Site Name: 87 Kent Avenue

Site Name (GIS): 87 Kent Avenue

Site Class Desc (GIS): Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).

Site Class Desc: Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).

Program: BCP

Program Desc: BCP

Assess DOH: Remedial actions are complete and have eliminated the potential for contact with site-related contaminants on-site. Additional evaluation is needed to determine whether actions are needed to address soil vapor intrusion off-site.

Source of Data:

Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Site Location: The site is located at the corner of Kent Avenue and North 9th Street in the Williamsburg area of Brooklyn, Kings County. To the north of the site is North 9th Street, to the south is North 8th Street, to the west is Kent Avenue, and to the east is Wythe Avenue. Site Features: The site is approximately 0.39 acres in size. The site will be used for a seven-story, mixed-use residential/commercial building, which is under development. The site is surrounded by mixed commercial and residential property uses. Current Zoning and Land Use: The site has an E-designation as part of the Greenpoint-Williamsburg Rezoning and is included in the M1-2/R6A mixed use district. The property is currently vacant. Past Use of the Site: From approximately 1980 to until 1998, the site was operated by Barouh Eaton Allen Corp., a manufacturer of typewriter ink and printer products. The building was used from 1998 to 2010 for warehousing and distribution by Lucky Paper Inc. (eastern portion), a distributor or restaurant supplies, and by LJJ, Inc. (western portion), a clothing wholesaler and distributor and from 2010 to 2012 by 200 Supplies Corp., a plumbing supplier. Site Geology and Hydrogeology: The surface topography in the surrounding area is generally flat, gradually sloping northwest towards the East River. Based on reports compiled by the United States Geological Survey (Brooklyn, NY Quadrangle), the property lies at an elevation of approximately 20 feet above the National Geodetic Vertical Datum of 1929 (an approximation of mean sea level). The soil beneath the site is miscellaneous fill at depths of up to eight feet. This is underlain by a fine to medium sand with silt and clay layers of varying thicknesses. United States Geological Survey reports indicate that the depth to bedrock at the site is expected to be approximately 100 feet below ground surface. Groundwater is approximately 15 feet below ground surface. The East River is the nearest surface water body, approximately 700 feet to the northwest. Groundwater beneath the site flows in north-northeast direction.

Assessment:

Remediation at the site is complete. Prior to remediation, the primary contaminants of concern in soil were trichloroethene, benzo(a)pyrene, chrysene and metals including mercury, copper and lead. Remedial actions have successfully achieved soil cleanup objectives for unrestrited use. Prior to remediation, the compounds exceeded groundwater standard were trichloroethene, cis-1,2-DCE and metals including mercury, copper and lead. Remedial action taken place at site removed on-Site sources and post-remedial groundwater sampling documented that the concentrations do not require further treatment or monitoring. Although chlorinated volatile organic compounds were detected in groundwater and soils during the remedial investigation, remediation at the Site consisted of removal of approximately 13,000 cubic yards of contaminated soil and approximately 5.5 million gallons of contaminated groundwater. Furthermore, the foundation of the Site building is below the water table which necessitated installation of a 60 mil thick polyethylene/rubberized asphaltic waterproofing material as part of foundation construction. No further actions are needed to address soil vapor intrusion based on post-remedial environmental data and the construction elements of the building.

Site Name: 87 Kent Avenue - (Off-Site)

Site Name (GIS): 87 Kent Avenue - (Off-Site)

Site Class Desc (GIS): Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Site Class Desc: Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Program: BCP

Program Desc: BCP

Assess DOH: Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

The area of concern subject to this work is considered off-site from BCP site C224188 and reflects the investigation and possible remediation of contamination that may have migrated from that site. This work is being carried out as provided for under the Environmental Conservation Law Section 27-1411.5. Please see C224188 for further information regarding the status of the site in the Brownfield Cleanup program. Site Location: 87 Kent Ave - Off-site is located in the Williamsburg area of Brooklyn, Kings County. To the north of the site is North 9th Street, to the south is North 8th Street, to the west is Kent Avenue, and to the east is Wythe Avenue. Site Features: The site consists of the areas surrounding by 87 Kent Ave. Current Zoning and Land Use: The site is included in the M1-2/R6A mixed use district. Site Geology and Hydrogeology: The surface topography in the surrounding area is generally flat, gradually sloping northwest towards the East River. Based on reports compiled by the United States Geological Survey (Brooklyn, NY Quadrangle), the property lies at an elevation of approximately 20 feet above the National Geodetic Vertical Datum of 1929 (an approximation of mean sea level). Based on information collected during the investigation of C224188, The soil beneath the site is miscellaneous fill at depths of up to eight feet. This is underlain by a fine to medium sand with silt and clay layers of varying thicknesses. United States Geological Survey reports indicate that the depth to bedrock at the site is expected to be approximately 100 feet below ground surface. Groundwater is approximately 15 feet below ground surface. The East River is the nearest surface water body, approximately 700 feet to the northwest. Groundwater beneath the site flows in north-northeast direction.

Assessment:

During the on-site Remedial Investigation for site C224188, soil and groundwater samples were collected and analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, PCBs, and pesticides. Soil vapor samples were analyzed for VOCs. Based upon the results of the RI, the primary contaminants of concern for on-site include trichloroethene (TCE) and cis-1,2-DCE. Contamination can likely be attributed to activities associated with the historic use of the site for manufacturing activities. Further investigation is needed to fully delineate the extent of off-site contamination.

Site Class Desc: Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).

Site Class Desc (GIS): Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Assess DOH: Remedial actions are complete and have eliminated the potential for contact with site-related contaminants on-site. Additional evaluation is needed to determine whether actions are needed to address soil vapor intrusion off-site.

Description:

Site Location: The site is located at the corner of Kent Avenue and North 9th Street in the Williamsburg area of Brooklyn, Kings County. To the north of the site is North 9th Street, to the south is North 8th Street, to the west is Kent Avenue, and to the east is Wythe Avenue. Site Features: The site is approximately 0.39 acres in size. The site will be used for a seven-story, mixed-use residential/commercial building, which is under development. The site is surrounded by mixed commercial and residential property uses. Current Zoning and Land Use: The site has an E-designation as part of the Greenpoint-Williamsburg Rezoning and is included in the M1-2/R6A mixed use district. The property is currently vacant. Past Use of the Site: From approximately 1980 to until 1998, the site was operated by Barouh Eaton Allen Corp., a manufacturer of typewriter ink and printer products. The building was used from 1998 to 2010 for warehousing and distribution by Lucky Paper Inc. (eastern portion), a distributor or restaurant supplies, and by LJJ, Inc. (western portion), a clothing wholesaler and distributor and from 2010 to 2012 by 200 Supplies Corp., a plumbing supplier. Site Geology and Hydrogeology: The surface topography in the surrounding area is generally flat, gradually sloping northwest towards the East River. Based on reports compiled by the United States Geological Survey (Brooklyn, NY Quadrangle), the property lies at an elevation of approximately 20 feet above the

National Geodetic Vertical Datum of 1929 (an approximation of mean sea level). The soil beneath the site is miscellaneous fill at depths of up to eight feet. This is underlain by a fine to medium sand with silt and clay layers of varying thicknesses. United States Geological Survey reports indicate that the depth to bedrock at the site is expected to be approximately 100 feet below ground surface. Groundwater is approximately 15 feet below ground surface. The East River is the nearest surface water body, approximately 700 feet to the northwest. Groundwater beneath the site flows in north-northeast direction.

Assessment:

Remediation at the site is complete. Prior to remediation, the primary contaminants of concern in soil were trichloroethene, benzo(a)pyrene, chrysene and metals including mercury, copper and lead. Remedial actions have successfully achieved soil cleanup objectives for unrestrited use. Prior to remediation, the compounds exceeded groundwater standard were trichloroethene, cis-1,2-DCE and metals including mercury, copper and lead. Remedial action taken place at site removed on-Site sources and post-remedial groundwater sampling documented that the concentrations do not require further treatment or monitoring. Although chlorinated volatile organic compounds were detected in groundwater and soils during the remedial investigation, remediation at the Site consisted of removal of approximately 13,000 cubic yards of contaminated soil and approximately 5.5 million gallons of contaminated groundwater. Furthermore, the foundation of the Site building is below the water table which necessitated installation of a 60 mil thick polyethylene/rubberized asphaltic waterproofing material as part of foundation construction. No further actions are needed to address soil vapor intrusion based on post-remedial environmental data and the construction elements of the building.

no release, tank test failure

DEC Remark:

10/10/17-Zhune spoke to Victoria from Protest Environmental. Victoria said the tank failed the test with a dry leak. It's a wrapped tank on concrete with Manhole issue. Protest gave a proposal to the management company to fix the manhole. 10/10/17-TFT letter sent to: Mr.Richard Herbst 315 Berry Street Corporation 5014 16 Avenue Suit 268 Brooklyn NY 11204 11/22/17 TJD File review. ProTest Environmental has submitted a closure report for this spill. On 10/9/17 a 5K #2 FO AST failed tightness test. On October 26th, contractor returned to site and isolated tank and lines - Technicians first replaced and re-bolted the manway cover. Further testing revealed a small wet leak previously masked by the loader dry leak. Technician inspected a lines and tightened a compression fitting on petrometer line. Upon completion above described repairs the tank system was retested with passing test results. Contractor reports no visible contamination was observed. Based upon the information provided there is no further action required. All documentation uploaded to DECDOCS. Spill closed.

3K TANK FAILED PETRO TITE WITH A LEAK RATE OF -.161GPH.

DEC Remark:

Tank test failure. PBS file shows tank in service, but next tank tes due prior to the date of this spill. PBS registration expired in 2000. Need to follow up. 9/22/06 left message for attorney found on deed to contact Williamsburgh Square LLC (new owner as of 2003). address:154 N. 7th St., Brooklyn 11211. deed had no individual's name (only corporation). bf 4/30/08 Sent Old TTF letter to: Jerry Lebedowicz Williamsburg Square LLC 52-47 Browvale Lane Little Neck, NY 11362 Address obtained from tank closure application. bf 5/2/08 Received message from J. Lebedowitz to call him back. bf 5/5/089 Received call from J. Lebedowitz tank was closed. Athena Environmental sampled after tank was removed. bf 6/18/08 Yesterday, recieved message from Spiro of (Name not clear) Environmental Services. He requested call back to (718)784-7490. I called the number today, but number is not in service at this time and no further informatuion is available. Review of PBS file shows tank was closed in 2008. They should have closure report. Called Jerry Lebedowicz and left message to call me back. His number (from PBS application) is (718)784-7490. Mr. lebedowicz hand-delivered sampling results from Athenica Environmental Services. One contaminant was above soil clean-up objectives to protect gw quality: chrysene (690 ppb) in sample B-3. Faxed nfa letter to Mr. Lebedowicz. Fax: (718)229-7111. Also mailed letter to him at address above. NFA. bf

DEC Remark:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was DEMEO TTF letter sent to Mr. Wersocki at 187 Bedford Ave Bklyn 11211 12/3/05: CBN Called Alex Wersocki (718) 963-2659 and left a message for hm to call me back, but haven't heard from him yet. 12/1/08 bf: Sent ttf old spill letter to: Alexander Wersocki 187 Bedford Avenue Brooklyn, NY 11211 10/14/14-Hiralkumar Patel. reviewed available information for DEC DeMeo. alternate address: none no other spills found. PBS #: 2-608263. as per PBS record, the site has one 2,000 gal #2 oil UST, in-service, installed in Jun. 1983. as per documents available on PBS database, the tank system was found tight during test on 11/26/2008 and 01/31/2014. Alexander Wersocki **property owner** 187 Bedford Avenue Brooklyn, NY 11211 PH. (718) 963-2659 (646) 287-6165 email: dg.nycbdrs@gmail.com 2/12/15 TJD Spill reassigned from DeMeo to Patel 03/24/15-Hiralkumar Patel. 10:35 AM:- went to site for inspection, but no one was available to provide access to the basement. found a color coded fill port and vent pipe by the building wall, at the southeast corner of the building (adjacent to building 189 Bedford Ave). 10:43 AM:- spoke with Mr. Wersocki. he mentioned that he doesn't remember the actual cause of test failure in 2003, but the tank system was tested tight after 2003. he confirmed no spill inside building. 10:47 AM:- spoke with Richard (917-647-6475), who maintains the boiler system at the site. he confirmed that the site has an underground tank which was found tight during recent testing. he also confirmed no signs of oil spill within building. in accordance with R2 TTF closure protocol, this spill is being closed due to no indication of a current release, no information indicating that there may have been a historical release, no information that this tank test failure will be an issue in the future and the tank system was found tight during subsequent testing.

Describe the Site: A former coal-gasification plant was purchased by BUG Co. During the operations as a CG plant, a hydrocarbon tar was produced and stored on
site until sold for use in roofing or road surfacing. The plant was decommissioned in 1895, all remaining tars were reportedly removed and the facility was razed. Ownership and use of the property since 1895 is unknown.
Describe the Threat:

The soil is possibly contaminated with trace amounts of hydrocarbon tar. (impact probably reduced due to time and excavation of soils) Leachate into groundwater is not a major concern because area groundwater is not a potable supply.

Site Class Desc (GIS): Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Site Class Desc: Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Assess DOH: Since the site is fenced and covered by asphalt or concrete, people will not come into contact with site-related soil and groundwater contamination unless they dig below the surface. People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by this contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. The potential exists for people to inhale site contaminants in indoor air due to soil vapor intrusion in the current building and any future on-site building development and occupancy.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: The Peoples Works Manufactured Gas Plant (MGP) site is located on three parcels and is comprised of 2 acres of land located between South 10th and South 11th Streets on the west side of Kent Avenue in Brooklyn, NY, Kings County. Site Features: The site is located along the Wallabout Channel, near the East River. The site slopes gently towards the river. The site is entirely covered by paved areas and buildings with concrete slab floors. The site is enclosed by lockable chain-link fencing and is monitored by security personel. Multi-unit residential housing (condominiums) are present north of the Site; Kent Avenue, multi-unit residential housing, and commercial properties are located east; commercial properties are located south; and the East River and Wallabout Channel are located west of the Site. Current Zoning/Uses: The site is zoned for commercial and industrial use. The current land use onsite is commercial. It is located in a mixed industrial, commercial, and residential area. Past Use of the Site: An 1887 Sanborn map shows a manufactured gas plant (MGP) known as the Peoples Gas Light Company operating on the site. By 1904 the MGP was no longer operating at the site. MGPs such as this converted coal and/or petroleum products to a flammable gas which was used in the surrounding community in much the same way that natural gas is used today. In 1999, LILCO and Brooklyn Union Gas merged to form KeySpan. National Grid acquired KeySpan in 2008 and currently maintains ownership of the site. Site Geology and Hydrogeology: Site is covered with up to 5 feet of fill. This material is typical urban fill, characterized by bricks and gravel. Below the fill materials are sands and silts. Near the river, a wedge of silts and clays was noted, underlain by a peat layer. This lithology reflects palustrine deposits along the East River channel, likely overlain by glacial sands and fill during development of the East River waterfront. Bedrock beneath the Site is the Ravenswood Formation gneiss, and is estimated to be approximately 100 feet bgs.

Assessment:

The primary contaminant of concern for the site is coal tar. Materials such as coal tar are commonly referred to as Non-Aqueous Phase Liquids (NAPL). Coal tar contains both volatile and semi-volatile organic compounds. Specific volatile organic compounds (VOCs) of concern are benzene, toluene, ethylbenzene and xylenes (BTEX). Specific semi-volatile organic compounds of concern are the polycyclic aromatic hydrocarbons (PAHs).

Site Class Desc (GIS): Potential: This classification is used for sites where preliminary information indicates that a site may have contamination that makes it eligible for consideration for placement on the Registry of Inactive Hazardous Waste Disposal Sites (commonly referred to as the list of State Superfund Sites). Further information and/or investigation, in the form of a site characterization, is needed to determine if a Class P site qualifies for listing of the site on the Registry. Generally, to qualify for placement on the Registry, there must be evidence that hazardous waste was disposed on the site and that any resulting contamination presents a significant threat (or reasonably foreseeable threat) to public health or the environment. Class P sites are not listed on the Registry and many are eventually found to not qualify for Registry listing. Sites that do not qualify for listing are typically then reclassified to a "Class N" site.

Site Class Desc: Potential: This classification is used for sites where preliminary information indicates that a site may have contamination that makes it eligible for consideration for placement on the Registry of Inactive Hazardous Waste Disposal Sites (commonly referred to as the list of State Superfund Sites). Further information and/or investigation, in the form of a site characterization, is needed to determine if a Class P site qualifies for listing of the site on the

Registry. Generally, to qualify for placement on the Registry, there must be evidence that hazardous waste was disposed on the site and that any resulting contamination presents a significant threat (or reasonably foreseeable threat) to public health or the environment. Class P sites are not listed on the Registry and many are eventually found to not qualify for Registry listing. Sites that do not qualify for listing are typically then reclassified to a "Class N" site.

Assess DOH: As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: The 0.49 acre site is located at 98, 100, and 104 South 4th Street in the Borough of Brooklyn, Kings County, NY in an urban area. It was previously known as 98-116 South 4th Street. Site Features: The Site consists of three buildings: 98-102 (now 98), 104-114 (now 100) and 116 (now 104) South 4th Street. Occupying almost the entirety of the site is a multi-story structure made up of a 7 story structure in the center (100 South 4th St.) flanked by two smaller 1 story structures. Two of the buildings were constructed in 1910 and the third was constructed in 1950. All three buildings were renovated in the early 2000s. The 7 story structure is a residential building with approximately 74 units. Current Zoning and Land Use: The site is currently zoned as M1-2/R6 and is surrounded by residential, commercial and industrial uses. It is identified as a single tax lot, Block 2443, Lot 13 and is a rectangular shaped parcel along the southern side of South 4th St., between Berry St. and Bedford Ave. Past Use of the Site: The Site previously had a variety of manufacturing uses, including an adhesives factory (98 S. 4th St, formerly 98-102 S 4th St), an electroplating operation, a laboratory (100 S. 4th St, formerly 104-114 S 4th St), and a dye factory (116 S 4th St). Carmin Industries was identified as a Large Quantity Generator of hazardous wastes, including undefined hazardous wastes, ignitable hazardous wastes, corrosive hazardous wastes, reactive hazardous wastes, chromium, lead and cyanides. Site Geology and Hydrogeology: Soil borings conducted in 1996 identified fill materials to a depth of approximately 7 feet below grade from the first floor of 98 S. 4th St and to a depth of approximately 6 feet below the basement floor of 100 S. 4th St. Beneath the surface fill layer is sand and silt to a depth of at least 17 feet below grade. Groundwater is present at a depth of approximately 15-17 feet below grade.

Assessment:

Nature and Extent of Contamination: A subsurface investigation was performed in 1997 in support of an application to participate in the Voluntary Cleanup Program (see site no. V00094). Previously there had been 4 other investigations including: Technical Report and Order of Compliance with NYCDEP (1992); and Environmental Site Assessment (1994); a Phase I Environmental Audit (1996) and a Phase II Environmental Summary Report (1996). Soil samples were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and polychlorinated biphenyls (PCBs). Groundwater samples were analyzed for VOCs only. The Voluntary Cleanup Agreement was terminated in 2003 due to failure to implement remedial activities. Soil - A total of nine soil borings were advanced throughout buildings 2 and 3 (access to building 1 was precluded by structural deficiencies). Samples were collected from nine soil borings. Various VOCs were detected at concentrations exceeding the unrestricted use soil cleanup objectives (SCOs), including: tetrachloroethylene (PCE) at a maximum concentration of 5.5 parts per million (ppm); trichloroethene (TCE) at 3.7 ppm; and toluene at 1.4 ppm. SVOCs were also detected above the unrestricted use SCOs including: fluoranthene at a maximum concentration of 14 ppm; phenanthrene at 19 ppm; and pyrene at 19 ppm. The majority of the contaminants appear to be found beneath building 3 (the western one-story building). Groundwater - Groundwater samples were collected from 3 locations on-site. PCE was detected at a maximum concentration of 86 parts per billion (ppb), TCE at 100 ppb, and toluene at 28 ppb. In addition, groundwater samples collected from a property immediately adjacent to the south of the site (BCP site no. C224233) identified PCE at a maximum concentration of 71.4 ppb and TCE at 27.2 ppb. Soil Vapor -No soil vapor samples were collected. Groundwater samples collected from a property immediately adjacent to the south of the site (BCP site no. C224233) identified PCE at a maximum concentration of 2870 micrograms per cubic meter (ug/m3) and TCE at 3510 ug/m3. Further delineation of the soil vapor was performed at 2 residential buildings located to the west of the Site on Berry Street identified the need for mitigation. Significant Threat: The significant threat determination will be made following the completion of the Site Characterization.

Site Name: 98-116 South 4th Street (El Puente)

Site Name (GIS): 98-116 South 4th Street (El Puente)

Site Class Desc (GIS): No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

Site Class Desc: No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

Assess DOH:

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

The site is located in an urban area in Brooklyn. The site is a rectangular shaped parcel along the southern side of South 4th St, between Berry St. and Bedford Ave. Occupying almost the entirety of the site is a multi-story structure made up of a 7 story structure in the center flanked by two smaller 1 story structures. All three buildings were constructed in the early to mid 1900's and are in varying stages of deterioration. The Site previously had a variety of uses, including an adhesives factory and an electrofoaming laboratory, but always manufacturing. The eastern building has been listed as a warehouse since the 1970s, but also was used as a factory, including a dye factory. The Volunteer was not the property owner and withdrew from the VCP. The owner of the property did an independent renovation of the buildings.

Assessment:

In 1998, the following removals were recommended: Various wastes from the buildings, PBS tanks, contaminated soil with VOCs and SVOCs in excess of recommended soil cleanup objectives in TAGM 4046. Air sampling was also recommended. The building was renovated without of DEC knowledge and/or oversight.

These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).

Program: BCP
Program Desc: BCP
Assess DOH: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site.
Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: The site is located at 99-101 South 5th Street aka 337 Berry Street (Block 2443; Lot 6, formerly known as Lots 6, 37 and 41), Williamsburg, Brooklyn; an urban area within New York City and represented by Brooklyn Community Board 1. The site is approximately 15,870 square feet or 0.36 acres. It is bordered on the south by South 5th Street and the Williamsburg Bridge, and on the north, east, and west by apartment buildings, residential structures, and commercial spaces. Site Features: The site has been recently redeveloped with a 12 story apartment building with a commercial business on the first floor. Prior to demolition in August 2016 the site had been improved with an abandoned warehouse that was used by the City of New York's Landmark Preservation Commission (LPC) as a salvage warehouse. Current Zoning and Land Use: This site is a 12-story apartment building and is zoned M1-2/R6, Special Mixed Use District (MX-8) which allows for restricted-residential/commercial/industrial uses. The surrounding parcels are currently used as residential condominiums and/or houses converted to apartment buildings and ground floor commercial spaces. Past Use of the Site: Previous site uses include an architectural salvage warehouse which started in 1980. Salvaged items such as doors, windows, fences, and decorative elements, were sold to the public. The program ended in 2000 due to budgetary constraints. Former lots 37 and 41 were originally improved with two story residential buildings from ca. 1868. All three former lots (6, 37, and 41) have New York City E Designation assigned in the Greenpoint-Williamsburg Rezoning Environmental Impact Statement (EIS) due to the presence of an auto body shop on former Lot 41. Five abandoned underground storage tanks (USTs) were discovered on-site during excavation activities that were part of the Interim Remedial Measures described in Section 6.2. One UST had a spill case opened due to leaking material that has since been closed. Site Geology and Hydrogeology: Fill material exists to depths between 0-5 feet below ground surface (bgs). Native soils beneath the fill layer consist of well-graded sand (ranging from fine to coarse) with silt. Small to large sized gravel and cobbles exist at all depths. Bedrock was encountered at depths ranging from 27 to 42 feet bgs and appears to slope downward to the north with the topography towards the East River. Groundwater exists at approximately 45-47 feet bgs and flows west towards the East River.

Assessment:

Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were SVOCs and mercury in soil, tetrachloroethene and trichloroethene in groundwater. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in the soil, groundwater, and soil vapor is being managed under a Site Management Plan.

It is bordered on the south by South 5th Street and the Williamsburg Bridge, and on the north, east, and west by apartment buildings, residential structures, and commercial spaces. Site Features: The site has been recently redeveloped with a 12 story apartment building with a commercial business on the first floor. Prior to demolition in August 2016 the site had been improved with an abandoned warehouse that was used by the City of New York's Landmark Preservation Commission (LPC) as a salvage warehouse. Current Zoning and Land Use: This site is a 12-story apartment building and is zoned M1-2/R6, Special Mixed Use District (MX-8) which allows for restricted-residential/commercial/industrial uses. The surrounding parcels are currently used as residential condominiums and/or houses converted to apartment buildings and ground floor commercial spaces. Past Use of the Site: Previous site uses include an architectural salvage warehouse which started in 1980. Salvaged items such as doors, windows, fences, and decorative elements, were sold to the public. The program ended in 2000 due to budgetary constraints. Former lots 37 and 41 were originally improved with two story residential buildings from ca. 1868. All three former lots (6, 37, and 41) have New York City E Designation assigned in the Greenpoint-Williamsburg Rezoning Environmental Impact Statement (EIS) due to the presence of an auto body shop on former Lot 41. Five abandoned underground storage tanks (USTs) were discovered on-site during excavation activities that were part of the Interim Remedial Measures described in Section 6.2. One UST had a spill case opened due to leaking material that has since been closed. Site Geology and Hydrogeology: Fill material exists to depths between 0-5 feet below ground surface (bgs). Native soils beneath the fill layer consist of well-graded sand (ranging from fine to coarse) with silt. Small to large sized gravel and cobbles exist at all depths. Bedrock was encountered at depths ranging from 27 to 42 feet bgs and appears to slope downward to the north with the topography towards the East River. Groundwater exists at approximately 45-47 feet bgs and flows west towards the East River.

Assessment:

Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were SVOCs and mercury in soil, tetrachloroethene and trichloroethene in groundwater. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in the soil, groundwater, and soil vapor is being managed under a Site Management Plan.

Caller Remark:			

1518 The caller advised dispatch the tank has failed their test and requested to obtain a spill number. No water ways have been affected. This was just a tank test failure. The owner will be incharge of the fixing of the system. At this time chemicals have spilled. 4000 gallon underground tank.

DEC Remark:

TTF sent to property manager: Mr. Martin Gurshon 233 Broadway - Suite 2704 New York, NY 10279 11/20/09. J.Krimgold reviewed the letter report submitted by Pro Test Enviro and dated 10/30/09. According to the letter the tank system failed the test due to a leak in the supply and/or return lines. The damaged portions of these line were replaced and the tank system retested and passed. During excavation of piping contaminated soil was encountered. This soil was excavated, drummed and properly disposed of. End point samples show no contaminant above TAGM limits. Case closed.

Caller Remark:			

also ground water affected - reprts says that site is contaminated with petro and heavy metals. Also see spill # 9401167.

DEC Remark:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was ZHITOMIRSKY TRANSFERRED FROM Y.KRIMGOLD. Also, refer to spill # 9607376 & 9401167. 12/14/04-Spill Case is trnsferred to I. Islam. The site is under remediation by LiRo Engineers. - II 4/22/05- Reviewed the quarterly monitoring report (Nov./04 - Jan./05). The monitoring data show persistently high level of both soil and groundwater contamination. LiRo claims that the long history of the site for operation as a manufactured gas plant (MGP) may be the cause of this. However, a letter has been issued in order for LiRo to consider alternative measure(s) to remediate the site. The monitoring report has been installed in the eDoc Folder. - II 5/13/05- Afsar Samani of DDC raised the MGP issue of this site in the meeting with DEC on 5/4/05 as LiRo has written them either to increase the cost for remediation of the MGP related contaminants at the site or get the Key Span and/or other responsible agency handle the MGP site through DEC. Koon Tang is exploring with the Central office as to the finding of responsible agency to handle the former MGP site remediation.- II. 5/31/03- Joe Moloughney of Central Office confirmed via email that this site would be remediated under the KeySpan Consent Order for MGP sites. This site has been assigned with # 224055 as the MGP site. Therefore, the spill is closed.- II

Town (GIS): New York City
Region (GIS): 2
County (GIS): Kings
Site Class Desc (GIS): No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

Site Class Desc: No Further Action at this Time: Sites are given a classification of "N" when:

Map Key	Number of Records	Direction	Distance (mi/ft)	Elev/Diff (ft)	Site	DB

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

This is a new BCP application which pertains to properties located at 285 and 291 Metropolitan Ave., Brooklyn, Kings County. This site is approximately 0.25 acres in size in an urban area. Surrounding uses are commercial and residential. Directly to the north, across the street from the site on North 4th Street, is a public school. The site consists of an automobile repair facility (former gas station) and a neighboring garage with residential uses on the second floor. The future use for this site is residential and commercial. Suspected and known contaminants are petroleum and metals and MTBE which are impacting the soil and groundwater. This BCP application is currently under review and the Department of Environmental Conservation will determine the application's approval and eligibility. Review of application terminated since the applicant is no longer an entity authorized in NYS to make the application. Following termination of the BCP application, the site was referred back for investigation and remediation under spill no. 0607903.

Assessment:

A limited investigation was performed on 291 Metropolitan Ave in October 2006 and spill number 0607903 was assigned. From four soil borings, one soil sample was collected from each. From another two soil borings, two samples were collected from each. From two borings, a grab groundwater was collected in each. The groundwater was contaminated with BTEX compounds and MTBE. Additional investigation will be required to define the extent of contamination.

Site Class Desc (GIS): Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Site Class Desc: Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Assess DOH: The NYSDOH will evaluate the potential for impacts to public health from exposure to site contaminants once sufficient information from the investigation of the site becomes available for review.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: The Williamsburg Works Manufactured Gas Plant (MGP) site is located in a commercial/industrial area in the Williamsburg section of Brooklyn, New York. The site is approximately six acres in size and is composed of three parcels of land located on the east bank of the East River between North 11th and North 12th Streets on the west and east sides of Kent Avenue. Site features: Site features include a vacant asphalt paved lot and the foundation slab for the recently demolished document storage warehouse on the west side of Kent Avenue and a two -story commercial building on the east side of Kent Avenue. Current zoning and land use: The land uses in the area surrounding the MGP site are currently a mix of industrial, residential, and parkland uses. The privately-owned document storage warehouse was in active use until it was destroyed in a fire on January 31, 2015 and subsequently demolished. The vacant lot at 50 Kent Ave. is owned by the NYC Department of Parks and Recreation and used as an outdoor music venue, flea market and skate park. The two-story commercial building on the east side of Kent Avenue is privately owned and in active use. The nearest residential property is located approximately 1 block to the south. Past use of the site: A manufactured gas plant operated on the site from circa 1850 until approximately 1930. Following the decommissioning of the MGP, the lot was occupied by a NYC Department of Sanitation Garage that was demolished around 2000. Site Geology and Hydrogeology: The site is underlain by: urban fill and varied glacial sediments consisting of outwash sand and gravel, till, and lenticular clay more than 100 feet in thickness. The groundwater table is approximately 5 feet below ground surface. Groundwater flows to the west, toward the East River.

Assessment:

The Remedial Investigation of the site has not been fully completed, since large portions of the site are occupied by buildings. However, the work that has been completed has identified significant coal tar contamination in the subsurface. Soils beneath the vacant lot at 50 Kent Avenue are heavily impacted. Design work is currently under way for an excavation IRM on this parcel during the 2015 field season, and tar collection wells have been completed around the perimeter of this property. Tar removal from these wells is taking place on a continuing basis. Tar contamination has moved off site to the north but does not appear to have reached the shoreline in that area. A large portion of the former plant footprint lies beneath a document storage warehouse. Test borings around the perimeter of this building confirm the presence of MGP tars in the area, and off site migration of this tar has taken place, leading to contamination of sediments beneath adjacent areas of the East River.

Site Class Desc (GIS): No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

Describe the Site: This was formerly the site of a coal-gasification plant, purchased by Brooklyn Union at the turn of the century. One of the by-products produced was a hydrocarbon tar which was temporarily stored on-site. Ownership and use of the property since 1936 is unknown.

Describe the Threat:

The soil was possibly contaminated with trace amounts of hydrocarbon tar; impact was probably reduced by time and excavation of soils.

Details

Description:

Location: The Williamsburg Works Manufactured Gas Plant (MGP) site is located in a commercial/industrial area in the Williamsburg section of Brooklyn, New York. The site is approximately six acres in size and is composed of three parcels of land located on the east bank of the East River between North 11th and North 12th Streets on the west and east sides of Kent Avenue. Site features: Site features include a vacant asphalt paved lot and the foundation slab for the recently demolished document storage warehouse on the west side of Kent Avenue and a two -story commercial building on the east side of Kent Avenue. Current zoning and land use: The land uses in the area surrounding the MGP site are currently a mix of industrial, residential, and parkland uses. The privately-owned document storage warehouse was in active use until it was destroyed in a fire on January 31, 2015 and subsequently demolished. The vacant lot at 50 Kent Ave. is owned by the NYC Department of Parks and Recreation and used as an outdoor music venue, flea market and skate park. The two-story commercial building on the east side of Kent Avenue is privately owned and in active use. The nearest residential property is located approximately 1 block to the south. Past use of the site: A manufactured gas plant operated on the site from circa 1850 until approximately 1930. Following the decommissioning of the MGP, the lot was occupied by a NYC Department of Sanitation Garage that was demolished around 2000. Site Geology and Hydrogeology: The site is underlain by: urban fill and varied glacial sediments consisting of outwash sand and gravel, till, and lenticular clay more than 100 feet in thickness. The groundwater table is approximately 5 feet below ground surface. Groundwater flows to the west, toward the East River.

Assess ENV:

The Remedial Investigation of the site has not been fully completed, since large portions of the site are occupied by buildings. However, the work that has been completed has identified significant coal tar contamination in the subsurface. Soils beneath the vacant lot at 50 Kent Avenue are heavily impacted. Design work is currently under way for an excavation IRM on this parcel during the 2015 field season, and tar collection wells have been completed around the perimeter of this property. Tar removal from these wells is taking place on a continuing basis. Tar contamination has moved off site to the north but does not appear to have reached the shoreline in that area. A large portion of the former plant footprint lies beneath a document storage warehouse. Test borings around the perimeter of this building confirm the presence of MGP tars in the area, and off site migration of this tar has

taken place, leading to contamination of sediments beneath adjacent areas of the East River.

Assess DOH:

The NYSDOH will evaluate the potential for impacts to public health from exposure to site contaminants once sufficient information from the investigation of the site becomes available for review.

Site Class Desc (GIS): Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Site Class Desc: Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Assess DOH:

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Map Key	Number of Records	Direction	Distance (mi/ft)	Elev/Diff (ft)	Site	DB

Description:

The Williamsburg-Pratt Refinery site is located in a commercial/industrial area in the Williamsburg section of Brooklyn The site comprises a single real estate parcel, Block 2277 Lot 1, at 26 N 12th St. It is approximately 7 acres in size and is located between Kent Ave. and the East River and between N 12th St. and Bushwick Inlet. Site Features: The site includes empty above ground petroleum bulk storage tanks, a 3 story office building, a one story cinder block garage, a fuel dispenser island, and a large asphalt paved area. Current Zoning and Land Use: The land use in the surrounding area is currently a mix of industrial, residential, commercial and parkland use. The nearest residential property is located approximately 2 blocks to the south. Past Use of the Site: A petroleum refinery operated on the site from circa 1870 into the early 1900s. Subsequently, the property was utilized as a major petroleum bulk storage facility until the early 2000s. Site Geology and Hydrogeology: The site is underlain by urban fill and varied glacial sediments consisting of outwash sand and gravel, till and lenticular clay more than 100 feet in thickness. The groundwater table is approximately 6 feet below ground surface. Groundwater flows to the west, toward the East River.

Assessment:

The Williamsburg former Pratt Refinery has not yet been subject to a formal remedial investigation, however, New York City commissioned an environmental assessment of the parcel prior to purchasing it, and an off-site component of the Williamsburg MGP remedial investigation evaluated portions of the site. Soils beneath the Williamsburg former Pratt Refinery are impacted with both petroleum and coal tar. Although not fully understood, the petroleum impacts appear to be spatially associated with historic refinery operations and from more recent petroleum bulk storage. Coal tar has migrated through the subsurface from the former Williamsburg MGP under the southern margin of the site. The coal tar impacts are relatively deep, ranging from 30 to 50 feet below ground surface. Sediment data gathered as part of the Williamsburg MGP RI show co mingled coal tar and petroleum contamination in the East River sediment adjacent to the site.

RECOMMEND TO UNCOVER-EVALUATE AND RE-TEST

DEC Remark:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was DEMEO 9/23/03, ROSSAN; DDO: Tank test failure letter was prepared and sent to: Mr. Frank Dross F N W Mechanical 139 North 10th Street Brooklyn, NY 11211 Ed. 10/3/05: CBN Called Phil Fazin, the tank tester and was told he would get back to DEC with more info. 9/22/06 ttf letter sent to owner: Sandra Maislen San Ten Raz LLC 120 Pleaseant St., Apt. 2 Brookline, MA 02446 bf 11/13/06 On 10/12/06, received letter from Sandra Maislen in response to ttf letter. Reviewed letter and the attachments. The fill line, stick line, and vent line failed. I called Petroleum Tanks to see if they remember detecting any contamination when lines were replaced. I was told Mark Salamack was the person in charge of the tank repairs. He was in a meeting at the time of the call and I left a message for him to call me. Mr. Salamack (718-624-4842) called me back and told me that there was no observed contamination and no elevated reading on the PID meter used at the time of the repairs. NFA. bf

SPILL ONTO BASEMENT FLOOR, CLEANUP COMPLETE:

DEC Remark:

05/10/07-Vought-Off hours responder. Vought called Winters and left message to return call to cell phone. Vought called Vijax and spoke to Anthony Rotello and cause of spill was bad gauge. Spill came out of gauge and onto concrete floor. No sewers or drains affected. Rotello confirmed that spill amount less than five gallons. Gauge will be replaced. No spill out of vent pipe. Vought received call from resident (Ms Winter) is satsified with cleanup and confirmed that spill on concrete and no sewers or drains affected. Vought provided contact info in case additional issues arrise. Spill closed by Vought.

Site Name: 416 Kent Avenue

Site Name (GIS): 416 Kent Avenue

Site Class Desc (GIS): Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).

Site Class Desc: Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).

Program: BCP

Program Desc: BCP

Assess DOH: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: The 416 Kent Avenue site is located in an urban area along the East River in Brooklyn, Kings County. The site is on the southern portion of the city block bordered by what would be an extension of Broadway followed by Block 2467 to the north (paper street), Kent Avenue to the east, what would be an extension of South 8th Street to the south (paper street) followed by Block 2134, and the East River to the west. Site Features: The irregularly-shaped site encompasses an area of approximately 46,000 square feet (1.056 acres). Currently the site is under construction for a 22-story residential building with subgrade parking and retail space, first- and second-floor amenity space, ground floor retail space with residential use beginning on the second floor. Current Zoning and Land Use: The site is located in zoning districts R7-3 and C4-3. Zone C4-3 encompasses approximately 3,900 square feet of the property, and the remaining approximately 42,100 square feet is in zoning district R7-3 with a C2-4 commercial overlay. The property will be mixed-use with residential and commercial spaces. Past Use of the Site: Past land uses associated with the site include a ferry terminal (1887), vacant land (1935 to 1965) and a trucking company (2001 to circa 2012). Site Geology and Hydrogeology: The subsurface strata at the site consists of historic urban fill characterized by dark gray and brown fine to coarse-grained sand with varying amounts of brick, concrete, gravel, organic clay, coal, and slag extending to depths ranging from 2 to 13 feet below ground surface (bgs) in the majority of the site and up to 24 feet bgs next to the East River. The fill layer is underlain by sand and silt layers with trace gravel and mica schist. Bedrock underlying the site is part of the Hartland Formation and depth to bedrock is approximately 75 to 100 feet bgs. Groundwater is between 6 and 15 feet bgs and is flowing to the west, toward the East River.

Assessment:

Remediation at the site is complete. Prior to remediation the contaminants of concern included certain metals, volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs). Remedial actions have successfully achieved the restricted residential soil cleanup objectives, which allow for the site's residential and commercial use. Endpoint samples collected and analyzed across the site confirmed the success of the remedial action. The site requires an institutional control, in the form of an environmental easement, and engineering controls in the form of a soil cover system and

submembrane depressurization system. A Site Management Plan (SMP) was completed to manage remaining contamination at the site and includes an Institutional and Engineering Control Plan that identifies all use restrictions and engineering controls for the site and details and steps and media-specific requirements necessary to ensure these controls remain in place and effective.

Site Class Desc: Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).

Site Class Desc (GIS): Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The

Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Assess DOH: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site.

Description:

Location: The 416 Kent Avenue site is located in an urban area along the East River in Brooklyn, Kings County. The site is on the southern portion of the city block bordered by what would be an extension of Broadway followed by Block 2467 to the north (paper street), Kent Avenue to the east, what would be an extension of South 8th Street to the south (paper street) followed by Block 2134, and the East River to the west. Site Features: The irregularly-shaped site encompasses an area of approximately 46,000 square feet (1.056 acres). Currently the site is under construction for a 22-story residential building with subgrade parking and retail space, first- and second-floor amenity space, ground floor retail space with residential use beginning on the second floor. Current Zoning and Land Use: The site is located in zoning districts R7-3 and C4-3. Zone C4-3 encompasses approximately 3,900 square feet of the property, and the remaining approximately 42,100 square feet is in zoning district R7-3 with a C2-4 commercial overlay. The property will be mixed-use with residential and commercial spaces. Past Use of the Site: Past land uses associated with the site include a ferry terminal (1887), vacant land (1935 to 1965) and a trucking company (2001 to circa 2012). Site Geology and Hydrogeology: The subsurface strata at the site consists of historic urban fill characterized by dark gray and brown fine to coarse-grained sand with varying amounts of brick, concrete, gravel, organic clay, coal, and slag extending to depths ranging from 2 to 13 feet below ground surface (bgs) in the majority of the site and up to 24 feet bgs next to the East River. The fill layer is underlain by sand and silt layers with trace gravel and mica schist. Bedrock underlying the site is part of the Hartland Formation and depth to bedrock is approximately 75 to 100 feet bgs. Groundwater is between 6 and 15 feet bgs and is flowing to the west, toward the East River.

Assessment:

Remediation at the site is complete. Prior to remediation the contaminants of concern included certain metals, volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs). Remedial actions have successfully achieved the restricted residential soil cleanup objectives, which allow for the site's residential and commercial use. Endpoint samples collected and analyzed across the site confirmed the success of the remedial action. The site requires an institutional control, in the form of an environmental easement, and engineering controls in the form of a soil cover system and submembrane depressurization system. A Site Management Plan (SMP) was completed to manage remaining contamination at the site and includes an Institutional and Engineering Control Plan that identifies all use restrictions and engineering controls for the site and details and steps and media-specific requirements necessary to ensure these controls remain in place and effective.

Site Name: Former Sterling Transformer Corp.

Site Name (GIS): Former Sterling Transformer Corp.

Site Class Desc (GIS): Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Site Class Desc: Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Program: BCP

Program Desc: BCP

Assess DOH: Since the site is fenced and covered by asphalt or concrete, people will not come into contact with site-related soil and groundwater contamination unless they dig below the ground surface. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because there are no on-site buildings, inhalation of site contaminants in indoor air due to soil vapor intrusion does not represent a concern for the site in its current condition. However, the potential exists for the inhalation of site contaminants due to soil vapor intrusion for any future on-site development. In addition, sampling indicates soil vapor intrusion is a concern for off-site buildings.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: The site is located in the Williamsburg section of the borough of Brooklyn, NY. The site has about175 feet of frontage along Driggs Avenue and 100 feet of frontage along North 8th Street. Site Features: The property is currently developed with an asphalt-paved parking lot, with a small unoccupied attendant's booth. Current Zoning and Land Use: The property is currently a vacant parking lot. The site is zoned commercial/industrial/high density residential (M1-2/R6A and R6B). Allowable uses include light manufacturing, warehouses, wholesalers, and multi-story residential buildings. Past use of the Site: Based on a map dated 1855, the property is believed to have been occupied by a manufactured gas plant (MGP). The MGP was demolished by 1887. By 1942, southern portions of the site were developed with a garage. Between 1942 and 1951, the garage was converted to an industrial building and occupied by a chair manufacturer. The chair manufacturer was replaced by a transformer manufacturer circa 1965 and later by a food warehouse circa 1991. Both buildings were demolished in 2006 and replaced with the existing parking lot. Geology and Hydrogeology: Soil at the site is described as historic fill materials to a depth of about 15 feet below the surface followed by native brown fine sand with silt and some clay. Groundwater is present at about 12 feet below ground surface, and flows to the northeast.

Assessment:

Nature and Extent of Contamination A Remedial Investigation (RI) was conducted at the site in August and September 2015. Soil and groundwater samples were analyzed for Volatile Organic Compounds (VOCs), Semi-Volatile Organic Compounds (SVOCs), Metals, Polychlorinated Biphenyls (PCBs) and Pesticides. Soil vapor samples were analyzed for VOCs. Soil borings in the southern half of the site encountered refusal between 18 and 21 feet below ground surface (bgs), in the vicinity of the suspected former MGP gas holder foundation. A source area near the location of the former MGP gas holder is suspected due to the presence of non-aqueous phase liquids (NAPL) and elevated levels of petroleum VOCs, chlorinated VOCs (CVOCs), and naphthalene. The following are the results for each medium sampled: Soil: Results of the RI show that fill materials are present to a depth of about 15 feet bgs. Chlorinated and petroleum-related VOCs were reported above unrestricted use soil cleanup objectives (SCOs) in samples collected in the southern portion of the site from 10 to 21 feet bgs. Compounds included benzene (up to 0.89 parts per million (ppm)), chrysene (up to 38 ppm,

naphthalene (up to 620 ppm) and vinyl chloride (up to 2.6 ppm). The unrestricted use SCOs for benzene, chrysene, naphthalene and vinyl chloride are 0.06 ppm, 1 ppm, 12 ppm and 0.02 ppm, respectively. SVOCs were detected above unrestricted use SCOs throughout the site at all sampled depths. Compounds included benz(a)anthracene (150 ppm) benzo(a)pyrene (86 ppm), benzo(b)fluoranthracene (100 ppm), chrysene (120 ppm), dibenz(a,h)anthracene (4.2 ppm), and indeno(1,2,3-cd)pyrene (27 ppm). The unrestricted use SCOs for benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthracene, chrysene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene are 1 ppm, 1ppm, 1 ppm, 1 ppm, 0.33 ppm, and 0.5 ppm, respectively. Off-site investigation of soil was not conducted as part of the RI. Metals including chromium, mercury, and lead were detected up to 121 ppm. Pesticides including chlordane, a-chlordane 4,4'-DDT, 4,4'-DDE, and deildrin were detected up to .97 ppm. Detections of metals and pesticides were predominantly at the 0 - 5 foot sampling depth. PCBs were not detected during environmental sampling. Groundwater: CVOCs were reported above ambient water quality standards (AWQS) at all of the sample locations, with pure solvent found in the southern portion of the site and elevated concentrations (up to 1,200 parts per billion, or ppb, of cis-1,2-dichloroethene) in the southeast corner of the site. The AWQS for cis-1,2-dichloroethene is 5 ppb. Benzene and SVOCs were also detected above AWQS in several monitoring wells. Benzene was detected up to 4,300 ppb in the central portion of the site. SVOCs including ben(a)anthracene, benzo(a)pyrene, benzo(b)flouranthene, chrysene, and indeno(1,2,3-cd)pyrene, were detected between 0.02 and 0.35 ppb, predominantly in the western portion of the site. Metals including iron, sodium, and manganese were detected above standards at levels commonly observed throughout Brooklyn due to historic over pumping of groundwater in the area. PCBs were not detected during environmental sampling. Data indicates potential off-site impacts in groundwater related to this site. Soil Vapor: Chlorinated solvents were reported in all of the soil vapor samples, with the highest levels (vinyl chloride at 116,000 micrograms (ug)/cubic meter) in the eastern portion of the site. Petroleum-related compounds were detected in soil vapor samples. Benzene was the highest petroleum- related compound at 1,240 ug/cubic meter, detected in the eastern portion of the lot. All other petroleum related compounds were detected between 2.26 ug/cubic meter and 390 ug/cubic meter. Data indicates potential off-site impacts in soil vapor related to this site.

Site Name: Former Sterling Transformer Corp. - Off-Site

Site Name (GIS): Former Sterling Transformer Corp. - Off-Site

Site Class Desc (GIS): Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Site Class Desc: Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Program: BCP

Program Desc: BCP

Assess DOH: Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

The area of concern subject to this work is considered off-site from BCP site C224203 and reflects the investigation and possible remediation of contamination that may have migrated from that site. This work is being carried out as provided for under the Environmental Conservation Law Section 27-1411.5. Please see C224203 for further information regarding the status of the site in the Brownfield Cleanup program. Location: The site is located in the Williamsburg section of the borough of Brooklyn, NY. Driggs Avenue bounds the property to the southeast, N 8th Street bounds the property to the southwest, and N 9th Street bounds the property to the north. The site is bound to the west by various mixed-use residential buildings. Site Features: The site consists of multiple tax lots including a paved parking lot and mixed-use residential buildings. Current Zoning and Land Use: The site is currently zoned commercial/industrial/high density residential and general residence (M1-2/R6A and R6B). Allowable uses include light manufacturing, warehouses, wholesalers, and multi-story residential buildings. Past Use of Site: Based on a map dated 1855, the property is believed to have been occupied by a manufactured gas plant (MGP). The MGP was demolished by 1887. By 1942, southern portions of the site were developed with a garage. Between 1942 and 1951, the garage was converted to an industrial building and occupied by a chair manufacturer. The chair manufacturer was replaced by a transformer manufacturer circa 1965 and later by food warehouse around 1991. Both buildings were demolished in 2006 and replaced with the existing parking lot. Geology and Hydrogeology: Soil at the site is described as historic fill materials to a depth of about 15 feet below the surface followed by native brown fine sand with silt and some clay. Groundwater is present at about 12 feet below ground surface, and flows to the northeast.

Assessment:

Nature and Extent of Contamination: Based upon the remedial investigation at the BCP site #C224203, the primary contaminants of concern are expected to be naphthalene, vinyl chloride, and cis-1,2-dichloroethene which were found in the BCP site soil, groundwater, and soil vapor. The BCP site soils also contained some semi-volatile organic compounds (SVOCs), such as benzo(a)pyrene, benzo(a) anthracene and benzo(b)fluoranthene, chrysene, dibenz[a,h]anthracene. The off-site investigation has not begun, therefore this section will be updated to reflect the investigation results as data become available.

The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: The Site is located in an urban area in the Williamsburg neighborhood of Brooklyn. The approximately 36,472 square-foot, irregularly shaped Site is bounded to the north by North 12th Street, to the east by Berry Avenue, to the west by a warehouse building used by the Brooklyn Brewery, and to the south by North 11th Street and two buildings containing residential apartments. Site Features: The Site is developed with an L-shaped, seven-story residential building that fronts Berry and North 12th Streets, with an open courtyard area located behind the building in the central portion of the Site. A basement level parking garage is located under the building and courtyard, with an entrance ramp located on North 11th Street. A small, street-level valet parking lot is also located on North 11th Street, immediately east of the garage entrance ramp. Current Zoning and Land Use: The Site is currently vacant and is zoned as M1-2/R6A (light manufacturing and residential uses). The surrounding area is developed primarily with residential and

commercial properties. Past Use of the Site: Historic records indicated that the Site was developed with industrial and manufacturing uses, including the New York Quinine and Chemical Works between 1887 and 1951. After 1951, the Site was used for freight loading and parking of vehicles. Sanborn maps from 1965 to 2006 (after decommissioning of the quinine factory) depict a large 2-story freight loading facility and warehouse in the western portion of the Site, a 2-story truck repair facility/warehouse and a 4-story unspecified manufacturing facility in the southwestern portion of the Site, and a parking lot in the eastern portion of the Site containing two gasoline tanks of unspecified capacity. All on-site buildings were demolished starting in April 2008, and construction of the existing residential structure started in June 2008. Building construction was completed in early 2009. Site Geology and Hydrogeology: The surface topography in the surrounding area is flat, gradually sloping northwest towards the East River, which is located approximately 1,100 feet from the site. The property lies at an elevation of approximately 20 feet above the National Geodetic Vertical Datum of 1929 (an approximation of mean sea level). Shallow subsurface soils encountered during previous investigations included urban fill material containing brick, asphalt, and concrete fragments to approximately 6 to 10 feet below grade, underlain by apparent native silty sand and silt. Depth to bedrock at the Site is expected to be approximately 100 feet below ground surface. The dominant groundwater flow direction at the Site is believed to be to the northwest; however, groundwater flow direction may be influenced by tidal fluctuations in the East River. Groundwater is approximately 13 to 14 feet below ground surface (relative to sidewalk grade).

Assessment:

Based on investigations conducted to date, identified contamination at the Site is associated with a petroleum spill. OM&M activities completed to monitor remediation efforts associated with the spill have identified a solvent plume in groundwater, consisting mainly of 1,2-DCA. Soil: Some 34 post-excavation grab samples at depths of 10 to 14 feet below grade revealed high levels of contamination. VOCs namely Chlorobenzene concentrations ranged from 1.6 to 16.2 ppm, 1,3-dichlorobenzene 4.5 ppm, toluene 1.8 ppm and 2-butanone 6.4 ppm compared to UUSCOs of 1.1, 2.4, 0.7 and 0.12 ppm respectively. Groundwater: Groundwater samples taken on a quarterly basis from wells located on-site and off-site revealed LNAPL present in the northeast section of the site. The extent and thickness of the plume has been reduced over the years by the recovery system. Petroleum-related VOCs (namely BTEX)were detected at concentrations ranging from 2.1 ppb to 750 ppb. CVOCs (namely DCA) were detected at concentrations ranging from 0.25 to 2,400 ppb. Soil Vapor: To date no soil vapor samples have been taken at the site. SVI is included in the proposed RIWP.

Site Name: Former Sunbelt Equipment

Site Name (GIS): Former Sunbelt Equipment

Site Class Desc (GIS): Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).

Site Class Desc: Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).

Program: BCP

Program Desc: BCP

Assess DOH: Remedial actions are complete and measures are in place where necessary to control the potential for coming in contact with residual contamination remaining at the site.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: The Former Sunbelt Equipment site is located in an urban area in the Williamsburg section of Brooklyn, Kings County. The site is bounded by Wythe Avenue to the east, N 13th Street to the north, Kent Avenue to the west, and N 12th Street to the south. Site Features: The site comprises the full block. The property formerly included two groups of interconnected structures which have been razed. The perimeter of the site is enclosed with 10-ft. tall chain-link, corrugated metal and/or plywood fencing. Concrete block walls, 2-3 feet tall, border portions of the north, east and west property boundaries and are topped by the aforementioned fencing. Current Zoning/Use: The site is currently zoned M1-2 which are often buffers between M2 or M3 districts and adjacent residential or commercial districts. M1 districts include light industrial uses although offices, hotels and most retail uses are also permitted. The property is currently vacant. Surrounding land uses are primarily industrial including a former MGP site and an abandoned major oil storage facility (MOSF); however, both of these sites are slated for redevelopment as parks. Past Use(s) of the Site: Beginning in roughly 1867, the site was part of a large, multi-block petroleum refinery known as the Pratt works. Sanborn fire insurance maps dated 1887 and 1916 show numerous storage tanks related to the Pratt Works, and to paint manufacturing facilities. Subsequent land uses include manufacturing, lumber storage, and a scrap metal yard. Most recently, the property was used for storage and maintenance of heavy construction equipment. Multiple spills have been reported related to petroleum free product observed at the water table near the intersection of Kent Ave and N. 13th St. and in association with underground storage tank (UST) removals. A total of 11 USTs were removed or closed in place and excavation and removal of petroleum contaminated soil was conducted near the northwest corner and at the center of the site. An approximate total of 85 tons of contaminated soil has been excavated and disposed of off-site. Site Geology and Hydrogeology: Regional maps show bedrock as an igneous intrusive known as the Ravenswood granodiorite of middle Ordovician to middle Cambrian age. Soil borings on the site have not encountered bedrock and it is presumed to be in excess of 70 feet below ground surface. Unconsolidated sediments overlie the bedrock and consist of Pleistocene aged sand, gravel and silty clays, deposited by glacial-fluvial activity. Non-native fill materials consisting of dredge spoils, rubble and/or other materials have historically been used to reinforce and extend shoreline areas and to raise and improve the drainage of low lying areas. Soil at the site is described as historic fill material to a depth of approximately 8 to 12 feet below the surface underlain by native brown fine sand with silt and some clay. Groundwater at the site is present under water table conditions at a depth of approximately 5 to 12 feet below grade. Local flow on site appears to be to the southeast; however, it is highly likely that overall flow is westward towards the East River.

Assessment:

Prior to Remediation: Sampling data indicate that soil, groundwater and soil vapor have been impacted by on-site and/or off-site contamination. The primary contaminants of concern include metals, VOCs and SVOCs. Soil: Soils contain metals above unrestricted and/or restricted use SCOs including high concentrations of arsenic and lead. Lead concentrations are particularly high in the western portion of the site where concentrations of lead range from 397 to 9,350 parts per million (ppm). Soils throughout the site contain VOCs above unrestricted use SCOs. Visibly petroleum-contaminated soils have been found in several areas near locations where underground storage tanks were once located. SVOCs including benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene above unrestricted and restricted use SCOs. Benzo(a)pyrene concentrations range from 1 to 13.6 ppm. Site contamination extends to depths of approximately 15 feet. Deeper soils appear to be unimpacted. Groundwater: Groundwater on the site exceeds standards for VOCs. Most notable is benzene at concentrations up to 3,300 parts per billion (ppb). SVOCs include naphthalene at concentrations up to 600 ppb. Both the VOCs and SVOCs appear to be derived from former petroleum tank locations. Soil Vapor: TCE (ND-16.2 ug/m3) PCE (ND-245 ug/m3) and TCA (ND-284 ug/m3) were detected in soil vapor samples collected from the site. These COCs have not been identified in soil or groundwater samples collected at the site and therefore no on-site source has been identified. Post-Remediation: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were VOCs, SVOCs and metals in soil; VOCs and SVOCs in groundwater; and VOCs in soil vapor. Remedial actions have successfully achieved soil cleanup objectives for unrestricted use over a majority of the site, and restricted residential and commercial use in two small areas of the site. Residual contamination in the soil in these two areas is being managed under a Site Management Plan.

Description:

Location: The Former Sunbelt Equipment site is located in an urban area in the Williamsburg section of Brooklyn, Kings County. The site is bounded by Wythe Avenue to the east, N 13th Street to the north, Kent Avenue to the west, and N 12th Street to the south. Site Features: The site comprises the full block. The property formerly included two groups of interconnected structures which have been razed. The perimeter of the site is enclosed with 10-ft. tall chain-link, corrugated metal and/or plywood fencing. Concrete block walls, 2-3 feet tall, border portions of the north, east and west property boundaries and are topped by the aforementioned fencing. Current Zoning/Use: The site is currently zoned M1-2 which are often buffers between M2 or

M3 districts and adjacent residential or commercial districts. M1 districts include light industrial uses although offices, hotels and most retail uses are also permitted. The property is currently vacant. Surrounding land uses are primarily industrial including a former MGP site and an abandoned major oil storage facility (MOSF); however, both of these sites are slated for redevelopment as parks. Past Use(s) of the Site: Beginning in roughly 1867, the site was part of a large, multi-block petroleum refinery known as the Pratt works. Sanborn fire insurance maps dated 1887 and 1916 show numerous storage tanks related to the Pratt Works, and to paint manufacturing facilities. Subsequent land uses include manufacturing, lumber storage, and a scrap metal yard. Most recently, the property was used for storage and maintenance of heavy construction equipment. Multiple spills have been reported related to petroleum free product observed at the water table near the intersection of Kent Ave and N. 13th St. and in association with underground storage tank (UST) removals. A total of 11 USTs were removed or closed in place and excavation and removal of petroleum contaminated soil was conducted near the northwest corner and at the center of the site. An approximate total of 85 tons of contaminated soil has been excavated and disposed of off-site. Site Geology and Hydrogeology: Regional maps show bedrock as an igneous intrusive known as the Ravenswood granodiorite of middle Ordovician to middle Cambrian age. Soil borings on the site have not encountered bedrock and it is presumed to be in excess of 70 feet below ground surface. Unconsolidated sediments overlie the bedrock and consist of Pleistocene aged sand, gravel and silty clays, deposited by glacial-fluvial activity. Non-native fill materials consisting of dredge spoils, rubble and/or other materials have historically been used to reinforce and extend shoreline areas and to raise and improve the drainage of low lying areas. Soil at the site is described as historic fill material to a depth of approximately 8 to 12 feet below the surface underlain by native brown fine sand with silt and some clay. Groundwater at the site is present under water table conditions at a depth of approximately 5 to 12 feet below grade. Local flow on site appears to be to the southeast; however, it is highly likely that overall flow is westward towards the East River.

Assessment:

Prior to Remediation: Sampling data indicate that soil, groundwater and soil vapor have been impacted by on-site and/or off-site contamination. The primary contaminants of concern include metals, VOCs and SVOCs. Soil: Soils contain metals above unrestricted and/or restricted use SCOs including high concentrations of arsenic and lead. Lead concentrations are particularly high in the western portion of the site where concentrations of lead range from 397 to 9,350 parts per million (ppm). Soils throughout the site contain VOCs above unrestricted use SCOs. Visibly petroleum-contaminated soils have been found in several areas near locations where underground storage tanks were once located. SVOCs including benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene above unrestricted and restricted use SCOs. Benzo(a)pyrene concentrations range from 1 to 13.6 ppm. Site contamination extends to depths of approximately 15 feet. Deeper soils appear to be unimpacted. Groundwater: Groundwater on the site exceeds standards for VOCs. Most notable is benzene at concentrations up to 3,300 parts per billion (ppb). SVOCs include naphthalene at concentrations up to 600 ppb. Both the VOCs and SVOCs appear to be derived from former petroleum tank locations. Soil Vapor: TCE (ND-16.2 ug/m3) PCE (ND-245 ug/m3) and TCA (ND-284 ug/m3) were detected in soil vapor samples collected from the site. These COCs have not been identified in soil or groundwater samples collected at the site and therefore no on-site source has been identified. Post-Remediation: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were VOCs, SVOCs and metals in soil; VOCs and SVOCs in groundwater; and VOCs in soil vapor. Remedial actions have successfully achieved soil cleanup objectives for unrestricted use over a majority of the site, and restricted residential and commercial use in two small areas of the site. Residual contamination in the soil in these two areas is being managed under a Site Management Plan.

OVER FILLED WHILE FILING UP A TANK: CLEANED UP:

DEC Remark:

Tipple was at the site at 6:40 AM and discovered the spill. Detailed work outline was discussed with Bayside and Classic Fuel to clean up both the yard area and the street. 08/10/06: This spill is transferred from Mr. Koon Tang to Q.Abidi. Called Pat at (718)372-9800 and talked to Ms. Dana regarding status of the spill. She said that when Mr. Pat will come she will find about it and she will convey my message to Pat. Mr. Pat will call me back. -QA 09/22/06: On September 21, received a closing confirmation letter from Mr. Albert Cirino (Model Petroleum Transportation INC.). According to Mr.Cirino the spill was on concrete. No water and no land were contaminted by the spill. the spill is cleaned. Also talk to Bayside Terminal manager Mr. Sergio, He said they clean their yard. Also talk to Mr. John (718)388-1515 he said yard is asphaltand asphalt is sealed, it is not open dirt. John spoke on phone that they picked up each & every pocket of the product. so according to letter of Albert Cirino and Conversation with John and Terminal Manager Sergio DEC Staff closed the spill. -QA

Survey Complete:	YES		
Survey:	Class B Fire Suppression Foam Usage Survey - New York State Bulk Storage Facilities		
Q. 6:	NO		
Q. 7:	NO		
Q. 8:	NO		
Q. 9:	NO		
Q. 10:	NO		
Q. 11:	NO		
Q. 12:			
Q. 13:			

Reference: If a respondent indicated that the facility used/stored/disposed PFOA/PFOS substances, it does not necessarily mean that there is an environmental/public health concern associated with that facility. Also, if a respondent indicated that they currently/formerly used, stored, disposed of, or released Class B firefighting foam it does not necessarily mean that the foam contains/contained PFOA/PFOS since many Class B foams do not contain these substances. DEC is in the process of reviewing/evaluating the returned surveys to determine if additional follow-up or study is needed.
Return rate: 91 surveys were sent to facilities; 90 were returned completed as of June 1, 2017.
Questions 1 & 2 relate to name and address; questions 3-5 relate to facility ownership.
Q. 6: Is any Class B fire suppression foam currently stored and/or used at the facility?
Q. 7: Has any Class B fire suppression foam ever been stored and/or used at the facility?
Q. 8: Has Class B fire suppression foam ever been used for training purposes at the facility?
Q. 9: Has Class B fire suppression foam ever been used for firefighting or other emergency response purposes at the facility?
Q. 10: Has the facility ever experienced a spill or leak of Class B fire suppression foam?
Q. 11: Has your facility ever been responsible for the use of Class B fire suppression foam at a location other than the facility (i.e. offsite training, emergency response, or spill)?

Site Name: Bayside Oil

Site Name (GIS): Bayside Oil

Site Class Desc (GIS): No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

The TransGas Energy (TGE) Facility is a project for a new energy facility located on the East River waterfront between the Greenpoint and Williamsburg sections of Brooklyn. TGE proposed to construct and operate an 1100-megawatt gas-fired plant on the Brooklyn waterfront near Bushwick Inlet between the communities of Greenpoint and Williamsburg. For over 100 years, the Site has been operated as a fuel oil storage and distribution facility. Site soils and groundwater are contaminated with Petroleum spill contaminants, MGP Waste and heavy metal contamination. TGE entered the Department?s Voluntary Cleanup Program (VCP) in December 2002. The current owner of the Site is the Bayside Fuel Oil Depot. Under Bayside Fuel and previous owners (which include Socony Mobil, Texaco Refining and Marketing and others), the Site has been operated as a fuel oil storage and distribution facility for over 100 years. The Phase II assessment was completed in January 2003 and confirmed widespread groundwater and soil contamination with MGP waste and petroleum related contaminants. RI is on-going. The VCP Agreement was terminated in 2009 for lack of progress. There is an existing oil spill stipulation (Spill No. 9804544) with Texaco Refining and Marketing that has resulted in ongoing recovery of free-product and contaminated-groundwater. See also site no. 224055 (Williamsburg Works MGP) for further information.

Assessment:

Previous studies at the Site confirm widespread petroleum contamination with MGP involvement. For example, fuel oil and naphthalene odors are reported in boring logs as deep as 60 feet, and in July 2002 TRC Environmental (TGE?s consultant) found heavy staining and MGP waste in a boring 20 feet below grade and reported the occurrence to NYSDEC as a spill (No. 0203677). In addition to organic pollutants, a 1997 investigation also found soil samples with elevated levels of lead. The Phase II assessment was completed in January 2003 and confirmed widespread groundwater and soil contamination with MGP waste and petroleum related contaminants. Heavy staining and odors (coal tar) observed from 20 feet depths to top of clay at 60 feet depths. VOCs and PAH exceed RSCOs below 20 feet depth. Benzene concentrations below 20 feet depth observed up to 864,000 ppb. Off-site benzene detected upto 128,000 ppb. Free product observed (wells B4, MW7). On-site groundwater impacted from water table to top of clay by petroleum and coal tar related compounds. Benzene detected throughout the site at concentrations of 6.5 ppb to 29,500 ppb (in MWB-11). MTBE ranged from 1.2 to 329 ppb and naphthalene ranged from 1.6 to 579 ppb.

The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

BCP Denial Letter signed by DER Div Director on 2/19/14. Site Location: The proposed 94 N. 13th Street BCP site is located in the Williamsburg section of Brooklyn, Kings County. The site is made up of two tax parcels and is bordered by Wythe Avenue, N. 12th Street, and N. 13th Street. Site Features: The site is developed with two-one story commercial/industrial buildings which were built in the 1960's and are occupied. There is a small parking area and buildings cover most of the site area, which is approximately 1.147 acres in size. Current Zoning and Land Use: The site is zoned M1-2 which includes light industrial uses and is currently used by a manufacturer of clear plastic bags, and a manufacturer of wooden pallets. Past Uses of the Site: Previous uses were manufacturing and include the storage of manufactured gas and also as a plating facility. Site Geology and Hydrogeology: The geologic setting of Long Island is well documented and consists of crystalline bedrock overlain by layers of unconsolidated deposits. The bedrock in this area is igneous intrusive classified as the ravenwood grano-diorite of middle Ordovician to middle Cambrian age. Unconsolidated sediments overlie the bedrock and consist of Pleistocene aged sand, gravel and silty clays, deposited by glacial-fluvial activity. Non-native fill materials consisteing of dredge spoils, rubble and/or other materials have historically been used to raise and improve the drainage of low lying areas. Subsurface soils consist of a mixture of a silty non-native fill, to a depth of approximately 12 feet below grade followed by sand and gravel. The elevation of the site is 15 feet above National Geodetic Vertical Datum (NGVD) and the area topography gradually slopes to the northwest. Groundwater is present at a depth of approximately 7 feet below the surface and is expected to flow north.

Assessment:

Nature of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include benzene, toluene, ethylbenzene and xylene (BTEX), napthalene, 1,2,4-trimethylbenzene, and 1,3,5-trimethylbenzene; various SVOCs (PAHs), including benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, chrysene and indeno(1,2,3-cd)pyrene; and several metals (lead, mercury, barium, nickel, zinc and copper). Soil- Subsurface soil contains maximum concentrations of BTEX (944 ppm), napthalene (280 ppm), total PAHs (218 ppm), lead (920 ppm), mercury (18 ppm). The metals concentrations were 920 ppm for lead, 18 ppm for mercury, 160 ppm for copper, 52 ppm for nickel, 2,300 ppm for zinc, and 2,400 ppm for barium. Groundwater- On-site groundwater contained low levels of PAHs, with a maximum concentration of total PAHs of 7 ug/L. Lead was detected at a maximum concentration of 254 ug/L. Off-site groundwater contained BTEX concentrations as high as 6,480 ug/L, 1,600 ug/L of napthalene, total PAHs of 1,670 ug/L, 600 ug/L of 1,2,4-trimethylbenzene,and 160 ug/L of 1,3,5-trimethylbenzene.

Site Class Desc (GIS): Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Site Class Desc: Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Assess DOH: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining in Operable Unit 1. Contaminated groundwater at the site is not used for drinking or other purposes and the area is served by a public water supply that is not affected by this contamination. Direct contact with contaminants in the soil is unlikely because the site is covered with pavement and buildings. Volatile organic compounds in the contaminated soil or contamination groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying structures and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. The potential exists for people to inhale site contaminants in indoor air due to soil vapor intrusion for any future on-site redevelopment of Operable Unit 2. Environmental sampling indicates that soil vapor intrusion is not a concern for off-site buildings.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: The former Wythe Avenue Station is located in the Williamsburg neighborhood of Brooklyn, New York, Kings County. The site occupies nine parcels, and is bounded by North 13th Street to the north, North 12th Street to the south, Berry Street to the east and Wythe Avenue to the west. These nine parcels are identified as Block 2283, Lots 1, 25, 28, 31, 33, 35, 38, 41 and 43, and comprise approximately 2.07 acres. Site Features: The site is comprised of commercial and industrial properties, and site topography is nearly flat. Lot 1 (OU1) contains a newly constructed twenty-one story hotel and retail stores, the remaining eight lots (OU2) comprise several one-story warehouse buildings on the east half of the site which are currently occupied by the Mirtex Trading Corporation. Current Zoning and Land Use: The area is zoned M1-1 and M1-2, which allow for light industrial and commercial uses. The site is surrounded by mixed use parcels, including light industrial, commercial and residential. The nearest residential area is within 100 feet to the southwest. Past Use of the Site: The site was operated as a Manufactured Gas Plant (MGP) holder station by Brooklyn Union Gas Co. from approximately 1903 to 1965. The station operated solely for gas distribution, and no gas production facilities were present at the site. Over the life of facility, manufactured gas, and possibly natural gas, based on the years of operation, was stored at the facility. In 1965 the holders and all associated MGP buildings were dismantled when the property was sold. Subsequent development of the site included two one-story buildings on the western two parcels, used for manufacturing and warehousing, in 1968. The eastern portion of the site was redeveloped with several warehouse buildings between 1985 and 1991. Operable Units: The site was divided into two operable units. An operable unit represents a portion of a remedial program for a site that for technical or administrative reasons can be addressed separately to investigate, eliminate or mitigate a release, threat of a release or exposure pathway resulting from the site contamination. Operable Unit 1 (OU1) consists of the parcel (Lot 1) owned by Wythe Berry LLC on the western half of the site (approximate size of 1.15 acres). Operable unit 2 (OU2) consists of the remaining eight parcels owned by Mihata Corporation on the eastern half of the site (approximate size of 0.92 acres). Geology and Hydrogeology: The site is underlain by up to 12 feet of urban fill material, then various layers of gravelly sands, silts and clays. Bedrock is approximately 100 feet below the ground surface. Groundwater is encountered at depths of 7 to 10 feet beneath the site, and generally flows to the north in the western portion of the site, and to the east in the eastern portion of the site.

Assessment:

Prior to Completion of Remediation For OU 1: Lot 1 Parcel Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), and pesticides. Based upon investigations conducted, the primary contaminants of concern for OU 1 were BTEX and naphthalene (VOCs), and polycyclic aromatic hydrocarbons (PAHs) (SVOCs). Prior to the IRM, the subsurface soil showed exceedances of the unrestricted soil cleanup objectives (SCOs) for benzene, toluene, ethylbenzene and xylene (BTEX), various PAH constituents, and several metals. Benzene was found as high as 70 parts per million (ppm), compared to an SCO of 0.06 ppm. Toluene was found as high as 550 ppm (0.7 SCO), ethylbenzene as high as 270 ppm (1 ppm SCO), and total xylenes as high as 610 ppm (0.26 ppm SCO). Naphthalene was detected as high as 9,400 ppm, compared to an SCO of 12 ppm. Several PAH compounds were detected as high as 96 ppm, with most having an SCO of 1 ppm. The metal constituents that exceeded the unrestricted SCOs were as follows: lead as high as 1400 ppm (63 ppm SCO); mercury as high as 18 ppm (0.18 ppm SCO); and arsenic as high as 40 ppm (13 ppm SCO). Subsurface soil offsite had minor exceedances of only the unrestricted SCOs. Groundwater - Groundwater was only sampled at one on-site location during the investigation due to existing buildings, and was found to be impacted by SVOCs and lead. Lead was detected at a concentration of 254 ppb (25 ppb standard); and the four PAHs detected (benz(a)anthracene, benz(a)pyrene, benzo(b)fluoranthene, and chrysene) had a maximum concentration of 0.08 ppb, with a standard of 0.002 ppb. Groundwater sampled at two offsite locations was found to be impacted by VOCs and SVOCs. Soil Vapor - There were no soil vapor samples collected at OU-1. Post-remediation (OU1 only): An IRM was performed at OU1 in 2014 that removed approximately 68,000 tons of impacted material to depths ranging from 15 to 30 feet below ground surface. Prior to remediation, the primary contaminants of concern were BTEX and naphthalene (VOCs), and PAHs (SVOCs). Of the 28 confirmatory samples taken, 25 met the site remedial action SCOs for restricted residential use. The three samples which did not meet the SCOs, and which exceeded only for metals and PAHs, were found at depths greater than 15 feet below ground surface. Groundwater samples collected post-IRM indicated a decrease in concentrations of detected constituents. Prior to Completion of Remediation For OU2 Parcel: Mihata Corporation Properties Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), and pesticides. Based upon investigations conducted, the primary contaminants of concern for OU2 were BTEX and naphthalene (VOCs), and polycyclic aromatic hydrocarbons (PAHs) (SVOCs). a full investigation of these media could not be performed due to the presence of existing buildings. The subsurface soil showed exceedances of the unrestricted soil cleanup objectives (SCOs) for benzene, toluene, ethylbenzene and xylene (BTEX), various PAH constituents, and several metals. Benzene was found as high as 330 pats per million (ppm), compared to an SCO of 0.06 ppm. Toluene was found as high as 840 ppm (0.7 SCO), ethylbenzene as high as 1,200 ppm (1 ppm SCO), and total xylenes as high as 1,600 ppm (0.26 ppm SCO). Naphthalene was detected as high as 1,300 ppm, compared to an SCO of 12 ppm. Several PAH compounds were detected as high as 13 ppm, with most having an SCO of 1 ppm. The metal constituents that exceeded the unrestricted SCOs were as follows: lead as high as 1,600 ppm (63 ppm SCO); mercury as high as 2.3 ppm (0.18 ppm SCO); and arsenic as high as 77 ppm (13 ppm SCO). Subsurface soil offsite had minor exceedances of only the unrestricted SCOs. Groundwater - Groundwater was sampled at two on-site locations during the investigation due to existing buildings, with one location within the holder footprint, and the other at the site boundary. The location within the holder was impacted by SVOCs and lead, while the boundary location had impacts from VOCs and one SVOC. Lead was detected at a concentration of 35 parts per billion (ppb) (25 ppb standard); and the four PAHs detected (benz(a)anthracene, benz(a)pyrene, benzo(b)fluoranthene, and chrysene) had a maximum concentration of 0.25 ppb, with a standard of 0.002 ppb. The VOCs found to exceed standards were benzene at 2,200 ppb (1 ppb standard), toluene at 1,200 ppb (5 ppb standard), ethylbenzene at 600 ppb (5 ppb standard), xylene at 2,480 ppb (standard of 5 ppb), isopropyl benzene at 30 ppb (5 ppb standard), naphthalene at 1,200 ppb (guidance value of 10 ppb), n-propylbenzene at 42 ppb (5 ppb standard), styrene at 690 ppb (5 ppb standard), 1,2,4-trimethylbenzene at 600 ppb (5 ppb standard), and 1,3,5-trimethylbenzene at 160 ppb (5 ppb standard). Naphthalene was the SVOC which was found at 1,100 ppb (guidance value of 10 ppb). Groundwater sampled at one offsite location was found to be impacted by VOCs and SVOCs. Soil Vapor- There were three soil vapor samples collected at OU2 during the investigation. The sub-slab vapor samples contained compounds, including BTEX and trimethylbenzenes, which may be associated with gas holder operations and which are common petroleum products. One compound, TCE, was detected at 11 micrograms per cubic meter. This compound is a chlorinated solvent, which is not associated with former gas holder operations.

Description:

Location: The former Wythe Avenue Station is located in the Williamsburg neighborhood of Brooklyn, New York, Kings County. The site occupies nine parcels, and is bounded by North 13th Street to the north, North 12th Street to the south, Berry Street to the east and Wythe Avenue to the west. These nine parcels are identified as Block 2283, Lots 1, 25, 28, 31, 33, 35, 38, 41 and 43, and comprise approximately 2.07 acres. Site Features: The site is comprised of commercial and industrial properties, and site topography is nearly flat. Lot 1 (OU1) contains a newly constructed twenty-one story hotel and retail stores, the remaining eight lots (OU2) comprise several one-story warehouse buildings on the east half of the site which are currently occupied by the Mirtex Trading Corporation. Current Zoning and Land Use: The area is zoned M1-1 and M1-2, which allow for light industrial and commercial uses. The site is surrounded by mixed use parcels, including light industrial, commercial and residential. The nearest residential area is within 100 feet to the southwest. Past Use of the Site: The site was operated as a Manufactured Gas Plant (MGP) holder station by Brooklyn Union Gas Co. from approximately 1903 to 1965. The station operated solely for gas distribution, and no gas production facilities were present at the site. Over the life of facility, manufactured gas, and possibly natural gas, based on the years of operation, was stored at the facility. In 1965 the holders and all associated

MGP buildings were dismantled when the property was sold. Subsequent development of the site included two one-story buildings on the western two parcels, used for manufacturing and warehousing, in 1968. The eastern portion of the site was redeveloped with several warehouse buildings between 1985 and 1991. Operable Units: The site was divided into two operable units. An operable unit represents a portion of a remedial program for a site that for technical or administrative reasons can be addressed separately to investigate, eliminate or mitigate a release, threat of a release or exposure pathway resulting from the site contamination. Operable Unit 1 (OU1) consists of the parcel (Lot 1) owned by Wythe Berry LLC on the western half of the site (approximate size of 1.15 acres). Operable unit 2 (OU2) consists of the remaining eight parcels owned by Mihata Corporation on the eastern half of the site (approximate size of 0.92 acres). Geology and Hydrogeology: The site is underlain by up to 12 feet of urban fill material, then various layers of gravelly sands, silts and clays. Bedrock is approximately 100 feet below the ground surface. Groundwater is encountered at depths of 7 to 10 feet beneath the site, and generally flows to the north in the western portion of the site, and to the east in the eastern portion of the site.

Assess ENV:

Prior to Completion of Remediation For OU 1: Lot 1 Parcel Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), and pesticides. Based upon investigations conducted, the primary contaminants of concern for OU 1 were BTEX and naphthalene (VOCs), and polycyclic aromatic hydrocarbons (PAHs) (SVOCs). Prior to the IRM, the subsurface soil showed exceedances of the unrestricted soil cleanup objectives (SCOs) for benzene, toluene, ethylbenzene and xylene (BTEX), various PAH constituents, and several metals. Benzene was found as high as 70 parts per million (ppm), compared to an SCO of 0.06 ppm. Toluene was found as high as 550 ppm (0.7 SCO), ethylbenzene as high as 270 ppm (1 ppm SCO), and total xylenes as high as 610 ppm (0.26 ppm SCO). Naphthalene was detected as high as 9,400 ppm, compared to an SCO of 12 ppm. Several PAH compounds were detected as high as 96 ppm, with most having an SCO of 1 ppm. The metal constituents that exceeded the unrestricted SCOs were as follows: lead as high as 1400 ppm (63 ppm SCO); mercury as high as 18 ppm (0.18 ppm SCO); and arsenic as high as 40 ppm (13 ppm SCO). Subsurface soil offsite had minor exceedances of only the unrestricted SCOs. Groundwater - Groundwater was only sampled at one on-site location during the investigation due to existing buildings, and was found to be impacted by SVOCs and lead. Lead was detected at a concentration of 254 ppb (25 ppb standard); and the four PAHs detected (benz(a)anthracene, benz(a)pyrene, benzo(b)fluoranthene, and chrysene) had a maximum concentration of 0.08 ppb, with a standard of 0.002 ppb. Groundwater sampled at two offsite locations was found to be impacted by VOCs and SVOCs. Soil Vapor - There were no soil vapor samples collected at OU-1. Post-remediation (OU1 only): An IRM was performed at OU1 in 2014 that removed approximately 68,000 tons of impacted material to depths ranging from 15 to 30 feet below ground surface. Prior to remediation, the primary contaminants of concern were BTEX and naphthalene (VOCs), and PAHs (SVOCs). Of the 28 confirmatory samples taken, 25 met the site remedial action SCOs for restricted residential use. The three samples which did not meet the SCOs, and which exceeded only for metals and PAHs, were found at depths greater than 15 feet below ground surface. Groundwater samples collected post-IRM indicated a decrease in concentrations of detected constituents. Prior to Completion of Remediation For OU2 Parcel: Mihata Corporation Properties Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), and pesticides. Based upon investigations conducted, the primary contaminants of concern for OU2 were BTEX and naphthalene (VOCs), and polycyclic aromatic hydrocarbons (PAHs) (SVOCs). a full investigation of these media could not be performed due to the presence of existing buildings. The subsurface soil showed exceedances of the unrestricted soil cleanup objectives (SCOs) for benzene, toluene, ethylbenzene and xylene (BTEX), various PAH constituents, and several metals. Benzene was found as high as 330 pats per million (ppm), compared to an SCO of 0.06 ppm. Toluene was found as high as 840 ppm (0.7 SCO), ethylbenzene as high as 1,200 ppm (1 ppm SCO), and total xylenes as high as 1,600 ppm (0.26 ppm SCO). Naphthalene was detected as high as 1,300 ppm, compared to an SCO of 12 ppm. Several PAH compounds were detected as high as 13 ppm, with most having an SCO of 1 ppm. The metal constituents that exceeded the unrestricted SCOs were as follows: lead as high as 1,600 ppm (63 ppm SCO); mercury as high as 2.3 ppm (0.18 ppm SCO); and arsenic as high as 77 ppm (13 ppm SCO). Subsurface soil offsite had minor exceedances of only the unrestricted SCOs. Groundwater - Groundwater was sampled at two on-site locations during the investigation due to existing buildings, with one location within the holder footprint, and the other at the site boundary. The location within the holder was impacted by SVOCs and lead, while the boundary location had impacts from VOCs and one SVOC. Lead was detected at a concentration of 35 parts per billion (ppb) (25 ppb standard); and the four PAHs detected (benz(a)anthracene, benz(a)pyrene, benzo(b)fluoranthene, and chrysene) had a maximum concentration of 0.25 ppb, with a standard of 0.002 ppb. The VOCs found to exceed standards were benzene at 2,200 ppb (1 ppb standard), toluene at 1,200 ppb (5 ppb standard), ethylbenzene at 600 ppb (5 ppb standard), xylene at 2,480 ppb (standard of 5 ppb), isopropyl benzene at 30 ppb (5 ppb standard), naphthalene at 1,200 ppb (guidance value of 10 ppb), n-propylbenzene at 42 ppb (5 ppb standard), styrene at 690 ppb (5 ppb standard), 1,2,4-trimethylbenzene at 600 ppb (5 ppb standard), and 1,3,5-trimethylbenzene at 160 ppb (5 ppb standard). Naphthalene was the SVOC which was found at 1,100 ppb (guidance value of 10 ppb). Groundwater sampled at one offsite location was found to be impacted by VOCs and SVOCs. Soil Vapor- There were three soil vapor samples collected at OU2 during the investigation. The sub-slab vapor samples contained compounds, including BTEX and trimethylbenzenes, which may be associated with gas holder operations and which are common petroleum products. One compound, TCE, was detected at 11 micrograms per cubic meter. This compound is a chlorinated solvent, which is not associated with former gas holder operations.

Assess DOH:

Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining in Operable Unit 1. Contaminated groundwater at the site is not used for drinking or other purposes and the area is served by a public water supply that is not affected by this contamination. Direct contact with contaminants in the soil is unlikely because the site is covered with pavement and buildings. Volatile organic compounds in the contaminated soil or contamination groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying structures and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. The potential exists for people to inhale site contaminants in indoor air due to soil vapor intrusion for any future on-site redevelopment of Operable Unit 2. Environmental sampling indicates that soil vapor intrusion is not a concern for off-site buildings.

Site Class Desc (GIS): No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

Site Class Desc: No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

Assess DOH:

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: The site is located at 215 North 10th Street in the Borough of Brooklyn, NY. The site is bordered on the south by North 10th Street with residential buildings on the opposite side of the street, to the west by a parking garage, to the north by a six story residential building, and to the east by Roebling Street with residential buildings on the opposite side of the street Site Features: The Site currently developed with one-story industrial building, two smaller one-story structures and parking areas. The Site is currently partially occupied by a motorcycle sales and service company and a marble importer/manufacturer. Current Zoning and Land Use: The site is currently zoned M1-2 (light manufacturing) with an R6A (residential) overlay. The site has a New York City 'e' designation for hazardous materials as a result of recent rezoning from the previous MX8 zoning (heavy industrial use). Past Use of the Site: The Site appears to have been developed sometime prior to 1887 and has been occupied by various industrial uses including a dry color and paint storage, a varnish research works (which utilized two benzene tanks and a gasoline tank) and a chemical warehouse. The site is listed as an inactive facility in the Chemical Bulk Storage database as site no. 2-000052 for storage of muriatic acid, ammonium hydroxide and nitric acid. Site Geology and Hydrogeology: NYSDEC has not received any reports including these details.

Assessment:

SEE SITE NO C224229 FOR FUTURE UPDATES Nature and Extent of Contamination: Based on preliminary sampling, contaminants of concern

include volatile organic compounds (VOCs) in soil, groundwater and soil vapor. Samples were analyzed for VOCs, semi-volatile organic compounds (SVOCs), metals, PCBs and pesticides. Soil - A total of eleven (11) soil borings were installed and from which twenty-five (25) soil samples were collected for analysis. Petroleum and chlorinated solvent-related VOCs were identified in soil samples. Benzene was found at a maximum concentration of 5.7 parts per million (ppm), ethylbenzene at a maximum concentration of 10 ppm, 1,3,5-trimethylbenzene at a maximum concentration of 35 ppm, tetrachloroethylene (PCE) at a maximum concentration of 9.4 ppm, trichloroethylene (TCE) at a maximum concentration of 220 ppm, cis-1,2-dichloroethylene (cis-1,2-DCE) at a maximum concentration of 36 ppm, vinyl chloride (VC) at a maximum concentration of 0.46 ppm and naphthalene at a maximum concentration of 100 ppm. Groundwater - As per the site map, total of four (4) monitoring wells were installed and sampled. Due to insufficient sample volume, only 3 of the wells were analyzed for VOCs (the likely downgradient well was not analyzed for VOCs). TCE was detected at a maximum concentration of 170 parts per billion (ppb), cis-1,2-DCE at a maximum concentration of 16 ppb, VC at a maximum concentration of 15 ppb and naphthalene at a maximum concentration of 31 ppb. Soil Vapor - A total of six (6) soil-vapor probes were installed, including one location beneath the occupied on-site building. Petroleum and chlorinated solvent contamination noted in soil-vapor samples including PCE at a maximum concentration of 7730 micrograms per cubic meter (ug/m3), TCE at a maximum concentration of 243,000 ug/m3, cis-1,2-DCE at a maximum concentration of 11,000 ug/m3 and VC at a maximum concentration of 1650 ug/m3. Significant Threat: Determination of significant threat will be made following completion of the Site Characterization.

Site Class Desc (GIS): This classification is assigned to a site at which contamination does not presently and is not reasonably foreseeable to constitute a significant threat to public health or the environment. This classification is not to be used for sites where insufficient data is available to make a definitive decision concerning significant threat.

Site Class Desc: This classification is assigned to a site at which contamination does not presently and is not reasonably foreseeable to constitute a significant threat to public health or the environment. This classification is not to be used for sites where insufficient data is available to make a definitive decision concerning significant threat.

Assess DOH: Residual arsenic and lead contamination remain under the BQE and is covered with several layers of concrete and asphalt, thereby preventing direct contact. Contaminated soil also underlies several on-site buildings formerly used by Ansbacher. Groundwater in the area is not used, since public water is available. Off-site sampling of surface soils from residential yards adjacent to the site indicated the presence of metals (particularly arsenic and lead) at concentrations above the range of concentrations typically encountered in urban neighborhoods. However, the exact source of the metals in the soils could not be determined from the data collected. The NYSDOH gave the residents advice on how to minimize their exposure to these surface soil contaminants.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: The site is located in the Williamsburg section of Brooklyn. The site is bounded by Havemeyer Street to the northwest, North 6th Street to the southwest, Macri Triangle park to the southeast, and North 8th Street to the northeast. Site Features: The site is completely covered with buildings in the northwest section; and covered with asphalt, concrete, and open park space in the southeast section. The site is bisected by an elevated portion of I-278

(the Brooklyn-Queens Expressway (BQE)) adjacent to the park. Current Zoning and Land Use(s): The site is zoned for residential, manufacturing, and commercial uses. The residential area is in the northwest section of the site. The manufacturing building along Meeker Avenue is unoccupied. Past Use of the Site: According to Sanborn maps, the former Ansbacher Color and Dye Factory (Ansbacher) occupied multiple buildings along North 6th Street, North 7th Street, and Metropolitan Avenue from ~1887 to ~1945. The assumed use of the facility was to manufacture paints and/or pigments for commercial and industrial use. In the early 1950's, the buildings in the southeastern section of the site were torn down to make room for the construction of the BQE. It is believed that during this construction, waste material and debris from the former Ansbacher plant may have been used as fill material in the project area. A Phase II - type investigation was conducted by the New York State Department of Transportation (NYSDOT) in 1988. The investigation found hazardous levels of arsenic and lead in the soil and elevated levels of arsenic, lead and cyanide in the groundwater. During the reconstruction of the BQE in the early 1990s, the NYSDOT completed an IRM (soil removal) within the project's right-of way. The remaining contaminated soil is located beneath asphalt and concrete. A Preliminary Site Assessment was completed by the New York State Department of Environmental Conservation (NYSDEC) during the summer of 1999 to evaluate the areas outside the BQE footprint. The sampling results indicate that the subsurface soils within the footprint of the former Ansbacher Plant contain elevated levels of arsenic, lead, and mercury. The groundwater in this area is also contaminated with these metals, but the contaminated groundwater has not migrated significantly beyond the footprint of the former factory. In 2015, the NYSDEC initiated an investigation on the perimeter of the site to identify the origin of chlorinated solvents found in groundwater beneath the sidewalk as part of routine sampling. Site Geology and Hydrogeology: The site is underlain by fine to medium sands; with limited quantities of coarse sand, gravel, and silt throughout the site at varying intervals. Groundwater is approximately 9.5 - 12.5' below grade. Flow direction in shallow groundwater is toward the west-southwest, while deeper groundwater appears to flow towards the east. (This may be due to the presence of the L train subway tunnel underneath North 7th Street.)

Assessment:

Nature and Extent of Contamination: - Soil Sampling was completed in multiple stages from 1988 to 1999. The primary contaminants of concern in soil at this site are arsenic, lead, and mercury. Arsenic has been found at concentrations up to 7,500 ppm, well above the cleanup objective for commercial use (16 ppm). This soil failed for EP Toxicity (48 mg/l, 5.0 mg/l criteria), indicating the soil is hazardous. Lead has been found at concentrations up to 10,600 ppm, well above the cleanup objective for commercial use (1,000 ppm). This soil failed for EP Toxicity (20.3 mg/l, 5.0 mg/l criteria), indicating the soil is hazardous. Mercury was also found at concentrations up to 294 ppm, well above the cleanup objective for commercial use (2.8 ppm). These concentrations were all found in the vicinity of the Arsenate Of Lead building in the southeast area of the site, which is now located in the footprint of the BQE. - Groundwater Sampling has been completed in multiple stages from 1988 to 2015. The primary contaminants of concern in groundwater are arsenic, lead, and mercury. Arsenic has been found at concentrations up to 15,500 ppb, well above the Class GA standard of 25 ppb. Lead has been found at concentrations up to 431 ppb, above the Class GA standard of 25 ppb. Mercury has been found at concentrations up to 75 ppb, well above the Class GA standard of 0.7 ppb. These concentrations were all found in the vicinity of the Arsenate Of Lead building in the southeast area of the site, which is now located in the footprint of the BQE. In 2015, groundwater in the northwest portion of the site was also found to contain tetrachloroethene (PCE) up to 1,900 ppb, trichloroethene (TCE) up to 120 ppb, and cis-1,2-dichloroethene (DCE) up to 320 ppb. PCE, TCE, and DCE all have a Class GA standard of 5 ppb. Significant Threat: The site does not constitute a significant threat to human health or the environment as the contaminated soil is covered by existing layers of asphalt and concrete, and the contaminated groundwater has not migrated significantly beyond the footprint of the former factory.

Site Class Desc (GIS): Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Site Class Desc: Active: The classification assigned to a non-registry site in any remedial program where work is underway and not yet complete (i. e., Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective action Program sites). This may be used for Manufactured Gas Plant sites or those being remediated under an EPA Cooperative Agreement.

Assess DOH: People may contact contaminants in the soil if they dig below the surface. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Currently the concentrations of site-related contaminants in indoor air are consistent with background levels; however, additional actions are needed to ensure that elevated

concentrations of site-related contaminants in sub-slab vapor do not affect the indoor air quality in the future. Any actions that are determined to be needed to address soil vapor intrusion outside of Operable Unit 3 will be implemented as part of other operable units.

Source of Data:

Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Transitioning from VCP site V00534 Location: The site is located on the lower East Side of the Borough of Manhattan in New York City. The site is bounded by East 13th Street to the north and East 10th Street to the south. South of 12th Street, the site extends from Avenue D to the East River and north of 12th Street the site extends from 250 ft east of Avenue C to the East River. Site Features: The site is divided into three distinct areas; the first, designated the "Jacob Riis" Area, is located along the east side of Avenue D between East 11th and East 14th Streets. It includes the portion of the New York City Housing Authority's (NYCHA) Jacob Riis Houses complex, encompassing the high-rise apartment buildings commonly known as 170 Avenue D, 178 Avenue D, 1115 FDR Drive, 1141 FDR Drive, 1223 FDR Drive and the adjacent New York City Department of Environmental Protection Manhattan Pumping Station. The second area, designated the "Saint Emeric's Property"; is located along the western side of Avenue D between East 12th and East 13th Streets. This area encompasses the grounds of the Roman Catholic Church of St. Emeric, Escuela Hispania Montessori Head Start School (formerly Saint Emeric's School) and the church/school's parking lot and sidewalks. There are currently four buildings on the Saint Emeric's property. The third area is designated as "Haven Plaza"; which is directly to the west of the Saint Emeric's Property between E. 13th Street and the former E. 12th Street. Current Zoning: New York City Planning Commission designates the properties as R7-2: Moderate to High-Density Residential District and includes land uses designated as multilevel elevator residential buildings, transportation and utility use, and public facilities and institutions. Past Uses of the Site: The East 11th Street Works began operations sometime between 1859 and 1868 and was shut down in approximately 1933. During its operational period, the manufactured gas plant (MGP) consisted of 17 gas holders ranging in capacity from approximately 50,000 cubic feet (cu ft.) to 5,000,000 cu ft. Several of the gas holders were converted from gas storage to liquid storage of naphtha, tar or gas oil. The original gas holders built in the late 1800s were most likely constructed with below grade bottoms. Many of these were replaced by large gas holders built on grade, with storage capacities greater than 1,000,000 cu ft. of gas. Other production and storage facilities that were present at the former MGP included retorts, fuel/gas oil tanks, tar separators, purifying houses, condensers and scrubbers. Site Geology and Hydrogeology: Overburden materials at the site comprise three primary stratigraphic units: fill, alluvium and glacial deposits. The Fill Unit is the uppermost unit encountered and is the present day surface of the site. The Fill Unit consists of typical urban debris, including reworked gravel, sand and clay, as well as various types of anthropogenic material, such as, but not limited to, concrete, brick, ash, cinder and glass. The Fill Unit is underlain by the Sand-Silt Unit, which is underlain by the Silty-Clay Unit. Beneath the overburden lies gneiss bedrock, which is located at least 90 feet below ground surface (ft bgs). The Fill Unit and the Sand-Silt Unit, represent a shallow unconfined aquifer (or water-table aquifer) and the Silty-Clay Unit appears to be semi-confining to groundwater. Shallow groundwater, found at approximately 10 ft bgs, appears to flow in a radial pattern from a groundwater mound centered in the southern portion of the site generally toward the East River. The site has been divided into four operable units (OUs). An operable unit represents a portion of a remedial program for a site that for technical or administrative reasons can be addressed separately to investigate, eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination. The OUs are defined as follows: OU1 - Jacob Riis Property OU2 - Off-site East River Park and East River sediments OU3 - St. Emeric's Property, now BCP site C231105 OU4 - Haven Plaza A site location map is attached as Figure 1. A site map with former and existing site features is attached as Figure 2.

Assessment:

Soil and groundwater samples have been analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, and cyanide. Based upon the investigations to date, the primary constituents of concern are benzene, toluene, ethylbenzene, and xylene (BTEX) compounds, and polycyclic aromatic hydrocarbons (PAHs). Inorganic compounds are also observed in exceedance of Soil Cleanup Objectives (SCO), but would not be considered primary constituents of concern for MGP sites with the exception of cyanide. Soil - BTEX compounds are observed in exceedance of NYSDEC Unrestricted Soil Cleanup Objectives (USCO) at depths between 20 and 27 feet below ground surface (bgs) on the western portion of the Site (Parcel C) and between 13 and 19 feet bgs on the eastern portion of the Site (Parcel E). PAHs are observed in exceedance of USCOs throughout the Site, aside from the northern parcel (Parcel A). Exceedances are primarily observed at depths ranging from 1 to 15 feet bgs, though exceedances are observed at depths from 20 to 27 feet bgs in the western portion of the Site (Parcel C), and from 53 to 60 feet bgs in the central portion of the Site (Parcel D). Inorganic compounds are found in exceedance of USCOs throughout the Site, aside from the northern parcel (Parcel A). Exceedances are primarily observed at depths between 1 and 15 feet bgs. Exceedances at depths greater than 15 feet bgs have been observed in the western portion of the Site (Parcel C) between 15 and 17 feet bgs, in the central portion of the Site (Parcel D) between 53 and 60 feet bgs, and in eastern portion of the Site (Parcel E) between 42 and 44 feet bgs. BTEX, PAHs, and inorganic compounds have been observed in exceedance of USCOs in offsite locations to the southwest (west of Parcel F). BTEX exceedances have been observed at depths between 3 to 19 feet bgs, PAH exceedances have been observed at depths between 1 to 9 feet bgs, and inorganic compounds have been observed at depths ranging from 1 to 25 feet bgs. PAHs and inorganic compounds have been observed in exceedance of USCOs in offsite locations to the southeast (east of Parcel F), with PAHs observed between 0 and 8 feet bgs, and inorganics observed between 0 and 17 feet bgs. Inorganic compounds (lead and mercury) have been observed in exceedance of USCOs in offsite locations to the northeast (adjacent to Parcel B) between 2 and 3 feet bgs. Groundwater - BTEX compounds are found in exceedance of NYSDEC Class GA Groundwater Quality Standards and Guidance Values (GQSGV) in the western (Parcel C), central (Parcel D), and eastern (Parcel E) portions of the Site. PAHs are found in exceedance of GQSGVs in the central (Parcel D), and eastern (Parcel E) portions of the Site. Cyanide has been observed in exceedance of GQSGVs in one location on the eastern portion of the Site (Parcel E). BTEX compounds, PAHs, and cyanide have been observed in exceedance of GQSGVs at offsite locations to the southwest (west of Parcel F). Phenol has been observed in exceedance of GQSGVs at one offsite location to the southeast (east of Parcel F).

Site Class Desc (GIS): No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any

actions were taken to investigate or remediate the site.

Site Class Desc: No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

Assess DOH:

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

The Kent Avenue Generating Station Site is located in Brooklyn, NY. It is along the waterfront (Wallabout Channel, trib to East River) on the west side of Kent Avenue, south of the intersection with Division Avenue. The site is the location of the former Kent Avenue Generating Station, which has since been demolished. Excepting activities related to building demolition and property rehabilitation, with respect to current use the site is considered inactive. The uses of the surrounding parcels are varied: across Kent Avenue is a NYC Park (Roberto Clemente Ballfield); immediately to the south is the Brooklyn Navy Yard 13 Acre Parcel Site (NYSDEC Site No. 224019A); immediately to the north across Division Avenue are commercial uses; properties to the northeast and to the southeast appear to have residential uses. Prior uses that appear to have led to site contamination include discharges during the period of operation of the power plant and on-site re-use of prior demolished structures as fill material. A number of environmental investigations of the property have occurred including a Phase II (2000) and other investigations focused on particular issues or areas of the site from 2006 to present. Reclassified to N. See V00732 - Kent Avenue Station Site. Work to be done under VCA Amendment.

Assessment:

The primary contaminants of concern at the site known at the time include PCBs, asbestos, various metals, petroleum constituents and PAHs. Investigations indicate SCG exceedances of PCB and petroeum compounds in sediments/ sludge contained in a large concrete structure (known as "the ash pit"); asbestos, metals and PAHs in subsurface soils/fill; and an area of groundwater petroleum contamination in the southwest corner of the property. The significance of the contamination needs to be determined.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: The East River Generating Station site (former East 14th Street Works) is located in Lower Manhattan, New York and is bounded by East 13th Street to the south and East 16th Street Service Center to the north, Avenue C to the west, and the FDR Drive to the East Site Features: With the exception of the ball field area, the entire site is either paved, covered by buildings, or has several feet of bluestone cover. Access to the entire facility is restricted, with internal operational areas such as substations and power generation areas further restricted to authorized workers. Current Zoning/Use(s): The site is now the location of various Con Edison facilities including the East River Generating Station (steam and steam-electric production plant), a Major Oil Storage Facility (MOSF), five electrical substations, a service center, an administration building, parking lots and recreational fields. Historical Uses: The Site has been used for utility generation and transmission for more then 100 years. In the early years of site operations, the blocks between FDR Drive and Avenue C and East 16th and East 14th Streets were the location of a manufactured gas plant (MGP). In addition, a separate MGP operation was situated on the property to the south of the site, along FDR Drive. Con Edison has investigated both of these FMGP sites under separate programs. Geology & Hydrogeology: Overburden on site ranges in thickness from approximately 80 feet to 130 feet and overlies an uneven bedrock surface. The overburden consists of three main units, listed from the ground surface down: Fill, Alluvial clay and silt with sand and organics, and Glacial sands and clay/silt beds. The fill consists of silty sand with wood, brick and concrete fragments(gravel to cobble size), cinders and incinerator ash fill, and glass fragments. The bedrock formation beneath the Site is the Manhattan Schist. Groundwater is present beneath the Site in the overburden under unconfined conditions at depths ranging from approximately five to eight feet below grade. Groundwater in this area is not used for potable purposes. Groundwater flow across the site is to the southeast, with some localized variations due to the presence of extensive underground utilities. Tidal influences on groundwater flow are not significant.

Assessment:

Some low level MGP contamination has been found at depth below the ball fields, but no contaminated material is found near the ground surface.

Site Class Desc (GIS): This classification is assigned to a site at which:

a. the disposal of hazardous waste has been confirmed and the presence of such hazardous waste or its components or breakdown products represents a significant threat to public health or the environment: or
b. hazardous waste disposal has not been confirmed, but the site has been listed on the Federal National Priorities List (NPL).

Site Class Desc: This classification is assigned to a site at which:

a. the disposal of hazardous waste has been confirmed and the presence of such hazardous waste or its components or breakdown products represents a significant threat to public health or the environment: or
b. hazardous waste disposal has not been confirmed, but the site has been listed on the Federal National Priorities List (NPL).

Assess DOH: Remedial actions are complete and measures are in place to control the potential for coming in contact with contamination remaining at the site.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

Location: This site is on the north-east portion of the Brooklyn Navy Yard Development Corp. Industrial Park (BNYDC) and is a portion of the site (224019A) which had been operated by the NYC Sanitation Department is currently being redeveloped by Steiner Studios into a new roadway and elevated parking lot. The site is bordered by the East River on the north and west, by Kent Avenue on the east, and by the rest of BNYDC site on the south. Site Features: The 13-Acre parcel site includes the former Building 419 transformer substation area and two former drum storage areas. The site surrounds Wallabout Channel (barge basin)on three sides. The 224019A site deals with only 5.89 acres of the parcel, and excludes the former coal gasification plant known to have existed at the remaining 3.5 acres of the site. Those 3.5 acres have been designated as a separate site and given the ID number of 224019B. Also excluded from the original 13 acres are an approximate 3.61 acres of land under water, which have been excluded from the original site definition. Current Zoning and Land Use: The site is zoned for commercial and industrial uses, and is currently used for vehicle and materials storage. The surrounding area includes industrial, commercial and residential uses. Past Use of the Site: The site was used in support of ship building and repair activities. Support actions included waste storage at the two drum storage areas, and power distribution at the transformer substation. The railroad siding area was used for the loading and unloading of materials and fuels. These uses, as well as historic filling practices throughout the waterfront, have led to demonstrable levels of lead, Polycyclic Aromatic Hydrocarbons (PAHs) and/or polychloriinated biphenyls (PCB) contamination. Site Geology and Hydrogeology: The site is underlain by historic fill to a depth of approximately fifteen feet in many areas. Beyond the fill material is a silt sand, then sand unit down to a depth of approximately 100 feet where the Gardiners Clay is found. Groundwater occurs at depths of approximately five feet, and flow is generally to the north and west towards the East River.

Assessment:

Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were semi-volatile organic compounds and PCBs in the soil. Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination in the soil is being managed under a Site Management Plan.

Site Class Desc (GIS): Potential: This classification is used for sites where preliminary information indicates that a site may have contamination that makes it eligible for consideration for placement on the Registry of Inactive Hazardous Waste Disposal Sites (commonly referred to as the list of State Superfund Sites). Further information and/or investigation, in the form of a site characterization, is needed to determine if a Class P site qualifies for listing of the site on the Registry. Generally, to qualify for placement on the Registry, there must be evidence that hazardous waste was disposed on the site and that any resulting contamination presents a significant threat (or reasonably foreseeable threat) to public health or the environment. Class P sites are not listed on the Registry and many are eventually found to not qualify for Registry listing. Sites that do not qualify for listing are typically then reclassified to a "Class N" site.

Site Class Desc: Potential: This classification is used for sites where preliminary information indicates that a site may have contamination that makes it eligible for consideration for placement on the Registry of Inactive Hazardous Waste Disposal Sites (commonly referred to as the list of State Superfund Sites). Further information and/or investigation, in the form of a site characterization, is needed to determine if a Class P site qualifies for listing of the site on the Registry. Generally, to qualify for placement on the Registry, there must be evidence that hazardous waste was disposed on the site and that any resulting contamination presents a significant threat (or reasonably foreseeable threat) to public health or the environment. Class P sites are not listed on the Registry and many are eventually found to not qualify for Registry listing. Sites that do not qualify for listing are typically then reclassified to a "Class N" site.

Assess DOH: As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). Details

Description:

Location: The Nassau Gas Works site is located in an urban area in Brooklyn. It is located at the northwest corner of Kent Avenue and Washington Avenue. The original site footprint ran from Kent Avenue, south and west, under the current Wallabout Channel. Site Features: The main site features are a salt storage barn on one side of the site. The rest of the site is flat and used as vehicle parking for the NYC Department of Sanitation. Current Zoning/Use: The site is zoned commercial and is currently used by the NYC Department of Sanitation to park vehicles and store road salt. The surrounding parcels are used for a combination of commerical and multi-unit residential. Past Use of the Site: The site was originally a manufactured gas plant on the far Eastern edge of the Navy Yard. The site is contaminated with MGP tar which is acting as a source of VOCs and SVOCs. This site was originally the second operable unit of the Brooklyn Navy Yard class 2 site (224019A). Site Geology and Hydrogeology: The site is underlain by a 5 to 10 foot layer of fill. Under that are intermingled layers of silt and sand down to roughly 100 feet below grade. Beneath the silt and sand is a clay confining unit. Groundwater at the site is roughly 8' below grade and flows radially out from the north corner of the site to the southwest, south, and southeast.

Assess ENV:

Nature and Extent of Contamination: The main contaminant is MGP tar that has been found at depths exceeding 80 feet below grade and has migrated under the adjacent Wallabout Channel Barge Basin and the eastern end of the Brooklyn Navy Yard. The tar is the source of soil and groundwater contaminants which include VOCs and SVOCs. The soil contamination is found in the same areas as the tar contamination. Contaminants exceed the commercial use SCOs, e.g., benzene was found at a maximum concentration of 1,500 ppm and naphthalene was found at a maximum concentration of 7,600 ppm. The groundwater is contaminated with VOCs. The shallow groundwater contamination extends to the Wallabout Channel. However, the deep groundwater contamination extends almost another 500 feet southwest of the site limit, with toluene found at 37 ppb. There is no evidence of sediment impacts to the Wallabout Channel Barge Basin or the adjacent basins of the Brooklyn Navy Yard. Special Resources Impacted/Threatened: A Fish and Wildlife Resources Impact Analysis was performed and it was determined that no special resources were being threatened or impacted by site related contamination.

The surrounding parcels are used for a combination of commerical and multi-unit residential. Past Use of the Site: The site was originally a manufactured gas plant on the far Eastern edge of the Navy Yard. The site is contaminated with MGP tar which is acting as a source of VOCs and SVOCs. This site was originally the second operable unit of the Brooklyn Navy Yard class 2 site (224019A). Site Geology and Hydrogeology: The site is underlain by a 5 to 10 foot layer of fill. Under that are intermingled layers of silt and sand down to roughly 100 feet below grade. Beneath the silt and sand is a clay confining unit. Groundwater at the site is roughly 8' below grade and flows radially out from the north corner of the site to the southwest, south, and southeast.

Assessment:

Nature and Extent of Contamination: The main contaminant is MGP tar that has been found at depths exceeding 80 feet below grade and has migrated under the adjacent Wallabout Channel Barge Basin and the eastern end of the Brooklyn Navy Yard. The tar is the source of soil and groundwater contaminants which include VOCs and SVOCs. The soil contamination is found in the same areas as the tar contamination. Contaminants exceed the commercial use SCOs, e.g., benzene was found at a maximum concentration of 1,500 ppm and naphthalene was found at a maximum concentration of 7,600 ppm. The groundwater is contaminated with VOCs. The shallow groundwater contamination extends to the Wallabout Channel. However, the deep groundwater contamination extends almost another 500 feet southwest of the site limit, with toluene found at 37 ppb. There is no evidence of sediment impacts to the Wallabout Channel Barge Basin or the adjacent basins of the Brooklyn Navy Yard. Special Resources Impacted/Threatened: A Fish and Wildlife Resources Impact Analysis was performed and it was determined that no special resources were being threatened or impacted by site related contamination.

Site Class Desc (GIS): No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

Site Class Desc: No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

Assess DOH: As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

Source of Data: Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

The site has transferred to the BCP and is being tracking under site #C224168.

Assessment:

Additional investigation will be needed in order to define the nature and extent of the contamination.

Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

Description:

The site did not qualify for addition to the Registry of Inactive Hazardous Disposal Sites. This site was listed in the Eckhardt subcommittee report as a disposal site. Investigation by the NYSDEC Regional offices indicate that this is an industrial operation to recycle, recover and refurbish drums and that no apparent disposal of hazardous or toxic waste have occurred here.

Assessment:

Map Key	Number of Records	Direction	Distance (mi/ft)	Elev/Diff (ft)	Site	DB

None known. No apparent disposal of significant quantities of any hazardous waste.

Describe the Site: This was formerly the site of a coal-gasification plant, purchased by Brooklyn Union at the turn of the century. One of the by-products produced was a hydrocarbon tar which was temporarily stored on-site. Ownership and use of the property since 1936 is unknown.

Describe the Threat:

The soil was possibly contaminated with trace amounts of hydrocarbon tar; impact probably reduced by time and excavation of soils.

Description of Events: DRIVER WAS AT AN INTERMEDIATE STOP MAKING A DELIVERY WHEN HE FOUND THAT A PAIL OF H/M HAD LEAKED ONTO THE TRAILER FLOOR. THE PAIL AND ANOTHER OF NON-REGULATED MATERIAL WERE LOADED ON THE LEFT SIDE TAIL END OF THE TRAILER. STRAPS WERE PLACED THROUGH THE HANDLES AND THE PAILS WERE SURROUNDED BY 2X2'S AND CHOCKED IN. SEVERAL NAILS THAT SECURED THE CHOCKS WERE NOT HAMMERED IN ALL THE WAY. DURING TRANSIT THE PAILS BOUNCED ONTO THE NAIL HEADS CAUSING THEM TO PUNCTURE AND TO LEAK. THE COMPANY AT THE LOCATION OF THE INCIDENT HAS ITS OWN IN-HOUSE HAZARDOUS MATERIALS TEAM WHO ASSISTED THE DRIVER. THEY ACCEPTED THE HIS CLEANUP MATERIALS FOR DISPOSAL. BOTH THE DAMAGED PAILS WERE SECURED TO A PALLET AND TAKEN TO THE CARRIER'S NEARBY FACILITY TO BE HELD FOR THE SHIPPER'S INSTRUCTIONS.

Preparer:	David K. Harrington(pmb) Env. Engineer 1 NYSDEC August 4, 1994
Nominated by:	
Describe the Site:	In 1989, this site was a vacant lot awaiting construction of low income housing by the New York City Housing Authority(NYCHA). The lot was previously occupied by various apartment houses and light industry such as assembly and fabrication, scrap metal storage, and auto maintenance. According to Brooklyn Buildings Department records, a cleaning fluid mixing and storage facility(Lightning Cleaner Company) utilized a 2500 gallon underground storage tank to store Solvasol #5, a xylene based solvent. The NYCHA attempted to excavate the tank in 1989, but could not locate it. However, during excavation, soil contaminated with xylene and ethylbenzene was found, indicating that Solvasol #5 was either dumped or spilled on the ground in this location.
Describe the Threat:	

Leakage of a cleaning solvent from an underground storage tank has caused the surrounding soil to become contaminated with xylene and ethylbenzene
(the primary ingredients in Solvasol #5). The extent of contamination in the soil is unknown. It is also unknown whether the contaminants have leached to
the groundwater, which is located within a sole source aquifer.

Describe the Site: A former coal-gasification plant was purchased by BUG Co. During the operations as a CG plant, a hydrocarbon tar was produced and stored on site until sold for use in roofing or road surfacing. The plant was decommissioned in 1895, all remaining tars were reportedly removed and the facility was razed. Ownership and use of the property since 1895 is unknown.
Describe the Threat:

The soil is possibly contaminated with trace amounts of hydrocarbon tar. (impact probably reduced due to time and excavation of soils) Leachate into groundwater is not a major concern because area groundwater is not a potable supply.

Details

Description:

Location: The Peoples Works Manufactured Gas Plant (MGP) site is located on three parcels and is comprised of 2 acres of land located between South 10th and South 11th Streets on the west side of Kent Avenue in Brooklyn, NY, Kings County. Site Features: The site is located along the Wallabout Channel, near the East River. The site slopes gently towards the river. The site is entirely covered by paved areas and buildings with concrete slab floors. The site is enclosed by lockable chain-link fencing and is monitored by security personel. Multi-unit residential housing (condominiums) are present north of the Site; Kent Avenue, multi-unit residential housing, and commercial properties are located east; commercial properties are located south; and the East River and Wallabout Channel are located west of the Site. Current Zoning/Uses: The site is zoned for commercial and industrial use. The current land use onsite is commercial. It is located in a mixed industrial, commercial, and residential area. Past Use of the Site: An 1887 Sanborn map shows a manufactured gas plant (MGP) known as the Peoples Gas Light Company operating on the site. By 1904 the MGP was no longer operating at the site. MGPs such as this converted coal and/or petroleum products to a flammable gas which was used in the surrounding community in much the same way that natural gas is used today. In 1999, LILCO and Brooklyn Union Gas merged to form KeySpan. National Grid acquired KeySpan in 2008 and currently maintains ownership of the site. Site Geology and Hydrogeology: Site is covered with up to 5 feet of fill. This material is typical urban fill, characterized by bricks and gravel. Below the fill materials are sands and silts. Near the river, a wedge of silts and clays was noted, underlain by a peat layer. This lithology reflects palustrine deposits along the East River channel, likely overlain by glacial sands and fill during development of the East River waterfront. Bedrock beneath the Site is the Ravenswood Formation gneiss, and is estimated to be approximately 100 feet bgs.

Assess ENV:

The primary contaminant of concern for the site is coal tar. Materials such as coal tar are commonly referred to as Non-Aqueous Phase Liquids (NAPL). Coal tar contains both volatile and semi-volatile organic compounds. Specific volatile organic compounds (VOCs) of concern are benzene, toluene, ethylbenzene and xylenes (BTEX). Specific semi-volatile organic compounds of concern are the polycyclic aromatic hydrocarbons (PAHs).

Assess DOH:

Since the site is fenced and covered by asphalt or concrete, people will not come into contact with site-related soil and groundwater contamination unless they dig below the surface. People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by this contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. The potential exists for people to inhale site contaminants in indoor air due to soil vapor intrusion in the current building and any future on-site building development and occupancy.

Caller Remark:			

CALLER STATES THAT THERE WAS A TANK ABANDONMENT 03/19/2004. CALLER HAS TEST RESULTS INDICATING SOIL CONTAMINATION.

DEC Remark:

Sangesland spoke to Steve Saltzman. A tank was pulled at the site 4 years ago and the report from the consultant said the owner should call into the DEC for a spill number. The owner never read the report and didn't call in a spill. Now the building is being refinanced and the bank read the report and is now asking for a copy of a closure letter. Owner needs to submit the report they have and DEC will determine if additional work is required. 12/3/08-Vought-Left message for Ken Saltzman to return call to DEC with more info. Vought received callback from Steve Saltzman and tank was abandoned in 2004 (possibly fuel oil UST) and SVOCs detected in sample analyticals. Saltzman will return call to Vought with fax number. Consultant that performed work was Hydro Tech. As per Saltzman, CSL sent to: Mr. Jay Weitzman False Alarm Limited 816 Avenue I Brooklyn, NY 11230 Fax: (732) 382-2270 12/3/08-Vought-Received email copy of Hydro Tech report dated 4/8/04. Report entitled Tank Abandonment . Tank was a 3000-gallon #2 fuel oil UST located in the western interior portion of the onsite building. Tank was abandoned in place via inert foam. GPR survey performed and four soil probes were performed. Soil borings samples at 2 foot intervals down to groundwater at 13'bg. No visual or olfactory evidence of petroleum contamination. Four soil samples analyzed via 8260/8270 show no TAGM 4046 Required Soil Cleanup Objective exceedences other than PAH exceedences attributable to fill material. Vought called and left message for Saltzman to return call to DEC with future use of property including possible redevelopment and requirement of installation of vapor barrier and SSDS. 12/4/08-Vought-Received phone message from Steve Saltzman that property is not being sold but is rather being refinanced and as such property use and foundation will not change and hence vapor barrier and SSDS not required. Spill closed and NFA sent to above address.

VAULT 1433 FAILED - 8 PPM 11-10-99

DEC Remark:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was FOLEY Con Ed e2mis #148227: 5-5-03 10:55HRS K. DAVIS 16852 (NET) REPORTS, FOUND APPROX 100 GALLONS OF HEAVY OIL ON 1000 GAL OF WATER. AT THIS TIME OIL APPEARS TO BE CONTAINED AND ALSO APPEARS THAT NO SEWERS OR WATERWAYS WERE AFFECTED. OIL WAS DISCOVERED WHILE PUMPING ADJACENT V4048. NO FIRE OR SMOKE OR PRIVATE PROPERTY INVOLVED AND NO INJURIES WERE RELATED TO SPILL AND NO WEATHER CONDITIONS CONTRIBUTED TO HAZARD OF SPILL. SUMP PUMP IN VAULT, AND PUMP NOT RUNNING. FEEDER INVOLVED IS 6B44. ENV STOP TAG# 13474 WAS PLACED. THE STANDING WATER THAT IS PRESENT HAS NO MOVEMENT . THERE IS NO SEWER CONNECTION, AND A SUMP IS PRESENT. ONE LIQUID SAMPLE WILL BE TAKEN FROM STRUCTURE. HISTORICAL RECORDS INDICATE 8PPM 11/10/99. UNABLE TO PRESSURE TEST VAULT BECAUSE FEEDER IS STILL ALIVE AND THE AMOUNT OF WATER. THIS JOB WILL BE TREATED AS A 50-499, ENV OPS CREW WAS SENT TO LOCATION ALONG WITH A SPILL VAN. ALSO OVER 50 TANKER WAS ORDERED. EPA # NYP 004 110 672. 12:45HRS R. JAMES REPORTS, WHILE UNDER 50 TANKER WAS DRAINING V4048, THEY NOTICED LIQUID MOVEMENT IN V1433 THEREFORE WE WILL CONTINUE DRAINING THE STRUCTURE WITH THE TANKER ON LOCATION. CLEANUP OF TANKER AND DISPOSAL OF LIQUIDS WILL BE BASED ON OIL RESULTS THAT WERE TAKEN IN THE ADJACENT VAULTS. OIL WAS ALSO FOUND IN V2597 AND V1856.VAULT 4048

IS BEING DRAINED. THE LIQUID LEVEL IN ALL VAULTS IS GOING DOWN. THE ESTIMATED OIL IS CHANGED TO THE FOLLOWING, A TOTAL OF 65 GALLONS IN THE THREE VAULTS (V1856,V2597, V1433) Update - 5/5/03 1500hrs R. James Env. ops mgr reports dep inspector Eves St. Jean arrived on location 1300hrs. Was shown spill area and told of clean up plans. At 1430hrs <50 tanker pulled off location and will handle liquids removed as >50 a new > 50 tanker will be sent out. 15:10HRS K. DAVIS (NET) REPORTS, THE TAG FROM VAULT 4048 FROM OLD INCIDENT 147277 WILL BE REMOVED AND A NEW TAG WILL BE PLACED WITH THE SAME TAG# 29637 AS THE THREE VAULTS FROM THIS INCIDENT (V2597,V433,V1856) 5/6/03=0350HRS O.S. B.BROWN ENVIR OPPS REPORTS PARTIAL CLEANUPS OF ALL VAUILTS ARE DONE . NETWORKS TO REPLACE UNIT.ENVIR TAG#13474 REMAINS. Update on 5/6/03 by R.James: R. James called transportation at 1600 on 5/5/03 to inform the on duty Tanker supervisor that B/Q will be taking samples of the oil in the structures from which the <50 tanker drew oil. We will also take a sample from within any transformer that is found to be leaking. The transformer in vault 1856 was found to be leaking. Transportation informed R. James that the oil would not be discharged from the tanker until they the next day. They took their own oil samp0les from the tanker. All results from the structure and the transformer returned less than 50 PPM pcbs (see results above and below).R. James informed Transportation Supervisor J. Poje of the sample results at 0700 on 5/6/03 and e-mailed him those results. THEY HAVE A 300 GALLON SPILL IN THE MANHOLE UNKNOWN WHERE IT CAME FROM.SAMPLE TAKEN FOR PCB'S CON ED SPILL-127499

DEC Remark:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was ENGELHARDT 9/17/99 - Saccacio - Called ConEd and they told me the spill was 3 gallons not 300 gallons. Con ed e2mis notes: 8/31: 10:31 spoke to Stan Piszczatowski, he is to call back with more info. 11/30: emailed ERT's for more info. con ed e2mis notes: approx 3 gallons of unknown oil on 300 gallons of water. test results: <1ppm Job incompleted added slicks to hole. Cleanup completed. Note: Liquid waste was removed by Astoria under 50 ppm tanker. Solid waste removed by Vactor. Structure double washed with slix. solid waste was dumped at 3rd ave waste water treatment facility. Liquid waste was dumped at astoria wwt facility.

UPDATING LEAK FROM PIPE LINE WHICH BUBBLED UP TO STREET - NOTIFIED DEPT & FIRE - REMOVED SOIL WILL GIVE TO SIGONA.

DEC Remark:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was O'CONNELL 5/18/93: AAA CLEANED UP OIL. DISPOSED OF CONTAMINATED SOIL EPOXY PIPELINE BACKFILLED. SPILL CLOSED BY TOMASELLO. 4/2/03: SPILL REOPENED BY O'CONNELL. APPENDIX B SITE NO. 25/45. 2/10/05: E-mail from Matthew Madsen, EH&S Remediation project manager: During excavation to uncover the above referenced pipeline, evidence of fuel oil contamination in the soil was discovered between North 3rd and North 4th Streets. This is the location of a known historic release (DEC Spill #9211325). In accordance with the approved Construction Plan for this project, since this is a known spill location, this has not been called into the DEC hotline. The contractor is currently only excavating the overburden soil from above the pipeline, so the extent of the impacted soil is not currently known. We anticipate beginning removal of the pipeline itself next week. I'll keep you updated on the status once we begin the removal of the impacted material. (JHO) Update 6/9/06 Spill closed based on final site investigation report located in eDocs App. B Site 25. (SKA)

transformer in vault leaking material due to faulty equipment clean up unk sample taken coned#128344 pcb test done on 12/10/98 test results 410 ppm no callback necessary

DEC Remark:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was O'CONNELL Con Ed e2mis notes: approx 15 gallons of oil on 6 of dirt, in TM 851, unable to see any defects at this time, unable to pressure testdue to conditions. 1-sample taken, records show 410PPM dated 12/10/98. pressure tested unit, unit not holding pressure, leak appears to be coming from groung switch handle shaft, unit is 15 gallons low on oil. No records to show any sewer connections. We have to deenegerize feeder which should be between 7 and 8pm, and will remove transformer monday 10-11-99. DEP is issuing a commissioners order requiring a complete cleanup of the vault by 8:00pm 10-10-99. Also they are issuing a notice of violation for the transformer not having a PCB label. E&S crew arrived at 14:50 hrs to begin excavation. 16:30 ERT reports, chem lab gave ert a verbal that oil sample is over 50ppm, lab seq # 99-10651 370 ppm. SPACE 49874 Dep Nancy Barsoum is back on location ans is very satisfied, she will back tomorrow afternoon approx 5:00pm, also transformer is in the prosess of being drained. removed 460 gallons from transformer, draining is completed. EPA# NYP004044467. transformer in tm851 removed. 9 barrells of solids removed. found clogged drain in nwc of structure--no discharge--sealed drain perm. with garton plug, steamed and double washed with bg-760 and slix, cannont replace transformer at this time due to structrual damage to walls. DEC Inspector notes: Duplicate of spill #9908351

Site Class Desc:

No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

Assess DOH:

Source of Data:

Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State".

Description:

The site did not qualify for addition to the Registry of Inactive Hazardous Disposal Sites. This site was used for disposal from 1924-1964 and is currently not in use. At the time of use a chemical company owned the property. The chemical composition of waste disposed of at the site includes miscellaneous waste material. Methods of disposal include mixed industrial waste landfill and other uncategorized methods. Site has been investigated by the region in 1984. The site was listed in the Eckhardt Committee Report. Site has since been cleaned up and paved.

Site Name: Peoples Works

Site Name (GIS): Peoples Works

Site Class Desc (GIS): No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

Site Class Desc: No Further Action at this Time: Sites are given a classification of "N" when:

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

Appendix: Database Descriptions

Environmental Risk Information Services (ERIS) can search the following databases. The extent of historical information varies with each database and current information is determined by what is publicly available to ERIS at the time of update. ERIS updates databases as set out in ASTM Standard E1527-13, Section 8.1.8 Sources of Standard Source Information:

"Government information from nongovernmental sources may be considered current if the source updates the information at least every 90 days, or, for information that is updated less frequently than quarterly by the government agency, within 90 days of the date the government agency makes the information available to the public."

Standard Environmental Record Sources

Federal

National Priority List: NPL

National Priorities List (Superfund)-NPL: EPA's (United States Environmental Protection Agency) list of the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action under the Superfund program. The NPL, which EPA is required to update at least once a year, is based primarily on the score a site receives from EPA's Hazard Ranking System. A site must be on the NPL to receive money from the Superfund Trust Fund for remedial action.

Government Publication Date: Jun 11, 2019

National Priority List - Proposed: PROPOSED NPL

Includes sites proposed (by the EPA, the state, or concerned citizens) for addition to the NPL due to contamination by hazardous waste and identified by the Environmental Protection Agency (EPA) as a candidate for cleanup because it poses a risk to human health and/or the environment.

Government Publication Date: Jun 11, 2019

Deleted NPL: DELETED NPL

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Government Publication Date: Jun 11, 2019

SEMS List 8R Active Site Inventory: SEMS

The Superfund Program has deployed the Superfund Enterprise Management System (SEMS), which integrates multiple legacy systems into a comprehensive tracking and reporting tool. This inventory contains active sites evaluated by the Superfund program that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The Active Site Inventory Report displays site and location information at active SEMS sites. An active site is one at which site assessment, removal, remedial, enforcement, cost recovery, or oversight activities are being planned or conducted.

Government Publication Date: Jun 11, 2019

SEMS List 8R Archive Sites: SEMS ARCHIVE

The Superfund Enterprise Management System (SEMS) Archived Site Inventory displays site and location information at sites archived from SEMS. An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time.

Government Publication Date: Jun 11, 2019

Inventory of Open Dumps, June 1985: ODI

The Resource Conservation and Recovery Act (RCRA) provides for publication of an inventory of open dumps. The Act defines "open dumps" as facilities which do not comply with EPA's "Criteria for Classification of Solid Waste Disposal Facilities and Practices" (40 CFR 257).

Government Publication Date: Jun 1985

Comprehensive Environmental Response, Compensation and Liability Information System - CERCLIS: CERCLIS

Superfund is a program administered by the United States Environmental Protection Agency (EPA) to locate, investigate, and clean up the worst hazardous waste sites throughout the United States. CERCLIS is a database of potential and confirmed hazardous waste sites at which the EPA Superfund program has some involvement. It contains sites that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The EPA administers the Superfund program in cooperation with individual states and tribal governments; this database is made available by the EPA.

Government Publication Date: Oct 25, 2013

EPA Report on the Status of Open Dumps on Indian Lands: IODI

Public Law 103-399, The Indian Lands Open Dump Cleanup Act of 1994, enacted October 22, 1994, identified congressional concerns that solid waste open dump sites located on American Indian or Alaska Native (AI/AN) lands threaten the health and safety of residents of those lands and contiguous areas. The purpose of the Act is to identify the location of open dumps on Indian lands, assess the relative health and environment hazards posed by those sites, and provide financial and technical assistance to Indian tribal governments to close such dumps in compliance with Federal standards and regulations or standards promulgated by Indian Tribal governments or Alaska Native entities.

Government Publication Date: Dec 31, 1998

CERCLIS - No Further Remedial Action Planned: CERCLIS NFRAP

An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time. The Archive designation means that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL). This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Government Publication Date: Oct 25, 2013

CERCLIS Liens: CERCLIS LIENS

A Federal Superfund lien exists at any property where EPA has incurred Superfund costs to address contamination ("Superfund site") and has provided notice of liability to the property owner. A Federal CERCLA ("Superfund") lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Jan 30, 2014

RCRA CORRACTS-Corrective Action: RCRA CORRACTS

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. At these sites, the Corrective Action Program ensures that cleanups occur. EPA and state regulators work with facilities and communities to design remedies based on the contamination, geology, and anticipated use unique to each site.

Government Publication Date: Jun 3, 2019

RCRA non-CORRACTS TSD Facilities: RCRA TSD

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. This database includes Non-Corrective Action sites listed as treatment, storage and/or disposal facilities of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Government Publication Date: Jun 3, 2019

RCRA Generator List: RCRA LQG

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Large Quantity Generators (LQGs) generate 1,000 kilograms per month or more of hazardous waste or more than one kilogram per month of acutely hazardous waste.

Government Publication Date: Jun 3, 2019

RCRA Small Quantity Generators List: RCRA SQG

RCRA Info is the EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Small Quantity Generators (SQGs) generate more than 100 kilograms, but less than 1,000 kilograms, of hazardous waste per month.

Government Publication Date: Jun 3, 2019

RCRA Conditionally Exempt and Very Small Quantity Generators List: RCRA CESQG

RCRA Info is the EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Conditionally Exempt and Very Small Quantity Generators (VSQG and CESQG) generate 100 kilograms or less per month of hazardous waste, or one kilogram or less per month of acutely hazardous waste. Additionally, VSQG and CESQG may not accumulate more than 1,000 kilograms of hazardous waste at any time.

Government Publication Date: Jun 3, 2019

RCRA Non-Generators: RCRA NON GEN

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Non-Generators do not presently generate hazardous waste.

Government Publication Date: Jun 3, 2019

Federal Engineering Controls-ECs: FED ENG

Engineering controls (ECs) encompass a variety of engineered and constructed physical barriers (e.g., soil capping, sub-surface venting systems, mitigation barriers, fences) to contain and/or prevent exposure to contamination on a property. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Sep 20, 2018

Federal Institutional Controls- ICs: FED INST

Institutional controls are non-engineered instruments, such as administrative and legal controls, that help minimize the potential for human exposure to contamination and/or protect the integrity of the remedy. Although it is EPA's (United States Environmental Protection Agency) expectation that treatment or engineering controls will be used to address principal threat wastes and that groundwater will be returned to its beneficial use whenever practicable, ICs play an important role in site remedies because they reduce exposure to contamination by limiting land or resource use and guide human behavior at a site.

Government Publication Date: Sep 20, 2018

Emergency Response Notification System: ERNS 1982 TO 1986

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories.

Government Publication Date: 1982-1986

Emergency Response Notification System: ERNS 1987 TO 1989

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories.

Government Publication Date: 1987-1989

Emergency Response Notification System: ERNS

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Mar 21, 2019

The Assessment, Cleanup and Redevelopment Exchange System (ACRES) Brownfield Database: FED BROWNFIELDS

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties protects the environment, reduces blight, and takes development pressures off greenspaces and working lands. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Jan 11, 2019

FEMA Underground Storage Tank Listing: FEMA UST

The Federal Emergency Management Agency (FEMA) of the Department of Homeland Security maintains a list of FEMA owned underground storage tanks.

Government Publication Date: Dec 31, 2017

Petroleum Refineries: REFN

List of petroleum refineries from the U.S. Energy Information Administration (EIA) Refinery Capacity Report. Includes operating and idle petroleum refineries (including new refineries under construction) and refineries shut down during the previous year located in the 50 States, the District of Columbia, Puerto Rico, the Virgin Islands, Guam, and other U.S. possessions. Survey locations adjusted using public data.

Government Publication Date: Jul 17, 2018

Petroleum Product and Crude Oil Rail Terminals: BULK TERMINAL

List of petroleum product and crude oil rail terminals made available by the U.S. Energy Information Administration (EIA). Includes operable bulk petroleum product terminals located in the 50 States and the District of Columbia with a total bulk shell storage capacity of 50,000 barrels or more, and/or the ability to receive volumes from tanker, barge, or pipeline; also rail terminals handling the loading and unloading of crude oil that were active between 2017 and 2018. Petroleum product terminals comes from the EIA-815 Bulk Terminal and Blender Report, which includes working, shell in operation, and shell idle for several major product groupings. Survey locations adjusted using public data.

Government Publication Date: Jan 18, 2019

LIEN on Property: SEMS LIEN

The EPA Superfund Enterprise Management System (SEMS) provides LIEN information on properties under the EPA Superfund Program.

Government Publication Date: Jun 11, 2019

Superfund Decision Documents: SUPERFUND ROD

This database contains a listing of decision documents for Superfund sites. Decision documents serve to provide the reasoning for the choice of (or) changes to a Superfund Site cleanup plan. The decision documents include Records of Decision (ROD), ROD Amendments, Explanations of Significant Differences (ESD), along with other associated memos and files. This information is maintained and made available by the US EPA (Environmental Protection Agency).

Government Publication Date: Jun 11, 2019

State

Hazardous Substance Waste Disposal Sites: HSWDS

A list of sites included in Hazardous Substance Waste Disposal Site Study reports made available by the New York Department of Environmental Conservation Division of Hazardous Waste Remediation. Provides information regarding the evolving status of hazardous substance waste disposal sites in New York.

Government Publication Date: Oct 24, 2003

Registry of Inactive Hazardous Waste Disposal Sites in New York State: SHWS

State-and tribal- equivalent CERCLIS. State Superfund Program (Inactive Hazardous Waste Disposal Site Remedial Program) (IHWDS) - Oversees the identification, investigation and cleanup of sites where consequential amounts of hazardous waste exist. These sites go through a process of investigation, evaluation, cleanup and monitoring that has several distinct stages. This list is made available by New York State Department of Environmental Conservation's State Superfund Program.

Government Publication Date: May 28, 2019

Delisted Registry of Inactive Hazardous Waste Disposal Sites in New York: DSHW

This database contains a Registry of Inactive Hazardous Waste Disposal sites which have been removed from New York Department of Environmental Conservation's Environmental Site Remediation database.

Government Publication Date: May 28, 2019

Vapor Intrusion Legacy Site List: VAPOR

New York is currently re-evaluating previous assumptions and decisions regarding the potential for soil vapor intrusion exposures at sites. As a result, all past, current, and future contaminated sites will be evaluated to determine whether these sites have the potential for exposures related to soil vapor intrusion. This list is made available by Department of Environmental Conservation's Vapor Intrusion Legacy Site List. This database is state equivalent CERCLIS.

Government Publication Date: Dec 31, 2018

Solid Waste Facilities and Landfills: SWF/LF

Solid Waste Information Management System (SWIMS) is an inventory containing active and inactive facilities throughout the state. This list is made available by Department of Environmental Conservation's Solid Waste Information Management System (SWIMS).

Government Publication Date: Jul 2, 2019

Leaking Storage Tanks: LST

This database contains records of chemical and petroleum spill incidents. They include leaking aboveground storage tanks or leaking underground storage tanks, with incidents of tank test failures, tank failures and tank overfill. This list is made available by New York State Department of Environmental Conservation's Spill Response Program.

Government Publication Date: Aug 21, 2019

Delisted Leaking Storage Tanks: DELISTED LST

List of Leaking Storage Tank sites which has been removed from New York Department of Environmental Conservation's Spill Response Program

Government Publication Date: Aug 21, 2019

Underground Storage Tanks- UST-Petroleum Bulk Storage (PBS): UST

Facilities within the Petroleum Bulk Storage (PBS) that have underground storage tanks. Underground petroleum storage facilities with a combined storage capacity over eleven hundred (1,100) gallons. This list is made available by NewYork Department of Environmental Conservation's Environmental Site Database Search.

Government Publication Date: Jun 26, 2019

The Bulk Storage Program Database - AST: AST

Facilities within the Petroleum Bulk Storage (PBS) that have aboveground storage tanks. Aboveground petroleum storage facilities with a combined storage capacity over eleven hundred (1,100) gallons. This list is made available by New York State Department of Environmental conservation's Petroleum Bulk Storage (PBS) program.

Government Publication Date: Jun 26, 2019

Delisted Storage Tanks: DELISTED TANKS

List of Storage Tank sites which has been removed from New York Department of Environmental Conservation's Environmental Site Database.

Government Publication Date: Jun 26, 2019

Petroleum Bulk Storage: TANKS

The Bulk Storage Program Database maintains the registrations of active and inactive bulk storage sites statewide. This database includes Petroleum Bulk Storage (PBS) tanks where no information is available on whether they are ASTs or USTs. This list is made available by Department of Environmental Conservation's Petroleum Bulk Storage (PBS) program.

Government Publication Date: Jun 26, 2019

Chemical Bulk Storage (CBS): CBS

Facilities that store regulated hazardous substances in underground tanks . "Hazardous substance" means any substance listed as hazardous or acutely hazardous in 6 NYCRR Part 597 or a mixture thereof. This list is made available by Department of Environmental Conservation's Chemical Bulk Storage (CBS) Program.

Government Publication Date: Jun 26, 2019

Major Oil Storage Facilities (MOSF): MOSF

In 1977, the New York State Legislature passed the "Oil Spill Prevention, Control and Compensation Act" (Article 12 of the Navigation Law). This law regulates all oil terminals and transport vessels operating in the waters of the State which have a storage capacity of 400,000 gallons or more. (Terminals and vessels with a capacity of 400,000 gallons or more are commonly referred to as major oil storage facilities or MOSFs). This list is made available by Department of Environmental Conservation's Major Oil Storage Facility (MOSF) Program.

Government Publication Date: Jun 26, 2019

Registry of Engineering Controls in New York State: ENG

Registry of Engineering Controls in New York State taken from the Environmental Site Remediation Database.

Government Publication Date: May 28, 2019

Registry of Institutional Controls in New York State: INST

Registry of Institutional Controls in New York State taken from the Environmental Site Remediation Database.

Government Publication Date: May 28, 2019

Voluntary Cleanup Agreements: VCP

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites. This list is made available by Department of Environmental Conservation's Voluntary Cleanup Program.

Government Publication Date: May 28, 2019

Environmental Restoration Program Listing: ERP

Environmental Restoration Program - Provides municipalities with financial assistance for site investigation and remediation at eligible brownfield sites. In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (Bond Act). Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. This list is made available by Department of Environmental Conservation's Environmental Restoration Program.

Government Publication Date: May 28, 2019

Brownfields Site List (Subset of Site Remediation): BROWNFIELDS

Brownfield Cleanup Program was developed to enhance private-sector cleanups of brownfields and to reduce development pressure on "Greenfields". A Brownfield site is real property, the redevelopment or reuse of which may be complicated by the presence or potential presence of a contaminant. Contaminants include hazardous waste and/or petroleum. This list is made available by Department of Environmental Conservation's Brownfield Cleanup Program.

Government Publication Date: May 28, 2019

Tribal

Leaking Underground Storage Tanks (LUSTs) on Tribal/Indian Lands: INDIAN LUST

LUSTs on Tribal/Indian Lands in Region 2, which includes New York and New Jersey. There are no LUST records in New York at this time.

Government Publication Date: Jan 28, 2016

Underground Storage Tanks (USTs) on Indian Lands: INDIAN UST

USTs on Tribal/Indian Lands in Region 2, which includes New York and New Jersey.

Government Publication Date: Apr 04, 2016

Delisted Tribal Leaking Storage Tanks: DELISTED ILST

Leaking Underground Storage Tank facilities which have been removed from the Regional Tribal LUST lists made available by the EPA.

Government Publication Date: Oct 14, 2017

Delisted Tribal Underground Storage Tanks: DELISTED IUST

Underground Storage Tank facilities which have been removed from the Regional Tribal UST lists made available by the EPA.

Government Publication Date: Oct 14, 2017

County

Cortland County Storage Tanks: CORTLAND TANKS

Listing of aboveground and underground storage tanks in Cortland County. *NYSDEC does not maintain the PBS registration records for this county.

Government Publication Date: Jun 4, 2019

Nassau County Storage Tanks: NASSAU TANKS

Listing of aboveground and underground storage tanks in Nassau County. This database does not include tanks of gasoline, diesel and kerosene. *NYSDEC does not maintain the PBS registration records for this county.

Government Publication Date: Apr 30, 2017

Rockland Storage Tanks: ROCKLAND TANKS

Listing of aboveground and underground storage tanks in Rockland County. *NYSDEC does not maintain the PBS registration records for this county.

Government Publication Date: Feb 2, 2017

Suffolk Storage Tanks: SUFFOLK TANKS

Listing of aboveground and underground storage tanks in Suffolk County. *NYSDEC does not maintain the PBS registration records for this county.

Government Publication Date: Jun 28, 2018

Westchester Storage Tanks: WSTCHST TANKS

Listing of aboveground and underground storage tanks in Westchester County.
*NYSDEC does not maintain the PBS registration records for this county.
Government Publication Date: May 10, 2019

Delisted County Records: DELISTED COUNTY

Records removed from county databases. Records may be removed from the county lists made available by the respective county departments because they are inactive, or because they have been deemed to be below reportable thresholds.
Government Publication Date: May 10, 2019

Additional Environmental Record Sources

Federal

PFOA/PFOS Contaminated Sites: PFAS NPL

List of sites where PFOA or PFOS contaminants have been found in drinking water or soil. Made available by the Federal Environmental Protection Agency (EPA).
Government Publication Date: Nov 15, 2018

Facility Registry Service/Facility Index: FINDS/FRS

The US Environmental Protection Agency (EPA)'s Facility Registry System (FRS) is a centrally managed database that identifies facilities, sites or places subject to environmental regulations or of environmental interest. FRS creates high-quality, accurate, and authoritative facility identification records through rigorous verification and management procedures that incorporate information from program national systems, state master facility records, data collected from EPA's Central Data Exchange registrations and data management personnel.
Government Publication Date: Apr 23, 2019

Toxics Release Inventory (TRI) Program: TRIS

The EPA's Toxics Release Inventory (TRI) is a database containing data on disposal or other releases of over 650 toxic chemicals from thousands of U.S. facilities and information about how facilities manage those chemicals through recycling, energy recovery, and treatment. One of TRI's primary purposes is to inform communities about toxic chemical releases to the environment.
Government Publication Date: Dec 31, 2017

Perfluorinated Alkyl Substances (PFAS) Releases: PFAS TRI

List of Toxics Release Inventory (TRI) facilities at which the reported chemical is a Per- or polyfluorinated alkyl substance (PFAS) included in the Environmental Protection Agency (EPA)'s consolidated PFAS Master List of PFAS Substances. The EPA's Toxics Release Inventory (TRI) is a database containing data on disposal or other releases of over 650 toxic chemicals from thousands of U.S. facilities and information about how facilities manage those chemicals through recycling, energy recovery, and treatment.
Government Publication Date: Dec 31, 2017

Hazardous Materials Information Reporting System: HMIRS

US DOT - Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA) Incidents Reports Database taken from Hazmat Intelligence Portal, U.S. Department of Transportation.
Government Publication Date: Jan 8, 2019

National Clandestine Drug Labs: NCDL

The U.S. Department of Justice ("the Department") provides this data as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy.
Government Publication Date: Jul 18, 2018

Toxic Substances Control Act: TSCA

The Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule.
The CDR enables EPA to collect and publish information on the manufacturing, processing, and use of commercial chemical substances and mixtures (referred to hereafter as chemical substances) on the TSCA Chemical Substance Inventory (TSCA Inventory). This includes current information on chemical substance production volumes, manufacturing sites, and how the chemical substances are used. This information helps the Agency determine whether people or the environment are potentially exposed to reported chemical substances. EPA publishes submitted CDR data that is not Confidential Business Information (CBI).
Government Publication Date: Jun 30, 2017

Hist TSCA: HIST TSCA
The Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule.
The 2006 IUR data summary report includes information about chemicals manufactured or imported in quantities of 25,000 pounds or more at a single site during calendar year 2005. In addition to the basic manufacturing information collected in previous reporting cycles, the 2006 cycle is the first time EPA collected information to characterize exposure during manufacturing, processing and use of organic chemicals. The 2006 cycle also is the first time manufacturers of inorganic chemicals were required to report basic manufacturing information.
Government Publication Date: Dec 31, 2006

FTTS Administrative Case Listing: FTTS ADMIN
An administrative case listing from the Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA) and Toxic Substances Control Act (TSCA), together known as FTTS. This database was obtained from the Environmental Protection Agency's (EPA) National Compliance Database (NCDB). The FTTS and NCDB was shut down in 2006.
Government Publication Date: Jan 19, 2007

FTTS Inspection Case Listing: FTTS INSP
An inspection case listing from the Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA) and Toxic Substances Control Act (TSCA), together known as FTTS. This database was obtained from the Environmental Protection Agency's (EPA) National Compliance Database (NCDB). The FTTS and NCDB was shut down in 2006.
Government Publication Date: Jan 19, 2007

Potentially Responsible Parties List: PRP
Early in the cleanup process, the Environmental Protection Agency (EPA) conducts a search to find the potentially responsible parties (PRPs). EPA looks for evidence to determine liability by matching wastes found at the site with parties that may have contributed wastes to the site.
Government Publication Date: Jun 11, 2019

State Coalition for Remediation of Drycleaners Listing: SCRD DRYCLEANER
The State Coalition for Remediation of Drycleaners (SCRD) was established in 1998, with support from the U.S. Environmental Protection Agency (EPA) Office of Superfund Remediation and Technology Innovation. Coalition members are states with mandated programs and funding for drycleaner site remediation. Current members are Alabama, Connecticut, Florida, Illinois, Kansas, Minnesota, Missouri, North Carolina, Oregon, South Carolina, Tennessee, Texas, and Wisconsin.
Government Publication Date: Nov 08, 2017

Integrated Compliance Information System (ICIS): ICIS
The Integrated Compliance Information System (ICIS) is a system that provides information for the Federal Enforcement and Compliance (FE&C) and the National Pollutant Discharge Elimination System (NPDES) programs. The FE&C component supports the Environmental Protection Agency's (EPA) Civil Enforcement and Compliance program activities. These activities include Compliance Assistance, Compliance Monitoring and Enforcement. The NPDES program supports tracking of NPDES permits, limits, discharge monitoring data and other program reports.
Government Publication Date: Nov 18, 2016

Drycleaner Facilities: FED DRYCLEANERS
A list of drycleaner facilities from the Integrated Compliance Information System (ICIS). The Environmental Protection Agency (EPA) tracks facilities that possess NAIC and SIC codes that classify businesses as drycleaner establishments.
Government Publication Date: May 29, 2018

Delisted Drycleaner Facilities: DELISTED FED DRY
List of sites removed from the list of Drycleaner Facilities (sites in the EPA's Integrated Compliance Information System (ICIS) with NAIC or SIC codes identifying the business as a drycleaner establishment).
Government Publication Date: May 29, 2018

Formerly Used Defense Sites: FUDS

Formerly Used Defense Sites (FUDS) are properties that were formerly owned by, leased to, or otherwise possessed by and under the jurisdiction of the Secretary of Defense prior to October 1986, where the Department of Defense (DoD) is responsible for an environmental restoration. This list is published by the U.S. Army Corps of Engineers.

Government Publication Date: Oct 23, 2018

Material Licensing Tracking System (MLTS): MLTS

A list of sites that store radioactive material subject to the Nuclear Regulatory Commission (NRC) licensing requirements. This list is maintained by the NRC. As of September 2016, the NRC no longer releases location information for sites. Site locations were last received in July 2016.

Government Publication Date: Nov 1, 2018

Historic Material Licensing Tracking System (MLTS) sites: HIST MLTS

A historic list of sites that have inactive licenses and/or removed from the Material Licensing Tracking System (MLTS). In some cases, a site is removed from the MLTS when the state becomes an "Agreement State". An Agreement State is a State that has signed an agreement with the Nuclear Regulatory Commission (NRC) authorizing the State to regulate certain uses of radioactive materials within the State.

Government Publication Date: Jan 31, 2010

Mines Master Index File: MINES

The Master Index File (MIF) contains mine identification numbers issued by the Department of Labor Mine Safety and Health Administration (MSHA) for mines active or opened since 1971. Note that addresses may or may not correspond with the physical location of the mine itself.

Government Publication Date: May 3, 2019

Alternative Fueling Stations: ALT FUELS

List of alternative fueling stations made available by the US Department of Energy's Office of Energy Efficiency & Renewable Energy. Includes Biodiesel stations, Ethanol (E85) stations, Liquefied Petroleum Gas (Propane) stations, Ethanol (E85) stations, Natural Gas stations, Hydrogen stations, and Electric Vehicle Supply Equipment (EVSE). The National Renewable Energy Laboratory (NREL) obtains information about new stations from trade media, Clean Cities coordinators, a Submit New Station form on the Station Locator website, and through collaborating with infrastructure equipment and fuel providers, original equipment manufacturers (OEMs), and industry groups.

Government Publication Date: Jun 26, 2019

Registered Pesticide Establishments: SSTS

List of active EPA-registered foreign and domestic pesticide-producing and device-producing establishments based on data from the Section Seven Tracking System (SSTS). The Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) Section 7 requires that facilities producing pesticides, active ingredients, or devices be registered. The list of establishments is made available by the EPA.

Government Publication Date: Sep 1, 2018

Polychlorinated Biphenyl (PCB) Notifiers: PCB

Facilities included in the national list of facilities that have notified the United States Environmental Protection Agency (EPA) of Polychlorinated Biphenyl (PCB) activities. Any company or person storing, transporting or disposing of PCBs or conducting PCB research and development must notify the EPA and receive an identification number.

Government Publication Date: Mar 20, 2019

State

Manufactured Gas Plants: MGP

A list of former Manufactured Gas Plants (MGP) made available by the New York Department of Environmental Conservation (NYSDEC). From the late 1800's to the mid 1900's, hundreds of manufactured gas plants across New York State supplied homes and industry with fuel. Former MGP structures such as gas holders, tar separators, wells, and tanks were often susceptible to spills and leaks. As a result, these structures were a significant source of contamination from the release of tar and other toxic by-products.

Government Publication Date: Jul 19, 2019

Spill Incidents Database: NY SPILLS

Spill Incidents Database has records dating back to 1978. This database contains records of chemical and petroleum spill incidents. The DEC Spill Response program receives and compiles reports of hazardous material spills occurring anywhere in New York State. These reports are submitted through the Spill Hotline and other mechanisms, and entered by DEC spill response staff into the state's official data base of Spill Incidents Reports. This list is made available by New York State Department of Environmental Conservation's Spill Response Program.

Government Publication Date: Aug 21, 2019

Per- and Polyfluoroalkyl Substances (PFAS): PFAS

A list of sites surveyed by the New York Department of Environmental Conservation to determine locations that manufacture, use, store, or release into the environment materials containing Per- and Polyfluoroalkyl Substances (PFAS). Per- and Polyfluoroalkyl Substances (PFAS) are a group of chemicals used to make fluoropolymer coatings and products that resist heat, oil, stains, grease, and water. Some PFAS are difficult to break down and persist in the environment that may cause harm to the public. This list is made available by the Department of Environmental Conservation of New York State.

Government Publication Date: Jan 16, 2019

Registed Dry Cleaner Facilities: DRYCLEANERS

The Division of Air Resources of the Department of Environmental Conservation (DEC) tracks all registered dry cleaner facilities.

Government Publication Date: May 2, 2019

Delisted Dry Cleaner Facilities: DELISTED DRYCLEANERS

Sites removed from the list of dry cleaner facilities registered with the Department of Environmental Conservation (DEC)'s Division of Air Resources.

Government Publication Date: May 2, 2019

Hazardous Waste Manifest - Facilities: NY MANIFEST

List of facilities located in New York that are included in the Hazardous Waste Manifest Data Downloads Location Address data file made available by the New York Department of Environmental Conservation (DEC), with which no manifests are associated. The Hazardous Waste Manifest Data made available by the NY DEC is compiled from hazardous waste manifest shipments to, from, or within New York State. The Bureau of Program Management, in the Division of Environmental Remediation, is responsible for maintaining hazardous waste manifest records.

Government Publication Date: Jan 14, 2019

Receivers from Hazardous Waste Manifests: REC MANIFEST

List of receiver facilities located in New York that are included in the Hazardous Waste Manifest Data Downloads Location Address data file made available by the New York Department of Environmental Conservation (DEC), which are identified as a receiver in associated manifests. The Hazardous Waste Manifest Data made available by the NY DEC is compiled from hazardous waste manifest shipments to, from, or within New York State. The Bureau of Program Management, in the Division of Environmental Remediation, is responsible for maintaining hazardous waste manifest records. Hazardous Waste Code Descriptions are from NY Part 371.4 (6 CRR-NY 371.4) Identification and Listings of Hazardous Waste, unless otherwise noted.

Government Publication Date: Jan 14, 2019

Generators from Hazardous Waste Manifests: GEN MANIFEST

List of generator facilities located in New York that are included in the Hazardous Waste Manifest Data Downloads Location Address data file made available by the New York Department of Environmental Conservation (DEC), which are identified as a generator in associated manifests. The Hazardous Waste Manifest Data made available by the NY DEC is compiled from hazardous waste manifest shipments to, from, or within New York State. The Bureau of Program Management, in the Division of Environmental Remediation, is responsible for maintaining hazardous waste manifest records. Hazardous Waste Code Descriptions are from NY Part 371.4 (6 CRR-NY 371.4) Identification and Listings of Hazardous Waste, unless otherwise noted.

Government Publication Date: Jan 14, 2019

Tier 2 Report: TIER 2

A list of Tier 2 facilities in the state of New York. This is a list of facilities which have reported hazardous substances provided by Homeland Security and Emergency Services.

Government Publication Date: Jan 28, 2019

Tribal

No Tribal additional environmental record sources available for this State.

County

New York City E-Designated Sites: E DESIGNATION

List of sites with an E-Designation - a NYC zoning map designation that indicates the presence of an environmental requirement pertaining to potential hazardous materials contamination, window/wall noise attenuation, or air quality impacts on a particular tax lot. The New York City Office of Environmental Remediation administers the E-Designation Environmental Review Program to avoid significant adverse impacts to human health or the environment through exposure to these hazards.

Government Publication Date: Mar 27, 2019

Definitions

Database Descriptions: This section provides a detailed explanation for each database including: source, information available, time coverage, and acronyms used. They are listed in alphabetic order.

Detail Report: This is the section of the report which provides the most detail for each individual record. Records are summarized by location, starting with the project property followed by records in closest proximity.

Distance: The distance value is the distance between plotted points, not necessarily the distance between the sites' boundaries. All values are an approximation.

Direction: The direction value is the compass direction of the site in respect to the project property and/or center point of the report.

Elevation: The elevation value is taken from the location at which the records for the site address have been plotted. All values are an approximation. Source: Google Elevation API.

Executive Summary: This portion of the report is divided into 3 sections:

'Report Summary'- Displays a chart indicating how many records fall on the project property and, within the report search radii.

'Site Report Summary'-Project Property'- This section lists all the records which fall on the project property. For more details, see the 'Detail Report' section.

'Site Report Summary-Surrounding Properties'- This section summarizes all records on adjacent properties, listing them in order of proximity from the project property. For more details, see the 'Detail Report' section.

Map Key: The map key number is assigned according to closest proximity from the project property. Map Key numbers always start at #1. The project property will always have a map key of '1' if records are available. If there is a number in brackets beside the main number, this will indicate the number of records on that specific property. If there is no number in brackets, there is only one record for that property.

The symbol and colour used indicates 'elevation': the red inverted triangle will dictate 'ERIS Sites with Lower Elevation', the yellow triangle will dictate 'ERIS Sites with Higher Elevation' and the orange square will dictate 'ERIS Sites with Same Elevation.'

Unplottables: These are records that could not be mapped due to various reasons, including limited geographic information. These records may or may not be in your study area, and are included as reference.

DEC REMARKS:

2/8/05, 3:43 PM - e-mail from Matthew Madsen, Con Ed project manager:
"Remember that 'spill' we talked about this morning at Kent and Metropolitan? Well, as it turns out, what they were looking at was foam glass insulation (the typical configuration for the pipeline inside to out is pipe, coal tar, expanded foam glass insulation, and then a canvass wrap as an outer layer). During pre-work test pitting and sampling, all of these layers have be sampled in the past. The foam glass and canvas are non-ACM and have not turned up any hazardous constituents (the pore space in the foam glass does contain hydrogen sulfides, so there is an odor when you cut or crush the stuff). Any way you slice it, there is no oil spill/release at this location." Close out. (JHO)

DEC REMARKS:

e2mis no. 129235:

P. Tokarz #97651 08-DEC-1999 1315 hours - At 1300 hours Robert Epps notified P. tokarz of sheen found in excavation at North 1st Street. Mr. Manfre was called and reported that the excavation (est. 2'x2'x5') had a sheen on the rainwater. Mr. Mar said the sheen was from a diesel Air Compreessor used to dig the hole. He stated that the rainwater washed the fuel from the air compressor to the excavation. The Air Compressor was removed and the excavation was emptied of the oily water by Vendor (LMS).

08-DEC-1999 phone message from Joe Manfre stating that cleanup completed at 13:55 hours

December 19, 1995

To: **Mr. Charles Durkin**
Vice President

From: **Mr. John Mucci**
Plant Manager
Ravenswood Station

Subject: Oil Spill Incident 10/30/95-

Following are details on a spill of approximately 25 gallons of #6 low sulphur fuel oil into the containment of Tank 500 at the North First Street Fuel Oil Facility

1) **DESCRIPTION OF THE INCIDENT:**
Contractor was water washing outside of Tank No. 500. At 17:05 the contractor reported to the North 1st Operator that a leak developed on Tank No. 500. Inspection of the tank revealed a ¼" hole about a foot from the bottom on the north east side.

2) **CONTAINMENT AND CLEANUP MEASURES:**
C.I.G was notified that there is a leak that is contained in the moat of Tank 500 and that approx. 25 gallons had spilled.

3) **PREVENTIVE MEASURES:**
Reevaluate the procedures for tank cleaning

4) **STATUS OF THE INCIDENT: Contained and cleaned**

5) **VISITORS ON THE SITE: Local Police, EMS, Local Fire Dept.,& Fire Dept. Hazwoper Unit, DEP, U.S.C.G, Miller Enviro., Allstate Power Vac., and Con Edison personnel.**

6) **CIG NOTIFICATION:**
The CIG (Devoti) was notified at 17:30 hours on Oct. 30, 1995

1.0 INTRODUCTION

Fenley and Nicol Environmental, Inc. (F&N) has been retained by Mr. Dan Rof of RGJ Contracting Co. (RGJ), Inc. to perform the documentation and closure of three 550-gallon, ten 1,080 gallon and one 1,500-gallon steel underground storage tanks at the Fyn Paint & Lacquer Co., Inc (Fyn Paint) facility, located at 33 North 1st Street, Brooklyn, New York *(hereafter referred to as "the site")*. Figure 1 provides a Site Location Map.

The site is registered with the New York State Department of Environmental Conservation (NYSDEC) as a Chemical Bulk Storage Facility (Facility ID# 2-000151). These tanks were utilized for the storage and mixing of chemicals utilized in the production of paints and thinners. It should be noted at this time that the site is a warehouse facility, and has a different street address then the main office of Fyn Paint. The official address of Fyn Paint is 229 Kent Avenue, Brooklyn, New York.

This closure report documents the removal and disposal of the above referenced tanks. This report has been prepared following guidelines set forth by the NYSDEC and the United States Environmental Protection Agency (USEPA).

1.1 Regulatory Requirements

Under the United States EPA Underground Storage Tank (UST) regulations (40 CFR, Part 280), an owner or operator, who is closing an underground tank storing a regulated substance, must inspect the site for leaks and spills and identify any soil or groundwater contamination. A regulated substance, as defined by 40 CFR, Part 280, includes all hazardous materials and petroleum products, except heating oil if used for on-site consumption.

If gasoline contamination is suspected, then the soil/water samples should be analyzed for Benzene, Toluene, Ethylbenzene, and Xylene (BTEX), and Methyl Tertiary Butyl Ether (MTBE), using EPA Methods 8020/602 respectively. If the

tank contained petroleum products other than gasoline, then soil samples should be analyzed for semi-volatile compounds, using EPA Methods 8270 and 8021.

Prior to the abandonment of the tanks, F&N was informed by Mr. Rof that he had notified the Petroleum Bulk Storage (PBS) unit of the NYSDEC regarding the abandonment.

F&N also contacted the NYSDEC regarding the tank abandonment. F&N was informed by Mr. Joe O'Connell that the NYSDEC does not have any guidelines or standards regarding the abandonment of chemical bulk storage tanks. Mr. O'Connell contacted Mr. Nick Kolak, the head of the Chemical Bulk Storage unit at the NYSDEC main office in Albany, regarding this situation. Mr. Kolak informed Mr. O'Connell that the supervision and handling of these tank abandonments would be determined by the local NYSDEC office on a case by case basis. Mr. O'Connell informed F&N that, at this time it had not been decided which unit or department in the NYSDEC Region 2 office (covering New York City) would be responsible for this type of tank abandonment. This information was obtained in a telephone conversation with Mr. O'Connell on January 28, 1999. Mr. O'Connell stated that he would inform F&N when a decision regarding this matter had been reached. As of this report, F&N had not received this information.

F&N also discussed testing parameters with Mr. O'Connell. Since authority within the NYSDEC regarding these tank abandonments had not been decided, Mr. O'Connell could not instruct F&N on which testing methods to use. However, Mr. O'Connell agreed with F&N's decision to utilized EPA Method 8260.

1.2 Regional Geology and Hydrogeologic Characteristics

The site is located in western Brooklyn, in the extreme western portion of Long Island. The site topography is essentially level and on-site surface elevation is

approximately 25 feet above mean sea level (U.S.G.S. Topographic Map, **Brooklyn** Quadrangle, 1979).

Long Island consists of a wedge-shaped mass of unconsolidated deposits which overlie ancient basement rock. The thickness of these deposits ranges from approximately 100 feet on the Island's north shore, to approximately 2,000 feet in some portions of the south shore. These deposits contain ground water which is the sole source of drinking water for some of the Island's 3.1 million residents.

The major landforms of Long Island of importance to the hydrologic system are the moraines and outwash plains, which originated from glacial activity. The moraines, which represent the farthest extent of the glacial advances, consist of till, a poorly sorted mixture of sand, silt, clay, gravel, and boulders. The till deposits are poorly to moderately permeable in most areas. The outwash plains lie to the south of the moraines. The plains were formed by the action of meltwater streams which eroded the headland material of the moraines, and laid down deposits of well-sorted sands, silts, and gravels. These deposits are moderately to highly permeable.

On-site lithology consists of Recent, Pleistocene, and Upper Cretaceous glacial deposits. The uppermost hydrogeologic unit is termed the Upper Glacial Aquifer. This aquifer encompasses the moraine and outwash deposits, in addition to some localized lacustrine, marine and reworked materials. The outwash plain portion of this unit is characterized by high horizontal hydraulic conductivity, however vertical hydraulic conductivity tends to be considerably less. Because the water table is located in the Upper Glacial deposits, this aquifer has been subjected to the degradation of water quality in many areas due to industrial activity.

Below the Upper Glacial aquifer lies the Raritan Formation. This formation consists of an upper unit and a lower unit. The upper unit, the Raritan Confining Unit, consists of layers of solid to silty clays with few lenses and layers of sands. The deposits are typically poorly to very poorly permeable.

Depth to groundwater at the subject site is approximately 20 to 25 feet below grade. The regional groundwater flow direction, as determined from the map of Water Table Altitude in Kings & Queens Counties, printed by the United States Geological Survey (USGS) (March, 1997), is to the west.

1.3 Site Description

The subject property is the square block bounded by Kent Avenue, Metropolitan Avenue, North 1st Street and River Street, in the Northside section of the Borough of Brooklyn, New York. The East River is located approximately 500 feet to the west of the site. The Willamsburg Bridge is located approximately 1,500 feet to the south. A Partial Site Plan is presented as **Figure 2**.

The site is occupied by a single story masonry building, with a partial loft, utilized for light industrial purposes. The building contains a small partial basement housing an aboveground oil tank and an oil burner. A concrete sidewalk surrounds the building. Fyn Paint produces paints and thinners for various applications. Some of the chemicals utilized are stored in underground storage tanks while other chemicals are stored in aboveground storage tanks or in 55-gallon drums.

Mr. Bill Feinstein, President, and Mr. Howard Simka, the chemist, of Fyn Paint, informed F&N that a total of eight underground storage tanks (USTs) were present at the site. Three 550-gallon USTs, identified as tanks 1 through 3, were located beneath the concrete floor of the western portion of the building. USTs #1 & 2 were utilized for the storage of methanol. UST #3 was utilized for the storage of varnish makers and painters naptha (VM&P). One 1,500-gallon UST and four 1,080-gallon USTs and were located beneath the concrete floor in the eastern portion of the building. According to Mr. Simka, the 1,500-gallon UST, which was identified as UST #4, was utilized for the mixing and dispensing of finished products. The 1,080 USTs, identified as USTs #5, #6, #7 and #8, were utilized, respectively, for the bulk storage of lacquer thinner, toluene or xylene, lacquer thinner and toluene.

2.0 WORK PERFORMED

Prior to the commencement of the tank abandonment, the proper permits were obtained by RGJ Contracting. RGJ also notified the NYSDEC Petroleum Bulk Storage Unit prior to the commencement of the work.

2.1 Tank Excavations

On January 13, 1999, a F&N crew, with the proper equipment, was on-site to begin the tank removal. Work was performed at the site over the course of the next two weeks (January 13, 14, 19, 20, 22, 25, 26, 27 and 28) to locate, excavate and access the tanks. A F&N geologist inspected the progress at the site on the January 14 and 25 to oversee and document the tank removal operation. There were no representatives of any regulatory agency present.

The first area excavated was the eastern floor of the building. Four overhead suction lines, associated with the tanks, entered the floor in the northern portion of the building. Five vent lines were identified exiting the concrete floor in the northeast corner of the building. These lines were followed until the USTs were encountered. Due to the inaccessibility of the area, a small bobcat-mounted hydraulic hammer and jackhammers were used to break-up the concrete floor. The soils covering the tanks were then removed by hand.

As the excavation was performed, the soils removed were stockpiled for later inspection by an F&N geologist for evidence of contamination. The soils exhibited olfactory evidence of contamination. A sample of these soils was taken for confirmatory laboratory analysis.

The tops of the storage tanks in the eastern area were encountered approximately 24 inches below grade. The tanks were discovered to be encased in concrete. After the tanks were uncovered any product remaining in them was removed by RGJ. The remaining chemical vapors were then removed by F&N utilizing dry ice. The tanks were then accessed utilizing the proper

equipment. Any remaining sludge and residue was then removed and the tanks were then wiped clean. After the tanks were cleaned they were filled with concrete. RGJ then temporarily filled the remainder of the excavation with the stockpiled contaminated soil and covered it with a thin coat of concrete. This was necessary to provide access to the rest of the building.

The western portion of the building was then excavated in the same manner as the western area. Three suction lines were identified in the southeastern portion of the building. These lines were followed until the tanks were encountered. The soils removed from the tank pit did not contain any olfactory evidence of contamination, and field screening with the PID did not indicate the presence of VOCs. The soil was stockpiled for later re-use as backfill. A total of three 550-gallon tanks, positioned end to end, were unearthed in the western portion of the building. The tops of the tanks were encountered approximately four feet below grade. These tanks were not encased in concrete, but were separated from each other by a masonry wall.

After the tanks were uncovered any product remaining in them was removed by RGJ. The remaining chemical vapors were then removed by F&N utilizing dry ice. The tanks were then accessed utilizing the proper equipment. Any remaining sludge and residue was then removed and the tanks were then wiped clean. After the tanks were cleaned they were backfilled with the stockpiled soil. RGJ then filled the remainder of the excavation with concrete.

After the tanks were abandoned, the suction lines and their associated dispensers were either removed or disabled with concrete. For the most part, the suction lines ran aboveground. However, in the immediate areas of the tanks they were located below grade. All fill lines were also disabled with concrete.

A total of five 55-gallon drums of sludge was generated during the tank clean-out. These drums are currently stockpiled at the site awaiting for disposal. At the time of this report, Mr. Feinstein had not decided whether to utilize F&N's

services to dispose of the drums, or to dispose of them himself. It should be noted that Fyn Paint is a registered small quantity generator (USEPA ID# NYUD001270867).

3.0 SOIL BORINGS

The soil borings were performed at the site on February 9 & 10, 1999, utilizing Geoprobe sampling methods. The soil samples were obtained with a Geoprobe large bore sampler. This sampler is a discreet depth sampler which can be utilized to obtain samples from exact depths with no fall back. A clean acetate liner was installed in the sampler before the collection of each sample. The sampler was installed utilizing either a truck mounted percussion hammer or a portable had-held percussion hammer.

Borings B-1 and B-2 were installed to the east and west, respectively, of the eastern tank area. Both of these borings were installed utilizing the truck mounted percussion hammer. Five other attempts were made to install borings to the north and south of the eastern tank area. All of these attempts met with rejection at shallow depths either due to debris in the fill material or concrete associated with the tank installation. It should be noted that due to the limited access conditions in this portion of the site, the rejected borings could only be attempted utilizing the smaller, hand-held geoprobe equipment.

Borings B-3, B-4, B-5, B-6, B-7 and B-8 were installed around the perimeter of the western tank area. These borings were installed utilizing the hand-held geoprobe equipment. A Boring Location Plan is provided as Figure 3.

Both Borings B-1 and B-2 were sampled continuously between depths of 4 and 12 feet below grade. The sample intervals were two feet. The 4 - 6 foot sample from B-1 consisted of fill material, composed of sand and masonry rubble. This sample exhibited a strong odor of solvents. The samples collected from the 6-8, 8-10 and 10-12 foot intervals consisted of a brown silty sand. All three of these samples also exhibited an odor of solvents.

It is estimated that the bottom of the tanks in the western area are approximately ten feet below grade. Therefore, borings B-3 through B-8 were sampled between 11 and 14 feet below grade. The samples obtained from all six borings consisted of the brown silty sand encountered in B-1 and B-2. None of these samples exhibited any olfactory evidence of contamination.

3.1 Soil Screening

In addition to visual observations, all soil samples were screened in the field for volatile organic compounds (VOCs) with a Photoionization Detector (PID). The soil sample was transferred from the sampler to a plastic bag and sealed closed. The bag was the shaken gently to encourage volitization and allowed to stand for three minutes. The tip of the PID was then inserted into the bag and a reading obtained. The results of the field screening are presented in Table 1.

A review of Table 1 indicates that moderate levels of VOCs are present in all of the soil samples. The levels of VOCs in the samples from B-1 and B-2 were greater than the PID's maximum capability (1,999 ppm). The moderate levels of VOCs found in the samples from B-3 through B-8 could, in part, be due to background VOC levels. Background VOC levels at the site were found to range from 100 ppm (near the dispensers) to 15.7 ppm (near the doors of the building). Just the transfer of the soils from the sampler to the plastic bag exposed the

samples and the bags to the background VOCs. The transfer and field screening could not be conducted outside the building due to adverse weather conditions.

Table 1
VOC concentrations in soil samples
Fyn Paint & Lacquer, Brooklyn

Boring #	Sample Depth (feet)	VOC levels (ppm)	Boring #	Sample Depth	VOC levels (ppm)
B-1	6 - 8	>1,999	B-2	12 - 14	>1,999
B-1	8 - 10	>1,999	B-3	11 - 14	114.0
B-1	10 - 12	>1,999	B-4	11 - 14	8.9
B-1	12 - 14	>1,999	B-5	11 - 14	157.0
B-2	6 - 8	>1,999	B-6	11 - 14	114.0
B-2	8 - 10	>1,999	B-7	11 - 14	40.7
B-2	10 - 12	>1,999	B-8	11 - 14	65.7

* All readings in parts per million (ppm)

4.0 ANALYTICAL RESULTS

Selected samples from each boring were then transported to an outside laboratory and analyzed for VOCs according to EPA Method 8260. The 10 - 12 sample from B-1 was identified as "Composite #1". The 10 - 12 sample from B-2 was identified as "Composite #2". These samples are not true composite samples, but really are grab samples. However, the original sampling plan had called for the compositing of samples and the containers had been pre-labeled.

Given that only low concentrations of VOCs were detected by the PID in borings B-3 through B-8, it was decided that the compositing of these soil samples would be performed for the purpose of laboratory analysis. The samples from B-3 and B-5 were composited and identified as "Composite #3". Samples B-4 and B-7 were composited and identified as "Composite #4". The samples from B-6 and B-8 were composited and identified as "Composite #5".

In addition, the soil sample obtained from the eastern excavation was also analyzed for USEPA Method 8260. This sample was obtained from directly above the concrete covering the tanks, and was also located in the area of the feed lines for the tanks. This sample was identified as "pipe area".

The results of the EPA Method 8260 analysis are presented in Table 2. Table 2 presents only those compounds which were detected in the samples, and only those samples which exhibited any VOC contamination.

A review of Table 2 indicates that the soil samples obtained from the western tank area did not exhibit any VOC contamination. However, all three samples from the eastern area did exhibit detectable concentrations of VOCs. The soil sample from the pipe area exhibited extremely elevated concentrations of ethylbenzene, toluene and o & m/p xylenes. The concentrations of all four of these compounds greatly exceed their respective NYSDEC Cleanup Criteria. It is not known where the ethylbenzene originated from. Mr. Simka informed F&N that, to his knowledge, ethylbenzene has never been stored in the storage tanks, nor was it a constituent of any chemicals that were stored in the tanks. It is possible that ethylbenzene was a constituent of chemicals that were stored in drums at the site, and were mixed with other compounds in the mixing tank.

The soil sample from B-1 also exhibited elevated concentrations ethylbenzene, toluene, o & m/p xylenes, 2-butanone and acetone. The concentrations of the

first four compounds exceeded their respective NYSDEC Cleanup Criteria. There is no NYSDEC standard for 2-butanone or acetone, as found in STARS. However, the concentration of acetone in B-1 exceeded the NYSDEC nuisance concentration of 10,000 ppb. Detectable concentrations of isopropylbenzene, 1,3,5 trimethylbenzene and 1,2,4 trimethylbenzene were also present in this sample, but did not exceed their respective NYSDEC standards.

The sample from B-2 exhibited detectable concentrations of toluene, m/p xylene, 2-butanone, acetone and 4-methyl-2-pentanone. Only acetone exhibited a VOC concentration that exceeded its respective NYSDEC standard. Copies of the laboratory results are provided in Appendix B.

Table 2
Results of Soil Analysis, EPA Method 8260
Fyn Paint, Brooklyn, NY

Parameters	Comp. #1 (B-1)	Comp. #2 (B-2)	Pipe Area	DEC Cleanup Criteria
Ethylbenzene	150	ND	4,400,000	100
Toluene	160	7.3	2,800,000	100
o-xylene	480	ND	5,000,000	100
m/p xylene	1,000	11	17,000,000	100
Isopropylbenzene	11	ND	ND	100
1,3,5 Trimethylbenzene	11	ND	ND	100
1,2,4 Trimethylbenzene	8.3	ND	ND	100
2-Butanone	1,000	4,500	ND	NS
Acetone	780,000	190,000	ND	NS
4-methyl-2-pentanone	ND	29	ND	NS

All concentrations are in microgram per kilogram or ppb
ND: Non - detectable All Cleanup Criteria are from NYSDEC STARS Memorandum.

5.0 CONCLUSIONS

A total of three 550-gallon USTs, utilized for the storage of methanol and varnish maker's and painter's naptha (VM&P) were abandoned in place at the site. Also, one 1,500-gallon UST, utilized for mixing, and four 1,080-gallon USTs, utilized for the bulk storage of lacquer thinner, toluene and xylene, were also abandoned at the site. The tanks were accessed, cut open and cleaned by F&N. The tanks and the excavations were then filled with soil and concrete by RGJ.

The three 550-gallon tanks were located beneath the western portion of the building. Soil samples taken from the area of these tanks were analyzed according to EPA Method 8260. The results of these analysis indicated that no VOCs were present in any of the soil samples.

The four 1,080 gallon USTs and the 1,500 gallon UST were located beneath the floor of the eastern portion of the building. These tanks were encased in concrete. Steel piping servicing the tanks was located above the tanks. Soils in the area of these pipes exhibited a solvent odor. A soil sample taken from the pipe area was analyzed according to EPA Method 8260 and was found to contain extremely high concentrations of ethylbenzene (4,400,000 ppb), toluene (2,800,000 ppb), o-xylene (5,000,000 ppb) and m/p xylene (17,000,000 ppb).

Soil samples obtained from borings installed in the eastern tank area also exhibited detectable concentrations of ethylbenzene, toluene and xylenes. However, these concentrations were all 1,000 ppb or less. In addition, the soil samples from the two borings exhibited elevated concentrations of acetone (780,000 and 190,000 ppb).

Based on the above facts, it is F&N's conclusion that since high concentrations of toluene, xylene and ethylbenzene were present in the pipe area, which is located above the USTs, and that much lower concentrations of these chemicals were detected in the samples from the soil boring, the piping leading from the

dispensers or the fill pipes have leaked, and have contaminated the soils in the area of the eastern tank area.

It is also F&N's conclusion that the presence of acetone in the samples is probably due to the lacquer thinners utilized and stored at the site. Therefore, the elevated concentrations of acetone in the soil samples from B-1 and B-2 are indicators that one of the 1,080 gallon USTs storing lacquer thinner had leaked.

6.0 RECOMMENDATIONS

Based on the above stated facts, it is F&N's opinion the contaminated soil at the site does may constitute an environmental threat to the subject property or the groundwater at the site. Therefore, it is F&N's recommendations that the following steps be taken:

1) The site should be reported to the NYSDEC, if it has not already been done so, as a chemical spill.

2) A more comprehensive site assessment, including the installation of groundwater monitoring wells, should be performed at the site.

3) After the site assessment has been performed, the NYSDEC should be contacted regarding what, if any, remedial measures should be taken.

NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION

VOLUNTARY CLEANUP AGREEMENT

In the Matter of the Implementation of a Remedial Response Program
for: **Fyn Paint and Lacquer Co., Inc.** by: **Fyn Paint and Lacquer Co., Inc.**, "Volunteer"
Site #: V-00380-2 Index #: W2-0873-00-10

WHEREAS, the Department is responsible for enforcement of the ECL and the NL and such laws provide the Department authority to enter into this Agreement; and

WHEREAS, the Department has established a Voluntary Cleanup Program to address the environmental, legal and financial barriers that hinder the redevelopment and reuse of contaminated properties; and

WHEREAS, the Volunteer represents, and the Department relied upon such representations in entering into this Agreement, that Volunteer is the operator of the Site and has been the operator of the Site as a paint and lacquer manufacturing business and powder coating warehouse since the property was acquired by the current owner, Kent River Corp., in or about January 1959; and

WHEREAS, the parties are entering into this Agreement in order to set forth a process through which the Department will approve and the Volunteer will implement activities designed to address in whole or in part environmental contamination at the Site; and

WHEREAS, the Department has determined that it is in the public interest to enter into this Agreement as a means to address environmental issues at the Site with private funds while ensuring the protection of human health and the environment;

NOW, THEREFORE, IN CONSIDERATION OF AND IN EXCHANGE FOR THE MUTUAL COVENANTS AND PROMISES, THE PARTIES AGREE TO THE FOLLOWING:

I. Site Specific Definitions

For purposes of this Agreement, the terms set forth in the Glossary attached to, and made a part of, this Agreement shall have the meanings ascribed to them in that Glossary. In addition, for purposes of this Agreement, the following terms shall have the following meanings:

A. "Contemplated Use": Heavy manufacturing uses consistent with current M3-1 zoning.

B. "Existing Contamination": Soil contamination on portions of the Site in proximity to exhumed underground storage tanks consisting of high concentrations of toulene, ethylbenzene, acetone and xylenes as more fully described in the March 23, 1999 Tank Closure Report of Fenley & Nichol Environmental Inc., prepared for RGJ Contracting Co., Inc.. The term also includes contamination encountered during the course of this Agreement's implementation, the nature and extent of which were unknown or insufficiently characterized as of the effective date of this Agreement, but which shall have been fully characterized to the Department's satisfaction.

C. "Site": Fyn Paint and Lacquer Co., Inc., which is located at 230 Kent Avenue, Brooklyn, New York, 11211 at latitude 40° 42' 30" and longitude 73° 57' 30" with Kings County Tax Map Identifier Numbers, District 16, Block 2362, Lot 1, and which is owned by Kent River Corp. located at the same address. Exhibit "A" of this Agreement is a map of the Site showing its general location.

D. "Volunteer": Fyn Paint and Lacquer Co., Inc., which is located at 229 Kent Avenue, Brooklyn, New York, 11211, and which is the current operator of the Site.

II. Development, Performance and Reporting of Work Plans

A. Work Plan Labels

The work plans ("Work Plan" or "Work Plans") under this Agreement shall be captioned as follows:

1. "Investigation Work Plan" if the Work Plan provides for the investigation of the nature and extent of contamination at the Site;

2. "IRM Work Plan" if the Work Plan provides for an interim remedial measure;

3. "Remediation Work Plan" if the Work Plan provides for the Site's remediation to cleanup levels sufficient to allow the Contemplated Use of the Site to proceed; or

4. "OM&M Work Plan" if the Work Plan provides for post-remedial construction operation, monitoring and maintenance.

B. Submission/Implementation of Work Plans

1. Any proposed Work Plan shall be submitted for the Department's review and approval and shall include, at a minimum, a chronological description of the anticipated activities, a schedule for performance of those activities, and sufficient detail to allow the Department to evaluate that Work Plan. A Professional Engineer must prepare, sign, and seal all Work Plans other than an Investigation Work Plan. Upon the Department's written approval of a Work Plan, such Department-approved Work Plan shall be incorporated into and become an enforceable part of this Agreement and shall be implemented in accordance with the schedule contained therein. If a proposed Work Plan is rejected by the Department, Volunteer shall elect in writing within 10 Days to: (i) modify or

expand it; (ii) complete any other Department-approved Work Plan(s); (iii) invoke the dispute resolution provisions of this Agreement pursuant to Paragraph XIII; or (iv) terminate this Agreement pursuant to the provisions set forth in Paragraph XII.

2. During all field activities, Volunteer shall have on-Site a representative who is qualified to supervise the activities undertaken and who may be an outside consultant retained by Volunteer to perform such supervision.

C. Revisions to Work Plans

If revisions to a Work Plan are required to satisfy the objectives of such Work Plan, the parties will negotiate revisions which shall be attached to and incorporated into the relevant Work Plan and enforceable under this Agreement. If the parties cannot agree upon revisions to the relevant Work Plan, then unless the Volunteer invokes the dispute resolution provisions of this Agreement pursuant to Paragraph XIII, either party may terminate this Agreement pursuant to Paragraph XII.

D. Submission of Final Reports

In accordance with the schedule contained in a Work Plan, Volunteer shall submit a final report containing on the cover page the caption of that Work Plan as set forth in Subparagraph II.A of this Agreement. The final report pertaining to that Work Plan's implementation shall include but not be limited to: all data generated relative to the Site and all other information obtained as part of the implementation of the subject Work Plan; all of the assessments and evaluations required by the subject Work Plan; a statement of any additional data that must be collected; "as-built" drawings, to the extent necessary, showing all changes made during construction. Additionally, the final report relative to the Investigation Work Plan shall contain a certification by the person with primary responsibility for the day to day performance of the activities under this Agreement that those activities were performed in full accordance with the Investigation Work Plan and all other final reports must contain such certification made by a professional engineer with primary responsibility for the day to day performance of the activities under this Agreement.

An OM&M Work Plan, if necessary, shall be submitted with the final report relative to an IRM Work Plan or a Remediation Work Plan.

E. Review of Submittals

1. The Department shall timely notify Volunteer in writing of its approval or disapproval of each submittal. All Department-approved submittals shall be incorporated into and become an enforceable part of this Agreement.

2. If the Department disapproves a submittal, it shall specify the reasons for its disapproval and may request Volunteer to modify or expand the submittal. Within 30 days after receiving written notice that Volunteer's submittal has been disapproved,

Volunteer shall either make a revised submittal that corrects the stated deficiencies or elect to terminate the Agreement pursuant to Paragraph XII. If the Volunteer submits a revised submittal and it is disapproved, the Department and Volunteer may pursue whatever remedies may be available under this Agreement or under law.

3. Within 30 days of the Department's approval of a final report, such report must be submitted to the Department in an electronic format acceptable to the Department.

F. Department's Determination of Need for Remediation

In addition to the Department's approval of the final report, the Department will determine upon its approval of each final report dealing with the investigation of the Site whether remediation, or additional remediation as the case may be, is needed to allow the Site to be used for the Contemplated Use.

1. If the Department determines that remediation, or additional remediation, is not needed to allow the Site to be used for the Contemplated Use, the Department shall provide Volunteer with the Release described in Subparagraph II.H.

2. If the Department determines that remediation, or additional remediation, is needed to allow the Site to be used for the Contemplated Use, Volunteer may, at its sole discretion, submit for review and approval a proposed Work Plan (or a revision to an existing Remediation Work Plan for the Site) which addresses the remediation of Existing Contamination. Such proposed Work Plan shall include, among other requirements, an evaluation of the proposed remedy considering the factors set forth in 6 NYCRR 375-1.10(c). At a minimum, the remedial activities contemplated by the proposed Work Plan must eliminate or mitigate all significant threats to the public health or environment and must be protective for the safe implementation of the Site's Contemplated Use. The Department will notice a proposed Work Plan addressing the Site's remediation for public comment in accordance with Subparagraph II.G of this Agreement. If Volunteer elects not to develop a Work Plan under this Subparagraph or either party concludes that a mutually acceptable Work Plan under this Subparagraph cannot be negotiated, then this Agreement shall terminate in accordance with Paragraph XII.

G. Notice of Proposed Work Plan for the Site's Remediation

Whenever a Work Plan for the Site's remediation (other than an IRM Work Plan) is proposed, the Department will publish a notice in the Environmental Notice Bulletin to inform the public of the opportunity to submit comments on the proposed Work Plan within 30 days after the date of the issue in which the notice appears. The Department shall mail an equivalent notice to the City of New York, County of Kings and Borough of Brooklyn. The Department will notify Volunteer following the close of the public comment period whether the proposed Work Plan needs to be revised. If the Department determines that revisions are necessary to protect human health or the environment for the Contemplated Use, Volunteer

agrees to negotiate revisions to the proposed Work Plan in accordance with Paragraph II.C. If the Department determines that no revisions are required, then the Work Plan shall be attached hereto as Exhibit "B".

H. Release and Covenant Not To Sue

Upon the Department's determination that i) it is satisfied with the implementation of the Agreement; ii) no remedial activities other than those conducted at the Site, if any, are necessary for the Contemplated Use to proceed with protection of human health and the environment; and iii) Volunteer has complied, if required, with Paragraph X, the Department shall provide Volunteer with a Release and Covenant Not to Sue which is substantially similar to the one attached hereto as Exhibit "C", subject to the terms and conditions stated therein.

III. Progress Reports

Volunteer shall submit written monthly progress reports to the parties identified in Subparagraph XI.A.1. by the 10th day of each month commencing with the month subsequent to the approval of the first Work Plan and ending with the Termination Date. Such reports shall, at a minimum, include: all actions taken pursuant to this Agreement during the previous month and those anticipated for the next month; all results of sampling and tests and all other data received or generated by Volunteer or Volunteer's contractors or agents, whether under this Agreement or otherwise, in the previous month, including quality assurance/quality control information; and information regarding percentage of completion, unresolved delays encountered or anticipated that may affect the future schedule, and efforts made to mitigate such delays.

IV. Enforcement

This Agreement shall be enforceable as a contractual agreement under the laws of the State of New York. Volunteer shall not suffer any penalty or be subject to any proceeding or action if it cannot comply with any requirement of this Agreement as a result of a Force Majeure Event provided it notifies the Department in writing within 10 business days of when it obtains knowledge of any such event. Volunteer shall include in such notice the measures taken and to be taken to prevent or minimize any delays and shall request an appropriate extension or modification of this Agreement. Volunteer shall have the burden of proving by a preponderance of the evidence that an event qualifies as a defense to compliance pursuant to this Paragraph.

V. Entry upon Site

Volunteer hereby consents, upon reasonable notice under the circumstances presented, to entry upon the Site or areas in the vicinity of the Site which may be under the control of Volunteer, by any duly designated officer or employee of the Department or any State agency having jurisdiction with respect to the matters addressed in a Department-

approved Work Plan, and any agent, consultant, contractor or other person so authorized by the Commissioner, all of whom shall abide by the health and safety rules in effect for the Site. Upon request, Volunteer shall permit the Department full access to all non-privileged records relating to matters addressed by this Agreement and to job meetings. Raw data is not considered privileged and that portion of any privileged document containing raw data must still be provided to the Department.

VI. Payment of State Costs

Within 30 days after receipt of an itemized invoice from the Department, Volunteer shall pay to the Department a sum of money which shall represent reimbursement for the State's expenses for work performed at or in connection with the Site prior to the effective date of this Agreement, as well as for negotiating this Agreement and all costs associated with this Agreement, but not including any expenses incurred by the State after the Termination Date. Each such payment shall be made by certified check payable to the Department of Environmental Conservation and shall be sent to: Bureau of Program Management, Division of Environmental Remediation, New York State Department of Environmental Conservation, 50 Wolf Road, Albany, NY 12233-7010.

Personal service costs shall be documented by reports of Direct Personal Service, which shall identify the employee name, title, biweekly salary, and time spent (in hours) on the project during the billing period, as identified by an assigned time and activity code. Non-personal service costs shall be summarized by category of expense (*e.g.*, supplies, materials, travel, contractual) and shall be documented by expenditure reports.

VII. Reservation of Rights

A. Except as provided in the Release and Covenant Not to Sue (Exhibit "C") after its issuance, nothing contained in this Agreement shall be construed as barring, diminishing, adjudicating, or in any way affecting any of the Department's rights including, but not limited to, the right to recover natural resource damages, the right to take any investigatory or remedial action deemed necessary, and the right to exercise summary abatement powers with respect to any party, including Volunteer.

B. Except as otherwise provided in this Agreement, Volunteer specifically reserves all defenses under applicable law respecting any Departmental assertion of remedial liability against Volunteer, and further reserves all rights respecting the enforcement of this Agreement, including the rights to notice, to be heard, to appeal, and to any other due process. The existence of this Agreement or Volunteer's compliance with it shall not be construed as an admission of liability, fault or wrongdoing by Volunteer, and shall not give rise to any presumption of law or finding of fact which shall inure to the benefit of any third party.

C. Except as provided in Subparagraph XIV.M, Volunteer reserves such rights as it may have to seek and obtain contribution and/or indemnification from its insurers and from

other potentially responsible parties or their insurers for past or future response/cleanup costs or such other costs or damages arising from the contamination at the Site as provided under applicable State and Federal law.

VIII. Indemnification

Volunteer shall indemnify and hold the Department, the State of New York, and their representatives and employees harmless for all claims, suits, actions, damages, and costs of every name and description arising out of or resulting from the fulfillment or attempted fulfillment of this Agreement prior to the Termination Date except for liability arising from willful, wanton or malicious acts or acts constituting gross negligence by the Department, the State of New York, and/or their representatives and employees during the course of any activities conducted pursuant to this Agreement.

IX. Notice of Sale or Conveyance

A. Within 30 days after the effective date of this Agreement, Volunteer shall cause to be filed the Notice of Agreement, which is attached to this Agreement as Exhibit "D", with the County Clerk in the county in which the Site is located and provide evidence of such filing to the Department. Volunteer may terminate such Notice on or after the Termination Date.

B. If Volunteer proposes to convey the whole or any part of Volunteer's ownership interest in the Site, Volunteer shall, not fewer than 60 days before the date of conveyance, notify the Department in writing of the identity of the transferee and of the nature and proposed date of the conveyance and shall notify the transferee in writing, with a copy to the Department, of the applicability of this Agreement. However, such obligation shall not extend to the granting of any rights under any mortgage, deed, trust, assignment, judgment, lien, pledge, security agreement, lease or any other right accruing to a person to secure the repayment of money or the performance of a duty or obligation by a person not affiliated with Volunteer.

X. Deed Restriction

Within 60 days of the Department's approval of a Remediation Work Plan which relies upon institutional controls, Volunteer shall, unless otherwise authorized by the Department in writing, cause to be recorded a Department-approved instrument to run with the land with the County Clerk in the county in which the Site is located which is substantially similar to Exhibit "E" attached to this Agreement, and shall provide the Department with a copy of such instrument certified by such County Clerk to be a true and faithful copy. The Volunteer may petition the Department to terminate the deed restriction filed pursuant to this Paragraph when the Site is protective of human health and the environment for residential uses without reliance upon the restrictions set forth in such instrument. The Department will not unreasonably withhold its approval of such petition.

XI. Communications

A. All written communications required by this Agreement shall be transmitted by United States Postal Service, by private courier service, or hand delivered.

1. Communication from Volunteer shall be sent to:

Ioana Munteanu- Ramnic, Technical Project Manager
New York State Department of Environmental Conservation
One Hunters Point Plaza
47-20 21st Street
Long Island City, New York 11101-5407

Note: four copies (one unbound) of work plans are required to be sent.

Thomas Lang, Regional VCP Coordinator, Region 2
New York State Department of Environmental Conservation
One Hunters Point Plaza
47-20 21st Street

2. Communication from the Department to Volunteer shall be sent to:

Nicholas Ward-Willis, Esq.
Keane & Beane, P.C.
One North Broadway
White Plains, New York 10601

B. The Department and Volunteer reserve the right to designate additional or different addressees for communication on written notice to the other.

XII. Termination of Agreement

Either party may elect to terminate this Agreement, in which event this Agreement shall terminate effective the 5th day after the written notification terminating this Agreement, except that such termination shall not affect the provisions contained in Paragraphs IV, VI and VIII and in Subparagraph XIV.M, nor Volunteer's obligation to ensure that it does not leave the Site in a condition, from the perspective of human health and environmental protection, worse than that which prevailed before any activities were commenced under this Agreement, which provisions and obligation shall survive the termination of this Agreement.

XIII. Dispute Resolution

Volunteer may commence dispute resolution within 20 days of Volunteer's receipt of the Department's notice of disapproval of a submittal or proposed Work Plan, disapproval of a final report, or termination of this Agreement pursuant to Subparagraph XIV.A.2. Disputes regarding Work Plan development and revision shall be heard by the Bureau Director of the Division of Environmental Remediation's remedial bureau within which the Site is located. All other disputes subject to dispute resolution shall be heard by the Assistant Division Director of the Division of Environmental Remediation. Volunteer shall serve upon the Department a request for dispute resolution and a written statement of the issues in dispute, the relevant facts upon which the dispute is based, factual data, analysis or opinion supporting its position, and all supporting documentation upon which Volunteer relies (hereinafter called the "Statement of Position"). The Department shall serve its Statement of Position no later than 20 days after receipt of Volunteer's Statement of Position. Volunteer shall have the burden of proving that the Department's position should not prevail. A meeting or telephone conference can be scheduled if it will promote a resolution of the issues. A final decision resolving the dispute will be issued timely. The final decision shall constitute a final agency action and Volunteer shall have the right to seek judicial review of the decision pursuant to Article 78 of the CPLR if Volunteer commences such proceeding no later than 30 days after receipt of a copy of the decision. The invocation of dispute resolution shall not extend, postpone or modify Volunteer's obligations under this Agreement with respect to any item not in dispute unless or until the Department agrees or a court determines otherwise. The Department shall keep an administrative record which shall be available consistent with Article 6 of the Public Officers Law.

XIV. Miscellaneous

A. 1. Volunteer hereby certifies that all information known to Volunteer and all information in the possession or control of Volunteer and its agents which relates in any way to the contamination existing at the Site on the effective date of this Agreement, and to any past or potential future release of hazardous substances, pollutants, or contaminants at or from the Site, and to its application for this Agreement, has been fully and accurately disclosed to the Department.

2. If the information provided and certifications made by Volunteer are not materially accurate and complete, this Agreement, except with respect to the provisions of Paragraphs IV, VI and VIII and Subparagraph XIV.M, at the sole discretion of the Department, and shall be null and void *ab initio* 15 days after the Department's notification of such inaccuracy or incompleteness and the Department shall reserve all rights that it may have, unless, however, Volunteer submits information within that 15 day time period indicating that the information provided and the certifications made were materially accurate and complete.

C. Each party shall have the right to take samples and to obtain split samples, duplicate samples, or both, of all substances and materials sampled by the other party.

D. Volunteer shall allow the Department to attend and shall notify the Department at least 5 business days in advance of any field activities to be conducted pursuant to this Agreement as well as any prebid meetings, job progress meetings, substantial completion meeting and inspection, and final inspection and meeting.

E. Volunteer shall obtain all permits, easements, rights-of-way, rights-of-entry, approvals, or authorizations necessary to perform Volunteer's obligations under this Agreement, except that the Department may exempt Volunteer from the requirement to obtain any permit issued by the Department for any activity that is conducted on the Site and that the Department determines satisfies all substantive technical requirements applicable to like activity conducted pursuant to a permit.

F. Volunteer shall not be considered an operator of the Site solely by virtue of having executed and/or implemented this Agreement.

G. Volunteer shall provide a copy of this Agreement to each contractor and subcontractor hired to perform work required by this Agreement and to each person representing Volunteer with respect to the Site and shall condition all contracts entered into in order to carry out the obligations identified in this Agreement upon performance in conformity with the terms of this Agreement.

H. The paragraph headings set forth in this Agreement are included for convenience of reference only and shall be disregarded in the construction and interpretation of any provisions of this Agreement.

I. 1. The terms of this Agreement shall constitute the complete and entire Agreement between the Department and Volunteer concerning the implementation of the Work Plan(s) attached to this Agreement. No term, condition, understanding or agreement purporting to modify or vary any term of this Agreement shall be binding unless made in writing and subscribed by the party to be bound. No informal advice, guidance, suggestion, or comment by the Department regarding any report, proposal, plan, specification, schedule, or any other submittal shall be construed as relieving Volunteer of Volunteer's obligation to obtain such formal approvals as may be required by this Agreement. In the event of a

conflict between the terms of this Agreement and any Work Plan submitted pursuant to this Agreement, the terms of this Agreement shall control over the terms of the Work Plan(s) attached as Exhibit "B". Volunteer consents to and agrees not to contest the authority and jurisdiction of the Department to enter into or enforce this Agreement.

2. If Volunteer desires that any provision of this Agreement be changed, Volunteer shall make timely written application to the Commissioner with copies to the parties listed in Subparagraph XI.A and the Commissioner or her designee shall timely respond. This Subparagraph shall not extend to revisions to any Work Plan.

J. The activities to be undertaken under the terms of this Agreement are not subject to review under the State Environmental Quality Review Act, ECL Article 8, and its implementing regulations.

K. If there are multiple parties, the term "Volunteer" shall be read in the plural where required to give meaning to this Agreement. Further, the obligations of the Volunteers under this Agreement are joint and several and the "bankruptcy" or inability to continue by any Volunteer shall not affect the obligations of the remaining Volunteer(s) to carry out the obligations under this Agreement.

L. Except as provided in Subparagraph XIV.M., and to the extent authorized under 42 U.S.C. Section 9613 and any other applicable law, Volunteer shall not be liable for any claim, now or in the future, in the nature of contribution by potentially responsible parties concerning the alleged contamination which is the subject matter of this Agreement. In any future action brought by Volunteer against a potentially responsible party under the Comprehensive Environmental Response, Compensation and Liability Act of 1980, as amended, the provisions of 42 U.S.C. Section 9613(f)(3) shall apply.

M. Volunteer and its employees, servants, agents, lessees, sublessees, successors, and assigns hereby waive any right to pursue reimbursement of monies expended by Volunteer prior to the Termination Date as against the State or the Spill Fund, and agree to indemnify and hold harmless the Spill Fund from any and all legal or equitable claims, suits, causes of action, or demands whatsoever with respect to the Site that any of same has or may have as a result of Volunteer's entering into or fulfilling the terms of this Agreement with respect to the Site.

N. Volunteer, Volunteer's lessees, sublessees, successors, and assigns shall be bound by this Agreement. Any change in ownership of Volunteer including, but not limited to, any transfer of assets or real or personal property, shall in no way alter Volunteer's responsibilities under this Agreement. Volunteer's successors and assigns shall provide to the Department a certification that they agree to be bound by this Agreement within 30 days of becoming a successor or assign.

O. The effective date of this Agreement shall be the date it is signed by the Commissioner or her designee.

DATED: April 1, 2001

ERIN M. CROTTY, COMMISSIONER
NEW YORK STATE DEPARTMENT OF
ENVIRONMENTAL CONSERVATION

CONSENT BY VOLUNTEER

Volunteer hereby consents to the issuing and entering of this Agreement, waives Volunteer's right to a hearing herein as provided by law, and agrees to be bound by this Agreement.

DEPARTMENT-APPROVED WORK PLAN(S)

Exhibit "C"

RELEASE AND COVENANT NOT TO SUE

Unless otherwise specified in this letter, all terms used in this letter shall have the meaning assigned to them under the terms of the Voluntary Cleanup Agreement entered into between the New York State Department of Environmental Conservation (the "Department") and Fyn Paint and Lacquer Co., Inc. ("Volunteer"), Index No.W21-0873-00-10 (the "Agreement").

The Department is pleased to report that the Department is satisfied that the Agreement's Work Plan(s) relative to the Site, located at 230 Kent Avenue, Brooklyn, New York has been successfully implemented.

The Department therefore, hereby releases, covenants not to sue, and shall forbear from bringing any action, proceeding, or suit against Volunteer and Volunteer's lessees and sublessees, successors and assigns, and their respective secured creditors, for the further investigation and remediation of the Site, based upon the release or threatened release of Covered Contamination, provided that (a) timely payments of the amounts specified in Paragraph VI of the Agreement continue to be or have been made to the Department, (b) appropriate deed restrictions remain recorded in accordance with Paragraph X of the Agreement, and (c) Volunteer and/or its' lessees, sublessees, successors, or assigns promptly commence and diligently pursue to completion the Work Plan providing for OM&M, if any. Nonetheless, the Department hereby reserves all of its respective rights concerning, and such release, covenant not to sue, and forbearance shall not extend to natural resource damages or to any further investigation or remedial action the Department deems necessary:

- due to migration off-Site of contaminants resulting in impacts to environmental resources, to human health, or to other biota that are not inconsequential and to off-Site migration of petroleum;

- due to environmental conditions or information related to the Site which were unknown at the time this Release and Covenant not to Sue was issued and which indicate that the Contemplated Use cannot be implemented with sufficient protection of human health and the environment;

- due to Volunteer's failure to implement the Agreement to the Department's satisfaction; or

- due to fraud committed by Volunteer in entering into or implementing this Agreement.

Additionally, the Department hereby reserves all of respective rights concerning, and any such release, covenant not to sue, and forbearance shall not extend toVolunteer nor to any of Volunteer's lessees, sublessees, successors, or assigns who cause or allow a release or threat of release at the Site of any hazardous substance (as that term is defined at 42 USC 9601[14]) or petroleum (as that term is defined in Navigation Law § 172[15]), other than Covered Contamination; or cause or allow the use of the Site to change from the Contemplated Use to one requiring a lower level of residual contamination before that use can be implemented with sufficient protection of human health and the environment; nor to any of Volunteer's lessees, sublessees, successors, or assigns who is otherwise a party responsible under law for the remediation of the Existing Contamination independent of any obligation that party may have respecting same resulting solely from the Agreement's execution.

Notwithstanding the above, however, with respect to any claim or cause of action asserted by the Department the one seeking the benefit of this release, covenant not to sue, and forbearance shall bear the burden of proving that the claim or cause of action, or any part thereof, is attributable solely to Covered Contamination.

Notwithstanding any other provision in this release, covenant not to sue, and forbearance,

- if with respect to the Site there exists or may exist a claim of any kind or nature on the part of the New York State Environmental Protection and Spill Compensation Fund against any party, nothing in this letter shall be construed or deemed to preclude the State of New York from recovering such claim.

- except as provided in this letter and in Agreement, nothing contained in the Agreement or in this letter shall be construed as barring, diminishing, adjudicating, or in any way affecting any of the Department's rights (including, but not limited to, the right to recover natural resources damages) with respect to any party, including Volunteer.

- nothing contained in this letter shall prejudice any rights of the Department to take any investigatory or remedial action it deems necessary if Volunteer fails to comply with the Agreement or if contamination other than Existing Contamination is encountered at the Site.

- nothing contained in this letter shall be construed to prohibit the Commissioner or his duly authorized representative from exercising any summary abatement powers.

- nothing contained in this letter shall be construed to affect the Department's right to terminate the Agreement under the terms of the Agreement at any time during its implementation if Volunteer fails to comply substantially with the Agreement's terms and conditions.

In conclusion, the Department is pleased to be part of this effort to return the Site to productive use of benefit to the entire community.

NEW YORK STATE DEPARTMENT OF
ENVIRONMENTAL CONSERVATION

Appendix "A"

(to Exhibit "C")

Map of the Site

Exhibit "D"

NOTICE OF AGREEMENT

This Notice is made as of the _____ day of _____, 2001 by Fyn Paint and Lacquer Co., Inc., regarding a parcel of real property located at 230 Kent Avenue, Brooklyn, New York 11211, at latitude 40° 42' 30" and longitude 73° 57' 30" with Kings County Tax Map Identifier Numbers, District 16, Block 2362, Lot 1 ("Property"); and

WHEREAS, Fyn Paint and Lacquer Co., Inc. ("Volunteer"), entered into a Voluntary Cleanup Agreement ("Agreement") with the Department of Environmental Conservation ("Department") Index #W2-0873-00-10, concerning the remediation of contamination present on the Property, which Agreement was signed by the Commissioner of the Department of Environmental Conservation on _____; and

WHEREAS, in return for the remediation of the Property pursuant to the Agreement to the satisfaction of the Department, the Department will provide Volunteer and its lessees and sublessees, successors and assigns, including their respective secured creditors, with a release, covenant not to sue, and forbearance from bringing any action, proceeding, or suit related to the Site's further investigation or remediation, subject to certain reservations set forth in the Agreement; and

WHEREAS, pursuant to the Agreement, Volunteer agreed to give notice of the Agreement to all parties who may acquire any interest in the Property by filing this Notice with the Kings County Clerk,

NOW, THEREFORE, Volunteer, for itself and for its successors and assigns, declares that:

1. This Notice of the Agreement is hereby given to all parties who may acquire any interest in the Property; and

2. This Notice shall terminate upon the filing by Volunteer, or its successors and assigns, of a termination of notice of Agreement after having first received approval to do so from the New York State Department of Environmental Conservation or having terminated the Agreement pursuant to its Paragraph XII.

IN WITNESS WHEREOF, Volunteer has executed this Notice of Agreement by its duly authorized representative.

Dated: By: _____

Exhibit "E"

DEED RESTRICTION

Fyn Paint and Lacquer Co. Inc., shall prohibit the Site from ever being used for purposes other than for the Contemplated Use without the express written waiver of such prohibition by the Department, or if at such time the Department shall no longer exist, any New York State department, bureau, or other entity replacing the Department;

Fyn Paint and Lacquer Co., Inc., shall prohibit the use of the groundwater underlying the Site without treatment rendering it safe for drinking water or industrial purposes, as appropriate, unless the user first obtains permission to do so from the Department, or if at such time the Department shall no longer exist, any New York State department, bureau, or other entity replacing the Department;

Fyn Paint and Lacquer Co, Inc., on behalf of itself and its successors and assigns, shall continue in full force and effect any institutional and engineering controls the Department requires Volunteer to put into place and maintain; and

Fyn Paint and Lacquer Co., Inc., on behalf of itself and its successors and assigns, hereby consents to the enforcement by the Department, or if at such time the Department shall no longer exist, any New York State department, bureau, or other entity replacing the Department, of the prohibitions and restrictions that this Paragraph X requires to be recorded, and hereby covenants not to contest such enforcement.

Glossary of Terms

The following terms shall have the following meanings:

"ALJ": Administrative Law Judge.

"Covered Contamination": the concentrations of Existing Contamination remaining on the Site on the date that the Department issues the Release set forth in Exhibit "C".

"ECL": the Environmental Conservation Law.

"Force Majeure Event": an event which is brought on as a result of fire, lightning, earthquake, flood, adverse weather conditions, strike, shortages of labor and materials, war, riot, obstruction or interference by adjoining landowners, or any other fact or circumstance beyond Volunteer's reasonable control.

"Day": a calendar day unless otherwise specified.

"Department": the New York State Department of Environmental Conservation.

"IRM": an interim remedial measure which is a discrete set of activities which can be undertaken without extensive investigation and evaluation to prevent, mitigate, or remedy environmental damage or the consequences of environmental damage attributable to a Site.

"NL": the Navigation Law.

"OM&M Plan": the Department-approved work plan detailing post-remedial operation, maintenance, and monitoring at the Site that Volunteer shall implement.

"Professional engineer": an individual registered as a professional engineer in accordance with Article 145 of the New York State Education Law. If such individual is a member of a firm, that firm must be authorized to offer professional engineering services in the State of New York in accordance with Article 145 of the New York State Education Law.

"Spill Fund": the New York State Environmental Protection and Spill Compensation Fund.

"State Costs": all the State's expenses including, but not limited to, direct labor, fringe benefits, indirect costs, travel, analytical costs, and contractor costs incurred by the State of New York for negotiating, implementing, and administering this Agreement. Approved agency fringe benefit and indirect cost rates will be applied.

"Termination Date": the date upon which (i) the Release (Exhibit "C") is issued or the Department approves the final report relative to the OM&M at the Site, whichever is later; or (ii) the Agreement terminates pursuant to Paragraph XII. or Subparagraph XIV.A.2.

"Trustee": the Trustee of New York State's natural resources.

"Work Plan": a Department-approved work plan, as may be modified, pertaining to the Site that Volunteer shall implement and that is attached to this Agreement.

SUPPLEMENTAL REMEDIAL INVESTIGATION REPORT

1.0 INTRODUCTION

Leggette, Brashears & Graham, Inc. (LBG) was retained by Fyn Paint & Lacquer Co., Inc. (Fyn) to conducted a Supplemental Remedial Investigation under the Voluntary Cleanup Program (VCP) in the vicinity of their facility at 230 Kent Avenue, Greenpoint, Brooklyn, New York. Fyn has entered into the Voluntary Cleanup Program (VCP) with the New York State Department of Environmental Conservation (NYSDEC) [NYSDEC Site ID V00380-2, Index No. W2-0873-00-10]. The purpose of the investigation was to further delineate the extent of contaminants encountered during the previous subsurface investigation conducted in May and June 2001. A copy of the NYSDEC approval letter is included in Appendix A. This investigation is described in the LBG report "Subsurface Investigation, Fyn Paint & Lacquer Co., Consolidated Edison, North First Street and Vicinity, Brooklyn, New York", dated February 2002.

The Supplemental Remedial Investigation consisted of the following:

- Sampling soil gas from beneath the Fyn building floor, the sidewalk outside the Fyn building and the ambient air within the building for laboratory analysis.
- Drilling of soil borings and sampling of soil at 8 locations surrounding and within the Fyn building for laboratory analysis.
- Construction of monitor wells within the 8 new soil borings.
- Sampling of ground water, for laboratory analysis, from the new and existing monitor wells.
- Survey of the new well locations and casing elevations and measurement of water levels within all wells at low and high tides to develop ground-water elevation contour maps.
- Laboratory analysis of air, soil and ground-water samples.
- Data evaluation and preparation of this report.

2.0 FIELD INVESTIGATION

2.1 Soil Gas and Ambient Air Sampling

On July 2, 2003, soil gas samples were collected from 5 points beneath the sidewalks adjacent to the east, south and west sides of the Fyn building. Sample locations are shown on figure 1. The sidewalk was drilled and a stainless steel probe was driven to between 3.5 and 4.0 ft bg (feet below grade). The probe was removed and a stainless-steel sampling tube with perforations along the bottom 0.5 foot was inserted in the hole. The hole in the sidewalk where the tube was inserted was sealed with modeling clay to prevent dilution of soil gas by ambient air. Soil gas was withdrawn with a peristaltic pump set to a 0.1 liter per minute flow rate and collected in laboratory supplied tedlar bags which were stored in a cool, dark environment prior to shipment. The soil gas was shipped to York Analytical Laboratories (York) of Stamford, Connecticut for analysis of volatile organic compounds (VOCs) by EPA Method TO-15. The stainless steel probe and sampling tube was decontaminated between sample points. The holes were filled with sand and the sidewalk was sealed with concrete-sealing material.

On July 29, 2003, soil gas was sampled from 2 points beneath the floor of the Fyn building and an ambient air sample was collected from inside the building. Soil-gas sample locations are shown on figure 1. The samples were collected with the same methodology described above except that two soil-gas samples were collected from each location; one immediately below the concrete slab and one at 2.5 feet below the slab. The ambient air sample was collected by placing the pump intake 5 feet above the floor in the center of the building.

2.2 Soil Boring, Soil Sampling

Between July 21 and August 8, 2003, an LBG hydrogeologist supervised the drilling of 11 soil borings. Soil boring locations are shown on figure 2. Drilling was completed by Aquifer Drilling & Testing, Inc. (ADT) of New Hyde Park, New York.

With the exception of Boring MW-16, all drilling was accomplished using the hollow-stem auger method. Two attempts were made to drill the MW-16 boring with an auger but an impassable subsurface obstruction was encountered. MW-16 was completed using a mud-

rotary technique. All boring locations were cleared for subsurface utilities and obstructions either by vacuum truck or hand digging, prior to the start of drilling.

Soil was sampled in advance of the auger using a 2-foot split-spoon sampling device. The split spoon was cleaned with alconox and water and rinsed with water between samples. Soil samples were visually inspected, recorded on a geologic log and screened for the presence of VOCs with a photoionization detector (PID). The soil sample collected from above the ground water interface was placed in laboratory-supplied containers for analysis. If the soil sample exhibiting the highest PID response did not correspond with this interface sample, it too was packaged for laboratory analysis. In some instances where VOCs were detected in soil sampled below the ground water, a soil sample was analyzed to determine the vertical extent of contamination. Soil was sampled at 2 to 5-foot intervals to the ground water in MW-10 and MW-11 and continuously to where practical beneath the ground water in all other borings.

All soil samples were sent to Toxikon Corporation (Toxikon) of Bedford, Massachusetts for analysis of VOCs, semivolatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), pesticides, cyanide and Target Analyte List (TAL) metals by methods outlined in the EPA SW-846 publication. Laboratory results were completed with an ASP Category B Deliverables package.

Soil cuttings generated during drilling were transferred to DOT approved 55-gallon steel drums and stored temporarily inside the Fyn building pending removal for disposal. Several soil samples from these drums were composited and sent to American Analytical Laboratories for analysis of disposal characteristics in accordance with the disposal facility. The drums were removed from the Fyn building on August 14 and August 28, 2003 by American Environmental Assessment Corporation of Wyandanch, New York. Soil was disposed at Vexor Technology, Inc. of Medina, Ohio. Transportation and disposal manifests are included in Appendix B.

2.3 Monitor Well Construction

Following the completion of soil borings, a monitor well was installed in the borehole. Because of subsurface obstructions, no monitor wells were installed in Soil Boring MW-9 or the first two MW-16 borings. All monitor wells installed during the Supplemental

Investigation with the exception of MW-16, are constructed of 4-inch diameter, Schedule 40, 0.020-slot PVC well screen and 4-inch diameter, Schedule 40 PVC riser pipe. MW-16 was constructed with 2-inch diameter PVC screen and riser pipe. Twenty feet of well screen was set in each boring with the exception of MW-12 where a subsurface obstruction necessitated that 15 feet of screen be used.

The annular space surrounding each well screen was filled with No. 2 quartz filter sand from the bottom of the boring to 2 feet above the top of the well screen. A bentonite seal was placed above the sand pack. Wells were completed at grade with a well plug and 8-inch diameter street box.

The newly-installed monitor wells were developed to remove fine material from the sand pack and from within the well screen by surging them with a PVC bailer and evacuating turbid well water with a suction pump or bailer. Approximately 50 gallons of development water was removed from each new well. All development water was contained in 55-gallon drums inside the Fyn building and disposed in the same manner, and on the same dates as the drill cuttings. Transportation and disposal manifests are included in Appendix C.

2.4 Ground-Water Sampling

On August 7, 2003, ground-water samples were collected from Monitor Wells MW-1, MW-2, MW-3, MW-5 and MW-8. Depth to ground water and total depth of each well was measured with a clean interface meter and the standing well volume was calculated. Three well volumes were removed from each well with dedicated polyethylene bailers. The water inside each well was allowed to recover and fine material allowed to settle out prior to sampling. Ground water was sampled with a bailer and sent to Toxikon for analysis of VOCs and SVOCs. The ground-water sample from MW-5 was additionally analyzed for TAL metals and cyanide.

On August 13, 2003, ground-water samples were collected from Monitor Wells GP-1, GP-2 and CE-4. These wells are 1-inch diameter and were purged and sampled by using a peristaltic pump and dedicated polyethylene and tygon tubing. Three well volumes were removed from each well prior to sampling. Samples from GP-1, GP-2 and CE-4 were analyzed by Toxikon for VOCs and SVOCs.

Ground-water samples were collected from Monitor Wells MW-9A, MW-10, MW-11, MW-12, MW-13, MW-14 and MW-16 between August 19 and August 25, 2003. These wells were constructed with 20 feet of well screen set from 15 to 17 feet below ground water. The wells were designed to be sampled at several different depths to define the vertical distribution of dissolved compounds.

These new wells were sampled by inserting a double 4-inch packer into the well to isolate a 2-foot section of the well screen. The packers were attached to a 2-foot length of 2-inch diameter steel pipe with holes for the admission of ground water. The packer assembly was lowered into the monitor well by attaching successive lengths of 2-inch diameter steel pipe. Once the packer assembly was set at the target sampling interval, a variable-rate submersible pump was lowered to the bottom of the packer assembly.

Single-use polyethylene tubing conveyed the water to the surface where it passed through a flow through cell containing a Horiba U-22XD multiparameter meter. The flow rate was set to less than 500 ml/m (milliliters per minute). Conductivity, turbidity, temperature, dissolved oxygen, oxygen-reduction potential and pH were measured during well evacuation. Samples were collected from the pump discharge upon successful stabilization of the above parameters. After completing the shallow sample interval in each well, the packer assembly was lowered to the next sample interval and the procedure was repeated. All samples were analyzed by Toxikon for VOCs and SVOCs. Six samples were additionally analyzed for TAL metals, cyanide, PCBs and pesticides. Monitor Wells MW-15 and CE-1 were not sampled due to the presence of free-phase product, details of which will be discussed in a following section. Monitor Wells CE-2, CE-3 and GP-3 were dry.

The remaining wells (MW-4, MW-6, MW-7 and MW-16) were sampled on August 21 and 25, 2003, by purging 3 well volumes with a submersible pump and sampling either with a bailer or from the pump discharge. Parameters were recorded during purging. An attempt was made to sample MW-16 at multiple intervals below the water table but due to the meager amount of water which flowed into the well, it was evacuated and sampled with a bailer after recovery.

Table 1 summarizes the depth intervals at which each well was sampled and the compounds for which each sample was analyzed. All purge water was contained for future

disposal (removed from the site on August 14 and August 28, 2003). Transportation and disposal manifests are included in Appendix B.

2.5 Monitor Well Survey and Water Level Measurements

On August 13, 2003, a differential leveling survey was conducted with a Topcon AT-G6 autolevel to determine the elevations of the tops of casings for the new monitor wells. Measurements were related to existing monitor wells, the elevations for which were previously established relative to the Brooklyn Topographic Datum. The horizontal position of each well was measured with measuring tape or measuring wheel relative to previously established well positions.

On August 22, 2003, the depths to ground water were measured in each monitor well with an electronic interface probe. The probe was decontaminated between wells. The measurement of wells near the East River was done near the time of low tide along the river. The measurements of all wells were repeated on September 22, 2003 at a time near high tide on the East River.

3.0 SOIL AND GROUND-WATER QUALITY

3.1 Soil Gas/Ambient-Air Survey Results

Laboratory results for the soil gas and ambient air samples are summarized on table 2. VOCs were detected in every soil-gas sample as well as the ambient air sample. The most prevalent VOC was acetone and was detected at concentrations up to 1,180,000 ppbv (parts per billion by volume) [Sample AS-6]. Other VOCs detected at high concentrations were toluene, xylenes and isopropanol. The exterior and interior soil-gas samples with the highest concentrations and greatest number of compounds detected were AS-1 and AS-6, respectively.

The ambient air sample was dominated by acetone, toluene and isopropanol. The acetone concentration was 540 ppbv. Laboratory results are included as Appendix C.

3.2 Soil Analysis Results

3.2.1 VOCs

Laboratory analysis of soil samples for VOCs are summarized on table 3 and indicates that 12 of the 13 samples analyzed (8 soil borings) contained at least one VOC at a concentration above the Method Detection Limit (MDL). Of the 8 soil borings completed, 4 contained VOCs at concentrations which exceeded the NYSDEC Recommended Soil Clean-up Objectives (RSCO) as outlined in the Technical Administrative and Guidance Memorandum (TAGM) 4046. These borings were MW-11, MW-12, MW-13 and MW-15.

The most prevalent VOC was xylenes and was detected at concentrations up to 2,100,000 ug/kg (micrograms per kilogram) [MW-15, 15-17 ft bg]. Other VOCs detected at high concentrations were toluene, ethylbenzene, acetone and 4-methyl-2-pentanone (methyl isobutyl ketone or MIBK). The most highly VOC-impacted soil came from the MW-15 boring followed by MW-11 and MW-12.

3.2.2 SVOCs

Laboratory analysis of soil samples for SVOCs are summarized on table 4 and indicate that 3 of 13 samples analyzed (8 soil borings) contained at least 1 SVOC at a concentration above the MDL. Of the 8 soil borings completed, 3 contained SVOCs at concentrations above TAGM 4046 RSCO. These borings were MW-10, MW-14 and MW-15.

The SVOC with the greatest exceedance above RSCO was benzo(a)pyrene which was detected at concentrations up to 210 ug/kg (micrograms per kilogram). The other SVOCs detected above RSCO were benz(a)anthracene and 2-methylphenol. The most highly SVOC-impacted soil came from MW-10 and MW-14.

3.2.3 PCBs and Pesticides

No PCBs or pesticides were detected at concentrations above the MDL in any of the 13 soil samples.

3.2.4 Metals

Every metal on the TAL metals list except silver was detected in at least one soil sample. Results are summarized on table 5. On average, iron, aluminum and magnesium were detected at the highest concentrations in the soil samples.

Individual cleanup objectives for many of the metals in TAGM 4046 are listed as a numeric concentration or "site background". No soil samples were collected during this investigation with the intent of establishing general site background metals concentrations. In an industrial, urban area such as the Fyn location, it is expected that metals concentrations in soil to be ubiquitous. Therefore. comparison of metals analysis results from this investigation to the numerically-specific RSCOs should not be considered as exceedance of the soil cleanup standards.

Seven metals were detected at concentrations exceeding their numerical Cleanup Objectives (iron, cadmium, chromium, nickel, selenium, zinc and copper).

Laboratory summary pages for soil analysis are included as Appendix D. Category B deliverables are submitted to the NYSDEC under separate cover.

3.3 Ground-Water Analysis Results

3.3.1 VOCs

Laboratory analysis of ground-water samples for VOCs are summarized on table 6 and indicate that of the 18 monitor wells sampled, 14 contained ground water with detectable concentrations of VOCs (above the MDL). VOCs at concentrations above the NYSDEC Ground-Water Quality Standard or Guidance Value (GWQS or GV) were detected in ground-water samples from

MW-4, MW-5, MW-6, MW-7, MW-8, MW-9A, MW-10, MW-11, MW-12, MW-16, GP-1 and GP-2.

The most prevalent VOCs in ground-water samples were xylenes, toluene, ethylbenzene and acetone. Xylenes and ethylbenzene were detected at their greatest concentrations in the MW-12 ground-water samples (xylenes at 56,000 ug/l [micrograms per liter] and ethylbenzene at 9,700 ug/l). Toluene was detected at 87,000 ug/l in one of the MW-9A samples and acetone was detected at 9,500 ug/l in the MW-4 sample. Figure 4 is a map showing dissolved concentrations for the most prevalent VOCs.

Monitor Wells MW-9A, MW-10, MW-11, MW-12, MW-13 and MW-14 were sampled at several depth intervals to lend insight to the vertical ground-water quality distribution. Dominant, lighter-than-water (specific gravity < 1.0) VOCs showed a decreased concentration with depth in most of the wells. For example, ethylbenzene, toluene and xylene concentrations in MW-9A samples decreased between 59 percent and 61 percent from the top sample (17-19 ft bg) to the bottom sample (25-27 ft bg). Ethylbenzene in MW-11 and acetone in MW-12 did not follow this trend and increased in concentration with depth. Chlorinated solvents (specific gravity > 1.0) concentrations remained the same or increased with depth (see table 6, MW-9A, MW-10 and MW-14).

3.3.2 SVOCs

SVOC laboratory results are summarized on table 7. Of the 18 monitor wells sampled, 14 contained ground water with detectable concentrations of SVOCs (above the MDL). SVOCs at concentrations above the GWQS or GV were detected in ground-water samples from MW-11, MW-12 and CE-4.

The most prevalent SVOCs in ground-water samples were bis (2-ethylhexyl)phthalate, 2,4-dimethylphenol, 2-methylphenol and benzyl alcohol. Bis (2-ethylhexyl) phthalate was detected at a concentration of 200 ug/l

in the CE-4 sample. 2,4-dimethylphenol was detected at a concentration of 90 ug/l in the MW-11 sample (23-25 ft bg interval).

Most SVOCs exhibited a decreased concentration with depth in those wells sampled at several intervals although several compounds did not follow this trend (see table 7).

3.3.3 PCBs and Pesticides

No PCBs or pesticides were detected at concentrations above the MDL in any of the ground-water samples.

3.3.4 Metals

Seven ground-water samples were analyzed for total TAL metals. Laboratory results are summarized on table 8. Each sample had a minimum of 4 and a maximum of 8 metals that exceed the GWQS or GV for that particular metal. Predominant metals in ground water include iron, sodium and manganese. Ground-water samples from MW-12 and MW-14 contained metals at the highest overall concentrations. Laboratory summary pages for ground-water analysis are included as Appendix E. Category B deliverables are submitted to the NYSDEC under separate cover.

4.0 HYDROGEOLOGY

Based on soil samples collected during drilling for monitor wells, subsurface geology consists mainly of medium to fine brown sand with varying amounts of silt and gravel. Geologic logs for the SRI borings are attached in Appendix F. Several borings (MW-9A, MW-11, MW-12, MW-13, MW-14 and MW-15) encountered coarse sand at depths between 9 and 24 ft bg and extending to 31 ft bg in some cases. Heavy drilling and/or auger refusal was encountered in MW-9 at 10.5 ft bg, MW-12 at 24 ft bg, MW-13 at 7-9 ft bg and MW-16 at 9-20 ft bg. Presumably, this heavy drilling is the result of a cobble/boulder layer at these depths.

Ground water depth below top of well-casing was measured between 5.41 feet (GP-2) and 18.03 feet (MW-D) on August 22, 2003. Ground-water elevations on this date ranged between -1.42 feet (MW-2) and 3.11 feet (MW-16) relative to the site datum.

Figures 5 and 6 are ground-water elevation contour maps for August 22 and September 22, 2003 and were measured near the times of low tide and high tide along the East River, respectively.

Ground water surrounding the site flows westward toward the East River. Ground water beneath the Fyn building is between 0.2 and 0.9 foot higher in elevation than areas to the east as evidenced by measurements in MW-11, MW-15, MW-16 and MW-9A. This causes the contour lines to bend toward the west and indicates a radial flow pattern toward the west, northwest and west-southwest.

Monitor Well CE-1 was not used in contouring these maps. The elevation of the product detected in CE-1 is 5 to 6 feet higher than the water and product elevations measured in wells only 40 and 70 feet away (MW-16 and MW-15, respectively). The water/product in this well may be abnormally high due to vadose zone material entering and becoming trapped in the well or due to its proximity to the tank grave of the underground storage tanks (UST) beneath the Con Edison parking lot.

Comparison of the ground-water elevation contour maps for times of low and high tide along the East River does not indicate a significant change in the ground-water flow patterns between the two. Influence of ground-water elevation by the East River tides extends approximately 100 feet inland from the shoreline. This is not far enough to impact the flow patterns within the areas of the dissolved plume or free-phase product.

Free-phase product was measured in Monitor Wells MW-15, CE-1 and MW-9A. Thicknesses of 0.48 and 0.02 foot were measured in CE-1 on August 7 and August 22, 2003. Product was first detected in MW-9A on September 22, 2003 at a thickness of 0.01 foot.

Product was first measured in MW-15 on August 4, 2003 at a thickness of approximately 5 feet. Product has been removed from MW-15 by hand-bailing 2 to 3 times per week and is contained in a steel 55-gallon drum within the Fyn building. Product thickness prior to bailing has varied between 1 and 2 feet. Table 9 summarizes water levels for the two measurement dates.

5.0 CONCLUSIONS

Laboratory analysis of soil samples collected during the SRI indicate the presence of VOCs including xylenes, toluene, ethylbenzene, acetone and methyl isobutyl ketone. Concentrations in soil were highest in the MW-11, MW-12, MW-13 and MW-15 borings. The impacted soil exists at and below the water table. PID screening indicated little or no VOCs in soil above the water table with the exception of MW-15 and MW-16.

Analysis of ground-water samples indicates the presence of dissolved VOCs in most of the ground-water samples. Twelve wells contained dissolved VOCs at concentrations above NYSDEC GWQS. Greatest VOC impact to ground water exists in the region of MW-4, MW-9A, MW-11, MW-12, MW-15, MW-16 and CE-1. Although little soil impact was detected in the MW-9A boring, high concentrations of VOCs were detected in ground-water samples from this monitor well. Conversely, VOCs observed in MW-13 soil samples were not reflected in ground-water samples.

The dissolved VOC plume extends to the northwest to MW-4 and MW-12 but not as far as CE-4, GP-2 or MW-1. Its lateral limit to the west is defined by low levels or no VOCs in MW-8, MW-10 and MW-14.

Free-phase product was observed in MW-15, CE-1 and MW-9A and has been observed in CE-2 in the past. The greatest thickness is near MW-15. The product appears to be confined to the area beneath the north wall of the Fyn building and an unknown portion of the Con Edison parking lot north of Fyn.

	Sample ID	GP-1	GP-2	GP-3	CE-1	CE-2	CE-3	CE-4	CE-4	
		DF=1	DF=1					DF=1	DF=10	NYSDEC
Compound	units									GWQS or GV
Benzyl alcohol	(ug/l)									---
2-methylphenol	(ug/l)									---
4-methylphenol	(ug/l)									---
2,4-dimethylphenol	(ug/l)									50
Naphthalene	(ug/l)									10
2-methylnathphalene	(ug/l)									---
Acenaphthene	(ug/l)									20
Diethylphthalate	(ug/l)									50
Phenanthrene	(ug/l)									50
Anthracene	(ug/l)									50
Di-n-butylphthalate	(ug/l)									---
Fluoranthene	(ug/l)									50
Pyrene	(ug/l)									50
Benz (a) anthracene	(ug/l)									0.002
Chrysene	(ug/l)									0.002
Bis (2-ethylhexyl) phthalate	(ug/l)	3 (BJ)	4 (BJ)					210 (EB)	200 (DB)	5
Benzo (b) fluoranthene	(ug/l)									0.002
Benzo (k) fluoranthene	(ug/l)									0.002
Benzo (a) pyrene	(ug/l)									< MDL
Indeno (1,2,3-cd) pyrene	(ug/l)									0.002
Benzo (g,h,i) perylene	(ug/l)									---

ft bg = feet below grade

NYSDEC GWQS or GV = New York State Department of Environmental Conservation Ground-Water Quality Standards or Guidance Values

DF = dilution factor

ug/l = micrograms per liter

(J) = indicates an estimated value. data indicate the presence of a compound less than the sample quantitation limit

(B) = analyte is found in the associated blank as well as in the sample

(E) = compound concentration exceeds the calibration range of the GC/MS

(D) = compound identified in an analysis at a secondary dilution factor

exceeds GWQS

Environmental Detailed Incident Report

Report Type: Preliminary

Brooklyn Electric Distribution System

Incident ID: 147277 **Rev. #:8** **Incident Status:** - Cleanup Pending

Incident Type: Spill - Dielectric, Transformer
Brief Description: V4048 - FOUND APPROX 300 GALS OF TRANSFORMER OIL ON APPROX 300 GALS OF WATER
Administrative Site: 30 Flatbush - HQ
Responsible Operation: FOD
Location: V4048 - S/S METROPOLITAN AVE 60' E/O RIVER ST
No. of Injuries: 0
Any Outside Impact: N
Immediate Abatement/Containment Actions: TOOK SAMPLE - PLACED TAG
Start (Incident First Discovered): 25-FEB-2003 01:55:00
First Reported: 25-FEB-2003 02:05:00
First Reported to CIG: 25-FEB-2003 02:34:00
Cleanup Completed/Stopped:
Resolved (administrative closure):
Duration Hours (discovery to closure):

Detailed Description: 2/25/03 - 0155
J. TRAEGER - 15760 - FOD, REPORTS FINDING APPROX 300 GALS OF DIELECTRIC FLUID ON 300 GALS OF WATER IN V4048 (6B43). SPILL IS CONTAINED. NO SEWERS OR WATERWAYS AFFECTED. NO FIRE OR SMOKE INVOLVED. NO INJURIES RELATED TO THE SPILL. NO PRIVATE PROPERTY AFFECTED. TAG # 13474 PLACED IN STRUCTURE. NO SEWER CONNECTIONS. NO MOVEMENT IN THE WATER. NO LARGE CRACKS IN THE STRUCTURE. UNIT PRESSURE TESTED & SAMPLED 11/7/02 - IT HELD PRESSURE AND THE COUNT CAME BACK AS 6 PPM (LSN # 02-10563). PCB SAMPLE TAKEN. CHAIN OF CUSTODY FORM # CC02078 FILLED OUT AND MARKED 'E' (WITHIN 8 HRS) PRIORITY. ENV MGR R. JAMES NOTIFIED. EPA # REQUESTED. TANKER ORDERED. ENV. OPS. NOTIFIED. CLEANUP TO BEGIN AS 50 - 499. TJ - 50495

CIG MORRIS NOTIFIED AT 0234 HRS. TJ - 50495

UPDATE: 2/25/03 - 0300
FDR 6B43 WILL NOT BE READY FOR WORK UNTIL APPROX 0800. BQE WILL NOTIFIED AT 0600 TO SEND A CREW TO LOC TO PRESSURE TEST TRANSF. OIL SAMPLE DELIVERED TO CHEM LAB. TJ - 50495

UPDATE: 2/25/03 - 0355
R. JAMES - ENV MGR, REPORTS ERT W. CAPUNE ARRIVED ON LOC AT 0355. MR. JAMES TOOK MEASUREMENT OF OIL IN STRUCTURE. NEW ESTIMATE IS 75 GALS OF OIL IN STRUCTURE. MR. CAPUNE LEFT AT 0420. TJ - 50495

Environmental Detailed Incident Report

Brooklyn Electric Distribution System

Report Type: Preliminary **Incident Status:** - Closed (submitted for NYSDEC approval)
Incident ID: 147277 **Revision No:** 32
Incident Type: Spill - Dielectric, Transformer
Brief Description: V4048 - FOUND APPROX 300 GALS OF TRANSFORMER OIL ON APPROX 300 GALS OF WATER
Administrative Site: 30 Flatbush - HQ
Responsible Operation: Flush Operations
Location: V4048 - S/S METROPOLITAN AVE 60' E/O RIVER ST
No. of Injuries: 0
Any Outside Impact: N
Immediate Abatement/Containment Actions: TOOK SAMPLE - PLACED TAG
Start (Incident First Discovered): 25-FEB-2003 01:55:00
First Reported: 25-FEB-2003 02:05:00
First Reported to CIG: 25-FEB-2003 02:34:00
Cleanup Completed/Stopped: 17-JUN-2003 14:00:00
Resolved (administrative closure):
Duration Hours (discovery to closure):

Detailed Description:

2/25/03 - 0155
J. TRAEGER - 15760 - FOD, REPORTS FINDING APPROX 300 GALS OF DIELECTRIC FLUID ON 300 GALS OF WATER IN V4048 (6B43). SPILL IS CONTAINED. NO SEWERS OR WATERWAYS AFFECTED. NO FIRE OR SMOKE INVOLVED. NO INJURIES RELATED TO THE SPILL. NO PRIVATE PROPERTY AFFECTED. TAG # 13474 PLACED IN STRUCTURE. NO SEWER CONNECTIONS. NO MOVEMENT IN THE WATER. NO LARGE CRACKS IN THE STRUCTURE. UNIT PRESSURE TESTED & SAMPLED 11/7/02 - IT HELD PRESSURE AND THE COUNT CAME BACK AS 6 PPM (LSN # 02-10563-008). PCB SAMPLE TAKEN. CHAIN OF CUSTODY FORM # CC02078 FILLED OUT AND MARKED 'E' (WITHIN 8 HRS) PRIORITY. ENV MGR R. JAMES NOTIFIED. EPA # REQUESTED. TANKER ORDERED. ENV. OPS. NOTIFIED. CLEANUP TO BEGIN AS 50 - 499. INTERIM REMEDIAL MEASURES
SITE ID #V00380-2

1.0 INTRODUCTION

The Fyn Paint & Lacquer Co., Inc. (Fyn) is the subject of a Voluntary Cleanup Program (VCP), Index Number W2-0873-00-10 pursuant to the New York State Department of Environmental Conservation (NYSDEC) VCP. Fyn has entered into the VCP with the NYSDEC and is listed as the volunteer for Site ID #V00380-2, Index No. W2-0873-00-10. Leggette, Brashears & Graham, Inc. (LBG) on behalf of Fyn, has completed the following Interim Remedial Measures (IRM). This IRM was completed based on the results of the 2004 Supplemental Remedial Investigation (SRI) and investigations performed in 2005 and 2006 consisting of a soil vapor survey, ground-water monitoring and aquifer testing. The remedial goals of the IRM are the following:

- removal of free-phase product from the subsurface to eliminate the source of dissolved phase contamination;
- reduction of the concentrations of contaminants in the ground water beneath the site to existing background levels in the area; and,
- prevent lateral and vertical migration of dissolved phase contaminants.

In order to achieve these goals, the following work has been completed at the site:

- installation and operation of a pump and treat system for removal of ground water contaminated with volatile organic compounds (VOCs) using a ground-water extraction well; and,
- removal of free-product which accumulates in the extraction well and adjacent monitoring wells.

2.0 AREA DESCRIPTION

The Fyn Paint & Lacquer Co., Inc. is located in an industrial/commercial area at the intersection of Kent Avenue and North First Street in the Borough of Brooklyn, New York City.

The Fyn Paint site consists of a one story industrial/warehouse building. The facility is currently utilized as a paint and lacquer factory. The vicinity of the property consists of industrial, commercial and residential properties.

The footprint of the building is approximately 5,000 ft^2 (square feet) on the first floor and approximately 3,500 ft^2 on the balcony. The building's heating system is provided by steam heat and the electrical service enters the building from Kent Avenue. A small basement is used for the heating oil tank, furnace and controls for the sprinkler system and air compressor. The site is connected to the New York City municipal sewer system.

Adjacent to the north of the Fyn building is a Con Edison (Con Ed) property located at 214 Kent Avenue, heretofore referred to as the Con Ed property. This property consists of one story building (currently vacant) and an associated parking lot. The building has an approximate footprint area of 7,500 ft^2 and the associated parking lot has an approximate footprint area of 3,500 ft^2. This property is/was associated with the Con Ed North First Street Terminal (NFST) which historically occupied an area between the East River, North Third Street, Grand Street and Kent Avenue. The NFST was used until April 1, 1998 for storage and distribution via pipeline of #6 oil. A total of over 31 million gallons of #6 oil was stored in six (6) above-ground storage tanks (ASTs) and in one 10,000-gallon underground storage tank (UST) which was located in the parking lot of 214 Kent Avenue.

3.0 GEOLOGY AND HYDROGEOLOGY

The Site is located in the Atlantic Coastal Plain physiographic province. The geology of this province is comprised of interbedded layers of sand, clay and marl. The marine deposits are Cretaceous and Quaternary. The drift deposits are derived from glacial activity that occurred during the Pleistocene. The total thickness of the marine and glacial deposits in Kings County ranges from 0 foot in northwest Brooklyn to 1,100 feet thick in northeastern Brooklyn.

The topography of the area is generally level. The vicinity of the Site is approximately 11 to 15 ft msl (feet above mean sea level). The ground surface at the Site consists of poured concrete and asphalt pavement. The shallow sediments beneath the Site consist of medium and coarse grained brown sand with some silt and trace gravel. In general, the subsurface beneath the area consists of interbedded layers of sand, gravel, clay and silt to approximately 75 feet below ground

surface. Bedrock beneath the Site is approximately 75 feet below ground surface. The regional direction of ground-water flow beneath the Site is westerly, toward the East River.

4.0 BACKGROUND

The Fyn Paint property located at 230 Kent Avenue and the Con Ed property located at 214 Kent Avenue are located above the subsurface contaminant source area. A Site Area Map is shown on figure 1.

4.1 Con Ed Property

Information provided by Con Ed has shown that in 1996, product containing VOCs was encountered in soil borings advanced for the cathodic protection installation associated with the Con Ed 10,000-gallon UST. The VOCs detected included toluene, ethylbenzene and xylenes totaling 876,000 mg/l (milligrams per liter) [Con Ed, no date]. The NYSDEC Spill Number 96-04977 was assigned to Con Ed in association with the contamination identified adjacent to the UST.

Soil borings were advanced into the water table at the former oil storage area and former Pfizer site. Laboratory analysis of the soil sample indicated VOC concentrations above the NYSDEC Recommended Soil Cleanup Objectives (RSCOs). Results for the metal analyses identified ten metals with concentrations above NYSDEC RSCOs.

Ground-water samples were collected from four monitoring wells which previously existed onsite. Of the four previously existing monitoring wells, only one contained VOCs in ground water in concentrations exceeding the NYSDEC Class GA standards.

4.2 Fyn Paint Property (230 Kent Avenue)

The Fyn Paint & Lacquer Co., Inc. is a facility which produces paints and lacquers. This facility is a NYSDEC registered Chemical Bulk Facility (ID #2-000151).

In 1996, Con Ed reported NYSDEC Spill #96-04977 for subsurface contamination discovered associated with the Con Ed 10,000-gallon UST. Although this contamination was discovered in 1996 and Con Ed informed NYSDEC that Fyn Paint was a potential contaminant source, the owner of Fyn Paint & Lacquer Co., Inc. was not notified of the spill and/or their potential involvement by NYSDEC and/or Con Ed.

In January 1999, Fenley & Nicol Environmental on behalf of Fyn Paint performed the closure of three (3) steel 550-gallon USTs; four (4) steel 1,100-gallon USTs; and one (1) steel 1,500-gallon UST at Fyn (figure 2).

Following the tank abandonment in February 1999, 8 soil borings were drilled inside of the Fyn Paint building. Selected soil samples were analyzed in the laboratory. The laboratory analysis indicated the presence of ethylbenzene, toluene, o-xylene, m/p xylene and acetone. A UST closure report was prepared by Fenley & Nicol Environmental on March 23, 1999.

In November and December 2000, Fenley & Nicol Environmental conducted a limited subsurface investigation in order to determine the ground-water quality beneath the Fyn Paint building. Three temporary ground-water sampling wells, as well as eight soil borings, were installed in the vicinity of the former USTs. The location of soil borings is shown on figure 2. Laboratory analysis of the ground-water samples collected from temporary wells identified VOCs, primarily acetone, xylene, toluene, ethylbenzene, 2-butanone and methylene chloride.

5.0 FYN PAINT SUBSURFACE REMEDIAL INVESTIGATIONS

In 2001, LBG conducted a subsurface investigation at the Fyn Paint factory and the adjacent areas including the Con Ed North First Street Facility. The purpose of the investigation was to evaluate the soil and ground-water quality beneath Fyn Paint, Con Ed and the areas surrounding these two facilities.

The results of laboratory analysis indicated concentrations of VOCs in soil and ground water in the Con Ed parking lot adjacent to Fyn Paint and beneath Fyn Paint building. Xylenes, acetone, ethylbenzene and toluene were the most prevalent VOCs detected in the soil samples collected.

The highest concentrations of dissolved VOCs were encountered in ground water collected from wells located in the Con Ed parking lot. The chemical compounds detected were, xylenes, toluene, ethylbenzene and acetone. Additionally, PCE was detected in a well located in the Con Ed parking lot.

Free-phase product was measured in two wells (CE-1 and CE-2) in the Con Ed parking lot on June 7, 2001. The location of monitoring wells is shown on figure 3.

In 2003, LBG conducted, on behalf of Fyn Paint, a Supplemental Remedial Investigation at the Site. Between July 21 and August 8, 2003, 11 soil borings were completed in the area.

Following the completion of soil borings, a monitor well was installed in each borehole. The location of monitoring wells is shown on figure 3.

The laboratory analysis showed the highest concentrations of VOCs (toluene, xylene, ethylbenzene, acetone, isopropylbenzene and naphthalene) in soil was collected from the soil boring completed for the installation of a monitoring well (MW-15) which is located on the east-northeast corner of the Fyn Paint building along Kent Avenue (see figure 3).

Analysis of ground-water samples indicated that twelve wells contained dissolved VOCs at concentrations above NYSDEC Technical and Operational Guidance Series (TOGS) Ground-Water Quality Standards (GWQS). In addition, several chlorinated solvents such as PCE, trichloroethene (TCE) and 1,1,1 trichloroethane were detected in ground-water samples collected from MW-5, MW-6 and MW-7. The source of the chlorinated solvents in ground water could not be identified during the subsurface investigation; however, the highest concentration of PCE identified throughout the Site in soil and ground water were found in CE-1 and CE-2.

Also in 2003, free-phase product was observed in MW-15, CE-1 and MW-9A and had been observed in CE-2 in the past. The product appeared to be confined to the area beneath the north wall of the Fyn building and an unknown portion of the Con Ed parking lot north of Fyn. Following the completion of the 2003 investigation, the free-phase product was bailed from the effected wells.

In February 2004, LBG performed a ground-water sampling round, sampling all of the available monitoring wells on and surrounding the Fyn Paint Site. The results of this ground-water sampling round indicate that the same primary contaminants observed in the dissolved phase throughout the Site, remain at similar concentrations with the exception of MW-4 which showed a significant decrease in VOC concentrations. Additionally, CE-2 and MW-9A were not sampled due to the presence of free-phase product observed on the water table.

In 2005, following the NYSDEC approval of the "Supplemental Investigation Work Plan, (Addendum I – Revised)", LBG conducted an additional subsurface investigation on behalf of Fyn Paint.

In 2005, Fyn Paint installed eight (8) additional ground-water monitoring wells and two (2) ground-water extraction wells (EW-1 and EW-2). The locations of these wells are shown on figure 3.

Following the soil sampling, the monitoring wells were installed using the hollow-stem auger drilling method. The monitoring wells and extraction wells (well screen and riser) were constructed of 2-inch diameter and 4-inch diameter stainless steel. The soil sampling and well installation activities in the Con Ed parking lot indicated that there are several significant sub-surface structures, obstacles, impediments, and/or obstructions present in the subsurface.

Soil samples collected prior to the installation of these wells indicated that the highest soil contamination is present in the east end of the Con Ed parking lot.

All of the newly installed wells and the previously installed wells were then included in the quarterly ground-water monitoring program. The laboratory results for the ground-water samples indicate the continued presence of VOCs in the ground water beneath the area and that the major contaminants at the Site continue to be toluene, xylenes, acetone and ethylbenzene.

In 2006, in order to evaluate the implementation of IRM, a pumping test was conducted from EW-1 (a 4-inch diameter stainless steel well constructed inside of the Con Ed parking lot adjacent to the northeast corner of the Fyn Paint building). The location of pumping well is shown on figure 3. The field data indicates a water-table aquifer in the overburden on top of surficial bedrock. The pumping test was conducted on April 4 and 5, 2006 from EW-1 at a rate of 4.75 gpm (gallons per minute) for approximately 18 hours. Based on ground-water level measurements recorded during the pumping test, a 4.75 gpm pumping rate from extraction well EW-1 is capable of influencing the ground-water table for a radius of at least 60 feet downgradient (EW-1 to MW-23). This result demonstrates that a ground-water pumping rate of 4.75 gpm has the potential to induce a cone of depression sufficient to draw free-phase product for extraction from the subsurface and to control further migration of ground water with dissolved VOCs. The pumping test results indicated that the ground-water remediation at the Site can be accomplished by the pump and treat technology.

6.0 PRELIMINARY PRODUCT RECOVERY (IRM)

Free-phase product was measured in CE-1 and CE-2 on June 7, 2001, at thicknesses of 0.84 foot and 0.02 foot, respectively. The free-phase product was removed from both wells during sampling on June 7, 2001. On June 20, 2001, measurements of these wells indicated that the free product thickness in CE-1 had recovered to 0.01 foot and there was no free product in CE-2. On July 12, 2001, CE-2 had no water or product in it and CE-1 had a free-product thickness of

0.14 foot. The product removed from these wells was temporarily stored in a 55-gallon drum onsite pending offsite disposal.

Also in 2003, free-phase product was observed in MW-15, CE-1 and MW-9A. The greatest thickness was near MW-15. The product appeared to be confined to the area beneath the north wall of the Fyn building and an unknown portion of the Con Ed parking lot north of Fyn. Following the initial product bailing activities, product was regularly bailed from MW-15 (every several weeks from May 2004 to January 2005) and temporarily stored in a 55-gallon drum onsite pending offsite disposal. The manual bailing activities performed from 2001 to 2005 generated approximately 40 gallons of free-phase product and approximately 100 gallons of contaminated ground water.

The free-phase product was pumped off of the top of the ground water from the storage drums into one drum (only product). The free-phase product bailed from the affected wells was stored temporarily onsite in one 55-gallon drum inside the Fyn building pending offsite disposal. The contaminated ground water was stored in two 55-gallon drums inside the Fyn building pending disposal.

7.0 INTERIM REMEDIAL MEASURES

Interim Remedial Measures (IRM) at the Site consist of: a ground-water extraction and treatment system; and, a free-phase product recovery system. The IRM component installation was completed in February 2007 and following receipt of the New York City Department of Environmental Protection (NYCDEP) discharge permit the treatment system was started in April 2007. The IRM installation activities were completed in accordance with the work plan submitted to the NYSDEC in August 2006.

The IRM was designed to be protective of human health and the environment in the short and long-term until the final site compliance is achieved. The objective of the IRM is the following:

- removal of free-phase product using product skimmer/ferret pumps;
- prevent migration of contaminated ground water using ground-water extraction treatment and discharge; and,
- monitoring (system and ground water) to evaluate and determine potential additional remedial alternatives.

The IRM installation began with trenching activities which were conducted on the Con Ed parking lot located at 214 Kent Avenue (adjacent to the north of the Fyn Paint building). The trenching activities were performed by American Environmental Assessment Corp. of Wyandanch, New York with oversight and supervision by LBG. All activities associated with the IRM trenching activities were conducted in accordance with the Site Specific Health and Safety Plan (HASP) and other addendums prepared and utilized for the Interim Remedial Measures Work Plan submitted to the NYSDEC in June 2006.

The extents of the trenches were saw-cut through the existing concrete and asphalt. The trenches were 5 feet wide. The locations of the trenches (for MW-21, MW-22 and EW-1) are shown on figure 4. After the extents were cut, the overlying asphalt and concrete were removed using a bobcat loader. The trenches were excavated to a depth of 3.75 feet below grade. All soil excavated from the trenches was placed into an onsite roll-off pending disposal. Following all excavation activities, the excavated soil stockpile was sampled and sent to a New York State approved laboratory for waste characterization analysis, as per Con Ed requirements. After the trenches were excavated to the final depth, a base layer of pea gravel (approximately 5-inches thick) was installed along the base of the excavation. A 4-inch diameter schedule 40 PVC pipe conduit was then installed in the excavation. Illustrations of the trench piping and well heads for both the ground-water extraction well (EW-1) and the two monitoring/product recovery wells (MW-21 and MW-22) are shown on figures 5 and 6. After the conduit piping was installed in the trenches, the piping was covered with approximately 1.5 feet of pea gravel. The pea gravel backfill was then covered in a layer of filter fabric and the remainder of the excavation was backfilled with clean fill. A trench cross section is illustrated in figure 7. As per the Con Ed requirement, the fill was certified as clean by the supplier. After the trench was backfilled, it was compacted and then capped with an asphalt layer. The site was inspected after the trenching activities to ensure that no additional settling had taken place. Following receipt of the laboratory analysis for waste characterization, the excavated soil was disposed of offsite by Con Ed. After the installation of the conduit trenches, the ground-water treatment system and product recovery system was installed. Both systems consist of pneumatic pumps installed within the wells EW-1 (for ground water) and MW-21 and MW-22 (for product). Ground-water extraction well and product recovery wells piping are shown on figure 4. The pumps were set based on the measured depths to ground water and/or product and the connected tubing was installed within the trenched

conduit piping to the inside of the Fyn Paint building. Both systems are powered by a 3 horsepower explosion-proof air compressor located within the Fyn Paint building.

The ground-water extraction and treatment system is composed of the following: a pneumatic submersible ground-water extraction pump; a low-profile air stripper and associated explosion-proof regenerative blower; a vapor exhaust stack; a transfer pump, a liquid phase carbon unit; all associated piping; and, a control panel. The ground water is currently being extracted using a 4-inch diameter stainless steel vertical extraction well (EW-1). The location of this well is shown on figure 3.

The ground water is pumped from the extraction well (through polyethylene and steel piping) to a low-profile air stripper which is equipped with the blower, cleanout holes, gauges and switches to control the operation. As the water flows through the air stripper, air is forced through it using an explosion-proof regenerative blower. After treatment through the air stripper, the ground water is then run through a liquid phase carbon polish and then discharged to the sanitary sewer utilizing the transfer pump. A process flow diagram for the ground-water extraction and treatment system is shown on figure 8.

The product pumps are set up with independent control boxes and cycle at set time intervals to allow maximum product accumulation/recovery. The product is pumped through chemical rated tubing and stored in steel 55-gallon drums. A process flow diagram for the product recovery system in shown on figure 9.

Detailed equipment specifications for all IRM equipment is outlined in Appendix I.

Following the first year of system operation (April-December 2007) a *Summary of 2007 Treatment System Operation* was prepared and submitted to the NYSDEC in December 2007.

This report summarized the status of the treatment system during the 2007 period of operation and presents the laboratory analysis of ground-water samples (pre-treatment and post-treatment) collected during the system sampling rounds performed at the Site. The data evaluation shows that the ground-water pump and treat system is actively removing contaminated ground water from beneath the Fyn Paint and Con Ed properties. Following initial recovery of free-phase product, no significant free-phase product accumulation has been observed in the product recovery wells.

8.0 SUMMARY OF 2007 AND 2008 GROUND-WATER TREATMENT AND PRODUCT RECOVERY SYSTEMS OPERATION

The IRM started on April 11, 2007. The IRM consists of an active ground-water extraction and treatment system and an active product recovery system. The locations of the ground-water extraction well (EW-1) and the product recovery wells (MW-21 and MW-22) are shown on figure 3.

All of the treatment system monitoring and sampling ports and operating parameters are located within the Fyn Paint building with the exception of well conditions (of which access to the Con Ed property is required). Additionally, ground-water quality beneath the Site is monitored via ground-water monitoring wells located throughout the Site and surrounding neighborhood.

Monitoring, sampling and maintenance of the ground-water extraction and treatment system as well as monitoring of the product recovery system commenced on March 19, 2007 and is conducted one time a month.

Water samples were collected from the post-stripper and effluent ports of the combination air stripper/liquid phase carbon treatment system. Water samples from the ground-water treatment system were analyzed for VOCs by USEPA Method 8260.

An air/vapor sample was collected from the effluent port of the vapor phase carbon treatment system. The air/vapor sample from the air stripper was analyzed for VOCs by USEPA Method TO-14 or TO-15. Of note, future analysis of the air/vapor sample will be performed using USEPA Method TO-15.

All operating parameters and any necessary adjustments of the ground-water treatment system, air stripper, air compressor and carbon units were recorded on monitoring field sheets.

System Monitoring - During the Site visits since the commencement of the system on April 11, 2007, all operating parameters were recorded onto monitoring field sheets. The dates in 2007 in which the system was monitored include: April 11, 18 and 25; May 16; June 27; August 3; and, October 24. The dates in 2008 in which the system was monitored include: February 4, 2008 and March 19, 2008. Site conditions were recorded in addition to information for the treatment/recovery system. For the ground-water treatment system, the totalizer flow meter readings as well as general system inspection observations were recorded. For the air stripper, flow rate, temperature, photoionization detector (PID) concentrations (effluent) as well as general system inspection observations were recorded. These monitoring field sheets are used to monitor the progress of the systems through the duration of its operation. Monitoring field sheets for the system operation during 2007 and 2008 are included in Appendix II.

Product Recovery System - Following the initiation of the free-phase product recovery pumps at the Site, the product was pumped to dedicated 55-gallon drums (one each for MW-21 and MW-22). Due to degradation of the float material on the pumps, the inlets on the product recovery pumps had to be modified to static inlets. From the ground-water treatment system activation up until August 2, 2007, approximately 5 gallons of product were recovered, 1 gallon from MW-21 and 4 gallons from MW-22. Additionally, approximately 10 gallons of water were recovered from MW-21; and approximately 30 gallons of water were recovered from MW-22.

On August 2, 2007, after the carbon change-out for the ground-water treatment system was performed, the contaminated ground water associated with the product bailing activities (as well as 2 drums of water collected in connection with onsite ground-water sampling activities) was pumped

through the treatment system. This was done following receipt of verbal consent from the NYSDEC.

Since August 2, 2007, no additional product was recovered from MW-21 or MW-22. In the end of 2007 and beginning of 2008, the product recovery system was not operational. On May 7, 2008 the product recovery system was restarted and product from MW-22 was recovering effectively.

To date, there is approximately 45 gallons of free-phase product (total recovered since 2001) temporarily stored in one 55-gallon drum inside the Fyn building pending offsite disposal.

Ground-Water Treatment System – Water samples collected from the ground-water treatment system were analyzed for VOCs by EPA Method 8260. Tables summarizing the ground-water quality for the influent, post-stripper (pre-carbon) and effluent (post-carbon) samples collected from the ground-water treatment system are included in Appendix III. Copies of ground-water laboratory reports are included in Appendix IV. Following treatment, the water is discharged to the New York City sanitary sewer which is managed by the NYCDEP. Of the contaminants of concern at the Site, the only compounds which have established NYCDEP maximum concentration discharge limits include methyl tert-butyl ether (MTBE), benzene, toluene, ethylbenzene and total xylenes.

The air stripper effluent vapor stream was sampled concurrent with the treatment system ground-water sampling. Tables summarizing VOC concentrations in the air stripper effluent vapors are included in Appendix V. Copies of the air stripper effluent laboratory reports are included in Appendix VI.

On May 14, 2007, a carbon change-out was performed so that the system was not discharging water exceeding the allowable discharge limits. This was brought about due to the fact that the toluene concentration in the effluent was just above the allowable limit during the April 25, 2007 sampling event. Following the carbon change-out, the effluent sample collected indicated that all VOCs were below NYCDEP discharge limits.

During the system inspection on June 26, 2007, a significant bacterial growth was observed to have accumulated in the air stripper. The air flow was significantly reduced as a result and as such, the air stripper was cleaned the following day. After the air stripper was cleaned, the effluent water sample was collected. This sample, collected on June 27, 2007 had concentrations of toluene and total xylenes exceeding the NYCDEP discharge limits. As such, the system was

shut down pending completion of a carbon change-out. Additionally, it was discovered that there was a blown pump seal on the transfer pump. On July 23, 2007 the pump seal was replaced and the system was available for restart pending the carbon change-out.

On August 2, 2007, a second carbon change-out was performed on the system. After the carbon was replaced, onsite purge water (drummed in connection with onsite ground-water sampling activities) was run through the system for treatment. The following day on August 3, 2007, the air compressor oil was replaced to ensure proper operation of the equipment. Following the equipment maintenance activities, the treatment system was sampled. Upon receipt of the laboratory analytical, it was recorded that toluene exceeded the NYCDEP discharge limit. This was interpreted as an anomalous value due to the fact that the carbon was replaced the day prior.

During a system inspection performed on October 5, 2007 it was observed that the air flow (effluent) on the air stripper was almost not measurable. It was determined that this was due to iron precipitate on the stripper trays as well as some bacterial growth (first observed June 26, 2007) which had occurred again. It was determined that the system needed to be serviced and the system was shut down pending the air stripper maintenance. The air stripper was disassembled and cleaned on October 9, 2007 which consisted of removing iron precipitate from the individual trays as well as bacterial growth. Following the maintenance, the system was re-started.

Following the air stripper maintenance activities, onsite personnel at Fyn Paint observed erratic ground-water flow through the system. This consisted of long periods of time during which no flow was observed at the flow meter and during which the transfer pump was not cycling. On October 24, 2007, the submersible ground-water pump was removed from the well and cleaned. Iron precipitate was observed on the pump float (the mechanism which triggers the pump cycles) which prevented the pump from cycling, thereby preventing it from operating. After the pump was cleaned, the system was sampled.

On October 31, 2007, after an extended period where the flow meter was not functioning properly (during which flow rates were manually calculated onsite) the flow meter was bypassed on the system and removed. Upon inspection it was identified that the internal components of the flow meter had degraded to the point that it was no longer functioning. The laboratory results of the post-stripper sample collected October 24, 2007 indicated that all VOCs were below NYCDEP discharge limits. The treatment system was equipped with a chemical rated flow meter on March 24, 2008.

Copies of all ground-water laboratory reports are included in Appendix IV. During the May 16, 2007, June 27, 2007, August 3, 2007, October 24, 2007, February 4, 2008 and March 19, 2008 sampling events, air stripper effluent samples were collected and analyzed by EPA Method TO-14/TO-15. The results of the laboratory analysis indicate that the air stripper is effectively stripping VOCs from the extracted ground water. Copies of all air stripper effluent air laboratory reports are included in Appendix VI.

As shown by the laboratory analysis of the ground-water samples collected in 2007 and 2008, regular treatment system monitoring is required to ensure compliance with NYCDEP discharge limits. Additionally, it appears that carbon change-outs should be scheduled approximately every two to three months.

Also, concentrations of VOCs in the effluent vapor stream of the air stripper indicate that it is effectively stripping VOCs from the extracted ground water.

Site visits completed on January 11, 2008 showed that the air stripper maintenance was required. The system was shut off and the maintenance was performed on January 22, 2008. The IRM system was restarted in February 2008 and a ground-water sample of the influent, post-stripper and effluent were collected on February 4, 2008. The laboratory analysis results are summarized in Appendix III. On February 27, 2008, maintenance of the air stripper was completed and the ground-water treatment system was put back in operation.

Additional water and air samples were collected from the system on March 19, 2008 and the system was turned off for air stripper maintenance. The air stripper maintenance was performed on March 24, 2008 and the system operation was not started until May 8, 2008 following the discharge permit renewal (Appendix VII).

As of March 19, an estimated total of 594,140 gallons of ground water have been treated by the carbon treatment system and discharged to the New York City sanitary sewer system. An application for renewal of the discharge permit was submitted to NYCDEP in March 2008. However, no approval to discharge treated water to NYCDEP sewer system was obtained until May 8, 2008. One of the reasons for the delay for the NYCDEP approval was a request for specific laboratory analysis method, which was not requested and/or reinforced previously.

The liquid phase carbon was replaced on April 3, 2008. Several samples of treated ground water showed toluene levels to exceed the NYCDEP limit of 28 ug/l (micrograms per liter) with 1 ug/l (April 14, 2008). Additional water sampling completed on April 30, 2008 indicated that all

the effluent parameters were below NYCDEP standards. Following several requests by LBG, a Ground Water Discharge Permit was received on May 8, 2008.

Copies of letters requesting the extension of the ground-water discharge permit, including treated ground-water laboratory analysis as well as a copy of the approved NYCDEP permit are included in Appendix VII.

Operation, maintenance and monitoring (OM&M) of the IRM system will be conducted monthly within the last two weeks of every month. Ground-water samples will be collected from the influent, post air stripper and effluent and analyzed in laboratory for VOCs by EPA Method 624. (This is the required analytical method by NYCDEP.)

In addition, during the treatment OM&M event which occurs concurrently with ground-water monitoring, the effluent sample will be analyzed in accordance with 40 CFR Part 136. A report summarizing the IRM system OM&M will be submitted to NYSDEC and NYCDEP within 21 days after the sampling event.

1.0 INTRODUCTION

The Fyn Paint & Lacquer Co., Inc. (Fyn Paint), pursuant to the New York State Department of Environmental Conservation (NYSDEC) Brownfield Cleanup Program (BCP), and is recorded as BCP Site No. C224154 in association with site remedial cleanup activities. Leggette, Brashears & Graham, Inc. (LBG) was retained to implement the Groundwater Monitoring Program at the Site. The primary purpose of the Groundwater Monitoring Program is to evaluate the groundwater quality beneath the Site. The field activities related to the Groundwater Monitoring Program included groundwater level measurements in all monitoring wells, low-flow sampling, direct sampling and the completion of the Groundwater Monitoring Report. On August 6, 2015, the NYSDEC authorized the modification of the groundwater monitoring program to reduce the sampling frequency from quarterly to biannual sampling. The October 2015 Biannual Sampling Event (event 2 of 2) groundwater level measurement and groundwater sampling round was conducted by LBG on October 26, 27 and 28, 2015.

2.0 SITE LOCATION AND DESCRIPTION

Fyn Paint is located in an industrial/commercial area at the intersection of Kent Avenue and North First Street in the Borough of Brooklyn, New York City. A site map is shown on figure 1. The Fyn Paint site consists of a one story industrial/warehouse building. The facility is currently inactive, however it was previously utilized as a paint and lacquer factory. The vicinity of the property consists of industrial and commercial properties.

The footprint of the building is approximately 5,000 ft^2 (square feet) on the first floor and approximately 3,500 ft^2 on the mezzanine. The building's heating system is provided by steam heat. A small basement (approximately 15 feet by 50 feet) is located along the south-southwestern side of the building. The basement contains two 275-gallon heating oil above-ground storage tanks (ASTs), the associated heating oil tank controls, an air compressor and controls for the sprinkler system. Additionally, there is a cinder block encased vault for an AST which was historically used for storage of heating oil (currently out of use). The Site is

connected to the New York City municipal sewer system (via North First Street) in this basement area. A second basement approximately 20 feet by 15 feet is located on the southeastern corner of the building (beneath the office area) along Kent Avenue. This second basement is where the electric service enters the building and is also where the furnace is located.

Fyn Paint was a facility which produced paints and lacquers. This facility was a NYSDEC registered Chemical Bulk Facility (ID #2-000151). Historical operations were performed on the first floor and partial second floor of the building. Historically, manufacturing activities at the Site utilized three (3) steel 550-gallon underground storage tanks (USTs) (western portion of the building); four (4) steel 1,100-gallon USTs (northeast corner of the building); and one (1) steel 1,500-gallon UST (northeast corner of the building). There were also several ASTs historically used in association with the manufacturing activities at the Site. Currently, there are no in-service chemical bulk storage tanks located at the Site.

3.0 GEOLOGY AND HYDROGEOLOGY

The Site is located in the Atlantic Coastal Plain physiographic province. The geology of this province is comprised of interbedded layers of sand, clay and marl. In Long Island the marine deposits are overlain by drift. The marine deposits are Cretaceous and Quaternary. The drift deposits are derived from glacial activity that occurred during the Pleistocene. The total thickness of the marine and glacial deposits in Kings County ranges from 0 foot in northwest Brooklyn to 1,100 feet thick in northeastern Brooklyn.

The groundwater resources that underlie western Long Island are composed of a series of unconsolidated deposits of sand, gravel and clay of late Cretaceous and Pleistocene age. The principle water-bearing units that provide usable quantities of water are the Upper Glacial Aquifer, the Jameco Aquifer, the Magothy Aquifer and the Lloyd Aquifer. Except for the Upper Glacial Aquifer and Jameco Aquifer, these units are vertically separated from each other by confining clay units.

The topography of the area is generally level. The vicinity of the Site is approximately 11 to 15 ft msl (feet above mean sea level). The ground surface at the Site consists of poured concrete and asphalt pavement. The shallow sediments beneath the Site consist of medium and coarse grained brown sand with some silt and trace gravel. In general, the subsurface beneath the area consisted of interbedded layers of sand, gravel, clay and silt. The regional direction of groundwater flow beneath the property is west toward the East River. There is currently an

extensive network of monitor wells, located both onsite and adjacent to the property, incorporated into the Groundwater Monitoring Program.

4.0 REMEDIAL ACTION WORK PLAN – ADDITIONAL WORK AND INTERIM REMEDIAL MEASURES

Under the historical status of the Site (performed under the NYSDEC Voluntary Cleanup Program), in addition to the Site characterization activities, the cleanup work performed as part of the Remedial Action Work Plan (RAWP) included the following components of the Remedial Design: the installation/replacement of several monitoring wells which have been destroyed or covered over during construction and/or sidewalk repair activities (MW-6, MW-7, MW-13, MW-15 and MW-25); the installation of a new monitoring well (MW-28) located inside of the Fyn Paint building; the installation of an air-sparging well (ASW-1) located in the adjacent Con Edison (Con Ed) parking lot; the replacement of monitoring Well CE-4 located on the Con Ed property on Metropolitan Avenue; as well as the decommissioning of GP-1 and GP-2 as per the NYSDEC letter dated December 23, 2009. The RAWP pilot test and subsequent remedial system component installation activities conducted onsite during 2012 and 2013 included the installation of monitoring Wells MW-29, MW-30, MW-31, MW-33 and ASW-2 in the adjacent Con Ed parking lot as well as an additional monitoring well (MW-32) inside the Fyn Paint building. Figure 2 shows the location of the monitor wells being sampled at the Site as well as the monitoring wells mentioned above. The Interim Remedial Measures (IRM) treatment system has been decommissioned as part of the Site preparation activities prior to the installation of the new permanent remediation system at the Site.

Additionally, mechanical and chemical well redevelopment activities were performed on EW-1, EW-2, MW-21 and MW-22 from July 26, 2011 to July 29, 2011. This activity was performed to increase the effectiveness of these wells as extraction points for the proposed future remediation system as well as required additional pilot test activities.

4.1 Dual-Phase Extraction Remediation System

Following the NYSDEC approval of the Remedial Design, the 2007 IRM treatment system was decommissioned. The remedial system trailer was installed at the Site in June 2014 and commenced operation in July 2014. The equipment in the remedial system installed con-

sists of: a Dual-Phase Extraction (DPE) recovery system; an oil-water separator and Non-Aqueous Phase Liquid (NAPL) storage tank; a Sub-Slab Depressurization System (SSDS); a groundwater extraction pump; an air sparging (AS) injection system (inactive); and associated groundwater and vapor treatment equipment. The extraction and treatment system components were installed in a trailer that was constructed offsite and transferred to the Site. The treatment trailer is currently staged on the west side of the Site building within the adjacent right-of-way.

The remedial system incorporates a network of extraction wells which are currently installed within flush-mount manholes. These wells include MW-11, MW-15, MW-21, MW-22, MW-23, MW-27, MW-28, MW-29, MW-30, MW-31, MW-32, MW-33, EW-1 and EW-2. The remediation system was inactive during the October 2015 Biannual Sampling Event Monitoring Event.

5.0 GROUNDWATER MONITORING PROGRAM

5.1 Groundwater Level Measurements

During the October 2015 sampling event; fluid levels in all accessible monitor wells were measured on October 26, 2015. The levels were measured to an accuracy of ±0.01 foot using an electronic water-level meter. The depth to water/product and the top of casing elevation of each well was used to calculate the corrected groundwater elevation at each point in the well network. The depths to groundwater/product and calculated groundwater elevations for October 26, 2015 are summarized on table 1.

5.2 Low-Flow Groundwater Sampling

On October 26, 27 and 28, 2015, groundwater samples were collected from 29 of the onsite and offsite monitor wells, of which 19 samples were collected using the Low-Flow Sampling Method. Groundwater samples were not collected from Monitor Wells MW-16 and MW-31 during the October 2015 Biannual Sampling Event sampling event. In addition, the monitoring wells historically associated with the annual sampling of the former Con Ed Major Oil Storage Facility (MOSF) (as per the NYSDEC approval) were sampled during the October 2015 Biannual Sampling Event sampling event. The locations of the onsite and offsite groundwater monitor wells are identified on figure 2.

Prior to sampling, the wells were opened and the static groundwater level within each was permitted to equilibrate, after which the water levels were recorded on field sheets. The total depths were previously recorded (at the conclusion of past well development activities). Copies of the field sheets for both the groundwater level measurement and the low-flow sampling activities are included in Appendix I. After the fluid-level measurements were recorded, groundwater samples were collected from 19 onsite and offsite monitor wells using the Low-Flow Sampling Method (United States Environmental Protection Agency [USEPA] Low-Flow Groundwater Sampling Procedures, April 1996). The Low-Flow (Minimal Drawdown) Groundwater Sampling Procedures are included in Appendix II. The groundwater was evacuated from the wells using a low-flow peristaltic pump fitted with dedicated polyethylene tubing. The tubing intake was set at approximately three feet above the bottom of each well. For each well, groundwater was purged for approximately 5 minutes prior to measuring any parameters, in order to minimize turbidity.

When conditions allowed, onsite field parameters were continually monitored by a Horiba U-22XD multi-parameter water-quality monitoring system. Measurements for pH, conductivity, turbidity, dissolved oxygen (DO), temperature and oxygen reduction potential (ORP) were obtained simultaneously as the groundwater was pumped through a flow-through cell at a rate of 100-500 ml/min (milliliters per minute). All field parameters were recorded at three-minute intervals until all parameters reached stabilization for three consecutive intervals. Stabilization requirements are recorded on individual low-flow sampling logs for each monitor well and are included in Appendix I. Upon reaching stabilization of all parameters, the effluent end of the polyethylene tubing running from the pump was disconnected from the flow-through cell and the groundwater samples were collected in laboratory-prepared sample containers. After sampling each well, the dedicated polyethylene tubing was disposed of and the flow-through cell was decontaminated with Alconox and water.

All of the samples were stored on ice in a cooler to maintain a constant temperature until delivery to the laboratory under chain-of-custody procedures. The groundwater samples were then delivered to AMRO Environmental Laboratories Corporation (AMRO) of Merrimack, New Hampshire for analysis of volatile organic compounds (VOCs) by EPA Method 8260 under chain-of-custody procedures.

5.3 Direct Groundwater Sampling

Remedial system maintenance activities were performed on October 27 and 28, 2015 concurrent to the low-flow sampling activities. On October 27 and 28, 2015, 10 of the 29 groundwater samples were collected from groundwater monitor wells which are incorporated in the DPE network. These wells from which direct grab groundwater samples were collected include: MW-15, MW-21, MW-22, MW-23, MW-29, MW-30, MW-32, MW-33, EW-1 and EW-2.

Prior to sample collection, the DPE extraction system was used to purge each well. Each well was evacuated dry, and subsequently groundwater was evacuated from these wells for approximately 30 minutes or more to ensure the recovered groundwater was representative of the surrounding formation.

After purging activities, the vacuum extraction drop tubing was removed from within each extraction well and groundwater levels within each well were allowed to recover. Groundwater samples were then obtained utilizing a dedicated disposable polyethylene bailer and the samples were then collected in laboratory-prepared sample containers. Additionally, measurements for pH, conductivity, turbidity, DO, temperature and ORP were taken for the each grab sample at the time of sample collection and recorded on a groundwater monitoring field sheet. After sampling was completed, the DPE drop tubing was replaced within the well.

All of the samples were stored on ice in a cooler to maintain a constant temperature until delivery. The groundwater samples were then delivered to AMRO for analysis of VOCs by EPA Method 8260 under chain-of-custody procedures.

5.4 Manual NAPL Recovery from Offsite Wells

On October 28, 2015, there was a film observed on the groundwater surface within MW-13. This well, in addition to adjacent well MW-25, have historically contained significant thicknesses of NAPL. Upon restarting the remedial system on October 28, 2015, manual bailing was performed in offsite Monitor Wells MW-13 and MW-25, as is standard practice while performing the monthly remedial system monitoring activities. As a result of the bailing activities, approximately 2 gallons of mixed NAPL and groundwater (primarily groundwater) was recovered. All groundwater was separated from the NAPL and processed using the remedial system. The remaining NAPL was transferred into a steel DOT approved drum in the Fyn Paint building for temporary storage pending offsite disposal.

6.0 QUALITY ASSURANCE AND QUALITY CONTROL (QA/QC) PLAN

QA/QC procedures were utilized throughout the project to ensure reliable data. AMRO, a National Environmental Laboratory Accreditation Conference (NELAC) certified laboratory (Certificate No. 11278) performed all analyses.

Based on past sampling completed on the Site, the groundwater samples were analyzed for VOCs by EPA Method 8260. Sampling methods, sample preservation requirements, sample handling times and decontamination procedures for field equipment were conducted in accordance with NYSDEC and USEPA standard operating procedures and industry standards. In addition to the collected groundwater samples, laboratory analysis was performed on a laboratory method blank. The table below summarizes the sampling standards.

SUMMARY OF SAMPLE HANDLING AND PRESERVATION

Sample Collection Area	Media	Analytical Method	Holding Time	Preservation
Monitoring Wells (previously installed and newly installed)	Groundwater	EPA Method 8260	< 2 Weeks	HCl ICE

7.0 DATA EVALUATION

7.1 Onsite Hydrogeology

The topography of the Site area is level in the developed sections with a moderate gradient to the west in the surrounding area (streets, undeveloped parcels...). Water-level measurements were collected from the monitoring wells on October 26, 2015 and are presented on table 1. The corrected groundwater elevations were calculated based on the respective measurements and were used to construct a groundwater elevation contour map to determine the direction of groundwater flow and the hydraulic gradient beneath the Site.

The corrected groundwater elevations were used to construct a groundwater elevation contour map and to determine the direction of groundwater flow. This October 26, 2015 groundwater elevation contour map is shown on figure 3. Several monitoring wells were not used in generating contours for the groundwater elevation contour map due to irregular groundwater elevation values observed (MW-4, MW-5, MW-7, MW-8, MW-9A, MW-24, MW-27 and MW-29). The contours generated using onsite and offsite monitoring wells show a general groundwater flow direction to the west toward the East River at an average hydraulic

gradient of approximately 0.0073 foot per foot (ft/ft) to 0.0085 ft/ft, with the gradient increasing at closer proximity to the Site.

There is significant variability in the observed groundwater elevations within the northeast portion of the Con Ed parking lot (to the north of the Site). This may be attributed to perched water within the material surrounding the closed in-place UST. However in this area there appears to be a localized area of groundwater mounding (most evident within MW-23) which is impacting the hydraulic gradient beneath both the Site and surrounding properties. In this area specifically, the groundwater mounding is projecting radially with a hydraulic gradient of approximately 0.2 ft/ft, which is more than an order of magnitude greater than the average gradient surrounding the Site. Of note, historical assessments did not identify any water source to which this mounding could be attributed, and to date, factors inducing this significant variability have not been identified/isolated.

It should be noted that during the duration of the groundwater sampling event the New York City Department of Environmental Protection (NYCDEP) discharge permit was in the process of being renewed. Therefore, the groundwater pump and treat system was inactive during the sampling event (and for the 2 months prior to the sampling event). On October 26, 2015 the NYCDEP discharge permit was issued. Remedial system maintenance activities were performed on October 27 and 28, 2015, following which the remedial system was re-started.

7.2 Groundwater Quality

Groundwater samples were collected from the groundwater monitor wells located throughout the Site with the exception of MW-16, MW-31 and the air sparge wells. The groundwater quality results for the monitor wells sampled are summarized on table 2.

VOCs, which are the primary contaminants of concern at the Site, were detected above groundwater quality standards per 6NYCRR Part 703.5 and the NYSDEC Division of Water Technical and Operational Guidance Series (TOGS) (1.1.1) Groundwater Quality Standards (GWQS) in 20 of the 29 groundwater samples collected. The primary contaminant compounds; acetone, toluene, ethylbenzene and xylenes (total), were detected at the highest concentrations of all VOCs present at the Site. Additional VOCs that were detected in the collected groundwater samples at concentrations exceeding TOGS GWQS include: naphthalene, 1,1-Dichloroethane (MW-7), isopropylbenzene (MW-33) and 1,2,4-Trimethylbenzene (MW-23). The dissolved phase concentrations of acetone, toluene, ethylbenzene and xylenes

(total) and their distribution throughout the Site for the October 2015 Biannual Sampling Event are illustrated in figure 4.

The acetone concentrations detected with the collected groundwater samples ranged from non-detect (all sample locations except for MW-23 and MW-29). The concentration of acetone in the groundwater sample from MW-29 of 35,000 ug/l (micrograms per liter) represents a decrease when compared to the July 2015 Biannual Sampling Event (75,000 ug/l). The concentration of acetone detected in the groundwater sample from MW-23 (13 ug/l) represent a slight increase when compared to the concentration from the July 2015 Biannual Sampling Event (non-detect).

The toluene concentrations in the groundwater samples collected ranged from non-detect (several sample locations) to 370,000 ug/l (MW-13) during the October 2015 Biannual Sampling Event. This toluene concentration observed in MW-9A (200,000 ug/l) represents a decrease relative to the concentration from the July 2015 Biannual Sampling Event (240,000 ug/l), which also represented the highest toluene concentration detected in the July event.

The ethylbenzene concentrations in the groundwater samples collected ranged from non-detect (several sample locations) to 18,000 ug/l (MW-29) during the October 2015 Biannual Sampling Event. The ethylbenzene detection in MW-29 represents a decrease relative to the concentration from the July 2015 Biannual Sampling Event (21,000 ug/l), which also represented the highest toluene concentration detected in the July event.

The total xylenes concentrations in the collected groundwater samples ranged from non-detect (several sample locations) to 108,000 ug/l (MW-30) during the October 2015 Biannual Sampling Event. The total xylene detection within MW-30 represents a decrease relative to the concentration from the July 2015 Biannual Sampling Event (129,000 ug/l), which also represented the highest toluene concentration detected in the July event.

Aside from low-level increases (MW-4, MW-6, MW-7), the only significant VOC concentration increases were detected in MW-15 (toluene, ethylbenzene and total xylenes), MW-32 (ethylbenzene and total xylenes) and EW-1 (ethylbenzene and total xylenes). The groundwater quality at MW-15 represents the greatest increase in concentrations of toluene (240,000 ug/l), ethylbenzene (7,100 ug/l) and total xylenes (46,000 ug/l) when compared to the July 2015 Biannual Sampling Event, during which concentrations consisted of toluene (160,000 ug/l), ethylbenzene (3,400 ug/l) and total xylenes (18,000 ug/l).

A summary of the VOC concentrations detected in the groundwater are shown on table 2. Copies of the full laboratory reports for the groundwater quality are included in Appendix III. Additionally, groundwater quality graphs presenting/illustrating historical changes in VOC concentrations for select onsite and offsite groundwater monitor wells are included in Appendix IV.

The elevated VOC concentrations observed beneath both the Site and the Con Ed parking lot (north and immediately adjacent of the Fyn Paint building) are indicative of a contaminant source remaining at the Site.

In general, the dissolved phase VOC concentrations detected in groundwater samples observed during the October 2015 Biannual Sampling Event have decreased when compared to the July 2015 Biannual Sampling Event. The most pronounced reduction in VOC concentrations detected from the October 2015 Biannual Sampling Event were for acetone concentrations which exceed GWQS in only two wells (MW-29), compared to the July 2015 Biannual Sampling Event for which acetone exceeded GWQS in seven wells. It should be noted that two wells with acetone exceeding GWQS (MW-16 and MW-31) were not sampled in October. As expected (and explained above), the highest concentrations of acetone, ethylbenzene and total xylenes were observed adjacent to the presumed source area (northeast corner of the Fyn Paint building). However, the highest concentration of toluene was observed offsite (to the south-southeast of the Site) in MW-13 and MW-25. Of note, no subsurface investigation activities have been performed to the east of MW-13/MW-25, to assess the groundwater quality upgradient of the Site.

The remediation system was inactive for approximately 2 months prior to (and during) the October 2015 Biannual Sampling Event.

8.0 CONCLUSIONS

1. Several VOCs were detected in the groundwater above groundwater quality standards. The primary VOCs detected above standards are acetone, toluene, ethylbenzene and xylenes (total). The highest concentrations of acetone, toluene, ethylbenzene and xylenes (total) were detected in Monitor Wells MW-29, MW-13, MW-29 and MW-30, respectively.

2. The dissolved-phase VOC concentrations represent an overall decrease relative to the concentrations observed in the July 2015 Biannual Sampling Event and earlier.

3. The remedial treatment system at the Site was not operational for approximately two months prior to (and during) the October 2015 Biannual Sampling Event. Following receipt of the renewed NYCDEP discharge permit, the remedial system resumed operation on October 28, 2015.

4. Anomalously high groundwater elevations (relative to surrounding background elevations) were observed and recorded beneath the north-northeastern corner of the Con Ed parking lot.

5. De minimis NAPL was observed within two offsite groundwater monitoring wells (MW-13 and MW-25) south of the Site. This represents continued NAPL reduction when compared to past monitoring rounds. NAPL was detected in thicknesses greater than 3 feet in both MW-13 and MW-25 (September 2014). In July 2015 no NAPL was detected in MW-25 and only 0.21 foot was detected in MW-13.

EPA Low-Flow Groundwater Sampling Procedures

United States Environmental Protection Agency | Office of Research and Development | Office of Solid Waste and Emergency Response | EPA/540/S-95/504 April 1996

Ground Water Issue

LOW-FLOW (MINIMAL DRAWDOWN) GROUND-WATER SAMPLING PROCEDURES

by Robert W. Puls[1] and Michael J. Barcelona[2]

Background

The Regional Superfund Ground Water Forum is a group of ground-water scientists, representing EPA's Regional Superfund Offices, organized to exchange information related to ground-water remediation at Superfund sites. One of the major concerns of the Forum is the sampling of ground water to support site assessment and remedial performance monitoring objectives. This paper is intended to provide background information on the development of low-flow sampling procedures and its application under a variety of hydrogeologic settings. It is hoped that the paper will support the production of standard operating procedures for use by EPA Regional personnel and other environmental professionals engaged in ground-water sampling.

For further information contact: Robert Puls, 405-436-8543, Subsurface Remediation and Protection Division, NRMRL, Ada, Oklahoma.

I. Introduction

The methods and objectives of ground-water sampling to assess water quality have evolved over time. Initially the emphasis was on the assessment of water quality of aquifers as sources of drinking water. Large water-bearing units were identified and sampled in keeping with that objective. These were highly productive aquifers that supplied drinking water via private wells or through public water supply systems. Gradually, with the increasing awareness of subsurface pollution of these water resources, the understanding of complex hydrogeochemical processes which govern the fate and transport of contaminants in the subsurface increased. This increase in understanding was also due to advances in a number of scientific disciplines and improvements in tools used for site characterization and ground-water sampling. Ground-water quality investigations where pollution was detected initially borrowed ideas, methods, and materials for site characterization from the water supply field and water analysis from public health practices. This included the materials and manner in which monitoring wells were installed and the way in which water was brought to the surface, treated, preserved and analyzed. The prevailing conceptual ideas included convenient generalizations of ground-water resources in terms of large and relatively homogeneous hydrologic *units*. With time it became apparent that conventional water supply generalizations of *homogeneity* did not adequately represent field data regarding pollution of these subsurface resources. The important role of *heterogeneity* became increasingly clear not only in geologic terms, but also in terms of complex physical,

chemical and biological subsurface processes. With greater appreciation of the role of heterogeneity, it became evident that subsurface pollution was ubiquitous and encompassed the unsaturated zone to the deep subsurface and included unconsolidated sediments, fractured rock, and *aquitards* or low-yielding or impermeable formations. Small-scale processes and heterogeneities were shown to be important in identifying contaminant distributions and in controlling water and contaminant flow paths.

It is beyond the scope of this paper to summarize all the advances in the field of ground-water quality investigations and remediation, but two particular issues have bearing on ground-water sampling today: aquifer heterogeneity and colloidal transport. Aquifer heterogeneities affect contaminant flow paths and include variations in geology, geochemistry, hydrology and microbiology. As methods and the tools available for subsurface investigations have become increasingly sophisticated and understanding of the subsurface environment has advanced, there is an awareness that in most cases a primary concern for site investigations is characterization of contaminant flow paths rather than entire aquifers. In fact, in many cases, plume thickness can be less than well screen lengths (e.g., 3-6 m) typically installed at hazardous waste sites to detect and monitor plume movement over time. Small-scale differences have increasingly been shown to be important and there is a general trend toward smaller diameter wells and shorter screens.

The hydrogeochemical significance of colloidal-size particles in subsurface systems has been realized during the past several years (Gschwend and Reynolds, 1987; McCarthy and Zachara, 1989; Puls, 1990; Ryan and Gschwend, 1990). This realization resulted from both field and laboratory studies that showed faster contaminant migration over greater distances and at higher concentrations than flow and transport model predictions would suggest (Buddemeier and Hunt, 1988; Enfield and Bengtsson, 1988; Penrose et al., 1990). Such models typically account for interaction between the mobile aqueous and immobile solid phases, but do not allow for a mobile, reactive solid phase. It is recognition of this third *phase* as a possible means of contaminant transport that has brought increasing attention to the manner in which samples are collected and processed for analysis (Puls et al., 1990; McCarthy and Degueldre, 1993; Backhus et al., 1993; U. S. EPA, 1995). If such a phase is present in sufficient mass, possesses high sorption reactivity, large surface area, and remains stable in suspension, it can serve as an important mechanism to facilitate contaminant transport in many types of subsurface systems.

Colloids are particles that are sufficiently small so that the surface free energy of the particle dominates the bulk free energy. Typically, in ground water, this includes particles with diameters between 1 and 1000 nm. The most commonly observed mobile particles include: secondary clay minerals; hydrous iron, aluminum, and manganese oxides; dissolved and particulate organic materials, and viruses and bacteria. These reactive particles have been shown to be mobile under a variety of conditions in both field studies and laboratory column experiments, and as such need to be included in monitoring programs where identification of the *total* mobile contaminant loading (dissolved + naturally suspended particles) at a site is an objective. To that end, sampling methodologies must be used which do not artificially bias *naturally* suspended particle concentrations.

Currently the most common ground-water purging and sampling methodology is to purge a well using bailers or high speed pumps to remove 3 to 5 casing volumes followed by sample collection. This method can cause adverse impacts on sample quality through collection of samples with high levels of turbidity. This results in the inclusion of otherwise immobile artifactual particles which produce an overestimation of certain analytes of interest (e.g., metals or hydrophobic organic compounds). Numerous documented problems associated with filtration (Danielsson, 1982; Laxen and Chandler, 1982; Horowitz et al., 1992) make this an undesirable method of rectifying the turbidity problem, and include the removal of potentially mobile (contaminant-associated) particles during filtration, thus artificially biasing contaminant concentrations low. Sampling-induced turbidity problems can often be mitigated by using low-flow purging and sampling techniques.

Current subsurface conceptual models have undergone considerable refinement due to the recent development and increased use of field screening tools. So-called hydraulic *push* technologies (e.g., cone penetrometer, Geoprobe®, QED HydroPunch®) enable relatively fast screening site characterization which can then be used to design and install a monitoring well network. Indeed, alternatives to conventional monitoring wells are now being considered for some hydrogeologic settings. The ultimate design of any monitoring system should however be based upon adequate site characterization and be consistent with established monitoring objectives.

If the sampling program objectives include accurate assessment of the magnitude and extent of subsurface contamination over time and/or accurate assessment of subsequent remedial performance, then some information regarding plume delineation in three-dimensional space is necessary prior to monitoring well network design and installation. This can be accomplished with a variety of different tools and equipment ranging from hand-operated augers to screening tools mentioned above and large drilling rigs. Detailed information on ground-water flow velocity, direction, and horizontal and vertical variability are essential baseline data requirements. Detailed soil and geologic data are required prior to and during the installation of sampling points. This includes historical as well as detailed soil and geologic logs which accumulate during the site investigation. The use of borehole geophysical techniques is also recommended. With this information (together with other site characterization data) and a clear understanding of sampling

objectives, then appropriate location, screen length, well diameter, slot size, etc. for the monitoring well network can be decided. This is especially critical for new in situ remedial approaches or natural attenuation assessments at hazardous waste sites.

In general, the overall goal of any ground-water sampling program is to collect water samples with no alteration in water chemistry; analytical data thus obtained may be used for a variety of specific monitoring programs depending on the regulatory requirements. The sampling methodology described in this paper assumes that the monitoring goal is to sample monitoring wells for the presence of contaminants and it is applicable whether mobile colloids are a concern or not and whether the analytes of concern are metals (and metalloids) or organic compounds.

II. Monitoring Objectives and Design Considerations

The following issues are important to consider prior to the design and implementation of any ground-water monitoring program, including those which anticipate using low-flow purging and sampling procedures.

A. Data Quality Objectives (DQOs)

Monitoring objectives include four main types: detection, assessment, corrective-action evaluation and resource evaluation, along with *hybrid* variations such as site-assessments for property transfers and water availability investigations. Monitoring objectives may change as contamination or water quality problems are discovered. However, there are a number of common components of monitoring programs which should be recognized as important regardless of initial objectives. These components include:

1) Development of a conceptual model that incorporates elements of the regional geology to the local geologic framework. The conceptual model development also includes initial site characterization efforts to identify hydrostratigraphic units and likely flow-paths using a minimum number of borings and well completions;

2) Cost-effective and well documented collection of high quality data utilizing simple, accurate, and reproducible techniques; and

3) Refinement of the conceptual model based on supplementary data collection and analysis.

These fundamental components serve many types of monitoring programs and provide a basis for future efforts that evolve in complexity and level of spatial detail as purposes and objectives expand. High quality, reproducible data collection is a common goal regardless of program objectives.

High quality data collection implies data of sufficient accuracy, precision, and completeness (i.e., ratio of valid analytical results to the minimum sample number called for by the program design) to meet the program objectives. Accuracy depends on the correct choice of monitoring tools and procedures to minimize sample and subsurface disturbance from collection to analysis. Precision depends on the repeatability of sampling and analytical protocols. It can be assured or improved by replication of sample analyses including blanks, field/lab standards and reference standards.

B. Sample Representativeness

An important goal of any monitoring program is collection of data that is truly representative of conditions at the site. The term *representativeness* applies to chemical and hydrogeologic data collected via wells, borings, piezometers, geophysical and soil gas measurements, lysimeters, and temporary sampling points. It involves a recognition of the statistical variability of individual subsurface physical properties, and contaminant or major ion concentration levels, while explaining extreme values. Subsurface temporal and spatial variability are facts. Good professional practice seeks to maximize representativeness by using proven accurate and reproducible techniques to define limits on the distribution of measurements collected at a site. However, measures of representativeness are dynamic and are controlled by evolving site characterization and monitoring objectives. An evolutionary site characterization model, as shown in Figure 1, provides a systematic approach to the goal of consistent data collection.

Figure 1. Evolutionary Site Characterization Model

The model emphasizes a recognition of the causes of the variability (e.g., use of inappropriate technology such as using bailers to purge wells; imprecise or operator-dependent methods) and the need to control avoidable errors.

1) Questions of Scale

A sampling plan designed to collect representative samples must take into account the potential scale of changes in site conditions through space and time as well as the chemical associations and behavior of the parameters that are targeted for investigation. In subsurface systems, physical (i.e., aquifer) and chemical properties over time or space are not statistically independent. In fact, samples taken in close proximity (i.e., within distances of a few meters) or within short time periods (i.e., more frequently than monthly) are highly auto-correlated. This means that designs employing high-sampling frequency (e.g., monthly) or dense spatial monitoring designs run the risk of redundant data collection and misleading inferences regarding trends in values that aren't statistically valid. In practice, contaminant detection and assessment monitoring programs rarely suffer these *over-sampling* concerns. In corrective-action evaluation programs, it is also possible that too little data may be collected over space or time. In these cases, false interpretation of the spatial extent of contamination or underestimation of temporal concentration variability may result.

2) Target Parameters

Parameter selection in monitoring program design is most often dictated by the regulatory status of the site. However, background water quality constituents, purging indicator parameters, and contaminants, all represent targets for data collection programs. The tools and procedures used in these programs should be equally rigorous and applicable to all categories of data, since all may be needed to determine or support regulatory action.

C. Sampling Point Design and Construction

Detailed site characterization is central to all decision-making purposes and the basis for this characterization resides in identification of the geologic framework and major hydro-stratigraphic units. Fundamental data for sample point location include: subsurface lithology, head-differences and background geochemical conditions. Each sampling point has a proper use or uses which should be documented at a level which is appropriate for the program's data quality objectives. Individual sampling points may not always be able to fulfill multiple monitoring objectives (e.g., detection, assessment, corrective action).

1) Compatibility with Monitoring Program and Data Quality Objectives

Specifics of sampling point location and design will be dictated by the complexity of subsurface lithology and variability in contaminant and/or geochemical conditions. It should be noted that, regardless of the ground-water sampling approach, few sampling points (e.g., wells, drive-points, screened augers) have zones of influence in excess of a few feet. Therefore, the spatial frequency of sampling points should be carefully selected and designed.

2) Flexibility of Sampling Point Design

In most cases *well-point* diameters in excess of 1 7/8 inches will permit the use of most types of submersible pumping devices for low-flow (minimal drawdown) sampling. It is suggested that *short* (e.g., less than 1.6 m) screens be incorporated into the monitoring design where possible so that comparable results from one device to another might be expected. *Short*, of course, is relative to the degree of vertical water quality variability expected at a site.

3) Equilibration of Sampling Point

Time should be allowed for equilibration of the well or sampling point with the formation after installation. Placement of well or sampling points in the subsurface produces some disturbance of ambient conditions. Drilling techniques (e.g., auger, rotary, etc.) are generally considered to cause more disturbance than *direct-push* technologies. In either case, there may be a period (i.e., days to months) during which water quality near the point may be distinctly different from that in the formation. Proper development of the sampling point and adjacent formation to remove fines created during emplacement will shorten this water quality *recovery* period.

III. Definition of Low-Flow Purging and Sampling

It is generally accepted that water in the well casing is non-representative of the formation water and needs to be purged prior to collection of ground-water samples. However, the water in the screened interval may indeed be representative of the formation, depending upon well construction and site hydrogeology. Wells are purged to some extent for the following reasons: the presence of the air interface at the top of the water column resulting in an oxygen concentration gradient with depth, loss of volatiles up the water column, leaching from or sorption to the casing or filter pack, chemical changes due to clay seals or backfill, and surface infiltration.

Low-flow purging, whether using portable or dedicated systems, should be done using pump-intake located in the middle or slightly above the middle of the screened interval. Placement of the pump too close to the bottom of the well will cause increased entrainment of solids which have collected in the well over time. These particles are present as a result of well development, prior purging and sampling events, and natural colloidal transport and deposition. Therefore, placement of the pump in the middle or toward the top of the screened interval is suggested. Placement of the pump at the top of the water column for sampling is only recommended in unconfined aquifers, screened across the water table, where this is the desired sampling point. Low-

flow purging has the advantage of minimizing mixing between the overlying stagnant casing water and water within the screened interval.

A. Low-Flow Purging and Sampling

Low-flow refers to the velocity with which water enters the pump intake and that is imparted to the formation pore water in the immediate vicinity of the well screen. It does not necessarily refer to the flow rate of water discharged at the surface which can be affected by flow regulators or restrictions. Water level drawdown provides the best indication of the stress imparted by a given flow-rate for a given hydrological situation. The objective is to pump in a manner that minimizes stress (drawdown) to the system to the extent practical taking into account established site sampling objectives. Typically, flow rates on the order of 0.1 - 0.5 L/min are used, however this is dependent on site-specific hydrogeology. Some extremely coarse-textured formations have been successfully sampled in this manner at flow rates to 1 L/min. The effectiveness of using low-flow purging is intimately linked with proper screen location, screen length, and well construction and development techniques. The reestablishment of natural flow paths in both the vertical and horizontal directions is important for correct interpretation of the data. For high resolution sampling needs, screens less than 1 m should be used. Most of the need for purging has been found to be due to passing the sampling device through the overlying casing water which causes mixing of these stagnant waters and the dynamic waters within the screened interval. Additionally, there is disturbance to suspended sediment collected in the bottom of the casing and the displacement of water out into the formation immediately adjacent to the well screen. These disturbances and impacts can be avoided using dedicated sampling equipment, which precludes the need to insert the sampling device prior to purging and sampling.

Isolation of the screened interval water from the overlying stagnant casing water may be accomplished using low-flow minimal drawdown techniques. If the pump intake is located within the screened interval, most of the water pumped will be drawn in directly from the formation with little mixing of casing water or disturbance to the sampling zone. However, if the wells are not constructed and developed properly, zones other than those intended may be sampled. At some sites where geologic heterogeneities are sufficiently different within the screened interval, higher conductivity zones may be preferentially sampled. This is another reason to use shorter screened intervals, especially where high spatial resolution is a sampling objective.

B. Water Quality Indicator Parameters

It is recommended that water quality indicator parameters be used to determine purging needs prior to sample collection in each well. Stabilization of parameters such as pH, specific conductance, dissolved oxygen, oxidation-reduction potential, temperature and turbidity should be used to determine when formation water is accessed during purging. In general, the order of stabilization is pH, temperature, and specific conductance, followed by oxidation-reduction potential, dissolved oxygen and turbidity. Temperature and pH, while commonly used as purging indicators, are actually quite insensitive in distinguishing between formation water and stagnant casing water; nevertheless, these are important parameters for data interpretation purposes and should also be measured. Performance criteria for determination of stabilization should be based on water-level drawdown, pumping rate and equipment specifications for measuring indicator parameters. Instruments are available which utilize in-line flow cells to continuously measure the above parameters.

It is important to establish specific well stabilization criteria and then consistently follow the same methods thereafter, particularly with respect to drawdown, flow rate and sampling device. Generally, the time or purge volume required for parameter stabilization is independent of well depth or well volumes. Dependent variables are well diameter, sampling device, hydrogeochemistry, pump flow rate, and whether the devices are used in a portable or dedicated manner. If the sampling device is already in place (i.e., dedicated sampling systems), then the time and purge volume needed for stabilization is much shorter. Other advantages of dedicated equipment include less purge water for waste disposal, much less decontamination of equipment, less time spent in preparation of sampling as well as time in the field, and more consistency in the sampling approach which probably will translate into less variability in sampling results. The use of dedicated equipment is strongly recommended at wells which will undergo routine sampling over time.

If parameter stabilization criteria are too stringent, then minor oscillations in indicator parameters may cause purging operations to become unnecessarily protracted. It should also be noted that turbidity is a very conservative parameter in terms of stabilization. Turbidity is always the last parameter to stabilize. Excessive purge times are invariably related to the establishment of too stringent turbidity stabilization criteria. It should be noted that natural turbidity levels in ground water may exceed 10 nephelometric turbidity units (NTU).

C. Advantages and Disadvantages of Low-Flow (Minimum Drawdown) Purging

In general, the advantages of low-flow purging include:

- samples which are representative of the *mobile* load of contaminants present (dissolved and colloid-associated);
- minimal disturbance of the sampling point thereby minimizing sampling artifacts;
- less operator variability, greater operator control;

- reduced stress on the formation (minimal drawdown);
- less mixing of stagnant casing water with formation water;
- reduced need for filtration and, therefore, less time required for sampling;
- smaller purging volume which decreases waste disposal costs and sampling time;
- better sample consistency; reduced artificial sample variability.

Some disadvantages of low-flow purging are:

- higher initial capital costs,
- greater set-up time in the field,
- need to transport additional equipment to and from the site,
- increased training needs,
- resistance to change on the part of sampling practitioners,
- concern that new data will indicate a *change in conditions* and trigger an *action*.

IV. Low-Flow (Minimal Drawdown) Sampling Protocols

The following ground-water sampling procedure has evolved over many years of experience in ground-water sampling for organic and inorganic compound determinations and as such summarizes the authors' (and others) experiences to date (Barcelona et al., 1984, 1994; Barcelona and Helfrich, 1986; Puls and Barcelona, 1989; Puls et. al. 1990, 1992; Puls and Powell, 1992; Puls and Paul, 1995). High-quality chemical data collection is essential in ground-water monitoring and site characterization. The primary limitations to the collection of *representative* ground-water samples include: mixing of the stagnant casing and *fresh* screen waters during insertion of the sampling device or ground-water level measurement device; disturbance and resuspension of settled solids at the bottom of the well when using high pumping rates or raising and lowering a pump or bailer; introduction of atmospheric gases or degassing from the water during sample handling and transfer, or inappropriate use of vacuum sampling device, etc.

A. Sampling Recommendations

Water samples should not be taken immediately following well development. Sufficient time should be allowed for the ground-water flow regime in the vicinity of the monitoring well to stabilize and to approach chemical equilibrium with the well construction materials. This lag time will depend on site conditions and methods of installation but often exceeds one week.

Well purging is nearly always necessary to obtain samples of water flowing through the geologic formations in the screened interval. Rather than using a general but arbitrary guideline of purging three casing volumes prior to sampling, it is recommended that an in-line water quality measurement device (e.g., flow-through cell) be used to establish the stabilization time for several parameters (e.g. , pH, specific conductance, redox, dissolved oxygen, turbidity) on a well-specific basis. Data on pumping rate, drawdown, and volume required for parameter stabilization can be used as a guide for conducting subsequent sampling activities.

The following are recommendations to be considered before, during and after sampling:

- use low-flow rates (<0.5 L/min), during both purging and sampling to maintain minimal drawdown in the well;
- maximize tubing wall thickness, minimize tubing length;
- place the sampling device intake at the desired sampling point;
- minimize disturbances of the stagnant water column above the screened interval during water level measurement and sampling device insertion;
- make proper adjustments to stabilize the flow rate as soon as possible;
- monitor water quality indicators during purging;
- collect unfiltered samples to estimate contaminant loading and transport potential in the subsurface system.

B. Equipment Calibration

Prior to sampling, all sampling device and monitoring equipment should be calibrated according to manufacturer's recommendations and the site Quality Assurance Project Plan (QAPP) and Field Sampling Plan (FSP). Calibration of pH should be performed with at least two buffers which bracket the expected range. Dissolved oxygen calibration must be corrected for local barometric pressure readings and elevation.

C. Water Level Measurement and Monitoring

It is recommended that a device be used which will least disturb the water surface in the casing. Well depth should be obtained from the well logs. Measuring to the bottom of the well casing will only cause resuspension of settled solids from the formation and require longer purging times for turbidity equilibration. Measure well depth after sampling is completed. The water level measurement should be taken from a permanent reference point which is surveyed relative to ground elevation.

D. Pump Type

The use of low-flow (e.g., 0.1-0.5 L/min) pumps is suggested for purging and sampling all types of analytes. All pumps have some limitation and these should be investigated with respect to application at a particular site. Bailers are inappropriate devices for low-flow sampling.

1) General Considerations

There are no unusual requirements for ground-water sampling devices when using low-flow, minimal drawdown techniques. The major concern is that the device give consistent results and minimal disturbance of the sample across a range of *low* flow rates (i.e., < 0.5 L/min). Clearly, pumping rates that cause minimal to no drawdown in one well could easily cause *significant* drawdown in another well finished in a less transmissive formation. In this sense, the pump should not cause undue pressure or temperature changes or physical disturbance on the water sample over a reasonable sampling range. Consistency in operation is critical to meet accuracy and precision goals.

2) Advantages and Disadvantages of Sampling Devices

A variety of sampling devices are available for low-flow (minimal drawdown) purging and sampling and include peristaltic pumps, bladder pumps, electrical submersible pumps, and gas-driven pumps. Devices which lend themselves to both dedication and consistent operation at definable low-flow rates are preferred. It is desirable that the pump be easily adjustable and operate reliably at these lower flow rates. The peristaltic pump is limited to shallow applications and can cause degassing resulting in alteration of pH, alkalinity, and some volatiles loss. Gas-driven pumps should be of a type that does not allow the gas to be in direct contact with the sampled fluid.

Clearly, bailers and other *grab* type samplers are ill-suited for low-flow sampling since they will cause repeated disturbance and mixing of *stagnant* water in the casing and the *dynamic* water in the screened interval. Similarly, the use of inertial lift foot-valve type samplers may cause too much disturbance at the point of sampling. Use of these devices also tends to introduce uncontrolled and unacceptable operator variability.

Summaries of advantages and disadvantages of various sampling devices are listed in Herzog et al. (1991), U. S. EPA (1992), Parker (1994) and Thurnblad (1994).

E. Pump Installation

Dedicated sampling devices (left in the well) capable of pumping and sampling are preferred over <u>any</u> other type of device. Any portable sampling device should be slowly and carefully lowered to the middle of the screened interval or slightly above the middle (e.g., 1-1.5 m below the top of a 3 m screen). This is to minimize excessive mixing of the stagnant water in the casing above the screen with the screened interval zone water, and to minimize resuspension of solids which will have collected at the bottom of the well. These two disturbance effects have been shown to directly affect the time required for purging. There also appears to be a direct correlation between size of portable sampling devices relative to the well bore and resulting purge volumes and times. The key is to minimize disturbance of water and solids in the well casing.

F. Filtration

Decisions to filter samples should be dictated by sampling objectives rather than as a *fix* for poor sampling practices, and field-filtering of certain constituents should not be the default. Consideration should be given as to what the application of field-filtration is trying to accomplish. For assessment of truly dissolved (as opposed to operationally *dissolved* [i.e., samples filtered with 0.45 µm filters]) concentrations of major ions and trace metals, 0.1 µm filters are recommended although 0.45 µm filters are normally used for most regulatory programs. Alkalinity samples must also be filtered if significant particulate calcium carbonate is suspected, since this material is likely to impact alkalinity titration results (although filtration itself may alter the CO_2 composition of the sample and, therefore, affect the results).

Although filtration may be appropriate, filtration of a sample may cause a number of unintended changes to occur (e.g. oxidation, aeration) possibly leading to filtration-induced artifacts during sample analysis and uncertainty in the results. Some of these unintended changes may be unavoidable but the factors leading to them must be recognized. Deleterious effects can be minimized by consistent application of certain filtration guidelines. Guidelines should address selection of filter type, media, pore size, etc. in order to identify and minimize potential sources of uncertainty when filtering samples.

In-line filtration is recommended because it provides better consistency through less sample handling, and minimizes sample exposure to the atmosphere. In-line filters are available in both disposable (barrel filters) and non-disposable (in-line filter holder, flat membrane filters) formats and various filter pore sizes (0.1-5.0 µm). Disposable filter cartridges have the advantage of greater sediment handling capacity when compared to traditional membrane filters. Filters must be pre-rinsed following manufacturer's recommendations. If there are no recommendations for rinsing, pass through a minimum of 1 L of ground water following purging and prior to sampling. Once filtration has begun, a filter cake may develop as particles larger than the pore size accumulate on the filter membrane. The result is that the effective pore diameter of the membrane is reduced and particles smaller than the stated pore size are excluded from the filtrate. Possible corrective measures include prefiltering (with larger pore size filters), minimizing particle loads to begin with, and reducing sample volume.

G. Monitoring of Water Level and Water Quality Indicator Parameters

Check water level periodically to monitor drawdown in the well as a guide to flow rate adjustment. The goal is minimal drawdown (<0.1 m) during purging. This goal may be difficult to achieve under some circumstances due to geologic heterogeneities within the screened interval, and may require adjustment based on site-specific conditions and personal experience. In-line water quality indicator parameters should be continuously monitored during purging. The water quality

indicator parameters monitored can include pH, redox potential, conductivity, dissolved oxygen (DO) and turbidity. The last three parameters are often most sensitive. Pumping rate, drawdown, and the time or volume required to obtain stabilization of parameter readings can be used as a future guide to purge the well. Measurements should be taken every three to five minutes if the above suggested rates are used. Stabilization is achieved after all parameters have stabilized for three successive readings. In lieu of measuring all five parameters, a minimum subset would include pH, conductivity, and turbidity or DO. Three successive readings should be within ± 0.1 for pH, ± 3% for conductivity, ± 10 mv for redox potential, and ± 10% for turbidity and DO. Stabilized purge indicator parameter trends are generally obvious and follow either an exponential or asymptotic change to stable values during purging. Dissolved oxygen and turbidity usually require the longest time for stabilization. The above stabilization guidelines are provided for rough estimates based on experience.

H. Sampling, Sample Containers, Preservation and Decontamination

Upon parameter stabilization, sampling can be initiated. If an in-line device is used to monitor water quality parameters, it should be disconnected or bypassed during sample collection. Sampling flow rate may remain at established purge rate or may be adjusted slightly to minimize aeration, bubble formation, turbulent filling of sample bottles, or loss of volatiles due to extended residence time in tubing. Typically, flow rates less than 0.5 L/min are appropriate. The same device should be used for sampling as was used for purging. Sampling should occur in a progression from least to most contaminated well, if this is known. Generally, volatile (e.g., solvents and fuel constituents) and gas sensitive (e.g., Fe^{2+}, CH_4, H_2S/HS^-, alkalinity) parameters should be sampled first. The sequence in which samples for most inorganic parameters are collected is immaterial unless filtered (dissolved) samples are desired. Filtering should be done last and in-line filters should be used as discussed above. During both well purging and sampling, proper protective clothing and equipment must be used based upon the type and level of contaminants present.

The appropriate sample container will be prepared in advance of actual sample collection for the analytes of interest and include sample preservative where necessary. Water samples should be collected directly into this container from the pump tubing.

Immediately after a sample bottle has been filled, it must be preserved as specified in the site (QAPP). Sample preservation requirements are based on the analyses being performed (use site QAPP, FSP, RCRA guidance document [U. S. EPA, 1992] or EPA SW-846 [U. S. EPA, 1982]). It may be advisable to add preservatives to sample bottles in a controlled setting prior to entering the field in order to reduce the chances of improperly preserving sample bottles or introducing field contaminants into a sample bottle while adding the preservatives.

The preservatives should be transferred from the chemical bottle to the sample container using a disposable polyethylene pipet and the disposable pipet should be used only once and then discarded.

After a sample container has been filled with ground water, a Teflon™ (or tin)-lined cap is screwed on tightly to prevent the container from leaking. A sample label is filled out as specified in the FSP. The samples should be stored inverted at 4°C.

Specific decontamination protocols for sampling devices are dependent to some extent on the type of device used and the type of contaminants encountered. Refer to the site QAPP and FSP for specific requirements.

I. Blanks

The following blanks should be collected:

(1) field blank: one field blank should be collected from each source water (distilled/deionized water) used for sampling equipment decontamination or for assisting well development procedures.

(2) equipment blank: one equipment blank should be taken prior to the commencement of field work, from each set of sampling equipment to be used for that day. Refer to site QAPP or FSP for specific requirements.

(3) trip blank: a trip blank is required to accompany each volatile sample shipment. These blanks are prepared in the laboratory by filling a 40-mL volatile organic analysis (VOA) bottle with distilled/deionized water.

V. Low-Permeability Formations and Fractured Rock

The overall sampling program goals or sampling objectives will drive how the sampling points are located, installed, and choice of sampling device. Likewise, site-specific hydrogeologic factors will affect these decisions. Sites with very low permeability formations or fractures causing discrete flow channels may require a unique monitoring approach. Unlike water supply wells, wells installed for ground-water quality assessment and restoration programs are often installed in low water-yielding settings (e.g., clays, silts). Alternative types of sampling points and sampling methods are often needed in these types of environments, because low-permeability settings may require extremely low-flow purging (<0.1 L/min) and may be technology-limited. Where devices are not readily available to pump at such low flow rates, the primary consideration is to avoid dewatering of

the well screen. This may require repeated recovery of the water during purging while leaving the pump in place within the well screen.

Use of low-flow techniques may be impractical in these settings, depending upon the water recharge rates. The sampler and the end-user of data collected from such wells need to understand the limitations of the data collected; i.e., a strong potential for underestimation of actual contaminant concentrations for volatile organics, potential false negatives for filtered metals and potential false positives for unfiltered metals. It is suggested that comparisons be made between samples recovered using low-flow purging techniques and samples recovered using passive sampling techniques (i.e., two sets of samples). Passive sample collection would essentially entail acquisition of the sample with no or very little purging using a dedicated sampling system installed within the screened interval or a passive sample collection device.

A. Low-Permeability Formations (<0.1 L/min recharge)

1. Low-Flow Purging and Sampling with Pumps

a. "portable or non-dedicated mode" - Lower the pump (one capable of pumping at <0.1 L/min) to mid-screen or slightly above and set in place for minimum of 48 hours (to lessen purge volume requirements). After 48 hours, use procedures listed in Part IV above regarding monitoring water quality parameters for stabilization, etc., but do not dewater the screen. If excessive drawdown and slow recovery is a problem, then alternate approaches such as those listed below may be better.

b. "dedicated mode" - Set the pump as above at least a week prior to sampling; that is, operate in a dedicated pump mode. With this approach significant reductions in purge volume should be realized. Water quality parameters should stabilize quite rapidly due to less disturbance of the sampling zone.

2. Passive Sample Collection

Passive sampling collection requires insertion of the device into the screened interval for a sufficient time period to allow flow and sample equilibration before extraction for analysis. Conceptually, the extraction of water from low yielding formations seems more akin to the collection of water from the unsaturated zone and passive sampling techniques may be more appropriate in terms of obtaining "representative" samples. Satisfying usual sample volume requirements is typically a problem with this approach and some latitude will be needed on the part of regulatory entities to achieve sampling objectives.

B. Fractured Rock

In fractured rock formations, a low-flow to zero purging approach using pumps in conjunction with packers to isolate the sampling zone in the borehole is suggested. Passive multi-layer sampling devices may also provide the most "representative" samples. It is imperative in these settings to identify flow paths or water-producing fractures prior to sampling using tools such as borehole flowmeters and/or other geophysical tools.

After identification of water-bearing fractures, install packer(s) and pump assembly for sample collection using low-flow sampling in "dedicated mode" or use a passive sampling device which can isolate the identified water-bearing fractures.

VI. Documentation

The usual practices for documenting the sampling event should be used for low-flow purging and sampling techniques. This should include, at a minimum: information on the conduct of purging operations (flow-rate, drawdown, water-quality parameter values, volumes extracted and times for measurements), field instrument calibration data, water sampling forms and chain of custody forms. See Figures 2 and 3 and "Ground Water Sampling Workshop -- A Workshop Summary" (U. S. EPA, 1995) for example forms and other documentation suggestions and information. This information coupled with laboratory analytical data and validation data are needed to judge the "useability" of the sampling data.

VII. Notice

The U.S. Environmental Protection Agency through its Office of Research and Development funded and managed the research described herein as part of its in-house research program and under Contract No. 68-C4-0031 to Dynamac Corporation. It has been subjected to the Agency's peer and administrative review and has been approved for publication as an EPA document. Mention of trade names or commercial products does not constitute endorsement or recommendation for use.

TEL: 914-694-5711
FAX: 914-694-5744

Subject: FYN Paint Workorder No.: 1511002

Dear Sean Groszkowski:

AMRO Environmental Laboratories Corp. received 29 samples on 11/2/2015 for the analyses presented in the following report.

AMRO is accredited in accordance with NELAC and certifies that these test results meet all the requirements of NELAC, where applicable, unless otherwise noted in the case narrative.

The enclosed Sample Receipt Checklist details the condition of your sample(s) upon receipt. Please be advised that any unused sample volume and sample extracts will be stored for a period of 60 days from sample receipt date (90 days for samples from New York). After this time, AMRO will properly dispose of the remaining sample(s). If you require further analysis, or need the samples held for a longer period, please contact us immediately.

This report consists of a total of 134 pages. This letter is an integral part of your data report. All results in this project relate only to the sample(s) as received by the laboratory and documented in the Chain-of-Custody. This report shall not be reproduced except in full, without the written approval of the laboratory. If you have any questions regarding this project in the future, please refer to the Workorder Number above.

Sincerely,

Nancy Stewart
Vice President

State Certifications: NH (NELAC): 1001, MA: M-NH012, CT: PH-0758, NY: 11278 (NELAC), ME: NH012 and 1001.

Hard copy of the State Certification is available upon request.

Please print clearly, legibly and completely. Samples can not be logged in and the turnaround time clock will not start until any ambiguities are resolved.

Samples arriving after 12:00 noon will be tracked and billed as received on the following day.

AMRO policy requires notification in writing to the laboratory in cases where the samples were collected from highly contaminated sites.

RE: Cooler for FYN Paint

From: Sean Groszkowski
Sent: Mon, Nov 2, 2015 at 9:48 am
To: Mirta Ghiraldi

Yes,
Run the samples.
I'll speak to them about the shipping error.
Sean

To: Sean Groszkowski
Subject: Cooler for FYN Paint

Hi Sean,
We received a cooler today for FYN Paint, the temperature was 15 degrees (Ice was melted) do you want us to run the analysis? the cooler was shipped on Friday overnight Saturday delivery wasn't check.

Thanks

Mirta Ghiraldi

GC/MS VOLATILES- 8260C:

1. A Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) were performed on 11/04/15 on V-2 (Batch ID: R56713). All %Rs and RPDs were within the laboratory control limits with the following exception(s):

1.1 The %R for 2 analytes out of 67 analytes in the LCS were outside the control limits.
1.2 The RPD for 1 analyte out of 67 analytes was outside the control limits.

2. A Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) were performed on 11/06/15 on V-2 (Batch ID: R56729). All %Rs and RPDs were within the laboratory control limits with the following exception(s):

2.1 The RPD for 1 analyte out of 67 analytes was outside the control limits.

3. A Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) were performed on 11/09/15 on V-2 (Batch ID: R56738). All %Rs and RPDs were within the laboratory control limits with the following exception(s):

3.1 The %R for 2 analytes out of 67 analytes in the LCS were outside the control limits.
3.2 The %R for 1 analyte out of 67 analytes in the LCSD was outside the control limits.

4. A Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) were performed on 11/10/15 on V-2 (Batch ID: R56752). All %Rs and RPDs were within the laboratory control limits with the following exception(s):

4.1 The %R for 3 analytes out of 67 analytes in the LCS were outside the control limits.
4.2 The %R for 2 analytes out of 67 analytes in the LCSD were outside the control limits.

5. A Matrix Spike (MS) and Matrix Spike Duplicate (MSD) were performed on sample MW-27(1511002-14). All %Rs and RPDs were within the laboratory control limits with the following exception(s):

5.1 The RPD for 1 analytes out of 67 analytes was outside the laboratory control limits.

6.No analytical or quality issues were noted, other than those described above or in the Data Comment page.

DATA COMMENT PAGE

Organic Data Qualifiers

ND	Indicates compound was analyzed for, but not detected at or above the reporting limit.
J	Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the data indicates the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than the method detection limit.
H	Method prescribed holding time exceeded.
E	This flag identifies compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.
B	This flag is used when the analyte is found in the associated blank as well as in the sample.
R	RPD outside accepted recovery limits
RL	Reporting limit; defined as the lowest concentration the laboratory can accurately quantitate.
S	Spike Recovery outside accepted recovery limits.
#	See Case Narrative
Q	RPD between signal 1 and signal 2 >40%.

Micro Data Qualifiers

TNTC	Too numerous to count

Inorganic Data Qualifiers

ND or U	Indicates element was analyzed for, but not detected at or above the reporting limit.
J	Indicates a value greater than or equal to the method detection limit, but less than the quantitation limit.
H	Indicates analytical holding time exceedance.
B	Indicates that the analyte is found in the associated blank, as well as in the sample.
MSA	Indicates value determined by the Method of Standard Addition
+	Indicates the correlation coefficient for the Method of Standard Addition is less than 0.995
E	This flag identifies compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.
R	RPD outside accepted recovery limits
RL	Reporting limit; defined as the lowest concentration the laboratory can accurately quantitate.
S	Spike Recovery outside accepted recovery limits.
PS	The analyte was below the Reporting Limit but has significant matrix interference as noted by the poor recovery of the Post Digestion Spike.
#	See Case Narrative
*	MCL Exceeded

Report Comments:

1. Soil, sediment and sludge sample results are reported on a "dry weight" basis.
2. Reporting limits are adjusted for sample size used, dilutions and moisture content, if applicable.

Qualifiers:
ND - Not Detected at the Reporting Limit
J - Analyte detected below quantitation limits
RL - Reporting Limit; defined as the lowest concentration the laboratory can accurately quantitate.
S - Spike Recovery outside accepted recovery limits
R - RPD outside accepted recovery limits
B - Analyte detected in the associated Method Blank
NA - Not applicable where J values or ND results occur

DECISION DOCUMENT

Fyn Paint and Lacquer Co., Inc.
Brownfield Cleanup Program
Brooklyn, Kings County
Site No. C224154
October 2016

Prepared by
Division of Environmental Remediation
New York State Department of Environmental Conservation

DECLARATION STATEMENT - DECISION DOCUMENT

Fyn Paint and Lacquer Co., Inc.
Brownfield Cleanup Program
Brooklyn, Kings County
Site No. C224154
October 2016

Statement of Purpose and Basis

This document presents the remedy for the Fyn Paint and Lacquer Co., Inc. site, a brownfield cleanup site. The remedial program was chosen in accordance with the New York State Environmental Conservation Law and Title 6 of the Official Compilation of Codes, Rules and Regulations of the State of New York (6 NYCRR) Part 375.

This decision is based on the Administrative Record of the New York State Department of Environmental Conservation (the Department) for the Fyn Paint and Lacquer Co., Inc. site and the public's input to the proposed remedy presented by the Department.

Description of Selected Remedy

The elements of the selected remedy are as follows:

1. Remedial Design

A remedial design program will be implemented to provide the details necessary for the construction, operation, optimization, maintenance, and monitoring of the remedial program. Green remediation principles and techniques will be implemented to the extent feasible in the design, implementation, and site management of the remedy as per DER-31. The major green remediation components are as follows;

- Considering the environmental impacts of treatment technologies and remedy stewardship over the long term;
- Reducing direct and indirect greenhouse gases and other emissions;
- Increasing energy efficiency and minimizing use of non-renewable energy;
- Conserving and efficiently managing resources and materials;
- Reducing waste, increasing recycling and increasing reuse of materials which would otherwise be considered a waste;
- Maximizing habitat value and creating habitat when possible;
- Fostering green and healthy communities and working landscapes which balance ecological, economic and social goals; and
- Integrating the remedy with the end use where possible and encouraging green and sustainable re-development.

2. Excavation

The existing on-site building will be demolished to facilitate the proposed remedy. Following

completion of the building demolition, a sheeting system consisting of a waterproof hydraulic barrier will be installed at the perimeter of the site. The waterproof hydraulic barrier will consist of a series of interlocked steel sheets with a sealable cavity within each interlock. After installation, the interlock is flushed and a low permeability grout is injected into the entire length of the interlock. The hydraulic barrier will be installed to a sufficient depth to provide structural support which will facilitate the soil excavation within the property boundaries. Due to these requirements, the sheeting system will be installed to an approximate depth of 25-30 feet below grade.

After the waterproof hydraulic barrier is installed all on-site soils which exceed unrestricted soil cleanup objectives (SCOs), as defined by 6 NYCRR Part 375-6.8, will be excavated and transported off-site for disposal. This will include excavation and off-site disposal of contaminant source areas, including:

- grossly contaminated soil, as defined in 6 NYCRR Part 375-1.2(u);
- removal of any underground storage tanks (USTs), fuel dispensers, underground piping or other structures associated with a source of contamination;
- non-aqueous phase liquids; and
- soils which exceed the protection of groundwater soil cleanup objectives (PGWSCOs), as defined by 6 NYCRR Part 375-6.8 for those contaminants found in site groundwater above standards.

It is anticipated that soil will be excavated to a depth of 15 to 17 feet below grade. Approximately 3,600 tons of contaminated soil will be removed from the site. Clean fill meeting the requirements of 6 NYCRR Part 375-6.7(d) will be brought in to establish the designed grades at the site.

3. Groundwater Treatment

A dual phase extraction system (DPES) was designed and previously installed under the Voluntary Cleanup Program. The extraction system currently covers the area beneath the footprint of the on-site building and the adjacent parking lot. Prior to installing the hydraulic barrier and implementing the excavation discussed in remedy bullet 2, above, the on-site components of the DPES will be removed. The DPES components will be relocated and will continue to operate to address the off-site groundwater contamination.

Due to the planned excavation depth and the typical groundwater elevations at the site, dewatering will be required to facilitate the excavation work. Contaminated groundwater from dewatering operations will be treated as necessary prior to discharge to the municipal sewer system. It is expected that the dewatering will improve groundwater quality beneath the site.

Following completion of the excavation, in-situ chemical oxidation (ISCO) will be implemented to achieve a bulk reduction of VOCs in groundwater. A chemical oxidant will be injected into the subsurface to destroy the contaminants via injection wells. The method and depth of injection will be determined during the remedial design.

4. Vapor Intrusion Assessment

A post-remedial soil vapor intrusion evaluation will be completed prior to occupying any

buildings developed on the site. The assessment will include a provision for implementing actions recommended to address exposures related to soil vapor intrusion.

The intent of the above remedial elements is to achieve Track 1 unrestricted use; therefore, no environmental easement or site management plan is anticipated. No groundwater use restriction is needed because the area is served by public water and Article 141 of the NYCDOH code prohibits potable use of groundwater without prior approval.

Contingent Remedial Elements:
In the event that a Track 1 cleanup is not achieved, including achievement of the groundwater and soil vapor remedial action objectives, imposition of an institutional control in the form of an environmental easement and a Site Management Plan, as described below, will be required and the site will achieve a Track 2 residential cleanup.

5. Institutional Control
Imposition of an institutional control in the form of an environmental easement will be required for the controlled property that:
- requires the remedial party or site owner to complete and submit to the Department a periodic certification of institutional and engineering controls in accordance with Part 375-1.8 (h)(3);
- allows the use and development of the controlled property for restricted residential, commercial and industrial uses as defined by Part 375-1.8(g), although land use is subject to local zoning laws;
- restricts the use of groundwater as a source of potable or process water, without necessary water quality treatment as determined by the NYSDOH or NYCDOH; and
- requires compliance with the Department approved Site Management Plan.

6. Site Management Plan
A Site Management Plan is required, which includes the following:
a. an Institutional and Engineering Control Plan that identifies all use restrictions and engineering controls for the site and details the steps and media-specific requirements necessary to ensure the following institutional and/or engineering controls remain in place and effective:
- Institutional Controls: The Environmental Easement discussed in remedy bullet 5.
- Engineering Controls: the in-situ chemical oxidation discussed in remedy bullet 3.

This plan includes, but may not be limited to:
o an Excavation Plan which details the provisions for management of future excavations in areas of remaining contamination
o descriptions of the provisions of the environmental easement including any land use, and groundwater use restrictions;
o a provision for evaluation of the potential for soil vapor intrusion for any buildings developed on the site, including provision for implementing actions recommended to address exposures related to soil vapor intrusion;
o provisions for the management and inspection of the identified engineering controls;
o maintaining site access controls and Department notification; and
o the steps necessary for the periodic reviews and certification of the institutional and/or engineering controls.

b. A Monitoring Plan to assess the performance and effectiveness of the remedy. The plan includes, but may not be limited to:

o a schedule of monitoring and frequency of submittals to the Department; and monitoring for vapor intrusion for any buildings developed on the site, as may be required by the Institutional and Engineering Control Plan.

c. an Operation and Maintenance (O&M) Plan to ensure continued operation, maintenance, optimization, monitoring, inspection, and reporting of any mechanical or physical components of the remedy. The plan includes, but is not limited to:

o procedures for operating and maintaining the remedy;

o compliance monitoring of treatment systems to ensure proper O&M as well as providing the data for any necessary permit or permit equivalent reporting;

o maintaining site access controls and Department notification; and

o providing the Department access to the site and O&M records.

Declaration

The remedy conforms with promulgated standards and criteria that are directly applicable, or that are relevant and appropriate and takes into consideration Department guidance, as appropriate. The remedy is protective of public health and the environment.

DECISION DOCUMENT

Fyn Paint and Lacquer Co., Inc.
Brooklyn, Kings County
Site No. C224154
October 2016

SECTION 1: SUMMARY AND PURPOSE

The New York State Department of Environmental Conservation (the Department), in consultation with the New York State Department of Health (NYSDOH), has selected a remedy for the above referenced site. The disposal of contaminants at the site has resulted in threats to public health and the environment that would be addressed by the remedy. The disposal or release of contaminants at this site, as more fully described in this document, has contaminated various environmental media. Contaminants include hazardous waste and/or petroleum.

The New York State Brownfield Cleanup Program (BCP) is a voluntary program. The goal of the BCP is to enhance private-sector cleanups of brownfields and to reduce development pressure on "greenfields." A brownfield site is real property, the redevelopment or reuse of which may be complicated by the presence or potential presence of a contaminant.

The Department has issued this document in accordance with the requirements of New York State Environmental Conservation Law and 6 NYCRR Part 375. This document is a summary of the information that can be found in the site-related reports and documents.

SECTION 2: CITIZEN PARTICIPATION

The Department seeks input from the community on all remedies. A public comment period was held, during which the public was encouraged to submit comment on the proposed remedy. All comments on the remedy received during the comment period were considered by the Department in selecting a remedy for the site. Site-related reports and documents were made available for review by the public at the following document repositories:

Brooklyn Public Library - Leonard Branch
81 Devoe Street at Leonard St.
Brooklyn, NY 11211
Phone: 718-486-6006

Brooklyn Public Library - Greenpoint Branch
107 Norman Avenue at Leonard St.
Brooklyn, NY 11222
Phone: 718-349-8504

Brooklyn Community Board No. 1
435 Graham Avenue
Brooklyn, NY 11211
Phone: 718 389 0000

Receive Site Citizen Participation Information By Email

Please note that the Department's Division of Environmental Remediation (DER) is "going paperless" relative to citizen participation information. The ultimate goal is to distribute citizen participation information about contaminated sites electronically by way of county email listservs. Information will be distributed for all sites that are being investigated and cleaned up in a particular county under the State Superfund Program, Environmental Restoration Program, Brownfield Cleanup Program, Voluntary Cleanup Program, and Resource Conservation and Recovery Act Program. We encourage the public to sign up for one or more county listservs at http://www.dec.ny.gov/chemical/61092.html

SECTION 3: SITE DESCRIPTION AND HISTORY

Location: The Fyn Paint and Lacquer Co., Inc. site is located in an urban area at 230 Kent Avenue in Brooklyn, Kings County. The site is situated on the block bounded by Kent Avenue to the east, Metropolitan Avenue to the north, North First Street to the south and River Street to the west. Alternate addresses for the property are: 230-232 Kent Avenue; 76-80 River Street; and 29-37 North First Street.

Site Features: The site consists of a 0.135-acre lot improved with an unoccupied two-story industrial/warehouse building with a gross floor area of approximately 5,862 square feet. A small basement contains the heating oil tank, furnace and controls for the sprinkler system.

Current Zoning and Land Use: The site land use is currently recorded as Industrial and Manufacturing. Zoning for the property is M3-1, which is designated for areas with heavy industries that generate noise, traffic or pollutants. The on-site building is currently vacant.

Past Use of the Site: Past land uses associated with the site include a chemical and coatings company (circa 1949) and paint and lacquer manufacturing (1959 - 2011). Prior to entry into the BCP, the site was managed under New York State's Voluntary Cleanup Program (VCP). Under the VCP a dual phase extraction system was installed to address on-site and off-site contamination in soil and groundwater. The system has been operating intermittently since 2012.

Site Geology and Hydrogeology: The ground surface at the property consists of concrete and asphalt pavement. The shallow soil beneath the property consist of medium and coarse grained brown sand with some silt and a trace of gravel. In general, the subsurface consists of interbedded layers of sand, gravel, clay and silt to approximately 65 feet below ground surface (fbgs).

Groundwater flow direction beneath the property is toward the west. The depth to groundwater is approximately 12 to 15 fbgs. The East River is approximate 500 feet to the west of the site

boundary.

A site location map is attached as Figure 1.

SECTION 4: LAND USE AND PHYSICAL SETTING

The Department may consider the current, intended, and reasonably anticipated future land use of the site and its surroundings when evaluating a remedy for soil remediation. For this site, an alternative which allows for unrestricted use of the site was evaluated.

A comparison of the results of the Remedial Investigation (RI) against unrestricted use standards, criteria and guidance values (SCGs) for the site contaminants is available in the RI Report.

SECTION 5: ENFORCEMENT STATUS

The Applicant(s) under the Brownfield Cleanup Agreement is a/are Volunteer(s). The Volunteer(s) does/do not have an obligation to address off-site contamination. The Department has determined that this site poses a significant threat to human health and the environment and there are off-site impacts that require remedial activities; accordingly, enforcement actions are necessary.

The Department will seek to identify any parties (other than the Volunteer(s)) known or suspected to be responsible for contamination at or emanating from the site, referred to as Potentially Responsible Parties (PRPs). The Department will bring an enforcement action against the PRPs. If an enforcement action cannot be brought, or does not result in the initiation of a remedial program by any PRPs, the Department will evaluate the off-site contamination for action under the State Superfund. The PRPs are subject to legal actions by the State for recovery of all response costs the State incurs or has incurred.

SECTION 6: SITE CONTAMINATION

6.1: Summary of the Remedial Investigation

A remedial investigation (RI) serves as the mechanism for collecting data to:

- characterize site conditions;
- determine the nature of the contamination; and
- assess risk to human health and the environment.

The RI is intended to identify the nature (or type) of contamination which may be present at a site and the extent of that contamination in the environment on the site, or leaving the site. The RI reports on data gathered to determine if the soil, groundwater, soil vapor, indoor air, surface water or sediments may have been contaminated. Monitoring wells are installed to assess groundwater and soil borings or test pits are installed to sample soil and/or waste(s) identified. If other natural resources are present, such as surface water bodies or wetlands, the water and sediment may be sampled as well. Based on the presence of contaminants in soil and

groundwater, soil vapor will also be sampled for the presence of contamination. Data collected in the RI influence the development of remedial alternatives. The RI report is available for review in the site document repository and the results are summarized in section 6.3.

The analytical data collected on this site includes data for:

- groundwater
- soil
- sub-slab vapor

6.1.1: Standards, Criteria, and Guidance (SCGs)

The remedy must conform to promulgated standards and criteria that are directly applicable or that are relevant and appropriate. The selection of a remedy must also take into consideration guidance, as appropriate. Standards, Criteria and Guidance are hereafter called SCGs.

To determine whether the contaminants identified in various media are present at levels of concern, the data from the RI were compared to media-specific SCGs. The Department has developed SCGs for groundwater, surface water, sediments, and soil. The NYSDOH has developed SCGs for drinking water and soil vapor intrusion. For a full listing of all SCGs see: http://www.dec.ny.gov/regulations/61794.html

6.1.2: RI Results

The data have identified contaminants of concern. A "contaminant of concern" is a contaminant that is sufficiently present in frequency and concentration in the environment to require evaluation for remedial action. Not all contaminants identified on the property are contaminants of concern. The nature and extent of contamination and environmental media requiring action are summarized below. Additionally, the RI Report contains a full discussion of the data. The contaminant(s) of concern identified at this site is/are:

benzene	toluene
ethylbenzene	acetone
xylene (mixed)	

The contaminant(s) of concern exceed the applicable SCGs for:

- air
- groundwater
- soil

6.2: Interim Remedial Measures

An interim remedial measure (IRM) is conducted at a site when a source of contamination or exposure pathway can be effectively addressed before issuance of the Decision Document.

There were no IRMs performed at this site during the RI.

6.3: Summary of Environmental Assessment

This section summarizes the assessment of existing and potential future environmental impacts presented by the site. Environmental impacts may include existing and potential future exposure pathways to fish and wildlife receptors, wetlands, groundwater resources, and surface water. The RI report presents a detailed discussion of any existing and potential impacts from the site to fish and wildlife receptors.

Nature and Extent of Contamination:

A remedial investigation for the site was completed under the Voluntary Cleanup Program, site code V00380. Soil and groundwater samples were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, pesticides/herbicides, and PCBs. The investigation identified the primary contaminants of concern in the soil, soil vapor and groundwater as VOCs including acetone, ethylbenzene, toluene, and mixed xylenes from the 14 closed-in-place underground storage tanks (USTs), and from spills which occurred during 50 years of manufacturing of paint and lacquer.

Soil:
VOCs in soil extend across the footprint of the Fyn Paint building and beneath the adjacent property and sidewalks to the north and west. The contaminants in soil include xylene at concentrations of up to 7,000 parts per million (ppm), acetone at 19 ppm, toluene at 4,000 ppm, and ethylbenzene at 1,700 ppm.

Groundwater:
During the groundwater monitoring sampling event conducted in October 2015, non-aqueous phase liquid (NAPL) and dissolved-phase contamination was detected in on-site and off-site monitoring wells. In on-site monitoring wells the dissolved toluene was as high as 16,000 parts per billion (ppb), xylene was as high as 13,400 ppb, and ethylbezene was as high as 1,700 ppb. In the adjacent off-site monitoring wells the toluene was as high as 240,000 ppb, xylene was as high as 108,000 ppb, ethylbenzene was as high as 18,000 ppb, and acetone was as high as 35,000 ppb. An off-site monitoring well across Kent Avenue had toluene as high as 370,000 ppb.

Sub-slab vapor:
Sub-slab vapor samples were collected beneath the on-site building's basement slab and the following VOCs were detected: acetone at up to 6,400 micrograms per cubic meter (ug/m3); benzene at 1,200 ug/m3; toluene at 180,000 ug/m3; xylene at 186,000 ug/m3 and ethylbenzene at 36,000 ug/m3. Contaminants in sub-slab vapor extend to the property boundaries and likely extend off-site.

6.4: Summary of Human Exposure Pathways

This human exposure assessment identifies ways in which people may be exposed to site-related contaminants. Chemicals can enter the body through three major pathways (breathing, touching or swallowing). This is referred to as *exposure.*

People may contact contaminated soils or groundwater if they dig below the surface. People are not drinking contaminated groundwater associated with the site because the area is served by a public water supply that is not affected by this contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. The potential exists for the inhalation of site contaminants due to soil vapor intrusion on-site. Further evaluation is needed to determine whether soil vapor intrusion is a concern for off-site structures.

6.5: Summary of the Remediation Objectives

The objectives for the remedial program have been established through the remedy selection process stated in 6 NYCRR Part 375. The goal for the remedial program is to restore the site to pre-disposal conditions to the extent feasible. At a minimum, the remedy shall eliminate or mitigate all significant threats to public health and the environment presented by the contamination identified at the site through the proper application of scientific and engineering principles.

The remedial action objectives for this site are:

Groundwater

RAOs for Public Health Protection

- Prevent ingestion of groundwater with contaminant levels exceeding drinking water standards.
- Prevent contact with, or inhalation of volatiles, from contaminated groundwater.

RAOs for Environmental Protection

- Restore ground water aquifer to pre-disposal/pre-release conditions, to the extent practicable.
- Remove the source of ground or surface water contamination.

Soil

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.
- Prevent inhalation of or exposure from contaminants volatilizing from contaminants in soil.

RAOs for Environmental Protection

- Prevent migration of contaminants that would result in groundwater or surface water contamination.

Soil Vapor

RAOs for Public Health Protection

- Mitigate impacts to public health resulting from existing, or the potential for, soil vapor intrusion into buildings at a site.

SECTION 7: ELEMENTS OF THE SELECTED REMEDY

The alternatives developed for the site and the evaluation of the remedial criteria are presented in the Alternative Analysis. The remedy is selected pursuant to the remedy selection criteria set forth in DER-10, Technical Guidance for Site Investigation and Remediation and 6 NYCRR Part 375.

The selected remedy is a Track 1: Unrestricted use remedy.

The selected remedy is referred to as the excavation and groundwater treatment remedy.

The elements of the selected remedy, as shown in Figure 2, are as follows:

1. Remedial Design

A remedial design program will be implemented to provide the details necessary for the construction, operation, optimization, maintenance, and monitoring of the remedial program. Green remediation principles and techniques will be implemented to the extent feasible in the design, implementation, and site management of the remedy as per DER-31. The major green remediation components are as follows;

- Considering the environmental impacts of treatment technologies and remedy stewardship over the long term;
- Reducing direct and indirect greenhouse gases and other emissions;
- Increasing energy efficiency and minimizing use of non-renewable energy;
- Conserving and efficiently managing resources and materials;
- Reducing waste, increasing recycling and increasing reuse of materials which would otherwise be considered a waste;
- Maximizing habitat value and creating habitat when possible;
- Fostering green and healthy communities and working landscapes which balance ecological, economic and social goals; and
- Integrating the remedy with the end use where possible and encouraging green and sustainable re-development.

2. Excavation

The existing on-site building will be demolished to facilitate the proposed remedy. Following completion of the building demolition, a sheeting system consisting of a waterproof hydraulic barrier will be installed at the perimeter of the site. The waterproof hydraulic barrier will consist of a series of interlocked steel sheets with a sealable cavity within each interlock. After installation, the interlock is flushed and a low permeability grout is injected into the entire length of the interlock. The hydraulic barrier will be installed to a sufficient depth to provide structural support which will facilitate the soil excavation within the property boundaries. Due to these requirements, the sheeting system will be installed to an approximate depth of 25-30 feet below grade.

After the waterproof hydraulic barrier is installed all on-site soils which exceed unrestricted soil cleanup objectives (SCOs), as defined by 6 NYCRR Part 375-6.8, will be excavated and transported off-site for disposal. This will include excavation and off-site disposal of contaminant source areas, including:

- grossly contaminated soil, as defined in 6 NYCRR Part 375-1.2(u);
- removal of any underground storage tanks (USTs), fuel dispensers, underground piping or other structures associated with a source of contamination;
- non-aqueous phase liquids; and
- soils which exceed the protection of groundwater soil cleanup objectives (PGWSCOs), as defined by 6 NYCRR Part 375-6.8 for those contaminants found in site groundwater above standards.

It is anticipated that soil will be excavated to a depth of 15 to 17 feet below grade. Approximately 3,600 tons of contaminated soil will be removed from the site. Clean fill meeting the requirements of 6 NYCRR Part 375-6.7(d) will be brought in to establish the designed grades at the site.

3. Groundwater Treatment

A dual phase extraction system (DPES) was designed and previously installed under the Voluntary Cleanup Program. The extraction system currently covers the area beneath the footprint of the on-site building and the adjacent parking lot. Prior to installing the hydraulic barrier and implementing the excavation discussed in remedy bullet 2, above, the on-site components of the DPES will be removed. The DPES components will be relocated and will continue to operate to address the off-site groundwater contamination.

Due to the planned excavation depth and the typical groundwater elevations at the site, dewatering will be required to facilitate the excavation work. Contaminated groundwater from dewatering operations will be treated as necessary prior to discharge to the municipal sewer system. It is expected that the dewatering will improve groundwater quality beneath the site.

Following completion of the excavation, in-situ chemical oxidation (ISCO) will be implemented to achieve a bulk reduction of VOCs in groundwater. A chemical oxidant will be injected into the subsurface to destroy the contaminants via injection wells. The method and depth of injection will be determined during the remedial design.

4. Vapor Intrusion Assessment

A post-remedial soil vapor intrusion evaluation will be completed prior to occupying any buildings developed on the site. The assessment will include a provision for implementing actions recommended to address exposures related to soil vapor intrusion.

The intent of the above remedial elements is to achieve Track 1 unrestricted use; therefore, no environmental easement or site management plan is anticipated. No groundwater use restriction is needed because the area is served by public water and Article 141 of the NYCDOH code prohibits potable use of groundwater without prior approval.

Contingent Remedial Elements:

In the event that a Track 1 cleanup is not achieved, including achievement of the groundwater and soil vapor remedial action objectives, imposition of an institutional control in the form of an environmental easement and a Site Management Plan, as described below, will be required and the site will achieve a Track 2 residential cleanup.

5. Institutional Control

Imposition of an institutional control in the form of an environmental easement will be required for the controlled property that:

- requires the remedial party or site owner to complete and submit to the Department a periodic certification of institutional and engineering controls in accordance with Part 375-1.8 (h)(3);
- allows the use and development of the controlled property for restricted residential, commercial and industrial uses as defined by Part 375-1.8(g), although land use is subject to local zoning laws;
- restricts the use of groundwater as a source of potable or process water, without necessary water quality treatment as determined by the NYSDOH or NYCDOH; and
- requires compliance with the Department approved Site Management Plan.

6. Site Management Plan

A Site Management Plan is required, which includes the following:

a. an Institutional and Engineering Control Plan that identifies all use restrictions and engineering controls for the site and details the steps and media-specific requirements necessary to ensure the following institutional and/or engineering controls remain in place and effective:

- Institutional Controls: The Environmental Easement discussed in remedy bullet 5.
- Engineering Controls: the in-situ chemical oxidation discussed in remedy bullet 3.

This plan includes, but may not be limited to:

o an Excavation Plan which details the provisions for management of future excavations in areas of remaining contamination

o descriptions of the provisions of the environmental easement including any land use, and groundwater use restrictions;

o a provision for evaluation of the potential for soil vapor intrusion for any buildings developed on the site, including provision for implementing actions recommended to address exposures related to soil vapor intrusion;

o provisions for the management and inspection of the identified engineering controls;

o maintaining site access controls and Department notification; and

o the steps necessary for the periodic reviews and certification of the institutional and/or engineering controls.

b. A Monitoring Plan to assess the performance and effectiveness of the remedy. The plan includes, but may not be limited to:

o a schedule of monitoring and frequency of submittals to the Department; and monitoring for vapor intrusion for any buildings developed on the site, as may be required by the Institutional and Engineering Control Plan.

c. an Operation and Maintenance (O&M) Plan to ensure continued operation, maintenance, optimization, monitoring, inspection, and reporting of any mechanical or physical components of the remedy. The plan includes, but is not limited to:

- procedures for operating and maintaining the remedy;
- compliance monitoring of treatment systems to ensure proper O&M as well as providing the data for any necessary permit or permit equivalent reporting;
- maintaining site access controls and Department notification; and
- providing the Department access to the site and O&M records.

1. A. The New York State Department of Environmental Conservation ("Department") is responsible for inactive hazardous waste disposal site remedial programs pursuant to Article 27, Title 13 of the Environmental Conservation Law ("ECL") and Part 375 of Title 6 of the Official Compilation of Codes, Rules and Regulations ("6 NYCRR") and may issue orders and enter into settlements consistent with the authority granted to the Commissioner by such statute.

B. The Department is responsible for brownfield cleanup remedial programs pursuant to Article 27, Title 14 of the ECL and Part 375 of Title 6 NYCRR.

C. The Department is responsible for carrying out the policy of the State of New York to conserve, improve and protect its natural resources and environment and control water, land, and air pollution consistent with the authority granted to the Department and the Commissioner by Article 1, Title 3 of the ECL.

D. This Order is issued pursuant to the Department's authority under, *inter alia*, ECL Article 27, Title 13, ECL Article 27, Title 14, and ECL 3-0301, and resolves Fyn Paint and Lacquer Co., Inc.'s and Kent River Corporation's liability to the State as provided at 6 NYCRR 375-1.5(b)(5).

2. In accordance with ECL §27-1411(5), the Department is required to "bring an enforcement action against any parties known or suspected to be responsible for contamination at or emanating from" a site in the BCP that has been determined to present a significant threat to public health or the environment.

3. 6 NYCRR 375-3.11(c)(1) authorizes the Department to expend moneys, in accordance with ECL 27-1411(5), from the hazardous waste remedial fund established pursuant to State Finance Law ("SFL") section 97-b and/or the New York environmental protection and spill compensation fund established pursuant to Navigation Law section 179, as appropriate, to pay, in whole or in part, the State costs incurred in the development and implementation of a remedial program for off-site contamination at a brownfield site where: (i) the applicant is a volunteer; and (ii) the site presents a significant threat. 6 NYCRR 375-3.11(c)(2) authorizes the Department to recover all State costs incurred pursuant to 6 NYCRR 375-3.11(c)(1) from any person responsible according to applicable principles of statutory or common law liability other than the volunteer.

4. 6 NYCRR 375-2.11(c)(1)(i)(*d*) authorizes the Department to expend moneys from the hazardous waste remedial fund established pursuant to SFL section 97-b to pay, in whole or in part, the State costs incurred in the development and implementation of a remedial program when the Department has made "all reasonable efforts to secure agreement" from responsible parties, has conducted diligent negotiations with those parties, and they have demonstrated inability/limited ability to pay pursuant to 6 NYCRR 375-2.11(c)(1)(i)(*d*)(5).

5. The Fyn Paint and Lacquer Co., Inc. real property located at 230 Kent Avenue, Brooklyn, NY 11249, Kings County (the "Fyn Paint Property") is in the Brownfield Cleanup Program ("BCP") and is designated as BCP Site No. C224154 ("the "BCP Site"). The Fyn Paint Property is not currently listed in the *Registry of Inactive Hazardous Waste Disposal Sites in New York State*, however, the Department has determined it presents a siginificent threat.

6. Site A is all of the off-site contamination related to disposal on the BCP Site. Site A is designated as DEC Site No. C224154A. Exhibit "A" is a map of Site A showing its approximate location.

7. For the purpose of this Order, the term "Existing Contamination" is defined as hazardous waste and hazardous substances (i) existing on the Fyn Paint Property as of the effective date of this Order, and (ii) such hazardous waste and hazardous substances which have emanated, are emanating from or may emanate in the future from the Fyn Paint Property. The *Remedial Investigation Report*, prepared for Fyn Paint & Lacquer Co., Inc. by Leggette, Brashears & Graham, Inc., dated January 2008, revised October 2008 identified volatile organic compounds ("VOCs") contamination in

the soil, soil vapor, and groundwater on and emanating from the Fyn Paint Property. The main VOCs are acetone, ethylbenzene, toluene, and mixed xylenes.

8. A. The Fyn Paint and Lacquer Co., Inc. ("Fyn Paint"), a domestic corporation, operated on the Fyn Paint Property from circa January 1959 until fall 2008 when it ceased operations.

B. Fyn Paint maintains that it has no assets. Fyn Paint is a closely held corporation with percentage of ownership of shares now being (i) The Estate of William Feinstein ("The Estate") and (ii) Gloria Roberts 36%. Ms. Roberts is Mr. Feinstein's sister.

C. Fyn Paint entered into a Voluntary Cleanup Agreement ("VCA") for the Fyn Paint Property effective April 1, 2001. Pursuant to the VCA, Fyn Paint completed installation of a Dual Phase Extraction System ("DPES") remedial system on the Fyn Paint Property in 2014. The VCA was terminated effective November 9, 2014 due to Fyn Paint's failure to fulfill its obligations under the VCA which upon information and belief resulted from the depletion of remedial funds from a court-ordered settlement as well as the depletion of the estate of William Feinstein.

9. A. Kent River Corporation ("Kent River"), a domestic corporation, has owned the real property which comprises the Fyn Paint Property/BCP Site No. C224154 since January 1959.

B. Kent River is a closely held single asset real estate holding corporation, *i.e.* the Fyn Paint Property is its only asset, with percentage of ownership of shares now being The Estate 50% and Gloria Roberts 50%.

C. Kent River entered into a contract with Mier Schweid which will result in the sale of the Fyn Paint Property to Kent Riverview, LLC.

D. Kent River is selling its sole asset and maintains that it has no other assets or sources of income.

10. Kent Riverview, LLC ("Riverview"), a domestic limited liability company which will take title to for the Fyn Paint Property, is a Volunteer under the Brownfield Cleanup Agreement for the Fyn Paint Property. Riverview entered into a Brownfield Cleanup Agreement for the BCP Site effective date March 5, 2015 (the "BCA"). Nothing contained in this Order on Consent and Administrative Settlement is intended to modify or amend the BCA and Riverview's obligations thereunder, or release Riverview with respect to any contamination on the BCP Site.

11. The goal of this Order on Consent and Administrative Settlement, in light of Kent River's and Fyn Paint's inability to pay, is to obtain fair, reasonable and equitable contributions by Kent River and Fyn Paint to response costs incurred and to be incurred by the State in the development and implementation of a remedial program for off-site

contamination at a brownfield site and for the Fyn Paint Property should Riverview fail to complete its obligations under the BCA, and to achieve the orderly relocation and transfer of ownership of the DPES equipment.

12. Respondents consent to the issuance of this Order without (i) an admission or finding of liability, fault, wrongdoing, or violation of any law, regulation, permit, order, requirement, or standard of care of any kind whatsoever; (ii) an acknowledgment that there has been a release or threatened release of hazardous waste at or from the Site; and/or (iii) an acknowledgment that a release or threatened release of hazardous waste at or from the Site constitutes a significant threat to the public health or environment.

13. Solely with regard to the matters set forth below, Respondents hereby waive any right to a hearing as may be provided by law, consent to the issuance and entry of this Order, and agree to be bound by its terms. Respondents consent to and agree not to contest the authority or jurisdiction of the Department to issue or enforce this Order, and agree not to contest the validity of this Order or its terms.

NOW, having considered this matter and being duly advised, **IT IS ORDERED THAT**:

I. Real Property

A. The BCP Site is the property located at 230 Kent Avenue, Brooklyn, New York and denoted as Tax Map ID No: Section 8, Block 2362, Lot 1. Site "A" which is subject to this Order pursuant to ECL Section 27-1411(5) is all of the off-site areas associated with the BCP Site. Site A, includes, but is not limited to, the parking lot area located at 218 Kent Avenue (Section 8, Block 2362, Lot 3) and the western portion of the former North First Street Terminal Major Oil Storage Facility – Parcel II.

B. The remedial program for the BCP Site will be implemented pursuant to the BCA. Riverview understands and acknowledges that should it or an affiliate acquire ownership of the Fyn Paint Property and Riverview fails to remediate the BCP Site under the BCP, the Fyn Paint Property will be listed in the Registry *of Inactive Hazardous Waste Disposal Sites in New York State* and it or its affiliate will have liability as an owner.

II. Respondents Obligations

A. Contemporaneously with the closing of title of the Fyn Paint Property as agreed between Kent River and Riverview, Respondents shall deliver or cause to be delivered to the Department a certified check in the amount of $750,000.00 SEVEN HUNDRED FIFTY THOUSAND U.S. DOLLARS payable to New York State Department of Environmental Conservation.

B. Contemporaneously with the closing of title of the Fyn Paint Property, Kent River and/or Fyn Paint shall, as evidenced by a bill of sale, transfer to Riverview

ownership of the equipment comprising the existing DPES remedial system[1] to be held by Riverview for the benefit of the Department subject to Subparagraphs II. C and D.

C. Within 10 days of the effective date of this Order on Consent and Administrative Settlement, Riverview shall submit to the Department a Work Plan for the relocation of the DPES (the "DPES Relocation Work Plan"). All relocation activities conducted pursuant to the DPES Relocation Work Plan are solely at Riverview's expense. Riverview shall continue to operate and maintain the DPES until such time as the Department accepts ownership.

D. After the relocation of the DPES remedial system to the adjoining Con Ed Parking Lot[2] and after the completion of the BCP Site remedy, when the Department is satisfied with the relocation and operational status of the DPES, including but not limited to, carbon change out and electrical connection, Riverview shall convey ownership of the DPES equipment to the Department. Such conveyance is subject to Paragraph III.

III. Department Obligation

After ownership of the DPES is accepted by the Department, the Department will operate and maintain the DPES as a remedial system for Site A. Nothing contained herein is intended to control or otherwise limit the Department's decision with respect to the selection of a final remedy for Site A. Further, nothing contained herein is intended to change, amend, or modify the Agreement regarding 218 Kent Avenue, Brooklyn between the Department and Consolidated Edison Company of New York, Inc., signed by the Department on August 6, 2015.

IV. Release and Covenant Not to Sue

Upon the completion of Respondents' Obligations set forth in Subparagraph II. A and B. above the Department, hereby releases and covenants not to sue, and shall forbear from bringing any action, proceeding, or suit pursuant to the Environmental Conservation Law, or the State Finance Law, and from referring to the Attorney General any claim for recovery of costs incurred by the Department, against Kent River and Fyn Paint and their respective shareholders, officers, directors, employees and secured creditors, and their respective successors and assigns (except for future owners or operators of the BCP Site) for the further investigation and remediation of Site A and the BCP Site, including, but not limited to, an action pursuant to Section 9607(a) of

---

1 The DPES remedial system consists of the following major components: The Dual-Phase Extraction recovery system (including extraction wells and associated pumps, pipes and filters); a groundwater recovery system (including extraction wells and associated pumps, pipes and filters); an oil-water separator and LNAPL storage tank; a sub-slab depressurization system; an Air Sparge injection system; associated groundwater and vapor treatment equipment; and an equipment trailer housing currently active remedial equipment, control panels, air sparge equipment and electrical equipment.

2 The Department has a separate agreement with Consolidated Edison Company of New York, Inc. regarding relocation of the DPES and access to the Con Ed Parking Lot.

CERCLA, 42 U.S.C. § 9607(a), based upon the release or threatened release of Existing Contamination. Nonetheless, the Department hereby reserves all of its rights concerning, and such release and covenant not to sue shall not extend to Natural Resources Damage or to any further investigation or remedial action the Department deems necessary:

- due to off-Site migration of petroleum; or
- due to fraud committed by Kent River and/or Fyn Paint in entering into or implementing the Order.

Notwithstanding the above, however, with respect to any claim or cause of action asserted by the Department, the one seeking the benefit of this release and covenant not to sue shall bear the burden of proving that the claim or cause of action, or any part thereof, is attributable solely to the Existing Contamination.

Notwithstanding any other provision in this release, covenant not to sue, and forbearance,

- if with respect to the Site there exists, or may exist, a claim of any kind or nature on the part of the New York State Environmental Protection and Spill Compensation Fund against any party, nothing in this order shall be construed or deemed to preclude the State of New York from recovering such claim.
- nothing contained in this Order shall be construed to prohibit the Commissioner or his duly authorized representative from exercising any summary abatement powers.

This release and covenant not to sue shall be null and void, *ab initio,* in the event of fraud relating to the execution or implementation of this Order by Kent River and/or Fyn Paint; or in the event of Kent River's or Fyn Paint's failure to materially comply with any provision of this Order.

V. Communications

A. All written communications required by this Consent Order shall be transmitted by United States Postal Service, by private courier service, by hand delivery, or by electronic mail.

1. Communication from Respondents shall be sent to:

B. The Department and each of the Respondents reserve the right to designate additional or different addressees for communication by delivering prior written notice to the the parties hereto. Additionally, the Department reserves the right to request that the Respondent Riverview provide more than one paper copy of any work plan or report.

C. Each party shall notify the other within ninety (90) days after any change in the addresses listed in this paragraph.

VI. Miscellaneous

A. Appendix A - "Standard Clauses for New York State Superfund Administrative Orders for Brownfield Site Offsite Cleanup" is attached to and hereby made a part of this Order as if set forth fully herein.

B. In the event of a conflict between the terms of this Order (including any and all attachments thereto and amendments thereof) and the terms of Appendix A, the terms of this Order shall control.

C. A Certificate of Completion will not be issued under this Order on Consent and Settlement Agreement.

D. The effective date of this Order is the 10th day after it is signed by the Commissioner or the Commissioner's designee.

APPENDIX "A"

STANDARD CLAUSES FOR NEW YORK STATE STATE SUPERFUND ADMINISTRATIVE ORDERS FOR BROWNFIELD SITE OFFSITE CLEANUP

APPENDIX A

STANDARD CLAUSES FOR NEW YORK STATE STATE SUPERFUND ADMINISTRATIVE ORDERS FOR BROWNFIELD SITE OFFSITE CLEANUP

The parties to the State Superfund Order (hereinafter "Order") agree to be bound by the following clauses which are hereby made a part of the Order. The word "Respondent" herein refers to any party to the Order, other than the New York State Department of Environmental Conservation (hereinafter "Department").

I. Citizen Participation Plan

Within twenty (20) days after the effective date of this Order, Respondent shall submit for review and approval a written citizen participation plan prepared in accordance with the requirements of Environmental Conservation Law (ECL) § 27-1417 and 6 NYCRR §§ 375-1.10 and 375-3.10. Upon approval, the Citizen Participation Plan shall be deemed to be incorporated into and made a part of this Order.

II. Initial Submittal

Within thirty (30) days after the effective date of this Order, Respondent shall submit to the Department a Records Search Report prepared in accordance with Exhibit "B" attached to the Order. The Records Search Report can be limited if the Department notifies Respondent that prior submissions satisfy specific items required for the Records Search Report.

III. Development, Performance, and Reporting of Work Plans

A. Work Plan Requirements

The work plans ("Work Plan" or "Work Plans") under this Order shall be prepared and implemented in accordance with the requirements of ECL Article 27, Titles 13 and 14 and 6 NYCRR §§ 375-1.6(a), 375-3.6, and 375-6. Upon approval of a Work Plan by the Department, Respondent shall implement such Work Plan in accordance with the schedule contained therein. Nothing in this Subparagraph shall mandate that any particular Work Plan be submitted. The Work Plans shall be captioned as follows:

1. "Remedial Investigation Work Plan" if the Work Plan provides for the investigation of the nature and extent of contamination within the boundaries of the Site.

2. "Remedial Work Plan" if the Work Plan provides for the development and implementation of a Remedial Program for contamination within the boundaries of the Site.

3. "IRM Work Plan" if the Work Plan provides for an interim remedial measure.

4. "Site Management Plan" if the Work Plan provides for the identification and implementation of institutional and/or engineering controls as well as any necessary monitoring and/or operation and maintenance of the remedy.

5. "Supplemental" if additional work plans other than those set forth in III.A.1-5 are required to be prepared and implemented.

B. Submission/Implementation of Work Plans

1. Respondent may opt to propose one or more additional or supplemental Work Plans (including one or more IRM Work Plans) at any time, which the Department shall review for appropriateness and technical sufficiency.

2. The first proposed Work Plan to be submitted under this Order shall be submitted no later than thirty (30) days after the effective date of this Order. Thereafter, the Respondent shall submit such other and additional work plans as

determined in a schedule to be approved by the Department.

3. Any proposed Work Plan shall be submitted for the Department's review and approval and shall include, at a minimum, a chronological description of the anticipated activities to be conducted in accordance with current guidance, a schedule for performance of those activities, and sufficient detail to allow the Department to evaluate that Work Plan. The Department shall use best efforts in accordance with 6 NYCRR § 375-3.6(b) to approve, modify, or reject a proposed Work Plan within forty-five (45) days from its receipt or within fifteen (15) days from the close of the comment period, if applicable, whichever is later.

i. Upon the Department's written approval of a Work Plan, such Department-approved Work Plan shall be deemed to be incorporated into and made a part of this Order and shall be implemented in accordance with the schedule contained therein.

ii. If the Department requires modification of a Work Plan, the reason for such modification shall be provided in writing and the provisions of 6 NYCRR § 375-1.6(d)(3) shall apply.

iii. If the Department disapproves a Work Plan, the reason for such disapproval shall be provided in writing and the provisions of 6 NYCRR § 375-1.6(d)(4) shall apply.

4. A Site Management Plan, if necessary, shall be submitted in accordance with the schedule set forth in the IRM Work Plan or Remedial Work Plan.

5. During all field activities conducted under a Department-approved Work Plan, Respondent shall have on-Site a representative who is qualified to supervise the activities undertaken in accordance with the provisions of 6 NYCRR 375-1.6(a)(3).

6. A Professional Engineer must stamp and sign all Work Plans other than SC or RI/FS Work Plans

C. Submission of Final Reports

1. In accordance with the schedule contained in an approved Work Plan, Respondent shall submit a Final Report for an Investigation Work Plan prepared in accordance with ECL § 27-1411(1) and 6 NYCRR § 375-1.6. If such Final Report concludes that no remediation is necessary, and the Site does not meet the requirements for Track 1, Respondent shall submit an Alternatives Analysis prepared in accordance with ECL § 27-1413 and 6 NYCRR § 375-3.8(f) that supports such determination.

2. In accordance with the schedule contained in an approved Work Plan, Respondent shall submit a Final Engineering Report certifying that remediation of the Site has been performed in accordance with the requirements of ECL §§ 27-1419(1) and (2) and 6 NYCRR § 375-1.6. The Department shall review such Report, the submittals made pursuant to this Order, and any other relevant information regarding the Site and make a determination as to whether the goals of the remedial program have been or will be achieved in accordance with established timeframes; if so, a written Certificate of Completion will be issued in accordance with ECL § 27-1419, 6 NYCRR §§ 375-1.9 and 375-3.9.

3. Within sixty (60) days of the Department's approval of a Final Report, Respondent shall submit such additional Work Plans as it proposes to implement. In addition, Respondent shall include with every report submitted to the Department a schedule for the submission of any subsequent work plan required to meet the requirements of ECL Article 27 Titles 13 and 14. Failure to submit any additional Work Plans within such period shall, unless other Work Plans are under review by the Department or being implemented by Respondent, result in the termination of this Order pursuant to Paragraph XIII.

D. Review of Submittals other than Work Plans

1. The Department shall timely notify Respondent in writing of its approval or disapproval of each submittal other than a Work Plan in accordance with 6 NYCRR § 375-1.6. All Department-approved submittals shall be incorporated into and become an enforceable part of this Order.

2. If the Department disapproves a submittal covered by this Subparagraph, it shall specify the reason for its disapproval and may request Respondent to modify or expand the submittal. Within fifteen (15) days after receiving written notice that Respondent's submittal has been disapproved, Respondent shall elect in writing to either (i) modify or expand it within thirty (30) days of receipt of the written notice of disapproval; (ii) complete any other Department-approved Work Plan(s); (iii) invoke dispute resolution pursuant to Paragraph XIV; or (iv) terminate this Order pursuant to Paragraph XIII. If Respondent submits a revised submittal and it is disapproved, the Department and Respondent may pursue whatever remedies may be available under this Order or under law.

E. Department's Determination of Need for Remediation

The Department shall determine upon its approval of each Final Report dealing with the investigation of the Site whether remediation, or additional remediation as the case may be, is needed for protection of public health and the environment.

1. If the Department makes a preliminary determination that remediation, or additional remediation, is not needed for protection of public health and the environment, the Department shall notify the public of such determination and seek public comment in accordance with ECL § 27-1417(3)(f). The Department shall provide timely notification to the Respondent of its final determination following the close of the public comment period.

2. If the Department determines that additional remediation is not needed and such determination is based upon use restrictions, Respondent shall cause to be recorded an Environmental Easement in accordance with 6 NYCRR § 375-1.8(h).

3. If the Department determines that remediation, or additional remediation, is needed, Respondent may elect to submit for review and approval a proposed Remedial Work Plan (or modify an existing Work Plan for the Site) for a remedy selected upon due consideration of the factors set forth in ECL § 27-1415(3) and 6 NYCRR § 375-1.8(f). A proposed Remedial Work Plan addressing the Site's remediation will be noticed for public comment in accordance with ECL § 27-1417(3)(f) and the Citizen Participation Plan developed pursuant to this Order. If the Department determines following the close of the public comment period that modifications to the proposed Remedial Work Plan are needed, Respondent agrees to negotiate appropriate modifications to such Work Plan. If Respondent elects not to develop a Work Plan under this Subparagraph then this Order shall terminate in accordance with Paragraph XIII. If the Respondent elects to develop a Work Plan, then it will be reviewed in accordance with Paragraph III.D above.

A. Failure to make an election or failure to comply with the election is a violation of this Order

F. Institutional/Engineering Control Certification

In the event that the remedy for the Site, if any, or any Work Plan for the Site, requires institutional or engineering controls, Respondent shall submit a written certification in accordance with 6 NYCRR §§ 375-1.8(h)(3) and 375-3.8(h)(2).

IV. Penalties

A. 1. Respondent's failure to comply with any term of this Order constitutes a violation of this Order, the ECL, and 6 NYCRR 375-2.11(a)(4). Nothing herein abridges Respondent's right to contest any allegation that it has failed to comply with this Order.

2. Payment of any penalties shall not in any way alter Respondent's obligations under this Order.

B. 1. Respondent shall not suffer any penalty except as provided in Paragraph IV, or be subject to any proceeding or action if it cannot comply with any requirement of this Order as a result of a Force Majeure Event as described at 6 NYCRR § 375-1.5(b)(4) provided Respondent complies with the requirements set forth therein.

V. Entry upon Site

A. Respondent hereby agrees to provide access to the Site and to all relevant information regarding activities at the Site in accordance with the provisions of ECL § 27-1431. Respondent agrees to provide the Department upon request with proof of access if it is not the owner of the site.

B. The Department shall have the right to periodically inspect the Site to ensure that the use of the property complies with the terms and conditions of this Order. The Department will generally conduct such inspections during business hours, but retains the right to inspect at any time.

C. Failure to provide access as provided for under this Paragraph may result in termination of this Order pursuant to Paragraph XIII.

VI. Payment of State Costs

A. Within forty-five (45) days after receipt of an itemized invoice from the Department, Respondent shall pay to the Department a sum of money which shall represent reimbursement for State Costs as provided by 6 NYCRR § 375-1.5 (b)(3)(i).

B. Costs shall be documented as provided by 6 NYCRR § 375-1.5(b)(3)(ii). The Department shall not be required to provide any other documentation of costs, provided however, that the Department's records shall be available consistent with, and in accordance with, Article 6 of the Public Officers Law.

C. Each such payment shall be made payable to the "Commissioner of NYSDEC" and shall be sent to:

Director, Bureau of Program Management
Division of Environmental Remediation
New York State Department of Environmental Conservation
625 Broadway
Albany, New York 12233-7012

D. Each party shall provide written notification to the other within ninety (90) days of any change in the foregoing addresses.

E. If Respondent objects to any invoiced costs under this Order, the provisions of 6 NYCRR §§ 375-1.5 (b)(3)(v) and (vi) shall apply. Objections shall be sent to the Department as provided under subparagraph VI.C above.

F. In the event of non-payment of any invoice within the 45 days provided herein, the Department may seek enforcement of this provision pursuant to Paragraph IV or the Department may commence an enforcement action for non-compliance with ECL § 27-1423 and ECL § 71-4003.

VII. Liability Limitation

Subsequent to the issuance of a Certificate of Completion pursuant to this Order. Respondent shall be entitled to the Liability Limitation set forth at ECL § 27-1421, subject to the terms and conditions stated therein and to the provisions of 6 NYCRR §§ 375-1.9 and 375-3.9.

VIII. Reservation of Rights

A. Except as provided at 6 NYCRR 375-1.9 and 375-2.9, nothing contained in this Order shall be construed as barring, diminishing, adjudicating, or in any way affecting any of the Department's rights or authorities, including, but not limited to, the right to require performance of further investigations and/or response action(s), to recover natural resource damages, and/or to exercise any summary abatement powers with respect to any person, including Respondent.

B. Except as otherwise provided in this Order, Respondent specifically reserves all rights and defenses under applicable law respecting any Departmental assertion of remedial liability and/or natural resource damages against Respondent, and further reserves all rights respecting the enforcement of this Order, including the rights to notice, to be heard, to appeal, and to any other due process. The existence of this Order or Respondent's compliance with it shall not be construed as an admission of liability, fault, wrongdoing, or breach of standard of care by Respondent, and shall not give rise to any presumption of law or finding of fact, or create any rights, or grant any cause of action, which shall inure to the benefit of any third party. Further, Respondent reserves

such rights as it may have to seek and obtain contribution, indemnification, and/or any other form of recovery from its insurers and from other potentially responsible parties or their insurers for past or future response and/or cleanup costs or such other costs or damages arising from the contamination at the Site as may be provided by law, including but not limited to rights of contribution under section 113(f)(3)(B) of CERCLA, 42 U.S.C. § 9613(f)(3)(B).

IX. Indemnification

Respondent shall indemnify and hold the Department, the State of New York, the Trustee of the State's natural resources, and their representatives and employees harmless as provided by 6 NYCRR 375-2.5(a)(3)(i).

X. Change of Use

Respondent shall notify the Department at least sixty (60) days in advance of any change of use, as defined in 6 NYCRR 375-2.2(a), which is proposed for the Site, in accordance with the provisions of 6 NYCRR § 375-1.11(d). In the event the Department determines that the proposed change of use is prohibited, the Department shall notify Respondent of such determination within forty-five (45) days of receipt of such notice.

XI. Environmental Easement

A. Within thirty (30) days after the Department's approval of a Remedial Work Plan which relies upon one or more institutional and/or engineering controls, or within sixty (60) days after the Department's determination pursuant to Subparagraph III.E.2 that additional remediation is not needed based upon use restrictions, Respondent shall submit to the Department for approval an Environmental Easement to run with the land in favor of the State which complies with the requirements of ECL Article 71, Title 36 and 6 NYCRR § 375-1.8(h)(2). Respondent shall cause such instrument to be recorded with the recording officer for the county in which the Site is located within thirty (30) days after the Department's approval of such instrument. Respondent shall provide the Department with a copy of such instrument certified by the recording officer to be a true and faithful copy within thirty (30) days of such recording (or such longer period of time as may be required to obtain a certified copy provided Respondent advises the Department of the status of its efforts to obtain same within such thirty (30) day period), which shall be deemed to be incorporated into this Order.

B. Respondent or the owner of the Site may petition the Department to modify or extinguish the Environmental Easement filed pursuant to this Order at such time as it can certify that the Site is protective of public health and the environment without reliance upon the restrictions set forth in such instrument. Such certification shall be made by a Professional Engineer or Qualified Environmental Professional as defined at 6 NYCRR § 375-1.2(ak) approved by the Department. The Department will not unreasonably withhold its consent.

C. If Respondent does not cause such environmental easement to be recorded in accordance with 6 NYCRR 375-1.8(h)(2), Respondent will not be entitled to the benefits conferred by 6 NYCRR 375-1.9 and 375-2.9 and the Department may file an Environmental Notice on the site.

XII. Progress Reports

Respondent shall submit a written progress report of its actions under this Order to the parties identified in Subparagraph IV.A.1 of the Order by the 10th day of each month commencing with the month subsequent to the approval of the first Work Plan and ending with the Termination date as set forth in Paragraph XIII, unless a different frequency is set forth in a Work Plan. Such reports shall, at a minimum, include: all actions relative to the Site during the previous reporting period and those anticipated for the next reporting period; all approved activity modifications (changes of work scope and/or schedule); all results of sampling and tests and all other data received or generated by or on behalf of Respondent in connection with this Site, whether under this Order or otherwise, in the previous reporting period, including quality assurance/quality control information; information regarding percentage of completion; unresolved delays encountered or anticipated that may affect the future schedule and efforts made to mitigate such delays; and information

regarding activities undertaken in support of the Citizen Participation Plan during the previous reporting period and those anticipated for the next reporting period.

XIII. Termination of Order

A. This Order will terminate upon the earlier of the following events:

1. Respondent's election in accordance with Paragraph III.E.2 not to implement the remedial activities required pursuant to the Decision Document. In the event of termination in accordance with this Subparagraph, this Order shall terminate effective the 5th Day after the Department's receipt of the written notification, provided, however, that if there are one or more Work Plan(s) for which a final report has not been approved at the time of Respondent's notification of its election not to implement the remedial activities in accordance with the Decision Document, Respondent shall complete the activities required by such previously approved Work Plan(s) consistent with the schedules contained therein. Thereafter, this Order shall terminate effective the 5th Day after the Department's approval of the final report for all previously approved Work Plans; or

2. The Department's written determination that Respondent has completed all phases of the Remedial Program (including Site Management), in which event the termination shall be effective on the 5th Day after the date of the Department's letter stating that all phases of the remedial program have been completed.

B. Notwithstanding the foregoing, the provisions contained in Paragraphs VI and IX shall survive the termination of this Order and any violation of such surviving Paragraphs shall be a violation of this Order, the ECL, and of 6 NYCRR §§ 375-2.11(a)(4), subjecting Respondent to penalties as provided under 3.5(b), (c), and (d) by providing written notification to the parties listed in Paragraph IV so long as such obligations accrued on or prior to the Termination Date of the Order.

C. If the Order is terminated pursuant to Subparagraph XIII.A.1, neither this Order nor its termination shall affect any liability of Respondent for remediation of the Site and/or for payment of State Costs, including implementation of removal and remedial actions, interest, enforcement, and any and all other response costs as defined under CERCLA, nor shall it affect any defenses to such liability that may be asserted by Respondent. Respondent shall also ensure that it does not leave the Site in a condition, from the perspective of human health and environmental protection, worse than that which existed before any activities under this Order were commenced. Further, the Department's efforts in obtaining and overseeing compliance with this Order shall constitute reasonable efforts under law to obtain a voluntary commitment from Respondent for any further activities to be undertaken as part of a Remedial Program for the Site.

XIV. Dispute Resolution

A. In the event disputes arise under this Order, Respondent may, within fifteen (15) days after Respondent knew or should have known of the facts which are the basis of the dispute, initiate dispute resolution in accordance with the provisions of 6 NYCRR § 375-1.5(b)(2).

B. All cost incurred by the Department associated with dispute resolution are State costs subject to reimbursement pursuant to Paragraph VI of Appendix A of this Order, if applicable.

C. Notwithstanding any other rights otherwise authorized in law or equity, any disputes pursuant to this Order shall be limited to Departmental decisions on remedial activities. In no event shall such dispute authorize a challenge to the applicable statute or regulation.

XV. Miscellaneous

A. Respondent agrees to comply with and be bound by the provisions of 6 NYCRR Subparts 375-1 and 375-2; the provisions of such Subparts that are referenced herein are referenced for clarity and convenience only and the failure of this Order to specifically reference any particular regulatory provision is not intended to imply that such provision is not applicable to activities performed under this Order.

B. The Department may exempt Respondent from the requirement to obtain any state or local permit or other authorization for any activity conducted pursuant to this Order in accordance with 6 NYCRR 375-1.12(b), (c), and (d).

C. 1. Respondent shall use best efforts to obtain all Site access, permits, easements, approvals, institutional controls, and/or authorizations necessary to perform Respondent's obligations under this Order, including all Department-approved Work Plans and the schedules contained therein. If, despite Respondent's best efforts, any access, permits, easements, approvals, institutional controls, or authorizations cannot be obtained, Respondent shall promptly notify the Department and include a summary of the steps taken. The Department may, as it deems appropriate and within its authority, assist Respondent in obtaining same.

2. If an interest in property is needed to implement an institutional control required by a Work Plan and such interest cannot be obtained, the Department may require Respondent to modify the Work Plan pursuant to 6 NYCRR 375-1.6(d)(3) to reflect changes necessitated by Respondent's inability to obtain such interest.

D. The paragraph headings set forth in this Order are included for convenience of reference only and shall be disregarded in the construction and interpretation of any provisions of this Order.

E. 1. The terms of this Order shall constitute the complete and entire agreement between the Department and Respondent concerning the implementation of the activities required by this Order. No term, condition, understanding, or agreement purporting to modify or vary any term of this Order shall be binding unless made in writing and subscribed by the party to be bound. No informal advice, guidance, suggestion, or comment by the Department shall be construed as relieving Respondent of Respondent's obligation to obtain such formal approvals as may be required by this Order. In the event of a conflict between the terms of this Order and any Work Plan submitted pursuant to this Order, the terms of this Order shall control over the terms of the Work Plan(s). Respondent consents to and agrees not to contest the authority and jurisdiction of the Department to enter into or enforce this Order.

2. i. Except as set forth herein, if Respondent desires that any provision of this Order be changed, Respondent shall make timely written application to the Commissioner with copies to the parties listed in Subparagraph IV.A.1.

ii. If Respondent seeks to modify an approved Work Plan, a written request shall be made to the Department's project manager, with copies to the parties listed in Subparagraph IV.A.1.

iii. Requests for a change to a time frame set forth in this Order shall be made in writing to the Department's project attorney and project manager; such requests shall not be unreasonably denied and a written response to such requests shall be sent to Respondent promptly.

F. 1. If there are multiple parties signing this Order, the term "Respondent" shall be read in the plural, the obligations of each such party under this Order are joint and several, and the insolvency of or failure by any Respondent to implement any obligations under this Order shall not affect the obligations of the remaining Respondent(s) under this Order.

2. If Respondent is a partnership, the obligations of all general partners (including limited partners who act as general partners) under this Order are joint and several and the insolvency or failure of any general partner to implement any obligations under this Order shall not affect the obligations of the remaining partner(s) under this Order.

3. Notwithstanding the foregoing Subparagraphs XV.F.1 and 2, if multiple parties sign this Order as Respondents but not all of the signing parties elect to implement a Work Plan, all Respondents are jointly and severally liable for each and every obligation under this Order through the completion of activities in such Work Plan that all such parties consented to; thereafter, only those Respondents electing to

perform additional work shall be jointly and severally liable under this Order for the obligations and activities under such additional Work Plan(s). The parties electing not to implement the additional Work Plan(s) shall have no obligations under this Order relative to the activities set forth in such Work Plan(s).

G. Respondent shall be entitled to receive contribution protection and/or to seek contribution to the extent authorized by ECL 27-1421(6) and 6 NYCRR 375-1.5(b)(5).

H. Any time limitations set forth in Section 113(g)(1) of CERCLA, as amended, 42 U.S.C. § 9613(g)(1), Section 1012(h)(2) of the Oil Pollution Act, as amended, 33 U.S.C. § 2712(h)(2), the Federal Water Pollution Control Act, the New York Navigation Law, the New York Environmental Conservation Law, or any other federal or state statute or regulation with respect to potential claims for natural resource damages against Respondent or any other time limitations for the filing of potential natural resource damages claims against Respondent under any other applicable state or federal law are tolled in their entirety from the effective date of this Order until termination of this Order.

I. Unless otherwise expressly provided herein, terms used in this Order which are defined in ECL Article 27 or in regulations promulgated thereunder shall have the meaning assigned to them under said statute or regulations.

J. Respondent's obligations under this Order represent payment for or reimbursement of response costs, and shall not be deemed to constitute any type of fine or penalty.

K. Respondent and Respondent's successors and assigns shall be bound by this Order. Any change in ownership or corporate status of Respondent shall in no way alter Respondent's responsibilities under this Order.

L. This Order may be executed for the convenience of the parties hereto, individually or in combination, in one or more counterparts, each of which shall be deemed to have the status of an executed original and all of which shall together constitute one and the same.

Ms. O'Connell,

On behalf of Sean Groszkowski of WSP USA, the attached Remedial System Relocation Work Plan is being submitted for your review and comment so we may address any additional steps necessary to proceed with the relocation activities.

As a follow up to the phone call from Friday, WSP requests that Con Edison provide the information for the sewer contractor to perform the utility disconnection activities for the former boiler house.

If you have any questions, please feel free to contact Sean Groszkowski directly via email at sean.groszkowski@wsp.com or by phone at (914) 694-5711.

Regards,

Dave Morelli

Remedial System Relocation Work Plan

Dear Mrs. O'Connell:

Introduction

As per the project meeting which took place on March 26, 2018 at the NYSDEC office, it was agreed that the remedial system currently staged on the western side of the Fyn Paint site will not be utilized for any of the construction dewatering activities associated with the site remedy. As outlined in the RAWP, the rationale for delaying the remedial trailer relocation until after the completion of the site remedy was specifically to have it available for localized construction dewatering activities associated with contaminated soil excavation below the water table. Therefore, with the change in scope for the excavation activities (to permit redevelopment with two sub-grade levels) as well as Con Edison's objection to the use of the remedial system for construction dewatering, the relocation delay is no longer necessary.

The system is currently inoperable (due to the electrical feeding having been disconnected in preparation for building demolition). Thus, considering that the NYSDEC (with Con Edison input) have determined that the remedial system may only be used for subsurface remediation, Kent Riverview LLC (KR) is ready to proceed with the relocation of the remedial system onto the Con Edison property. The following sections present the Remedial System Relocation Work Plan, and outline the scope of work required to transfer the remedial system trailer and associated components to the Con Edison property, as well as the activities required to make the remedial system operable.

Site Safety During Relocation Activities

All activities associated with the relocation and staging of the remedial system on the Con Edison property will be performed in accordance with the site-specific Health and Safety Plan as prepared and submitted in association with the Fyn Paint RAWP.

A Contact, Site Safety Briefing, Air Monitoring sheets, and a site and hospital location map have been prepared for the site activities.

In addition, while work is being performed on Con Edison property, all workers present shall conform to the Con Edison "Rules We Live By 2013" as well as additional Con Edison Environmental Health and Safety Protocol documents applicable to the proposed activities associated with the remedial system relocation activities. The applicable Con Edison Environmental Health and Safety Section Protocol documents included:

- CEHSP A32.00 – Rules We Live By (including table);
- Con Edison – Standard Safe Work Practices;
- Con Edison – Work Area Protection and Traffic Control Field Manual;
- CEHSP A28.00 – Calling A Time Out;
- CEHSP E08.02 – Noise Construction and Utility Activities;
- CEHSP S05.03 – Personal Protective Equipment: Protective Clothing;
- CEHSP S12.00 – Lockout/Tagout Procedures;
- CEHSP S05.01.06 – Activities with Potential to Contact Energized Subsurface Electrical Installations.

System Relocation Activities

All activities associated with the relocation and staging of the remedial system on the Con Edison parking lot property will be coordinated with Con Edison representatives. The proposed relocation area for the remedial system is on the northern perimeter of the Con Edison property. This area is within the footprint of the former boiler house building which has been razed. The proposed remedial system staging area is presented on the attached figure.

Prior to relocation, the existing electrical connections will be disconnected from the remedial trailer. All Electrical feed wires and conduit will be temporarily stored on the Fyn Paint site pending the electrical connection activities (to be performed on the Con Edison property).

Kent Riverview will be responsible for coordinating with a contractor for disassembly of the current system fencing enclosure, removing the blocking currently in place from the beneath the trailer, and transporting the trailer to the Con Edison property. Additionally, the contractor will

perform the relocation of the vapor phase carbon units and the NAPL recovery drum (with secondary containment enclosure

Once the trailer is transported to the Con Edison property, it will be staged on the norther portion of the property. The trailer will be oriented with the tongue facing Kent Avenue. This orientation will provide the most access to the DPE inlet connections in addition to providing access to both the electrical disconnect (adjacent to the trailer tongue) and the to the rear entry doors on the trailer.

The dual phase extraction (DPE) conduits for the trenched extraction wells and air sparge wells are accessible from the Con Edison parking lot. Once the remedial system trailer is transferred, the DPE and air sparge well will be connected at the conduit stick-ups (adjacent to the Fyn Paint building). Flexible chemical rated tubing will be connected at the conduit stick-up, and will be run along the surface to connect to the remedial trailer. For the portion of the property encompassed within the exclusion zone (extending 15 feet from the Fyn Paint building as described in the NYS DOB demolition plans), the extraction tubing will be overlain with a temporary protective covering. This will consist of a conduit cover constructed of 4x4 wood beams and plywood. This will ensure that the process tubing is protected from any potential damage resulting from the building demolition activities at the Fyn Paint site.

Vapor Phase Carbon Units and NAPL Recovery Drum

A carbon service company will be contracted in the next one to two weeks to perform carbon change out activities on both the two (2) 800-lb liquid phase carbon units and the two (2) 1,600-lb vapor phase carbon units.

Temporary staging of spent carbon will be performed on the KR property. Waste profiling, transportation and disposal at an approved disposal facility will be coordinated by KR and their representatives. KR requests that this carbon change-out activity satisfy the respective conveyance requirement outlined in the consent order.

Once the carbon-change-out activity is completed, the two (2) 1,600-pound vapor phase carbon units will be relocated to the Con Edison property after the remedial system staging is complete. The vapor phase carbon units will be staged on the eastern side of the property adjacent to the Kent Avenue property line. In addition to the vapor phase carbon units, a vapor phase effluent discharge pipe will be installed on the southeastern corner of the system trailer. The effluent pipe will be installed with 4-inch diameter PVC, and will extent approximately 15 feet above grade elevation. This will ensure that the effluent discharge will be directed away from any pedestrian traffic (current or future) passing by the Site along Kent Avenue.

The 55-gallon NAPL recovery drum will be staged adjacent to the remedial trailer. The drum will be contained within a roll-top hardcovered secondary containment enclosure for both spill

protection and to protect from the elements. The proposed locations of these remedial components are presented on the attached figure.

Utilities

Electric

The remedial system will require a 400 amp 3-phase power supply for the equipment operation. KR will work in coordination with Con Edison and the NYSDEC to select an installation location and to complete the electric feed installation. Following install of 400-amp meter, a 400-amp service disconnect will also be installed. Once the service is installed, the electrical wiring will then be installed connecting the power supply to the remedial trailer disconnect. If possible, the meter/disconnect/wiring installed in the Fyn Pain building will be utilized for the new service connection. This should be acceptable, considering the equipment was installed in 2014, and has limited usage. The service connection account set up will need to coordinate with both Con Edison and the NYSDEC.

Sanitary/Combined Sewer

The effluent water (treated groundwater) will be discharged to the NYCDEP sanitary sewer. This will require a house connection to the NYS DEC combined sewer be installed onsite. WSP requests that Con Edison provide the contact information for the plumber who was contracted for the closing of the sewer connection(s) in association with the Boiler House demolishment. KR will contract a licensed plumber (same as used by Con Edison if possible) to obtain a sewer connection permit and to perform the house connection installation. All activities required for the installation of the sewer connection will be coordinated with Con Edison representatives.

NYC DEP Discharge Permit

The NYC DEP sewer discharge permit is currently issued for the discharge utilizing a house connection for the Fyn Paint building. The NYCDEP will be contacted to inquire if the existing sewer permit can be transferred to the NYSDEC and if the point of discharge can be modified to reflect the new sewer connection.

If required, a new sewer discharge permit application will be prepared collaboratively with the NYSDEC.

Upon receipt of the NYSDEP discharge permit, operation of the remedial system can re-start.

Interim Remedial System OM&M

KR understands that the NYSDEC must follow established contractor procurement procedures in relation to selecting a remedial contractor for performance of the remedial system OM&M

activities. Therefore, once the remedial system relocation is complete and the system is operational, KR will continue to perform the OM&M activities until such time that NYSDEC remedial contractor procurement is completed. OM&M activities will continue to be performed as per the OM&M work plan outlined in the RAWP.

Temporary Access Agreement for System OM&M

Pending NYSDEC remedial contractor procurement, KR requests that Con Edison prepare a temporary access agreement which will allow KR representatives access to the site for both routine and unexpected OM&M site visits. This will allow for implementation of the RAWP OM&M activities once the remedial system is operational.

KR requests that NYSDEC, NYSDOH and Con Edison review the proposed remedial system relocation plan and provide comments for aspects that do not adequately address the scope of work connected with the proposed activities.

We look forward to hearing back from you regarding the proposed work plan, and are willing to implement the outlined activities immediately once any additional logistical details can be addressed to the satisfaction of the NYSDEC, NYSDOH and Con Edison.

If you have any question or comments, you may contact me directly via email at sean.groszkowski@wsp.com or by telephone at (914) 694-5711.

Kind regards,

Sean Groszkowski, P.G.

Re: **Former North First Street Terminal, Parcel II, Brooklyn, New York**

Date: September 29, 2017

We have been asked to review existing environmental reports that have been prepared for the former North First Street Terminal, Parcel II (Block 2361, Lot 1) ("Parcel II"), which is owned by Consolidated Edison Company of New York, Inc. ("Con Edison") and which Con Edison plans to divest, and to provide advice as to whether additional investigation or remediation should be undertaken prior to sale. The 1.2-acre Parcel II is located in a mixed residential, commercial, and manufacturing section of Williamsburg, Brooklyn at 105 River Street, Kings County, New York.

Technical Summary

We have been informed by Con Edison's Real Estate Department that the highest and best future use for Parcel II is restricted residential development. The following technical analysis is based on meeting the requirements for restricted residential development. As discussed below, other than in the southeast corner, the soils on the property exhibit qualities of urban fill that is typical of waterfront properties in New York City.

Based on information in the Phase I ESA Report (H2M; September 1999), Parcel II was acquired along with two other parcels from the NEPCO Terminal Corp. in October 1984. NEPCO established a No. 6 fuel oil storage and transfer facility on the three parcels in 1965. Con Edison operated this Major Oil Storage Facility ("MOSF") until the late 1990s. As indicated in the Phase II Site Investigation Report developed by consultant HDR in January 2000, and the Site Investigation Report – Second Phase, developed by HDR in June 2012, three aboveground storage tanks ("ASTs") with a combined capacity of 14,325,000 gallons were located on Parcel II. Con Edison abandoned the main fuel oil line in 2000 and demolished the three ASTs at Parcel II in 2012. The ASTs were identified as a Recognized Environmental Condition ("REC") in the 1999 Phase I ESA Report, prompting the planning and implementation of a series of soil and groundwater investigations by HDR. The June 2012 HDR Report was prepared in support of Con Edison's request to NYSDEC Region 2 for closure of the MOSF License (No. 2-1480). In its July 24, 2012 response, the NYSDEC indicated that no further

action was required in relation to the former MOSF License and that gauging/sampling of MOSF monitoring wells could be discontinued.

In 2012, an extensive investigation was completed across the footprint of the former MOSF. Twenty two soil borings and five temporary monitoring wells were installed. A total of forty-four surface and subsurface soil samples were collected, ten of which had one or more Semi-Volatile Organic Compounds ("SVOCs") exceeding the NYSDEC Recommended Soil Cleanup Objectives ("RSCOs") for Restricted Residential ("RR") use. One subsurface soil sample exceeded the RR RSCO for Total Xylenes, a group of Volatile Organic Compounds ("VOCs"). This exceedance is attributed to the migration of hazardous substances from the underground solvent storage tanks at the former Fyn Paint and Lacquer Co. (Fyn Paint) property located directly across the street (on the east side River Street), which is hydraulically upgradient from Parcel II. The surface and subsurface soil samples collected from one location exceeded the RR RSCO for metals. There were no RR RSCO exceedances for polychlorinated biphenyls. The soil quality and concentrations are indicative of typical urban fill, which is prevalent at this parcel and this area of the Brooklyn waterfront. Exceedances of groundwater quality standards for VOCs (benzene, toluene, ethylbenzene and xylene ("BTEX") and SVOCs (phenols) were also detected at the five temporary monitoring wells, located generally between Parcel II and the Fyn Paint property. The former Fyn Paint operations are suspected to have contributed to the groundwater exceedances of BTEX detected in four of the five monitoring wells. The soil and groundwater concentrations are not indicative of a historical release from the former MOSF operations at Parcel II.

In 2015, a focused site investigation was conducted to delineate the vertical and horizontal extent of VOC contamination detected within Parcel II during the 2012 investigation. During an investigation conducted in 2015, nine soil borings/temporary monitoring wells were installed at Parcel II. Of the nine soil samples collected, only one sample location had VOCs (Total Xylene) concentrations exceeding the corresponding RR RSCO. Six of the nine temporary monitoring wells had exceedances of groundwater quality standards for VOCs; only one location had exceedances for all four BTEX compounds.

In February 2017, a supplemental site investigation was conducted to further delineate the extent of the VOC contamination at Parcel II, specifically in the southeast corner of Parcel II, directly downgradient from the Fyn Paint property. Two soil borings were installed, from which four soil samples were collected. Groundwater samples were collected from six existing / surrounding wells. Based on comparison of groundwater data to prior results, the groundwater quality in this area of Parcel II appears to be relatively unchanged. Contaminants of concern and concentrations detected in 2017 are generally consistent with the 2015 and 2012 data. Moreover, toluene, ethylbenzene and xylenes concentrations detected near the southeast corner of Parcel II were lower than the previous concentrations detected, by an order of magnitude. This may suggest that the offsite contamination from the Fyn Paint site is diminishing.

In July 2017, a 20 inch fuel oil line running between Parcels II and III that had been used during Parcel II's historic MOSF operations was inspected. The pipeline was confirmed to have been previously abandoned properly and grouted in place during decommissioning of the MOSF facilities. There was no indication of impacts to surrounding soils identified during the July 2017 inspection and the fuel oil pipeline has since been removed.

Soil and groundwater data collected during the prior investigations do not appear to be indicative of any releases associated with the historic operations at Parcel II. The data suggest, however, that there is a preferential pathway in the southeastern corner of Parcel II, where historic operations at the Fyn Paint property have impacted both soil and groundwater with dissolved phase VOCs. Prior studies conducted by Fyn Paint's consultant, LBG, had suggested that this southeast area of Parcel II could be addressed by installation of an interceptor trench. NYSDEC agreed to defer the interceptor trench installation with the understanding that a soil vapor extraction system installed on the Fyn Paint property in July 2014 could help mitigate the Fyn Paint contamination plume and that Con Edison intended to sell Parcel II in the near future to another party who could redevelop Parcel II and address the southeast corner at that time. In the interim, Con Edison agreed to conduct the further studies of Parcel II described above that have since shown that the Fyn Paint contamination is diminishing but still exists in the southeast corner of Parcel II. At this time, we do not recommend installing an interceptor trench in the southeast corner of Parcel II, unless required by NYSDEC, because depending on the future development plans for the property, other remedial actions may be preferable. The potential path forward for the southeast corner of Parcel II in connection with the sale of Parcel II is discussed in the Law Summary below.

Groundwater is not used for domestic consumption in the area. Excavated soils generated during potential future site redevelopment should be characterized for disposition at a permitted waste disposal facility. Based on the results of previous environmental investigations conducted at, and surrounding Parcel II, and a good faith review of the records in EH&S's possession, no further environmental investigation is required at this time.

Legal Summary

It is expected that NYSDEC will require future action by Con Edison or a future owner to address the Fyn Paint contamination that has migrated onto the southeast corner of Parcel II. The most cost-effective path forward would be to combine future remedial action with redevelopment of Parcel II. The future property owner should evaluate its potential options for coordination with NYSDEC, including whether the project would qualify for entry into the New York State Brownfield Cleanup Program.

We would suggest, to the extent obtainable in negotiations, that the following terms be considered for inclusion in a Purchase and Sale and Agreement for Parcel II:

- Acknowledgement by the purchaser that they have conducted an independent environmental evaluation of Parcel II.
- No representations or warranties from Con Edison regarding the environmental condition of Parcel II. Con Edison can provide its readily-available environmental reports on Parcel II, but with no representations or warranties regarding their completeness or accuracy.

- Full indemnity and release of Con Edison for any environmental conditions, whether known unknown, existing or future, including a covenant with this same release/indemnity that also must be signed by any future purchasers of Parcel II (except any residential condominium owners).

Please let us know if you have any questions or require additional information.

Date: September 23, 2015

Re: Former North First Street Terminal, Parcels I and IV

This memorandum relates to the former North First Street Terminal, Parcels I and IV (the "Site"), which is owned by Consolidated Edison Company of New York, Inc. ("Con Edison"), and which Con Edison plans to divest. All technical information regarding Site conditions and prior investigation is based on information received from Barry Cohen and David Rubin of EH&S.

The 1.5-acre Site is located in a mixed residential, commercial, and manufacturing section of Williamsburg, Brooklyn at 87 River Street and 2 North First Street (respectively), Kings County, New York. According to the Phase I ESA Report (H2M; September 1999), Parcel I (Block 2355, Lot 1) was acquired along with two other parcels from the NEPCO Terminal Corp. in October 1984. NEPCO established a No. 6 fuel oil storage and transfer facility on the three parcels in 1965. As indicated in the Phase II Site Investigation Report (HDR; January 2000) and the Site Investigation Report – Second Phase (HDR; June 2012), Parcel I had three above-ground storage tanks ("ASTs") with a combined capacity of 16,950,000 gallons. Con Edison demolished the three ASTs at the Site in 2011. The presence of the ASTs at the Site was identified as a Recognized Environmental Condition ("REC") in the 1999 Phase I ESA Report, prompting the planning and implementation of a series of soil and groundwater investigations by HDR. The June 2012 HDR Report was prepared in support of Con Edison's request to NYSDEC Region 2 for closure of the Major Oil Storage Facility ("MOSF") License (No. 2-1480). In its July 24, 2012 response, DEC indicated that no further action was required in relation to the former MOSF License, the reported spill (petroleum sheen) observed during tank demolition activities had been closed, and gauging/sampling of MOSF monitoring wells could be discontinued.

With respect to Parcel IV (Block 2376, Lot 50), the 1999 Phase I ESA Report states that Con Edison acquired property (consisting of Parcel IV and the adjoining, upland lot) from Charles Pfizer and Company ("Pfizer") in 1993. Pfizer utilized the upland lot for the storage and transfer of molasses and sulfuric acid in the production of cough syrup (at a separate

manufacturing facility in Brooklyn). The Phase I Report indicates that the storage and transfer operation at the upland lot ceased around July 1984. The upland facilities were subsequently removed and Con Edison sold the upland lot to the New York Power Authority ("NYPA"). Parcel IV has remained unused by Con Edison since its acquisition from Pfizer.

In 2012, twenty soil borings and four temporary monitoring wells were installed within the footprint of the No. 6 fuel oil tank farm formerly located on Parcel I. Of the 40 surface and subsurface soil samples collected, 23 had one or more Semi-Volatile Organic Compounds ("SVOCs") exceeding the DEC Recommended Soil Cleanup Objectives ("RSCOs") for Restricted Residential ("RR") use ("highest and best future use" per Con Edison's Real Estate Department). There were no RR RSCO exceedances for VOCs, metals, or polychlorinated biphenyls ("PCBs"). The SVOC RR RSCO exceedances are typical for urban fill which is prevalent at the Site. The presence of remnant creosote-treated piles used to support the former MOSF tanks are also a potential contributor to the SVOC/Polycyclic Aromatic Hydrocarbons ("PAHs") concentrations. Exceedances of groundwater quality standards for VOCs (benzene, toluene, ethyl benzene and xylene ("BTEX")) and SVOCs (phenols; PAHs) were detected at the four temporary monitoring wells. Leaching from the creosote piles is a suspected contributor to the BTEX, phenol, and naphthalene ("PAH") groundwater standard exceedances. The reported concentrations for the soil and groundwater samples collected during the 2012 Parcel I investigation do not appear to be indicative of any potential release of No. 6 oil from the MOSF.

During 2013, six soil borings and two temporary monitoring wells were installed at Parcel IV. Of the 12 surface and subsurface soil samples collected, 8 had one or more SVOCs and 7 had metals exceeding the corresponding RR RSCOs. There were no RR RSCO exceedances for VOCs and PCBs. The soils encountered at Parcel IV consisted primarily of urban fill, and the analytical data were consistent with the chemical composition of urban fill. There were no exceedances of groundwater quality standards for VOCs, SVOCs, and PCBs. Filtered samples from the two wells exceeded the groundwater standards for two metals (magnesium and sodium). These exceedances are likely associated with the brackish, tidal East River (located a few feet west of the temporary wells). The soil and groundwater analytical data collected during the Parcel IV investigation do not appear to be indicative of any spills/leakage of chemicals or petroleum products associated with historic site activities.

Based on the results of the environmental investigations that Con Edison has undertaken with respect to the Site, remediation of soil and groundwater at the Site is not warranted. The soil exhibits qualities of urban fill that are typical of waterfront sites in New York City. Excavated soils generated during potential future site redevelopment should be characterized for disposition at a permitted waste disposal facility. Groundwater is not used for domestic consumption in the area. Although the potential risk to human health from vapor intrusion of VOCs in soil and groundwater is low, it would be prudent that a passive vapor barrier be incorporated into the design of any future residential structure that may be constructed at the Site.

Based on the foregoing analysis of environmental conditions associated with the Site conducted by EH&S, Law recommends that, to the extent possible, any agreement of purchase and sale include the following: (a) that purchaser takes the Site as-is and subject to all existing environmental conditions; (b) no representations and warranties from Con Edison regarding the Site's environmental condition and an acknowledgment that purchaser has independently evaluated the Site; and (c) a full indemnity and release from the purchaser for any environmental conditions.

1. INTRODUCTION

Henningson, Durham and Richardson Architecture and Engineering, P.C. (HDR), on behalf of Consolidated Edison Company of New York, Inc. (Con Edison), has performed a subsurface investigation to assess subsurface conditions at the former North First Street Terminal (NFST) Parcel IV. The investigation was performed in accordance with the Site Investigation Work Plan, prepared by HDR and dated March 2013.

1.1 Site Overview

Parcel IV is located in Williamsburg, Brooklyn, Kings County, New York. A Site Location Map is included as Figure 1. Parcel IV is located in a predominately mixed residential, commercial and industrial community. In recent years, the manufacturing demographic has been replaced with mixed residential and commercial properties. The former NFST Tank Complexes A ("Parcel II") and B ("Parcel I") are located north of Parcel IV. The New York Power Authority (NYPA) Gas Turbine Generation Station is located to the east of Parcel IV. A small city park and the East River are located south of Parcel IV and the East River is to the west (Figure 2).

1.2 Regional Geology/Hydrogeology

The Site is in the Atlantic Coastal Plain physiographic province. This province is comprised of unconsolidated deposits including interbedded layers of sand, clay and marl as well as sedimentary rock. The marine deposits are Cretaceous and Quaternary in age. The stratified drift deposits are derived from glacial activity that occurred during the Pleistocene Epoch. The total thickness of the marine and glacial deposits in Kings County ranges from 0 feet in northwest Brooklyn to 1,100 feet thick in northeastern Brooklyn.

The topography of the area slopes to the west towards the East River. The elevation of the Site is approximately 11 to 15 feet above mean sea level (msl). The ground surface at the Site consists of vegetated sandy fill. The shallow deposits beneath the Site consist of a brown, medium to coarse grained sand with some silt and trace gravel. In general, the subsurface area beneath the Site consists of interbedded layers of sand, gravel, and clay and silt mixture to at least 75 feet below ground surface (bgs). Bedrock beneath the Site is greater than 75 feet bgs. The regional direction of groundwater flow beneath the Site is to the west, toward the East River.

1.3 Site History and Previous Investigations

In 1999, a Phase I ESA (H2M) identified several areas of environmental concern at the Site (former Pfizer property subsequently subdivided into NYPA and Parcel IV) as follows:

- Mycelium and sulfuric acid heating coil disposal, which apparently was remediated but no end point samples were collected
- A potential 550 gallon UST in the northern portion of the former Pfizer property
- Two elevated stainless steel tanks and residual material
- Suspected asbestos and lead containing paint materials, but reported in good condition
- Floor penetrations in south structure
- Containers of toxic or hazardous materials
- Soils impacted by historic Site usage

To investigate potential Recognized Environmental Conditions (RECs) identified on the former Pfizer property, Con Edison contracted HDR (formerly Lawler, Matusky, and Skelly Engineers) to conduct a Phase II Site Investigation. HDR advanced 5 borings on the former Pfizer property as shown in Figure 3, one of which (S-06) was in close proximity to Parcel IV. Analytical results from the 1999 limited Phase II investigation showed that two of the five borings (S-06 and S-09) had impacts of volatile organic compounds (VOCs) with concentrations exceeding NYSDEC Recommended Soil Cleanup Objectives (RSCOs) that were in effect at the time of the sampling. Concentrations of semi-volatile organic compounds (SVOCs) and metals were also detected above RSCOs in all borings except for S-08 where SVOCs were not detected above the RSCOs.

These areas of concern were either assessed in the Phase 2 Site Investigation (2000) or subsequently addressed during the construction of the NYPA peaking generation/substation facility. However, no documentation associated with the NYPA construction activities was reviewed to assess how the areas of concern were addressed.

2. SITE INVESTIGATION ACTIVITIES

2.1 Field Mobilization/Utility Clearance

Prior to HDR's mobilization to the Site to commence the investigation, Con Edison personnel m-scoped the project area to identify subsurface utilities that may interfere with the investigation. To complement this activity, HDR contracted a private utility mark-out contractor, Diversified Geophysics Inc. of Mineola, New York, to mark out utilities and other underground anomalies within the work area.

A utility clearance was conducted prior to implementing intrusive activities. The procedure entailed utility mark-outs in accordance with the NYS Code 753 process, obtaining and reviewing available Consolidated Edison utility drawings and an HDR field reconnaissance Site visit to verify, to the extent possible, the location of utilities relative to the planned intrusive locations. Aquifer Drilling and Testing, Inc. (ADT) of New Hyde Park, NY, the drilling subcontractor selected by HDR to perform the probe drilling, called in the Code 753 request to the New York State One Call center.

As an added precaution and in accordance with Con Edison's intrusive investigation procedures, the upper 5 feet at each soil boring location was excavated using non-mechanical methods to confirm the absence of utilities (soft dig). ADT was subcontracted to perform non-mechanical clearance. At each location, ADT utilized hand tools (posthole digger and digging bar), an air knife, a vactron or a combination of the three, to excavate to five feet.

2.2 Soil Borings

Six vertical soil borings (B1 through B6) were advanced to assess the subsurface conditions at Parcel IV. Borehole locations are shown on Figure 4 and information from the boreholes is summarized on Table 1. The objective of these borings was to physically characterize subsurface soil conditions and allow for the collection of soil samples for laboratory chemical analysis. Borings were spaced approximately 50 feet apart except at B4. At B4, the final location was offset approximately 4-6 feet to the south due to the presence of underground utilities located at the proposed borehole location. In an effort to collect accurate subsurface lithology and undisturbed soil samples, borings were off set 1-2 feet from the soft dig location. ADT was subcontracted by HDR to advance soil borings using direct push technology (DPT) drilling methods and tooling. All borings were advanced continuously in five-foot increments using a 2-inch diameter Macro-Core® barrel with dedicated PVC liners. Each borehole was

advanced to the water table. Two soils borings were advanced at each location to ensure an adequate volume of soil was available for sample collection and analysis. Each boring location was advanced to ten feet. At some borings, refusal was encountered at approximately 8 feet. Upon retrieval of the sampler, wood was observed in the shoe at each refusal location.

An HDR environmental scientist was on-Site during the drilling activities to log soils and collect soil samples for laboratory analyses. Soils collected from each boring were described in accordance with the Unified Soil Classification System (USCS). Boring logs of each of the boreholes are included in this Site Investigation report as Appendix A. A MultiRAE Plus portable gas monitor that includes an oxygen sensor, lower explosive level sensor, hydrogen sulfide sensor, carbon monoxide sensor and a photoionization detector (PID) was used to monitor subsurface soils and headspace of the boring holes. Samples were immediately screened with the MultiRAE to identify areas where volatile organic vapors and/or methane or possibly hydrogen sulfide may be present. Observations and field screening data from each boring were recorded on the boring logs (Appendix A). No PID readings were noted above background concentrations during soil screening. In addition, none of the other sensors detected concentrations above background conditions during the investigation.

Subsurface soils observed during the investigation were described as silty sand with lower compositions of debris such as brick or concrete. No physical evidence (i.e., staining or odors) of contamination was observed during this investigation. Depths to groundwater ranged from 5 to 7 feet bgs. The variation in depth to groundwater may be attributed to the Site's proximity to the East River and the changes in tidal elevation during the investigation activities.

2.2.1 Soil Sampling and Analyses

As part of investigation, six surface soil samples (0-0.5 feet bgs) and six subsurface samples with varying depths ranging from 4 to 7 feet bgs were collected. A summary of the analytical parameters collected is provided in Table 2.

On May 2, 2013, six surface samples (0-0.5 feet bgs) were collected and retained by the HDR Environmental Scientist for laboratory analysis. Additionally, a blind duplicate sample (B7) was also collected from the B2 borehole. Surface samples were collected using a stainless steel trowel. Surface soils were placed in a stainless steel bowl for homogenization before sample collection. Once homogenized, samples were transferred to laboratory-supplied glassware labeled with the appropriate information including sample identification number and depth; date and time; analytical parameters requested, as well as, field personnel who collected the samples.

Samples collected for VOCs were collected directly from the Macro-Core® liners using dedicated En Core® samplers. Samples were then placed in a cooler containing ice pending shipment to the laboratory for analysis. All non-dedicated sampling equipment was cleaned between sample locations using a non-phosphate detergent and potable water wash followed by a de-ionized water rinse.

On the following day (May 3, 2013), six subsurface samples were collected utilizing a Geoprobe® DT6610 drill rig to advance Macro-Core® samplers outfitted with dedicated PVC liners to ten feet bgs. Subsurface samples from each of the six boreholes were collected from the interval immediately above the saturated zone, ranging from 4 to 7 feet bgs depending on the borehole. Following documentation of the field screening with the MultiRAE Plus portable gas monitor and USCS descriptions, soil samples were transferred directly into laboratory-supplied glassware, labeled with the appropriate information including sample identification number and depth; date and time; and the analytical parameters requested, as well as the field personnel who collected the samples. Samples were then placed in a cooler containing ice pending shipment to the laboratory for analysis. Upon completion of each borehole, non-dedicated sampling equipment was cleaned with a non-phosphate detergent and potable water wash followed by a de-ionized water rinse. During borehole advancement, no drill cuttings were observed to be impacted by contaminants. Therefore, the cuttings were returned to the borehole from which they were generated.

Upon completion of each days field activities, samples were submitted under proper chain of custody protocol to TestAmerica Laboratories, Inc., Shelton, CT (TestAmerica), a New York State Department of Health (NYSDOH) certified laboratory, via a laboratory-provided courier. Soil samples submitted to the laboratory were analyzed for VOCs using EPA Method 8260B, SVOCs using EPA Method 8270C (base-neutral compounds only), Target Analyte List (TAL) metals via EPA Method 6010B, and polychlorinated biphenyls (PCBs) using EPA Method 8082. Additionally two representative samples (one surface and one sub-surface) were analyzed for pesticides following EPA Method 8081 as stated in the Parcel IV Work Plan.

2.3 Temporary Piezometer Installation

ADT installed two temporary piezometers at select locations within the footprint of Parcel IV in accordance with the work plan. These temporary piezometers were installed using DPT drilling methods and tooling. All borings were advanced continuously in five-foot increments using a 2-inch diameter Macro-Core® barrel with dedicated PVC liners. Each borehole was advanced into the water table. One piezometer was installed at borehole B2 and the other was installed at borehole B5. An HDR environmental scientist was on-Site during the drilling activities to

observe the installation process and to log the boreholes. Observations and field screening data from each boring was recorded on boring logs, which are included in Appendix A.

Upon reaching the termination depth for each borehole, a 10-foot length of 1-inch diameter polyvinyl chloride (PVC), 0.002 inch slot screen was placed in the borehole such that the screened section of each piezometer intersected the water table. Piezometer construction logs documenting the construction details are included as Appendix B and a summary of temporary piezometer construction details is provided on Table 3. Following installation of the temporary piezometers, the groundwater was allowed to equilibrate before sampling.

2.3.1 Groundwater Sampling and Analyses

As part of this Parcel IV subsurface investigation, one groundwater sample was collected from each of the two temporary piezometers. Dedicated ¼-inch inside diameter (ID) low density polyethylene (LDPE) tubing was placed into each temporary piezometer and connected to a variable speed peristaltic pump utilizing dedicated laboratory-grade silicone tubing. The piezometers were then purged of approximately 1 gallon (gal) of water in an effort to collect visually turbid free samples. Purged water was collected in a five gallon pail and was assessed using olfactory senses for potential VOC contaminant impacts for subsequent disposal.

Once visually turbid free conditions were reached, groundwater samples were collected directly into laboratory supplied glassware. Each container was then labeled with the appropriate sample identification number, parameters to be analyzed, date and time, as well as the field personnel who collected the samples. Sample containers were then placed in a cooler containing ice and sent under chain of custody protocol to TestAmerica via laboratory-provided courier.

Purge water was determined to be free of visible contamination (no free phase product or heavy sheen) and was then discharged back into the borehole from which it was purged following sample collection. Upon completion of ground water sampling, the temporary PVC piezometers were removed and the boreholes were filled with soils generated during drilling activities.

All groundwater samples were analyzed for VOCs using EPA Method 8260B, SVOCs using EPA Method 8270C (base-neutral compounds only), TAL metals via EPA Method 6010B, and PCBs using EPA Method 8082.

3. DISCUSSION OF ANALYTICAL RESULTS

3.1 Soil Boring Results

Analytical results obtained from the Parcel IV subsurface soil samples were compared to NYSDEC Part 375 Soil Cleanup Objectives (SCOs) including Unrestricted, Restricted Residential, Commercial, Industrial, and Protection of Groundwater SCOs. SVOCs and metals were also compared to the 98th percentile of background concentrations in Manhattan as calculated in the *Characterization of Soil Background PAH and Metal Concentrations,* March 24, 2007 by the RETEC Group Inc. (RETEC). Based on the results of the laboratory analyses of the 12 samples, the soils across the Site generally appear consistent with urban fill typical at waterfront sites. Some exceedances of certain end use SCOs and Protection of Groundwater SCOs are reported. A summary of the number of soil samples/locations with SCO exceedances is presented in the following table.

Sample Parameter	No. of Soil Samples Collected	Unrestricted Use SCO	Restricted Residential Use SCO	Commercial Use SCO	Industrial Use SCO	Protection of Groundwater SCO
VOCs	12	1	0	0	0	1
SVOCs	12	8	8	6	6	6
Pesticides	2	1	0	0	0	0
PCBs	12	0	0	0	0	0
Metals	12	11	7	5	3	7

Figures 5 through 7 show the locations with exceedances of the Unrestricted, Restricted Residential, Commercial, Industrial, and Protection of Groundwater SCOs. In reviewing the exceedances, the sample analytical results are within the same order of magnitude or are one order of magnitude higher than their respective SCOs. A summary of the analytical results with comparison to the land use SCOs is presented in Table 4. Table 5 provides a summary of the analytical results in comparison to the Protection of Groundwater SCOs. Table 6 provides a summary of SVOC and metals as compared to the 98th percentile of background concentrations in Manhattan as calculated in the *Characterization of Soil Background PAH and Metal Concentrations*, March 24, 2007 by RETEC.

3.1.1 Surface Soil Sample Results

Five out of the six surface soil samples collected were reported to have concentrations above Part 375 Unrestricted Use and Restricted Residential Use SCOs. For Unrestricted Use, one sample contained VOC exceedances, five samples contained SVOC exceedances, five samples contained metal exceedances, and one sample exceeded for one pesticide compound. With respect to Restricted Residential SCOs, five samples contained SVOC exceedances and two samples contained metal exceedances.

No VOCs were detected at concentrations in excess of their respective SCOs in any of the surface soil samples.

Benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene were the only SVOCs detected at concentrations above their respective Restricted Residential Use SCOs in the surface samples (benzo(k)fluoranthene and chrysene exceeded their Unrestricted Use SCOs). Concentrations of benzo(a)anthracene were detected at 1,300 ug/kg in B3, 2,300 ug/kg in B4, and 1,400 in B5; benzo(a)pyrene concentrations were detected at 1,200 ug/kg in B3, 2,500 ug/kg in B4, and 1,400 ug/kg in B5; and benzo(b)fluoranthene concentrations were detected at 1,500 ug/kg in B3, 2,800 ug/kg in B4, and 1,700 ug/kg in B5; and dibenzo(a,h)anthracene concentrations as detected at 540 ug/kg in B4. The only other PAH that was detected in surface samples at a concentration above its Unrestricted and Restricted Residential Use SCO was indeno(1,2,3-cd)pyrene. It was detected at concentrations above the SCO of 500 ug/kg in five of the six surface soil samples (B1, B2, B3, B4, and B5) at concentrations up to 2,200 ug/kg (in B4). The following table provides a summary of the SVOC Restricted Residential RSCO exceedances in the surface soil samples.

Compound	Restricted Residential Use SCO (ug/kg)	Number of Restricted Residential Use SCO Exceedances	High Concentration (ug/kg)	Location of High Concentration
benzo(a)anthracene	1,000	3	2,300	B4 (0-0.5)
benzo(a)pyrene	1,000	3	2,500	B4 (0-0.5)
benzo(b)fluoranthene	1,000	3	2,800	B4 (0-0.5)
dibenzo(a,h)anthracene	330	1	460	B4 (0-0.5)
indeno(1,2,3-cd)pyrene	500	5	2,200	B4 (0-0.5)

Concentrations of six metals (arsenic, chromium, copper, lead, mercury, and zinc) exceeded their Unrestricted Use SCOs in surface soils, while two metals (arsenic and mercury) also exceeded their respective Restricted Residential Use SCOs in the surface samples. Arsenic was detected in one sample, B4 (0–0.5) at 34.9 mg/kg above the Restricted Residential Use SCO of 16 mg/kg. Mercury was the only other metal detected in surface samples at concentrations above Restricted Residential Use SCO. It was detected in B2 (0–0.5) at 0.82 mg/kg and 0.91 mg/kg in the duplicate sample, above the 0.81 mg/kg Restricted Residential Use SCO. Both the arsenic and mercury exceedances are on the same order of magnitude as their respective Restricted Residential Use SCOs.

No pesticides or PCBs were detected above the Restricted Residential Use SCO in any of the surface samples collected. The pesticide 4,4'-DDT was detected above its Unrestricted Use SCO of 3.3 ug.kg in sample B2(0-0.5) at an estimated concentration of 4.2 ug/kg.

It should be noted that in accordance with the Quality Assurance Project Plan (QAPP), one blind duplicate sample was also collected during the advancement of the surface samples. Analytical results from sample B7 (0-0.5) [duplicate of B2 (0-0.5)] were consistent with the sampling results from B2 (0-0.5). This suggests that laboratory analytical procedures are reproducible and the sample collection process is consistent.

Based on the analytical data summarized above, the surface sample that appears to be most impacted was collected at B4 (0–0.5). Analytical results show B4 had the greatest concentrations of the compounds detected with the most SVOC and metals that exceeded their respective Unrestricted Use and Restricted Residential Use SCOs.

With respect to comparison of surface soil samples to the Protection of Groundwater SCOs, one VOC, three SVOCs, and two metals were reported at concentrations that exceed the SCO for surface soil samples. Acetone exceeded the Protection of Groundwater SCO (50 ug/kg) in one sample [B1 (0 – 0.5)], with a concentration of 76 ug/kg. However, it should be noted that acetone was also detected in laboratory blank. Therefore, the concentration that was reported may not be indicative of Site conditions. The three SVOCs that exceeded the Protection of Groundwater SCOs in the surface samples were benzo(a)anthracene, benzo(b)fluoranthene, and chrysene. These exceedances were noted in boreholes B3, B4, and B5. Benzo(a)anthracene and chrysene were detected in three of the six surface samples above their respective Protection of Groundwater SCOs. Concentrations of benzo(a)anthracene ranged from 1,300 ug/kg (B3) to 2,300 ug/kg (B4). Concentrations of chrysene ranged from 1,400 ug/kg (B3) to 2,500 ug/kg (B4). Benzo(b)fluoranthene was detected in one (B4) of the six samples collected at a

concentration of 2,800 ug/kg, above its respective Protection of Groundwater SCO. Surface samples collected from B2 and B4 exceeded applicable Protection of Groundwater SCOs for arsenic (B4) and mercury (B2). Arsenic was detected at 34.9 mg/kg whereas mercury was detected at 0.82 mg/kg. Both of these sample concentrations are on the same order of magnitude as the respective SCOs (arsenic at 16 mg/kg and mercury at 0.73 mg/kg).

Select SVOC and metals from surface soils samples were also compared to background PAH and metal concentrations in Manhattan soils in combination with the Unrestricted Use and Restricted Residential Use SCOs. Surface samples from one location exceeded Manhattan background levels for two SVOC compounds, benzo(b)fluoranthene and indeno(1,2,3-cd)pyrene, and one metal compound (arsenic). All exceedances for these compounds were the same order of magnitude as their respective SCOs or background concentration.

3.1.2 Subsurface Soil Sample Results

Results of the subsurface sample analyses show exceedances of the Unrestricted Use SCOs at all six subsurface sampling locations, and Restricted Residential Use SCOs at five of six locations (no Restricted Residential exceedances were detected in the sample collected from borehole B3). Acetone was the only VOC detected during subsurface sampling. It was detected in five of the six samples collected with concentrations ranging from 4.2 ug/kg to 16 ug/kg, but it did not exceed the Unrestricted Use and Restricted Residential Use SCOs. However, it should be noted that acetone was also detected in the laboratory blank. Therefore, the reported concentrations may not be indicative of Site conditions.

Regarding the subsurface samples, three of six samples have SVOC concentrations exceeding the Unrestricted Use and Restricted Residential Use SCOs. The SVOCs with concentrations exceeding these SCOs are PAHs, specifically benzo(a)anthracene, benzo(a)pyrene, benzo(k)fluoranthene (Unrestricted only), benzo(b)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene. In general, the concentrations of these compounds were the same order of magnitude as the respective Unrestricted Use and Restrictive Residential Use SCOs, with the exception of benzo(k)fluoranthene and indeno(1,2,3-cd)pyrene, which were one order of magnitude above the Unrestricted Use and Restricted Residential Use SCOs, respectively. The sample collected from B5 (5–6.5) appears to have the highest detected concentrations of SVOCs. A summary of the SVOC concentrations that exceed the Restrictive Residential Use SCOs is provided in the following table.

Compound	Restricted Residential Use SCO (ug/kg)	Number of Restricted Residential Use SCO Exceedances	High Concentration (ug/kg)	Location of High Concentration
benzo(a)anthracene	1,000	3	4,400	B5 (5 – 6.5)
benzo(a)pyrene	1,000	3	5,000	B5 (5 – 6.5)
benzo(b)fluoranthene	1,000	3	7,000	B5 (5 – 6.5)
chrysene	3,900	3	5,600	B5 (5 – 6.5)
dibenz(a,h)anthracene	330	3	610	B5 (5 – 6.5)
indeno(1,2,3-cd)pyrene	500	3	2,100	B1 (4.5 – 6.0)

Metal concentrations exceeded the Restricted Residential Use SCOs in five of the six subsurface samples; all six samples had Unrestricted Use SCO exceedances. Arsenic, copper, lead, mercury, and selenium all have concentrations that exceeded their respective Restricted Residential SCOs. Arsenic, selenium and lead are the same order of magnitude as their respective Restricted Residential SCOs, whereas copper and mercury were the same order or were one order of magnitude above cleanup objectives. A summary of the metal concentrations that exceed the Restrictive Residential Use SCOs is provided in the following table.

Metal	Restricted Residential Use SCO (mg/kg)	Number of Restricted Residential Use SCO Exceedances	High Concentration (mg/kg)	Location of High Concentration
Arsenic	16	2	48.1	B4 (5-6.5)
Copper	270	2	2,300	B3 (4.5-6)
Lead	400	3	645	B6 (5-6.5)
Mercury	0.81	3	1.3	B3 (4.5-6)
Selenium	310	1	883	B5 (5-6.5)

PCBs and pesticides were not detected at concentrations exceeding the Unrestricted Use or Restricted Residential Use SCOs in any of the samples analyzed. However, pesticides were only analyzed from the B2 (5-7) subsurface sample.

For the subsurface samples, the Protection of Groundwater SCOs were exceeded for SVOCs and metals. No exceedances of the Protection of Groundwater SCOs were reported for VOCs, pesticides or PCBs. Samples with SVOC exceedances include B1 (4.5–6.0), B5 (5–6.5), and B6 (5-6.5) where benzo(a)anthracene, benzo(b)fluoranthene, and chrysene exceeded their respective

SCOs. The sample collected from B5 (5–6.5) also had an exceedance for benzo(k)fluoranthene. Metals that exceeded the Protection of Groundwater SCOs were detected in five of the six samples collected and include arsenic (samples collected from B4 and B6), copper (sample from B3), lead (sample from B6), mercury (samples from B1, B3, and B6), and selenium (sample from B5).

Select SVOC and metal analytes from sub-surface soils samples were also compared to background PAH and metal concentrations in Manhattan soils in combination with the Unrestricted Use and Restricted Residential Use SCOs. Three of the six subsurface samples (B1, B5, and B6) had SVOC concentrations including benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene that exceeded all three criteria. Five of the six subsurface samples (all but B3) contained metals with concentrations exceeding the criteria. These metals include arsenic in the B4 and B6 samples, nickel in the B1 and B2 samples, and selenium in the B5 sample. These exceedances were the same order as, or were one order of magnitude above the respective SCOs.

3.2 Groundwater Results

To assess the groundwater beneath Parcel IV, two temporary piezometers were installed and groundwater samples were collected and analyzed. The analytical results from the two temporary wells indicate there was only one VOC (chloroform) detected in the two groundwater samples. However, the chloroform concentrations were below the TOGS GWQS. There were no detectable concentrations of SVOCs or PCBs in the two groundwater samples.

The groundwater results indicate that six metals were detected in unfiltered Site groundwater above applicable TOGS 1.1.1 GWQS or guidance values including iron, lead, magnesium, manganese, sodium, and mercury. Analytical results also suggest that Site groundwater has been impacted by metals typically associated with urban fill prevalent at waterfront sites. Metals concentrations also show the effect of the brackish East River water as supported with the potassium, magnesium and sodium concentrations.

It should be noted that along with the standard (unfiltered) metals analysis, samples for dissolved metals were also analyzed. Five metal compounds (barium, calcium, magnesium, potassium, and sodium) were detected in the two filtered samples, two of which (magnesium and sodium) exceeded TOGs 1.1.1 standards (35,000 ug/l and 20,000 ug/l, respectively). It should also be noted that temporary piezometers B2 and B5 were located in close proximity (a few feet to the east) to the tidal East River, which is adjacent to Parcel IV. Dissolved concentrations of magnesium were 645,000 ug/l in the B2 sample and 815,000 ug/l in the B5 sample. Sodium

concentrations were 4,930,000 ug/l in the B2 sample and 6,090,000 ug/l in the B5 sample. All other metals that were detected in the standard (unfiltered) metal analysis exceeding TOGS criteria (iron, lead, manganese, and mercury) were not detected in the dissolved (filtered) metals samples.

Although the above metals are in exceedance of their respective TOGS 1.1.1 groundwater standard and guidance values, their presence is not indicative of a significant impact associated with historic use of Parcel IV. It is also noteworthy that groundwater at and in the Site vicinity is not used as a potable drinking water source.

4. CONCLUSIONS

The soils encountered during this investigation primarily consist (as anticipated) of urban fill. The sample analytical data for VOCs, SVOCs, pesticides, PCBs and metals are generally consistent with the chemical composition of urban fill. With a few exceptions, the exceedances are within the same order of magnitude as Part 375 Unrestricted Use and Restricted Residential Use SCOs. Based on the analytical data and field measurements and observations, there is no apparent indication of impacts to soil or groundwater attributable to spills/leakage of chemicals or petroleum products from tanks, ancillary piping, accidental discharges or other historical activities that may have occurred on-Site or at nearby properties. Based on the collected Site data, the surface soil sample at the B4 location had the highest surface SVOC and metals concentrations and the subsurface soils at B5 were shown to have the highest subsurface SVOC and metals concentrations.

Contaminants of concern associated with the upgradient Fyn Paint property (acetone, toluene, and ethyl benzene) were not evident in the Parcel IV subsurface soil samples. Only one VOC (chloroform at a low concentration) was detected in the two Parcel IV groundwater samples.

Notes:
Highlighted cells indicate exceedances of NYSDEC Part 375 Tables 375-6.8(a) and 375-6.8(b) Soil Cleanup Objectives (SCO)
GV - Indicates guidance value from NYSDEC CP-51 Supplemental Soil Cleanup Objectives.
ND - compound was not detected at the MDL.
J - Indicates an estimated value.
B - The analyte was found in an associated blank, as well as in the sample.
P - The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
* - Surrogate exceeds the control limit
* - RPD of the LCS and LCSD exceeds the control limits
* - LCS or LCSD exceeds the control limits
NS - No Standard
NC - Samples not collected for this parameter.
ug/kg - microgram per kilogram
mg/kg - milligram per kilogram

Notes:
Highlighted cells indicate exceedances of NYSDEC Part 375 Tables 375-6.8(a) and 375-6.8(b) Soil Cleanup Objectiv
GV - Indicates guidance value from NYSDEC CP-51 Supplemental Soil Cleanup Objectives.
ND - compound was not detected at the MDL.
J - Indicates an estimated value.
B - The analyte was found in an associated blank, as well as in the sample.
P - The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reporte
* - Surrogate exceeds the control limit
* - RPD of the LCS and LCSD exceeds the control limits
* - LCS or LCSD exceeds the control limits
NS - No Standard
NC - Samples not collected for this parameter.
ug/kg - microgram per kilogram
mg/kg - milligram per kilogram

Notes:
Highlighted cells indicate exceedance of NYSDEC Unrestricted Use SCOs, Restricted Residential Use SCOs **and** Manhattan Background values (referenced below).
Manhattan Background Levels - RETEC Group, *Characterization of Soil Background PAH and Metal Concentrations; Tables 5-4a and 5-4b 98th Percentile* , 24 March, 2007
ND - compound was not detected at the MDL.
J - Indicates an estimated value.
B - The analyte was found in an associated blank, as well as in the sample.
P - The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
* - Surrogate exceeds the control limit
* - RPD of the LCS and LCSD exceeds the control limits
* - LCS or LCSD exceeds the control limits
NS - No Standard
NC - Samples not collected for this parameter.
ug/kg - microgram per kilogram
mg/kg - milligram per kilogram

Appendix C – Laboratory Analytical Data Packages

TestAmerica
THE LEADER IN ENVIRONMENTAL TESTING

ANALYTICAL REPORT

Job Number: 460-55357-1

Job Description: Con Ed North 1st Street

For:
Henningson, Durham & Richardson
One Blue Hill Plaza
PO BOX 1509
Pearl River, NY 10965

Attention: Mr. Edward Schwetz

Approved for release.
Kristina Blocker
Project Manager I
5/15/2013 3:48 PM

Designee for
Melissa Haas, Project Manager I
128 Long Hill Cross Road, Shelton, CT, 06484
melissa.haas@testamericainc.com
05/15/2013
Revision: 1

cc: Mr. Brian Montroy
Mr. Michael Pantliano

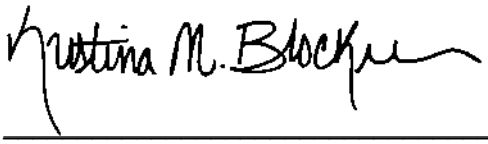
The test results in this report meet all NELAP requirements unless specified within the case narrative. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. All questions regarding this report should be directed to the TestAmerica Edison Project Manager.

TestAmerica Edison Certifications and Approvals: Connecticut: CTDOH #PH-0200, New Jersey: NJDEP (NELAP) #12028, New York: NYDOH (NELAP) #11452, NYDOH (ELAP) #11452, Pennsylvania: PADEP (NELAP) 68-00522 and Rhode Island: RIDOH LAO00132

Job Number: 460-55357-1

Job Description: Con Ed North 1st Street

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed within the body of this report. Release of the data contained in this sample data package and in the electronic data deliverable has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.



Approved for release.

CASE NARRATIVE

Client: Henningson, Durham & Richardson

Project: Con Ed North 1st Street

Report Number: 460-55357-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 05/02/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.4° C.

Sample 460-55357-7: Metals may have been incorrectly diluted in the lab. New data has been uploaded and a revised report created.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

TOTAL METALS
Samples 460-55357-1 through 460-55357-7 were analyzed for total metals in accordance with EPA SW-846 Method 6010B. The samples were prepared and analyzed on 05/03/2013.

The matrix duplicate %RPD for copper associated with batch 158778 was outside the control limits.

Samples 460-55357-1 through 460-55357-7(4X) required dilution prior to analysis. The reporting limits have been adjusted accordingly.

As a standard practice all soil samples and related QC samples (i.e., MB, LCS, Dup, MS, SD) are diluted 2X-4X prior to analysis. Further dilutions may be required dependent upon analyte levels in the samples. Refer to the analytical results forms for dilutions.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL METALS
Sample 460-55357-9 was analyzed for total metals in accordance with EPA SW-846 Method 6010B. The samples were prepared and analyzed on 05/03/2013.

No difficulties were encountered during the metals analysis.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY
Sample 460-55357-9 was analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 05/03/2013.

No difficulties were encountered during the Hg analysis.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY
Samples 460-55357-1 through 460-55357-7 were analyzed for total mercury in accordance with EPA SW-846 Method 7471A. The

samples were prepared and analyzed on 05/05/2013.

Sample 460-55357-7(2X) required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the Hg analyses.

All quality control parameters were within the acceptance limits.

ORGANOCHLORINE PESTICIDES
Sample 460-55357-2 was analyzed for organochlorine pesticides in accordance with EPA SW-846 Method 8081A. The samples were prepared on 05/04/2013 and analyzed on 05/06/2013.

The closing calibration verification (CCV) for multiple analytes associated with batch 159367 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. (CCV 460-159367/22)

No other difficulties were encountered during the pesticides analysis.

All other quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS
Samples 460-55357-1 through 460-55357-7 were analyzed for polychlorinated biphenyls in accordance with EPA SW-846 Method 8082. The samples were prepared on 05/04/2013 and analyzed on 05/05/2013.

No difficulties were encountered during the PCBs analyses.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)
Sample 460-55357-9 was analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 05/03/2013 and analyzed on 05/05/2013.

Aroclor 1016 and Aroclor 1260 failed the recovery criteria high for LCS 460-158770/2-A. Aroclor 1016 and Aroclor 1260 failed the recovery criteria high for LCSD 460-158770/3-A. Refer to the QC report for details.

No other difficulties were encountered during the PCBs analysis.

All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples 460-55357-1 through 460-55357-7 were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 05/02/2013 and analyzed on 05/05/2013.

Acetone was detected in method blank LB3 460-158707/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Acetone was detected in method blank MB 460-159050/4 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Refer to the QC report for details.

No other difficulties were encountered during the volatiles analyses.

All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples 460-55357-8 and 460-55357-9 were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 05/03/2013.

2-Butanone failed the recovery criteria high for LCS 460-158768/3. Refer to the QC report for details.

No other difficulties were encountered during the volatiles analyses.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples 460-55357-1 through 460-55357-7 were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 05/05/2013 and 05/06/2013 and analyzed on 05/08/2013 and 05/09/2013.

Samples 460-55357-2(2X) and 460-55357-7(2X) required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the semivolatiles analyses.

All quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Sample 460-55357-9 was analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 05/04/2013 and analyzed on 05/06/2013.

No difficulties were encountered during the semivolatiles analysis.

All quality control parameters were within the acceptance limits.

PERCENT SOLIDS/PERCENT MOISTURE

Samples 460-55357-1 through 460-55357-7 were analyzed for percent solids/percent moisture in accordance with EPA Method CLPISM01.2 (Exhibit D). The samples were analyzed on 05/03/2013.

No difficulties were encountered during the %solids/moisture analyses.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: Henningson, Durham & Richardson Job Number: 460-55357-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Analyzed for but not detected.
	J	Indicates an estimated value.
	*	LCS or LCSD exceeds the control limits
	B	The analyte was found in an associated blank, as well as in the sample.
GC/MS Semi VOA		
	U	Analyzed for but not detected.
	J	Indicates an estimated value.
GC Semi VOA		
	U	Analyzed for but not detected.
	E	Compound concentration exceeds the upper level of the calibration range of the instrument for that specific analysis.
	J	Indicates an estimated value.
	*	LCS or LCSD exceeds the control limits
	p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
Metals		
	U	Indicates analyzed for but not detected.
	J	Sample result is greater than the MDL but below the CRDL

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	Not present
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	2.4° C IR #4
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

CASE NARRATIVE

Client: Henningson, Durham & Richardson

Project: Con Ed North 1st Street

Report Number: 460-55458-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 05/03/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.1º C and 2.1º C.

Except:

An analysis was not selected on the COC for the following sample: Trip Blank (460-55458-11) .
The sample will be analyzed for volatiles.

The following sample was activated for pesticides analysis by the client on 5/10/13: B2 (5-7) (460-55458-3). This analysis was not originally requested on the chain-of-custody (COC).

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

TOTAL METALS
Samples 460-55458-2 through 460-55458-7 were analyzed for total metals in accordance with EPA SW-846 Method 6010B. The samples were prepared on 05/05/2013 and analyzed on 05/06/2013.

Samples 460-55458-2 through 460-55458-7(4X) required dilution prior to analysis. The reporting limits have been adjusted accordingly.

As a standard practice all soil samples and related QC samples (i.e., MB, LCS, Dup, MS, SD) are diluted 2X-4X prior to analysis. Further dilutions may be required dependent upon analyte levels in the samples. Refer to the analytical results forms for dilutions.

No difficulties were encountered during the metals analyses.

All quality control parameters were within the acceptance limits.

DISSOLVED METALS
Samples 460-55458-8 through 460-55458-10 were analyzed for Dissolved metals in accordance with EPA SW-846 Method 6010B. The samples were prepared and analyzed on 05/10/2013.

Samples 460-55458-8(30X), 460-55458-8(4X), 460-55458-9(30X), 460-55458-9(4X), 460-55458-10(30X) and 460-55458-10(4X) required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the dissolved metals analyses.

All quality control parameters were within the acceptance limits.

TOTAL METALS
Samples 460-55458-1 and 460-55458-8 through 460-55458-10 were analyzed for total metals in accordance with EPA SW-846 Method 6010B. The samples were prepared on 05/06/2013 and analyzed on 05/07/2013 and 05/08/2013.

Iron and Sodium failed the recovery criteria low for the MS of sample 460-55458-8 in batch 460-159503. Magnesium and Potassium failed the recovery criteria high.

Refer to the QC report for details.

Samples 460-55458-8(30X), 460-55458-8(4X), 460-55458-9(30X), 460-55458-9(4X), 460-55458-10(30X) and 460-55458-10(4X) required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

DISSOLVED MERCURY

Samples 460-55458-8 through 460-55458-10 were analyzed for dissolved mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 05/06/2013.

No difficulties were encountered during the dissolved mercury analyses.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples 460-55458-1 and 460-55458-8 through 460-55458-10 were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 05/08/2013.

No difficulties were encountered during the Hg analyses.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples 460-55458-2 through 460-55458-7 were analyzed for total mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared and analyzed on 05/06/2013.

Samples 460-55458-2(3X) and 460-55458-4(3X) required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the Hg analyses.

All quality control parameters were within the acceptance limits.

ORGANOCHLORINE PESTICIDES

Sample 460-55458-3 was analyzed for organochlorine pesticides in accordance with EPA SW-846 Method 8081A. The samples were prepared on 05/06/2013 and analyzed on 05/15/2013.

No difficulties were encountered during the pesticides analysis.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS

Samples 460-55458-2 through 460-55458-7 were analyzed for polychlorinated biphenyls in accordance with EPA SW-846 Method 8082. The samples were prepared on 05/06/2013 and analyzed on 05/06/2013 and 05/07/2013.

The continuing calibration verification (CCV) associated with batch 159589 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No difficulties were encountered during the PCBs analyses.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples 460-55458-1 and 460-55458-8 through 460-55458-10 were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 05/08/2013 and analyzed on 05/08/2013 and 05/09/2013.

Aroclor 1016 and Aroclor 1260 failed the recovery criteria high for LCS 460-159589/2-A. Refer to the QC report for details.

No other difficulties were encountered during the PCBs analyses.

All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples 460-55458-2 through 460-55458-7 were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 05/03/2013 and analyzed on 05/08/2013.

Acetone was detected in method blank LB3 460-158922/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Acetone was detected in method blank MB 460-159543/5 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

1,1,1-Trichloroethane, 2-Hexanone and Methyl Ethyl Ketone failed the recovery criteria high for LCS 460-159543/3.
cis-1,3-Dichloropropene failed the recovery criteria low for LCSD 460-159543/4. Refer to the QC report for details.

No other difficulties were encountered during the volatiles analyses.

All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples 460-55458-1 and 460-55458-9 through 460-55458-11 were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 05/08/2013.

No difficulties were encountered during the volatiles analyses.

All quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples 460-55458-2 through 460-55458-7 were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 05/06/2013 and analyzed on 05/10/2013.

Samples 460-55458-2(2X), 460-55458-6(5X) and 460-55458-7(2X) required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the semivolatiles analyses.

All quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples 460-55458-1 and 460-55458-8 through 460-55458-10 were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 05/06/2013 and 05/07/2013 and analyzed on 05/08/2013 and 05/09/2013.

Hexachlorocyclopentadiene failed the recovery criteria high for LCS 460-159336/2-A. Refer to the QC report for details.

No other difficulties were encountered during the semivolatiles analyses.

All other quality control parameters were within the acceptance limits.

PERCENT SOLIDS/PERCENT MOISTURE
Samples 460-55458-2 through 460-55458-7 were analyzed for percent solids/percent moisture in accordance with EPA Method CLPISM01.2 (Exhibit D). The samples were analyzed on 05/04/2013.

No difficulties were encountered during the %solids/moisture analyses.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: Henningson, Durham & Richardson Job Number: 460-55458-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Analyzed for but not detected.
	J	Indicates an estimated value.
	*	LCS or LCSD exceeds the control limits
	B	The analyte was found in an associated blank, as well as in the sample.
GC/MS Semi VOA		
	U	Analyzed for but not detected.
	J	Indicates an estimated value.
	*	LCS or LCSD exceeds the control limits
GC Semi VOA		
	U	Analyzed for but not detected.
	*	LCS or LCSD exceeds the control limits
Metals		
	U	Indicates analyzed for but not detected.
	4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
	J	Sample result is greater than the MDL but below the CRDL
	N	Spiked sample recovery is not within control limits.
