program for future monitoring and maintenance at the Site, with specific contingency actions. Continuous LFG monitoring with local and remote alarm capabilities will occur in all enclosed Site buildings for the protection of occupants.

The LFG monitoring and maintenance (M&M) supervisor will be assigned responsibility for overseeing all Site LFG M&M activities, and will serve as the primary point of contact for DPR. The LFG M&M supervisor will be a DPR employee with the responsibility and authority to direct all OM&M work activities and maintain the necessary monitoring personnel for the required M&M activities.

OM&M for the Site's LFG management system will take place on an ongoing, routine schedule, with additional inspections to address maintenance concerns and potential alarm call-outs and to provide contingency monitoring and actions as needed. The OM&M plan for the Site is presented in Section 6 of the LFGMP (see Appendix F.1). This plan has also been incorporated by reference into the Post-Construction Custodial Plan (see Appendix I) for the Site.

## 4.5 Groundwater Characterization

Municipal solid waste (MSW) filling operations ceased at the Site in the 1960s, prior to the implementation of the comprehensive environmental regulations now in place, and a formal groundwater sampling program was not required at that time. Information on groundwater quality at a former landfill site such as Ferry Point Park East can be used to help evaluate existing groundwater conditions.

For the 2005 Permit application, the Site's history was reviewed and a geotechnical investigation was performed to evaluate the potential for adverse impacts on the Site's groundwater due to the placement of fill during construction of the golf course and parks.

A summary provided in the 2005 Engineering Report concluded *"that the placement of fill would not have an adverse impact on pre-development groundwater conditions at the site and that the proposed golf course construction would not result in an increased flow of contamination into the river through groundwater flow."* (TRC 2005a).

In their comments of June 25, 2010, NYSDEC asked DPR whether any new information was available regarding groundwater conditions at the Site, and if any new, relevant information was available, to verify the conclusions of the geotechnical portion of the 2005 Engineering Report (TRC 2005a).

Following several discussions with DPR, and because no prior sampling had been required, NYSDEC requested that DPR undertake a groundwater sampling program and develop a reference point for background water quality conditions at the Site.

To comply with this request, DPR prepared written field procedures for new well installations, well development, and groundwater sampling (see Appendix G.1). The field procedures were submitted to, and approved by, NYSDEC prior to the start of the work effort. Prior to installation, the locations of the monitoring wells were approved by NYSDEC during a meeting held with DPR on September 22, 2011.

In February 2012, eleven new groundwater monitoring wells were installed across the Site to obtain information on current groundwater conditions. Design documents for the groundwater monitoring wells are included in Appendix G.2. An initial sampling event was completed in February 2012 and included the testing activities described below.

- **Groundwater Elevation Measurements:** Water depths were measured at the 11 groundwater monitoring wells. Two measurements were taken from each well within one hour each of high and low tides, starting at the shoreline and moving inland.

- **Elutriate Testing:** One soil core sample per well was collected during well installation in order to perform elutriate analysis. Samples were selected from shaping material zones based on visual observation of the soil cores.

- **Groundwater Testing:** Groundwater samples were collected at each of the 11 wells and shipped for laboratory analysis.

- **Hydraulic Conductivity Testing:** In situ slug testing for hydraulic conductivity was completed at each of the 11 groundwater monitoring wells.

The initial groundwater monitoring data from February 2012 was submitted to NYSEC by email on March 28, 2012. This data is included in the report for the initial groundwater monitoring event (see Appendix G.5). At that time, DPR requested direction from NYSDEC concerning procedures for future sampling events. That is, should future sample collection be modified due to the high turbidity (>1,000 nephelometric turbidity units [NTUs]) observed in the initial samples.

A call was held with NYSDEC on May 8, 2012, to discuss the initial data and provide guidance on future monitoring (see Appendix G.3 for call minutes. Also during this call, NYSDEC directed DPR to perform inorganic analyses on both filtered and unfiltered samples collected during the next sampling event. If the next round of results is found to be in expected ranges, then future sampling events will utilize only filtered samples for inorganic analyses.

NYSDEC provided DPR with requirements for future groundwater monitoring in their FPP Groundwater Characterization/Monitoring Objective, on May 8, 2012 (see Appendix G.4). DPR will implement the groundwater monitoring program in accordance with the schedule and monitoring parameters requested by NYSDEC.

The schedule includes two additional quarterly sampling events, followed by approximately three semi-annual events (through completion of construction) and three post-construction annual sampling events. After the third annual sampling event, DPR may request to reduce the sampling frequency or cease the groundwater sampling program at the Site. Table 4-1 provides a schedule of the monitoring events that will be performed to complete this program and the parameters that will be analyzed for during each event.

Post-construction groundwater monitoring and groundwater monitoring well maintenance requirements are incorporated into the Post-Construction Custodial Care Plan for the Site (see Appendix I).

**Table 4-1 Groundwater Monitoring Program Schedule**

| Sampling Frequency | Approximate Dates of Sampling Events | Parameters |
|---|---|---|
| Quarterly | May 2012 | 6 NYCRR Subpart Part 360-2.11 Baseline Parameters; analysis for inorganic parameters on both filtered and unfiltered samples. |
| Quarterly | August 2012 | 6 NYCRR Subpart Part 360-2.11 Baseline Parameters; analysis for inorganic parameters on filtered samples only. |
| Bi-Annually (2x/year) | March 2013<br>September 2013<br>March 2014 | 6 NYCRR Subpart Part 360-2.11 Baseline Parameters; analysis for inorganic parameters on filtered samples only. |
| Annually | September 2014[1]<br>September 2015<br>September 2016 | 6 NYCRR Subpart Part 360-2.11 Routine Parameters; analysis for inorganic parameters on filtered samples only. |

Notes:
1. It is currently anticipated that golf course operations will begin in the fall of 2014, and that this event will be become the first of the three required annual sampling events.

## 4.6 Settlement Monitoring

### 4.6.1 Impacts on Short- and Long-Term Settlement Monitoring

Special Conditions 7 and 8 of the 2005 Permit set forth settlement monitoring requirements related to the placement of fill material across the Site. Monitoring must also conform to the recommendations provided in the Settlement Evaluation and Long-Term Monitoring Plan prepared by Langan Engineering and Environmental Services, Inc. (Langan 2005).

#### Short-Term Settlement Monitoring

The short-term settlement monitoring program began in December 2002 with the bi-weekly monitoring of seven test fills and six settlement plates located throughout the Site. Test fills consist of an engineered soil fill ranging from 10 to18 feet deep, generally located on-site in areas where significant thicknesses of fill are required. Settlement plates consist of a subsurface plate beneath a casing and a flush-mount monitoring access port, similar to a monitoring well. Settlement plates that are part of the short-term settlement monitoring program were generally located in areas of the site already at or close to final grade.

In their report, Langan recommended the following adjustments be made to the monitoring program during construction:

- Test fills that obstruct construction activities should be replaced with a settlement plate to be monitored near the location of the test fill.
- Settlement plates that need to be moved for construction purposes should be relocated to the same general area and monitored until long-term monitoring points have been installed.

Short-term settlement monitoring continues to be performed bi-weekly at the Site. Monitoring at several points has now been discontinued due to interference with ongoing construction. In an email correspondence dated May 1, 2012 (see Appendix H), NYSDEC informed DPR that these short-term monitoring locations do not need to be replaced as long as construction at the Site progresses.

As construction is concluded in each area of the Site, long-term monitoring plates will be installed as described below.

### Long-Term Settlement Monitoring

The revised Settlement Plate Locations Plan and a sketch that shows the additional monitoring point between golf course holes 6 and 7 (Appendix H) were approved by NYSDEC in an email dated May 1, 2012. The long-term settlement monitoring points will be installed as construction is concluded in each area. Upon installation, the long-term settlement plates will be monitored in accordance with the criteria set forth in Special Condition 8 of the 2005 Permit.

## 4.7 Post-Construction Custodial Care Plan

The Ferry Point Park East Post-Construction Custodial Care Plan (FPCCCP) has been prepared to meet the relevant requirements of NYDEC Part 360 Permit No 2-6006-00014/00013-0 (hereafter referred to as the "Permit") and all other applicable conditions as agreed upon between NYSDEC and DPR. This document provides for the post-construction custodial care requirements as they relate to the systems and components installed as part of Site-wide development specific to Ferry Point Park East. The Post-Construction Custodial Care Plan is provided in Appendix I.

As specified in Special Condition 39 of the 2005 Part 360 Permit, as built drawings and a written post-construction certification report for NYSDEC review and approval and certification by the IEM shall be prepared within 60 days of completion of the filling operation on the Site and construction of the earthwork portion of the Project. Therefore, no as-built drawings or post-construction certification report has been provided in this FPCCCP.

The scope of the FPCCCP is to provide the current monitoring and maintenance plans and descriptions for the components and systems within Ferry Point Park East as they will exist following the conclusion of construction at the Site. For each component or system, a brief overview is included within the scope of this document. In addition, an emergency personnel contact list is provided in the Site's Health and Safety Plan, which is referenced in the Post-Construction Custodial Care Plan.

# 1 Introduction

Ferry Point Park in the Bronx (the Site) is a former landfill that is bounded by the Bronx Whitestone Bridge and Hutchinson River Parkway to the west, Balcom, Miles, and Emerson avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south.

New York City Department of Parks (DPR) has initiated development of a community park, waterfront park, and a golf course on the Site. The boundaries of these portions on the Site are presented in Figure 1-1.

Ecology and Environment Engineering, P.C. (EEEPC) has prepared this Landfill Gas Management Plan (LFGMP) to evaluate landfill gas (LFG) conditions at the Site and to describe the systems proposed for long term LFG control at the Site.

The Ferry Point landfill ceased municipal waste (MSW) landfill operations in the 1960s, and has been closed for approximately 50 years. Over 12 years of LFG monitoring data is available for the Site, dating from 1999. Several field investigations and two gas emissions models have also been completed for the Site. This extensive supply of data forms the basis for the LFG management and monitoring methods proposed in this document.

## 1.1 Purpose and Scope

Environmental compliance for site development is being conducted in accordance with a November 2005 New York State Department of Environmental Conservation (NYSDEC) modified Part 360 Solid Waste Management Permit, for which DPR is the current permit holder.

The proposed LFG management and monitoring approach presented in this document will be incorporated into the Part 360 permit renewal application for the Site. A review of available documentation of previous activities relating to LFG monitoring, investigation, and control at the Site was performed and is presented as a preface to the design component of this plan.

The LFG design presented in this LFGMP supplements prior site conceptual LFG designs and proposes a Site-wide passive system for the venting of LFG in all areas not covered by enclosed facilities. The primary goal for the Site's LFG management has always been to ensure safe conditions and the protection of human health.

The proposed passive system is consistent with the plans presented in the 1999 EAS (AKRF 1999), the 2002 Technical Environmental Assessment (AKRF 2002), and the 2005 Engineering Reports (TRC 2005a, b), and approved under the current Part 360 Permit. It deviates from the 2009 permit renewal application prepared by TRC Engineers (TRC), which recommended an active system. A review of TRC Site investigations and extraction testing by Walsh Environmental Scientists and Engineers, LLC (Walsh) and emissions modeling performed by EEEPC in 2010 was used to conclude that a passive system is sufficient to achieve safe conditions for golf course users or workers.

Existing and proposed LFG control systems are listed in Table 1-1.

**Table 1-1 Existing and Proposed Landfill Gas Control Systems at the Site**

| Control System and Location | Type | Concept Included in 2005 Permit | To be Included in Renewed Permit? |
|---|---|---|---|
| **Golf Course** | | | |
| Irrigation Lake Venting System | Passive[1] | Yes | Yes |
| Water Quality Ponds Venting System | Passive | No | Yes |
| Sub-slab depressurization systems<br>1) One 12,000-square-foot maintenance facility<br>2) One 800-square-foot comfort station on the eastern area of the Site; and<br>3) One approximately 15,000-square-foot combined golf course, clubhouse, and banquet facility (not yet designed (NYD)) | <br>Active<br>Active<br>NYD | <br>Yes<br>Yes<br>Yes | <br>Yes<br>Yes<br>NYD |
| LFG passive venting for subsurface utility lines that enter enclosed facilities or travel offsite | Passive | Yes | Yes |
| Perimeter Vent Trench | Passive | Yes | Yes |
| Individual LFG Vents[2] | Passive | Yes | Yes |
| **Community Park** | | | |

Notes:

1. The Irrigation Lake venting system infrastructure allows for the connection of an active blower system as a potential contingency action. Section 6 discusses the conditions under which contingency actions may be taken.
2. See Section 5 for discussion of passive venting design and Appendix A for layout and details of passive gas vents.
3. NYD denotes "Not Yet Designed".

## 1.2 Document Organization

The remainder of this document is divided into four sections. The purpose of each section of this LFGMP is as follows:

- Section 2 - Landfill Gas Generation and Movement: Discusses gas generation rates and primary gas migratory pathways within landfills.

- Section 3 - Background: Discusses Site setting and project history, proposed facilities, sampling and monitoring data, and the evolution of the LFG collection system design.

- Section 4 - Evaluation of Existing Landfill Gas Data and LFG Exposure Assessment: Presents a Site conceptual model that includes an outline of the vertical and lateral extent of the LFG within the interior of the Site and at and along the Site perimeter, and an assessment of the risk from exposure to LFG both on site and at the Site perimeter. Provides a collective review of the data and draws conclusions on current and future site LFG conditions.

- Section 5 - Landfill Gas Management Approach: Discusses the basis for the proposed design. Provides design details of the proposed final LFG collection system.

# 2 Landfill Gas Generation and Movement

## 2.1 Landfill Gas Generation

LFG is generated in a landfill when bacteria in the landfill waste use anaerobic processes to break down organic material. LFG is composed primarily of methane and carbon dioxide. LFG also contains small amounts of nitrogen, oxygen, water vapor, sulfur, hydrogen, and other non-methane organic compounds (NMOCs). NMOCs comprise less than 1% of LFG and include ethane, propane, butanes, pentanes, and other carbon compounds.

The specific components and quantity of LFG depend on a number of factors, which include but are not limited to the following:

- Waste composition;
- Age of refuse;
- Moisture content; and
- Temperature.

### 2.1.1 Methane Generation

Methane concentrations in landfills can vary according to the season, with low concentrations of methane and high concentrations of carbon dioxide in the summer.

## 2.2 Landfill Gas Migration Pathways

Migration of LFG in the subsurface is influenced by several site-specific factors such as pressure and diffusion gradients, subsurface lithology and soil stratigraphy, and groundwater levels. The factors affecting LFG migration are discussed below.

### 2.2.1 Diffusion

LFG does not build up in a landfill in a uniform manner. As it builds up in the subsurface, it moves from areas of high concentration to areas of lower concentrations. Since gas concentrations are higher within the landfill than outside the landfill, LFG will tend to diffuse, or spread, to surrounding areas.

### 2.2.2 Pressure Gradient

Pressure gradients enable LFG to move both vertically and horizontally within a landfill. This is the primary way LFG moves within the subsurface. As gas continues to be generated, the pressure increases and LFG moves to areas of lower pressure. If there is a confining, or less permeable, layer in place above the MSW layer, LFG will move laterally toward an area of lower pressure.

If no confining layer is present, LFG will migrate vertically to the surface, where it exits the landfill surface into the atmosphere. This occurs when the LFG subsurface pressure is higher than barometric pressure. Diffusion of LFG into the atmosphere results in a rapid reduction to negligible and safe levels once it reaches the landfill surface.

## 2.3 Vertical Landfill Gas Migration

The methane component of LFG is lighter than air. As a result, LFG will travel upward if the permeability of the overlying material is equal or higher than that of the surrounding material

Groundwater level is another factor that influences vertical migration: as the water table rises into an area of the landfill, it forces the LFG upward.

## 2.4 Horizontal Landfill Gas Migration

LFG can migrate horizontally through both natural pathways (fractured rock and porous soil) and man-made pathways (e.g., porous pipe bedding materials, utility pipes and conduits, sand or gravel layers). Layers of low-permeability material that overlie LFG-producing waste material can significantly reduce surface emissions but increase the likelihood for horizontal migration.

# 3 Background

## 3.1 Site Setting and Project History

### 3.1.1 Setting

The Site, a former landfill, is located in the Bronx next to the Whitestone Bridge and is bounded by the Hutchinson River Parkway to the west; Balcom, Miles, and Emerson Avenues to the east; Schley Avenue and Saint Raymond's Cemetery to the north; and the East River to the south (see Figure 3-1). The original parcel of 171 acres was first acquired by New York City in 1937, and two additional parcels totaling 243 acres were acquired by the City in 1948. From 1951 into the 1960s, the New York City Department of Sanitation (DSNY) used the Ferry Point property as a municipal waste importation site (DPR 2007). Figure 3-1 shows the approximate fill progression at the Site. Landfill operations ceased in the 1960s. Upon closing, the landfill was capped with a soil cover of varying thickness across the site.

A summary of the results from previous investigations is presented in the 2005 Engineering Report (TRC 2005a, b). A bibliography of documents reviewed is provided in Section 6 of this LFGMP.

### 3.1.2 Project History

In the late 1990s, the DPR entered into an agreement with Ferry Point Partners, LLC (FPP) to develop, construct, and operate a new public recreation facility, including a golf course, community park, waterfront park, and related facilities that would encompass 222 acres of the Site. At that time, all required reviews for the Project were completed under the City Environmental Quality Review (CEQR), the State Environmental Quality Review Act (SEQRA), and the City's Uniform Land Use Review Procedure (ULURP).

In July 2000, NYSDEC issued a Part 360 Solid Waste Management Permit (NYSDEC No. 2-6006-00014-000110; Part 360 Permit) jointly to the FPP and the DPR (collectively, the "Historic Permittee") for a non-specific "facility" under Part 360-1.9(b) at the Site. This permit allowed the import and placement of a total of 1,000,000 cubic yards (cy) of fill necessary to construct the golf course. In February 2002 and November 2005, the Part 360 Permit was modified to accommodate additional golf course design features and changes in the design approach. In November 2005, NYSDEC issued a modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013) to place a total of 2,370,000 cy of in-place fill on the Site (NYSDEC 2005).

In 2007, the DPR terminated its license agreement with the FPP. Since that time, the DPR has taken over the site development responsibilities and has initiated re-development of the community park, waterfront park, and golf course portions of the Site.

## 3.2 Current Project Plans

### 3.2.1 Overview

The project includes the development of public recreational facilities (waterfront and community parks) on 29.5 acres, a comprehensive golf facility on 192.5 acres, and a fine-dining/banquet facility incorporated into the golf course club-house facilities.

### 3.2.2 Cover Soil

As per the 2005 Part 360 Permit, 423,729 cy of uncontaminated soil were approved for use in the cover layer. The final cover/topsoil layer will consist of uncontaminated soil materials, which meet background levels approved by NYSDEC and will be imported from non-industrial sites. (For cover layer fill specifications see Section 2.1.2 of the 2005 Fill Report Volume 2, Exhibit C [TRC 2005b]).

Major components of the cover layer will be constructed to meet the Nicklaus Design Technical Specification as noted in Exhibit C of the June 30, 2005, Engineering Report (TRC 2005a), and summarized here as follows:

- Greens mix imported to the site shall be tested per the specified material testing requirements. Fertilizer and soil amendments may be applied on the greens mix after spreading and grassed; and

- Topsoil imported shall be free of rock and debris greater than three-quarters of an inch. Soil amendments, fertilizer applications, and seed may be applied to tee, fairway, and rough areas.

A NYSDEC letter from July 28, 2009 (NYSDEC 2009) notes that a minimum thickness of 2 feet of cover layer material is required for all active recreation areas that are not covered with a building or other acceptable impermeable cover and at least 1 foot of cover layer material is required for passive recreation areas.

The 2005 permit requires that "the major components (greens, contours, heights and topsoil) of the cover layer shall meet the Nicklaus Design Technical Specification, as noted in Exhibit C of the June 30, 2005 Engineering Report." In accordance with the Nicklaus Technical Design Specifications, the Permit allows amendments to the topsoil and/or sand capping. Because imported material may not be readily available, sand capping may be used as an alternative to topsoil on portions of the course.

### 3.2.3 Buildings

The following buildings are proposed for the golf course portion of the Site:

- Two 220-square-foot, open-air rain shelters located on the western and northern portions of the site
- One 12,000-square-foot maintenance facility on the western portion of the site
- One 800-square-foot comfort station on the eastern area of the site
- One approximately 15,000-square-foot combined clubhouse and banquet facility on the southwest portion of the site.

The following is proposed for the community park:

- One 800-square-foot comfort station near the center of the park.

The following is proposed for the waterfront park:

- One comfort station on the western area of the park.

### 3.2.4 Utilities

An extensive storm sewer system will be installed throughout the golf course. Storm water will be drained from the golf course and directed to on-site water quality ponds located within the golf course or to New York City Department of Environmental Protection (NYCDEP) combined sewer systems. Excess water beyond the storage capacity of the ponds will also be directed from the water quality ponds to the NYCDEP sewer system.

The main drainage line for the golf course surface catchment system will be set at a depth of approximately 3 to 4 feet below ground surface (BGS). Lateral branches to the fairways will intersect the main line at this elevation and will be graded to the fairways with a final depth of 1.5 to 2 feet. A fairway "herring-bone"-shaped surface drainage system will tie into these lateral branches and into the main site storm drainage line.

The drainage master plan is presented in the NYCDEP Master Plan (Drawing X.126-808M of the Golf Course Contract Drawings).

A sanitary sewer is to be installed along the south, west, and north perimeter of the golf course and cross into the golf course at hole 18 and to the comfort station on the eastern area of the site. Other on-site subsurface utilities include water main, electric, telephone, and gas. These utilities will service buildings and run along the western and northern perimeter of the Site as well as to the comfort station on the eastern area of the Site. Subsurface electric utilities are also to be installed throughout the practice area. Irrigation lines will be installed throughout the golf course fairways, greens, and tees.

Existing utilities at the Site include the Emerson Avenue Box Culvert and an abandoned passive methane-venting system. The box culvert runs along the Emerson Avenue alignment through the middle of the golf course. The methane-venting system was installed at the northeast portion of the site, east of the Emerson Avenue Box Culvert, in 1986. The system contained a series of collection lines that allowed LFG to travel through one main vent. Attempts to locate this system were unsuccessful, and the system's structural integrity or viability cannot be ascertained. Therefore, the existing system will not be incorporated into the currently proposed LFG venting system (see Section 3.3.2).

## 3.3 History and Evolution of the System

EEEPC reviewed site documents and reports generated since 1999 to develop an understanding of previous monitoring and control of LFG at the Site. A list of the documents reviewed for this LFGMP is presented in Section 6.

### 3.3.1 1999 Activities and Landfill Gas Control Systems

As described in the Hazardous Materials section of the 1999 Environmental Assessment Statement (EAS), Allee, King, Rosen, & Fleming, Inc. (AKRF) evaluated LFG at the Site (AKRF 1999). Both ambient air and subsurface borings were monitored. This investigation and recommended control systems are discussed below.

Although AKRF produced the 1999 EAS report and performed several gas monitoring studies for the project, TRC wrote the Hazardous Materials section of the report and incorporated AKRF investigations into their text. TRC analyzed methane emissions rate as part of this work.

#### Landfill Gas Monitoring

AKRF surveyed for soil gas in April 1999 to characterize LFG occurrence and assess the potential for adverse effects of methane gas on the golf course facilities. Thirty-one borings were measured for percentages of methane, carbon dioxide, and oxygen at depths of 2 to 3 feet below the landfill surface. Ambient air was monitored in the immediate vicinity of the survey points. Methane was not detected in the ambient air, even when measurements were taken at the surface immediately adjacent to the soil gas survey points. Readings below the landfill surface ranged from non-detect to 76% methane by volume and were described as being "not atypical of a landfill this size and age."

#### Landfill Gas Emission Rates

The 1999 EAS describes TRC's analysis of methane generation, which was used to determine sub-slab venting requirements under on-site buildings. Using the United States Environmental Protection Agency's (EPA's) "Compilation of Air Pollutant Emission Factors" (EPA 1995), TRC calculated a methane gas generation rate that considered the age of the waste, the rate and amount at which waste had been accepted over the lifetime of the landfill, and several constant factors for methane generation potential and rate constant based on Site conditions.

The calculations yielded a Site methane gas generation rate of 0.00004 cubic feet per minute (cfm) of methane per square foot, or about 2 cfm per acre of surface area. TRC determined that the maximum allowable gas concentration in the air beneath a structure was 1% or less of methane in air (less than 20% lower explosive level [LEL]).

Using the above generation rate and a safety factor of 2, a minimum venting rate of 0.008 cfm of air per square foot of sub-slab was determined (0.00004 cfm methane generation rate/ [1% allowable concentration/2])(see Section 4.1.6 for a comparison of this estimate with the LandGEM modeling results.

Based on the estimated methane emission rate and venting calculation, TRC recommended installing active venting systems beneath the planned Site structures. The 1999 report did not recommend LFG venting systems in open space areas, except for specific turf grass areas.

The movement of methane through turf grass and the vegetative soil layer was anticipated by TRC to have limited and isolated impacts. If needed, based on future evaluations, TRC suggested that an impermeable barrier with a permeable gas-venting layer could be constructed below selected areas of the course ensure turf health. This was to be determined on a hole-by-hole basis during the final project design phase.

#### 1999 Conceptual Proposal for LFG Control Systems

The 1999 EAS recommended the following features for the LFG control system:

- LFG interception and venting systems would be below buildings and, in the area of built structures, direct LFG away from buildings to designated release points. Several venting systems were considered for further evaluation, including passive vents, continuous mechanical venting, or intermittent mechanical venting controlled by a methane monitor.

- Ponds to collect and store water on-site were to be constructed with impermeable membrane liner systems to prevent water leaks and a gas-venting layer for passive gas collection and venting.

- Soil plugs and conduit seals for underground utilities and drainage features would be constructed.

### 3.3.2 2001 through 2004 Activities at and around the Perimeter Vent Trench

#### Landfill Gas Control Systems

The LFG perimeter vent trench was the primary gas-management structure proposed and constructed in 2001. No additional changes were proposed to the 1999 conceptual LFG control systems (described above in Section 3.3.1) during this

time. The LFG perimeter vent trench was installed in order to prevent the migration of LFG off-site. TRC designed and oversaw the installation of the trench and provided certified drawings to NYSDEC for each stage for approval (AKRF 2002).

The LFG vent trench was constructed along the eastern and part of the northern Site perimeter from May 2001 to December 2001 (see Figure 3-2). The purpose of the trench was to allow passive gas venting and provide a physical gas barrier between the Site and adjacent residential neighborhoods. The passive vent trench extends from the water's edge near the foot of Emerson Avenue, along the length of the Balcolm Avenue Site boundary and continues approximately 1,050 feet west past the intersection of Schley and Buttrick avenues.

## Landfill Gas Monitoring

**Off-site Monitoring Study.** Starting in March 2001, AKRF sampled off-site soils to evaluate off-site LFG migration. The results were reported in the February 2002 AKRF Methane Monitoring Study (Attachment A of the 2002 Technical EAS [AKRF 2002]), and included the following findings:

- Perimeter monitoring performed by Emteque Corporation indicated that methane outside the vent trench was below the LEL since November 2001. However, MW-0, located at the corner of Schley and Buttrick avenues in the former Baxter Creek, showed no change after the vent trench was installed and ranged from 10% to 20% methane by volume. AKRF concluded that the source of methane in this area was off-site.

- Elevated levels were noted on Buttrick Avenue between Randall and Schley Avenues. Specifically, three monitoring points along Buttrick Avenue (300 to 400 feet north of the Site) had elevated levels of methane in the soil ranging from 10% to 50% methane by volume. AKRF also reported that installation of the LFG vent trench had not impacted these readings and presented two explanations:

  1. Elevated methane levels were located over former Baxter Creek, a marshy area filled in before 1954. The plants and organic sediments could have produced methane when covered with fill and subsequent laboratory test results indicated that soils were rich in organic material.

  2. Garbage was found in two test pits along Buttrick Avenue and outside of the Site.

  Considering these factors and the fact that no methane was detected in the ambient air above the trench, AKRF concluded that methane detected on Buttrick Avenue was due to an off-site source.

SOURCE: Ecology and Environment Engineering, P.C. 2011

**Figure 3-2 Monitoring Locations**

TRC reported results for biweekly monitoring of methane in perimeter wells and off-site, semi-permanent monitoring points and measuring depth to groundwater in the piezometer network starting in February 2002 (TRC 2002). Locations of sampling points included in the monitoring program are shown in Figure 3-2. A discussion of the results of the off-site monitoring is presented in Section 4 of this LFGMP.

**Perimeter Monitoring Wells.** At NYSDEC's direction, FPP installed perimeter LFG monitoring wells MW-0 through MW-18 (not including MW-13) at approximately 250-foot intervals along the eastern border of the Site, adjacent to a residential neighborhood (AKRF 2002). In accordance with the Part 360 Permit, these wells were monitored biweekly and continue to be included in the LFG monitoring program.

## Part 360 Permit Modification Application

In February 2002, TRC submitted a permit modification application to supplement the April 2000 Engineering Report prepared for the original Part 360 Permit application. TRC indicated in this document that the LFG control systems presented in the 2000 Engineering Report would be implemented. The following items were discussed.

**Piezometer Installation and Monitoring.** Details regarding installation and monitoring of piezometers were presented in this report. Twenty-five piezometers (PZ-01 through PZ-25) were installed at approximate 300-foot intervals along the trench, adjacent to Miles Avenue. The piezometers were installed to monitor groundwater elevations relative to the vent trench depth.

Monitoring was proposed to begin one week after the piezometers were installed and every month thereafter until six months after all fill had been placed on the Site. The piezometers were to be inspected every month.

**LFG Perimeter Vent Trench.** The vent trench was reported to be operating and forming a physical barrier to prevent methane from migrating off-site. The Permit application indicated that the trench was designed to operate passively. The trench was on a biweekly inspection schedule.

**1986 Passive Ventilation System.** In a response to NYSDEC comments on the February 2002 permit modification application, dated July 2, 2002, TRC indicated that FPP planned a visual and test pit program to evaluate the systems around the 1986 passive-venting system outflow vent location. If the outflow vent could be located and nearby piping from the collection wells to the outflow vent were found to be functioning (i.e., conveying methane), the passive venting system would remain in place and FPP would construct and maintain a new outflow vent "at a nearby location removed from the primary golf course features." It is also stated in this response that MW-19 was installed separately by FPP and is not the outlet vent of the 1986 system. In follow-up correspondence with NYSDEC, dated February 10, 2003, TRC discussed their field investigations to locate the his-

toric venting system (TRC 2003a). Test pits and visual investigations were unsuccessful in locating the historic venting system. TRC recommended that if this system were uncovered during the upcoming construction activities, it should be preserved. (To date, the historic venting system has not been uncovered and, therefore, will not be included in the proposed LFG venting design).

### 3.3.3 2005 Activities and Landfill Gas Control Systems

Consistent with information presented in the 1999 EAS, the 2005 Engineering Report indicated that because of the age of the waste materials at the Site, which was approaching 40 to 50 years, the LFG generation rate is declining (TRC 2005a,b). Conceptual design of the LFG control system was also to remain similar to that proposed in 1999, noting that building slab areas would contain active venting systems, and the golf course and utilities would contain passive systems where necessary.

A number of monitoring activities were included in this report, along with a revised description of the LFG control system.

#### Landfill Gas Monitoring

**Monitoring Wells.** The 2005 Engineering Report (TRC 2005 a) provided the following information on monitoring wells:

- TRC continued to monitor all perimeter gas monitoring wells and off-site gas monitoring points biweekly for methane and oxygen per the 2002 Permit. Monitoring points were repaired and maintained as needed

- Elevated levels continued to be found in three monitoring points on Buttrick Avenue between Randall and Schley Avenues after construction of the vent trench, thus suggesting the presence of an off-site methane source.

- From October 2002 to February 2005, two off-site semi-permanent monitoring points (9 and 10) along Buttrick Avenue exceeded 25% of the LEL. Additionally, MW-0, located near the trench and within the Ferry Point Park property, routinely showed elevated levels.

#### Piezometers and Piezometer Monitoring

Groundwater was monitored every month at the piezometers as per the 2002 Permit requirements. TRC generated a construction-phase Response Action Plan to define response to conditions where groundwater in one or more groundwater level-monitoring piezometer was beneath the base of the trench elevation.

#### Landfill Gas Control Systems

The 2005 Engineering Report proposed the following components of the LFG control system, which were consistent with, but more detailed than those described in the 1999 EAS.

- Sub-slab venting components were primarily described as active systems beneath buildings and on-site structures. Several venting systems were recommended for further evaluation and the design was to be finalized based on building structure and location.

- The irrigation lake and ponds were proposed to have impermeable membrane liner systems with a gas-venting layer for passive gas collection and venting.

- Underground site utilities were proposed to have soil plugs and conduit seals for piping and conduits.

- The movement of methane through turf grass and the vegetative soil layer was anticipated to have limited and isolated impacts. If specific greens required venting for the maintenance of turf health, an impermeable barrier with a permeable gas venting layer was recommended beneath the vegetative soil.

- The 2005 Engineering Report did not propose LFG venting systems in open space areas, except for specific turf grass areas as described above.

### 3.3.4 Post-2005 Monitoring at and around the Perimeter Vent Trench

#### Landfill Gas Monitoring

**Methane Monitoring.** Permanent monitoring wells and semi-permanent points have been monitored biweekly in accordance with the 2005 Permit. Since issuance of the 2005 Permit, several exceedences have occurred at MW-0, with sporadic exceedences at MW-14 and E3R.

#### Piezometers and Piezometer Monitoring

Monthly monitoring of groundwater depth was completed in each piezometer in accordance with Special Condition 30 of the 2005 Permit. Sustained, low groundwater levels have not been observed since 2005.

#### Vent Trench

Routine inspections and maintenance ensured continued vent trench functionality. A review of historic vent trench data by TRC (TRC 2009a) concluded that the LFG vent trench was providing an effective perimeter control based on the following:

- In the year following installation of the vent trench, methane levels near the trench decreased significantly in most monitoring wells.

- Methane levels generally increased in 2005, likely due to installation of new monitoring points and repaired wells.

### 3.3.5 2007 through 2009 Activities

#### Methane Monitoring Reports (2007 through 2009)

Monthly methane monitoring reports were prepared by TRC from 2007 through September 2009. The monitoring routine included noting weather conditions; measuring methane and oxygen levels from both on-site methane monitoring wells and off-site semi-permanent methane monitoring points; and measuring groundwater levels in piezometers adjacent to the vent trench.

#### Pre-Extraction Pilot Test Subsurface Investigation (2008/2009)

In 2008 and 2009, TRC performed a subsurface investigation through the installation of borings and LFG probes and tested for soil gas with slam bars (sampling rods with slotted points) in order to supplement existing site data and assess the current nature and extent of LFG at the Ferry Point site (TRC 2009c).

Data obtained from TRC's investigation include:

- MSW thickness ranged from 4 to 47 feet. Saturated MSW thickness ranged from 0 to 24 feet.

- Methane gas concentrations observed in 16 of the western perimeter slam bar monitoring locations were less than the 25% LEL regulatory level for landfill gas control in on- and off-site structures, and less than the 100% LEL regulatory level at or beyond the property boundary (New York Code of Rules and Regulations [NYCRR]360-2.15(e) and.360-2.15(k)(4)).

- Combustible gas concentrations observed in the shallow slam bar monitoring locations were lower than those present in the deeper soil borings. Only one slam bar monitoring point exceeded 0.5% methane by volume.

- In 39 of 54 borings within the golf course interior, combustible gas was measured at 25% LEL or higher.

- Permeability field testing revealed that the average permeability of the existing shaping layer material was on the order of $10^{-5}$ inches per second (in/sec). Non-domestic MSW (typically soil with some construction and demolition debris) and domestic MSW had average permeabilities of $10^{-2}$ in/sec and $10^{-3}$ in/sec, respectively.

#### Extraction Pilot Test

TRC performed an extraction pilot test in 2009 with the intention of gaining a better understanding of on-site gas generation. NYSDEC's Air Guide 1 air toxics assessment procedure was used as the testing protocol and a comparison of emissions from the test to short-term guideline concentrations (SGCs) was made to confirm that SGCs were not exceeded. Details of the pilot extraction test are included in the Pre-Design Landfill Gas Investigation Scope of Work (SOW) and

the Amendment to Volume No. 1 of the Permit application dated November 25, 2009 (TRC 2009a).

Data from the test reported by TRC include the following:

- During static conditions, pressures measured in the LFG were less than 0.02 to 0.08 inches of water column (in-wc) gauge.
- During passive venting of the extraction well, monitoring probes showed positive pressure readings from 0.04 to 0.30 in-wc gauge.
- LFG samples collected from the extraction well produced methane concentrations of approximately 61% by volume. Methane concentrations measured with pressure probes exceeded LELs at several locations.
- Data from the active blower test were as follows:
  - An 85 standard cubic feet per minute flow rate was shown capable of evacuating pore volume and creating negative pressure over a 150 foot test radius.
  - Atmospheric infiltration was noted in several probes when the induced pressure vacuum was increased to 14 to 16 in-wc.

Shortcomings of the pilot test performed by TRC have been evaluated by EEEPC and are discussed in Section 4.2.1.1.

### Landfill Gas Control Systems

Based on TRC's interpretation of the 2009 subsurface investigation and extraction pilot tests, they proposed a low-flow active LFG control system for "the golf course area of the site". The rationale for this design was that passive venting was not expected to achieve safe levels of methane in the subsurface in time for the anticipated opening of the golf course. The proposal for active systems for subslab venting was similar to those previously proposed by TRC in the 2005 Engineering Report (2005a). The irrigation pond venting system was proposed for incorporation into the active system.

However, the TRC report did state that operating an active LFG extraction at high flow rates could cause dangerous atmospheric infiltration, pulling air underground from the surface and potentially causing underground fires or explosions.

In this report, TRC proposed the following system components:

- Vertical LFG collection wells, screened in the MSW layer, would consist of horizontal collection systems, including perforated collection pipes placed underneath an impermeable liner below the green and tee areas and the clubhouse parking lot asphalt; horizontal collection pits/pipes under the comfort station and maintenance facility; and gas venting geocomposite and perforated collection pipe system associated with the lined irrigation pond.

- Forty control zones of extraction wells and green and tee horizontal collection piping would be established, divided to accommodate Site conditions (topography and "other features such as the box culvert") and to allow "flexible operations." Wells and piping in each zone would be connected through a network of header pipes to a vent flare with an in-line fan. Flexible operation would be enabled by a blanked flange in each vent point. Subsurface collection piping network would be incorporated into the irrigation pond and parking lot with piping connected to a central discharge location. Sub-slab active depressurization systems would be installed for the comfort station and maintenance facility and would include automated methane monitoring and alarm systems.

- A probe network for monitoring LFG control system performance and LFG across the Site and along the boundary would be installed.

# 4 Evaluation of Existing LFG Data and LFG Exposure Assessment

Based on the 2008/2009 TRC investigations and proposal for a Site-wide active LFG extraction systems for all open space areas of the site, it was decided that a re-evaluation of LFG data be performed to ensure the appropriate mitigation systems were selected. An exposure assessment and additional emissions modeling effort was also undertaken to provide additional Site data.

## 4.1 Additional Data Collection

The following data was gathered through monitoring, investigations, and computer modeling to provide additional information regarding LFG conditions at the Site.

### 4.1.1 Methane Monitoring Reports (2009 through present)

Monthly methane monitoring reports are prepared by American Environmental Services, Inc. (AES). From October 2009 to May 17 2012, AES monitored:

- Ambient weather conditions
- Methane, oxygen, hydrogen sulfide, and carbon monoxide levels in on-site methane monitoring wells, perimeter methane monitoring wells, and off-site semi-permanent methane monitoring points
- Groundwater levels in piezometers adjacent to the vent trench

As of May 23, 2012, AES began monitoring the expanded parameters requested by NYSDEC in their January 3, 2011 letter. The following parameters are now being monitoring in addition to those above:

- Well pressure
- Well temperature
- Ambient relative humidity

### 4.1.2 Walsh Review of Site Investigations (2010)

Walsh reviewed TRC's subsurface investigation and extraction test in May and August of 2010 (Walsh 2010a, b). The review reported that the results of the TRC testing were consistent and expected based on the age and character of the landfill. Due to low pressure readings throughout the Site and methane levels below the LEL in most shallow monitoring points, Walsh concluded that a site-wide

active venting system would not be necessary to achieve safe conditions for golf course users or workers.

Based on the Walsh reviews and as requested by NYSDEC (NYSDEC 2010), TRC completed a flux box sampling in October 2010 in order to more accurately determine surface methane emission rates at the Site. The results of the flux box sampling were reported by TRC as an insert to the Supplement to the 2009 Engineering Report.

### 4.1.3 TRC Flux Box Testing (2010)

The TRC flux box and ambient air sampling event in October 2010, in accordance with the sampling plan submitted to NYSDEC, is included as Appendix B of EEEPC's November 2010 Landfill Gas Report. A flux box is a container of known volume which is used at the surface of the landfill for the measurement of LFG emissions and concentrations. A total of 30 test locations were sampled: 19 in the area of the golf course and associated facilities, three each in the waterfront and community parks, and five at the LFG vent trench. Results of this sampling were as follows:

- Methane was not detected in any of the flux box samples.
- No sulfur compounds were detected above the detection limit in any flux box or ambient air sample.
- Five compounds were found at concentrations higher than the NYSDEC Annual Guideline Concentrations (AGCs): benzene, carbon tetrachloride, methylene chloride, tetrachloroethylene, and trichloroethylene. Due to the concentrations found in the ambient air samples, it was concluded that these compounds were likely from off-site urban environment sources. Three of the five compounds warranted further evaluation using the NYSDEC Area Source Method. The results indicated on-site annual impacts would be less than 1.5% of the AGC, and off-site impacts less than 0.25% of the AGC for tetrachloroethylene, trichloroethylene, and methylene chloride.

### 4.1.4 Community Park Vent Monitoring (2011)

In June 2011, EEEPC conducted a monitoring event of the twelve (12) passive LFG vents previously installed at Community Park (EEEPC 2011b). Vent testing was used to identify and quantify the emission rates of LFG constituents from the vents. Air samples were collected from each vent and analyzed to determine the concentration of methane, carbon dioxide ($CO_2$), oxygen ($O_2$), nitrogen ($N_2$), volatile organic compounds (VOCs), and sulfur compounds. The LFG flow rate for each vent pipe was also measured.

The field data and analytical results were used to estimate hourly and annual emission rates of chemical constituents from the LFG vents. Modeled ambient air concentrations resulting from the estimated emission rates were found to be below NYSDEC short-term and annual guideline concentrations (SGCs/AGCs).

### 4.1.5 LFG Fingerprinting Investigation (2011)

In an effort to supplement existing data regarding the source of offsite methane detections in the vicinity of Buttrick/Schley avenues, EEEPC conducted an investigation in June 2011, in accordance with a May 2011 Fingerprinting Protocol (EEEPC 2011b).

The following wells/probes were included in the investigation:

- Offsite monitoring points 9 and 10, located on Buttrick Avenue between Randall and Schley avenues;
- Perimeter monitoring well, MW-0, located in the vicinity of Buttrick Avenue; and
- Onsite monitoring wells MW-13 and MW-19.

The fingerprinting protocol recommended that methane measurement be conducted in interior monitoring well MW-4R. However, this well was previously decommissioned and as a result, measurement was conducted in well, MW-13, which is also an onsite monitoring well.

Each location was purged according to procedures outlined in the protocol and then monitored for methane concentration. None of the locations yielded methane concentrations sufficient for isotopic gas analysis, a minimum of 1% methane by volume. As a result, LFG samples could not be collected for isotopic fingerprinting analyses.

### 4.1.6 Landfill Gas Generation Modeling

Using LandGEM Model Version 3.02, EEEPC (2010) modeled emission rates for the Site in order to compare to the flux box sampling and previous emission rates estimated by TRC in 1999.

The LandGEM model generates emission estimates during landfill operation and for the years following closure. For use in the model, the waste acceptance rate at the site and the years of waste acceptance were based on site characteristics and historical data. Conservative Clean Air Act (CAA) municipal solid waste landfill defaults were used for the remaining input parameters.

- Years of waste acceptance: 1940 to 1959
- Annual waste acceptance rate: 319,566 megagrams per year (Mg/yr) assumed to be equal from 1940 to 1959
- Methane generation rate: 0.05 $yr^{-1}$

- Potential methane generation capacity: 170 cubic meters per megagram ($m^3$/Mg)

- Methane content: 50% by volume.

LandGEM generated the following results, predicting methane emissions from the start of waste acceptance in 1940 through the year 2040:

- The 1999 model year emissions rate was calculated to be 3,268 Mg/yr, equivalent to 0.00003 cfm per square foot (SF) a rate similar to the 1999 TRC estimate of 0.00004 cfm/SF calculated using EPA Method AP-42.

- For the model year 2010, the results yielded a methane emission rate of 1,885 Mg/yr, or 2,078 tons per year (tons/yr) in 2010. This is equivalent to an emission rate of 0.00002 cfm/SF or slightly less than 1 cfm/acre.

- LandGEM also projected methane generation calculations up to 30 years into the future, projecting that by 2040 emissions would be reduced to 25% of current day emissions (420 Mg/yr, approximately 0.000005 cfm/SF). Overall, methane generation shows a consistent decrease over time.

- The emission rate projected by LandGEM in 2010 is just a fraction of the peak estimated emission rate of 22,970 Mg/yr (0.00023 cfm/SF), predicted for the year 1960.

Like other landfill sites, the rate of LFG production at the Site is affected by waste composition, waste volume, moisture content, age, and landfill geometry. Field measurements have shown that the LFG produced at the Site predominantly contains methane and carbon dioxide, with small amounts of nitrogen, oxygen, water vapor, sulfur, and other contaminants. Some NMOCs, which can also be classified as hazardous air pollutants (HAPs) were reported at much lower quantities.

Section 4.2 presents an assessment of the lateral and vertical extents of LFG within the MSW and the current shaping layers, both in the interior and at and around the perimeter of the Site. Figures 4-1 and 4-2 are conceptual cross sections illustrating the lateral and vertical extents of methane at the Site. Figure 4-3 shows methane concentrations in samples collected within the Site interior, along the Site perimeter, and at off-site locations.

Also included is an assessment of the risk of exposure to LFG both on and at the perimeter of the Site. The exposure assessment includes a comparison of LFG concentrations to applicable New York Codes, Rules, and Regulations (NYCRR) Part 360 standards.

International Specialists in the Environment

Notes: 1. Data are from the TRC 2009 Supplemental Landfill Gas Investigation, the TRC 2009 Pre-Extraction Pilot Test Subsurface Investigation, and the TRC 2010 Emissions and Air Quality Testing.
2. Color coding for monitoring wells and methane survey points based on data from a 2 year period between January 2009 and January 2011. Color coded as yellow if 2 or more meausurements equal or exceed 25% LEL and as red if 2 or more measurements equal or exceed LEL.

## 4.2 Evaluation of LFG Data

### 4.2.1 Occurrence of LFG in the MSW Layer

#### 4.2.1.1 Site Interior

**Historical LFG Operations Monitoring Data**

Since 2000, field methane measurements have been collected from two interior gas wells; MW-4/4R and MW-19 (see Figure 4-4, which shows temporal trends for these monitoring points from 2000 to 2011). Between 2008 and 2010 these measured concentrations had declined from 100% of LEL to non-detect levels.

Due to concerns raised by NYSDEC regarding the condition of the wells, DPR submitted a plan to abandon the existing onsite gas wells and install two replacement gas wells within the Site's interior. Concurrently, DPR requested that gas well MW-0 be abandoned and a replacement gas well installed within the Site's interior. This request was made due to a suspected off-site source(s) of methane in the vicinity of this location (AKRF 2002; TRC 2005a, 2009a). Monitoring at the approved replacement locations began in February 2012. Measured methane concentrations in the three interior replacement gas wells (see Appendix C), is consistent with LFG data from samples collected within the MSW layer at the Site between 2008 and 2009, which indicated methane concentrations above the LEL.

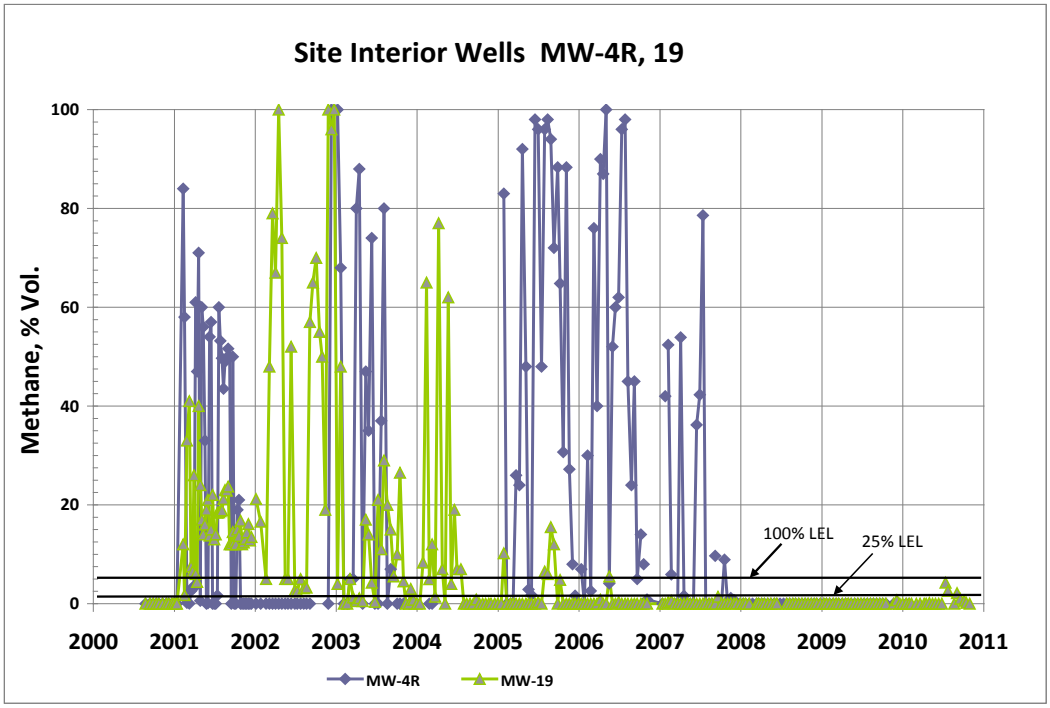

**Figure 4-4 Temporal Trends in Methane Concentrations at Site Interior Wells, 2000 to 2011**

### Recent LFG Investigation Data

**Pre-Extraction Subsurface Investigation.** Methane concentrations were measured by TRC at on-site borings in 2008 and 2009 (see Figure 3-2 for boring locations).

Methane was measured at concentrations exceeding 25% LEL in 82 of 135 samples and exceeding the LEL in 73 of 135 samples within the MSW layer. Mean and median of the measured methane concentrations were both greater than the LEL. Methane concentrations exceeding 25% LEL were measured in approximately two-thirds of the samples collected from the MSW layer, which supports the premise that methane is not present in specific areas but appears to exist in the MSW layer throughout the interior of the Site. However, measured data in the shaping layer, overlying the MSW layer, and at the surface indicates that concentrations decline rapidly as gas migrates upward toward the surface (see Sections 4.2.2 and 4.2.3).

**LFG Extraction Test.** TRC utilized EPA Method 2E in their 2009 extraction testing. EPA Method 2E was historically used to determine LFG flow (EPA 2000). This method states that the purpose of short-term testing is to determine the "maximum vacuum that can be applied to wells without infiltration of ambient air into the landfill." In 2003, an article in the *Journal of Air & Waste Management* (Walter 2003) discussed fatal flaws that existed with this method for measuring landfill gas generation rates. In addition, TRC's extraction pilot test diverged from the recommended EPA method, which identifies ambient air intrusion by percent volume of nitrogen. TRC identified ambient air intrusion by percent volume of oxygen. TRC determined the radius of influence based on differential pressures at the surrounding test wells, yet EPA Method 2E specifies determining the radius of influence based on absolute pressures under static and active extraction conditions.

More importantly, because of the atmospheric intrusion noted during the extraction test, the LFG extraction rate used by TRC during the pilot testing would be significantly higher than the actual LFG generation rates within the area of the pilot test. If LFG generation rates for the entire Site are based on the pilot test results, the resulting estimate would grossly over-estimate actual LFG generation.

#### 4.2.1.2 Site Perimeter

### Historical LFG Operations Monitoring Data

Since 2000, biweekly field methane measurements have been collected from wells located next to the passive vent trench along the perimeter of the Site (see Figure 3-2). Measured methane concentrations have declined from more than 100% of LEL to non-detect levels with a few exceptions (see Figure 4-5 for temporal trends in selected perimeter wells from 2000 to 2011). This significant decline in methane concentrations in perimeter wells demonstrates the effectiveness of the perimeter trench in venting LFG, along with an overall decline in LFG gen-

eration. However, a number of monitoring locations were missing valves during this time, which may have impacted the data collected.

A suspected offsite source of methane in the vicinity of MW-0 located close to the intersection of Buttrick and Schley Avenues, outside the northeastern corner of the Site) was attributed to elevated methane readings at this location (see Section 4.2.1.3 for further discussion). MW-0 has now been abandoned and relocated within the Site's interior as discussed in Section 4.2.1.1 above.

### Gas Monitoring Well Repairs

During their routine inspections of the Site, the IEM noted out that many of the perimeter monitoring wells were missing valves and caps, or otherwise needed repair. DPR performed an inspection of all perimeter wells, and performed the necessary repairs, or installed replacement wells as necessary to bring them into compliance with the current Part 360 Permit.

Monitoring following the repairs began in February 2012 (see Figure 4-6 for temporal trends in selected perimeter wells. The new bi-weekly data from the site perimeter wells shows that methane concentrations remained consistent with concentrations measured at these wells between 2008 and 2011 (see Appendix C for methane monitoring data).

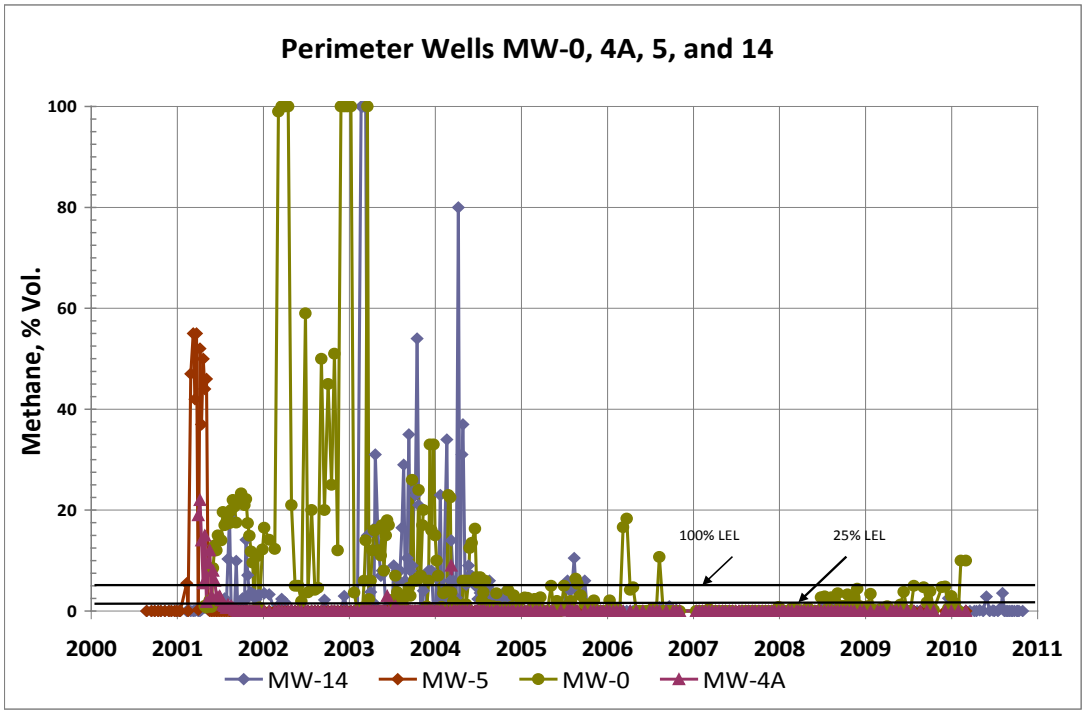

**Figure 4-5 Temporal Trends in Methane Concentrations in Site Perimeter Wells, 2000 to 2011**

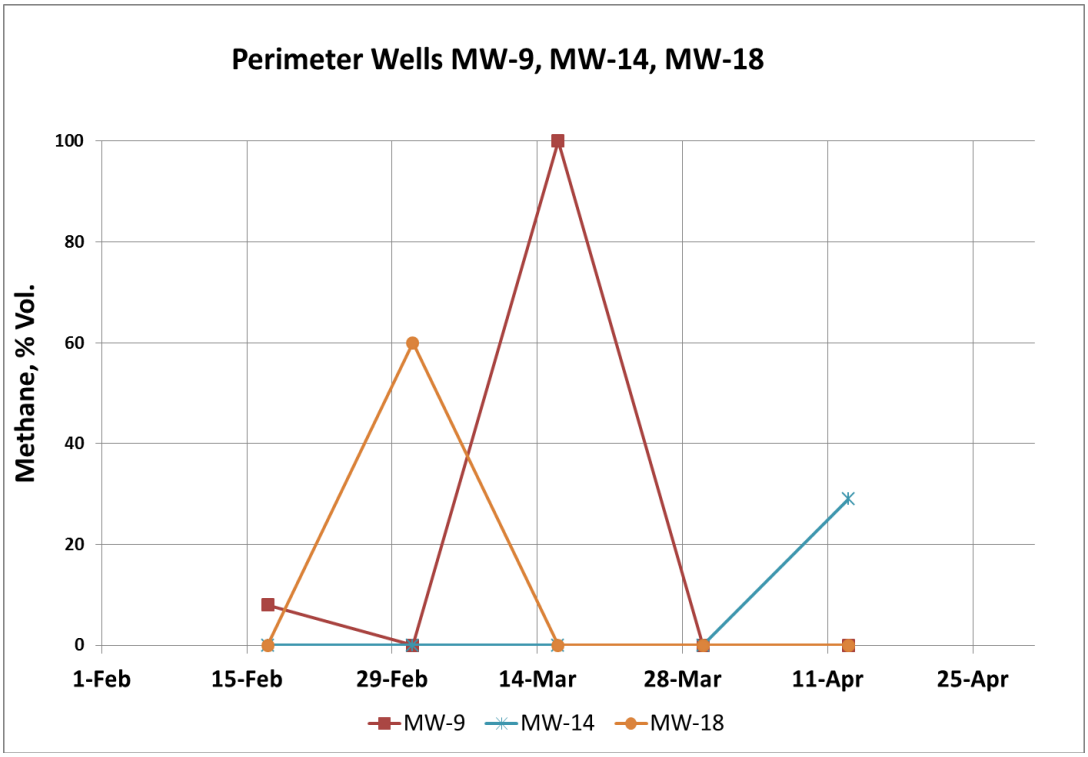

**Figure 4-6 Temporal Trends in Methane Concentrations in Site Perimeter Wells, Biweekly Sampling Events 2012**

The TRC 2008 and 2009 investigations (TRC 2009c) did not measure methane in the MSW along the site perimeter.

### Recent Community Park Vent Data

Sampling was performed at 12 vents within Community Park in June 2011, using the procedures established in the *Landfill Gas Vents Sampling and Analysis Protocol*,(EEEPC 2011c). The protocol summarized the procedures used to identify and estimate the emission rates of air pollutants as well as procedures to conduct an air quality model analysis to identify and compare potential impacts associated with these emissions. The protocol was approved as noted by NYSDEC on March 30, 2011. The June 2011 data reported no measurable gas flow in the Community Park vents. The presence of methane was detected in only 3 of the 12 vents sampled, with detections in the three vents ranging from 1.5 to 7.3% by volume (7.5% LEL to >100%LEL). In the 9 remaining vents, concentrations were below laboratory reporting limits (EEEPC 2011b).

#### 4.2.1.3 Off-site Areas on Schley, Buttrick, Balcom, and Emerson Avenues

### Historical LFG Operations Monitoring Data

Since the early 2000s, field methane measurements have been collected from probes, located on Schley, Buttrick, Balcom, Miles, and Emerson avenues (see Figure 3-2). Measured methane concentrations have been lower than the LEL in

the Schley, Balcom, Miles, and Emerson Avenue probes since 2002, indicating absence of significant methane at these off-site locations.

Methane concentrations in the probes on Buttrick Avenue, however, have been higher than the LEL in several probes (see Figures 4-7 and 4-8). The presence of elevated methane levels in these probes indicates an off-site source of methane, separate from landfill activities at the Site. This is further discussed below under the heading "Gas Monitoring Well Repairs."

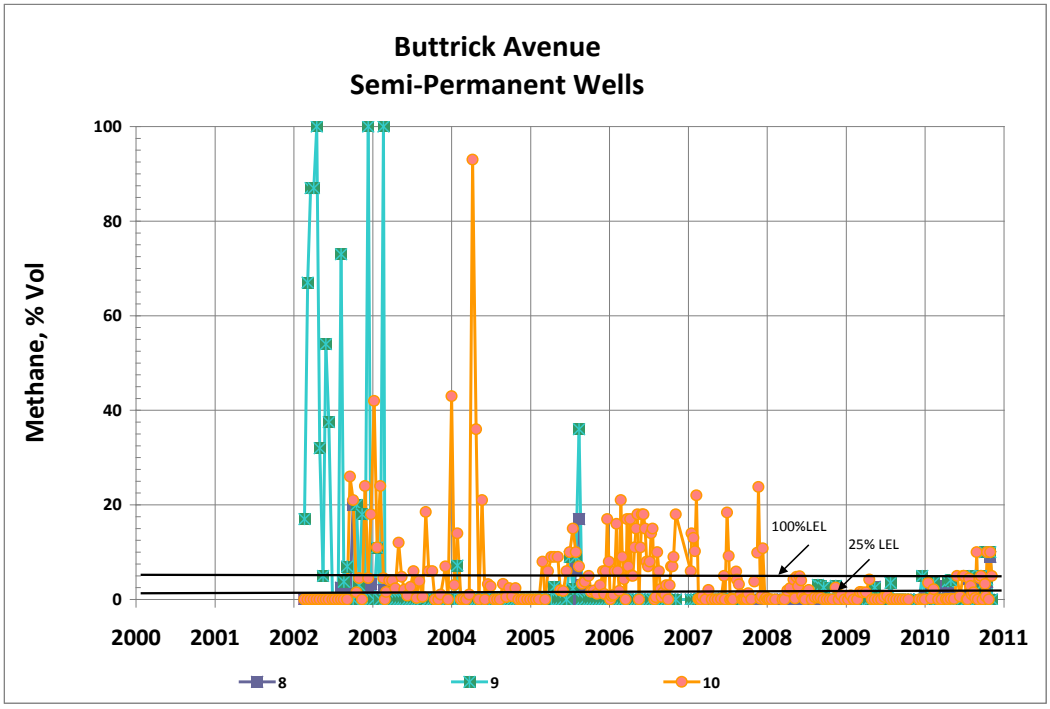

**Figure 4-7 Temporal Trends in Methane Concentrations in Off-site Probes on Buttrick Avenue, 2000 to 2011**

## Gas Monitoring Well Repairs

As discussed in Section 4.2.1.2, off-site monitoring locations were also subject to repairs based on the IEM's routine inspections. DPR has performed the necessary repairs, or installed replacement wells as appropriate for the majority of monitoring locations.

Monitoring following these repairs began in February 2012 (see Figure 4-8). The new bi-weekly data showed that methane concentrations remained consistent with concentrations measured at these wells between 2008 and 2011.

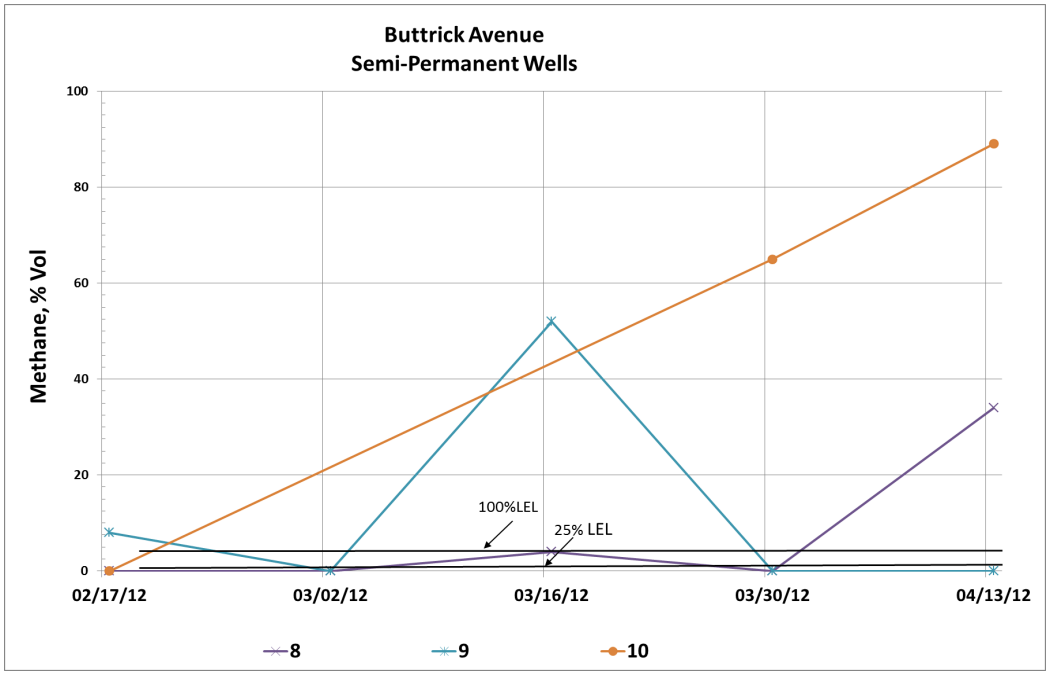

**Figure 4-8 Temporal Trends in Methane Concentrations in Off-site Probes on Buttrick Avenue, Biweekly Sampling Events 2012**

The following findings from previous investigations/LFG monitoring provide evidence for the presence of an offsite source of methane in the Buttrick Avenue area:

1. The February 2002 AKRF Methane Monitoring Study in which two test pits were excavated in areas of elevated methane detections along Buttrick Avenue in September 2001 identified presence of garbage at this location.
   a. According to the report: "*Garbage was identified in the material excavated and included wood, paper, cloth, metal cans, plastic bottles, glass, ceramic, asphalt, foam, and shoe soles*".

2. The 2002 AKRF study also confirmed the presence of soils rich in organic material, consistent with the reported presence of historic marshlands in this area.
   a. To confirm the presence of historic marshlands, soil samples from the excavations from the test pits in this area were sent for laboratory analysis and AKRF reported that "the laboratory results indicate the soils are rich in organic material". These results support the presence of a former marsh, which was likely to contain organic-rich sediments.

3. During the sampling conducted following the installation of the perimeter vent trench, AKRF concluded the following in their 2002 study:
   a. *"because there has been little change in the elevated methane levels on Buttrick Avenue since the installation of the landfill gas venting trench, garbage and organic rich materials were found in the test pits excavated*

*in this area, and the area is located over a filled marshy area, the source of methane on Buttrick Avenue is offsite".*

4. Further, as discussed in the TRC 2005 and 2009 engineering reports (TRC 2005a, 2009a), this area was a former tidal marsh subject to potential filling with MSW prior to 1945. According to TRC, organic-rich marsh deposits and fill possibly containing MSW are the likely sources of methane in this area. (Figure 3-1 shows the approximate MSW fill progression at the Site and surrounding historic waterbodies and marshlands.)

In the TRC 2008 and 2009 investigations (TRC 2009c), samples for methane measurement were not collected at off-site locations.

### 4.2.2 Occurrence of LFG in the Shaping Layer

#### 4.2.2.1 Site Interior

Methane concentrations were measured by TRC in the shaping layer at on-site borings drilled in 2008 and 2009 (see Figure 3-2). Samples were collected from within the top 2 feet of the shaping layer and from 2 to 6 feet BGS, also within the shaping layer (TRC 2009c).

Methane concentrations observed in the shaping layer were lower than those in the underlying MSW layer (see Figure 4-3). More importantly, methane concentrations attenuated from the bottom to the top of the shaping layer; concentrations in the top 2 feet are significantly lower than those measured from 2 to 6 feet BGS.

The mean and median values for samples within the top 2 feet of shaping layer were 17.84% LEL and 0.0% LEL, respectively. Samples collected between 2 and 6 feet BGS resulted in a mean and median of 100% LEL and 60% LEL, respectively.

#### 4.2.2.2 Site Perimeter

During the 2008 and 2009 investigation, TRC measured methane concentrations in the shaping layer in shallow, temporary monitoring points installed along the western perimeter of the Site (see Figure 3-2). Samples were collected from within the top 2 feet of shaping material (TRC 2009c).

The mean and median values of methane concentrations in these samples were 1.6% LEL and 2% LEL, respectively. The absence of methane concentrations above the LEL in these perimeter monitoring points demonstrates the rapid attenuation that occurs in the westward direction. These findings indicate that mitigation measures are not deemed necessary along the western perimeter of the Site.

### 4.2.3 Occurrence of LFG at the Surface

At 30 locations, flux box and ambient air testing was conducted by TRC in 2010, for field measurements of methane and laboratory analysis of VOCs (see Figure 3-2). Monitoring and analysis was performed using the procedures established in the "Flux Chamber Testing Program Work Plan", included as Appendix B to the

Ferry Point Landfill Gas Report (EEEPC 2010). The work plan summarized the flux chamber sampling and analysis techniques that would be used to determine surface emission rates from the landfill. The results of the analysis were used to develop total hourly and annual emission rates. These rates were used for the analysis of potential impacts to on site and off site receptors for methane and hazardous air pollutants (HAPs).

Methane was not detected in field measurements in any of the sampling locations (EEEPC 2010). The absence of methane in the flux box samples demonstrates a rapid attenuation of methane occurring in the upward direction from the MSW layer through the shaping layer and to the surface. It provides further evidence that methane is not present at measurable rates at the surface of the Site.

Low levels of select VOCs were reported in some flux box samples. However, the concentrations were either below NYSDEC acceptable standards or similar to background concentrations reported in ambient air samples (EEEPC 2010).

## 4.3 LFG Emission Rates

### 4.3.1 Methane Emission Rates

The surface emission rate of methane at the Site was estimated using LandGEM Version 3.02 (EEEPC 2010 [see Appendix B]). Because the LandGEM model is intended to be used to design gas collection systems, it typically overpredicts LFG generation. CAA defaults were used in the model, which also yields conservative emission estimates.

As discussed in Section 4.1.6 the LandGEM model estimated a 2010 methane emission rate of 1,885 Mg/yr (or 2,078 tons/yr). This corresponds to an average hourly emission rate of 0.237 tons/hr (based on 24 hours/day and 365 days/year). The model predicts substantial reductions in each subsequent year, ranging from a predicted rate of 2,078 tons/yr in 2010 to a rate of 463 tons/yr in 2040. This represents an approximate 75% decrease in methane production over time.

For comparison, in 1999, TRC estimated a methane emission rate of 0.00004 cfm/SF, calculated using the EPA Method AP-42. The LandGEM modeling performed in 2010 calculated 1999 model year emissions rate equivalent to 0.00003 cfm/SF, which is nearly the same value as the TRC AP-42 estimate.

### 4.3.2 HAP and Other VOC Emission Rates

#### Flux Box Measurements

The emission rates of HAPs and other reported VOCs in the LFG from the Site were estimated using the average concentration of each compound in the flux box samples. The average concentration was calculated only from samples with compound concentrations over the detection limit. This methodology produces a very conservative (i.e., biased high) emission rate as it ignores samples with results below detection limits. The assumptions and the approach used to model the

emission rate are presented in EEEPC's Landfill Gas Report, Ferry Point (November 2010).

NYSDEC's guidelines for estimating annual impacts, when applied to the calculated emission rates, resulted in ambient air concentrations below NYSDEC's acceptable thresholds (EEEPC 2010).

#### Community Park Vent Measurements

The emission rates of VOCs and sulfur compounds in the community park vents were estimated by multiplying an assumed vent flow rate (1 $cm^3$/sec was used because no measurable flow was observed) and reported concentration of each constituent. Emission rates were below levels that would result in an adverse impact to public receptors in the vicinity of the vents (EEEPC 2011b).

## 4.4 Exposure Assessment

### 4.4.1 Criteria

#### Methane

NYCRR Part 360 criteria, which requires that combustible gas concentrations not exceed 25% of the LEL in structures on-site and off-site and not exceed the LEL at or beyond the Site boundary, were used for comparison with methane concentrations measured within and along the perimeter of the Site.

#### HAPs and Other VOCs

NYSDEC SGCs and AGCs are screening-level values used to determine the appropriate environmental rating of air pollutant emissions. SGCs are chosen to protect the general population from adverse acute one-hour exposures; AGCs are chosen to protect against adverse chronic exposure and are based upon the most conservative carcinogenic or non-carcinogenic annual exposure limit. SGCs and AGCs are used to assess impacts on ambient air caused by an emission source.

### 4.4.2 Comparison of Flux Box & Community Park Testing Results with Exposure Criteria

#### Methane

Methane was not detected in the flux box samples collected within the interior of the Site, indicating that methane is not emitted at the ground surface at measurable rates. Absence of methane at the surface indicates that NYCRR Part 360 criteria are met.

Also both mean and median concentrations of methane in the top 2 feet of the shaping layer within the interior of the Site did not exceed 25% LEL, as would be required by NYCRR Part 360 for on and off-site structures.

Methane concentrations in the perimeter wells, except in MW-0, located along the existing vent trench, abutting Emerson, Miles, Balcom, and Schley avenues were below the LEL, as required by NYCRR Part 360. Methane concentrations were

also below the NYCRR Part 360 criteria for samples collected along the western perimeter.

Methane concentrations in the probes on Buttrick Avenue, located close to MW-0, have been higher than 100% LEL. As discussed in Section 4.2.1.3, the presence of elevated methane levels in these probes along with the nearby organic-rich marshland and pre-1945 use of the area for MSW fill indicates an off-site source of methane that likely contributes to elevated levels at MW-0.

### VOCs

**Flux Box Measurements.** Of the four VOCs detected in flux box samples in the 2009 TRC investigation, benzene was reported below the concentrations found in the ambient samples, which are representative of background concentrations. Three other VOCs— methylene chloride, trichloroethylene, and tetrachloroethylene—concentrations in flux box samples were roughly equivalent to and/or slightly greater than those in the ambient samples (EEEPC 2010). Potential impacts on ambient air as a result of emission of these VOCs at the Site were assessed by EEEPC, and the results indicated no exceedences of NYSDEC standards (EEEPC 2010).

Carbon tetrachloride was detected in an ambient sample but not in the flux box sample. Because of its reported widespread use in operations within urban areas and its absence in Site flux box samples, the Site is not considered to be a source of carbon tetrachloride in ambient air.

**Community Park Vent Measurements.** Recent testing indicates that the VOC emissions from the 12 community park vents would result in ambient air concentrations that are well below NYSDEC standards, indicating an absence of impacts above public exposure thresholds in the vicinity of the vents (EEEPC 2011b).

In an email dated July 1, 2011, NYSDEC confirmed their acceptance of these tests and indicated that emissions from the vents pose no health impact to the public using the park.

## 4.5 Conclusions

The following conclusions were drawn from the evaluation of the LFG data collected and modeling conducted to date at the Site:

- The reported data indicates the presence of methane within the MSW, as expected from a landfill of its age. Methane levels at the surface were below regulatory limits for structures within the interior of the Site (below 25% LEL). Methane levels in the subsurface were below regulatory limits at the perimeter of the Site (below LEL).

- At the current landfill surface, concentrations of other LFG compounds, primarily VOCs, were either below their acceptable thresholds or similar to background levels measured in ambient air samples.

- Modeled ambient air concentrations using VOC concentrations reported in the flux box samples demonstrated no reportable impact of VOCs on ambient air at the Site.

- The LandGEM model, which predicts a conservative estimate of LFG generation rates, shows that methane emissions from Ferry Point do not contribute significantly to greenhouse gas (GHG) emissions. The estimated 2010 annual methane emissions from Ferry Point are approximately 0.048 million tons of $CO_2$-equivalent emissions.

- No measurable LFG flow was measured in recently tested Community Park Vents.

- Recent testing of the vents at the Community Park indicate that emissions for VOCs and sulfur compounds from the LFG vents that would cause short-term and annual impacts that are well below the SGCs and AGCs. The impacts are several orders of magnitude less than these guideline concentrations, which is indicative of the limited emissions from the LFG that is present in the subsurface.

- Subsurface MSW and historic marshlands in the Buttrick Avenue area have been identified as the likely offsite source(s) of elevated methane measurements in LFG probes in this area.

LFG does not exceed regulatory and health-based thresholds at the surface, which indicates that LFG generation within the waste occurs at low levels, consistent with the age of the landfill. Therefore, active LFG extraction systems at the Site are not warranted.

However, methane concentrations exceeded the LEL in 73 out of 135 samples collected within the subsurface MSW layer during the 2008/2009 TRC subsurface investigation. Therefore, passive venting systems are proposed for the open areas of the Site. Active depressurization systems are recommended to be placed under building footprints to minimize the potential for LFG to collect underneath structures.

# 5 Landfill Gas Management Approach

## 5.1 Summary of LFG Data and Planned LFG Control Measures

### 5.1.1 Summary of Data

#### Site Interior

The MSW layer in the interior of the golf course and community park portions of the Site ranges from 4 feet thick to 47 feet. Concentrations of methane, the primary component of LFG, are elevated in the MSW layer, with both mean and median concentrations above the LEL. However, as the LFG migrates upward toward the ground surface through the shaping layer, methane concentrations decline rapidly. Concentrations in samples collected at the surface in flux boxes were below the instrument's detection.

#### Site Perimeter

Along the northern and eastern perimeters of the Site, where the perimeter vent trench is located, methane concentrations have declined significantly. As described in Section 3.3.4, groundwater levels measured during biweekly piezometer monitoring events have been observed to be above the vent trench bottom depth since 2005. This demonstrates the effectiveness of the vent trench in controlling the migration of LFG in this area. Along the western perimeter of the Site, methane concentrations in the upper section of the shaping layer are below the LEL, thus precluding the need for placing LFG control measures in this area.

### 5.1.2 Planned LFG Control Measures

A description of the planned LFG control measures is included below and the type of LFG control measures to be installed for each Site feature is presented in Table 1-1 (see Figure 5-1 for a conceptual layout of the LFG control measures).

#### Site Interior

Methane generation, as shown in the 2010 LandGEM modeling, is currently estimated at approximately 1 cfm/acre or less, a very low rate that correlates well with the 1999 TRC AP-42 modeling. Elevated levels of subsurface methane are expected to decrease over time and, as described in Section 2, methane that exits the landfill via the permeable soil cover into the open atmosphere will quickly diffuse to negligible levels. Moreover, elevated subsurface levels do not result in

unsafe levels at the landfill's surface, as demonstrated by the lack of methane detection in the flux box measurements taken by TRC in October 2010.

In order to provide adequate ventilation to enclosed structures at the site, the migration of LFG into occupied structures or structures where there is an ignition source (such as electrical connections) needs to be prevented or minimized (to at or below the regulatory-prescribed levels). Thus, all on-site buildings will have an active sub-slab depressurization (SSD) system (see Section 5.3).

Although the data do not indicate the need for LFG control within the site interior (other than within enclosed structures), methane concentrations exceeded the LEL in 73 out of 135 samples within the MSW layer during the 2008/2009 TRC subsurface investigation. Hence, a passive venting system consisting of venting wells screened across the MSW layer will be installed as a precautionary measure (see Figure 5-1 and Appendix A for a layout of the venting system, and Section 5.2 for a design description). Figure 5-1 currently shows the location of passive vent wells within the golf course portion of the Site.

Also, methane was not present in the upper section of the shaping layer above the NYCRR Part 360 limit (25% LEL) for on-site structures. During the recent 2008/2009 TRC investigations, less than 10% of samples collected in the upper 2 feet of the Site subsurface were reported to have concentrations exceeding this limit. None of these sample locations, where methane was reported above the 25% LEL, were below the planned footprint of proposed onsite structures. Conservatively, an SSD system is proposed for installation underneath the footprints of the structures as a precautionary measure to allow the LFG to be directed to and vented at the rooftops. This design will mitigate the threat of exposure to building occupants and preclude explosive conditions. Refer to Figure 5-1 for locations of the planned buildings where a SSD system is planned and Section 5.3 for a design description.

Risk management measures to control LFG under subsurface features, including utility corridors, ponds, and lakes in the interior of the Site are described in Section 5.4.

### Site Perimeter

Because passive venting has been effective in reducing methane concentrations along the eastern and northern perimeters of the Site, the existing vent trench will continue to operate in accordance with the existing program requirements outlined in the Part 360 permit (see Figure 5-1).

LFG control along the western perimeter of the Site, where methane concentrations are below the LEL is not planned The East River will provide an effective block to off-site migration of LFG on the south side of the Site.

## 5.2 Passive Vent Well System Design

### 5.2.1 System Description

EEEPC has prepared a layout of the vertical passive gas vent wells for the golf course (see Figure 5-1 and Appendix A). The number of vent wells and their locations were selected to maximize the LFG removal efficiency while avoiding the golf course playing area using the following criteria, in order of priority:

- Vent wells were first located in areas exhibiting high historical subsurface and shaping layer LFG concentrations (see Figure 4-3).
- The locations were further biased toward areas exhibiting larger waste thicknesses because these areas could generate more LFG.
- The locations were then biased toward areas of higher shaping layer thickness and higher top of MSW elevations because these areas will influence LFG pressure build-up and/or lateral migration of LFG.
- The locations were selected to avoid subsurface utilities and playing areas of the golf course.
- The Site includes a network of vertical vent trenches along the northern and eastern boundaries that capture and release any LFG that laterally migrates towards these Site boundaries.
- The Site design includes a porous sand layer that will diffuse any LFG releasing from any preferential pathway in the shaping layer.
- Subsurface utilities that travel off-site or into/out of occupied structures will have soil/bentonite collars and additional passive vents installed (see Section 5.4).
- Water quality ponds will be lined up to their permanent pool elevations with a low permeability low density polyethylene (LDPE) liner and include passive vent systems. Ponds to be lined and passively vented include: K, L, M, P1, P2, and the irrigation lake. Pond P2 will be lined for its entire volume due to the presence of MSW encountered during excavation.
- The three enclosed buildings (maintenance facility, comfort station, and clubhouse/banquet facility) on the golf course will have active SSD systems with additional venting installed. The maintenance facility and comfort station are shown on the engineering drawings S-202.00, C-221.00/C-222.00, and C-321.00/C-322.00, respectively prepared for the DPR under Contract X.126-209M (TRC 2009b). Community and waterfront parks will have one comfort station each which will also be designed with active SSD systems. The community park is shown on the engineering drawings prepared for the DPR under Contract X.126-208M (TRC 2008), which were also included in the November 2009 Permit Application (TRC 2009a).

Twenty-five stand-alone vertical passive vents and 12 passive vents installed into utility pipe bedding material are planned for the site. There are approximately 190 acres not covered by ponds or buildings, which are vented separately. This equates to a frequency of one vent per 5 acres. It is anticipated that this same venting frequency will be applied to the waterfront park. The community park already has 12 passive vent wells installed, which is a greater frequency than one vent per 5 acres. The community park passive vent design is shown on Drawings H-1.1 through H-1.7 (submitted under separate cover). These drawings show that the stand-alone vertical vents facilitate venting through the aspirometric cowl. The drawings also show a sample port on the side of each vent stack that will facilitate the monitoring of the vented gases.

Passive venting, combined with an LFG generation rate that is more than 50 years past its maximum, the vertical vent trenches and those vents incorporated into utilities, SSD systems, and the pond liner systems will more than adequately vent the LFG such that all emissions and health and safety requirements are met.

These vents will work predominantly via a pressure gradient. The vertical vents will be screened for the entire thickness of the MSW layer and extend to below the lowest known water table. When the LFG pressure in the subsurface is higher than the atmospheric pressure, LFG will be conveyed towards the vent and released through the top of the vent. During periods of equal subsurface and vent pipe pressure, a smaller amount of LFG will be released via diffusion as the subsurface gas concentrations in or near the vent pipe seek to equalize with the atmospheric concentrations. Radii of Influence (ROIs) are calculated for active venting systems and do not apply to the performance of passive venting systems. Therefore, no ROI calculations can be made for the passive vents as the pressure gradient in the subsurface will convey LFG to the passive vents.

## 5.3 Sub-Slab Depressurization Systems for Building Structures

SSD systems will be installed for all enclosed buildings at the site. This includes the maintenance building, clubhouse/banquet facility, and comfort station at the golf course; and one comfort station each at community and waterfront parks.

The SSD systems will be designed to capture and actively vent LFG from beneath each building foundation. Vent piping will be installed to penetrate the foundation slabs at each building, and travel up through the roof via a suction fan to discharge accumulated LFG to the atmosphere.

At each building, an impermeable geotextile liner will be placed directly on top of a 12-inch thick gas permeable aggregate sub-base layer, beneath the entire building's floor slab. Sub-slab depressurization pit(s) will be installed in the aggregate layer. A six-inch diameter vertical riser pipe will extend from the SSD pit(s) through the building to the roof, where a suction fan shall be installed to actively vent LFG.

Sub-slab LFG concentrations will be monitored through monitoring points installed through the floor slabs of each building. Indoor air combustible gas levels will be monitored via combustible gas indicators installed throughout the buildings.

## 5.4 LFG Control in Subsurface Features

### LFG Control in Utility Corridors

All site utilities will be installed within the subsurface. Low-permeability soil/bentonite collars will be installed in utility corridors containing permeable pipe bedding materials at the building line into structures and where the utilities travel off-site. This will be done to prevent LFG from migrating laterally within pipe bedding and into buildings or off-site. These utilities are predominantly water and sanitary sewer lines but will include other utilities if they were installed with permeable pipe bedding material and they either enter a building or extend off-site.

Where such utilities are routed off-site through a perimeter vent trench, the soil collar will be installed immediately adjacent to the off-site side of the vent trench, thus allowing any gas traveling through the pipe bedding to be vented to the atmosphere through the vent trench. In locations where these utilities are not routed through a vent trench, a vertical passive vent will be installed immediately on the landfill side of the soil collar. In locations where these utilities travel into a building, the soil collar will be at the building line and a passive vent will be installed to vent the pipe bedding to the roof of the building.

Other utility LFG controls include air vents on vault and manhole covers and conduit seals and electrical connection.

Locations and details of the soil/bentonite collars and vent locations are shown on the Design Drawings prepared for the DPR under Contract X.126-208M (EEEPC 2012). The Design Drawings also include a detail of the conduit seals.

### LFG Control Underneath Ponds/Lakes

An irrigation lake with a geomembrane liner has been constructed in the northwestern area of the golf course. The liner is an impediment to the surface venting of LFG. A gas transmission layer has been installed underneath the geomembrane liner and is connected to perforated piping around the perimeter of the lake as shown on TRC's Contract Drawings H2.1, H2.2, and H2.13 of Contract X.126-109M (TRC 2009c). This perforated pipe enables the passive venting of LFG from beneath the liner. This venting system could be activated should contingency actions be needed as described below.

Should perimeter LFG monitoring data indicate the off-site migration of methane, this venting system allows for the contingency connection of an active blower. Section 6.3.4.1 discusses the conditions for this potential contingency action.

Water quality ponds will be lined with a low permeability liner up to their permanent pool elevation. The low permeability LDPE liner will include passive venting. Ponds to be lined and passively vented include: K, L, M, P1, P2, and the irrigation lake. Pond P2 will be lined for its entire volume due to the presence of MSW encountered during excavation. The water quality ponds are shown on TRC's Contract Drawings C3.4 through C3.9 of Contract X.126-109M (TRC 2009c) and C-351.00 of Contract X.126-209M (TRC 2009b). The water quality pond liner designs are shown in EEEPC's Supplemental Drawings of Contract X.126-109M (EEEPC 2011a). A geocomposite layer will transfer, via a pressure gradient, any LFG building up pressure beneath the liner to the perimeter trench perforated pipe, where it will be passively vented to the atmosphere. Once the gas reaches the atmosphere, it will diffuse quickly to negligible levels, as described in Section 2.

## Additional Risk Management Measures

The venting of enclosed but rarely occupied spaces, such as manholes, will be conducted by following confined space entry protocols, including active ventilation just prior to and during entry. A health and safety plan that addresses confined space ventilation, required air monitoring, and required personal protective equipment will be prepared and provided to NYSDEC.

# 6 Landfill Gas Maintenance and Monitoring Requirements

## 6.1 Introduction

Since 2000, DPR has performed bi-weekly LFG monitoring at on-site, perimeter, and off-site monitoring locations in accordance with the Site's 2005 Part 360 Permit (Permit No. 2-6006-00014/00013). Compliance with Part 360-2.17(f) requires methane concentrations at the site boundary to be less than the LEL. However, the 2005 Permit required the Ferry Point site to comply to a more restrictive criteria of 25% LEL as the action level for which additional sampling and reporting was required. The Part 360 renewal application for the site will comply with the regulatory guidance of NYCRR Part 360-2.17(f) for LFG monitoring and reporting, as described below in Section 6.1.1.

The required operations, maintenance, and monitoring (OM&M) actions presented in this document will be incorporated into the Part 360 permit renewal application for the Site.

LFG monitoring is planned using existing LFG probes, and will be conducted in accordance with this Plan. Figure 3-2 shows the location of LFG monitoring probes and piezometers.

### 6.1.1 Regulatory Guidance

The NYCRR Part 360 "Solid Waste Management Facilities" regulations concerning LFG were used as guidance in developing the OM&M program. The following criteria will be used for the Site:

Part 360-2.17(f):

- Concentration of explosive gases must not exceed 25% LEL in on-site and off-site structures; and
- Concentration of explosive gases must not exceed LEL at the property boundary.

Because of the planned future uses of the site as a golf course, banquet facility, and public park, the LFG monitoring plan provides a comprehensive program for future monitoring and maintenance, with specific contingency actions as needed.

Continuous monitoring for methane will occur in all enclosed buildings at the Site for the protection of occupants.

## 6.2 Monitoring Activities through Completion of Golf Course Construction

LFG monitoring activities through the completion of construction will continue to comply with the existing 2005 Part 360 permit special conditions, as summarized below. OM&M personnel for the site will remain as-is (AES or other DPR authorized gas monitoring subcontractor) through turnover of the project to post-construction operations.

- Special condition 26: Monthly inspections shall be performed of the gas venting trench to verify the integrity of the trench and mulch cover. The gas venting trench shall be maintained at all times and soil washouts promptly repaired. Mulch cover shall be replaced at a minimum every spring to maintain the effectiveness of the trench.

- Special condition 30: Monthly groundwater elevation gauging shall be performed to measure the depth to groundwater in each piezometer installed at the gas venting trench until completion of construction. If groundwater elevation in an individual piezometer is measured below the base of the vent trench during a single event, DPR will implement a response plan in accordance with special condition 31 of the 2005 permit. This response plan supersedes the requirements outlined in Exhibit I of Volume II of TRC's 2005 Engineering Report.

- Special condition 31: In the event groundwater level in an individual piezometer is measured below the base of the perimeter vent trench, the following actions will be taken:

    1. NYSDEC will be notified within 24 hours of an individual detection of groundwater elevation below the base of the trench.

    2. Frequency of piezometer monitoring will be switched to bi-weekly if two consecutive exceedences of LEL occur at nearby gas probes; or two consecutive groundwater elevation measurements in the piezometer are reported below the trench elevation.

    3. Monitoring will return to its routine frequency when groundwater elevation in the piezometer is reported above the base of the trench for three consecutive bi-weekly measurements; or methane measurements in nearby probes drop below the LEL for three consecutive measurements.

- Special conditions 32 and 34: Bi-weekly monitoring shall be performed for perimeter gas monitoring wells (0, 1A, 1 to 3, 5 to 12, and 14 to 18) and on-site monitoring wells (13 and 19).

If any individual monitoring point has a reading equal to or greater than 100% LEL or three consecutive bi-weekly readings greater than 25% LEL, monitoring will be performed weekly for the individual points with the elevated readings. An individual monitoring point will return to the regular bi-weekly monitoring schedule when three consecutive weekly readings are measured below the 25% LEL.

- Special conditions 36 and 37: Bi-weekly monitoring shall be performed for the off-site gas monitoring network.

  If any individual monitoring point has a reading that equals or greater than 100% LEL, or three consecutive bi-weekly readings greater than 25% LEL, monitoring will be performed weekly for the individual points with elevated readings. An individual monitoring point will return to the regular bi-weekly monitoring schedule when three consecutive weekly readings are measured below 25% LEL.

- As per NYSDEC's January 3, 2011, letter, additional LFG monitoring parameters will be added to the gas probe monitoring program for the remainder of Site construction. These parameters will continue to be monitored post-construction. These parameters include hydrogen sulfides, VOCs, and carbon monoxide, reported in parts per million (ppm); and well temperature and pressure.

## 6.3 Post-construction Monitoring and Maintenance

The information presented in the post-construction monitoring and maintenance plan is organized as follows:

- Description of OM&M personnel and responsibilities;
- Description of site gas monitoring and maintenance infrastructure, and the activities that will occur for each monitoring and/or maintenance event;
- Schedule of proposed maintenance and monitoring frequency;
- Performance criteria for:
  - Contingency actions,
  - Reduction in maintenance/monitoring,
  - Abandonment of gas venting and monitoring infrastructure; and
- Record keeping and reporting requirements.

Monitoring locations and frequencies are summarized in Table 6-1. O&M forms are included in Appendix D.

### 6.3.1 OM&M Personnel

#### New York City Departments of Parks and Recreation

The DPR is responsible for maintaining this OM&M Plan and ensuring that the LFG control systems are operated and maintained.

#### LFG Monitoring and Maintenance Supervisor

The LFG monitoring and maintenance (LFG M&M) supervisor will be an employee of DPR, oversee all Site LFG monitoring and maintenance activities, and serve as the primary point of contact for DPR for OM&M activities for the Site's LFG control systems. This individual shall be required to have a minimum of 5 years experience with the monitoring and reporting of LFG. The individual will be proficient in operating and maintaining gas monitoring equipment. They will have completed the initial 29 CFR 1910.120 (OSHA 40-hour HAZWOPER) training, and maintain the annual 8-hour refresher training. The LFG M&M supervisor has responsibility and authority to direct all OM&M work activities. The LFG M&M supervisor will maintain the necessary monitoring personnel for the required maintenance and monitoring activities.

#### LFG O&M Personnel

Each inspection/monitoring event will be performed by up to two personnel, who shall have prior experience with LFG monitoring, and who will be assigned by the LFG M&M supervisor. O&M personnel will be trained in the operation and maintenance of gas monitoring equipment and have completed the initial 29 CFR 1910.120 (OSHA 40-hour HAZWOPER) training, and maintain the annual 8-hour refresher training.

The duties of the LFG operation and maintenance (O&M) personnel include:

- Routine monitoring, maintenance, and inspections as detailed in Section 6.3.2;
- Performing contingency activities as detailed in Section 6.3.4.1; and
- Providing completed LFG O&M forms to the LFG M&M supervisor.

#### New York State Department of Environmental Conservation

NYSDEC is the regulatory agency under whose oversight maintenance and operation of LFG control systems will be conducted.

### 6.3.2 LFG Monitoring and Maintenance Infrastructure

#### 6.3.2.1 Perimeter LFG Probes

Perimeter probes are located at approximately 250-foot intervals along the north, east, and southern site boundaries (refer to Figure 6-1 for probe locations and Exhibit H of Volume II of the TRC 2005 Engineering Report for probe completion details).

**Routine Monitoring and Maintenance**
During each event, OM&M personnel will:

1. Record the following field measurements at each location:
   a. Methane (% by volume and % LEL), $O_2$ (% by volume), hydrogen sulfides (ppm), VOCs (ppm), and carbon monoxide (CO) (ppm).
   b. Well temperature degrees Fahrenheit (°F) and well pressure pounds per square inch (psi).

2. Observe the probes and surrounding ground surface for damage and settlement, and make repairs as necessary (inspect inner and outer casings, check sample tube for holes or cuts, and make sure it is not kinked, make sure valve is operable, replace bolts, well lid, and check well locks as necessary). A summary of necessary repairs will be included in the Annual Report.

3. Complete a monitoring report following each event.

### 6.3.2.2 Off-site LFG Monitoring Network

Off-site probes are located along Buttrick, Balcom, Schley, Miles, and Emerson, avenues (see Figure 3-1 for probe locations and AKRF [2002] for probe construction details).

**Routine Monitoring and Maintenance**
During each event, OM&M personnel will:

1. Record the following field measurements at each location:
   a. Methane (% by volume and % LEL), $O_2$ (% by volume), hydrogen sulfides (ppm), VOCs (ppm), and CO (ppm).
   b. Well temperature (°F) and well pressure (psi).

2. Observe the probes and surrounding ground surface for damage and settlement and make repairs as necessary (inspect inner and outer casings, replace bolts, well lid, and check well locks). A summary of necessary repairs will be included in the Annual Report.

3. Complete a monitoring report following each event.

### 6.3.2.3 Piezometers

In 2002, 25 piezometers were installed to evaluate the groundwater elevation relative to the bottom of the passive-vent trench (see Figure 6-1 for piezometer locations and Exhibit I of Volume II of TRC's 2005 Engineering Report for piezometer details).

**Routine Monitoring and Maintenance**
During each event, OM&M personnel will:

1. Record the following field measurements at each location:

a. Depth to groundwater in the piezometer.

2. Observe the piezometers and surrounding ground surface for damage and settlement and make repairs as necessary (e.g., inspect inner and outer casings, replace bolts, well lid). A summary of necessary repairs will be included in the Annual Report.

3. Complete a monitoring report following each event.

#### 6.3.2.4 Passive Vent Trench

The passive-vent trench is installed along the eastern perimeter of the Site and along a portion of the northern Site perimeter. The passive vent trench will be inspected annually, and maintained by DPR to verify the trench is operating as designed. During each event, OM&M personnel will:

1. Observe the vent trench for soil washouts of the mulch cover or other visible signs of damage.

2. Replace mulch cover for areas noted to have washouts.

3. Remove any woody vegetation that has accumulated in the trench.

4. Restore to grade any areas observed to have settled or eroded.

5. Complete a maintenance report, noting the schedule for any maintenance unable to be completed during the original event.

#### 6.3.2.5 LFG Passive Vents

The passive venting system consists of:

- 25 individual vents within the golf course interior (See Appendix A – Passive Vent Layout and Details – Sheet S-H11.01 and SH11.02 for locations of these vents.)

- 12 passive vents inserted into utility pipe bedding material within golf course interior

- 12 passive vents within the community park.

- Additional passive vents as-needed for site features such as water quality pond liners.

Passive vents are intended to relieve LFG pressure buildup within in the buried waste and prevent offsite gas migration. Data trends observed in onsite probes MW-4R and MW-19 (Appendix C – LFG Monitoring Data - Sheets S-H6.01 and S-H6.02 –Existing Gas Monitoring and Venting Plan) illustrate the behavior of LFG that is anticipated at passive vent locations that are drilled into areas where

LFG is present. Elevated methane levels might be observed for up to several years following installation when decreased methane levels are expected.

The 25 stand-alone passive vents will be monitored for stack height reduction eligibility and decommissioning purposes, as described in Section 6.3.4.3 – Decommissioning of LFG Management Infrastructure. Passive vents will have an access port to facilitate monitoring. Passive vent monitoring will occur during routine vent inspection.

Routine monitoring of perimeter probes is based on the regulatory requirements outlined in Section 6.1, and will continue to detect the potential of off-site gas migration and be used for the recommendation of contingency actions for the Site.

Elevated levels of methane in a vent do not indicate an unsafe surrounding, since the vents are designed to transport LFG from within the landfill to the atmosphere for dispersal. Contingency actions for the stand-alone passive vents are given in Section 6.3.4.

### Routine Maintenance and Inspection

During each event, OM&M personnel will:

1. Observe the ground surface around the vents and confirm that the vents are firmly anchored in their original intended position.

2. Observe the vent riser and confirm absence of damage to vent piping.

3. Provide general upkeep, including:
   a. Removing excessive vegetation at and around the vent area,
   b. Repairing any erosion or settlement around the vent riser, and
   c. Repairing any damage to vent risers, as necessary.

4. Monitoring of the 25 stand-alone passive vents within the golf course will be performed to evaluate stack height reduction eligibility. These measurements will be recorded and reported in the maintenance or inspection report.

   Perimeter probe monitoring will be used to determine if methane may be migrating off site. Contingency actions are discussed in Section 6.3.4.1.

   The following parameters will be measured and recorded:

   a. Methane (% by volume and % LEL), $O_2$ (% by volume), hydrogen sulfides (ppm), VOCs (ppm), and CO (ppm)
   b. Vent temperature (°F).

5. Complete a maintenance report, noting the schedule for any repairs/maintenance unable to be completed during the original event.

#### 6.3.2.6 Sub-Slab Depressurization Systems

SSD systems are proposed for enclosed buildings at the Site. Monitoring requirements for SSD systems are presented in this section. The locations of the enclosed buildings where the SSD systems are to be installed are presented in Figure 3-2, Monitoring Locations. The proposed SSD systems must be approved by both NYSDEC and the New York State Department of Health (NYSDOH) prior to installation. Upon completion of the detailed design of these systems, DPR will provide NYSDEC with the manufacturer's specification sheets for the vapor barrier materials; manufacturers' operation and maintenance manuals for all vapor monitoring and control systems; and sizing calculations for vent fans. Installation and proper functioning of the SSDS shall be certified by a Professional Engineer registered in New York State.

The following buildings will have SSDSs:

- Golf Course Comfort station, as shown on drawings X-002.00 through X-005.00 (TRC 2009b);
- Golf Course Maintenance Facility, as shown on drawings X-001.00 and X-003.00 through X-005.00 (TRC 2009b);
- Community Park Comfort Station, as shown on drawing EV-1 (Whitestone Associates 2009);
- Golf Course Clubhouse (not yet designed); and
- Waterfront Park Comfort Station (not yet designed).

Any new structures at the Site will be designed in accordance with New York City Department of Buildings permitting procedures. The need and extent of LFG mitigation systems for future site structures will be evaluated on a case by case basis.

#### Routine Maintenance and Inspections

System inspections will be performed on a routine basis for the site's SSD systems. During each event, OM&M personnel will:

1. Perform routine maintenance on the SSD equipment based on manufacturer's manuals, including calibration of the methane gas monitors using standard gasses.

2. Download continuous SSD monitoring data retained by the system controller at each building.

3. Complete maintenance activities indicated by equipment manufacturers of the respective systems.

4. Complete an inspection report, with the following readings:
   a. Sub-slab vacuum readings at the sub-slab monitoring points located within each building,
   b. Vacuum gauge readings located on the suction fan inlet, and

c. Note the schedule for any maintenance unable to be completed during the original event.

### Real-Time Monitoring and Contingency Actions for Occupied Structures

Each enclosed facility will have at least one continuous combustible-gas monitor that will transmit real-time methane readings to a system controller. The installed system will be capable of retaining the readings and generating reports that include date, time, and methane concentration.

One air-flow switch will be installed for each suction fan. The switch will detect and transmit low-flow conditions to a system autodialer.

An autodialer system will enable the DPR to be notified remotely based on "early warning" indicators. Early warning levels will be set to allow time for corrective action to be taken before methane levels reach 25% LEL in the enclosed space.

Early warning indicators will identify the following conditions:

- Reduction of system flow rate below what is required for effective operation.
- Detection of methane levels at a sentinel concentration of 10% LEL.

Visible and audible alarms will occur at levels of 25% LEL and above to signal the need for building evacuation. Upon notification of elevated methane levels, the building will be evacuated and ventilated. Building occupants will be allowed to re-enter the enclosed facility only after continuously monitored LEL levels drop below 25% LEL.

If methane readings exceed 25% LEL in an enclosed space, NYSDEC will be notified within 24 hours of the event.

### 6.3.2.7 Irrigation Lake Venting System

An irrigation lake with a geomembrane liner has been constructed in the northwestern area of the golf course. The liner is an impediment to the surface venting of LFG. A gas transmission layer has been installed underneath the geomembrane liner and is connected to perforated piping around the perimeter of the lake as shown on TRC's Contract Drawings H2.1, H2.2, and H2.13 of Contract X.126-109M. This perforated pipe enables the passive venting of LFG from beneath the liner. This venting system could be activated should contingency actions be needed as described below.

Should perimeter LFG monitoring data indicate the off-site migration of methane, this venting system allows for the contingency connection of an active blower. Section 6.3.4.1 discusses the conditions for this potential contingency action.

### 6.3.3 LFG Monitoring Schedule

Implementation of the post-construction monitoring plan will collect data necessary to meet the regulatory guidance and to confirm the effectiveness of the installed LFG control measures. The monitoring program will be used to confirm that future LFG conditions are consistent with noted historical trends and LandGEM model projections.

#### Basis for Proposed Monitoring Schedule

A review of Site data from 2000 to April, 2012 was performed to create the basis for the recommended method of post-construction gas monitoring. The data review included five bi-weekly monitoring events that occurred after the well repairs (including retrofits) were made. LFG design criteria and LandGEM modeling data were also reviewed.

Methane emissions modeling performed by both TRC in 1999 (AKRF 1999) and EEEPC in 2010 projected estimates that were approximately 10% of the peak generation rate, and were higher in concentration than actual field measured emissions obtained through the 2010 flux box sampling event (see Figure 6-1). The flux box sampling event found no reportable surface methane concentrations at any of the 30 on-site test locations.

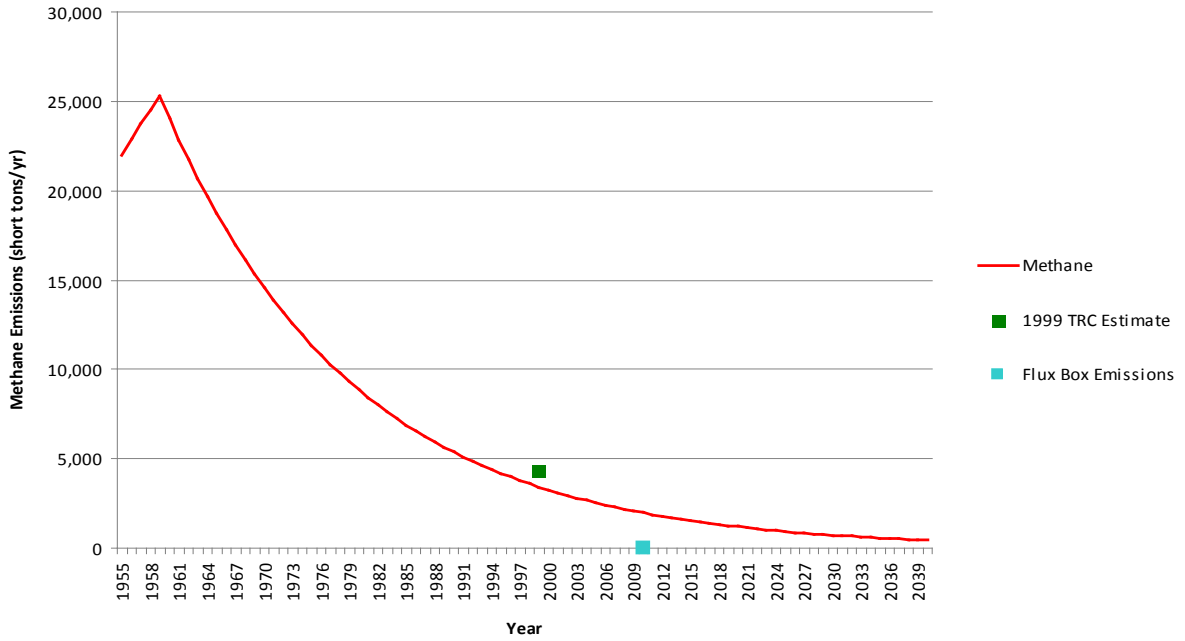

**Figure 6-1 LandGEM Emissions Model Results**

#### Piezometer Measurements

In compliance with the current permit and consistent with Part 360-2.15(f) performance objectives, the DPR has taken groundwater elevation measurements bi-weekly at piezometer locations. The data collected from 2007 through 2010 demonstrates that groundwater elevations in the piezometers have been above the base of the vent trench during the entire period.

#### 6.3.3.1 Proposed Monitoring Frequencies

The monitoring schedule below is proposed as the initial post-construction monitoring plan. Adjustments to monitoring frequencies will be requested of NYSDEC upon meeting the performance criteria thresholds identified in this document. DPR will submit a request with supporting documentation to NYSDEC 30 days prior to the desired date of the proposed change in monitoring. DPR will not change monitoring frequencies until the request has been approved.

All wells that have not been approved for abandonment by NYSDEC, have undergone the repairs necessary to bring them into compliance with the current Part 360 Permit. Data collected from the repaired well locations has been used, with the historic data to recommend the initial monitoring frequencies shown in Table 6-1.

- Perimeter and off-site gas probes that reported detections of methane above 25% LEL in the last five years of monitoring (since 2006) will be monitored quarterly. Inspections and maintenance at these locations will be performed during monitoring events.

- Perimeter and off-site gas probes that reported no detections of methane above 25% LEL in the last five years of monitoring (since 2006) will be monitored annually. Inspections and maintenance at these locations will be performed during monitoring events.

- On-site LFG monitoring probes will not be included in the post-construction monitoring program. Inspections and maintenance at these locations will be performed annually.

- Piezometers locations will be monitored and inspected monthly.

- The 25 stand-alone passive vents within the golf course boundary will be inspected approximately one month after completion of installation of all vents. Inspections will occur quarterly for the first year following installation, and continue annually thereafter. NYSDEC reserves the right to require an inspection frequency other than annual after the first year. Inspections of passive vents include LFG monitoring as described in Section 6.3.2.5.

- The remaining passive venting infrastructure, including the passive vent trench, and vents for Community Park, water quality ponds, and utility soil collar vents will be inspected annually.

- Monitoring in enclosed structures will be conducted using combustible gas monitors that will record real-time methane concentrations. System alarms will be monitored and maintained inside these structures. Inspections and maintenance of sub-slab depressurization systems at enclosed structures will be performed quarterly.

Monitoring will continue at the frequency outlined in this Plan until: 1) the DPR provides NYSDEC a formal request to change the monitoring frequencies along with supporting documentation and 2) the request is approved by NYSDEC. Additional inspections of passive venting infrastructure may occur upon the implementation of contingency activities, as discussed in Section 6.3.4.1.

**Table 6-1 Post Construction Landfill Gas Initial Monitoring Frequency**

| Location | Number of Methane Detections Above 25% LEL | | | Proposed Monitoring Frequency[1,2] |
|---|---|---|---|---|
| | August 2000 – January 2010 | January 2006 – January 2010 | Post-Retrofit 2/21/12 – 4/16/12 | |
| **Perimeter LFG Monitoring Probes** | | | | |
| **MW-0** | **176** | **61** | NA | None – Abandoned. Replaced with onsite MW-0REP |
| MW-1 | **41** | 0 | NA | None (Previously Decommissioned) |

Notes:
1. Locations selected for annual monitoring - No detections of methane above 25% LEL since January 2006.
2. Locations selected for quarterly monitoring - At least one detection of methane above 25% LEL since January 2006.
3. On-site wells will not be included in post-construction monitoring.
4. Off-site probe locations selected for abandonment based on proximity to other monitoring points.

### 6.3.4 Gas Monitoring Performance Criteria

#### 6.3.4.1 Contingency Actions for LFG Monitoring Wells and Gas Management Infrastructure

The following contingency actions are recommended for post-construction site operations for LFG monitoring wells and gas management infrastructure:

- NYCDPR will provide verbal and electronic notification within 24 hours of an individual LFG measurement exceeding the criteria established in the Part 360 Permit to FDNY, NYCHA, NYSDEC, and NYCDOHMH, according to the following guidelines:
  - NYSDEC & FDNY – Will be notified for all post-construction monitoring events and contingency action events where an exceedance is observed.
  - NYCHA & NYCDOHMH – Will be notified for post-construction monitoring and contingency action events where an exceedance is observed within an enclosed building, or at a perimeter or offsite monitoring location. Enclosed buildings are defined as those buildings within the site that have sub-slab depressurization systems: golf course maintenance building, clubhouse, comfort station/snack bar and community park comfort station.
  - All monitoring, maintenance, and contingency actions will be documented and kept at the NYCDPR Bronx Borough Office (Ranaqua), Bronx Park, Bronx, New York.

- If two consecutive measurements above 100% LEL occur at any perimeter gas monitoring probe, or at an offsite gas monitoring probe located on Emerson, Miles, or Balcolm avenues, a monitoring and maintenance event will be performed within seven days following the second consecutive measurement and consist of the following:
  1. Inspection and maintenance of the perimeter vent trench within 100 feet on either side of the individual probe location.
  2. Water level gauging at the two nearest piezometers to the individual probe location.
  3. Inspection of any additional passive venting infrastructure located within a 100-foot radius of the individual probe location for damage and overgrowth.
  4. Follow up monitoring for all parameters at the individual probe location two weeks after completion of the items above.

  If contingency maintenance reveals a potential cause for the elevated methane measurements (e.g., vent trench clogged and water levels below trench), this will be reported to NYSDEC and routine monitoring frequency will resume once maintenance is complete, and follow-up monitoring indicates levels have dropped.

  If monitoring following contingency maintenance indicates that methane levels remain above 100% LEL, the following actions will be completed and reported to NYSDEC within 45 days of completion of initial contingency maintenance:
  1. Review of recent elevated detections at nearby monitoring locations.
  2. Evaluation of methane levels at the property boundary and off-site, if necessary.
  3. Evaluation of potential outside causes of elevated methane (i.e., mulching/composting activities nearby).
  4. Evaluation of potential Site disturbances (i.e., excavation or construction) that may have resulted in the movement of subsurface methane.
  5. A proposed plan for the mitigation of elevated methane, which includes:
     a. Mitigation of outside causes of elevated methane, if identified.
     b. LFG monitoring in the vicinity of site work to determine impacts resulting from site activities.
     c. Inspection and maintenance of passive vent trench.
     d. Follow-up monitoring to confirm methane levels following completion of contingency actions.
  6. Evaluation for the potential installation of additional venting infrastructure may be considered if the contingency actions above are shown to be ineffective. These include:
     a. Installation of additional individual passive vents, and
     b. Installation of active blower system for the irrigation lake;

- Off-site probes on Buttrick and Schley avenues are believed to be located near an off-site source of methane. In addition, perimeter gas probes exist on

Schley Avenue which will indicate the presence of methane at the Site boundary. Therefore, elevated methane measurements at off-site probes located on Buttrick and Schley avenues will not require contingency actions.

- For the twenty-five stand-alone passive vents at the golf course:

If the routine vent inspections indicate that any stand-alone passive vent is not functioning as designed, DPR will:

1. Perform a 25-foot radius scan using the LFG monitoring instrument around that vent to confirm safe conditions in the breathing zone.

2. Prepare a specific work plan to evaluate conditions at that vent and recommend contingency actions.

#### 6.3.4.2 Performance Criteria for Reduction of LFG Monitoring

The following performance thresholds will be used as guidance reductions in monitoring frequency. When the data thresholds assigned show that site conditions are acceptable for such reductions, DPR will provide NYSDEC with the supporting documentation and a request to change the monitoring frequency, for NYSDEC review and approval.. These thresholds apply to the post-construction period only.

For perimeter, on-site and off-site probes initially subject to quarterly monitoring:

- Following three consecutive years of quarterly methane measurements below 25% LEL at an individual location, DPR will request that monitoring at that location will be reduced to annually.

- Following two additional consecutive years of annual methane measurements below 25% LEL at an individual location, DPR will request that monitoring at that location will be discontinued and decommissioned. Discontinued gas monitoring locations may be selected for decommissioning upon approval by NYDEC.

For perimeter, on-site and off-site probes initially subject to annual monitoring:

- Following five consecutive years of annual methane measurements below 25% LEL at an individual location, DPR will request that monitoring at that location will be discontinued. Discontinued gas monitoring locations may be selected for decommissioning upon approval by NYSDEC.

For piezometers (all subject to annual monitoring):

- Following five years of annual groundwater measurements above the base elevation of the perimeter vent trench at an individual location, DPR will request that monitoring at that location will be discontinued. Discontinued pie-

zometer locations may be selected for decommissioning upon approval by NYSDEC.

#### 6.3.4.3 Decommissioning of LFG Management Infrastructure

LFG monitoring and mitigation systems will be evaluated for phase-out and decommissioning as described in the sections below. DPR will submit a request with supporting documentation to NYSDEC 30 days prior to the desired date of decommissioning of any LFG mitigation infrastructure. Decommissioning of LFG management infrastructure will not occur until after the request has been approved by NYSDEC.

**Perimeter, On-Site and Off-site Monitoring Probes**

Decommissioning of perimeter, on-site and off-site gas probes will be requested when an individual location has met the criteria for removal from the monitoring program.

**Off-site Probes in Buttrick/Schley Avenue (North and South) Areas:**

Persistent methane detections in probes, located on Buttrick/Schley Avenue areas are attributed to a source separate from a landfill. The DPR has performed desktop and field evaluations to determine the source of the methane measurements.

1. Historic mapping shows the previous presence of marshlands, which are a likely contributor to elevated subsurface methane.

2. Following installation of the landfill gas perimeter vent trench, no significant changes in the elevated methane levels on Buttrick Avenue were observed.

3. LFG fingerprint testing for selected wells on Buttrick Avenue was attempted in June 2011. Monitoring following well purging observed methane levels too low on this occasion to obtain sufficient samples for laboratory analysis.

Due to these considerations, decommissioning of these probes may be requested of NYSDEC prior to meeting the criteria established in this document.

**Piezometers**

Monitoring of perimeter piezometer locations within the LFG vent trench will continue while LFG monitoring continues at perimeter gas monitoring locations. Once data shows that all perimeter gas monitoring locations have met the criteria for removal from the monitoring program, monitoring of the piezometers will also be discontinued, and piezometer locations will be abandoned in place, pending approval by NYSDEC.

**Passive Vent Trench**

Maintenance of the passive vent trench will continue while LFG monitoring continues at perimeter gas monitoring locations. Once data shows that all perimeter gas monitoring locations have met the criteria for removal from the monitoring

program, inspections of the vent trench and its use as a passive gas mitigation method will be discontinued, pending approval by NYSDEC.

### Passive Venting Systems

The 12 community park vents will remain in place after LFG monitoring and mitigation activities cease, due to their incorporation into park facilities. Once it is determined that on-site and perimeter monitoring can be discontinued, inspections of these vents and their use as a passive gas mitigation method will be discontinued, pending approval by NYSDEC.

Passive vents associated with utilities, structures, and ponds may be selected for decommissioning on site, pending approval by NYSDEC.

The 25 stand-alone passive vents within the golf course boundary will be monitored for stack height reduction eligibility only during annual inspection events. The stand-alone passive vents are designed with a sampling port to facilitate monitoring. Vents will be eligible for a stack height reduction according to the following:

- Following five years of methane detections reported below the LEL at an individual vent location, vent height will be reduced to 6 inches above ground surface. Reduced height vents will continue to remain in service and be fitted with an appropriate cover to allow venting and protect from damage or foreign objects.

The 25 stand-alone passive vents within the golf course boundary may be selected for decommissioning, pending approval by NYSDEC. Once on site and perimeter monitoring locations have shown compliance with the criteria for removal from the monitoring program, inspections of the vents and their use as a passive gas mitigation method will be discontinued.

DPR will submit a request with supporting documentation to NYSDEC 30 days prior to the planned date to decommission of any passive venting locations. DPR will not take action until the request has been approved by NYSDEC.

### SSD Systems

Once it is determined that all of the 25 stand-alone onsite passive vents have been decommissioned based on the decommissioning guidelines provided in this document and upon approval by NYSDEC, SSD systems will be phased out of active operations. At this time the SSD systems will be retrofitted to enable passive venting. Continuous methane monitors and alarms will remain in place inside each building, and be maintained until approval to discontinue continuous monitoring is granted by NYSDEC.

## 6.4 Record-Keeping and Reporting

### 6.4.1 Record-Keeping

All project documents, maintenance, and monitoring records will be held at the NYCDPR Bronx Borough Office (Ranaqua), Bronx Park, Bronx, New York. An additional copy of the LFG OM&M plan will be maintained at the Site's Maintenance Facility office. Project documents held by the DPR will include:

- Construction Specifications;
- Record Drawings;
- Ferry Point Landfill Gas Management Plan;
- Ferry Point Landfill Gas Operations, Maintenance, and Monitoring Plan; and
- Equipment Manufacturers Operations and Maintenance Documents and Specifications.

Monitoring personnel will be required to fill out the forms enclosed in Appendix D upon completion of the respective Site activity. Completed forms will be kept on-site for a minimum of one year and retained by the DPR thereafter. These documents will be provided to NYSDEC as part of the Annual Report.

### 6.4.2 Contingency Reporting

#### LFG Monitoring Locations

- NYSDEC will be notified within 24 hours if methane is detected above the LEL during monitoring activities.
- NYSDEC will be notified within 24 hours when methane detections indicate contingency actions are necessary.
- NYSDEC will be notified within seven days following completion of contingency actions.
- The DPR will prepare and submit a follow-up report to NYSDEC upon completion of contingency actions.

#### Piezometer Monitoring Locations

- NYSDEC will be notified within 24 hours if groundwater elevation is detected below the base of the passive-vent trench during monitoring activities.

### Sub-slab Depressurization Systems

- NYSDEC will be notified within 24 hours if methane levels are reported above 25% LEL.

### 6.4.3 Annual Reporting

The DPR will prepare and submit an Annual Report to NYSDEC describing monitoring activities each year. Observation, repair, and monitoring reports will be included as appendices to the annual report. Annual reports will be submitted until the phase-out and decommissioning of all LFG-control systems and monitoring locations has occurred. The annual report will be submitted to NYSDEC by March 31 of the year following the monitoring period.

# TABLE OF CONTENTS

**SECTION** **PAGE NO.**

1 Introduction ..... 6

1.1 Purpose ..... 6

1.2 Report Organization ..... 6

1.3 Background Information ..... 7

1.3.1 Project Scope ..... 7

1.3.2 Project Site ..... 7

1.3.3 Key Agencies ..... 9

1.3.4 Independent Environmental Monitor ..... 10

1.3.5 Project and Part 360 Permitting History ..... 10

1.3.6 Construction Drawings ..... 19

2 Part 360 Permit ..... 20

2.1 Part 360 Permits and Modifications ..... 20

2.2 Reference Documents ..... 20

2.3 Non-Conformance Issues ..... 20

2.4 Operational Upsets, Emergencies, and Unusual Circumstances ..... 20

2.4.1 Security breaches, Unauthorized Entries, Injuries, Fires, Theft, Vandalism, etc. ..... 20

# 1 Introduction

## 1.1 Purpose

This Final Construction Certification Report for the Ferry Point Park Golf Course is submitted to the New York State Department of Environmental Conservation upon completion of the construction of Ferry Point Park East, a solid waste management facility, which includes the resultant information prepared in accordance with 6NYCRR Part 360 of the New York State Solid Waste Management Program.

This report is to certify that the construction of Ferry Point Park East has been completed in accordance with the 6NYCRR Part 360 and the Ferry Point Park Part 360 permits. Therefore, this report will present in great detail each specific approved component of the project – what was approved, what was actually constructed initially (with pictures), the changes that were made, and the final status and design as of the date of this report (with pictures).

## 1.2 Report Organization

This report has been generated to provide a written post-construction certification report to comply with the requirements of the Project's Part 360 Permits. The narrative and supporting information provided in this report have been organized such that any individual, especially those not familiar with the project, can gain a concise understanding of the history of improvements at the Site. As such, the report has been organized into the following sections:

- This report begins with this introductory chapter (Section 1) which briefly describes the purpose and scope of the project, provides details pertaining to the Site background including a Site description, key agencies involved, and Project and permitting history.

- Section 2 describes the Part 360 Permits and modifications, Permit reference documents, non-conformance issues, operational upsets, emergencies, and unusual circumstances, and reporting completed associated with the Project.

- Section 3 details the fill importation QA/QC program, specifically source site reviews for shaping layer and cover layer material, on-site fill importation inspection, trucking manifests, rejected trucks and materials, fill tracking, and total carcinogenic semi-volatile organic compound tracking.

- Section 4 provides details related to construction activities on-site including construction of the Community Park and the Golf Course, status of the Waterfront Park, environmental controls such as landfill gas wells, groundwater wells, liners, gas venting systems, vent trench, landfill cap, municipal solid waste handling, earthwork and fill placement, demarcation layer, miscellaneous golf course materials such as greens and tees mix, construction progress meetings, and deviations from the approved design plans and/or Permit requirements with as-built surveys.

- Section 5 details the environmental monitoring completed during the Project including Stormwater Pollution Prevention Plan (SWPPP), landfill gas, piezometer, settlement plate, and groundwater monitoring as well as information related to the deed restriction and post construction monitoring requirements at the Site.

- Section 6 provides a summary of the report.

- Report certification is provided in Section 7.

## 1.3 Background Information

### 1.3.1 Project Scope

Ferry Point Park in the Bronx (the "Site") is a former landfill covering 222 acres that is bounded by the Bronx-Whitestone Bridge and Hutchinson River Parkway to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond's Cemetery to the north, and the East River to the south (See Figure 1-1 Ferry Point Park Project Area Map). The project was originally managed under Ferry Point Partners, LLC and was taken over solely by the City of New York Department of Parks and Recreation in October 2007.

The original project scope (the "Project") included the construction of three main elements including a golf course, a community park, and a waterfront park over the 222-acre Site (see Figure 2-1 Ferry Point Park Site Layout) as follows:

1. An 18-hole golf course with practice facility, driving range, clubhouse, maintenance facility, irrigation lake, stormwater retention ponds, and a parking lot (192.5 acres);
2. A passive recreation waterfront park with walkways and a comfort station (19.5 acres); and
3. A community park with baseball fields, basketball court, walkways, comfort station, and landscaped stormwater retention area (10 acres).

### 1.3.2 Project Site

The origins of the site for purposes of presenting a description of the site and surrounding area for this report extend back to the early 1900's. At that time an available 1900 map of the Bronx (Figure 2-2) showed the western edge of the site which now contains the expressway and Whitestone Bridge was a long narrow peninsula extending out to the same area that the northern landing of the Whitestone Bridge now extends to. Immediately east of this peninsula was a large open bay which is the area that the Ferry Point Golf Course is located within. Further to the northeast of this bay and well inland and beyond the current golf course was the Baxter Creek that drained into the bay. The eastern landfall of this embayment area is a larger peninsula that contains roadways and what appears to be residential development. The road patterns do not resemble the roadways that currently exist in that area and appear to have been changed.

A 1938 aerial photo (Figure 2-3) showing the construction of the Whitestone Bridge shows the Bay, mooring, residential area and land to the west to be virtually the same as shown in the 1900 map (Fig. 2-2). The significant change is in the widening of the western peninsula where the expressway was being constructed leading to the bridge ramps. The widening was not significant at this time but a rectangular area in the extreme northwest corner of what is now the site does appear to be filled and graded possible for bridge and expressway construction staging or support. Areas of filling can be readily identified by the contrasting lighter color typically indicative of sandy dredge sand placement. Other areas along the shoreline can be seen as containing a lighter colored band of fill material and this includes much of the new Ferry Point Park located west of the Whitestone Bridge. Much of the park area was filled, graded and completed by 1938. Bulkheads were constructed with linear components to present a smooth shoreline but one that does not appear to contain a beach where water diminishes in depth to 0. Photos of the eastern area of the bay where mooring and docks can be seen showing large vessels moored against the shore. This would indicate the water has significant depth all of the way to the center of the bay.

Aerial photographs from the 1950's (Figure 2-4) show a drastic change in the area currently referred to as the site. Large expansion of the filling that was evident in 1938-39 up in the northeast corner can be clearly seen. The filling extends well into the bay and it appears that a connective bridge was constructed from the eastern shore to the fill area. It is difficult to discern if this is a usable structure for crossing or if it had some other purpose. The filling operation appears from the photo to consist of the same light colored material that was placed in the Ferry point Park and from photos showing a large number of barges in the water filled with material of the same light color. There is no specific logs and documentation that presents the specific origin and consistency of the material but from the prior aerials showing filling and this large expansion, it appears to be of a similar origin which would be dredge sand. In the 1951 aerial, no specific municipal solid waste dumping and disposal can be seen but the records indicate the landfill operated from this approximate time period. So it can be assumed that municipal solid waste was dumped within the site area very soon after that. The filling shown in the aerial may very well have been the initial construction of the upper portion of the landfill with the tidal gate or bridge closing in the upper bay area. Additional aerials of the landfilling were not identified and more recent aerials document the completion of filling as well as the more recent golf course construction.
What can be discerned from this compilation of photos is that the landfill was located on area that may have been completely filled open water as well as some area that was previously reclaimed land with dredge material.

The Site operated as a landfill from before 1951 to the 1960's. The landfill reportedly accepted municipal solid waste during its operating period and was closed and covered in the mid-1960's, with additional closure operations conducted more recently in the 1980's. Prior Site use was determined from historic aerial photographs from 1951 thru 1991. The aerial photographs span practically the entire operational period of the prior landfill, from its initial operations to the present, and provides substantial information about the Site's development.

### 1.3.3 Key Agencies

The following were the key agencies associated with the project providing oversight, administration, design, construction, and monitoring services. The following is not intended to be an exhaustive list of involved entities related to the Project. A more extensive list of project participants is included in Appendix 18.

Primary Regulatory Agency:
New York State Department of Environmental Conservation Region 2 ("NYSDEC")

Project Permittee (Prior to October 2007):
Ferry Point Partners, LLC ("FPP")
City of New York Department of Parks and Recreation ("NYCDPR")

Project Permittee (Post October 2007):
City of New York Department of Parks and Recreation ("NYCDPR")

Primary Design, Engineering, Construction, and Monitoring Consultants:
Sanford Golf Design ("Sanford")
Nicklaus Design ("Nicklaus")
TRC Companies, Inc. ("TRC")
Langan Engineering & Environmental Services, Inc. ("Langan")
Ecology and Environment, Inc. ("E&E")
KS Engineers PC ("KSE")
Wesler Cohen Associates ("WCA")
The Pignato Group ("TPG")
Thomas Balsley Associates ("TBA")
Green Bases, Inc. ("GBI")

Independent Environmental Monitor ("IEM"):
ARCADIS/Geraghty & Miller (July 2000 – December 2000)
Gannett Fleming (December 2000 – October 24, 2010)
Woodard & Curran ("WC") (October 25, 2010 – Project Completion)

General Contractor:
Golf Course and Community Park: LAWS Construction Corp. ("LAWS")
Community Park Comfort Station: TJM Construction Corp. / Long Island Concrete, Inc.
Golf Course Maintenance Building, Rain Shelter, Comfort Station: Triton Structural Concrete, Inc.
Golf Course Cover Layer Material Importation: MFM Contracting Corp.

Golf Course Concessionaire/Operator:
The Trump Organization ("Trump")

### 1.3.4 Independent Environmental Monitor

The requirement for an Independent Environmental Monitor ("IEM") on this project was associated with an increased level of monitoring exceeding normal review and oversight practices of the NYSDEC in order to protect public health and the environment. The increased level of review and oversight for this Project was mainly associated with the extensive effort required for evaluation of fill material sources, source site testing and inspection, importation of the fill material, extensive earthwork, and environmental monitoring required at the 222-acre Site.

In accordance with Special Condition 24 of the 2014 Permit, NYCDPR was responsible to retain an IEM, accountable to the NYSDEC, to provide environmental oversight of all activities authorized under the Permit including but not limited to the quantification, importation and placement of fill, and the monitoring of the Site. Particular activities performed by the IEM for this Project included the following:

- Report deviations from or non-compliance with permitted activities to the NYSDEC;
- Evaluate and inspect fill sources;
- Witness source site investigation, sampling, and compare lab test results to Permit requirements;
- Visual and Photo-Ionization Detector (PID) inspection of imported fill materials to the Site;
- Monitor offloading of all trucks and reject unacceptable materials from being dumped on the Site and used for construction;
- Monitor environmental sampling on the Site (i.e. landfill gas, piezometer, groundwater, settlement, etc.);
- Monitor all aspects of fill operations on the Site, particularly the installation of minimum thickness of shaping layer and cover layer materials as well as demarcation layer installation; and
- Complete and submit to the NYSDEC Daily Observation Reports, bi-weekly Fill Management Reports, and Quarterly Reports related to Project activities.

The selection, continued retention, discharge, or replacement of the IEM was subject to the approval of the NYSDEC, at its sole discretion.

### 1.3.5 Project and Part 360 Permitting History

The following represents an overview of project and permitting history outlining key events associated with the Project. For more detailed and additional supporting information, reference the updated Permit Modification application package titled "Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East", dated May 31, 2012 and subsequently revised on August 31, 2012, June 20, 2013, and October 15, 2013 ("2013 Engineering Report") included in Appendix 20.

In May 1997, a Request for Proposals was released for the development of the Site. In May of 1998 Ferry Point Partners, LLC ("FPP") was selected as the developer and in the late May 2000, the City of New York Department of Parks and Recreation ("NYCDPR") initially entered into a license agreement with FPP to develop, construct, and operate the new recreation facility. The facility included a Jack Nicklaus signature golf course, a community park, a waterfront park, and related facilities (the "Project"). At that time, all required reviews for the Project were completed under the City Environmental Quality Review (CEQR),

State Environmental Quality Review Act (SEQRA), and New York City's Uniform Land Use Review Procedure (ULURP).

On July 17, 2000, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-00014-00011) (the "2000 Permit") jointly to NYCDPR and FPP (the "Permittee"), for a non-specific "facility" under Part 360-1.9(b) at the Site (see Appendix 1 for a copy of the permit). This permit allowed the Permittee to import and place fill necessary to construct the Project. This permit allowed for 1,000,000 cubic yards of fill material (in-place volume) to be imported and placed on the Site. The Permittee prepared an Engineering Report, dated April 11, 2000 and a Report on Fill Management Operations & Maintenance, dated May 16, 2000 as part of the permit application.

After the receipt of the original Part 360 Permit in July 2000, FPP entered into a contract with LAWS Construction Company, Inc. (the "Contractor") to construct the golf course, parks and other features of the Project, and to identify, secure and import the off-site fill material to be used to meet the design elevations of the grading plans referenced in the 2000 Permit.

Initially ARCADIS/Geraghty & Miller, Inc. was retained as the IEM. ARCADIS/Geraghty & Miller, Inc. was retained as the IEM for a period from July 2000 to December 2000 and was replaced as the IEM by Gannett Fleming Engineers and Architects, P.C. in December 2000.

FPP began importing fill to the Site in August 2000 and continued, with some interruptions, until January 2002 when fill deliveries were halted pending the modification of the 2000 Permit.

On January 10, 2001, the NYSDEC issued a letter addressing quality control protocol for potential sources of material from sites that previously experienced backfilling with soil, but not with waste materials, for the use in the shaping layer.

On May 21, 2001, the NYSDEC issued a Fill Procurement Protocol letter addressing acceptance of uncontaminated, unprocessed construction and demolition debris ("C&D") from registered C&D processing facilities.

On May 24, 2001, the NYSDEC issued a Fill Procurement Protocol letter addressing paragraph b in the May 21, 2001 letter and clarifying the definition of processed material.

From May to December 2001, based on the results of the Site perimeter methane gas monitoring, the NYSDEC required the construction of a landfill gas passive vent trench along most stretches of the Site perimeter from the water's edge near the foot of Emerson Avenue, along the entire length of the Site boundary with Balcom Avenue, and along Schley Avenue and continuing approximately 1,050 feet to the west past the intersection of Schley Avenue and Buttrick Avenue. In total, approximately 5,350 feet of passive vent trench was constructed (see Section B.3.a of Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx,

NY, Engineering Report, dated June 30, 2005 (revised) for additional information). Additional discussion related to the vent trench construction is included in Sections 4.2.4 and 4.6 of this report.

In February 2002, the Permittee requested a modification to the 2000 Permit to increase the volume of in-place fill to approximately 1,550,000 cubic yards and changes in design features. The Permittee prepared a Supplement to the Engineering Report, dated February 11, 2002 and a Response to Request for the Additional Information, dated July 2, 2002 as part of the permit modification.

On October 18, 2002, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-0014-00013) (the "2002 Permit") to allow the Permittee to place 1,522,300 cubic yards of in-place fill on the Site (see Appendix 1 for a copy of the permit modification). Prior to October 18, 2002, 446,500 cubic yards of shaping material had been imported to the Site.

After the NYSDEC issued the 2002 Permit in October 2002, FPP resumed importing fill to the Site. The importation of fill to the Site was performed in accordance with the 2000 Permit, the 2002 Permit, the 2000 Fill Report and the Fill Procurement Protocol per the NYSDEC letters dated January 10, 2002, May 21, 2001 and May 24, 2001.

On December 10, 2002, NYCDPR submitted the Response Action Plan ("RAP") as required by Special Condition 31 of the 2002 Permit. A copy of the RAP is included in Appendix 19.

On March 10, 2003, NYCDPR submitted a proposal to the NYSDEC to repair and replace methane monitoring system components. A copy of the proposal is included in Appendix 19.

In response to NYCDPR's March 10, 2003 request to repair and replace methane monitoring system components, the NYSDEC approved replacement of 34, 25-foot spaced, semi-permanent monitoring wells with eighteen, 50-foot spaced, monitoring wells along Miles and Emerson Avenues, in accordance with Special Condition #37 of the 2002 Permit, on March 17, 2003. Installation of the replacement monitoring wells was completed in May 2003.

On November 18, 2003, the NYSDEC approved the Work Plan for the Final Consent Order, Case No. R2-20030724-187, dated November 18, 2003. This provided for the placement on Site of the solid waste material excavated during the construction of the gas venting trench, the size reduction of concrete on Site, and the processing and composting of existing wood on Site. The solid waste material was moved and placed in January 2004 and the processing and composting of the wood was completed in the spring of 2004. A copy of the approval is included in Appendix 19.

On January 12, 2004, the NYSDEC transmitted a copy of the executed Order on Consent No. R2-20030724-187 to NYCDPR. A copy of the fully executed consent order is included in Appendix 19.

On November 1, 2004, the NYSDEC approved the revised truck compaction factor of 42.4% based on the October 10, 2003 30% aerial topographic survey as was required per the 2002 Permit.

On December 7, 2004, the NYSDEC approved the revised truck compaction factor of 41% based on the July 17, 2004 60% aerial topographic survey as was required per the 2002 Permit.

In May 2005, the Permittee requested a modification to the permit to increase the volume of in-place fill to approximately 2,370,000 cubic yards among other items in order to reshape the Golf Course related to a revised design by the golf course architect. The Permittee prepared Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associated dated June 30, 2005 (revised) and Volume #2, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associated dated June 30, 2005 (collectively known as the "2005 Engineering Report"). A copy of the 2005 Engineering Report is included in Appendix 20.

On August 2, 2005, NYCDPR responded to NYSDEC comments on the previously submitted June 30, 2005 Permit Modification and Engineering Report. A copy of the comment response is included in Appendix 19.

On November 18, 2005, the NYSDEC issued the modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013) to place a total of 2,543,729 cubic yards of in-place fill on the Site (see Appendix 1 for a copy of the permit modification). This action was followed by a December 27, 2005, revision (No. 2-6006-00014/00013) that amended the total in-place fill volume to 2,370,000 cubic yards (the "2005 Permit").

On April 4, 2006, NYCDPR submitted a request for a determination related to cover layer material chemical criteria to the NYSDOH. On August 2, 2006, the NYSDOH provided written determination related to fill material chemical criteria required under Permit Special Condition 15(d) of the 2005 Permit. The submission and response are included in Appendix 19.

On October 25, 2006, the NYSDEC authorized the importation of shaping layer material from otherwise allowable sites with a total carcinogenic SVOC level in exceedance of the site limit, but 10 ppm or lower provided that a weighted average equal to or less than 3 ppm would be achieved by the end of each quarter of each year. A copy of the correspondence is included in Appendix C.1 of the 2013 Engineering Report (Appendix 20).

On October 26, 2007, the NYCDPR terminated the license agreement with Ferry Point Partners, LLC and took over site development activities. Ferry Point Partners, LLC was no longer involved with the Project or a Permittee.

On February 29, 2008, FPP submitted an application to the NYSDEC to transfer the Part 360 Permit solely to NYCDPR.

On July 25, 2008, a permit renewal application package to the 2005 Permit was submitted by NYCDPR. This submittal requested a modification of the 2005 Permit to allow the use of dredge and processed dredge material (PDM) as fill and the barge delivery of such fill material to the Site.

On August 12, 2008, the NYSDEC notified NYCDPR and FPP that the Part 360 Permit had been transferred to NYCDPR.

On October 24, 2008, the NYSDEC issued a Notice of Incomplete Application and comments to the July 25, 2008 submittal.

On December 2, 2008, the NYSDEC issued a letter to advise NYCDPR that the 2005 Part 360 Permit (with the corresponding November 30, 2008, expiration date) remained in full force and effect until NYSDEC approved the permit renewal application, as per Section 401(2) of the State Administrative Procedure Act (SAPA). See Appendix A of the 2013 Engineering Report (Appendix 20) for a copy of the SAPA letter.

On December 26, 2008, a response to NYSDEC's comments of October 24, 2008 was submitted by NYCDPR with a supplemental permit application package to the 2005 Permit.

On April 8, 2009, the NYSDEC issued comments to the December 26, 2008, permit application submittal. A copy of the comment letter is included in Appendix 19.

On April 9, 2009, the NYCDPR withdrew its request for a permit modification to allow the use of Processed Dredged Material ("PDM") as fill.

On April 30, 2009, the NYSDEC directed NYCDPR to not accept or place on the Site any cover layer materials with arsenic concentrations greater than 16 ppm or lead concentrations greater than 400 ppm. A copy of the correspondence is included in Appendix C.2 of the 2013 Engineering Report (Appendix 20).

On July 9, 2009, NYCDPR submitted proposed cover layer material chemical criteria to NYSDEC for review and approval. A copy of the correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

On July 28, 2009, the NYSDEC notified NYCDPR that cover material is divided between two classifications: Active (suitable for use in Active or Passive Recreation areas), and Passive (suitable for use in Passive Recreation areas only). NYSDEC provided a table to NYCDPR listing modified heavy metal chemical limits for the cover layer at the Site. A copy of the correspondence is included in Appendix C.2 of the 2013 Engineering Report (Appendix 20).

On September 18, 2009, NYCDPR submitted rationale for a revised shaping layer correction factor based on the latest survey and fill imports volumes at that time. A December 11, 2012 letter evaluating the September 18, 2009 submittal was also submitted to the NYSDEC. The submissions are included in Appendix 19.

On September 25, 2009, the NYSDEC revised and clarified the chromium chemical limits for the cover layer previously presented in the July 28, 2009 correspondence. A copy of the correspondence is included in Appendix C.2 of the 2013 Engineering Report (Appendix 20).

On November 25, 2009, a response to NYSDEC's comments of April 8, 2009, was submitted by NYCDPR with a second supplemental permit application package to the 2005 Permit. This submittal withdrew the request to allow the use of dredge material and PDM as fill and the barge delivery of such fill material to the Site. This submittal also proposed a design modification for a Site-wide active landfill gas control system. The 2005 Permit included passive venting systems for the Site, with active systems proposed only in enclosed structures. The November 25, 2009 permit renewal application is included in Appendix 20.

On June 25, 2010, the NYSDEC issued a Notice of Incomplete Application and comments on the November 25, 2009, permit application submittal. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On August 6, 2010, the NYSDEC issued additional comments on the November 25, 2009, permit application submittal. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On September 29, 2010, a response to NYSDEC's comments of June 25 and August 6, 2010, was submitted by NYCDPR with a third supplemental permit application package for the 2005 Permit. This submittal withdrew the proposed design modification of a Site-wide active landfill gas control system and proposed a system consistent with the 2005 Permit. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On October 7, 2010, a supplemental response to NYSDEC's comments of June 25 and August 6, 2010, was submitted by NYCDPR to accompany the September 29, 2010, permit renewal application submittal. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On October 25, 2010, Woodard & Curran replaced Gannett Fleming, assuming the duties of the IEM for the Project.

On December 17, 2010, NYCDPR submitted supplemental information to the NYSDEC related to the Landfill Gas Report originally submitted to the NYSDEC on November 16, 2010 to address requests from the NYSDEC from a December 2, 2010 meeting. The November 2010 Landfill Gas Report and the December 17, 2010 supplemental information are included in Appendix E of the 2013 Engineering Report (Appendix 20).

On January 3, 2011, the NYSDEC issued a letter directing NYCDPR to collect and provide additional landfill gas data to better elucidate the subsurface conditions at a frequency described in the 2005 Permit. The letter requested that NYCDPR expand the landfill gas monitoring to include concentrations of hydrogen

sulfide, volatile organic compounds, and carbon monoxide, well temperature, and well pressure. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On January 10, 2011, NYCDPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to fill material imported to the Site that violated the Permit. During 2010, fill material was brought on-site and placed in seven different stockpiles. The material was believed to be in conformance with Permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. Under the terms of the consent order, the material was allowed to remain on-site under controlled conditions. The material was used to construct the base of the clubhouse and maintenance facility parking lots. Additional details are included in the Order on Consent, which is included in as Appendix I of the 2013 Engineering Report (Appendix 20).

On January 12, 2011, NYSDEC issued a response to NYCDPR's Request for Explanation of NYSDEC Request for Expansion of Ferry Point Park Landfill Gas Monitoring Parameters. Additional parameters included collecting data for hydrogen sulfide, volatile organic compounds and carbon monoxide, well temperature and well pressure. A copy of the correspondence is included in Appendix J of the 2013 Engineering Report (Appendix 20).

On February 16, 2011, NYCDPR submitted test pit analytical data to NYSDEC for review related to demarcation layer installation requirements. A copy of the correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

On March 9, 2011, the NYSDEC issued a response to NYCDPR's February 16, 2011 correspondence requiring demarcation layer to be installed on the Site only in areas where there was less than five feet of shaping and cover layer materials. A copy of the correspondence is included in Appendix C.3 of the 2013 Engineering Report (Appendix 20).

On May 13, 2011, NYCDPR issued a memorandum to the NYSDEC presenting the results of a site-wide water balance based on a cover layer material permeability of 14 inches per hour, which indicated that there would be a reduction in the infiltration rate over the entire Site. A copy of the correspondence, which includes additional details on the topic, is included in Appendix D.1 of the 2013 Engineering Report (Appendix 20).

On May 26, 2011, NYCDPR requested confirmation from the NYSDEC that the use of USEPA Analytical Method 625/8270 was an acceptable alternative method for the analysis of dioxin and furan constituents. The NYSDEC provided verbal confirmation that this was an acceptable method to be used. A copy of the correspondence is included in Appendix C.5 of the 2013 Engineering Report (Appendix 20).

NYCDPR issued a June 2011 report to the NYSDEC regarding sampling and analysis of landfill gas vents at the Community Park. A copy of the report, which includes further details of this sampling and analysis, is included in Appendix E.3 of the 2013 Engineering Report (Appendix 20). On July 1, 2011, the NYSDEC concluded that there were no ambient air impacts due to the landfill gas emissions from the twelve vents

located in the Community Park and that no further monitoring was necessary beyond routine maintenance.

On August 10, 2011, NYCDPR issued a subsequent water balance memorandum indicating that a higher cover layer material permeability of 30 inches per hour would also result in a lower volume of water infiltrating through the surface of the Site after completion of construction. Section 4.2.1 includes the description relating to the site permeability modifications. Additional details related to the water balance are included in Appendix D.2 of the 2013 Engineering Report (Appendix 20).

On September 19, 2011, NYCDPR prepared technical memorandum Field Sampling Procedures for Ferry Point Site related to groundwater characterization. The memorandum is included in Appendix G of the 2013 Engineering Report (Appendix 20).

On October 18, 2011, NYCDPR submitted a technical drainage review memorandum to the NYSDEC for review regarding the final cover material and site wide water balance. A copy of the correspondence is included in Appendix D.5 of the 2013 Engineering Report (Appendix 20).

On October 21, 2011, the NYSDEC provided a response to NYCDPR's October 18, 2001 technical drainage review memorandum including a conditional approval allowing cover layer material to have a percolation rate of up to 30 inches per hour. The condition was that NYCDPR was required to submit for approval an amendment to the Stormwater Pollution Prevention Plan (SWPPP) including plans and computations that reflect the partial lining of stormwater basins. A copy of the correspondence is included in Appendix D.5 of the 2013 Engineering Report (Appendix 20).

On November 16, 2011, NYCDPR provided NYSDEC with a technical memorandum addressing the conditions included in the October 21, 2011 conditional approval for the cover layer material percolation rate. A copy of the correspondence is included in Appendix D.6 of the 2013 Engineering Report (Appendix 20).

On December 2, 2011, the NYSDEC provided an approval for NYCDPR's SWPPP amendment via email. A copy of the correspondence is included in Appendix D.6 of the 2013 Engineering Report (Appendix 20).

On January 26, 2012, the NYSDEC clarified that the average percolation rate from all samples collected within one cover layer material stockpile could be used as the representative percolation rate of that stockpile due to the mixing that occurred during loading, unloading, transport, stockpiling, and spreading of the material. A copy of the correspondence is included in Appendix 19.

On March 28, 2012, NYCDPR submitted to the NYSDEC initial groundwater monitoring data from the installation of 11 new monitoring wells installed and sampled in February 2012. NYCDPR requested additional direction from the NYSDEC concerning procedures for future sampling events.

On May 1, 2012, the NYSDEC acknowledged that settlement plate monitoring at several points has been discontinued due to interference with ongoing construction, and informed NYCDPR that the short-term monitoring locations did not need to be replaced as long as construction at the Site progressed and the long-term plates were installed as construction was completed. A copy of the correspondence is included in Appendix H of the 2013 Engineering Report (Appendix 20).

On May 8, 2012, a conference call was held between NYCDPR and the NYSDEC to discuss the initial groundwater monitoring data submitted on March 28, 2012 and to discuss guidance for future groundwater monitoring. The NYSDEC provided NYCDPR with requirements for future groundwater monitoring in their May 8, 2012 Ferry Point Park Groundwater Characterization/Monitoring Objective. Meeting minutes are included in Appendix G of the 2013 Engineering Report (Appendix 20).

On May 24, 2012, the NYSDEC verified via email that there were no outstanding enforcement actions for the Site. A copy of the correspondence is included in Appendix B of the 2013 Engineering Report (Appendix 20).

In May 2012, the Permittee requested a modification to the Permit presenting studies, modeling, investigations, and design work that were performed to resolve outstanding comments that were received by the Permittee after the April 8, 2009 Notice of Incomplete Application and the November 25, 2009 permit application to the NYSDEC. NYCDPR submitted the initial version of the Supplemental Engineering Report dated May 31, 2012.

On June 8, 2012, the NYSDEC confirmed that the sand material used for the tees, greens, and sand traps (bunkers) should not be counted towards the Permit stated allowable cover soil maximum of 250,000 cubic yards. Based on information provided to the IEM by NYCDPR, NYCDPR's consultants have estimated the required sand material volumes as follows: Tees and Greens (24,705 cubic yards), Driving Range Tee (3,025 cubic yards), and bunkers (6,076 cubic yards). Since these values were estimated and calculated by NYCDPR's consultants, it shall be noted that actual installed volumes may fluctuate from the volumes identified above. Information is from an email from Joe Voss to Faisal Choudhury on June 13, 2012. A copy of the correspondence is included in Appendix 19.

On January 23, 2013, NYCDPR submitted the rationale for increasing the amount of cover layer material that could be imported to the Site under the Permit. A copy of the correspondence is included in Appendix 19.

On February 1, 2013, The NYSDEC issued an amendment to the 2005 Permit (last modified October 17, 2012) authorizing the Permittee to import a total of 2,514,000 cubic yards of in-place fill totaling approximately 2,120,000 cubic yards of shaping layer material and approximately 394,000 cubic yards of cover layer material. A copy of the amendment is included in Appendix 1.

On April 26, 2013, the NYSDEC notified NYCDPR that the compaction factor for cover layer material was revised to 18%, approving NYCDPR's revised April 8, 2013 submittal. A copy of the approval letter and submittal are included in Appendix 19.

On October 15, 2013, NYCDPR submitted the final version of the "2013 Engineering Report", entitled Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East Bronx, NY dated May 31, 2012 (Revised August 31, 2012, October 15, 2013) to address concerns raised by the NYSDEC since the Notice of Incomplete Application of November 25, 2009 to modify the 2005 Permit. The 2013 Engineering Report is attached in Appendix 20.

On April, 17, 2014, the NYSDEC confirmed via email that a minor exceedance of the cover layer in-place volume as included in the Permit is acceptable considering no additional shaping material will need to be imported and that the exceedance could be addressed via as-built drawings and in the final construction certification report. A copy of the email is included in Appendix 19.

On May 21, 2014, the NYSDEC issued the modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013 (SW)) and Tidal Wetlands Permit (No. 2-6006-00014/00016 (TW)) (the "2014 Permit"). See Appendix 1 for a copy of the permit.

On October 29, 2014, the NYSDEC issued an amendment to Special Condition 24 of the 2014 Permit stating that during fill delivery and earthwork, NYCDPR should submit quarterly reports to the NYSDEC summarizing all Site activities set forth in the Permit. Each report should provide details of all rejected fill material, quantify the amount of material imported to the Site using truck volumes, and the results of all on-site monitoring for that period. All fill tracking, earthwork activities, landfill gas monitoring, and associated reporting requirements typically contained within each Fill Management Report would be addressed by Quarterly Reports moving forward and Fill Management Reports would no longer be issued. FMRs were no longer being issued due to a significant reduction in fill importation and earthwork activities at the Site. A copy of the letter is included in Appendix 1.

For a detailed history of site operations and activities prior to June 30, 2005, see Volume #1, Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY, Engineering Report, prepared by TRC Raymond Keyes Associated dated June 30, 2005 (revised) which is attached in Appendix 20.

### 1.3.6 Construction Drawings

The project included a substantial number of different construction drawings associated with the Project. Construction drawings are included in Appendix 4.

# 2 Part 360 Permit

## 2.1 Part 360 Permits and Modifications

The following is a list of the permits and modifications issued for this Project:

On July 17, 2000, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-00014-00011) (the "2000 Permit").

On October 18, 2002, the NYSDEC issued a Part 360 Solid Waste Management Permit (DEC No. 2-6006-0014-00013) (the "2002 Permit").

On November 18, 2005, the NYSDEC issued a modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013), followed by a December 27, 2005 revision (the "2005 Permit").

On May 21, 2014, the NYSDEC issued a modified Part 360 Solid Waste Management Permit (No. 2-6006-00014/00013 (SW)) and a Tidal Wetlands Permit (No. 2-6006-00014/00016 (TW)) (the "2014 Permit").

Note that a separate SPDES General Permit for Stormwater Discharges from Construction Activity (GP-08-001) was obtained for the Project and the Acknowledgement of Notice of Intent is dated May 12, 2009 (Permit Identification No. NYR10R112).

Copies of the aforementioned permits and modifications are included in Appendix 1.

## 2.2 Reference Documents

Refer to Appendix 2 for a list of Permit reference documents. These documents support the original Permit and/or provide basis for subsequent permits renewals and modifications.

## 2.3 Non-Conformance Issues

In accordance with Special Condition 24, the IEM reported on Permit related non-conformance issues during the duration of construction at the Site. A complete list of all non-conformance issues observed and corrective actions taken during the Project is included in Appendix 3.

## 2.4 Operational Upsets, Emergencies, and Unusual Circumstances

### 2.4.1 Security breaches, Unauthorized Entries, Injuries, Fires, Theft, Vandalism, etc.

The following information was gathered from TRC, NYCDPR's design and construction consultant:

In July/August of 2013, a CBS film crew received authorization from the Agency to scout and film areas within the Ferry Point Golf Course proper. There were no known issues with those activities.

TRC did not have specific detailed reports for thefts or vandalism that occurred on the Site. To the best of their knowledge, there were two incidents of vandalism to contractor equipment (broken glass

windows and spray painted vehicles), and a few incidents when the perimeter fence was damaged (bent/scratched vertical bars). Landfill gas vent caps were damaged, but there was no evidence of vandalism; the vent caps may have been damaged by lawn mowers or other equipment running over them.

There were no known major fires or injuries during the construction time period.

The only unusual event was the discovery of the body of a construction worker who had fallen from the Throggs Neck Bridge and washed up at the Waterfront Park. For several days there was police presence and other related activity. However, that event was not related to the work at the golf course nor did it delay or adversely affect the progress of the project.

As reported by the IEM:

On the evening of August 18, 2011, the Site was broken into by unknown persons. LAWS equipment storage containers were forced open and various tools and copper piping was stolen. The trespassers appeared to have entered the Site at the back entrance to the golf course along Balcom Avenue. The fence was observed cut open in that area.

Upon arrival at the Site on August 26, 2011, IEM staff observed that the IEM trailer had been broken into by unidentified persons. On-site security and LAWS representatives were notified as well as the local police (by LAWS). Two digital cameras were stolen from the IEM trailer.

On June 25, 2012, the IEM witnessed a trailer of imported fill material slide off its frame during dumping activities. No injuries were reported.

On October 31 and November 1, 2012, IEM staff performed on-site inspections to assess damage caused by Hurricane Sandy. IEM staff observed many areas around the Site where restoration work needs to be performed on the vent trench, silt fence repair, site security fence repair, and garbage/debris removal. The southern site boundary was observed to have significant damage and washout. The entire south end of the Site was open without protection and it was filled with debris from the storm.

On October 25, 2012, the IEM witnessed both a truck and a trailer roll over onto their side during dumping activities. No injuries were reported.

Various Permit non-conformance issues were observed related to unsatisfactory security at the Site beginning with non-conformance issue 12 on October 1, 2003 where security fence and other controls were not properly maintained on-site allowing for unauthorized entry to the Site. Site security, control, and unauthorized access were the subject of non-conformance issues 15, 72, 90, 93, 97, 98, 122, and 127. Ultimately, all of these non-conformance issues were resolved and closed out during construction on an ongoing/as-needed basis.

There was a presence of coyotes at the Site as tracked and studied as part of the Gotham Coyote Project. The work was conducted under NYCDPR permits and information was released to NYCDPR for informational purposes. Coyotes were initially monitored by game camera in Ferry Point Park beginning in January 2012 through 2013. Coyote monitoring did not occur at the Site in 2014.

## 2.5 Reporting

The IEM was responsible for reporting to the NYSDEC related to Permit activities and compliance for the Project in accordance with Special Condition 24 of the 2014 Permit. The IEM prepared and submitted to the NYSDEC Daily Observation Reports ("DOR"), bi-weekly Fill Management Reports ("FMR"), and Quarterly Reports ("QR"). These reports are attached as appendices to this report and available at the NYCDPR Bronx Borough Headquarters (Ranaqua) document repository and are part of the public record. The address of the repository is 1 Bronx River Parkway, Bronx, NY 10462, telephone: (718) 430-1800.

### 2.5.1 Daily Observation Reports (DOR)

The IEM reported to the NYSDEC on a daily basis on the following information: weather conditions, municipal solid waste material removal from the site, fill materials imported to the site, detailed notes of construction activities, and non-conformance issues related to the Permit conditions.

DORs are attached in Appendix 5 beginning on October 25, 2010. Daily site activity observations for the time period prior to October 25, 2010 are summarized in the IEM's Fill Management Reports.

### 2.5.2 Fill Management Reports (FMR)

The IEM prepared Fill Management Reports (FMRs) that were submitted to the NYSDEC on a bi-weekly basis. Generally, the FMRs contained the following information and data: a project summary including an overview of site activities, Permit non-conformance issues, fill source site review activities and associated data, site testing activities, filling and shaping activities, and environmental monitoring. FMRs contained figures identifying imported material dump locations and any active filling, grading, and shaping areas associated with the landfill cap.

FMRs were discontinued on October 31, 2014 with FMR 346. FMRs were discontinued because the importation of shaping layer and cover layer materials and earthwork activities were significantly reduced in scope and scale on the Site. In a Permit amendment issued to NYCDPR on October 29, 2014, the NYSDEC stated that all fill tracking, earthwork activities, landfill gas monitoring, and associated reporting requirements would be addressed by Quarterly Reports thereafter.

FMRs 1 through 346 are attached in Appendix 6.

### 2.5.3 Quarterly Reports

The IEM prepared Quarterly Reports (QRs) that were submitted to the NYSDEC on a quarterly basis. Generally, the QRs contained summarized and aggregated information included in FMRs over each quarterly reporting period.

QRs beginning with the 4th Quarter of 2002 through the 1st Quarter of 2015 (with the exception of the 1st Quarter of 2011) are attached in Appendix 7. Observations for site activities for the 1st Quarter of 2011 are included in FMRs 247 through 253.

## 2.6 Authorized Fill Volumes

On July 17, 2000, the NYSDEC issued 2000 Permit jointly to NYCDPR and FPP to allow for a total of 1,000,000 cubic yards of fill to be imported and placed on the Site including approximately 750,000 cubic yards of in-place shaping layer material and 250,000 cubic yards of in-place cover layer material.

On October 18, 2002, the NYSDEC issued the 2002 Permit to allow a total of 1,522,300 cubic yards of fill (in-place) to be imported and placed on the Site. The fill material was to consist of approximately 1,272,300 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The 2002 Permit also stated that, "approximately 415,000 cubic yards of fill was deposited on the Site prior to the effective date of the Permit and the projection for in-place fill material to complete the project was 1,107,300 cubic yards, consisting of approximately 857,300 cubic yards (in-place volume) of select exempt construction debris for the shaping layer and approximately 250,000 cubic yards (in-place volume) of uncontaminated soil for the cover layer.

In 2003, the golf course architect determined that the tournament quality and signature status of the course could be significantly improved by making the facility a "links" style golf course. The changes to the Project as compared to the work authorized under the 2002 Permit included:

- Increasing the support mounding between golf holes and grading the course in a links style.
- Re-routing of holes 11, 12 and 13 to reverse their direction in order to improve player circulation and playing time.
- Moving Hole 9 to the west of the golf driving range in order to improve the safety zone of the driving range and remove the need for high netting.
- Realigning the centerlines of holes: 10, 16, 17, and 18 to improve the strategic layout and visual experience of the golf course.
- Lowering the elevations of tees 4 and 6. This eliminated the retaining wall proposed at the northeast corner of the Site.
- Adding a golf training area at the north end of the driving range. This required shifting the centerline of Hole 8 slightly north and increasing the support mounding around this area to buffer the adjacent holes.
- Increasing the mounding adjacent to the TBTA toll plaza in order to block noise and adjacent traffic from view.
- Shifting the Site roadway along the east side of the bridge to accommodate a TBTA easement that extends 25 feet east of the bridge. This required changes to the parking lot at the clubhouse and the location of detention/water quality basin and Waterfront Park.
- Eliminating the Boathouse Grill restaurant in the Waterfront Park. A restaurant would be located within the banquet facility. Parking spaces for the banquet facility were increased to

accommodate the restaurant. A restaurant may be constructed within the Waterfront Park in a future phase, based on economic demands.

- Modifying the parking lot for the Waterfront Park. The 120 parking spaces for the Waterfront Park will be located near the Whitestone Bridge approach structure.

These proposed changes to the Project increased the total needed in-place fill volume for the project to 2,370,000 cubic yards to shape the golf course in a links style.

The quantification of the imported fill material was continuously tracked by both truck volume and periodic topographic surveys of in-place volumes. Initially it was assumed that truck volume would be reduced by 25% when compacted into place, but a new correction factor was to be calculated. On November 1, 2004, the NYSDEC approved a revised truck correction factor of 42.4%, which was based upon an October 10, 2003 30% aerial topographic survey, and on December 7, 2004, the NYSDEC approved a revised truck correction factor of 41%, which was based upon a July 17, 2004 60% aerial topographic survey. These recalculations were performed by dividing the actual in-place volume by the total cubic yards of truck volume delivered to the Site as of the date of the survey, as required by the 2002 Permit.

TRC prepared the 2005 Engineering Report, which comprised of Volume #1, Volume #2, and a 26 sheet drawing set entitled, "Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2". The 2005 Engineering Report is included in Appendix 20 and represented the following scope of work:

- An 18 hole golf course with practice area;
- Maintenance Area in the northwest corner of the Site;
- Clubhouse parking lot in the southwest portion of the Site;
- Banquet Facility in the southwest portion of the Site (along Emerson Avenue);
- Community Park;
- Waterfront Park with parking lot; and
- Drawing G-3 and G-4 of "Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2", showed the deviations in grading between the plans approved on October 18, 2002 with the proposed plan.

On November 18, 2005, the NYSDEC issued the 2005 Permit authorizing the importation of a total of 2,370,000 cubic yards of in-place fill material to the Site. The fill material was to consist of approximately 2,120,000 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The correction factor was 41% at that time and could be further modified.

On January 22, 2009, in accordance with Special Condition 10 of the 2005 Permit, TRC submitted a revised truck reduction factor of 40.3%. On September 18, 2009 TRC submitted a truck reduction factor of 43.3% based on a May 10 2009 aerial topographic survey. On February 11, 2010, the NYSDEC approved a truck reduction factor of 41.7% as submitted by the IEM on December 11, 2009 (included in Appendix 19).

The Golf Course layout that NYCDPR moved forward with was modified from what was shown in the 2005 Engineering Report as revised by the 2013 Engineering Report. One major change was the complete removal of the Banquet Facility in the southeast part of the Site. There were also changes in the placement, alignment, and grading of some holes on the Golf Course.

On February 1, 2013, the NYSDEC granted a permit modification to increase the limit of cover material from 250,000 to 394,000 cubic yards with the stipulation that NYCDPR revisit the correction factor for cover layer material. It was determined that the correction factor for the granular cover material (sand) was 18%. This revised the truck volume to 480,488 cubic yards. The correction factor for cover layer material was approved per an April 26, 2013 letter from NYSDEC to NYCDPR as included in Appendix 19.

On May 21, 2014, the NYSDEC issued the 2014 Permit to NYCDPR to allow the import of a total of 2,514,000 cubic yards of in-place fill material including 2,120,000 cubic yards of in-place shaping layer material and 394,000 cubic yards of in-place cover layer material.

# 3 Fill Importation QA/QC Program

Fill material importation commenced on August 2, 2000 and the last day for fill import was May 5, 2015. The fill importation QA/QC program implemented for the Project based on the Permit and associated reference documents was adhered to. The fill importation consisted of two main components including source site reviews and on-site inspections. A source site review was conducted by the IEM prior to any fill material being imported to the Site and additional visual and photo-ionization detector (PID) inspections were completed by the IEM upon the material entering the Site at the IEM inspection platform and again once the material was dumped at the work or stockpile location on the Site.

## 3.1 Source Site Reviews

Prior to any shaping layer or cover layer material being imported to the Site, each potential source was thoroughly evaluated by the IEM. An environmental review was performed for all proposed source sites in accordance with Special Condition 24 of the 2014 Permit. The source site review process criteria was specified in the Report on Fill Management, Operations and Maintenance, prepared by TRC on May 16, 2000, and revised June 30, 2005 (Volume #2 of the 2005 Engineering Report). The source site review process was modified over time as compared to the original process outlined in the various engineering reports and permit modification requests. The process generally consisted of the following main components:

1. NYCDPR would notify the IEM of a new potential source site. NYCDPR would provide the IEM with the site name and location as well as any available historical site information and soil environmental analytical results that existed for the potential source site.

2. Once NYCDPR confirmed that they wanted to move forward with pursuing the potential source site, NYCDPR authorized the IEM to retrieve any available site information from Environmental Data Resources, Inc. (EDR) which included environmental and historical land use records for the source site property under evaluation including Sanborn maps, city directories, topographic maps, and aerial photographs. NYCDPR then completed an initial review of the existing site information,

generated a sampling plan, and provided the results of the initial review and sampling plan to the IEM. NYCDPR then authorized the IEM to conduct a desktop review of the existing site information (i.e. EDR), any available soil environmental analytical results, and NYCDPR's sampling plan. The IEM provided NYCDPR with comments related to their review and their sampling plan in consultation with the NYSDEC. Once a final sampling plan was agreed upon, the source site investigation was initiated and executed per the NYCDPR sampling plan with IEM oversight. For source sites with in situ material, test pits were typically completed with additional soil samples inspected, collected, and analyzed in accordance with the Permit requirements. Once all the sampling was completed, the IEM reviewed sample results and the IEM generated a memorandum summarizing the review process and provided recommendations and requirements necessary for NYCDPR to address in order to continue pursuing the potential source site. The recommendations typically included conditions associated with overseeing the excavation, loading, and import of the source site material to the Site in accordance with the Permit. The IEM submitted the memo of recommendations to the NYSDEC for review and comment prior to issuing the final memorandum to NYCDPR. The NYSDEC would provide final comments and approval of the source site with any additional required conditions.

3. If NYCDPR determined that the potential source site was worth pursuing considering site-specific conditions, schedules, etc., they coordinated with the source site operator and IEM on importation schedule and requirements. The IEM provided oversight to confirm that the loading, hauling, and overall import of the approved material was completed in accordance with the memorandum of recommendations, NYSDEC conditions, and the Permit.

4. The IEM provided oversight during export from the approved source sites on an as needed basis and provided oversight at each source site during additional sampling activities if the source site was exporting more than the minimum sampling frequency outlined in the Permit (i.e. 10,000 cubic yards for shaping layer material and 2,000 cubic yards for cover layer material).

If at any time during the review process there were reasons for concern identified by the IEM resulting in the potential source site being classified as a "complex" source site, the NYSDEC became the primary reviewer and made final recommendations related to additional site investigation requirements or approval/rejection of the potential source site with support from the IEM. A complex source site was defined by the presence of an abundance of or particular Recognized Environmental Concerns ("RECs") and the NYSDEC made any decisions related to approval and/or associated conditions for further evaluation or import of the fill material.

A flow chart detailing the source site review process is included as Appendix 21.

Details of source site review and site testing activities are included in the report text and tables of each bi-weekly Fill Management Report issued by the IEM. Source site review supporting information and testing data is included in Appendix 8.

The following is a listing of source site reviews completed by the IEM since October 25, 2010. Since October 25, 2010, Woodard & Curran's first day as the IEM, 42 potential source sites were formally identified as potential fill source options by NYCDPR. Of the 42 potential source sites identified since October 25, 2010, 39 were advanced to at least a preliminary review stage. Potential source sites did not advance to a full source site review for various reasons such as changes in schedule, insufficient material, financial infeasibility, red flags identified with past uses of the source site, etc. Details of each source site review and site testing activities completed by the IEM, prior to any importation to the Site, are included in Sections 3.1.1 and 3.1.2 below.

A total of 15 of the potential source sites evaluated after October 25, 2010 and through project completion resulted in material being imported to the Site during that same time period. It is noted that all of the source site reviews included in Sections 3.1.1 and 3.1.2, are associated with the Golf Course and all cover layer material exposed at the surface within the golf course was imported from the cover layer material source sites included in Section 3.1.2 below. Refer to FMRs 1 through 241 for details related to source site reviews and site testing prior to October 25, 2010, which are included in Appendix 6.

For a list of source sites that imported material to the Site between November 18, 2005 and October 25, 2010, see the table included in Appendix 12. Refer to FMRs in Appendix 6 for source sites and estimated fill material imported to the Site prior to November 18, 2005.

The following were potential source sites that were identified by NYCDPR since October 25, 2010 where a review was not initiated:

1. 10 Byron Place (Larchmont, NY)
2. College Point
3. PS-331 (Tremont Avenue, Bronx, NY)

The following were potential shaping layer source sites that were identified by NYCDPR since October 25, 2010 with some level of source site review being completed. Source sites that resulted in a complete review and the importation of shaping layer material to the Site after October 25, 2010 are identified with bold text.

1. **PS-310 (942 62nd Street, Brooklyn, NY)**
2. PSAC
3. Barclays Arena (620 Atlantic Avenue, Brooklyn, NY)
4. JFK Jet Blue/Delta Runway (Jamaica, NY)
5. Columbia University
6. Long Island Jewish Center (270-05 76th Avenue, New Hyde Park, NY)
7. Highbridge Terrace (220 West 167th Street/Sedgewick Avenue, Bronx, NY)
8. Astoria (27-07 23rd Avenue, Queens, NY)
9. **Eastside Access (Queens Street and Jackson Avenue, Queens, NY)**

10. **Kew Gardens (Van Wyck Expressway between Grand Central Avenue and 86th Avenue, Queens, NY)**
11. PS-285 (1065 Martin Luther King Boulevard, Bronx, NY)
12. Flushing Hotel (133-63 Roosevelt Avenue/39-20 Prince Street, Queens, NY)
13. **2nd Avenue (2nd Avenue and 94th Street, New York, NY)**
14. 2nd Avenue (2nd Avenue and 72nd Street, New York, NY)
15. Alexander Hamilton Bridge (Bronx, NY)
16. **Throgg's Neck/Target/USPS (815 Hutchinson River Parkway, Bronx, NY)**
17. **PS-287 (110-10 Northern Boulevard, Queens, NY)**
18. City Point Brooklyn (1 Dekalb Avenue, Brooklyn, NY)
19. 400 Park Avenue South (New York, NY)
20. **Union Street (43-31 Union Street, Flushing, NY)**
21. **Mount Vernon Recycling Corp. (113 Edison Avenue, Mount Vernon, NY)**
22. 228th Street (Rosedale, NY)
23. Evergreen Recycling/Tully Environmental (Willets Point Boulevard, Corona, NY)
24. Waterpointe-Whitestone
25. Don Carlo Environmental/Brooklyn (1247 38th Street, Brooklyn, NY)
26. Castle Hill Recycling (1000 Zerega Avenue, Bronx, NY)
27. Springfield Gardens
28. Calvert Vaux (Brooklyn, NY)
29. 160 Myrtle Avenue (Brooklyn, NY)
30. 215 E. 68th Street (New York, NY)
31. **DEP Valhalla (10 Walker Road, Valhalla, NY)**
32. **Tilcon (Bronx) (980 East 149th Street, Bronx, NY)**
33. **NY Recycling (475 Exterior Street, Bronx, NY)**
34. Little Bay (Queens, NY)

The following were potential cover layer source sites that were identified by NYCDPR after October 25, 2010 with some level of source site review being completed. Source sites that resulted in complete reviews and the importation of cover layer material to the Site after October 25, 2010 are identified with bold text.

1. **Bloomingburg (C.M. & Sons Trucking Site, 680 Bloomingburg Road, Bloomingburg, NY)**
2. **Ranco Sand (115 South Street, Manorville, NY)**
3. **East Coast Mines (Lewis Road near Route 104, East Quogue, NY)**
4. Amboy Aggregates (415 Main Street, South Amboy, NJ)
5. **Long Island Compost/Great Gardens (445 Horseblock Road, Yaphank, NY)**

### 3.1.1 Shaping Layer Material

Materials accepted for use as shaping layer on the Site were sampled prior to acceptance and after the import of each additional 10,000 cubic yards as required by Special Condition 14 of the 2014 Permit. For recycling facilities, sampling was conducted after each additional 5,000 cubic yards. As per the November

18, 2005, Permit Modification, each soil sample was analyzed for TCLP VOCs and metals as well as total VOCs, SVOCs, priority pollutant metals, pesticides, PCBs, sulfur, and asbestos.

Fill material imported to the Site and used for the shaping layer was analyzed for the following parameters, per Special Condition 14 of the 2014 Permit. A description of which can be found below as included in Section 4.2.1.1 of the 2013 Engineering Report.

Based on source site reviews and site testing activities, the shaping layer material imported to the Site met the following chemical limits:

Total carcinogenic SVOC levels less than 10 ppm from individual fill material sources, provided that a weighted average of equal or less than 3 ppm for the entire Project. The following are the list of carcinogenic SVOCs that are subject to this 10 ppm limit: Benzo(a)pyrene, Dibenzo(a,h) anthracene, Benzo(a)anthracene, Benzo(b)fluoranthene, Indeno(1,2,3-cd)pyrene, Benzo(k)fluoranthene, and Chrysene.

Total SVOCs less than 500 ppm.

Metals:

- Arsenic less than 28 ppm;
- Barium less than 2,000 ppm;
- Cadmium less than 20 ppm;
- Chromium less than 1,000 ppm;
- Copper less than 1,000 ppm;
- Lead less than 400 ppm;
- Mercury less than 0.57 ppm;
- Selenium less than 11 ppm;
- Silver less than 100 ppm

Asbestos for all layers 0.5% or less
Total sulfur for all layers 0.5% or less
Total PCBs less than 10 ppm
Total Pesticides less than 10 ppm
VOCs (all individual analytes less than TAGM 4046)

In a letter dated October 25, 2006 (included in Appendix C.1 of the 2013 Engineering Report), the NYSDEC provided a clarification adding that a carcinogenic SVOC limit of 10 ppm or lower is allowable from individual fill material sources, provided that a weighted average of equal or less than 3 ppm is achieved by the end of the Permit.

NYCDPR followed the NYSDEC's directives since receipt of each one associated with the importation of shaping layer material to the Site.

Details of the source site reviews and site testing for each potential shaping layer material source site are as follows:

#### 3.1.1.1 PS-310 (942 62nd Street, Brooklyn, NY)

Source site testing analytical results for the PS-310 site were provided to the IEM by NYCDPR in a submittal dated October 6, 2010, and reviewed by the IEM for potential shaping layer material, based on the site visit performed by Gannett Fleming (the previous IEM) on September 21, 2010, and as recommended in their memo dated September 28, 2010. Samples were collected and tested by Analytical Chemists and issued via lab reports dated October 1, 2010. Analytical results were collected from five test pits from both the fill and natural formation soil layers. An exceedance of lead relative to the Site Permit shaping layer material chemical limits was noted in the fill layer within test pit #3. This information was factored into the final memo of recommendations issued by the IEM dated October 26, 2010 regarding the approved locations and depths of shaping layer material from the source site.

The IEM was on-site on November 10, 2010 to visually inspect and confirm that all fill and petroleum impacted fill from Areas of Concern 1 and 2 were removed. The IEM was also on-site on November 12, 2010 to observe the sampling of three additional sample locations of natural formation soil. The IEM submitted a detailed email to the NYSDEC and NYCDPR summarizing the November 12, 2010 site visit. Shaping material analytical results were reviewed for the PS-310 source site for three samples collected on November 12, 2010. All parameters met Permit criteria for import to the Site.

Approximately 5,308.48 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.2 PSAC

Initial site and fill material information was provided to the IEM between October 25 and November 5, 2010 by Gannett Fleming (the previous IEM). No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.3 Barclays Arena (620 Atlantic Avenue, Brooklyn, NY)

Initial site and material information was provided to the IEM by Gannett Fleming (the previous IEM) between October 18 and November 5, 2010. An initial site visit was completed by the IEM to initially inspect site conditions and materials at the source site. The IEM issued a memo of recommendations for the source site on November 16, 2010 based on materials available at that time. Materials were not reviewed further or imported to the Site at that time.

New material became available at this source site and additional data was provided for IEM review between December 18 and December 31, 2010. The review of this additional data and associated information was initiated. The sampling plan from mid-November 2010 was resubmitted to NYCDPR for the new materials being evaluated at Barclays Arena between January 1 and January 14, 2011 as the

original plan still applied to the additional/revised materials being made available. NYCDPR subsequently notified the IEM that the site source manager did not consider the Site as a viable option at that time.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.4 JFK Jet Blue/Delta Runway (Jamaica, NY)

On December 3, 2010, NYCDPR forwarded the IEM initial lab data for this potential source site associated with a Jet Blue/Delta runway at JFK Airport. On December 6, 2010, the IEM visited the potential source site to inspect the material totaling an estimated 7,000 cubic yards. The IEM witnessed evidence of asphalt and slag in the fill material and notified NYCDPR and the NYSDEC that the material was not a viable option for import to the Site. (See section 3.2.3)

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.5 Columbia University

Initial site and material information was provided to the IEM by Gannett Fleming (the previous IEM) between October 25 and November 5, 2010.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.6 Long Island Jewish Center (270-05 76th Avenue, New Hyde Park, NY)

The IEM conducted an initial site visit on November 5, 2010. An email containing the summary of site visit activities and summary of recommendations was provided. The IEM issued a formal memo of recommendations on November 11, 2010.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.7 Highbridge Terrace (220 West 167th Street/Sedgewick Avenue, Bronx, NY)

On January 10, 2011, a formal fill source site review was initiated for the Highbridge Terrace source site. Sanborn Maps, historical topography maps, historical aerial photos, and the EDR and NYSDEC Spill Databases were reviewed. Approximately 5,900 cubic yards of potential fill material was reportedly available. Initial analytical data was provided however, the IEM was informed by NYCDPR that this potential source site was no longer a viable option at the time and further review did not occur.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.8 Astoria (27-07 23rd Avenue, Queens, NY)

A formal fill source site review was conducted for the Astoria source site February 3, 2011 and consisted of the review of historical information and existing source site sampling data and EDR information. The existing sample data was reviewed and some sample results did not meet the Site Permit limits for shaping material. Preliminarily, the site contractor estimated approximately 2,000 cubic yards of potentially approvable material. The initial review was completed and NYCDPR reported that this source site was no longer a viable option and no further action was expected.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.9 Eastside Access (Queens Street and Jackson Avenue, Queens, NY)

A coordination call was held with the IEM, NYCDPR, and the source site contractor on February 8, 2011. The IEM witnessed initial source site sampling as requested by NYCDPR at the Eastside Access source site on February 9, 2011. A total of seven grab sample collections were observed and one discrete VOC sample collection was observed. The existing stockpile was estimated to measure approximately 2,000-4,000 cubic yards based on an approximation of stockpile dimensions by the IEM.

The IEM received a submittal of information from NYCDPR between February 12 and February 25, 2011. The IEM reviewed the material and found the site to be noncompliant with the Site Permit as material could not be segregated and stockpiled at the source site. Per NYSDEC directive, NYCDPR would be coordinating directly with the NYSDEC for further site review. The site was reviewed by the NYSDEC and a site-specific analytical parameter list (for Metals) was approved by the NYSDEC between March 12 and March 25, 2011.

Between March 26 and April 8, 2011, the IEM was notified by the NYSDEC and NYCDPR that this source site had been approved to export fill materials to the Site by the NYSDEC. The IEM discussed the conditions of the approval with the NYSDEC and began witnessing sample collection of the East Side Access crushed stone material and review of lab reports.

The IEM conducted monitoring of shaping layer material sampling and loading at the East Side Access source site for materials exported to the Site. Sampling at this source site generally occurred the day before materials were expected to ship to the Site. Samples were being analyzed for metals, laboratory results were compared to the Site Permit requirements, and no exceedances of shaping material limits were identified.

Between April 2011 and December 2011, the IEM continued monitoring for this source site. The IEM witnessed sample collection of East Side Access crushed stone material every 10,000 cubic yards, reviewed lab reports, and periodically monitored loading of trucks with shaping layer materials for export to the Site as materials were shipped to the Site.

The IEM reviewed the lab results related to the IEM witnessed source site sampling conducted on December 12, 2011 for proposed shaping material at the East Side Access source site and found the sampled material to be unacceptable for import to the Site based on the fact that the detected value for Arsenic was 48.7 ppm. The permit allowable maximum concentration for Arsenic is 28 ppm. The sampled material was determined to be unacceptable for import to the Site as shaping layer material per the Permit.

NYCDPR requested that the material sampled on December 12, 2011 be removed from consideration for import to the Site and requested that a sample be collected for the next available material at the East Side Access source site. The IEM reviewed the lab results dated December 14, 2011 related to the IEM witnessed sampling conducted on December 13, 2011 for the proposed shaping material and found them to be acceptable based on the fact that the RCRA metals results fell below the Permit shaping layer material allowable maximum concentrations and the Permit USEPA referenced testing method was used. It was determined that approved shaping material to be imported to the Site could only originate from the stockpiles witnessed during the December 13, 2011 sampling event. Material previously sampled on December 12, 2011 was not imported to the Site.

NYCDPR and their associated representatives hypothesized that the unacceptable sample results for arsenic may be a result of a change in the rock removal process, which included drilling, blasting, and crushing to generate the shaping layer material. On December 16, 2011, the NYSDEC stated that if the mining technique did not change (i.e. drilling as opposed to blasting) the sampling frequency could remain unchanged on the basis of the number of successful past results. However, in the event of another failure, the sampling frequency would become one sample per 2,000 cubic yards. The IEM proceeded with observing one sample per 2,000 cubic yards based on a change in mining operations as per discussions with the source site operator.

On February 7, 2012, the NYSDEC stated that based on the number of successful test results for the East Side Access material since the December 12, 2011 failure due to high arsenic content, the NYSDEC approved NYCDPR's request for future testing of East Side Access material at a reduced frequency of one sample per 10,000 cubic yards.

On December 18, 2012, Analytical Chemists collected samples from stockpiled East Side Access Source Site shaping material at the Site that had elevated PID readings when scanned during the on-site inspection process upon import and after dumping. The six segregated loads of East Side Access shaping layer material passed the Site Permit criteria for shaping layer material based on sampling conducted at the Site. Sampling consisted of collected samples witnessed by the IEM on December 18, 2012. Therefore, the material remained on-site and was used as shaping layer material.

Approximately 191,293.87 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.10 Kew Gardens (Van Wyck Expressway between Grand Central Avenue and 86th Avenue, Queens, NY)

Initial site and material information was provided to Woodard & Curran by Gannett Fleming (the previous IEM) between October 25 and November 5, 2010.

A formal fill source site review was initiated for the Kew Gardens between November 6 and November 19, 2010 consisting of compiling and reviewing historical maps, photos, EDRs, and spills database and available information from the source site contractor.

A formal fill source site review was continued for the Kew Gardens source site between November 20 and December 3, 2010 and consisted of the review of Sanborn maps, topographic maps, aerial photographs, NYSDEC spills and remediation database, and the City Directory. A Phase II Environmental Site Assessment (ESA) and associated analytical data was reviewed and sample results did not exceed the Permit limits for shaping layer material. Preliminarily, the source site contractor estimated approximately 10,000 to 15,000 cubic yards of potentially approvable material was available.

On February 11, 2011, the IEM issued a memo of recommendations and sampling plan for the Kew Gardens source site.

The IEM conducted fill material source site sampling oversight at the Kew Gardens site on February 17, 2011. Six areas (1, 2, 3, 4, 5, and 9) were assessed by IEM desktop review and a sampling plan was submitted to, and approved by the NYSDEC for potential cover material evaluation. Representatives from the laboratory, NYCDPR, IEM, and the source site operator met prior to the initiation of sampling activities. The source site operator stated that the full extents of Areas 4, 5, and 9 would not be accessible for visual screening and analytical sample collection and soils in Area 9 were being actively loaded for off-site use. NYCDPR requested that source material evaluation proceed for accessible material. Composite grab and discrete VOC soil samples were collected for laboratory composite and analysis from Areas 1, 2, 5, and 9. Area 4 was not accessible for evaluation. Asphalt and other materials non-compliant with the Site Permit were observed on various soil horizons in Area 3, and as such, no samples were collected as the material was no longer considered for import to the Site.

On February 25, 2011, NYCDPR submitted draft analytical data from the Kew Gardens site for IEM review. At the request of NYCDPR, the IEM performed an initial review of the draft analytical data for cover material, understanding that no final determination can be made until the complete and final data package has been submitted, reviewed by the IEM, and approved by the NYSDEC. The initial IEM review identified cadmium in composite samples from Areas 1, 2, 5, and 9 at concentrations that exceed the Site Permit requirements for cover material. NYCDPR was informed and subsequently requested the material be evaluated for shaping layer material. No exceedances of the Site Permit requirements were identified in the draft data submittal. Additional draft data from the Kew Gardens source site was submitted on March 8, 2011. No exceedances of the Site Permit requirements were identified in that draft data submittal.

Final laboratory data was submitted to the IEM for review on March 18, 2011. Laboratory results were compared to the Site Permit requirements and no exceedances of shaping layer material limits were identified. Metals concentrations in the samples did exceed cover layer material limits. Fill material from

the Kew Gardens source site was approved by the NYSDEC for importation to the Site for use as shaping layer material on March 24, 2011.

Per NYCDPR request, the IEM submitted the Kew Gardens EDR files to NYCDPR on July 1, 2011.

Beginning on August 5, 2011, NYCDPR indicated to the IEM that they had renewed interest in considering shaping layer material from Area 17 at the Kew Gardens source site. The IEM provided a list of concerns and items to address in the sampling plan associated with the attempt to obtain approval for this shaping layer material. On August 11, 2011, NYCDPR indicated that the Kew Gardens review was on hold.

On September 19, 2011, IEM representatives were on-site at Area 17 of the Kew Gardens Source Site to perform a visual, physical, and PID inspection of the existing soil via a total of seven test pits excavated from ground surface to approximately 12 feet to 16 feet below the existing ground surface. The first four test pits were excavated to approximately terminal depth. The last three test pits were terminated prior to reaching terminal depth due to instability of the sidewalls as a result of the presence of dry sand material. The test pits were completed consecutively moving from south to north. The area consisted of approximately 10,000 cubic yards of proposed shaping layer material as identified by NYCDPR and the source site contractor. In addition, the IEM witnessed the collection of grab samples for chemical analysis by NYCDPR's laboratory and logged the test pit locations using handheld GPS equipment.

IEM staff observed an initial layer of organics, which contained a slight odor attributable to decomposition and yielded PID results of 0.1 to 0.5 ppm. This material was not approved for use at the Site and this was communicated directly to NYCDPR and the site contractor. The IEM indicated that any potential approval of shaping layer material from Area 17 would require the full removal of the organic layer prior to any loading and shipping of potentially approval soils to the Site, which would need to be confirmed by the IEM.

The soil below the initial organic layer (beginning approximately 0.5'-1.5' below grade) consisted of brown, silt with some sand and a trace of clay. Cobbles and boulders were also evident throughout the soil profile. No soil staining or odors were observed, and the material encountered below the organic layer was generally consistent in composition. The soil shifted to more of a sand and cobble composition as the test pits progressed towards the north. No asphalt or any other debris was observed in the soil, and the PID scans did not yield any detections.

IEM staff observed the collection of a grab samples at approximately two-foot intervals in each of the seven test pits completed at the Kew Gardens Source Site on September 19, 2011. It was estimated by NYCDPR and the site contractor that approximately 10,000 cubic yards were available from Area 17 of the source site. In addition to the required discrete sampling of VOCs/TCLP VOCs, the lab was instructed by NYCDPR to run three composite samples for the remaining analyses. The composite samples consisted of the grabs from each depth interval. The first two test pits completed represented composite sample #1, the second two test pits represented composite sample #2, and the last three test pits represented composite sample #3.

The IEM completed a preliminary review of shaping layer material originally sampled on September 19, 2011 proposed for import to the Site from Area 17. The IEM required a revised lab report from Analytical Chemists which contained the TCLP VOA and Metals results as well as the dioxin/furan scan using SW 8270. All other lab data was complete and did not exceed any of the Site Permit criteria. Prior to final

approval to import this material to the Site, NYCDPR was required to obtain the NYSDEC's approval to use the alternative dioxin/furan analysis.

NYCDPR received NYSDEC approval to use Method 8270 for analysis of dioxins/furans at this source site on January 3, 2012. The IEM completed a final review of shaping layer material (originally sampled on September 19, 2011) proposed for import to the Site from Area 17 on January 4, 2012. The review of available lab data identified that sampled material does not exceed any of the Site Permit criteria. On January 5, 2012, the IEM inspected the source site and visually confirmed the removal of the top 0.5 feet to 1.5 feet of soil which consisted of an initial layer of organics that were previously considered unacceptable for import to the Site. It was determined that the available shaping layer materials from Area 17 totaling approximately 500 cubic yards of the original estimated 10,000 cubic yards were approved for export to the Site.

The source site operator provided the IEM with a proposed excavation plan on December 5, 2012 for additional materials available at the source site. On December 8, 2012, the IEM notified NYCDPR that the previous desktop review (i.e. EDR, etc.) performed for this source site was still applicable for the latest area proposed for excavation. The IEM was on-site at the Kew Gardens source site on December 14, 2012 to witness test pits and environmental sampling for additional shaping layer materials being considered for import to the Site.

On January 3, 2013, the IEM provided a memo of recommendations to the NYSDEC regarding an additional estimated 7,500 cubic yards of shaping layer material being considered for import to the Site that was sampled on December 14, 2012. On January 4, 2013, the NYSDEC approved the importation of this material to the Site subject to the following conditions. The outer limits and depths of all areas of excavation should be clearly delineated in the field and confirmed by the IEM in the field prior to any excavation, loading, or trucking of approved soils. The approval only applied to the material samples and inspected on December 14, 2012, consisting of what appeared to be native material, free of debris and any traces of organics. The limits beyond test pit #8 consisted of observed unauthorized C&D material mixed into the soil (i.e. metal and glass, etc.), and were not approved for import to the Site. The IEM periodically inspected the excavation and hauling activities at the Kew Gardens Phase II site to perform visual and physical screening of the proposed shaping layer material. Inspection frequency was at the discretion of the IEM and the NYSDEC. The exportation of all material to the Site was conducted in accordance with the current Permit requirements (i.e. trucking manifests, etc.).

On June 5, 2013, the IEM issued a third memo of recommendations dated June 5, 2013 for the Kew Gardens source site. The IEM notified NYCDPR that the latest round of shaping layer material (approximately 5,000 CY) was acceptable for import to the Site due to the fact that the material met the Site Permit requirements. The approval applied to the material sampled and inspected on May 22, 2013, consisting of what appeared to be native material, free of debris and any traces of organics, and as delineated horizontally and vertically on the provided test pit plan. The top portion of unauthorized soil (i.e. RCA, geotextile, organic) was stripped and removed off-site to the depths and locations listed on the provided test pit plan, and this condition was witnessed by the IEM prior to importation to the Site. The importation of all material to the Site was conducted in accordance with the Permit requirements (i.e. trucking manifests, etc.).

Approximately 11,988.51 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.11 PS-285 (1065 Martin Luther King Boulevard, Bronx, NY)

On March 10 and 11, 2011 the IEM was provided with fill source site documentation for the PS-285 source site. The IEM initiated review of the source site materials provided per request of NYCDPR. Site visits to the PS-285 source site by the IEM were completed on March 14, 2011 to observe test pits and on March 25, 2011 to discuss the approval process and submittal requirements. NYCDPR requested the IEM purchase an EDR Report for the site on March 25, 2011.

The IEM witnessed additional test pits and sampling on March 29, 2011. At the time of sampling, certain portions of the source site were not accessible for sampling. Samples were collected from four test pits and composited into two samples. Lab results were provided on March 30, 2011, but were deemed incomplete by the IEM. A revised report was submitted to the IEM addressing the missing parameters, but it did not address the non-compliant dioxin/furan USEPA Test method used to generate the lab report. Final laboratory data was submitted to the IEM for review on April 5, 2011. Laboratory results were compared to the Site Permit requirements and no exceedances of shaping material limits were identified. Additional review by the IEM and the NYSDEC was required to determine if the source site was approved for material importation to the Site. The IEM completed the review of NYCDPR's EDR and desktop review, and issued a memo to the NYSDEC detailing the IEM's review results on April 5, 2011. The NYSDEC provided their review comments on April 7, 2011.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.12 Flushing Hotel (133-63 Roosevelt Avenue/39-20 Prince Street, Queens, NY)

NYCDPR requested that the IEM order and provide the EDR materials to NYCDPR for their review and submission to the IEM. The draft initial submittal was provided to the IEM over the course of several days (April 5, 6, and 7, 2011). The IEM's review commenced during this timeframe.

The IEM witnessed test pits and sampling at the Flushing Hotel source site on April 8, 2011. Final laboratory data was submitted to the IEM for review on April 19, 2011. Laboratory results were compared to the Site Permit requirements and no exceedances of shaping layer material limits were identified. Additional review by the IEM and the NYSDEC was required to determine if the source site was approved for material importation to the Site.

The IEM conducted a review of NYCDPR's EDR review, as well as a full review of the EDR, and submitted Phase I and Phase II ESA reports. The IEM reviewed the lab results provided on April 19, 2011. The IEM prepared a review document dated April 20, 2011 titled "Flushing Hotel Source Site - Desktop Submittal Review" and submitted it to NYSDEC and NYCDPR. The NYSDEC provided a response on April 21, 2011.

NYCDPR provided the IEM with supplemental historical lab data and two (2) separate Phase II reports on April 26, 2011. The IEM provided additional review comments based on the aforementioned documents to NYCDPR via conference call and email on April 29, 2011. NYCDPR provided a draft submittal response package dated May 5, 2011.

NYCDPR provided the IEM with a final submittal dated May 13, 2011 in response to IEM comments. The IEM reviewed the final submittal and transmitted that submittal to the NYSDEC for review and comment on May 18, 2011. Due to the fact that this was a complex site, final comments regarding acceptance for import to the Site was to be provided by the NYSDEC.

Conditional approval for the export of shaping material from rows 4, 5, and 6 was provided from the NYSDEC on May 27, 2011. The IEM witnessed the first day of test pits on June 3, 2011 as requested by NYCDPR. Five test pits were excavated at the source site to the maximum depth reachable by the heavy equipment available. The IEM witnessed a second day of test pits on June 6, 2011 as requested by NYCDPR. Three additional test pits were excavated to the maximum depth reachable by the heavy equipment available. NYCDPR submitted a revised site review proposal for importing shaping layer material from this source site on June 15, 2011.

A total of eight (8) test pits were excavated at the Flushing Hotel source site on June 3 and June 6, 2011. One composite sample and one discrete VOC sample was collected from each test pit. Lab results were submitted to the IEM on June 10, 2011. The IEM provided preliminary review and comments to NYCDPR regarding the source site review proposal on June 17, 2011.

The IEM submitted the memo of recommendations to the NYSDEC on June 20, 2011. The IEM visited the site on June 21, 2011 to confirm conditions within the memo of recommendations were met or could be achieved. The IEM reported conclusions to the NYSDEC via email on June 21, 2011. The observed site conditions did not allow for the source site to be approved due to the presence of asphalt, objectionable material, and stockpiles that did not allow for the confirmation of soil elevations. The NYSDEC also indicated that as of June 21, 2011, a formal submittal from NYCDPR to NYSDEC had not occurred to date. The IEM's site observations from June 21, 2011, were emailed to NYCDPR on June 23, 2011. NYCDPR submitted a revised site proposal on June 27, 2011. On June 28, 2011, the IEM indicated that items included in NYCDPR's submittal were non-complaint with the current Site Permit requirements, and therefore required approval from the NYSDEC.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.13 2nd Avenue (2nd Avenue and 94th Street, New York, NY)

The IEM witnessed fill material sampling for this potential source site on May 12 (two samples) and May 16, 2011 (one sample) regarding acceptance of crushed rock from NYCMTA's 2nd Avenue Subway construction project at 94th Street in Manhattan. Samples were analyzed for the nine RCRA metals and all passed the Site Permit requirements relative to the nine RCRA metals. One sample on May 12 was collected from material directly out of the hopper after it was deposited into a truck and the other sample was taken from a stockpile. The May 16 sample was also taken from material that came directly out of the hopper and deposited directly into a truck. The NYSDEC performed all associated reviews for this

source site similar to the East Side Access source site due to the nature of the material that was being generated from subway tunnel construction.

The NYSDEC provided approval for this source site to export shaping layer material to the Site. Shaping layer material sampling began on May 26, 2011 and occurred on a continual basis after each consecutive 2,000 cubic yards of material was imported to the Site.

Approximately 86,667.95 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.14 2nd Avenue (2nd Avenue and 72nd Street, New York, NY)

NYSDEC staff reviewed NYCDPR's submittal dated October 28, 2011 regarding acceptance of crushed rock from NYCMTA's 2nd Avenue Subway construction project at 72nd Street in Manhattan which was proposed for import to the Site. NYCDPR's proposal was acceptable to the NYSDEC provided that a composite sample of this material was tested for the proposed analytical parameters and the sample results were obtained (and approved) prior to loading material for export to the Site.

The IEM reviewed the lab results related to the IEM witnessed source site sampling conducted on December 5, 2011 for the proposed shaping layer material at the source site. The IEM identified that the sampled material was unacceptable for import to the Site based on the fact that the detected value for Arsenic was 38.4 ppm. The permit allowable maximum concentration for Arsenic is 28 ppm. The sampled material was determined to be unacceptable for import to the Site as shaping layer material per the Permit. It was determined that no material may be imported from the 2nd Avenue at 72nd Street source site to the Site. The IEM also witnessed that the physical composition of the sampled material was not that of pure stone dust as witnessed previously at the 2nd Avenue ($94^{th}$ Street) and East Side Access source sites. This material had stones as large as 12 inches to 24 inches in size. The IEM was advised that the hopper at the 2nd Avenue at 72nd Street source site used a screen that contained openings that were 24 inches by 20 inches.

On December 5, 2011, NYCDPR requested that the IEM witness one additional sample from the 2nd Avenue at 72nd Street source site. On December 6, 2011 in response to NYCDPR's request to perform one additional sample, the NYSDEC stated that if re-sampling produced acceptable results, a more stringent sampling frequency would be required for this source (i.e. one sample per 2,000 cubic yards instead of one sample per 10,000 cubic yards). NYCDPR advised the IEM that they were not pursuing material from this source site any further because it did not meet the specified physical properties for the golf course construction.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.15 Alexander Hamilton Bridge (Bronx, NY)

NYCDPR notified the IEM on February 8, 2012 that NYCDPR was interested in the opportunity to obtain potential shaping layer materials from the Alexander Hamilton Bridge source site (originally sampled July

7, 2009) which had been reviewed and approved in the past by the previous IEM. The IEM requested, obtained, and reviewed the previous files for the source site including previous approvals and corresponding lab data. On February 10, 2012, the IEM requested and received the proposed location for the recently considered shaping layer material.

The IEM visited the Alexander Hamilton Bridge source site on February 22, 2012. The IEM visually inspected a stockpile of approximately 3,000 to 5,000 cubic yards of potential shaping layer material from the previously approved source site (as per IEM records from 2009). Upon a visual inspection, it was determined that the material did not meet the Site Permit requirements due to the presence of unauthorized C&D material including asphalt and metal, as well as other miscellaneous debris. Site observations were photo documented. The IEM notified NYCDPR of its observations and NYCDPR determined that they did not want to pursue this source site any further at that time.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.16 Throgg's Neck/Target/USPS (815 Hutchinson River Parkway, Bronx, NY)

On February 28, 2012, NYCDPR requested that the IEM begin the source site review for the Throgg's Neck/Target/USPS source site. The source site was an existing USPS building that was proposed to be redeveloped with a new Target retail building. The anticipated volume of material being considered as potential shaping layer material was reported to be approximately 20,000 cubic yards per information forwarded to the IEM by NYCDPR. The IEM ordered the EDR and provided the EDR information to NYCDPR. The IEM reviewed the Phase I ESA and the Phase II ESA. The IEM completed a review of the EDR on March 9, 2012. NYCDPR provided the IEM with an EDR review memo on March 27, 2012. The IEM provided NYCDPR with some initial comments and NYCDPR submitted a revised EDR review memo on April 2, 2012.

NYCDPR provided the IEM with a proposed sample location plan with proposed depths for source site sampling on April 19, 2012. The IEM provided comments on a revised sampling plan identifying the location and quantity of test pits on April 20, 2012.

The IEM witnessed three of ten proposed test pits and the associated source site sampling at the source site on April 25, 2012. The remaining test pits were completed and witnessed by the IEM on May 11 and May 14, 2012.

The IEM reviewed the lab data (originally dated May 15 and May 24, 2012 and revised May 30, 2012) and no exceedances of shaping layer material limits were identified. The IEM prepared a memo of recommendations and submitted it to the NYSDEC on May 30, 2012. The NYSDEC reviewed the IEM's May 30, 2012 memo of recommendations for the source site. On May 31, 2012, the NYSDEC approved importation of shaping material from this source site to the Site, provided that all recommendations in the memo of recommendations were implemented. The source site commenced trucking shaping layer material to the Site.

The IEM conducted an inspection of the source site on November 6, 2012. The purpose of the inspection was to determine if site conditions warranted allowing the source site to resume importation of shaping layer material to the Site, in light of the nine truck rejections (due to presence of asphalt) that occurred on October 23, 2012 (resulting in ceasing of importation that same day). Based on the IEM inspection and observations, it was determined that importation may resume to the Site. Observations included surface asphalt had been stripped from within the approved limits of excavation between former TP-6 and TP-8, stockpiles of excavated soil from areas outside the approved excavation limits (i.e. cut along Weiner Place) were located outside the approved excavation limits, and no stockpiles of asphalt material or other poor housekeeping practices were observed within the current area in preparation for export to the Site. NYCDPR was notified that all importation must comply with all previous conditions outlined in the source site approval memo of recommendations (i.e. top +/-3 feet of fill was not approved for importation to the Site; this layer was clearly identifiable due to its color and consistency relative to the native approved material).

The IEM was on-site at the source site on February 6, 2013 to complete a source site inspection associated with a request to resume import to the Site. The site was approved to resume importation of shaping layer material on February 6, 2013 based on the IEM's inspection, which confirmed that the material originated from IEM inspected/approved areas, and the fact that the material is the native approved soil, and there are no signs of asphalt or historical fill on-site in the vicinity of the work area. The area inspected was consistent with the approved areas included in the original NYSDEC approval and IEM memo of recommendations.

Approximately 27,262.77 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.17 PS-287 (110-10 Northern Boulevard, Queens, NY)

On March 2, 2012, NYCDPR requested that the IEM begin the source site review for the PS-287 source site. The source site was a former parking facility that was being redeveloped into a new school. The anticipated volume of material being considered as potential shaping layer material was reported to be approximately 7,000 to 9,000 cubic yards per information forwarded to the IEM by NYCDPR. The source site operator expected to remove the top two feet of asphalt and historical fill, as well as a one-foot buffer. The potential shaping layer material that was being considered was what was claimed to be native soils from a depth of approximately 3 feet to 15 feet below grade. NYCDPR and the site operator wanted to proceed with sampling prior to review of the EDR. A sampling plan was provided to the IEM for review. The IEM completed a review of submitted documents including the Phase I ESA, Phase II ESA, and the proposed sampling plan and issued a review memorandum with comments on March 7, 2012. The site operator submitted a revised sampling plan for review by the IEM on March 8, 2012.

The IEM received NYCDPR's initial review of the EDR on March 14, 2012. The IEM completed a review of the EDR and forwarded a copy to NYCDPR on March 16, 2012. On March 16, 2012, the IEM requested that NYCDPR submit a revised EDR review memo incorporating the identified Recognized Environmental Concerns ("RECs") and other site conditions that were not included in the original review memo.

On March 22, 2012, the IEM received sample results for shaping layer source site sampling that occurred on March 15, 2012. The IEM completed an initial review of the sample data and although there were no exceedances relative to the Site Permit limits for the parameters that were analyzed in the lab reports, there were multiple parameters missing from the lab report.

The IEM received a revised lab report for the PS-287 source site on March 28, 2012. The IEM reviewed the revised lab report for the previously missing lab data and confirmed that the tested soil met the Site Permit criteria for shaping layer material. The IEM issued a memo of recommendations for this source site to the NYSDEC on March 28, 2012. The IEM visited the source site on March 30, 2012 and confirmed that all asphalt, historic fill, and areas not being considered for import to the Site were previously removed from the source site to the appropriate depth including the one-foot buffer below the fill layer. The NYSDEC approved the PS-287 source site for shaping layer material and NYCDPR was notified of the approval on April 2, 2012.

Approximately 6,754.8 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.18 City Point Brooklyn (1 DeKalb Avenue, Brooklyn, NY)

The IEM issued a desktop review summary for the City Point Brooklyn source site to the NYSDEC on July 27, 2012. The review included information acquired or provided to the IEM including EDR files, Phase II report, and boring information. The material being considered was approximately 22,000 cubic yards of native material proposed to be used as shaping layer material.

The NYSDEC approved the City Point Brooklyn source site for further investigation (i.e. physical and visual inspection via test pits and sampling) on August 13, 2012 since all environmental samples for the source site were made available to the IEM for review.

The IEM was on-site at the source site on August 31, 2012 to witness site investigation and sampling activities for 8,000 cubic yards of potential shaping layer material.

On September 11, 2012, the IEM received sample results for source site sampling that occurred on August 31, 2012. On September 20, 2012, the IEM issued a Site Investigation Memorandum (dated September 19, 2012) to the NYSDEC for review for the source site related to IEM witnessed activities that occurred at the source site on August 31, 2012.

On September 25, 2012, the NYSDEC notified the IEM that the City Point source site was conditionally approved pending implementation of the recommendations included in the IEM's September 19, 2012 Site Investigation Memorandum and satisfactory responses to NYSDEC questions.

On October 10, 2012, the IEM notified NYCDPR that the City Point Brooklyn source site was approved by the NYSDEC considering implementation of the recommendations included in the IEM's September 19,

2012 Site Investigation Memorandum. The IEM needed to complete a final inspection of the proposed material prior to importation to the Site.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.19 400 Park Avenue South (New York, NY)

The IEM received initial documents associated with this source site beginning on July 3, 2012. The IEM performed an initial review of the submitted documents. The IEM requested a proposed sampling plan on July 11, 2012.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.20 Union Street (43-31 Union Street, Flushing, NY)

On May 15, 2012, NYCDPR submitted a request to the NYSDEC to import shaping layer material from the Union Street source site. On June 11, 2012, the NYSDEC provided NYCDPR with email approval to import up to 30,000 cubic yards of shaping layer material from the Union Street source site based on environmental testing results submitted to the NYSDEC that was not witnessed by the IEM. On June 14, 2012, NYCDPR notified the IEM that they would begin importing, no earlier than June 18, 2012, an estimated 5,000 to 10,000 cubic yards of shaping layer material from this source site to the Site. The material originated from 30 to 55 feet below grade.

Approximately 1,675.69 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.21 Mount Vernon Recycling Corp. (113 Edison Avenue, Mount Vernon, NY)

On November 27, 2012, the IEM notified NYCDPR that the topsoil on-site that originated from the Mount Vernon Recycling Corp. facility was approved as shaping layer material based on previous NYSDEC approval allowing material to be used as shaping material, and the fact that the material passed all Site Permit criteria per IEM witnessed sample collection and a review of the associated analytical reports. The IEM witnessed sampling on October 11 and November 12, 2012. The approval was pending a receipt of all truck tickets/manifests, and confirmation of the volume of on-site soil. The Site Permit requires that this material be covered with a minimum 1-foot thick layer of approved cover soil.

Approximately 3,920.0 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.22 228$^{th}$ Street (Rosedale, NY)

The IEM completed a review of initial lab data dated December 28, 2012 for the 228th Street source site. Of the 12 lab reports that were reviewed, none of the sampled soil exceeded Site Permit levels for the shaping layer parameters that were analyzed in the reports. A significant number of parameters (including some VOCs, SVOCs, pesticides, and metals) were not analyzed and NYCDPR was notified of the review

findings on January 22, 2013. Sample collection for the submitted lab reports was not witnessed by the IEM.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.23 Evergreen Recycling/Tully Environmental (Willets Point Boulevard, Corona, NY)

On January 28, 2013, the IEM notified NYCDPR that an initial review of the lab data provided for the Evergreen Recycling source site (operated by Tully Environmental) was completed. Sampling was not witnessed by the IEM. There were no exceedances relative to the Site Permit criteria for shaping layer material, however there were a significant number of parameters that were not analyzed. The IEM received a Registration Form for a Waste Management Facility (DEC Registration # 41W93) for the source site. The IEM performed a visual inspection of stockpiled material at the source site material on January 30, 2013 and identified asphalt fragments in the source site material. The stockpiled material was not acceptable for import to the Site based on the presence of asphalt.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.24 Waterpointe-Whitestone

On February 1, 2013, the IEM notified NYCDPR that an initial review of the lab data provided for the Waterpointe-Whitestone source site was completed. Sampling was not witnessed by the IEM. There were no exceedances relative to the Site Permit criteria for shaping layer material, however there were a significant number of parameters that were not analyzed.

On March 27, 2013, the NYSDEC informed NYCDPR that shaping layer material from the Waterpointe-Whitestone source site could be imported to the Site if the material meets the required Permit limits and that the NYSDEC review would continue once involved staff was available to complete the review. On April 3, 2013, the IEM forwarded the NYSDEC correspondence regarding previous NYSDEC work plan acceptance for the proposed source site, which was for work occurring as part of a separate project under NYSDEC review.

On April 3, 2013, the NYSDEC confirmed that the Waterpointe-Whitestone source site was not approved as a potential source for shaping layer material.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.25 Don Carlo Environmental/Brooklyn (1247 38th Street, Brooklyn, NY)

On February 1, 2013, the IEM notified NYCDPR that an initial review of the lab data provided for the Don Carlo Environmental/Brooklyn source site was completed. Sampling was not witnessed by the IEM. The results in the submitted report exceeded the levels in the Site Permit for shaping layer material for the

VOC's ethylbenzene (6.9 ppm vs. 5.5 ppm), toluene (2.1 ppm vs. 1.5 ppm), and xylenes (57 ppm vs. 1.2 ppm). There were a significant number of parameters that were not analyzed.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.26 Castle Hill Recycling (1000 Zerega Avenue, Bronx, NY)

On February 11, 2013, NYCDPR provided the IEM with a permit for Castle Hill Recycling (DEC Registration #03-W-94) that was being considered as a potential shaping layer material source site. The IEM was notified that the source site was creating a 2,000 cubic yard stockpile for sampling. Castle Hill Recycling was a NYSDEC registered solid waste management facility.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.27 Springfield Gardens

On February 21, 2013, the IEM completed an initial review of a soil analysis summary documentation (no lab reports) for approximately 2,500 cubic yards of potential shaping layer material at the Springfield Gardens source site as provided by NYCDPR. The IEM did not witness sample collection. The IEM notified NYCDPR that there were several parameters exceeding the Site Permit criteria and multiple required parameters were not analyzed.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.28 Calvert Vaux (Brooklyn, NY)

On February 20, 2013, NYCDPR provided the IEM and NYSDEC with lab data for the Calvert Vaux source site for approximately 500 cubic yards of shaping layer material. On February 22, 2013, the IEM was notified by the NYSDEC that the NYSDEC would be handling the review of this source site.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.29 160 Myrtle Avenue (Brooklyn, NY)

On February 20, 2013, NYCDPR forwarded the IEM initial sample data information for a potential shaping layer material source site located at 160 Myrtle Avenue, Brooklyn, NY. The potential shaping layer materials totaled approximately 40,000 cubic yards. On February 21, 2013, the IEM notified NYCDPR that the initial review of the soil analysis summary documentation (no lab reports) was completed for the information provided to the IEM. The reviewed material had exceedances for lead and mercury relative to the Site Permit criteria.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.30 215 E. 68th Street (New York, NY)

On March 7, 2013, NYCDPR requested that the IEM review initial lab data for approximately 3,000 to 4,000 cubic yards of potential shaping material at 215 E. 68th Street, New York, NY. On March 8, 2013, the IEM notified NYCDPR that there were exceedances for Mercury and total cSVOC's for multiple samples and multiple VOC, SVOC, Pesticide, and TCLP VOC parameters were missing in all samples.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.1.31 DEP Valhalla (10 Walker Road, Valhalla, NY)

On February 25, 2013, the IEM initiated review of potential shaping material at the DEP Valhalla source site (Catskill and Delaware Water Treatment Facility). On March 1, 2013, the IEM notified the NYSDEC that a review of the initial lab results and site background information was completed. The initial review indicated that there were no exceedances relative to shaping layer material criteria for the hardcopy data, some sample parameters were missing, and there were no records indicating unacceptable background conditions. The IEM notified the NYSDEC that there was a discrepancy in the hardcopy and electronic data and clarification was requested from NYCDPR/NYCDEP. On March 5, 2013, the IEM completed a visual and physical inspection of the potential shaping layer material at the source site. On March 6, 2013, the IEM notified NYCDPR and the NYSDEC that the potential shaping layer material passed all visual and physical inspection requirements and the material passed the Site Permit criteria for shaping layer material (hardcopy data) although not all parameters were tested. In addition, the data provided electronically on CD contained information demonstrating that previous soil investigations identified soil containing elevated levels of lead and mercury that did not pass the Site Permit criteria for shaping layer material. It was communicated to the IEM verbally that the NYCDEP has been handling all impacted soil separate from the stockpiled material that was inspected, and that all impacted soil has been disposed of off-site and tracked accordingly.

On March 13, 2013, the IEM received requested documentation from the source site owner/operator regarding conditions of the existing soil stockpile and removal of contaminated materials at the DEP Valhalla source site. On March 14, 2013, the IEM notified NYCDPR that the IEM must be notified prior to importation of shaping layer material from the DEP Valhalla source site in order to witness initial loading of trucks at the source site.

Approximately 6,631.2 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.32 Tilcon (Bronx) (980 East 149th Street, Bronx, NY)

On April 1, 2013, the IEM received initial lab data and a NYSDEC Registration Form for a Solid Waste Management Facility (NYSDEC Registration #03W39R) for the Tilcon (Bronx) source site. On April 1, 2013, the NYSDEC confirmed that the Tilcon (Bronx) source site had a valid Registration Form for a Solid Waste Management Facility. On April 2, 2013, the IEM notified NYCDPR that a review of the initial lab data was completed and noted that sampled parameters did not exceed Site Permit criteria for shaping layer

material (samples WCA-1 to WCA-6), however the following parameters were not analyzed: TCLP Metals missing for sample WCA-3, WCA-5, and WCA-6, VOC: 1,2,4-trichlorobenzene, methyl ethyl ketone, and tetrachloroethylene in all samples, SVOC: 4-chloro-3-methylphenol, 2-chlorophenol, 4-methylphenol, and naphthalene in all samples, and Pesticides: 2,4 D, dibenzo-p-dioxins, endrin ketone, gamma-bhc, gamma-chlordane, mitotane (2,4 DDD), and parathion. On April 3, 2013, the IEM witnessed sampling of approximately 4,000 cubic yards of the proposed shaping material at the Tilcon (Bronx) source site.

On April 9, 2013, the IEM notified NYCDPR that the Tilcon (Bronx) shaping layer material, totaling approximately 4,000 cubic yards, witnessed by the IEM on April 3, 2013, was acceptable for import to the Site due to the fact that environmental results met the Site Permit requirements. The IEM conducted a visual inspection of material, and the IEM confirmed that the material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.).

Approximately 3,041.8 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.33 NY Recycling (475 Exterior Street, Bronx, NY)

On April 23, 2013, NYCDPR requested that the IEM initiate review of a potential shaping layer material source site named New York Recycling. On April 24, 2013, the IEM verified that the facility's NYSDEC registration was valid and that the submitted analytical results did not reveal any exceedances relative to the Site shaping layer material Permit requirements; however, several parameters were missing including TCLP metals, TCLP VOCs, and four pesticide parameters. NYCDPR was notified that in order to proceed with this potential source site, the IEM will need to complete a site visit to the facility for visual and physical inspection of the material, and witness collection of samples for chemical testing. In addition, NYCDPR would be required to collect a sample of the fines for submittal to the NYSDEC for review. On April 25, 2013, NYCDPR requested that the IEM take a grab sample of the material fines and provide that sample to the NYSDEC as required. On April 30, 2013, the IEM performed a visual, physical, and PID inspection of the material and collected a sample of fines using a No. 35 sieve. The sample was delivered to the NYSDEC on April 30, 2013.

On Friday, May 24, 2013, the IEM notified NYCDPR that Stockpile #1 of NY Recycling shaping layer material (approximately 8,000 CY) was acceptable for import to the Site due to the fact that the source site qualified as a valid NYSDEC registered C&D processing facility, the IEM conducted a visual/physical inspection of the stockpile on April 30, 2013, the IEM confirmed that the stockpiled material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.), all PID readings measured 0 ppm, and the environmental results were acceptable per the Site Permit requirements for IEM witnessed sampling completed on May 21, 2013. In addition, a sample of fines was collected by the IEM and submitted to NYSDEC for visual review, and subsequent approval. Approved shaping material to be trucked to the Site could only originate from the stockpile witnessed during the May 21, 2013 sampling event.

On June 19, 2013, the IEM notified NYCDPR that Stockpile #2 of NY Recycling shaping layer material (approximately 10,000 cubic yards) as witnessed by the IEM on June 11, 2013, was acceptable for import

to the Site. The IEM conducted a visual/physical inspection of stockpile #2 on June 11, 2013, and the IEM confirmed that the stockpiled material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.). The site qualified as a valid NYSDEC registered C&D processing facility and the test results were acceptable per the Site Permit requirements. Approved shaping material to be trucked to the Site could only originate from the stockpile witnessed during the June 11, 2013 sampling event.

On July 16, 2013, the IEM notified NYCDPR that the latest stockpile of shaping layer material (approximately 5,000 cubic yards) from the NY Recycling source site was acceptable for import to the Site. The submitted lab report met all Permit chemical requirements for sample collection witnessed by the IEM on July 11, 2013 and met Permit visual and physical criteria as per inspection by the IEM.

On August 1, 2013, the IEM notified NYCDPR that the latest stockpile of shaping layer material (approximately 5,000 cubic yards) from the NY Recycling source site was acceptable for import to the Site. The submitted lab report met all Permit chemical requirements for sample collection witnessed by the IEM on July 29, 2013 and met Permit visual and physical criteria as per inspection by the IEM.

On October 24, 2013, the IEM notified NYCDPR that the latest 5,000 cubic yard stockpile of NY Recycling shaping layer material as represented by the submitted TAGM lab report and per samples witnessed by the IEM on October 11, 2013, was acceptable for import to the Site. The approval was based on the fact that the source site qualified as a valid NYSDEC registered C&D processing facility and the IEM conducted a visual/physical inspection of the stockpile on October 11, 2013. The IEM confirmed that the stockpiled material did not contain unauthorized materials (i.e. asphalt, C&D debris, etc.), and all PID readings registered in at 0 ppm. The test results were acceptable per the Site Permit requirements. Approved shaping material to be trucked to the Site could only originate from the stockpile witnessed during the October 11, 2013 sampling event.

Approximately 26,688.05 cubic yards of shaping layer material were imported to the Site from this source site.

#### 3.1.1.34 Little Bay (Queens, NY)

On October 16, 2013, the IEM notified NYCDPR of the findings associated with a preliminary review of available data for the Little Bay source site. The IEM reviewed lab data for Stockpiles 1 through 9 (S-1 through S-9). The lab report did not capture all of the parameters required for testing by the Site Permit, and was missing the full TCLP VOC and TCLP Metals analyses, as well as several SVOC, VOC, Pesticide/Herbicide, and PCB parameters. Based on the data presented, at a minimum, the following stockpiles did not pass the Site Permit criteria as shaping layer material: S-1 exceeded for copper, lead, mercury, and total PCBs; S-4 exceeded for mercury; S-5 exceeded for lead and mercury; and S-9 exceeded for mercury and total PCBs.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

### 3.1.2 Cover Layer Material

Materials accepted for use as cover layer on the Site were sampled prior to acceptance and after each additional 2,000 cubic yards. As per the 2005 Permit modification, the parameters for cover layer material included the complete analyte list of TAGM 4046 for total VOCs, total SVOCs, total pesticides and herbicides, total PCBs, total metals, sulfur, and asbestos.

Fill material imported to the Site and used for the cover layer was subject to the following requirements, per Special Condition 14 of the 2014 Permit and Section 4.2.1.2 of the 2013 Engineering Report. A table of the cover layer material chemical acceptance criteria listed below is included in Appendix C.2 of the 2013 Engineering Report.

In order for topsoil material to be used on the Site for the cover layer, it was sampled prior to acceptance and after the importation of each additional 2,000 cubic yards (in truck volumes). Each soil sample was analyzed for the entire analyte list in the NYSDEC Technical and Administrative Guidance Memorandum (TAGM) 4046, total volatile organic compounds (VOCs), total semi-volatile organic compounds (SVOCs), pesticides and herbicides, polychlorinated biphenyls (PCBs), and metals (including Resource Conservation and Recovery Act (RCRA) metals).

Based on source site reviews and site testing activities, the cover layer material imported to the Site met the following chemical limits:

TAGM 4046 Table 1 – Volatile Organic Compounds (VOCs)

TAGM 4046 Table 2 – Semi-Volatile Organic Compounds (SVOCs)

TAGM 4046 Table 3 – Pesticides/Herbicides and Polychlorinated Biphenyls (PCBs)

TAGM 4046 Table 4 – Metals

Total Asbestos 0.5% or less

Total Sulfur 0.5% or less

The following additional criteria were directed in NYSDEC correspondence:

April 30, 2009 – Directed NYCDPR not to accept or place on the Site any cover layer materials with arsenic concentrations greater than 16 ppm or lead concentrations greater than 400 ppm.

July 28, 2009 – Provided a table to NYCDPR listing modified heavy metal chemical limits for the cover layer at the Site.

September 25, 2009 – Revised and clarified the chromium chemical limits for the cover layer previously presented in the July 28, 2009 letter.

NYCDPR followed the NYSDEC's directives since receipt of each one associated with the importation of cover layer material to the Site.

Details of the source site reviews and site testing for each potential cover layer material source site are as follows.

#### 3.1.2.1 Bloomingburg (C.M. & Sons Trucking Site, 680 Bloomingburg Road, Bloomingburg, NY)

NYCDPR requested that the IEM witness fill material sampling for this potential source site on May 9, 2011. The Site is a sand and gravel supply yard. Material was separated into sand and gravel of various sizes and stockpiled. The source site had been importing sand and gravel material from a nearby real estate development under construction. Material being considered for the Site included two stockpiles (SP-1 and SP-2) of a brown, medium to coarse sand. Both stockpiles were from material generated on-site. Each stockpile was approximately 25,000 cubic yards. Prior to sample collection the piles were screened in various locations using a calibrated PID. No detections of VOCs were observed. The material was inspected using a 3/4-inch screen. No prohibited materials were observed in the screened material. The IEM witnessed a total of six samples collected from two separate stockpiles. Per the AES sampling plan, three samples were collected from each stockpile. Each sample consisted of 20 grabs (depths ranging from the surface to three feet into the pile) which were composited. One discrete grab per sample was collected specifically for VOC analysis without being composited.

NYCDPR provided the IEM authorization to commence review of this source site on May 24, 2011. NYCDPR requested this source site review be put on hold on May 27, 2011. It was requested by NYCDPR that the IEM witness sampling for physical parameters on June 1, 2011. NYCDPR provided authorization to the IEM to order the EDR on NYCDPR's behalf on June 8, 2011.

On June 24, 2011, the IEM emailed the final source site review updates to NYCDPR which identified that Sample #2 for SP-1 failed to meet the cover layer material Permit requirements due to an Antimony exceedance. NYCDPR requested that the source site review be put on hold on June 24, 2011. On June 30, 2011, NYCDPR requested that the IEM resume the source site review. The IEM notified NYCDPR that the review was completed on June 24, 2011 and forwarded the original June 24, 2011 review findings/comments to NYCDPR. On July 1, 2011, NYCDPR requested that the IEM provide the EDR files to NYCDPR which were ordered for the site in June. The IEM resubmitted the EDR files to NYCDPR.

On July 8, 2011, NYCDPR submitted a preliminary review of the EDR to the IEM via email. The IEM provided comments to NYCDPR via email. On July 11, 2011, NYCDPR submitted a preliminary site review submittal via email and the IEM provided comments to NYCDPR via email. On July 12, 2011, NYCDPR submitted the site review submittal to the NYSDEC and the IEM via email. On July 12, 2011, the NYSDEC requested that the IEM provide preliminary comments of NYCDPR's submittal and the IEM provided comments to the

NYSDEC via email. On July 15, 2011, the NYSDEC provided comments to the IEM and a request for clarification on NYCDPR's submittal.

The IEM provided NYCDPR a review status update with respect to this source site via phone and email on July 20, 2011. The update contained action items required for NYCDPR to advance the review process. The IEM provided the NYSDEC with an update on the status of NYCDPR submittals for this source site on July 22, 2011 via email. NYCDPR provided the cover layer material permeability testing results to the IEM on July 22, 2011. The IEM consulted with the NYSDEC beginning on July 22, 2011 regarding the permeability results and the IEM notified NYCDPR on July 28, 2011 that the cover soil permeability rate of 1.51 X 10-2 cm/s (21.4 in/hr.) did not meet the NYSDEC maximum allowable permeability of 1 x 10-2 cm/s (14.7 in/hr.). The IEM also requested clarification on NYCDPR's intent on handling the SP-1 Antimony exceedance as identified in lab reports.

NYCDPR requested the analytical lab data from the IEM on August 8, 2011 and indicated that they would be submitting a final proposal to the NYSDEC regarding the request to import cover material from the Bloomingburg source site by addressing outstanding metals and permeability requirements. The IEM forwarded requested lab data to NYCDPR via email on August 8, 2011.

IEM staff visited the Bloomingburg source site to inspect the cover layer material on October 6, 2011 and the existing material appeared to be the same material that the IEM inspected originally in May 2011 with the exception that SP-1 had been removed off-site and was no longer available. The results of the site visit were consistent with what the IEM was told by the site operator earlier on October 6, 2011. The IEM confirmed that the GPS coordinates of the stockpile (SP-2) were consistent with the original location, the soil appeared to be the same color and consistency, and the stockpile had vegetation growing on it, indicative that it had been untouched for an extended period. The IEM witnessed the loading of one truck on October 6, 2011 headed to the Site, which was carrying approximately 26 cubic yards of cover layer material. IEM staff was on-site at Bloomingburg on October 7, 2011 to witness the initial rounds of cover layer material loading.

In general, the NYSDEC allowed up to 16,000 cubic yards of approved cover material (from all cover material source sites) to be stockpiled in the rough of holes 4 and 5 (8,000 cubic yards per hole) prior to satisfying the conditions associated with spreading the cover material on the Site. These conditions included meeting permeability and shaping layer thickness requirements. On October 21, 2011, the NYSDEC provided NYCDPR with a conditional approval to allow NYCDPR to import cover layer material with a permeability of up to 30 inches per hour pending NYCDPR submitting for approval of an amendment to the Stormwater Pollution Prevention Plan (SWPPP). With this permeability approval, NYCDPR was notified that they could spread cover material on-site at their own risk pending shaping layer thickness compliance which occurred at a later time.

Approximately 4,768.0 cubic yards of cover layer material were imported to the Site from this source site.

#### 3.1.2.2 Ranco Sand (115 South Street, Manorville, NY) [LAWS]

On December 2, 2011, the IEM was directed by NYCDPR to order the EDR for the Ranco Sand source site located in Manorville, NY. The IEM visited the Ranco Sand source site on December 8, 2011 to inspect a stockpile of approximately 10,000 to 12,000 cubic yards of proposed cover soil. The soil was inspected and visually appeared to be 100% sand, free of any debris. The material appeared to be native as it was mined from a NYSDEC permitted facility, extending approximately 100 feet below original grade. The stockpile of sand that was inspected was mined from below the water table.

The IEM witnessed the collection of six composite soil samples and six discrete VOC samples, as well as a physical sample to be analyzed for permeability. The IEM logged the location of the perimeter of the stockpile via GPS. The source site owner and NYCDPR were made aware that the stockpile must remain untouched in order for the material to be considered for approval.

NYCDPR/LAWS submitted a copy of a previous NYSDEC mining permit containing the source site's previous permit number (1-4722-00218/00001). LAWS was informed by the source site representative that the source site is operating under a NYSDEC authorized permit extension.

The EDR was ordered on December 9, 2011. The IEM performed a review of the EDR and provided observations and a list of RECs to the NYSDEC. The IEM received the lab data (from the December 8, 2011 sample event) from LAWS on December 19, 2011. The IEM completed review of the lab data on December 19, 2011 and found that the material met the Site Permit criteria for cover layer soil. The IEM reviewed the NYCDPR submittal associated with the EDR for the source site. Based on review of the NYCDPR EDR review memo, site visits, inspections, and data review, the IEM did not have any objections associated with proceeding with this source site. Prior to receiving approval for importation of this cover material to the Site, the NYSDEC needed to receive and review the permeability testing data.

On January 4, 2012, the IEM forwarded the NYSDEC the permeability data for review. On January 9, 2012, the NYSDEC identified that this source site was conditionally approved as a source for cover material based on samples meeting the approved permeability specification at a frequency of one sample per five hundred cubic yards for the initial 2,000 cubic yards (analysis for permeability only). Thereafter, sampling for permeability would be performed at a frequency of one sample per 2,000 cubic yards if the permeability results for the initial 2,000 cubic yards were satisfactory. This conditional approval was based upon information provided by NYCDPR in its January 5, 2012 email and the IEM's January 4, 2012 email to the NYSDEC. Additional permeability sampling witnessed by the IEM was required since only one IEM witnessed sample has occurred (i.e. January 2, 2012). The IEM witnessed permeability testing at the source site on January 10, 2012.

NYCDPR transmitted additional percolation testing results to the NYSDEC on January 26, 2012. The results were for IEM witnessed sampling completed on January 10, 2012 and January 23, 2012. On January 26, 2012, the NYSDEC provided NYCDPR with approval to use the average of twenty permeability test results as representative of the 12,000 cubic yards of stockpiled cover layer material at the source site. This

approval was based on the fact that loading, transporting, stockpiling, and spreading of the material would result in thorough mixing. The initial 12,000 cubic yards were approved for import to the Site.

On February 1, 2012, IEM staff was on-site to observe loading and transportation of cover layer materials from the approved stockpile and completion of trucking manifests. On February 7, 2012, IEM staff notified NYCDPR and NYSDEC that the IEM had reviewed the environmental sample data for the second round of environmental sampling completed on January 30, 2012 for cover soil (i.e. eight composite samples from an approximately 15,000 cubic yard stockpile). Per the results in the lab report transmitted to the IEM, the IEM verified that the material complied with the Site permit criteria for cover layer material. On February 9, 2012, the IEM reviewed the infiltration rate test results for the second stockpile of cover layer material, and all of the sample results met the Site Permit criteria (i.e. less than 29.4 in/hr.). Based on a review of the submitted environmental data and the infiltration testing data, the second stockpile (up to 16,000 cubic yards) was approved for import to the Site since it met all of the Site Permit criteria.

The IEM was on-site at the Ranco Sand source site on February 22, 2012 to witness sampling of a new stockpile of potential cover layer material (stockpile #3). The IEM witnessed the collection of five samples from the stockpile consisting of approximately 10,000 cubic yards of potential cover layer material.

The IEM reviewed the environmental sampling results from the February 22, 2012 sampling event for this source site and found that the sample results fell below the Site Permit limits. The IEM reviewed the percolation test results and found that the percolation rates for stockpile #3 exceeded the established threshold of 29.4 inches/hour. The IEM required a proposal from NYCDPR on an acceptable approach to remedy the percolation rate exceedance.

On March 15, 2012, the NYSDEC notified the IEM that the environmental testing (TAGM) frequency for this source site had been reduced from one sample per 2,000 cubic yards to one sample per 10,000 cubic yards of cover layer material. The percolation testing frequency remained unchanged at one sample per 2,000 cubic yards.

On March 15, 2012, the NYSDEC found NYCDPR's proposed truck loading and mixing protocol acceptable to address elevated percolation rates for the stockpile #3 materials. On March 19, 2012, the IEM informed NYCDPR that stockpile #3 at the Ranco Sand source site had been approved for import as cover layer material based upon the acceptable environmental testing results and the percolation results in conjunction with the required mixing and truck loading protocol. The IEM witnessed the appropriate truck loading protocol of the first round of trucks at the source site on March 16, 2012. Trucks were loaded in an alternating pattern from both stockpile #2 and stockpile #3.

The IEM witnessed source site sampling at this source site on March 30, 2012. The IEM received a lab report on April 5, 2012 containing infiltration testing data for ten samples collected from stockpile #4. The IEM reviewed the infiltration testing data and confirmed that the results met the permeability requirement for cover soil.

The IEM received the environmental (TAGM) lab report on April 6, 2012 for the samples collected for stockpile #4 on March 30, 2012. On April 9, 2012, the IEM confirmed that sample results for stockpile #4 did not exceed any of the Permit criteria for cover material and the material was acceptable for import to the Site.

The IEM received the environmental (TAGM) lab report on May 9, 2012 for the samples collected for stockpile #5 on April 30, 2012. On May 10, 2012, the IEM confirmed that sample results for stockpile #5 did not exceed any of the Permit criteria for cover material and the material was acceptable for import to the Site. The IEM reviewed the infiltration testing data on May 17, 2012 and confirmed that the results met the permeability requirement for cover soil.

The IEM approved Ranco stockpile #5 on May 17, 2012, as the environmental testing results did not exceed any of the Permit criteria for cover layer material. The 20,000 cubic stockpile from Ranco that was tested and witnessed by the IEM met the Site Permit criteria and was acceptable for import to the Site. Infiltration testing was also approved by the IEM. The NYSDEC lowered the frequency of infiltration testing to one infiltration sample per 10,000 cubic yards for this source site on May 11, 2012. Through May 17, 2012, this source site was approved to export 78,000 cubic yards of cover material to the Site.

The IEM was on-site at this source site on June 8, 2012 to witness the collection of samples from stockpile #6. Two samples were collected for environmental and infiltration analysis for the approximate 20,000 cubic yard stockpile. The IEM received infiltration testing data on June 14, 2012. Infiltration test results were reviewed and approved on June 19, 2012. The IEM received environmental testing lab results on June 18, 2012. The environmental testing lab results were reviewed and approved on June 19, 2012. Stockpile #6 (20,000 CY) did not exceed any of the Site Permit criteria for cover layer material and infiltration requirements and was therefore acceptable for import to the Site.

The IEM was on-site at this source site on July 17, 2012 to witness sampling of stockpile #7 consisting of 10,000 cubic yards of cover layer material. On July 26, 2012, the IEM notified NYCDPR and LAWS that the material from stockpile #7 was acceptable for import to the Site based on the fact that the submitted environmental and infiltration lab reports met the Site Permit requirements.

The IEM reviewed the infiltration and environmental lab reports for stockpile #8 of cover layer material (10,000 cubic yards) sampled on August 14, 2012. The IEM notified NYCDPR on August 22, 2012 that the material was approved for import to the Site as both infiltration and environmental results were acceptable per the Site permit requirements.

On September 17, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #9 of cover layer material sampled at this source site on September 7, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

On October 1, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #10 of cover layer material sampled at this source site on September 21, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

On November 7, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #11 of cover layer material sampled at this source site on October 17, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

On December 10, 2012, the IEM notified NYCDPR that the 10,000 cubic yard stockpile #12 of cover layer material sampled at this source site on November 16, 2012 was acceptable for import to the Site as both environmental and infiltration lab results met the Site Permit requirements.

IEM staff was on-site February 1, 2013 at this source site to perform the visual inspection and witness sampling of the cover soil for environmental and infiltration testing associated with stockpile #13 (10,000 cubic yards). The IEM witnessed collection of one environmental sample and one infiltration sample.

On February 19, 2013, the IEM notified NYCDPR that the latest round of cover layer material for this source site was acceptable for import to the Site based on the fact that both the environmental and infiltration results met the Site Permit requirements. The results were for sampling witnessed by the IEM on February 1, 2013 for stockpile #13.

The IEM witnessed sample collection for stockpiles #14 and #15 totaling 20,000 cubic yards worth of proposed cover layer material at this source site on March 19, 2013. Based on review of submitted lab results, the proposed cover layer material was approved for import to the Site as both infiltration and environmental results were acceptable per the Site Permit requirements.

On June 3, 2013, the IEM notified NYCDPR that the latest round of cover layer material for stockpiles #16 and #17 totaling approximately 20,000 cubic yards were acceptable for import to the Site as both infiltration and environmental results met the Site Permit requirements. Submitted infiltration and environmental lab reports were for sampling witnessed by the IEM on May 22, 2013.

On August 5, 2013, the IEM notified NYCDPR that the latest round of cover layer material for stockpile #18 (approximately 10,000 cubic yards) was acceptable for import to the Site. The submitted infiltration and environmental lab reports for sampling witnessed by the IEM on July 26, 2013 met the Site Permit requirements.

On August 29, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #19 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on August 21, 2013.

On September 13, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #20 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on September 6, 2013.

On October 3, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #21 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on September 25, 2013.

On October 28, 2013, the IEM notified NYCDPR that the latest stockpile of cover layer material for stockpile #22 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on October 16, 2013.

On November 8, 2013, the IEM notified NYCDPR that the latest cover layer material stockpile #23 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on October 25, 2013.

On November 18, 2013, the IEM notified NYCDPR that the latest cover layer material stockpile #24 (approximately 10,000 cubic yards), as represented by submitted infiltration and environmental lab reports, was acceptable for import to the Site. Both infiltration and environmental results met the Site Permit requirements for sampling witnessed by the IEM on November 8, 2013.

On March 14, 2014, the IEM notified LAWS and NYCDPR that the cover layer material stockpile #24, originally sampled and witnessed on November 8, 2013 was acceptable for importation. On March 14, 2014, the IEM completed a site visit and performed a visual inspection of the existing stockpile on-site.

#### 3.1.2.2.1 Ranco Sand (115 South Street, Manorville, NY) [MFM]

On July 10, 2012, the IEM received lab results for a 10,000 cubic yard stockpile of cover layer material sampled at the Ranco Sand source site on July 2, 2012 for MFM. On July 11, 2012, the IEM confirmed that the environmental lab testing results did not exceed any of the Site Permit criteria for cover layer material environmental analyses however the stockpile could not be approved for import as infiltration test results were not reviewed and approved.

The NYSDEC approved the infiltration test results on August 21, 2012 for stockpiled cover layer material (10,000 cubic yards) sampled on July 2, 2012. Based on the NYSDEC approval of the infiltration results, the IEM notified NYCDPR on August 22, 2012 that the stockpiled material was approved for import to the Site as both infiltration and environmental results were acceptable per the Site Permit requirements.

#### 3.1.2.2.2 Ranco Sand (115 South Street, Manorville, NY) [Triton]

On June 6, 2013, the IEM notified NYCDPR that the revised environmental lab report for a 5,000 cubic yard stockpile met the Site Permit requirements for IEM witnessed sampling completed on May 31, 2013. On June 7, 2013, the IEM notified NYCDPR that the infiltration testing results did not meet the Site Permit requirements.

On June 24, 2013, the IEM notified NYCDPR that the additional infiltration tests analyzed for a 5,000 cubic yard stockpile did not meet the Site Permit requirements for IEM witnessed sampling completed on May 31, 2013 and it was not approved for import to the Site. On June 24, 2013, NYCDPR notified the IEM that this material would not be sampled any further.

Approximately 271,801.2 cubic yards of cover layer material were imported to the Site from this source site based on approved materials noted above in Sections 3.1.2.2 and 3.1.2.2.1.

#### 3.1.2.3 East Coast Mines (Lewis Road near Route 104, East Quogue, NY)

Between August 10 and August 12, 2011, NYCDPR and the IEM coordinated a site visit to the East Coast Mines source site (DEC Facility ID: 1-4736-00539), and discussed review requirements. The EDR was ordered by the IEM on August 12, 2011, and the initial EDR files were forwarded to NYCDPR.

The IEM visited the source site on August 17, 2011 to inspect two stockpiles each consisting of approximately 2,000 cubic yards of soil. The soil was inspected and visually appeared to be sand, free of any debris. The material appeared to be native as it was mined from roughly 80-100 feet below original grade. The stockpiles were inspected with a PID, which yielded no detections. The IEM witnessed the collection of a composite and discrete VOC sample from each stockpile, as well as a physical sample to be analyzed for permeability.

The IEM visited the site again on September 29, 2011 to inspect a separate stockpile of proposed cover layer material of approximately 2,000 cubic yards of soil. The soil was inspected and visually appeared to be sand and free of any debris. The material appeared to be native as it was mined from roughly 80-100 feet below original grade. The IEM witnessed the collection of a composite and discrete VOC sample from the stockpile, as well as a physical sample to be analyzed for permeability. The IEM logged the location of the perimeter of the stockpile via GPS. The source site owner and NYCDPR were aware that the stockpiles must remain untouched in order for them to be considered for approval. NYCDPR performed a review of the EDR. The IEM performed a review of NYCDPR's review submittal, as well as a review of the EDR. No RECs were identified. NYCDPR submitted the facility's NYSDEC mining permit to the IEM.

On October 11, 2011, the NYSDEC identified that they had reviewed the initial analytical data for the East Coast Mines source site and authorized the importation of two stockpiles of cover material totaling approximately 3,500 cubic yards. This approval was associated with cover material that was sampled on August 17, 2011. This material was approved for only stockpiling on-site, and had not been approved for spreading on-site. Cover material was stockpiled in the rough of holes 4 and 5 pending NYSDEC approval for spreading. The NYSDEC had not reviewed the September 29, 2011 analytical data resulting in a

maximum allowable import volume from this source site of 3,500 cubic yards. In general, the NYSDEC allowed up to 16,000 cubic yards of approved cover material (from all cover material source sites) to be stockpiled in the rough of holes 4 and 5 (8,000 cubic yards per hole) prior to satisfying the conditions associated with spreading the cover material on-site. These conditions included meeting permeability and shaping layer thickness requirements. On October 21, 2011, the NYSDEC provided NYCDPR with a conditional approval to allow NYCDPR to import cover layer material with a permeability of up to 30 inches per hour pending NYCDPR submitting for approval of an amendment to the Stormwater Pollution Prevention Plan (SWPPP). With this permeability approval, NYCDPR was notified that they could spread cover material on-site at their own risk pending shaping layer thickness compliance.

On April 18, 2012, NYCDPR requested that the IEM witness source site sampling for two 2,000 cubic yard stockpiles at this source site.

The IEM witnessed source site sampling at this source site on April 23, 2012. Four samples were collected for environmental testing and four samples were collected for agronomic testing. The IEM reviewed the environmental and infiltration testing data and confirmed that the environmental results met the Site Permit requirements for cover layer material and three of four stockpiles met the NYSDEC permeability requirements. The stockpile SP2 infiltration rate exceeded the Permit limit. Material from SP2 was not acceptable for import to the Site.

The East Coast Mines stockpiled material sampled on April 23, 2012 was formally approved by the NYSDEC on May 15, 2012. Although the environmental results passed the Site Permit criteria, one of the four stockpiles (each stockpile was 2,000 cubic yards) did not meet the Site Permit infiltration criteria. However, the NYSDEC, after a review of a NYCDPR submittal request, granted approval of the four stockpiles by allowing averaging of the four stockpile infiltration results; the average of the four stockpiles met the Site Permit criteria.

The IEM forwarded the Site environmental testing criteria per the Permit for cover layer material to the lab on July 2, 2012. On July 4, 2012, the IEM notified NYCDPR, the lab, and the source site contact of parameters that had to be re-analyzed or re-reported to coincide with the required Permit limits for potential cover layer material sampled on June 22, 2012. On July 5, 2012, the IEM reviewed the revised lab report for material sampled on June 22, 2012 and determined that the material (6,000 cubic yards) was acceptable for import to the Site. On July 10, 2012, the IEM received a lab report associated with a 10,000 cubic yard stockpile sampled on July 2, 2012. On July 10, 2012, the material was found to be acceptable for import to the Site based upon review of the submitted lab report and NYSDEC review and approval of the infiltration testing results. The NYSDEC approved the infiltration results based on the condition that the stockpiled materials were mixed at the source site prior to import to the Site.

The NYSDEC notified NYCDPR on July 18, 2012 that the proposed 1:3 ratio of mixing for cover layer material stockpiles #1, #3, and #6 at East Coast Mines source site was acceptable and subject to verification by the IEM. The IEM notified NYCDPR and the source site operator on July 18, 2012 that the submitted lab report was missing the analysis of dibenzofuran. NYCDPR and the source site operator

submitted revised lab reports on July 18, 2012. The IEM notified NYCDPR and the source site operator that the two separate stockpiles of material (8,000 cubic yards each) sampled at the East Coast Mines source site on July 11, 2012 were conditionally acceptable for import based upon proper mixing of the stockpiles. The IEM was on-site at the East Coast Mines source site to witness sampling of a new 10,000 cubic yard stockpile and the mixing of the cover soil stockpiles on July 23, 2012. The IEM notified NYCDPR and the source site operator that the sampled materials were acceptable for import to the Site on July 24, 2012.

The IEM was on-site at the East Coast Mines source site on July 31, 2012 to witness mixing of cover layer material stockpiles. On August 6, 2012, the IEM notified NYCDPR that the cover layer materials sampled on July 23, 2012 at the East Coast Mines source site, totaling 14,000 cubic yards, were acceptable for import to the Site based on review of submitted environmental and infiltration lab reports.

On August 20, 2012, the IEM notified NYCDPR that the 8,000 cubic yard stockpile of cover layer material sampled on July 31, 2012 was approved for import to the Site. The approval was based on the submitted environmental results meeting the Site Permit requirements, approval from the NYSDEC to mix and average the infiltration test results, and the mixing of the stockpiled material at the source site which was witnessed by the IEM on August 14, 2012.

On August 30, 2012, the IEM notified NYCDPR that the 12,000 cubic yards of cover layer material sampled on August 14, 2012 was approved for import to the Site. The approval was based on the submitted environmental results meeting the Site Permit requirements, approval from the NYSDEC to mix and average the infiltration test results (August 23, 2012 email), and the mixing of the stockpiled material at the source site which was witnessed by the IEM on September 4, 2012.

On September 12, 2012, the IEM notified NYCDPR that a portion of the 14,000 cubic yards of cover layer material sampled on September 4, 2012 was approved for import to the Site. Stockpile SW consisting of 6,000 cubic yards of cover layer material was approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile DSS consisting of 8,000 cubic yards had acceptable environmental results meeting the Site Permit requirements but was not approved due to infiltration results not meeting the Permit requirements. On September 14, 2012, the IEM notified NYCDPR that Stockpile DSS consisting of 8,000 cubic yards of cover layer material was approved for import to the Site since the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of September 14, 2012.

On September 20, 2012, the IEM notified NYCDPR that a portion of the 14,000 cubic yards of cover layer material sampled on September 14, 2012 was approved for import to the Site. Stockpile FFS consisting of 6,000 cubic yards of cover layer material was approved was based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile NW consisting of 8,000 cubic yards had acceptable environmental results meeting the Site Permit requirements but was not approved due to infiltration results not meeting the Permit requirements. On September 21, 2012, the IEM notified NYCDPR that Stockpile NW consisting of 8,000 cubic yards of cover layer material was

approved for import to the Site since the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of September 21, 2012.

On September 28, 2012, the IEM notified NYCDPR that a portion of the 12,000 cubic yards of cover layer material sampled on September 21, 2012 was approved for import to the Site. Stockpile SW consisting of 2,000 cubic yards of cover layer material was approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile DSS consisting of 10,000 cubic yards had acceptable environmental results meeting the Site Permit requirements but was not approved due to infiltration results not meeting the Permit requirements. On October 2, 2012, the IEM notified NYCDPR that Stockpile DSS consisting of 10,000 cubic yards of cover layer material was approved for import to the Site since the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of October 2, 2012.

On October 8, 2012, the IEM notified NYCDPR that all of the 16,000 cubic yards of cover layer material sampled on October 2, 2012 was approved for import to the Site. Stockpile SW consisting of 6,000 cubic yards of cover layer material was approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results. Stockpile NW consisting of 10,000 cubic yards which had acceptable environmental results meeting the Site Permit requirements was approved based on the fact that the average of the infiltration test results met the Permit requirements and the IEM witnessed thorough mixing of the stockpiled material at the source site on the morning of October 9, 2012.

On October 18, 2012, the IEM notified NYCDPR that all of the 16,000 cubic yards of cover layer material sampled on October 9, 2012 was approved for import to the Site. The stockpiled cover layer material was approved was based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results.

On November 7, 2012, the IEM notified NYCDPR that all of the 16,000 cubic yards of cover layer material sampled on October 24, 2012 was approved for import to the Site. Stockpile SW consisting of 6,000 cubic yards of cover layer material and Stockpile NW consisting of 10,000 cubic yards of cover layer material were approved based on the submitted environmental results meeting the Site Permit requirements and acceptable infiltration results.

On May 8, 2013, the IEM inspected previously tested and approved cover layer material (sampled October 24, 2012) at the source site and notified NYCDPR that import may resume for the previously approved material.

On July 25, 2013, the IEM notified NYCDPR that the latest round of East Coast Mines cover layer material (approximately 8,000 cubic yards) was acceptable for import to the Site. The submitted infiltration and environmental lab reports for sampling witnessed by the IEM on July 19, 2013 met the Site Permit requirements.

Approximately 167,007.05 cubic yards of cover layer material were imported to the Site from this source site.

#### 3.1.2.4 Amboy Aggregates (415 Main Street, South Amboy, NJ)

The IEM reviewed the infiltration and environmental lab reports for cover layer material (2,000 cubic yards) sampled on August 27, 2012. The IEM notified NYCDPR on September 6, 2012 that the environmental results were acceptable per the Site Permit requirements, however the infiltration results did not pass the Permit requirements for cover layer material. The IEM's involvement on this source site was limited to witnessing the collection of the soil samples for testing and a review of the lab results.

No further action was reported associated with this potential source site and no material was imported to the Site from this source site after October 25, 2010.

#### 3.1.2.5 Long Island Compost/Great Gardens (445 Horseblock Road, Yaphank, NY)

On November 16, 2012, the IEM notified NYCDPR and LAWS that the Long Island Compost/Great Gardens source site (DEC Permit Number: 1-4722-03647/00001) was conditionally approved to allow for the import of topsoil to be used as cover layer material pending IEM visual inspection and witnessing the collection of soil samples of the proposed material at the source site.

On December 7, 2012, the IEM notified NYCDPR that the 2,000 cubic yard stockpile of cover layer material sampled at this source site on November 30, 2012 was acceptable for import to the Site as both environmental lab results and visual inspection met the Site Permit requirements. The NYSDEC waived infiltration testing requirements for this material as long as the material was used solely in tree pits.

The IEM witnessed sample collection for a 2,000 cubic yard stockpile of proposed cover layer material at this source site on March 20, 2013. On March 28, 2013, the IEM notified NYCDPR and LAWS that the submitted sample results did not pass the Site Permit criteria due to the fact that Benzo(a)pyrene exceeded the permit limit of .061 mg/kg in sample 49369 with a value of .097 mg/kg and Chromium exceeded the permit limit of 19.4 mg/kg in sample 49369 with a value of 22.9 mg/kg. The material was not approved for import to the Site as cover layer material at that time.

On April 9, 2013, the IEM notified NYCDPR and LAWS that the submitted sample results for a 2,000 cubic yard stockpile of proposed cover layer material at this source site (sampled on March 20, 2013) did not pass the Site Permit criteria due to the fact that Benzo(a)pyrene exceeded the permit limit of .061 mg/kg in sample 49369 with a value of .097 mg/kg. The revised lab report dated April 8, 2013 addressed concerns with the analysis of trivalent and hexavalent chromium (the previous lab report had only analyzed total chromium). On April 10, 2013, the NYSDEC notified NYCDPR that after further review of the revised lab results, the 2,000 cubic yards of material was acceptable for import to the Site.

On April 29, 2013, the IEM notified NYCDPR and LAWS that the submitted sample results for a 2,000 cubic yard stockpile of proposed cover layer material at this source site (sampled on April 19, 2013) did not pass the Site Permit criteria due to the fact that Benzo(a)pyrene exceeded the permit limit of 0.061 mg/kg with

a value of 0.140 mg/kg and Dibenzo(a,h)anthracene exceeded the permit limit of 0.014 mg/kg with a value of 0.020 mg/kg. On May 1, 2013, NYCDPR requested approval to use the material as backfill for the tree pits only. On May 1, 2013, the NYSDEC notified NYCDPR that the 2,000 cubic yards of material was acceptable for import to the Site.

On May 14, 2013, the IEM notified NYCDPR and Triton that the submitted environmental and infiltration sample results for 2,000 cubic yards of proposed cover layer material at this source site (witnessed by the IEM and sampled on April 30, 2013) was acceptable for import to the Site as both environmental and infiltration results met the Site Permit requirements.

On October 28, 2013, the IEM notified NYCDPR that that a review was completed for a 2,000 cubic yard stockpile of proposed cover layer material from this source site. The proposed material was visually inspected and sampling was witnessed by the IEM on October 16, 2013. Although the material passed the IEM's physical/visual inspections and did not yield any PID detections, the sampled material did not comply with Site Permit criteria for the following parameters: Benzo(a)pyrene exceeded the permit limit of 0.061 mg/kg in sample GBF65277 with a value of 0.150 mg/kg; Dibenzo(a,h)anthracene exceeded the permit limit of 0.014 mg/kg in sample GBF65277with a value of 0.024 mg/kg; and Dieldrin exceeded the permit limit of 0.044 mg/kg in sample GBF65277 with a value of 0.100 mg/kg. On October 29, 2013, NYCDPR submitted additional documentation to the NYSDEC for evaluation. Based on review of submitted information, the NYSDEC notified NYCDPR on October 29, 2013 that this material may be imported to Site and used solely for backfilling the parking lot curb planters and shall not be used as capping material.

On March 11, 2014, the IEM notified LAWS and NYCDPR that the 2,000 cubic yard stockpile of cover layer material originally sampled and witnessed on October 16, 2013 was acceptable for importation. On March 11, 2014, the IEM completed a site visit and performed a visual inspection of the existing stockpile at the source site.

Approximately 8,434.85 cubic yards of cover layer material were imported to the Site from this source site.

## 3.2 On-Site Fill Importation Inspections

### 3.2.1 Process

As required under Special Condition 24 of the 2014 Permit, all fill importation was inspected at the Site by the IEM. Fill material volume (truck volume) was measured and recorded for each delivery of fill material as it arrived on-site by NYCDPR's appointed representative. The fill material was then inspected by the IEM at the observation platform near the entrance to the Site. At this time, the fill material was visually and chemically inspected. The visual inspection included observations of the material, disturbing the material with a shovel, and close-up observations of the material retrieved by shovel while still in the truck or trailer. Chemical inspection of the fill material was executed using a calibrated PID. If the fill material failed to meet the Permit requirements for reasons such as a PID reading above ambient air, the presence of asphalt or some other unauthorized debris, etc., the load was rejected immediately prior to

dumping. If the material was rejected, the truck was not allowed to dump on-site and was directed to exit the site immediately.

If the fill material passed the initial inspection at the IEM observation platform, either it was allowed to dump directly at a work location for immediate use as shaping layer material or cover layer material or it was transported to, and dumped at, a stockpile location. At the dump location, the IEM screened the fill material visually and with a PID for a second time prior to spreading if dumped at an active work location. If the fill material did not meet the permit requirements at the dump location, it was immediately rejected, loaded back onto the same truck, and transported off-site.

After the second round of inspection and after the material was dumped on-site and accepted for use, the IEM recorded dump and stockpile locations utilizing handheld GPS units. The data was uploaded to a web-based GIS system intermittently throughout the process in order to provide real-time data to authorize users including the NYSDEC and NYCDPR and to generate figures used to track the dump locations in the biweekly FMRs. The web-based GIS database was maintained by the IEM. Figure 2, included in each FMR beginning with FMR 246, identifies where fill materials were being used and dumped on the Site during construction activities.

A flow chart detailing the on-site fill importation inspection process is included as Appendix 21.

### 3.2.2 Trucking Manifests

Trucking manifests were utilized for all imported shaping layer and cover layer materials. A 5-ply manifest form was completed for each load of material to track each load of material from origination at the source site to destination at the Site. The manifest contained information including but not limited to a manifest number, the source site name and address, the truck driver's name, truck and trailer license plate numbers, as well as the time of departure from the source site and arrival time at the Site. See fill import manifests included in Appendix 13.

Note that manifests for material approved for importation prior to November 2008 cannot be retrieved and are not included in Appendix 13. The manifest information was stored in a NYCDPR document repository that was damaged by flooding and the files have been lost. However, the FMRs for the time period prior to 2008 comment on the nature of this work.

### 3.2.3 Rejected Trucks & Materials (JFK Consent Order Material & Misc. Debris)

Generally, materials were either rejected upon initial inspection at the IEM observation platform or rejected upon dumping at the work area or stockpile location. The most common reasons for rejection were the presence of asphalt or other unauthorized debris mixed with the material or elevated PID readings.

Details for all rejected trucks were included in each bi-weekly Fill Management Report (FMR). Trucking manifests associated with rejected truckloads were marked with the word "REJECTED" by the IEM. Trucking manifests for rejected trucks are included as Appendix 13.

During 2010, fill material from one particular source at JFK Airport was brought on-site and placed in seven different stockpiles ultimately being used as fill material beneath the clubhouse and maintenance building parking lots. The material was believed to be in conformance with permit conditions. However, the material was found to be in violation of 2005 Permit Special Conditions 1, 9, and 16, during NYSDEC and IEM inspections. On January 10, 2011, NYCDPR signed an Administrative Order on Consent (Consent Order), Case No. R2-20100521-172, related to this fill material. The Consent Order is included as Appendix I, of the 2013 Engineering Report included in Appendix 20.

## 3.3 Fill Tracking

Special Condition 9 of the 2014 Permit required quantification of all imported fill material. Fill importation was continuously tracked by the IEM. To account for the difference in truck volume and in-place volume, the IEM applied a 41.7% correction factor for shaping layer material and an 18% correction factor for cover layer material as set forth in the Permit. Additional details and methodology related to calculation of the shaping layer correction factor is included in a December 11, 2009 letter included in Appendix 19.

The cover layer material correction factor was separated from the shaping layer correction factor and revised in accordance with a NYCDPR submittal dated April 1, 2013 and revised April 8, 2013. The methodology for calculating the cover layer material correction factor is included in the revised April 8, 2013 submittal, which is included in Appendix 19.

As shaping layer and cover layer fill materials were imported to the Site, the IEM tracked volumes for each source site with respect to authorized volume based on approved sample analysis results for each source at the required sampling frequency (i.e. per 10,000 cubic yards for shaping layer material and per 2,000 cubic yards for cover layer material as included in Special Condition 14 of the 2014 Permit). The volume of imported material was tracked real-time as the IEM uploaded source, truck, and fill material volume information as each load of material was dumped on the Site. The fill tracking process, as part of the overall environmental monitoring and database management web-GIS system developed by the IEM and utilized beginning on October 25, 2010, was awarded a New York Chapter American Council of Engineering Companies (ACEC) Platinum Award in April of 2013. The web-GIS system allowed the IEM to upload and store data related to each load of fill material entering the Site, map its location, and allow real-time access to the data and mapping for NYCDPR, NYSDEC, the Contractor, and the general public.

At various times throughout fill importation activities, source site, shaping layer, or cover layer material totals were modified for various reasons. Additional details related to corrections and modifications can be found in Section 4 of corresponding Fill Management Reports, notably FMRs 213, 266, 277, 290, and 305.

Effective with FMR 290 and retroactive to October 25, 2010 (i.e. Woodard & Curran's first day as the IEM on-site at the Site), shaping layer and cover layer material volumes were tracked based upon the calculated volumes within each truck, as calculated by TRC and provided to the IEM (i.e. Tables 4-2 and 4-3 of each FMR). This provided for the most accurate and consistent approach to monitoring the volume

of imported fill materials. Prior to receipt of the calculated volumes from TRC, the IEM tracked estimated volumes as trucks dumped on the Site.

The Fill Delivery Summary Table included in Appendix 11 contains information related to the total amount of shaping layer and cover layer materials imported to the Site. The total volume of shaping layer material imported to the Site since October 18, 2002 was 2,681,338.15 cubic yards (truck volume) or approximately 93.4% of the authorized amount under the Permit. The total volume of cover layer material imported to the Site since October 18, 2002 was 480,959.49 cubic yards (truck volume) or 100.1% of the authorized amount under the Permit.

On April, 17, 2014, the NYSDEC confirmed via email that a minor exceedance of the cover layer in-place volume as included in the Permit is acceptable considering no additional shaping material will need to be imported and that the exceedance could be addressed via as-built drawings and in the final construction certification report. A copy of the email is included in Appendix 19.

The Bronx-Whitestone Bridge bound the “Site” to the west, Balcom, Miles, and Emerson Avenues to the east, Schley Avenue and St. Raymond’s Cemetery to the north, and the East River to the south. The project was originally managed under Ferry Point Partners, LLC (FPP).
On July 17, 2000 the New York State Department of Environmental Conservation (NYSDEC) issued Part 360, Solid Waste Management Permit No. 2-6006-00014-000110 jointly to the New York City Department of Parks and Recreation (NYCDPR) and FPP to allow a total of 1,000,000 cubic yards of fill to be imported and placed on the Site. Importation began in August 2000.

On October 18, 2002 the NYSDEC issued Part 360, Solid Waste Management Permit No. 2-6006-00014-000113 (2002 Permit) to allow a total of 1,522,300 cubic yards of fill to be imported and placed on the Site. The fill material was to consist of approximately 1,272,300 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The 2002 Permit also stated that, “approximately 415,000 cubic yards of fill was deposited on the Site prior to the effective date of the permit and the projection for in-place fill material to complete the project was 1,107,300 cubic yards, consisting of approximately 857,300 cubic yards (in-place volume) of select exempt construction debris for the shaping layer and approximately 250,000 cubic yards (in-place volume) of uncontaminated soil for the cover layer.

In 2003, it was determined that the tournament quality and signature status of the course could be significantly improved by making the facility a "links" style course. The changes from the 2002 Permit include:

- Increasing the support mounding between golf holes and grading the course in a links style.
- Re-routing of holes 11, 12 and 13 to reverse their direction in order to improve player circulation and playing time.
- Moving Hole 9 to the west of the golf driving range in order to improve

the safety zone of the driving range and remove the need for high netting.

- Realigning the centerlines of holes: 10, 16, 17 and 18 to improve the strategic layout and visual experience of the golf course.
- Lowering the elevations of tee 4 and 6. This will eliminate the retaining wall proposed at the northeast comer of the Site.
- Adding a golf training area at the north end of the driving range. This required shifting the centerline of Hole 8 slightly north and increasing the support mounding around this area to buffer the adjacent holes.
- Increasing the mounding adjacent to the TBTA toll plaza in order to block noise and adjacent traffic from view.
- Shifting the Site roadway along the east side of the bridge to accommodate a TBTA easement that extends 25 feet east of the bridge. This required changes to the parking lot at the clubhouse and the location of detention/water quality basin, and waterfront park.
- Eliminating the Boathouse Grill restaurant in the Waterfront Park. A restaurant will now be located within the banquet facility. Parking spaces for the banquet facility were increased to accommodate the restaurant. A restaurant may be constructed within the waterfront park in a future phase, based on economic demands.
- Modifying the parking lot for the Waterfront Park. The 120 parking' spaces for the Waterfront Park will be located near the Whitestone Bridge approach structure.

These proposed changes to the golf course would have increased the total in-place fill volume for the project to 2,370,000 cubic yards to shape the course in a links style.

The quantification of the imported fill material was to be continuously tracked by both truck volume and periodic topographic surveys of in-place volumes. Initially it was assumed that truck volume would be reduced by 25% when compacted into place, but a new correction factor was to be calculated. On November 1, 2004, the NYSDEC approved a revised truck reduction factor of 42.4%, which was based upon an October 10, 2003 30% aerial topographic survey, and On December 7, 2004, the NYSDEC approved a revised truck reduction factor of 41%, which was based upon a July 17, 2004 60% aerial topographic survey. These recalculations were performed by dividing the actual in-place volume by the total cubic yards of truck volume delivered to the site as of the date of the survey as per the “2002 Permit

TRC Raymond Keyes Associates, A Division of TRC Engineers, Inc. prepared an, “Application for Modification to the Solid Waste Management Facility Permit for Construction of Ferry Point Park Recreation Facility, Bronx, NY – Engineering Report; Dated May 31, 2005; Revised June 30, 2005” which comprised of Volume #1, Volume #2 and a twenty six (26) sheet drawing set entitled, “Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2” (2005 Report) . The 2005 Report represented the following scope of work:

- An eighteen (18) hole golf course with practice area.
- Maintenance Area in the northwest corner of the Site.
- Clubhouse Parking Lot in the southwest portion of the Site.
- Banquet Facility in the southwest portion of the site (along Emerson Avenue)
- Community Park
- Waterfront Park with parking lot.
- Drawing G-3 and G-4 of "Ferry Point Park Public Recreational Facility Bulk Earthwork, Bronx, New York, Supplement No. 2", showed the deviations in grading between the plans approved on 10/18/02 with the proposed plan.

On November 18, 2005 the NYSDEC issued Part 360, Solid Waste Management Permit No. 2-6006-00014-000113 ("2005 Permit") authorizing the importation of a total of 2,370,000 cubic yards of in-place fill material to the Site. The fill material was to consist of approximately 2,120,000 cubic yards of select exempt construction and demolition debris for the shaping layer, and approximately 250,000 cubic yards of uncontaminated soil for the cover layer. The truck reduction factor was 41% and could be further modified.

In 2007, TRC Engineers, Inc. ("TRC") was awarded a one (1) year contract to provide "Civil, Environmental and Construction Services for Compliance with DEC permit Related to the Construction of a Golf Course at Ferry Point Park". The order to work date for that contract was October 25, 2007. The scheduled completion date was October 23, 2008. The contract was extended an additional year to October 24, 2009. On October 26, 2009, "TRC" issued a "Year 2 End Project Summary" and estimated that approximately 202,000 total cubic yards of material was imported to the Site by October 22, 2007.

On October 26, 2007, the NYCDPR and FPP terminated the license agreement to develop, construct and operate the Project at the site and on February 29, 2008 FPP submitted an application to transfer the "2005 Permit" solely to the NYCDPR. On August 12, 2008, the NYSDEC notified the NYCDPR and FPP that the "2005 Permit" had been transferred to the NYCDPR.

The order to work date for construction of the Community Park was August 11, 2008. Fill importation continued as witnessed by the Independent Environmental Monitor (Gannett Fleming). On September 30, 2009, Thomas Balsley Associates, NYCDPR design consultant issued a revised drawing changing the limit of the Community Park. The new Site was reduced in size by moving the fence line in the south further north and by moving the fence along the proposed golf course closer to Balcom Avenue.

On January 22, 2009, in accordance with Special Condition #10 of the "2005 Permit", TRC Engineers, Inc. (TRC) submitted a revised truck reduction factor of 40.3%. On February 11, 2010, NYSDEC approved a truck reduction factor of 41.7%.

The order to work date for construction of the Ferry Point Golf Course was October 23, 2009. The golf course layout that the NYCDPR bid was modified from that which shown in the 2005 Report. One major

change was the total removal of the Banquet Facility in the southeast part of the Site. There were also changes in the placement, alignment and grading of some holes.

On February 1, 2013, the NYSDEC granted a permit modification to increase the limit of cover material to 394,000 cubic yards with the stipulation that the Agency revisit the compaction factor. It was determined that the compaction factor for the granular cover material (sand) would be 18%. This would revise the "trucked in" quantity to 480,488 cubic yards. The compaction factor for cover layer material approved per April 26, 2013 letter from NYSDEC to DPR.

On May 21, 2014, the NYSDEC issued Part 360, Solid Waste Management Permit No. 2-6006-00014-00013 (SW) & 2-6006-00014-00013 (TW) to the NYCDPR to allow a total of 2,514,000 cubic yards of material in-place volume (2,120,000 cubic yards in-place shaping material/394,000 cubic yards in-place cover material).

## 3.4 Total Carcinogenic Semi-Volatile Organic Compound Tracking

As identified in Special Condition 14 of the 2014 Permit, the NYSDEC Acting Regional Director letter dated October 25, 2006, authorized the import of shaping material with a total carcinogenic SVOC (tcSVOC) level of up to ten parts per million (ppm), which would not otherwise be acceptable, provided the tcSVOC weighted average of all imported material is equal to or less than 3 ppm at the end of each quarter. The tcSVOC weighted average is defined as the sum of the products of the material volume and the material tcSVOC, for each material source, divided by the total volume of the material imported. The weighted average was calculated over the course of construction and the final weighted average for shaping layer and cover layer materials imported to the Site was 0.70 ppm, less than the 3 ppm maximum. The total carcinogenic SVOC weighted average table and computations are included in Appendix 12 for materials imported to the Site after November 18, 2005.

SVOCs were not sampled for at the East Side Access and 2nd Avenue (94th Street) source sites due to the source being undisturbed, virgin rock material generated from subway tunnel boring. NYSDEC email correspondence dated April 15, 2011 stated that the IEM should apply one-half of the method detection limit (MDL) from the latest lab report sampled at that time for materials originating from those two source sites.

# 4 Construction

## 4.1 General Construction

### 4.1.1 Community Park

Construction of the Community Park consisted with capping the 11 acre site, installing baseball fields, a basketball court, walkways, a comfort station, and a landscaped stormwater retention area. Construction started on August 11, 2008. As of December 31, 2011, the stormwater retention pond, passive landfill gas (LFG) vents, and recreation facilities were considered complete. The Order to Work date for the comfort

station was March 19, 2014. The original scheduled completion date was September 15, 2014. The anticipated completion date is currently the Fall of 2015.

### 4.1.2 Golf Course

Generally, construction for the Golf Course was completed from the northeast to the southwest. The sequence of construction started by grading, rough shaping and compacting each hole, installing major drainage lines and inlet drains, installing irrigation lines and fine shaping the holes, installing branch drainage lines, constructing the greens and tees, installing demarcation material, grading cover material, fine grading cover material, and final stabilization by hydro-seeding. Each hole was constructed individually and then turned over to Trump, who is contracted with NYCDPR to maintain and operate the grounds and golf course, for care and maintenance during the grown-in period and prior to course operations.

LAWS completed construction work, including punch list items associated with their construction contract, and demobilized from the site in July 2014. Trump has and continues to perform various earth disturbance related work on the Site, in addition to standard maintenance of the Site. All permit related activity, including earthwork, general construction, and fill deliveries have been coordinated with the IEM, and the IEM has witnessed the work activity and documented inspection observations in the Daily Observation Reports. Specifically, IEM oversight related to Trump's on-site activity includes, but is not limited to, the replacement and relocation of trees, construction of a clock tower and associated subsurface concrete footing, excavation of trenches and installation of utilities to support various on-site facilities including the temporary clubhouse, installation of a cart barn, re-grading of an existing shaping and cover layer earthen berm and subsequent installation of concrete block letters at the surface, and installation of asphalt. For a detailed description of Trump's work activities requiring IEM oversight subject to the Permit conditions, refer to the Daily Observation Reports located in Appendix 5 beginning on June 19, 2014.

### 4.1.3 Waterfront Park

Special Condition 37 of the 2014 Permit requires that NYCDPR submit a revised design for the Waterfront Park and provides NYCDPR the flexibility to remove the Waterfront Park from the NYSDEC Part 360 Permit and permit the project under a separate NYSDEC tidal wetlands permit. The Waterfront Park is currently in the process of being conceptually scaled back in magnitude due to the impacts of Hurricanes Irene and Sandy, and design plans are being value engineered and developed. NYCDPR intends to submit plans to the NYSDEC upon completion of an approved design, and handling the construction via a separate NYSDEC tidal wetlands permit. Any SEQR related documents will be updated accordingly. The final end use of the Waterfront Park is anticipated to be publically accessible and consists of a passive recreational feature. NYCDPR will not be performing post-construction monitoring in this area of the Site until construction is completed and approved, and will restrict public access until such time.

## 4.2 Environmental Controls/Construction

### 4.2.1 Wells (Landfill gas, groundwater and water balance analysis)

NYSDEC requested NYCDPR on August 6, 2010 to demonstrate that soil being used for final cover material (not specifically the uppermost layer) would have a sufficiently low coefficient of permeability and percentage of organic material to minimize infiltration of water into the lower layer of fill material. These comments were submitted as additional comments to the November 25, 2009 permit application submittal.

NYCDPR performed a site-wide water balance evaluation to predict post-construction infiltration rates. EPA's Hydrologic Evaluation of Landfill Performance (HELP) model was used for this evaluation. The results were presented to NYSDEC on May 13, 2011 as well as incorporated in Supplemental Engineering Report for the Solid Waste Management Facility Permit Application for Ferry Point Park East, Bronx New York October 15, 2013. The model used criteria including a typical one-foot thick soil landfill cover with the proposed soil cover material as designed for the facility. The model also accounted for impermeable areas of the site, irrigation of the golf course, drainage system stormwater capture and the lining of ponds.

The soil cover permeability of 14 inches per hour was used for the overall site model. Using this infiltration rate the overall volume of water penetrating the site would be lowered by approximately 9,700 gallons per day. A subsequent water balance analysis was submitted to NYSDEC on August 10, 2011 presenting infiltration rates with a soil permeability of 30 inches per hour that also lowered the overall volume of water infiltrating the site following completion of construction. Discussion and request for confirmation that the site drainage was adequate for a 30 inch per hour permeability took place and the final maximum permeability of 30 inches per hour was approved by NYSDEC for cover material. Cover material imported to the site was tested subsequent to this approval to insure it was able to meet the goal for material permeability. More specifically, testing was combined from individual stockpiles and sources and the average from those was used to determine acceptability of material. Individual variability in sample results was expected because loading, unloading, stockpiling and spreading over the site was recognized as providing a homogeneous layer over the site. Samples were collected at a frequency of one per 2,000 cubic yards moving forward from January 26, 2012 until importation of material was completed.

Additional impacts on water balance came from lined irrigation and retention ponds. There is one large irrigation pond located on the course and several small retention ponds located throughout the open course. The irrigation pond's purpose is to collect storm runoff during storm events and stor it to be utilized for irrigation of the upper cover layer during non-storm periods. The grading and drainage for the stormwater collection and retention were provided in the November 25, 2009 permit application. NYSDEC requested that infiltration beyond the upper layer of cover material be minimized to the maximum extent possible on August 6, 2010 and this included lining each of the five on-site retention ponds to limit infiltration as much as could be done.

The subsequent changes to cover permeability and the lining of irrigation and retention ponds required a review of the Stormwater Pollution Prevention Plan (SWPPP) in order to confirm the additional flow would

not exceed the design criteria for the storm system. The engineering review conducted at that time (October 18, 2011) confirmed the stormwater system design was adequate to carry this flow.

NYSDEC granted a conditional approval for the Ferry Point Site to accept a 30 in. percolation rate per hour cover material on October 21, 2011. The conditional approval was based on a request for DPR to "submit for approval an amendment to the Stormwater Pollution Prevention Plan (SWPPP) dated November 13, 2009, with plans and computations that reflect the partial lining of the stormwater basins." DPR provided this in a technical memorandum to NYSDEC on November 16, 2011. The memorandum presented a formal submittal of the pond liner design to NYSDEC and included excerpts of calculations from the November 13, 2009, SWPPP. An approval was provided by NYSDEC on December 2, 2011.

Municipal solid waste (MSW) filling operations ceased at the Site in the 1960s, prior to the implementation of the comprehensive environmental regulations now in place, and a formal groundwater sampling program was not required at that time. Information on groundwater quality at a former landfill site such as Ferry Point Park East can be used to help evaluate existing groundwater conditions. For the 2005 Permit application, the Site's history was reviewed and a geotechnical investigation was performed to evaluate the potential for adverse impacts on the Site's groundwater due to the placement of fill during construction of the golf course and parks.

A summary provided in the 2005 Engineering Report concluded "that the placement of fill would not have an adverse impact on pre-development groundwater conditions at the site and that the proposed golf course construction would not result in an increased flow of contamination into the river through groundwater flow." (TRC 2005a).

In their comments of June 25, 2010, NYSDEC asked DPR whether any new information was available regarding groundwater conditions at the Site, and if any new, relevant information was available, to verify the conclusions of the geotechnical portion of the 2005 Engineering Report (TRC 2005a).
Following several discussions with DPR, and because no prior sampling had been required, NYSDEC requested that DPR undertake a groundwater sampling program and develop a reference point for background water quality conditions at the Site.

To comply with this request, DPR prepared written field procedures for new well installations, well development, and groundwater sampling (see Appendix G.1).
The field procedures were submitted to, and approved by, NYSDEC prior to the start of the work effort. Prior to installation, the locations of the monitoring wells were approved by NYSDEC during a meeting held with DPR on September 22, 2011.

Landfill gas monitoring over the entire Site has incorporated various different types and configurations of monitoring points. These include perimeter and interior wells and vents that have been monitored over time on a regular frequency. Monitoring has been recorded and reported according to Special Conditions Monitoring as referenced in the March 2014 permit and results dictate continued additional monitoring when that has been necessary. This monitoring continues under the Post Closure Monitoring

requirements and in accordance with the Landfill Gas Management Plan. A total of thirty seven passive vents were installed throughout the Golf Course and Community Park on an average spacing of approximately one vent for every five acres. These vents are considered passive and allow the natural venting of subsurface gases to take place without any additional vacuum or fans. Additional active vapor removal does take place at each of the constructed buildings on the site. This includes the comfort station and maintenance shed on the Golf Course and comfort station at the Community Park. Active systems operate at both of these locations on a continual basis and vent the subsurface area beneath the associated slabs to the atmosphere. There are no structures planned for or constructed on the Waterfront Park parcel at this time.

Passive gas vents are installed throughout the golf course and are included along the perimeter within the venting trenches, within the overall golf course as individual stand-alone vents and in combined systems of interconnected piping to carry landfill gas from beneath irrigation ponds.
Landfill gas monitoring includes perimeter probes located along an approximate 250 linear ft. interval on the north, east and southern site boundaries; off-site monitoring points along Buttrick, Balcom, Schley, Miles and Emerson Avenues; a passive vent trench installed along the eastern and northern perimeters of the course with piezometers installed along the vent trench to allow for monitoring of the groundwater levels associated with the vent trenches; individual passive vents within the golf course and community park space; a passive vent system of interconnected piping serving the irrigation pond; and sub-slab depressurization systems beneath the enclosed buildings located within the golf course and community park.

In February 2012, eleven new groundwater monitoring wells were installed across the Site to obtain information on current groundwater conditions. Design documents for the groundwater monitoring wells are included in Appendix G.2 of the 2013 Engineering Report, included in Appendix 20. An initial sampling event was completed in February 2012 and included the testing activities described below.

■ Groundwater Elevation Measurements: Water depths were measured at the 11 groundwater monitoring wells. Two measurements were taken from each well within one hour each of high and low tides, starting at the shoreline and moving inland.
■ Elutriate Testing: One soil core sample per well was collected during well installation in order to perform elutriate analysis. Samples were selected from shaping material zones based on visual observation of the soil cores.
■ Groundwater Testing: Groundwater samples were collected at each of the 11 wells and shipped for laboratory analysis in accordance with the required testing as referenced in the 2002 permit.
■ Hydraulic Conductivity Testing: In situ slug testing for hydraulic conductivity was completed at each of the 11 groundwater monitoring wells.

The initial groundwater monitoring data from February 2012 was submitted to NYSDEC by email on March 28, 2012. This data is included in the report for the initial groundwater monitoring event (see Appendix G.5 of the 2013 Engineering Report, included in Appendix 20). At that time, DPR requested direction from

NYSDEC concerning procedures for future sampling events. That is, should future sample collection be modified due to the high turbidity.
(>1,000 nephelometric turbidity units [NTUs]) observed in the initial samples. A call was held with NYSDEC on May 8, 2012, to discuss the initial data and provide guidance on future monitoring (see Appendix G.3 of the 2013 Engineering Report, included in Appendix 20 for call minutes.) Also during this call, NYSDEC directed DPR to perform inorganic analyses on both filtered and unfiltered samples collected during the next sampling event. If the next round of results is found to be in expected ranges, then future sampling events will utilize only filtered samples for inorganic analyses.

NYSDEC provided DPR with requirements for future groundwater monitoring in their FPP Groundwater Characterization/Monitoring Objective, on May 8, 2012 (see Appendix G.4 of the 2013 Engineering Report, included in Appendix 20). DPR implemented the groundwater monitoring program in accordance with the schedule and monitoring parameters requested by NYSDEC.

The schedule included two additional quarterly sampling events, followed by approximately three semi-annual events (through completion of construction) and three post-construction annual sampling events. After the third annual sampling event, DPR may request to reduce the sampling frequency or cease the groundwater sampling program at the Site. Table 4-1 provides a schedule of the monitoring events that will be performed to complete this program and the parameters that will be analyzed for during each event.

Post-construction groundwater monitoring and groundwater monitoring well maintenance requirements are incorporated into the Post-Construction Custodial Care Plan for the Site (see Appendix I).

### 4.2.2 Liners

A single irrigation pond has been constructed at the Site. The purpose of this pond is to collect and store stormwater runoff and reuse it later for irrigation and maintenance of the golf course vegetative cover. This pond is fully lined to maximize the retention of irrigation water. The irrigation pond design documents were included in the November 25, 2009, permit application package. In addition, there are five smaller water quality ponds designed to provide active stormwater retention and limit the off-site migration of sediment. The geometry and grading (engineering design) of these ponds were also provided in the November 25, 2009, permit application package. DPR considered various methods to meet NYSDEC's request of August 6, 2010, to minimize the infiltration of water through "the lower layers of material to the maximum extent possible." Based on this consideration, DPR is implementing a recommendation contained in the November 16, 2010, memorandum (see Appendix D.1 of the 2013 Engineering Report, included in Appendix 20) to line the five on-site water quality ponds to limit water exfiltration. The pond system has been included in the overall water budget evaluation that was submitted and approved by NYSDEC in addition to the permeability of the upper imported fill material.

Supplemental drawings and specifications for the lining of these ponds are provided in Appendix D.4 of the 2013 Engineering Report, included in Appendix 20. The pond liner designs are consistent with the

previously approved geometry and grading (engineering design) presented in the November 25, 2009, permit application package.

### 4.2.3 Gas Venting

#### 4.2.3.1 Active

According to the 2009 permit the site wide active landfill gas control system consistent with the proposed with the 2005 permit was withdrawn as a design modification. Active systems were installed at buildings and initially proposed for the irrigation lake.

Based on the Final Engineering report, due to the explosive nature, LFG is not allowed to accumulate within any enclosed structure at the site. Therefore active sub-slab depressurization systems (SSDS) have been installed at each of the enclosed buildings at the site. These systems have continuous explosive gas monitoring components of the design. The irrigation lake was not made active and continues as a passive system as per the September 2009 permit modification application.

The SSDS engineering drawings for the golf course facilities (maintenance building and comfort station) are provided in Appendix F.3 of the 2013 Engineering Report, included as Appendix 20. The Community Park comfort station design was provided in the November 25, 2009, permit application. The Waterfront Park comfort station has not been designed. Maintenance of the SSDS and their monitoring equipment will be performed in accordance with the operations, monitoring, and maintenance (OM&M) program for the Site's Landfill Gas management system (see Section 4.4.4). The design of any additional structures at the Site will be completed in accordance with New York City Department of Buildings requirements. The need for LFG mitigation systems for any future Site structures will be evaluated as part of their design.

#### 4.2.3.2 Passive

The LFG management system as redesigned for the Site (since the November 25, 2009, permit application submittal) is an update of prior conceptual passive LFG designs and includes a passive system for the venting of LFG in all areas not covered by enclosed facilities. The primary goals for the design of the Site's LFG management system are to provide safe operating conditions and protect human health.

The proposed passive system is consistent with the plans presented in the 1999 EAS (AKRF 1999), the 2002 Technical Environmental Assessment (AKRF 2002), and the 2005 Engineering Reports (TRC 2005a, b) and was approved under the 2005 Part 360 Permit. It deviates from the 2009 permit renewal application prepared by TRC Engineers (TRC), which recommended an active system. An active system uses blowers or fans to extract gas through vents from the landfills subsurface, whereas a passive system uses vents without blowers or fans. Supplemental Site investigations and extraction testing performed by TRC Engineers at the Site in 2009 and 2010 were reviewed by Walsh Environmental Scientists and Engineers, LLC (Walsh) in 2010. Emissions modeling was also performed by EEEPC in 2010, as discussed in Section 4.4.1. Based on these evaluations and modeling of Site conditions, a Landfill Gas Management Plan (LFGMP) was prepared (see Appendix F.1 of the 2013 Engineering Report, included in Appendix 20). The plan concluded that a passive venting system is sufficient to achieve safe operating conditions for users and workers of the golf course and parks. A description and details of the Site's LFG management system

are presented in the LFGMP. The LFG management system as currently designed is consistent with the proposed venting system described in the 2005 Permit.

### 4.2.4 Vent Trench

The landfill gas perimeter trench was the primary gas-management structure installed in or about 2001. The Trench was initially proposed in the 1999 conceptual LFG control system. The purpose of the vent trench was to capture and prevent the off-site migration of LFG. The 2002 AKRF Report included installation details and certified drawings of the trench and its details.

The LFG trench was constructed along the eastern and a portion of the northern perimeter and was completed in 2001. The trench begins at the water's edge at the foot of Emerson Avenue, continues along the length of the Balcom Avenue Site boundary and continues approximately 1050 ft. in a westerly direction past the intersection of Schley and Buttrick Avenues.

The LFG passive trench is essentially a stone-filled /geotextile-wrapped envelope that begins three feet below the groundwater surface and extends upward to just below the ground surface. The upper 6 inches of the trench is dressed and finished with a layer of wood chips that allow LFG entering the trench to vent to the atmosphere. During the construction there were some areas where stability of the fill material at the water table was noted to be an issue and in these areas the trench was extended to a depth of one foot below the groundwater surface. In addition to the gravel filling of the trench to allow for a porous medium allowing LFG to move upward and escape, a continuous 4 to 6 inch diameter perforated PVC pipe was buried in the upper portion of the stone backfill. Vertical passive vents are connected to this horizontal piping to allow for future modifications should the top of the trench need a cap installed above it. The trench will collect and disperse any and all LFG that comes into it but it was primarily designed to remove methane from passing beyond the site boundary. The vent trench was specifically installed below the elevation of measured groundwater in order to maintain a constant layer of saturation within the lower part of the trench. This groundwater layer would prevent landfill gas from migrating beneath the trench and off of the site. Passive vents were also installed within the trench to allow a rapid ascent of LFG out of the trench and into the atmosphere. Concentrations of LFG that could be an issue within the trench would immediately be diffused in the atmosphere and reduced to a concentration that is not a concern.

Following the installation of the trench, methane concentrations were noted to have declined significantly, demonstrating the effectiveness in controlling LFG in the area.

Landfill gas migration is influenced by a number of factors including barometric pressure, diffusion gradients, composition and distribution of subsurface soil and fill material and groundwater. As landfill gas builds up and accumulates, it moves outward from the points or areas /zones where it is generated, spreading into other areas. Landfill gas migrating vertically will reach the surface and diffuse when it mixes with ambient atmospheric air. The other main concern for migration from the landfill was horizontal migration from the landfill to areas off-site. This horizontal migration can be controlled and to a significant extent can be eliminated through the use of LFG trenches. The LFG trench configuration can prevent accumulated gas from passing beyond the site because it creates an area allowing for diffusion and mixing of LFG with ambient air. The overall trench is constructed and filled with material of a higher

permeability than the surrounding soil or fill and typically offers a more direct connection to the open atmosphere. The base of the trench is extended into the water table which performs two functions that both increase the opportunity for LFG to be removed and thus prevent it from migrating offsite. The first offers a more open contact of the shallow groundwater surface to ambient air allowing dissolved concentrations to be volatilized out of the water column into the air and the second prevents LFG that exits from the landfill soil from travelling beneath the trench out beyond the site.

Approximately 5,350 feet of LFG passive vent trench was constructed along the site boundary between May 2001 and December 2001.

Routine inspections of the LFG passive vent trench included the following observations, depth of wood chip layer over geotextile, excessive fine grained materials, vegetation, erosion along the vent trench and any other condition that may have a potential to compromise the ability of the LFG passive vent trench to intercept and transmit LFG to the atmosphere. Refer to the non-conformance table. Monitoring includes routine bi-weekly observations and inspection of the following specific components of the trench:

- Observation of the covering wood chips to insure they extend to and are level with the ground surface and are free of excessive fine grained materials that would restrict the flow of LFG from the trench once it is intercepted.
- Observation of the vertical hard piping risers to insure they do not show signs of cracking bends or breaks;
- Observation of the vertical riser piping to insure they remain vertical and anchored as they were installed;
- Observation of the vertical vents and openings to insure they remain open.

Continued monitoring of the trench is described in Special Conditions 30 of the modified Permit with NYSDEC. This includes monitoring of groundwater levels in the adjacent monitoring wells. If the groundwater is noted below the bottom of the trench, the following actions are initiated:

1. Evaluate the methane concentrations in nearby perimeter methane monitoring wells and semi-permanent monitoring points. If the methane concentrations measured that day are below the site-specific action level of 25% LEL, continue the normal (bi-weekly) methane monitoring frequency and increase the groundwater level measurements at the location of concern to bi-weekly.
2. If the groundwater level measured at the initial bi-weekly monitoring event is above the base of the vent trench, then defer back to the routine monthly piezometer monitoring frequency.
3. If the groundwater level remains below the trench bottom for the first additional bi-weekly monitoring event, but nearby perimeter methane monitoring wells and semi-permanent monitoring points are below the site-specific methane action level of 25% LEL, continue groundwater level and methane monitoring at a bi-weekly frequency until such time as the

groundwater level is above the base of the trench. Then defer back to the routine monthly piezometer monitoring frequency.

4. If the groundwater level remains below trench bottom for the first additional bi-weekly monitoring event, and nearby perimeter methane monitoring wells and semi-permanent monitoring points are at or above the site-specific methane action level of 25% LEL, then continue monitoring the groundwater levels and methane concentrations for the second bi-weekly event.
5. If the groundwater level remains at or below the trench bottom for the second bi-weekly monitoring event, and the nearby perimeter monitoring wells and semi-permanent monitoring points remain at or above the site-specific methane action level of 25% LEL, further recommendations will be made to NYSDEC.

### 4.2.5 Landfill Cap

In accordance with provisions of the Permit dated May 21, 2014 the landfill was capped with minimum of one foot of shaping layer material over the landfill and one foot of cover layer material over top of the shaping layer material. In areas where there was less than 4 feet of shaping material over the waste layer, a layer of demarcation material was installed. See Section 4.4 for additional information related to the landfill cap construction.

The permit authorized importation of 2,514,000 cubic yards of material to the Site for overall capping of the waste material. This consisted of approximately 2,120,000 cubic yards of select exempt construction and demolition (C&D) debris for the shaping layer, and approximately 394,000 cubic yards of cover material. Specific restrictions were incorporated into the material and those restrictions were maintained and are described under the importation section of this Report. Final surface components of the cap including; greens, contour, heights and top soil) were incorporated into the site under the Nicklaus Design Technical Specification of the June 30, 2005 Engineering Report. This included:

- Greens-Mix imported to the site and tested as per the material testing requirements. Fertilizer and soil amendments applied on the greens after spreading to construction specifications and then grassed as per the specifications.
- Topsoil-Imported to be consistent with native topsoil, and free of rock and debris greater than three quarters of an inch as per Exhibit C of the Engineering Report. Soil amendments, fertilizer applications and seed were added to tee, fairway and rough areas as per Exhibit C of the June 30, 2005 Engineering Report.

### 4.2.6 Environmental Controls On-Site Structures

Due to its potentially explosive nature, LFG shall not be allowed to accumulate within any enclosed structure at the Site. To protect the occupants, an under slab vent system for each enclosed building shall be installed and continuously operated. The LFGMP (see Appendix F.1 of the 2013 Engineering Report, included in Appendix 20) describes the active sub-slab depressurization systems (SSDS) that have been designed for the under-slab of each enclosed building at the Site. These systems will have continuous explosive gas monitoring with local and remote alarm capabilities. The SSDS engineering drawings for the

golf course facilities (maintenance building and comfort station) are provided in Appendix F.3 of the 2013 Engineering Report, included in Appendix 20. The Community Park comfort station design was provided in the November 25, 2009, permit application.
Maintenance of the SSDS and their monitoring equipment will be performed in accordance with the operations, monitoring, and maintenance (OM&M) program for the Site's Landfill Gas management system (see Section 4.4.4). The design of any additional structures at the Site will be completed in accordance with New York City Department of Buildings requirements. The need for LFG mitigation systems for any future Site structures will be evaluated as part of their design

Low-permeability soil/bentonite collars ("soil collars") will be installed for all utility trenches that contain permeable bedding in order to prevent the migration of LFG into enclosed buildings at the Site. The soil collars will be installed around the water and sewer pipelines, within the trenches at the subsurface location where the pipeline crosses above the building foundation (the building line). Each soil collar will be passively vented as described in the LFGMP (see Appendix F.1 of the 2013 Engineering Report, included in Appendix 20) and as shown on the engineering design drawings in Appendix F.2 of the 2013 Engineering Report, included in Appendix 20. Similarly, conduit seals will be used for electrical conduits that are installed in trenches using permeable bedding materials. The conduit seals will be installed at the building lines. Other utility LFG controls include the under slab passive venting for the aboveground double-check valve (DCV) enclosure. The DCV enclosure is for the potable water supply line as it enters the golf course site. Detailed design drawings for the venting the DCV enclosures are provided in Appendix F.4 of the 2013 Engineering Report, included in Appendix 20. The need for LFG venting for any future Site subsurface vaults will be evaluated as part of their design.

## 4.3 Municipal Solid Waste (MSW)

Municipal solid waste ("MSW") was generated throughout site development and excavation activities. MSW material was not utilized as fill material on-site after it was encountered and excavated during construction activities with the exception of MSW excavated and reused on-site in accordance with an Order On Consent issued by the NYSDEC and fully executed as of January 4, 2004 (Order On Consent No. R2-20030724-187). A copy of the executed consent order is included in Appendix 19. In accordance with Special Condition 8 of the 2014 Permit, upon encountering MSW during site development, the material was transported and properly secured into segregated stockpile locations prior to off-site disposal. MSW material consisted of metal, glass, tires, plastics, rubber, paper, fabrics, and miscellaneous debris not suitable for the shaping layer. Refer to Section 4.5 of this report to review further details regarding the minimum fill cover over top of the MSW.

Prior to stockpiling any excavated MSW, the existing ground surface was covered with an impermeable plastic membrane. The stockpile was then encircled with silt fence and the stockpile was covered with an impermeable plastic that was secured with sand bags after the MSW was stockpiled and prior to off-site disposal.

Waste characterization sampling was performed prior to off-site removal as required prior to acceptance by each solid waste facility. Prior to disposal, waste samples were collected from each of the stockpiles

and analyzed to determine if the material was hazardous and to determine a suitable NYSDEC facility for disposal by way of a permitted hauler. A January 22, 2010 letter approving Seneca Meadows Landfill as a disposal facility is included in Appendix 19.

Residual MSW excavated by Trump associated with utility and drilling work at the Golf Course stockpiled in the adjacent Waterfront Park have been removed.

### 4.3.1 Manifests

Manifests were collected for each load of MSW generated and disposed of off-site. Manifests were completed for each load of MSW prior to leaving the Site. Completed manifests contained the following information: driver signatures and appropriate transporter information, facility designation including the address for the facility that was receiving the material, a description of the material being transported, the site generator's mailing and site address, and a total quantity of the material leaving the Site. The weight of MSW was determined by weighing the material (in tons) during the loading process. The MSW was loaded with a pay loader with a scale attached to the bucket. A receipt for the weight of each load was printed and was presented to NYCDPR with the manifest for review. NYCDPR and/or their designated representative signed the manifests as the generator, and then the manifests were then presented to the IEM for final verification.

Copies of the MSW disposal manifests are included in Appendix 14.

Note that MSW manifests accounting for material prior to October 25, 2010 (i.e. Woodard & Curran's first day on-site as the IEM), cannot be retrieved and are not included in the appendix. The information was stored in a NYCDPR document repository that was damaged and the files have been lost. However, the FMRs prior to October 25, 2010 comment on the nature of this work.

## 4.4 Earthwork/Fill Placement

Earthwork and fill placement for this Project were performed in accordance with the Permit. A response received from NYSDEC on July 28, 2009 (included in Appendix C.2 of the 2013 Engineering Report, included in Appendix 20), provided additional clarification regarding what are considered active and passive recreational areas. As per this letter:

Active Recreation – "…all other areas that are not covered with a building or other impermeable cover system… are deemed active recreational areas."

Passive Recreation – "…the golf course is deemed a "passive recreational area" and is required to have a one foot thick cover layer over a demarcation layer."

Following this directive, NYCDPR requested clarification from NYSDEC regarding the demarcation layer requirement for the extent of the Golf Course. The request for clarification was based on the need for further specificity regarding the use of a demarcation layer on the Golf Course.

In response, NYSDEC and NYSDOH reviewed a summary of the analytical data for all the shaping material imported to the Site. Upon review of the data set, confirmatory analytical sampling of the in-place shaping material was requested by the NYSDEC and NYSDOH. NYCDPR conducted test pit sampling and analysis under an approved work plan and submitted the data to the NYSDEC on February 16, 2011.

In their letter dated March 9, 2011, the NYSDEC stated that "NYSDOH reviewed the shaping layer test pit data and determined that it confirmed existing shaping layer data." The NYSDEC and NYSDOH agreed that a demarcation layer would not be required at areas of the golf course having a fill thickness of five or more feet of combined shaping and cover layer materials. The March 9, 2011 letter is included in Appendix C.3 of the 2013 Engineering Report, included in Appendix 20.

The aforementioned directives were the basis for the earthwork, fill placement, and landfill capping process. Additional details related to shaping layer material placement, demarcation layer installation, cover layer material installation, and related construction is as follows.

### 4.4.1 Shaping Layer Material

The Permit requires a minimum of one foot of clean shaping layer material to be installed over top of the existing MSW prior to cover layer material placement. Specific to the Golf Course, grading and compaction activities associated with the shaping layer material were generally completed by hole, consistent with the golf course architect's design. Once grading and compaction of the shaping layer material was completed, NYCDPR completed topographic surveys of the newly graded shaping material layer to assist in determining the depth of clean shaping layer material that was present over the pre-existing landfill surface. These shaping layer material surveys were generated intermittently as shaping layer material installation was completed in sections of the Golf Course.

An analysis was conducted by the IEM, which compared compiled historic surveys from 1998 to the final shaping layer surface surveys completed by NYCDPR. The 1998 surveys included elevations representative of the landfill surface for the Site prior to the earthwork associated with the Project. Based on an analysis and comparison of the survey data, portions of the Site that had less than four feet of approved shaping layer material were identified in a series of earthwork analysis drawings that were provided to the NYSDEC. The earthwork analysis drawings are included in Appendix 10. These plans identify the depth of shaping layer material and show the general progression of shaping layer material filling across the Site. Figure SP-001 entitled "Shaping Layer Material Earthwork Analysis via Surveys" includes a site wide earthwork analysis compiled from the various Site surveys and earthwork analyses completed as construction progressed at the Site.

In areas identified on the earthwork analysis drawings to have less than one foot of clean, in-place shaping material, test pits were performed by the Contractor and observed by the IEM to verify that a minimum of one foot of shaping layer material was present over the MSW, per the plans and Permit requirements.

If areas were found to have less than the required one-foot minimum of shaping material and could not receive additional fill based on the design plans, these areas were adjusted by over excavating the MSW

and backfilling with clean shaping layer material. This process was necessary in order to maintain the designed grades and comply with the Permit conditions. With oversight by the IEM, areas with MSW encountered at shallow depths in the tests pits were excavated outwards from the test pit location until one foot of clean shaping layer material was present. See Figure SP-100 entitled "Shaping Layer Material Test Pit Plan", which includes test pit locations superimposed on an earthwork analysis that visually represents the frequency, location, and presence of MSW within the required one foot minimum shaping layer section prior to reshaping. All test pit locations and the limits of the over-excavation were GPS located by the IEM utilizing a handheld GPS unit. Test pit locations were spaced 50 feet apart over the entire areas that the survey analysis estimated to have less than one foot of shaping layer material. In addition, if MSW material was encountered within the one-foot minimum shaping layer, the frequency of test pits were increased at the IEM's discretion to more accurately determine the extent of over-excavation required. Observations of test pit activities associated with evaluating the shaping layer material thickness are detailed in the IEMs Daily Observation Reports.

### 4.4.2 Demarcation Layer

Consistent with Special Condition 14 of the 2014 Permit, a demarcation layer was installed at the Site, specifically the Golf Course, where the combined thickness of shaping layer and cover layer materials combined were less than five feet. For this Project, "demarcation layer" meant a brightly colored, permeable plastic material placed on top of the Site's shaping layer material and directly beneath the Site's final cover layer material that is easily recognizable during an excavation. The request was made for the protection of Site workers during any future excavation work beneath the cover layer at the Site. Demarcation layer material for this Project consisted of orange construction fencing for the Golf Course.

On July 10, 2012, the NYSDEC confirmed that a nine-inch thick asphalt and subbase layer for the cart paths did not require any underlying cover material or demarcation layer. A black geo-grid material was installed under the cart paths associated with the Golf Course as part of the design. A copy of the correspondence is included in Appendix 19.

On November 21, 2012, the NYSDEC notified NYCDPR that demarcation layer may be eliminated from under ponds as NYCDPR identified that demarcation layer was not required as part of the Permit. A copy of the November 21, 2012 correspondence is included in Appendix 19.

NYCDPR prepared a Demarcation Layer Plan based on a comparison of final design grades and the top of waste elevations extrapolated from soil boring data. The Demarcation Layer Plan is included in Appendix C.4 of the 2013 Engineering Report (Appendix 20). Field verification that the demarcation requirements were being met was performed continuously and routinely by the IEM to confirm Permit compliance as outlined in the shaping layer material section above. Based on the data gathered from the earthwork analysis plans and the test pit excavations, actual areas requiring demarcation layer were identified.
