DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was TIPPLE 10/24/2000 MET WITH MIKE MURPHY FROM LAW ENVIRONMENTAL AT THE SITE. THE SPILL MATERIAL APPEARED TO BE A HEAVY, VERY OLD PETROLEUM PRODUCT. THE BLACK PETROLEUM PRODUCT WAS SEEPING OUT FROM THE WALL INTO THE BOILER ROOM IN THE SUB BASEMENT OF THE PROPERTY, AND FROM A BRICK WALL INTO A WALKWAY ALONG THE WEST SIDE OF THE PROPERTY BELOW THE ROAD ELEVATION. THIS PROPERTY APPEARS TO BE A RECEPTOR, WORK WILL CONTINUE TO REVEAL THE SOURCE. 12/01/2000 THE PRODUCT WAS FOUND BY MY SUPERIORS TO BE AN OLD SEALING TAR, WHICH IS AN UNREGULATED SUBSTANCE, THEREFORE NO FURTHER INVESTIGATION IS REQUIRED BY THIS DEPARTMENT. 8/11/11 - Raphael Ketani. Jeremiah Foley of RLN (201) 626-8968 had left a message yesterday requesting information about this spill case. I tried to contact him, but I could only leave information with his associate at RLN. "

DEC Memo:	"01/10/08 - See eDocs for Con Ed report detailing cleanup and closure. 163351. 03-15-06. Stephen Asfour #49908 I&A North calls to report that at 09:30 he found approx 5 gallons of dielectric fluid leaking from the bottom of the transformer from V1137 located at f/o 206 E.86 St. Mr. Asfour was doing maintenance checks at the time of the discovery working under acct #W3245.The feeder associated with this vault is 3M63. The oil was found on the concrete floor and in the sump pump even thought it was not running and the trap to the sewer line was checked and found no presence of oil to be leaking to waterways or sewers. There were no injuries related to the spill and fire or smoke involved. Weather conditions did not contribute to the hazard of the spill. The transformer is filled with dielectric fluid and will have to be replaced. There is no water present at the time of the pill and no private property was affected. There is a sump located in the structure but its not running and no substantial cracks in the vault. Steph Asfour took 2 samples on priority E for PCB and ID with a chain of custody number DD13349. No initial cleanup was taken and absorbent pads were used to verify the oil. Edgar Rios 85938"

DEC Memo:	"07/16/08-Vought-Duty desk officer. Spill assigned to DEC Rahman as off-hours responder. As per PBS #2-373206 site has a 5000-gallon #6 fuel oil AST-contact with soil. Owners address as per PBS is: Mr. Larry Grunfeld 61 East 86th Street Owners Corp. 415 Madison Avenue 5th Floor New York, NY 10017 ph: (212) 371-2525 Vought sent out TTF letter with cc to Mungra. 08/26/08 Rec'd work proposal for tank replacement and contaminated soil removal by Cardinal Boiler & Tank corp.(sr) 12/04/08 I had a site meeting this morning with Cardinal Tank(Anthony Lara)at the site. The 5,000 gallon tank was removed from the tank room.Approx. 60 drums of contaminated debri and soil was removed from the tank bottom area.The tank room bottom area is dug down to 2-3' below the floor level. No end point sample was taken due to bottom being bed rock.No odor observed in the tank room. Apparently, most of the oil contamination that was caused from the tank has been removed.A report will be sent to dec with pictures of the tank room. A new PBS application for tank replacement will be sent to DEC, as per Cardinal Tank.(sr) 12/18/08 Rec'd letter report from Cardinal Tank Corp. Pictures of the tank room attached with manifest.Case closed.(sr)"

Many manholes have a sealed sump in the floor which is used to allow runoff when pumping the structure. A hose is place in this sump and water on the floor will flow into the sump allowing the floor to be cleaned. If cleaned prior to analysis of the fluid, the structure will be cleaned as >50 PPM and all liquid and waste will be manifested accordingly. The structure will be double washed with a degreaser, i.e. Slix. All cleaning material and PPE will also be treated as >50. If any sludge is found within a manhole it is treated as lead contaminated and manifested accordingly. The spill identification tag will remain secured to the structure until the analysis is completed and if <500 PPM the signage will be removed. If the analysis is >499 PPM, a grid will be prepared for wipe testing the area. Until the analysis of the wipes are proven to be <10ugs/100cme2 all additional waste produced from the structure will be treated as the original analysis. If this spill occurred in a transformer vault containing a sump pump and there was a possible release, the drainpipe trap will be dismantled to determine if oil was released. Sludge found in a vault, through historical analysis, has been determined not to contain lead. On 9/26/98 @ 22:00 Underground crew cleaned and double washed structure using Bio-Gen 760. One drum of solid waste picked up by Astoria for disposal. Spill tag left in place pending lab results. Crew E.Cox #185, B.Degeorge #15949 Supervisor R.Mockler #77412 10/2/98 Analysis received SA98-10301 = <1.0 PPM Tag to be removed. .. roz 10-5-98 08:30 Tag 03130 removed on 10-2-98 by P.Rubino 69511. Spiller Address:	300 EAST 85TH STREET
Spiller Company:	001
Contact Name:	RENEE LEWIS
DEC Memo:	"07/16/07-Hiralkumar Patel. spoke with Rene at Eastmond. as part of routine cleanup of 15,000 gal #2 oil UST (PBS #: 2-476781). to do tank cleaning, EAstmond installed 1080 gal temp tank and connected that tank to boiler, which is located on roof of building at 38 story height. Eastmond did tank cleaning and today they got call from building operator complaining dry tank at site. Eastmond checked both tanks on-site and found both dry. they checked supply and return lines for any leak and after their observations on-site, Rene believes leak in return line. return line runs from boiler straight to garage at ground floor and runs few feet horizontal under garage floor before it enters into 15000 gal tank. Rene disconnected return line at point where it enters into on-site tank and connected copper line to temp tank. he believes that before oil from coming back from boiler under force of gravity and may have not leaked out from leaking return line, but now return line runs more horizontally and oil may have leaked from return line while oil standing in part of line which runs on floor. during investigation, they found oil in sump. odors inside basement. Asked Rene to notify NYC DEP as found oil in sump. spoke with Marty Weiss (212-288-7474), building super. as per super, there is no vapor complaints from tenants. asked him to ventilate garage area. building manager: Neil Duggam 300 East 85 Housing Corp. Rose Associates, Inc. 200 Madison Avenue, 5th Floor New York, NY 10016 7/16/07- DEC Piper responded to site. Upon arrival light odors were present in the lobby. NYCDEP arrived on site to investigate as well. Piper met w. Neil Duggam and Marty Weiss. As per initial conversation, Neil stated that there was no spill and the tanks were not empty. They were having trouble with air in the tank. Piper explained to him that Eastmond mentioned oil in a sump. Neil brought Piper downstairs to garage where 15,000 gal #2 oil UST. Neil quickly flashed light in manway and stated that the liquid was water. Piper noticed that it was worse and proceed to get his own flashlight. Upon return Piper observed oil on top of tank in manway as well as a sump pump that was put in sometime afterwards due to concrete patch to drain at grade. Neil stated that it was cut off and discharging to itself. This was clearly not what was going on and Piper asked to see sump near pool as Eastmond had stated. Upon inspection, a couple hundred plus gallons of #2 oil was observed.

ROSE ASSOC. (Continued) **S106017181**

Neil said this is the first he knew of this. This does not jibe, since Eastmond was there putting in temp return line. Eastmond would not leave out the part about hundreds of gallons of oil in sump. Hence a spill was called in. The building had to be aware of this and Neil was misleading DEC and DEP from the start. Numerous PBS violations exist as well as Spill violations. Piper will look into why Eastmond set up temp to begin with. Seems it may be because they lost oil prev., used old return, and that was bad so they continued to lose oil because they tapped into the return and feed at the old tank. Eastmond vacced out sump in pool area. They recovered approx 500 gal of #2 oil. They have also tested the buried portion of the return line and it failed. The recharge rate of the sump is less than an inch an hour. They will return on Wed and vac out sump. RND Rervices Inc. was retained to perform a subsurface investigation. a total of eight borings were installed. Due to shallow bedrock, refusal was met at 3' in most of the borings. Where borings extended to the gw interface, recovery wells were installed and product was observed entering RW-1 on the south side of the tank. As the spill pathway was an e-w direction on the north side of the tank I requested that a third receovery well be put in on the north side of the tank grave to recover oil there as the sump that collected oil initially was located within 8-10 feet of the northern side of the tank. GW samples have not been collected as free phase oil is still present. GW flow direction will be determined once the third well is installed. Currently, RND is vaccing out recovery well 1 on a monthly basis. Product has dimished. RND is also determine alternative ways of remediating site. This spill referred to remediation. One (1) 1 inch monitoring well was installed at 300 east 85th street, New York, NY on 12/18/08. The well was installed in the garage south east ofthe UST between the tank and the pool room (near the location of previously installed SB-6). RND returned to the site to sample the monitoring well on Friday, January 9, 2009. The well was installed to a depth of 7.68 inches below grade. Separate phase product was discovered in the well at a depth of 2.40 to 3.93 feet below grade. Due to the presence of separate phase product, a groundwater sample could not be collected. 8/16/10- DEC Piper- Monitoring and sampling of Recovery wells continuing. 01/20/11: This spill case transferred from V. Brevdo to J. Kolleeny (before Brevdo, handled by R. Piper). Spoke with James Wilson of RND Svcs (consultant), requested pdf files of past rpts, data on product recovery, site plan showing bldg in relation to surrounding streets. Mr. Wilson said bldg super confirms there's still no water present in recov wells. - JK 01/21/11: Received email from James Wilson of RND with attached pdf files of Oil-Water Recovery Table & Project Timeline (in eDocs). Email stated: Attached please find information you requested regarding site (oil/water recovery log and timeline). I have scanned 3 rpts as PDF files and put them on disk which I will forward to you via USPS. Please call me if you need any addt'l information or have any questions. I wrote back: Thanks for project timeline and oil/water recovery log. I had also asked, if possible, for site plan showing outline of entire building and adjacent street and avenue, plus tank location and all wells. J. Wilson sent reply: Yes, I forgot to mention. We do have PE drawings of site which show floor plans. However, we only have 1 copy and our copy machine is currently down. As soon as copier is up and running I will forward you a copy of plans we have via USPS; it should be sometime late next week. - J. Kolleeny 01/26/11: Received disk with 3 rpts by RND: Sept. 2007 work

ROSE ASSOC. (Continued) **S106017181**

plan for well install'n, Nov. 2007 investigation summary rpt, and Feb. 2009 well install'n summary rpt (all in eDocs); also received large, fold-out diagram of Cellar Floor Plan (hard copy only). - J. Kolleeny 02/09/11: Received phone call from Sharima of RND, asking if I had any info on depth to bedrock in vicinity of site. I sent email reply to James Wilson: I spoke with Sharima of your office this morning, and she asked if I had any info on depth to bedrock from well logs or boring logs for spill sites in vicinity of your site. I have two relatively close spill sites, both of which are now closed. One spill, on East 84th St., had boring logs showing refusal on weathered schist bedrock at depths ranging from 2-13 ft below grade. Another spill, on East 89th St., had two borings/wells, both of which hit refusal at 13 ft below grade; notes indicated they weren't sure if they had hit bedrock or concrete footing of building's basement. They initially didn't have enough GW to sample in 1 of these borings, but when they came back couple of weeks later, there was sufficient water in both wells. I hope this information is helpful. Please remember to send an email address for Mr. Russ Heigel of Rose Associates, if available. Later same day, received email from J. Wilson: Attached please find info you requested. Attached is PDF file of Recovery Well Inspection Rpt dated Nov. 2010 [in eDocs]. Rpt was left how it was sent to Mr. Piper in Nov. 2010, I did not make any changes to site sketch as we previously discussed. Below please find contact info for Property Manager, Mr. Russell Heigel: Mr. Russell Heigel Property Manager 200 Madison Avenue New York, NY 10016 rheigel@rosenyc.com If you have any questions or need any addt'l info, please call me at 845-348-6355. - JK 02/17/11: Finished review of Recovery Well Inspection Rpt, other site rpts, Cellar Floor Plan, and discussed site with Ryan Piper of DEC spill response. Recovery Well Inspection Rpt states that no water is present in monitoring & recovery wells at site; RND therefore requested spill closure. I sent letter (in eDocs) to Mr. Russ Heigel (property mgr), cc to James Wilson of RND, denying spill closure and requesting install'n of one mon well in sidewalk along E. 85th St, near storm-water ejector sump pit adjacent to swimming pool where product was recovered during initial spill response, to evaluate soil & GW in that area. Asked that RND clear 2 locations to drill (with HSA rig) in case one hits refusal, and asked that in meantime, indoor mon and recov wells continue to be checked for recharge of GW. Asked that RND submit brief work plan for well install'n. - J. Kolleeny 09/22/11: On 9/21/11, received email from James Wilson of RND (consultant) with attached Proposed Work Plan dated Sept. 2011 for install'n of requested monitoring well (in eDocs). After prelim review, on 9/22/11 I sent email to Mr. Wilson: Hi Mr. Wilson, I've looked over Proposed Work Plan, and I have several comments about rpt. First, on page 2 of rpt (page 4 of pdf file), rpt states: On October 14, 2011, during regularly scheduled pump-out, 3 recovery wells and 1-inch monitoring well did not contain any oil or water. Since October 14, 2011 is still 3 weeks in future, I'm pretty sure that date cited is incorrect. Also, I believe that back in February of this year when we were discussing site, I requested some changes to site plan in RND's reports, to better show surrounding streets and incorporate some features shown in large cellar floor plan you mailed to me, such as swimming pool and storm-water ejector sump pit. However, diagram in work plan has not been revised as we discussed. Since my letter of February 15, 2011 requested a well in sidewalk as close as possible to storm-water ejector sump pit, site plan showing proposed well

ROSE ASSOC. (Continued) **S106017181**

location should show this sump pit. In addition, I had requested that 2 potential drilling locations be pre-cleared for safe drilling (in terms of underground utilities), but site plan in work plan only shows 1 proposed drilling location (also, text makes no mention of pre-clearing 2 potential drilling locations). Finally, rpt does not state that soil will be sampled during well install'n, only that it will be screened with PID for monitoring of soil characteristics and to determine if GW is present. My letter had stated that soil should be screened and sampled for lab analysis during well install'n, to evaluate both soil and GW conditions in vicinity of well. DEC policy requires that soil sample be collected from interval with highest PID reading, and that sample be collected at soil-GW interface. If there are no elevated PID readings (or other field indications of contam), one sample should be taken at GW interface for lab analysis. Please make necessary corrections, additions and revisions to Proposed Work Plan and send pdf file of revised rpt to me on a CD. Let me know if you have any questions. Then sent follow-up email: I forgot to add that revised work plan should not include extensive table of NYS water quality standards, but should state that GW samples will be analyzed for petroleum-related VOCs & SVOCs. Once new well is installed, GW samples should be collected from new well and from any of existing wells at site (recovery wells and monitoring wells inside building) that have water present for sampling. - J. Kolleeny 02/24/12: Proposed Work Plan for well install'n (Sept. 2011; revised Feb. 2012) received on 2/23/12 via email from Sharima Ryan of RND Services; plan is under review. - J. Kolleeny 03/05/12: Reviewed Proposed Work Plan for mon well install'n by RND Svcs, dated 9/11, revised 2/12 (in eDocs). Rpt proposes two potential drilling locations in sidewalk along East 85th Street, as requested by DEC. Soil sampling will be performed during well install'n; once well is installed, GW will be sampled if present. If no GW is present in new sidewalk well or existing indoor wells, GW grab sample will be collected from storm-water ejector sump pit near swimming pool at site. RND will prepare letter rpt summarizing field activities and sample data. I sent letter (in eDocs) approving work plan to Russel Heigel (RP), cc's to James Wilson & Sharima Ryan of RND, asking that summary rpt include conclusions and recommendations for further action as appropriate, based on data. My email to Mr. Heigel also stated that if investigation results look favorable for spill closure, summary rpt should include exposure assessment for any residual soil/GW contam remaining at site. - J. Kolleeny 02/08/13: On 2/5/13, I sent email to James Wilson of RND, cc to Russel Heigel (RP): Mr. Wilson, It's been quite a while (almost a year) since I heard anything about this spill site. I don't think I've received any rpts or correspondence since I approved a work plan for well install'n back in March 2012. Can you please send me an update on status of site? On 2/8/13, received email from Sharima Ryan of RND: Jon, I am respomding to this email on behalf of James. In last conversation we had (back in March) I had requested consideration of various factors why I believed drilling at this location would have been difficult (and costly) and would not produce requested information in repsect to condition of GW. You considered my request and recommended that I send you information outling my rationale. Due to an oversight on my part, information was not forwarded. However, I would like to rectify this and respectfully ask that you reveiw information which I will forard to you by next Friday, Feb. 15. I hope that you will be in agreement and I apologize for this delay. -

ROSE ASSOC. (Continued) **S106017181**

JK 02/20/13: On 2/19/13, I sent email reply to Sharima Ryan of RND: Sharima, I don't actually recall conversation you refer to, and I don't really understand why install'n of a well in approx location(s) shown on RND's approved work plan would not provide useful information regarding GW quality and potential migration of free product. Nevertheless, I am willing to review addt'l information behind your rationale for not drilling. (Can you at least propose an alternative location for a well?) In any case, you said below you would submit this info by Feb. 15, 2013. That date has come and gone, so please send requested info as soon as possible. On 2/20/13, I received email reply from Sharima: Please see attached. And yes, our conversation was about a year ago so it's been a while. However, I do appreciate your time in reviewing attached. Thank you. Attachment consists of 2/15/13 letter (in eDocs) arguing that dry state of recovery wells and mon well at site may be due to pumping of GW for nearby subway construction, that addt'l info to be gained by putting well in sidewalk does not substantiate addt'l costs involved, and that sidewalk has a lot of utilities that make drilling unsafe; also included is horizontal profile of bldg starting at street level, showing relative positions of basement floor, UST, recovery wells and mon well, and refusals on bedrock, and also site plan showing existing features and two proposed drilling locations, with utilities marked to best of knowledge. I contacted Sharima by phone and requested a site visit to confirm that recovery wells and mon well are still dry. She agreed. - J. Kolleeny 03/08/13: On 3/7/13, received email from James Wilson of RND with attached letter rpt dated 3/7/13 (in eDocs). Letter rpt summarizes site visit performed on 2/27/13 which confirmed that no GW is present in on-site recovery wells or monitoring well, and that wells exhibited no petroleum odors, but gave PID hits up to 55 ppm. Rpt further states that water was present in two storm water ejector pits in fire pump room and in ejector pit near swimming pool, and that no product or sheen was observed on water, nor were petroleum odors noticed. RND also notes that construction work for 2nd Ave subway is ongoing, that on-site wells didn't recharge after Hurricane Sandy, and that potable water enters bldg from 2nd ave side (i.e., not in sidewalk along 85th St where I've requested well be installed). Rpt includes photodocumentation and updated site plan with addt'l info regarding locations of electric lines, and rpt recommends sampling storm water ejector pits in lieu of drilling in sidewalk. On 3/8/13, after reviewing letter rpt, I sent email to Mr. Wilson, cc to RP: Mr. Wilson, Thank you for visiting site to check wells, and sending letter and site diagram. I have a question: what is nature of water in storm water ejector pits? Do those pits intersect GW table? If so, why is there water in ejector pits but not in recovery wells and monitoring well? Are storm water ejector pits at a lower elevation than wells? I'm okay with collecting GW samples from storm water ejector pits as proposed in your letter, since there is no water in on-site recovery wells and monitoring well. However, this will not address my concern about potential migration of contaminants causing off-site impacts. Based on your site plan, it still seems to me that it's possible to drill at western proposed well location. Another possible drilling location, which might even be superior, would be in sidewalk to east of diagonal lines indicating electrical lines entering bldg (i.e., in front of adjacent property to east). That location would presumably be down-gradient of both UST and ejector pit near pool. As I stated in my well install'n work plan approval

ROSE ASSOC. (Continued) **S106017181**

letter, if refusal is encountered when drilling in sidewalk and it's not possible to install a well, then water samples from ejector pits will have to suffice. But I believe there should be a good faith effort to evaluate possibility of off-site impacts from this spill. Please let me know what you think of these suggestions, and please let me know about nature of water in ejector pits. - JK 03/20/13: Sent email to James Wilson of RND: Mr. Wilson, I just wanted to confirm that you received my email sent on March 8th? Another option to evaluate potential off-site migration of free product or GW contam from this spill might be to check if adjacent building to east has a sump or ejector pit with GW in it, and if so, to check their sump pit for presence of product or dissolved impacts. This might alleviate need for well in sidewalk. Please let me know if you received these emails, and let me know your thoughts on these suggestions. - JK 03/26/13: Received email reply from James Wilson of RND: Mr. Kolleeny: Yes, I did receive your email. During site visit on February 27, 2013, water in both storm water ejector pits appeared to be clear and oil/water indicator did not detect separate phase product. Oil/water indicator probe did not have a petroleum odor after use and no odors were observed emanating from pits and wells. Three (3) recovery wells and one (1) monitoring well were completed to bedrock in garage area at following depths: RW-1 = 4.25 ; RW-2 = 4.10 ; RW-3 = 6.0 ; MW-1 = 7.68 . Storm water ejector pit in fire pump room extends to 7.93 below grade and storm water ejector pit in swimming pool area extends to 8.92 below grade. During site visit on 2/27/13 depth to water was measured in 2 ejector sumps at 5.2 and 5.58 below grade. However, although both RW-3 and MW-1 are completed beyond 5.58 there was no water present in these 2 wells on 2/27/13. We believe that water present in sumps on 2/27/28 is building water and not necessarily GW. Field observations from subsurface investigation and install'n of wells has shown that depth to bedrock increases further east (i.e. in direction of 1st avenue and swimming pool). Based on general knowledge of development of property and area it is believed that bedrock was blasted to install UST. It is possible that storm water ejector pits (and other below grade structures) were also installed by blasting hence their final completion at a greater depth than wells. Although evaluating sumps of adjoining properties could possibly produce some useful information that would benefit our client we are currently of opinion that adjacent properties would not allow this as it may present a more complex legal issue. There are two markings indicative of borings and/or wells on sidewalk along 85th St (84-16, 84-17). We have been informed by on-site supervisor that they represent borings that were installed in conjunction with subway install'n. It is possible that records may exist that would be able to inform us about subsurface conditions. - James I called RND and spoke with Sharima Ryan, said I understood that on-site wells and sumps show no indications of free product or petroleum odors, but reiterated that in order to close out spill, I need some confirmation that oil did not migrate off-site, or at least a good faith effort to confirm this. Sharima said she would check again with owner about possibility of inspecting sump(s) in adjacent bldg vs. attempting to install well in sidewalk, with hand clearing boring to several ft bg to try to avoid any utilities, and then get back to me. - J. Kolleeny 09/27/13: Received email from Russell Heigel, bldg property mgr., with attached letter dated 9/25/13 (in eDocs) from him to rep of neighboring bldg at 308 East 85th St., requesting access to basement to inspect sump

ROSE ASSOC. (Continued) **S106017181**

for indications of oil impact, as I had suggested. - JK 04/28/14: On 4/25/14, I sent email to Russell Heigel, bldg property mgr: Mr. Heigel, I just wanted to follow up on this situation and ask if you ever were able to access neighboring building to check their basement sump for oil and collect a GW sample? Please let me know. On 4/28/14, received email reply from Sharima Ryan of WCD Group (formerly RND Services): Jonathan, Yes we did. We didn t find anything. I have a draft letter that s been sitting on my desk to send to you. It is a summary of what we did/found. I will get it over to you this week. Thanks. - J. Kolleeny 05/09/14: On 4/29/14, received email from Sharima Ryan of WCD Group, with attached letter dated 4/29/14 summarizing inspection of adjacent bldg's basement (in DecDocs). Letter states that no sumps, drains or water pathways were observed in adjacent bldg basement, and no petroleum staining or oders were observed during inspection of various rooms in basement. Furthermore, property mgr of adjacent bldg stated that he has never observed any evidence of petroleum on property that could be attributed to spill at 300 East 85th St. Letter concludes that based on this info and previously submitted documentation, WCD Grp requests spill closure, noting that install'n of nearby 2nd Ave subway system has likely contributed to dry condition of on-site recovery & monitoring wells due to pumping of subway tunnels, and is indicative of present and possibly future hydrologic conditions. After consulting with my supervisor Vadim Brevdo, who agreed that since there seem to be no remaining petroleum impacts within site bldg or adjecent bldg and level of local water table has declined due to pumping for 2nd Ave subway, any residual impacts from this spill pose little to no risk to public health or environment. I closed spill, sent closure letter (in DecDocs) to Mr. Russell Heigel (property mgr), cc's to Sharima Ryan and James Wilson of WCD Group. - J. Kolleeny "

DEC Memo:	"7/26/10 - Raphael Ketani. I made an unannounced site visit and met the Chief Engineer from Rose Associates (the management company), Raymond Cardinale (212) 328-5523, and Marty Weiss, the Resident Manager (also from Rose Associates). Mr. Cardinale showed me the spill. We went to the top of the building. This was where the boiler room was located and the site of the spill. This was an enclosed room. A large staff from Riteway Tank was putting down sand and cleaning up the spill. Mr. Cardinale told me that they were starting the process of dismantling the boilers in order to replace them when a copper fitting broke on one boiler. The #2 oil flowed out and onto the floor. Langan Engineering responded to the spill and called it in. Michael Burke from Langan was on site and is the project manager. Mr. Cardinale added that the floor had drains, but the plumber looked into the drains and didn't find any product, nor a sheen. Mr. Cardinale showed me an overlook area above the boilers. Here, a large fan and another fan in the distance were moving the air out of the boiler room. The vapors were strong and the air was hot. I could see the spilled oil on the floor of the boiler room. Mr. Cardinale told me that everything is shut down. The crew from Riteway was working well and appeared to have the spill under control and contained. Next, we went down to the penthouse level. Mr. Cardinale said that he had smelled a slight odor at this level and so he told Mr. Burke to order some canisters for each apartment for 24 hour ambient air vapor sampling. I sensed the air, but didn't smell anything. After this, I left the building. 7/28/10 - Raphael Ketani. Mr. Burke (212) 479-5413 called to say that the spill has been completely cleaned up. The oil was absorbed from the floor on 7/26/10, the day of the spill. The

APARTMENT BUILDING (Continued) **S110487723**

spent Speedi Dri was picked up, drummed and carted away on 7/27/10. Mr. Burke said that post-cleanup outside air samples were taken and the results were 2 to 5 ug/m3. I told Mr. Burke to check on the possibility that the ventilation intakes for the building were near or downwind to the exhaust fans for the boiler room. I told him the DEC was concerned that vapors were sucked into the building. He said that he will look into this. I added that the DEC needs a report regarding the cleanup in order to close the case. Mr. Burke said that he will put one together. 8/19/10 - Raphael Ketani. I received the Spill Closure Report and began my review. 8/20/10 - Raphael Ketani. I finished my review of the Spill Closure Report. From the information in the report, it appears that the spill was completely cleanded up. Also, the indoor air monitoring results for the two penthouse apartments and the hallway demonstrate that there are no significant vapor impacts. Based upon the information in the 8/18/10 Langan Spill Closure Report, I have determined that there is no threat to the public or the environment. Therefore, I am closing the spill case. "

RESIDENCE (Continued) **U000393618**

Tenants Corp. c/o Goodstein Management, Inc. 211 East 46th St New York, NY 10017 Attn: Teresa Austin 09.20.05. SR//Teresa Austin replied by a letter stating they are going to install temp. tank to replace the existing tank and re test it. That work was scheduled to be done in August. 10.05.05 SR// Sharif reviewed and approved the site assesment work plan. 12/28/05 Sharif//Rec'd and reviewed investigation summary report prepared by Jade Environmental,Inc.Six soil borings were advanced around the tank and analyzed for VOC/SVOC.Soil analytical results shows excedance for Xylene,Benzo(a)anthracene, Chrysene,Napthalene at the north end of the tank.Reason for not removing contaminated soil is not justified in the report. Removal of contaminated soil is recommended. Moreover, in case of closing the tank in place, samples should be taken by installing borings through the bottom of the tank to identify any underlying contamination that might exist.Mr. Dave Pelletier(845)897-2188 and Ms. Laura Bruno(212)376-8600 have been relayed the requirement for considering closure of the case. 10/11/06 Rahman- Inspected the excavation work at the site.After removal of the contaminated, stained soil, end point sample will be collected.A new aboveground tank will be installed. 12/06/06 Rahman-Closure report available on edocs.Contaminated soil was removed after breaking the concrete covering the tank.Approx. 48 tons of contaminated soil went out for disposal.Waste disposal manifest was provided.Six end point samples were sent to lab for analysis.VOC/SVOCs were below TAGM limit except Chrysene which is slightly above the limit.NFA required.New tank needs to be registered."

The feeder is 3M66. The source of the spill is transformer fluid, The cause of the spill is damaged equipment: hole in the transformer. The spill is on the concrete & there is oil filled equipment in the structure.There is a dielectric-filled feeder in the structure. One sample was taken for PCB count. A yellow tag #22471 was hung in the structure & a chain of custody #BB02905 was issued along with the courier being called to pick up the sample.Oil absorbant pads as well as pigs were laid down in the structure. Update 7-30-01 @ 08:09 As per lab sequence #01-06884-001 pcb's are 16ppm. 7/31/01 15:30 G. Martin reports that O.S. V. Mirance (58484) SSC (Cleanup Supervisor) reports cleanup completed when transformer was removed. Cleanup was completed with Flush truck. Envio tag # 22471 removed. Cleanup complete."

ROADWAY SIDE WALK (Continued) **S123661170**

Contact Name: NIKITA PERMINOV
DEC Memo: "2/19/19- Zhune spoke to Nikita Perminov 929-214-2799. Nikita said EFS transport overfilled the tank and approximately 50 gallons of fuel oil #2 came by vent pipe and it went to the sidewalk and the curb. ESF is applying absorbent pads on the spill. ESF contracted All Boro to do the clean up. Lonnie- Manager 917-348-3862 EFS Transport 718-366-6662 02/19/19-Hiralkumar Patel. 12:45 PM:- visited site and met with Anthony from All Boro. approx. 5-7 gal of #4 oil spilled onto sidewalk due to an overfill. some of the spilled material impacted asphalt street along the curb, but nothing went into sewer catch basin at the street corner. All Boro has almost completed cleanup on sidewalk and will power wash impacted concrete surface during warm weather. site has one (1) 7,500 gal #4 oil AST in a tank room located beneath the sidewalk in front of the building's main entrance. the tank is sitting on floor. no signs of active leak noted from the tank. Anthony mentioned that they will remove some of the oil from the tank as the tank is full to the top of the manhole. noted signs (product/splash stain) of oil spill on tank room's southern wall, under the fill line penetration. remote fill port is near the curb and fill line runs under the sidewalk for about 2 ft before entering tank room. there is a metal hatch on sidewalk, along fill line run, in area of 90 degree elbow on the line. found a plastic patch on the elbow and horizontal leg of the fill line that runs towards the fill port. all other tank piping are aboveground. a small retaining wall was built in tank room's southwest corner, approx. 3 ft from the southern wall. found contaminated dirt within the retaining wall area which could be result of leak in the fill line. signs of oil stain on wall right beneath the fill line penetration, plastic patch on elbow and signs of oil splash onto beams under the sidewalk suggest leak in the remote fill line near the sidewalk. a sump was noted inside the tank room at the entrance, approx. 2 ft from the tank. no signs of oil noted in the sump. most of tank room floor around the sump was found dry. during inspection, some petroleum odors were noted in building's main lobby possibly due to contaminated rug as a result of cleanup crew/residents walking with oily footwear. spoke with Lonnie Wilkofsky, property manager. Lonnie is managing this building for past couple of months and doesn't know anything about fill line repair (with plastic patch) in past. informed Lonnie that the Department requires following based on field observations: - immediate sealing of remote fill port to prevent further oil deliveries to the tank system until necessary repairs are made and tank system tested tight - tank system tightness test - immediate disconnection of sump pump in the tank room and closure of sump pit to prevent accidental discharge of any spilled petroleum into sewer system - ventilation in main entrance lobby based on field observations, total amount of material spilled changed from 50 gal (initially reported by NYC DEP) to 15 gal (total including on sidewalk and in the tank room). 02/20/19-Hiralkumar Patel. alternate address: 49-51 East 86th St, 1175-1179 Madison Ave PBS #: 2-113387. as per PBS record, the site has one (1) 7,500 gal #4 oil AST, in-service, installed in June 1931. other spill # 1811539 was reported on 02/19/19 which is duplicate of the subject spill case. 49 East 86th Street, Inc. **property owner** c/o Brown Harris Stevens Residential Management LLC. 770 Lexington Avenue New York, NY 10075 Attn.: Lonnie Wilkofsky **property manager** PH. (212) 508-7260 (917) 348-3862 email: lwilkofsky@bhsusa.com ESF Transport Inc. 360 Kingsland Ave Brooklyn, NY 11222 Attn.: Paul Padovino Ph. (718)

ROADWAY SIDE WALK (Continued) **S123661170**

366-6662 email: esftrans@gmail.com 1:17 PM:- received call from Chris from All Boro. he met with property manager and environmental consultant for the insurance company. Chris provided summary of activities conducted yesterday. All Boro tested the tank system yesterday which failed. during system test, they noted leak in both fill and vent lines. the tank only was not tested, but approx. 200 gal of oil was removed from the tank as the tank was full to the top. today, the 84 in. diameter tank has 77 inches of product (approx. 7,300 gal). Chris mentioned that as per building's representative, the tank had approx. 2,500 gal oil in it before delivery and they ordered 3,000 gal delivery, but the 7,500 gal tank got overfilled indicating broken petrometer. Chris also noted that the vent whistle was out of order. based on no signs of leak noted from the tank during yesterday's inspection, and current product level in the tank, no need for immediate tank only test. 2:18 PM:- sent letter to Mr. Wilkofsky/Mr. Padovino requiring delineation/remediation of contamination and tank system tightness test. asked them to submit report by the end of 03/29/19. letter emailed to Mr. Wilkofsky, Mr. Padovino and Chris. 03/06/19-Hiralkuamr Patel. received email from Erik Draijer (at 4:125 PM on 03/05/19) from PVE LLC including an investigation work plan. the work plan proposes three soil borings: one boring in tank vault and two borings in the sidewalk. the work plan also proposes soil borings on sidewalk to groundwater and collection of groundwater sample from one temporary well. the work plan does not include map with proposed boring locations. Erik Draijer PVE LLC. Ph. (646) 602-4999 (973) 975-7135 email: edraijer@pve-llc.com 12:32 PM:- spoke with Erik and inquired him about location of proposed borings. he mentioned that one boring in tank vault will be placed by sump/fill line location. informed Erik that the sump and fill line location in the tank room is on opposite walls. as Erik did not inspect tank vault's interior, he is not aware of small dike wall along fill line location creating containment area to capture spilled material from the fill line. suggested Erik to inspect tank vault's floor condition where oil/contaminated debris were noted along foundation wall prior to any drilling in tank room. also informed him that the department requires complete delineation of contamination, and soil borings should be extended to groundwater only if soil contamination extends to water table. asked Erik to submit a revised work plan including a map with proposed boring locations. 03/13/19-Hiralkumar Patel. 12:36 PM:- received call from Erik. he mentioned that All Boro was retained by the property owner to replace the fill line. as sidewalk permit application would take longer due to MTA bus stop in the area, All Boro decided to cut existing faulty fill line where it penetrates the foundation wall and install a new fill line with fill port at different location. Erik mentioned that area behind the dike wall (beneath fill line penetration in the tank room) was cleaned and no cracks were noted in the floor which was impacted by the spill. based on these, Erik recommended no further investigation at the site. informed Erik that the Department requires investigation along the underground portion of the faulty fill line (approx. 2 ft long line beneath the sidewalk) to confirm subsurface condition. instead of soil borings in the sidewalk, PVE will apply for sidewalk permit to remove remaining section of the faulty fill line and any associated contamination. asked Erik to send post-cleanup pics of tank room dike area to confirm its integrity. 1:56 PM:- spoke with Chris. he mentioned that to avoid sidewalk permit application, they decided to install a new

ROADWAY SIDE WALK (Continued) **S123661170**

fill line from the tank, with a fill port through existing metal hatch on sidewalk. 03/19/19-Hiralkumar Patel. 9:52 AM:- received call from Erik. he mentioned that All Boro removed remaining underground section of the former faulty fill line from inside the tank room via horizontal excavation. no contamination was noted beneath the sidewalk. asked Erik to submit a complete spill closure report, including tank system tightness test result. 03/22/19-Hiralkumar Patel. 8:37 AM:- received email from Erik including closure report. based on review of all available information, no further spill investigation/remediation is required at the site. the spill case will be closed upon receipt of tank system tightness test result confirming tank's integrity. 10:44 AM:- sent email to Erik and asked him to submit tank system tightness test result. email copied to Mr. Wilkofsky and Chris. 03/27/19-Hiralkumar Patel. 11:35 AM:- received email from Erik including tank system test result. the tank system was tested tight on 03/26/19. case closed based on review of all available information. 3:01 PM:- sent spill closure letter to Mr. Wilkofsky/Mr. Padovino. letter emailed to Mr. Wilkofsky, Mr. Padovino, Erik and Chris."

DEC Memo:	"9/9/08 - Sangesland spoke to NYFD & Clean Ventures. Patel responding to the site. Apartment building has a back up generator which had a problem with it's tank. 100 gal of diesel spilled to the street and down the storm sewer. Heavy rains are expected within the next 1-2 hours. Clean Ventures (908-354-0210) was called for the cleanup - they should be there by 10:45AM. 09/09/08-Hiralkumar Patel. visited site. subject site is located at the corner of East 71st Street and 1st Avenue and garage entrance is located along E 71st street. site has one 300 gal diesel tank in the basement, and one 250 gal diesel tank paired up with a generator on the roof. building contractor recently installed the tanks and the generator system, and they were testing the system today. during testing, they started pumping diesel from the basement tank to the tank on the roof. pump stopped successfully after completing the tank fill cycle, but due to some mechanical problem, fuel from the tank on the roof dropped back to the tank in basement via a suction line. as the basement tank was full, oil was pushed out through a vent pipe. oil spilled onto the concrete sidewalk, and ran on the asphalt paved street to a storm drain located at the intersection of York Ave and 71st street. FDNY responded and spread out sand on the oil slick on street along the curb. as per FDNY, about 3 inches of oil was also found inside the storm drain. there is ConEd vault next to this storm drain area that mayt have been impacted. DEC Steve notified ConEd regarding possible oil seeping into their vault. inspected the basement tank room and found a very minor (about 1 gal) spill on a new concrete floor. as per building super, there was no spill from the tank on the roof. there was no subsurface impact. FDNY and OEM were on scene. Brown 36 OEM Ph. (718) 422-8700 Property owner/RP rep: New York-Presbyterian Michael Waye Director, Real Estate 435 East 70th Street, Room 302A New York, NY 10021 Ph. (212) 746-1987 Fax (212) 746-8543 Email: miw9033@nyp.org no subsurface impact. 09/12/08-Hiralkumar Patel. discussed with DEC Austin. he asked to close the case as no subsurface impact. case closed."
Remarks:	"A generator failure caused above fuel to spill and run down the block into the storm sewer."

Contact Name:	ROB HILL
DEC Memo:	"3/21/13-Vought-Daytime runner. Called and spoke to Rob Hill and spill caused by G&D Petroleum (Owner is Gabe) and spill came out of vent pipe into rear yard onto concrete. Vent pipe not visible from fill port and must be relocated. No drains affected as per Hill and no vapor complaints received to date. Spill will be cleaned via speedy dry and then powerwash with vacuum truck as well as removal of impacted debris from yard. 3/26/13-Vought-Received call from DEC Sangesland while Vought on vacation that boiler room at site was heavily impacted with oil and DEC Sangesland to follow up on reports. Vought called Rob Hill (Riteway Ph:718-855-7272 email:info@petroleumtek.com) for update. Vought spoke to Rob Hill and they performed another site visit on 3/22 and they inspected boiler room and no spill in boiler room and they left coat of drysorb on

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

floor as some oil penetrated sidewalk in case in seeped through walls (which has not been observed to date). Contractor is renting basement out. Loose debris and oil was removed from the back and they found oil in boiler room sump pit which was pumped out. Oil may have seeped into concrete in basement as per Hill. Vought to perform site visit today to 2:30pm. 3/27/13-Vought-Site visit by Vought. As per PBS #2-605134 site has one 4000-gallon #2 fuel oil AST and owner as per PBS is: Mr. Joseph Bildirici Mr. Sivel Aviv ABM Realty LLC Millenium Management 12 East 37th Street New York, NY 10016 Ph:(212)447-6848 Cell:(917)447-0613 email:josef.bnfimp@verizon.net) Site is a five story residential apartment building with basement level contractor office occupied by Liebhaber Construction (Michael Liebhaber Ph:212-628-8800 Fax:212-628-8803 email:michael@liebhaberconstruction.com) and Vought noted fuel oil odors in rear photocopier room and file room of office. At time of site visit air scrubber was operational in copier room. Vought met onsite Richard Clifford (Castle Oil Fax:212-579-3516) and Riteway representative (Joe or Peter?) as well. As per Clifford, G&D was making delivery of 2400-gallons of #2 fuel oil to the 4000-gallon AST and the petrometer before delivery showed an on-hand amount of 1200-gallons of fuel in tank suggesting petrometer not working correctly. Note as well that vent pipe in rear of building (with no alarm) and fill pipe in front of building). Spill came out of vent pipe in rear courtyard of building and numerous cracks with heavy staining and two drywells impacted as well. Oil flowed down rear stair well into file room from elevated courtyard and also seeped through schist secondary containment wall (evidenced by fresh product seeping in from outside in tank room) and oil also flowed out of top of tank manway and impacted debris and dirt in secondary containment. Vought not able to determine competency of concrete in secondary containment due to presence of impacted speedy dry and debris on floor. Estimate of spilled amount based on VISUAL observations and not mass balance (which is not capable due to bad petrometer) and spill estimate is from 50-60 gallons. Contact for delivery company is Gabriel Nortesano (Cell:347-723-6583 Fax:718-439-6305). 3/27/13-Vought-Drafted letter reqiuring: 1)cc to M. Liebaher, Riteway, Castle Oil (Gifford), Millennium (Alev)2)installation of basement ventilation3)petrometer repair. 4)PID survey 5)relocation of vent pipe to front of building.6)excavation of impacted drywells and soils in rear yard and collection of confirmation samples7)removal of impacted debris and speedy dry from secondary containment and inspection of concrete/removal of impacted elevated floor boards and materials in file room. Vought called Millenium Management at contact on PBS and received general mailbox voicemail. Vought called and left message on cell phone for Joseph Bildirici to return call to Vought immediately regarding oil spill. Vought sent out letter via mail to G&D and ABM 75 Realty and also sent letter via email to Josef Bildirici at email provided by Liebhaber (josef.bnfimp@verizon.net). 3/28/13-Vought-Recevied call from Michael Liebhaber that odors were still strong and asking about status of dig out and possibly response from Bildirici. Vought received no call back from Bildirici and Vought arranged site visit today for 3:00pm with Liebhaber. Vought called and spoke to Sivel Aviv (who will send Justin Cell:347-291-7077), Riteway (Rob Hill) who will send representative to meeting, Gabe (who will send representative to meeting). Vought also spoke to Rich Clifford who will also attend meeting as well. Site visit by Vought and onsite were Castle (Clifford), G&D

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

(Nortesano), Riteway (Hill), Leibhaber, Millenium Management (Justin Schiebel) and owner Josef Bildirici was also present via cell phone. Vought noted continued petroleum vapors in rear file room and office of basement. Elevated wood flooring adjacent to outside stairway and secondary containment was removed and concrete underneath showed evidence of petroleum staining however no significant cracks or pathways to subsurface on concrete inside file room. Impacted speedy dry and debris had been removed from secondary containment and no significant cracks in containment worthy of remedial excavation. Vought required Riteway to wash and degrease floors and walls of secondary containment followed by application of epoxy. Riteway noted as well that fans will also be brought in for ventilation during work as well. Building owner (Bildirici) provided agreement for excavation of impacted soils in back as well to Riteway. Castle and Riteway to submit proposals to building owner and management for replacement of coppper fill line with regulation steel tubing and will also submit proposal for relocation of the vent pipe to the front of the building as well as possible check valve installation. Riteway will be onsite on 3/29 to wash and seal secondary containment as well as remove additional impacted wood flooring from file room. Excavation of rear yard to start on Saturday 3/30 and building super to be onsite at all times to ensure no impact to the contractor office (through which contaminated soil will be brought to the front of the building for disposal). Excavation in rear yard will also be covered in plastic due to residential windows right above excavation and expected good weather this weekend. 3/29/13-Vought-Received email from Ronald Herrygers (Herrygers Environmental Services Ph:803-951-8947 email:rherrygers@windstream.net) that am the environmental consultant working for G&D Petroleum's insurance carrier. I have been in contact with Robert Hill with Riteway Environmental.Please copy me on any correspondence you will be sending out for this spill. If you have any pictures that you can forward me that would be helpful. If you could provide me with the contact information for the architect/construction person who is in the office right next to the apartment complex's tank room and the contact information for the superintendent that would be helpful too. Thank you very much. Vought replied to Herrygers with copy of spill notes, site photos and DEC requirement letter with cc to Gifford, Bildirici, Liebhaber and Riteway. Received email from Herrygers that Eastern Environmental is working on installing a ventilation system in the LOI offices this afternoon and we will be mobilizing our geologist and a crew with Eastern Monday morning to continue removal of the broken concrete and contaminated soil from the alley and assessing (with PID) the tank room and LOI offices and performing some additional scrubbing & cleaning of the floors (if elevated PID readings remain, which is what we anticipate). If after several intense scrubbing and cleanings of the concrete floors indoors we are still getting elevated readings our plan is to collect sub-slab soils samples via concrete coring for delineation of any impacted soil below the slabs.Please let me know if you have any questions or suggestions. 4/1/13-Vought-Received email from Liebhaber on 3/29 that I want to give you an update. Riteway was here this morning. They pulled up some more plywood, scrubbed the floor and the floor in the tank room. The oil travelled a bit further than we thought and there are some cracks in the slab where it seeped in. A short while ago, an environmental company sent by one of the insurance companies installed some negative air machines, one in the tank room and one in the back storage room. That

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

said, there still isn t any noticeable change in the smell. It s pretty sickening. I d like to all meet again on Monday to assess the progress. Josef, I understand that you will be back next week. You need to be a this meeting to see what is happening here. Bildirici replied that Micheal , i am schedule to be in New York Thursday God willing , as soon as I come tell me the time I will get there and meet u , I don't have much past experience on that issue , but I hope the involved parties are doing all the right things, if thee is anything that I can Do pls advise. Herrygers replied that Michael: I am the lead environmental consultant working for G&D Petroleum's insurance carrier. We were first alerted to assist with this cleanup later in the day yesterday. I sent our lead field geologist, Pat Crawford to meet with you late in the day yesterday. He inspected the site to assess actions that need to be taken. I subsequently have been in contact with Jeff with the DEC and have received his guidance and recommendations too. I know that Riteway Environmental has been performing some tasks on-site, but we are in the process of getting a more experienced environmental contractor with more resources to perform the rest of the spill remediation. That contractor is Eastern Environmental. Eastern personnel were on-site today installing 2 negative air machines and will be installing a 3rd negative air machine in your office on Monday - this will complete the system of drawing air from your office into the back room and outside of the building. Also on Monday, we plan to take measures to remove the remaining oil absorbed plywood and other non-concrete materials (that may be functioning as source materials for heating oil vapors in your office). We also will be performing multiple floor scrubbing & cleaning events on all concrete floor slab areas in the building that came into contact with the spilled heating oil - we will be using substances specifically designed to remove heating oil. One of our geologist, JV, will also be on-site Monday to perform a comprehensive organic vapor air concentration evaluation throughout the building using a PID. This will better allow us to determine the exact locations that require remedial measures. Our geologist will also begin his subsurface assessment of contaminated media in the rear alley tomorrow and Eastern Environmental will also begin removing concrete debris and contaminated soil from the alley tomorrow too - I believe Riteway may have someone on-site tomorrow (Saturday) to begin to break up concrete in the alley too. If after performing sufficient cleaning of the oil affected concrete floor slab areas, our PID readings still confirm the presence of residual oil vapors along the floor, then we will be coring in the concrete slab floor at those areas or residual oil vapor in order to collect and sample sub-slab soils for laboratory analysis. Please note that essentially our goal is to remove all accessible media within and below the building or alley that either exceeds DEC Standards or is emanating heating oil vapor above background concentrations. Our goal also includes restoring spill affected areas to their pre-spill condition. Our task will not be completed until those goals are achieved. We are utilizing professionals and personnel who have years of experience performing this same sort of heating oil spill cleanup - this particular crew is also currently assisting us with other heating oil spills elsewhere. I appreciate your patience so far, but please be reassured that actions are now being taken that will soon yield better results than you have been experiencing. If we were not contacted on the eve of the Easter weekend holiday, probably more would be accomplished in the next few days. Once JV establishes a PID

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

baseline of the ambient air concentrations within your office, back room and tank room - you all will be provided with periodic updated PID readings as our work progresses. Please note that it is not uncommon to measure organic vapor concentrations of up to 1.0 ppm in buildings with a heating oil tank that has not experienced a spill. Keep this number in mind when JV provides you with PID concentrations. If you have any concerns, please feel free to contact me or JV (610-955-7309). Thank you. 4/1/13-Vought-Called and spoke to Liebhaber regarding his email requesting a site visit due to continuing vapor issues and response from Herrygers on 3/29. Liebhaber noted that Riteway installed ventilation fans to rear yard on 3/29 and dismanted fans on Saturday (most likely due takeover of cleanup by Eastern Environmental). Riteway also epoxied floor and removed wood deck from rear yard as well as a 12'x12' area of concrete from year yard. Liebhaber noted that odors were reduced this morning and that he did not wish for a onsite meeting today as requested in his 3/29 email. Vought noted to Liebhaber to call Vought with any concerns or questions that may arise and that Vought would perform a site visit to the middle of end of the week after more progress is made with excavation of the impacted soil from the rear yard. Vought sent email to all parties of same. Vought received reply from Herrygers that Jeff:Thanks. For the record, we had Eastern install 2 negative air machines on Friday, but Riteway returned on Saturday, disconnected them and stacked them up in the back room when they applied their epoxy. They did not reconnect or start these Eastern machines again. Naturally this morning Eastern re-positioned their 2 negative air machines (one in the tank room and another one in the back stairs room area at LOI) and Eastern installed a 3rd negative air machine in the LOI offices to draw the air out of the offices to the outside. Understood about the PID readings. I know that studies have shown that buildings with operating heating oil tanks (with no spill histories) measure detectable organic vapors via PID, but almost always below 1.0 ppm. Obviously, our goal will be to not only meet that target, but also to make sure no olfactory heating oil odor is noticeable in tenant occupied spaces too. Vought sent another email that Ron, I think one of the problems with the tank room is that the tank is just above the floor making access to the oiled areas directly under it difficult to address. We may also want to consider insulating the gap between the secondary containment wall and ceiling (which is I believe is the dominant vapor pathway into the offices and storage room). Suggestions but not requirements at this time. Herrygers sent reply that Thanks - I've conveyed this. We are erecting some additional vapor barrier measures too.The alley assessment is underway as well with definite elevated soils at least 6 inches below the ground surface.We also identified some elevated soil present exposed inside the building too that we are removing as well.Trying to also work with the superintendent to obtain approval and information about any utilities buried under the building for our upcoming concrete coring & sub-slab soil sampling.
4/3/13-Vought-Received email from Herrygers that Please call me tomorrow at your convenience, I'd like to provide you with an update of the progress of our work and there are a few things we discovered that I wanted to convey to you. Also, there's a potential concern on-site that I needed your help with. Vought received call from and spoke to Herrygers who noted that they will be onsite today continuing to remove soil and concrete from the rear yard and they are considering use of a vactor to reduce excavation time. Herrygers

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

noted as well that Liebhaber objected to use of vactor through offices however did continue to allow removal of 5-gallon buckets through the office. Herrygers also suggested that there was possibly another way to the tankroom without going through the office but will confirm with his onsite representative. Herrygers also noted that PID readings of up to 2.6ppm detetected in backroom (less than 5ppm NYCDOH criteria) and that they were going to work on concrete coring the file room and tank room today for investigation of possible soil contamination. Herrygers noted that readings of 6ppm in indoor air were detected in tank room and Vought again suggested sealing of top of secondary wall which may be dominant pathway of vapor intrusion into file room and offices. Herrygers also noted that he has seen no efforts to date for relocation of the vent pipe as well as repair of the petrometer gauge and expressed concerns about another spill occurring due to same problem. Herrygers noted that he left messages for Bildirici to discuss site access on both 4/1 and 4/2 and also left messages with Millenium Management as well. Vought noted that he would send email to all parties with emphasis to building owner (Bildirici) that any impedance to the cleanup on part of the owner as a partially responsible party would be considered a enforceable violatoin and that an Environmental Conservation Officers would be sent out to issue Bildirici and Millenium fines and immediatel penalties. Herrygers also noted that he spoke and received approval from adjacent property owner at 440 East 75th Street (John Ventura email: Jvent37@aol.com Ph:914-629-2034) with respect to the impact and investigation of the drain in the rear yards of his building as well. Vought sent email of this days note entry to all parties with emphasis to Bildirici on working with consultants. Vought spoke with Ventura who confirmed that he saw no signs of seepage nor received any vapor complaints regarding spill. Vought provided Ventura cell phone number for future questions or concerns. Vought received email from Herrygers that Thanks. I've added the plugging of the secondary containment wall gaps to our on-site contractor's plate. He confirmed that he's already removed the speedy dry in the secondary containment area. They just drilled several cores in the back room and tank room and will be screening soils at depth with a PID for selection for rushed laboratory analysis (I'll be analyzing the sample just below the concrete floor slabs for all cores). We will also be coring and sampling through the adjacent building rear alley's concrete slab area near the floor drain. I've requested that John Ventura (the adjacent property owner) stop by to give our crew access into this building so they can open & inspect the sewer cleanouts. I did get ahold of Mr. Bildirici's property manager this morning. They said they already directed Castle Oil to purchase a new petrometer and install it and are waiting for them to do so - I expressed my concerns about delays regarding repairing the petrometer. I was also informed by their property manager (Sybil) that Mr. Bildirici has been in Florida and because Monday & Tuesday were Jewish Holidays, he does not answer his phone, but that he will be back in NY tomorrow morning and she'll have him to call me to discuss the issues about access into the LOI offices and use of our guzzler.
4/3/13-Vought-Received email from Herrygers that It looks like the tenant is now open to having us use the guzzler (he's getting tired of our bucket brigade and anticipating it for another 3-4 weeks).Who do we need to call at the police to get a parking permit for the guzzler (and possibly a sidewalk permit for our walking ramp) - can you assist with this - please call Scott with Eastern Environmental

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

if you need our cleanup contractor to contact someone directly, his number is (631) 774-9821. Vought sent sidewalk permit letter to all parties and added to E-docs as well. 4/5/13-Vought-Email sent by Bildirici to all parties that Gentleman, As advised earlier in the week I am back in new your ,if my input is needed please advise me I would be available anytime for anything except Saturdays but including Sunday or evenings, I would like to thank all parties that work so hard to coordinate all issues ,and I am sorry that could not be around in past days. Please let me know if I can be of ant assistance, and please advise me what is required from us as owner/management that you want us to ,if you can detail it clearly . Received email from Bildrici that Thank you for your email,I visited the premises and I will be kept informed if any question I will be in touch with ou,hank you for all work. 4/9/13-Vought-Received call from and spoke to Liebhaber and sent following email to all parties: I just got off the phone with Mr. Liebhaber who noted that despite the continuing efforts that he still had petroleum vapors around his desk area. He also noted that due to permit and parking difficulties that it was difficult to schedule more than one vacuum truck in a day. In light of this information and the need to take a look at the progress to date, I will be performing a site visit tomorrow (4/10) at 2pm. It would be quite helpful to have representatives from Crawford or Herrygers there to assist in trouble shooting the source of vapors as well as any potential permit issues. Received email from Herrygers that Our geologist (JV) has been on-site every day since we began the remediation on-site, because the alley has been delineated we were planning to have him back in the office for 2 days beginning tomorrow, returning to the site this Friday, when we probably would have all of our sub-slab lab results back in - is there any way you can reschedule your site visit for this Friday? Just checking.We will have our Senior Technician (Shawn) on-site tomorrow. He’s been on-site since the beginning, but he’s not our geologist and may not have all of the answers to your questions. Please let me know what would work best for you?I tried calling you earlier with an update. We did not identify any fuel or odor (PID of 0.0 ppm) in the sewer cleanout in the adjacent building.We have some lab results back for our surficial soil samples collected directly below the slabs in both the back storage room and tank room, but are still waiting on lab results for our deeper samples in both of these rooms and the samples from the adjacent property alley area - we should have those results in later this week. Elevated concentrations of some VOCs and SVOCs were identified in 4 of our 6 indoor sub-slab soil samples, but the concentrations are not very high.We continue to measure concentrations between 6-7 ppm in the tank room. The openings in the secondary containment wall have apparently been plugged, but we are under the impression that this room could still use some more cleaning (including below the epoxy paint that Riteway attempted to apply to the floor. There are 2 open boreholes in this room too.We have been measuring 0.0 to less than 1.0 ppm in the back LOI storage room.There remains a combustion odor elsewhere in the building, but it appears to be related to either the subway or something else other than the fuel. We’ve been running into a road block with getting the police to assist us with towing some autos that are constantly parked at the location where we need to park our guzzler. We are now attempting to obtain a road closure permit in the hopes that we can gain access for our guzzler that way. We have been parking a large truck somewhere along the road every day and loading it with soil

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

transferred from the rear alley via buckets. We probably have removed about 30% of the total contaminated soil from the rear alley, to date.We also are getting a quote for the removal of a tree in the back alley because we've discovered that the soils surrounding that tree's roots are heavily saturated - this is a very tall tree and we may not be able to remove this tree - we'll see. I'd like your opinion on this (when you visit the site and inspect this area).Thanks. Vought called and spoke to Herrygers and noted that site visit would be performed on 4/10 due to vapor issue reported by Liebhaber. 4/10/13-Vought-Site visit by Vought and oniste were Crawford Environmental, Liebhaber and Bildirici. Vought noted olfactory evidence and visual evidence of oil on carpet (stain was approximnately 1'x1') which was four feet from desk of Liebhaber. Vought required removal of carpet which was done immediately and stained concrete noted underneath. No spill evidence form fill line which runs above the area so unexplained cause for oil stain. Concrete will be washed and epoxied tomorrow. Ventilation units running to back of building and Vought inspected file room and noted that five soil borings were performed and analytical results pending. Vought also noted some insulation at top of secondary wall but sealing not complete as light was able to penetrate from file room into secondary containment room. Containment room floor appeared clean with no additional recoverable product on the surface of the concrete. Rear yard excavation is approximately 15'longx10'widex4'deep and heavily stained soils noted under roots of five story high sumac tree and original spill extended to second sumac tree of same height which may also require removal. Crawford requested permission to removal tree and also noted that local NYPD precinct could not enforce parking permit and as such they were limited to only one vacuum truck per day. Crawford requested DEC assistance in either obtaining a second vacuum truck and/or faciliation of NYPD car removal. 4/11/13-Vought-Spoke with DEC Natural Resources Gary Koplun and he requested that Vought send email to him with inquiry. Vought sent email inquiry with Google Earth Photo and copy of spill report and request for advisement with cc to Herrygers and Bildirici. 4/15/13-Vought-Email file review by Vought: Email from Hamarich to Vought-4/12/13. Email that It seems we may be at the last hurdle on obtaining an enforcement for parking at the site. I have a conference call with the main enforcement office scheduled for today. The individual handling this will be in at noon. The local enforcement branch was unable to assist and a supervisor at the main branch (34th street) has provided assistance that her subordinates were unable to. I will have an answer on the parking in a few hours. Email from Herrygers to Vought-4/12/13. Email from Herrygers that Please call to discuss something. Email from Liebhaber to Herrygers-4/12/13. Email from Liebhaber that Ron,I m told that you are aware of the persistent fuel odor within our office. It is very strong and has not abated at all. It is coming from an electrical closet (which is within the path of the oil tank supply line) near the front of the office. There was a meeting on Wednesday with Jeff, JV, Josef, and me. Priority directions were given to JV to direct the workers to remove some oil soaked carpet in the closet, clean and seal the concrete underneath it, as well as other suggestions in addition to ongoing assessment of the issue. 2 days later and these items have not been completed. Each day I ask about it, I am referred to you. Speaking with JV today, he again referred me to you and said that you would give me a call. I have not heard from you. I am

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

getting the sense from various conversations with the men on site, that this odor is being considered unrelated to the spill and not part of the scope of remediation and that this decision is coming from the top of the organization. I can assure you of one thing. Prior to the spill, there was NO odor coming from this area. Absence of a definitive cause being determined does not preclude any potential causes. It is now 3 weeks since the spill occurred. Several exhaust fans, running 24/7, have been installed to vent our space. These have been completely ineffective. As the tenant of this space, our #1 priority is to have this odor eliminated. We have identified from where it is emanating but not conclusively identified the source. This odor is sickening, and despite all the protestations from the workers onsite, I m certain is not healthy for us. Please advise me of your strategy to address this urgent matter. I do not want to go another week enduring these conditions. Received email from Herrygers to Vought-4/12/13. Email that Based on the inspections performed by our 2 geologists we have sent to the site (JV & Pat), they are both advising us that the combustion odor that is noticeable in the front utility closet and any associated staining on the carpet at that closet were not caused by the March 21, 2013 heating oil tank overfill. The surface pathway from the known heating oil spill locations (i.e., rear alley, tank room and rear storage room) are too far and our PID investigation did not identify any evidence that spilled heating oil flowed from those locations all the way to the front utility closet and impacted its carpet. I noticed in your report that you also concurred that there was no evidence that the nearly heating oil fill port line leaked onto the carpet. Therefore, the staining observed on the carpet (and its apparent associated combustion odor) do not appear to have been caused by the March 21st heating oil spill. However, please note that I already discussed this with Mr. Bildirici (the building owner) and even offered to lend him our cleanup crew to perform the 2 tasks you requested for this former carpet area, but he told me (yesterday) that he would get it taken care of using someone else. I'll let you know if we observe that Mr. Bildirici has addressed this issue. We are still waiting for our lab results for the soil sample that we collected from the open slab area in this front utility closet; however our PID testing and other observations indicate that the soils in this closet were not contaminated by the heating oil that spilled on March 21, 2013 - we expect our forthcoming lab results to indicate this as well and I will convey those results to you as soon they are available. Ultimately, we will be identifying and remediating all sub-slab or subsurface pathways for the spilled heating oil. Our goal for the rear alley is to excavate until all contaminated soil has been removed and we have confirmation soil samples to confirm this - if we identify any subsurface pathways, they will be explored and remediated, if necessary. We recently received our lab results for the soil samples below the concrete floor slabs in both the tank room and rear storage room and of our 8 samples, 2 did not contain any compounds above State Standards. Of the 6 that did only 2 of those contained any individual compounds that exceeded 10,000 ppb (but just barely). We plan to expand our excavations in both of those rooms in order to remove contaminated soil and to obtain base & sidewall confirmation soil samples in all areas with elevated compounds that meet State Standards. Naturally, if we discover any preferential pathways, those will be investigated and remediated. Some other good news to report is that our confirmation soil sample collected below

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

the rear alley concrete slab behind the adjacent building (where photographs have documented that some of the spilled fuel flowed & pooled) were well below State Standards. Therefore, we seem to have sufficient evidence that the spilled heating oil that flowed onto the adjacent property was cleaned up shortly thereafter and did not migrate into the subsurface on that property. I will be providing those lab results to that building owner. If you would like to discuss any of this, please feel free to call me. Thank you for all of your help with promptly responding to the various issues raised pertaining to this spill (especially the help you've given to Eastern in our efforts to obtain the necessary permits to utilize our guzzler on-site - hopefully that will become a reality soon).Thanks. Email from Herrygers to Liebhaber-4/12/13. Our PID testing since our involvement has documented that the heating oil odor entering your space from the heating oil spill areas (rear storage room, tank room and alley) has been significantly mitigated due to the air scrubbers and blowers that are being used on-site. Additionally, mitigative measures have been taken to plug the pre-existing gaps in the tank's secondary containment wall to further mitigative measures (additional gap plugging is planned early next week). Furthermore, a significant amount of the heating oil vapor source material has been removed from the back alley and next week we plan to begin remove additional contaminated soil identified below the floor slab in both the tank room and rear storage room, so we have been making very good progress.The alley excavation would be essentially complete already, except for the bureaucratic delays in obtaining all of the necessary permits. Jeff Vought has been helpful and we are getting much closer to finally obtaining all necessary permits to begin using our guzzler to vacuum up soils at a much faster rate.We did not identify any indications of heating oil in the soils observed in the front closet - we are currently awaiting lab results from that soil sample for further confirmation.Additionally, we have examined all plausible spilled oil flow pathways from the rear alley, tank room and rear storage room and no realistic routes have been identified. We have also tested organic vapor readings along the floor and have identified no indication (or trail) of spilled oil from those known spill areas to this front closet area. Multiple experts have advised that the front closet odor is a combustion odor and verify different than the residual heating oil odor in the back. It's source is likely unrelated and therefore its mitigation is not part of our heating oil remediation. We've examined this already and pending our upcoming lab results for the soil sample collected in this closet area, have no evidence it is related (in addition to our evidence that it is unrelated) to the March 21, 2013 heating oil spill. However, I've already discussed this matter with the building owner (Josef Bildirici) and he advised me today that he will be getting someone to address this unrelated combustion odor issue. Please note that we did offer to lend our cleanup contractors to him to address the specific measures requested by Jeff Vought; however he advised that he would hire someone else to address this former carpet area. So please contact Mr. Bildirici with any complaints about the combustion odor issue.Thank you. 4/15/13-Vought-Sent email to NYSDOH Hughes and NYCDOH D'Andrea that Hope all is well at your respective Departments and I was hoping I could have your assistance on the above reference spill (email string with tenant concerns and Spill Report and requirement letter are attached below). The Department was notified of a #2 fuel overfill on 3/21/13 at the above site that is a

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

four-five story residential Unit. The Spill came out of the vent pipe in the rear yard of the building and seeped into the soil and also ran into a back file room stairway and into the file room itself of the basement of the building which is currently and fully occupied by Liebhaber Construction Services (who have been impacted by vapors). We have been having ongoing PID monitoring by the contractor performing the cleanup (hired by the oil company's insurance company) as well as ongoing operation of ventilation units. Unfortunately due to access constraints the only way for remediation and removal of soils is through the contractor offices however the contractor is working on obtaining a guzzler to remove additional soils due the large volume of contaminated soil associated with the spill. I have been so the site numerous times and as recently as 4/11 and their still is an olfactory evidence of oil in the office by Mr. Liebhabers desk and we discovered a patch of 1' square oil impacted carpet that I had removed and I just spoke with the property owner who will have someone visit the site today to wash and epoxy seal the floor. Mr. Liebhaber noted in his email on 4/12 below that This odor is sickening, and despite all the protestations from the workers onsite, I'm certain is not healthy for us. Would it be possible to have someone from NYCDOH go out as soon as possible to do a confirmatory PID inspection? Vought called and spoke to Hamarich who had conference call with NYPD and he will receive call back from gentlemen from NYPD today and as such no DEC facilitation needed to date. Received email from NYCDOH D'Andrea that Hi Jeff. We will call today to try and set up an appointment. -chris Bildirici then sent email that hi ron, regarding the small spill by the closet, talking to the office of liebhiber contracting co,i feel that if we do the job we will not be able to satisfy them,so please as discussed omn the phone try to do the job and we will be responsable for the $400. can you please advise if you can do it asap. josef 4/16/13-Vought-Received email from Herrygers that Jeff:Attached are the lab results for the confirmation soil sample that we collected in the front utility room (after some initial soil was excavated from the floor of that room). Note that even though some minimal concentrations of some SVOCs are present, nothing exceeds applicable Soil Cleanup Levels for Fuel Oil Contaminated Soil.All lab results (including these) will be included in a final report which will be provided to you once the remediation has been completed. 4/17/13-Vought-Received email from Herrygers that I just wanted to relay that the small former carpeted area at the front utility room was scrubbed & cleaned, acid etched, dried and coated with epoxy paint (all of this occurred yesterday). My field geologist advised me that the Department of Health's PID measurements in the office spaces and front utility room were all below 1 ppm - is this correct? Our crew is completing the initial sawcutting in the rear storage room and tank room floors today and beginning to remove contaminated soil from below the concrete floor slabs in both rooms. Excavation of contaminated soil in the rear alley is continuing (most of the contaminated soil has been removed already and we anticipate that some time next week we should have all of the contaminated soil in the rear alley removed, with the exception of contaminated soil in the root system of 2 trees. Please let me know if you have any questions. Vought sent email to NYCDOH D'Andrea with cc to Liebhaber requesting copy of NYCDOH site visit report. 4/18/13-Vought-Received email from NYCDOH D'Andrea that Glad we could help. I will pass your thanks onto Allan Friedman, who made the arrangements to make this

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

happen. The inspector will be back in the office on Monday with the report and we will send it over to you then. If you need it sooner, we would need to make special arrangements. -chris . Vought replied that Chris, Monday is absolutely fine and thanks again for your help.-Jeff . 4/22/13-Vought-Received email from NYCDOH D'Andrea that FYI, attached is the report to the owner. We issued an advisory to continue to ventilate while work is ongoing. No fuel oil odors were detected in the occupied spaces of the building. Attached to email was NYCDOH Site visit report and Vought added it to e-docs. 4/25/13-Vought-Received email update from Herrygers that We seem to be nearing the point where we cannot excavate any more soil from below the concrete floor slabs in both the rear storage room or tank room. We are following our structural engineer's excavation guidelines and it is likely we will need to leave some limited contaminated soil still in place for structural reasons. We are in the process of collecting confirmation soil samples from both room floor excavations and I'll get back to you with our results. The good news is that we've excavated quite a bit of soil in these rooms and several of our sidewalls appear to be clean, based on PID readings.The alley excavation is progressing, but there is still quite a bit to excavate in the rear alley. Once we've excavated all we need to (or can, next to the building footer), then our plan (after collecting confirmation soil samples) is to pump concrete into the alley to create a new thick concrete pad - this will be much less time consuming than trying to use a bucket brigade for over a month to place backfill in this alley - the plans for the backfilling of the alley have obviously not been finalized yet. We are taking daily readings in the LOI office spaces and don't seem to be measuring anything over 0.5 ppm - our highest reading today was 0.2 ppm. The 2 rear rooms (sealed from the offices with plastic on the walls) maintain just under 5 ppm when we are not working, but jump up to around 70 ppm when we are excavating and stirring up contaminated soil. Today (for the first time since the spill occurred on March 21, 2013, to the best of our knowledge) heating oil was poured into the 4,000 gallon heating oil tank. Castle Oil pumped an unknown volume of oil into the tank while our crew was excavating in the tank room today. We noticed that during pumping, there was a noticeable increase in heating oil odor in the tank room and our PID increased to around 250 ppm and maintained that level until pumping had ceased, then it dropped back down to around 70 ppm. No oil spillage was noted around the tank or from the vent, which remains in the alley. I just wanted to pass along this update - we will at least still be excavating in the rear alley (and have open excavations in the 2 rooms) for your inspection later this week - please let me know when you plan to be on-site later this week. Thank you. Vought sent reply with cc to Bildiric and Liebhaber that Ron, thanks for the update. The Department always concurrs with leaving contaminated soil in place in lieu of possible structural impairment. I look forward to the confirmation sample results as well so that we may close the excavations and consider other possible remedial methods (if necessary) pending my review of the results. Please ensure that they are continued to be covered in plastic due to potential vapor issues. With respect to a site visit the first day I can be available is Tuesday 4/30 as I am taking vacation Monday and Friday. Please keep in mind that I may also go to Albany for Wed 5/1 and Thurs 5/2.Keep me posted Received reply from Herrygers that Will do. The crew just finished excavating all we can structurally in the tank room and we

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

collected confirmation soil samples.Our plan is to install SVE piping below the slab in areas where we've excavated soil and to vent any potential sub-slab vapors outside of the building.Thank you. 5/7/13-Vought-Received call from and spoke to Liebhaber who noted that cleanup has been ongoing now for seven weeks and the noise from Vactron is quite severe and requested site visit by Vought. Vought sent email to Herrygers with cc to Liebhaber requesting status of site and good time for site visit. Herrygers replied that We finally were able to take possession of the space in front of the building and have our guzzler in use, so the remaining alley excavation is moving along much faster now and should not take much more than a few more days to a week or so (vs. the bucket brigade which probably would have taken another 2-3 weeks to complete the excavation only. The alley excavation is mostly complete and we expect to have our tree removal contractor on-site later this week too. Our indoor excavation confirmation soil samples should be in today, I will relay those results to you. We are hopeful to begin backfilling with concrete and/or flowable fill soon. We plan to install an SVE piping system below the new slab sections inside too. 5/8/13-Vought-Received via separate emails from Herrygers including site plan and laboratory analyses and soil analyticals showed only two CP51 Unrestricted SCO exceendences including: 2000ppb ethylbenzene(SB8), 5100ppb xylene(SB8), and 820ppb xylene(A-1). No further soil excavation due to structural limitations associated with the adjacent property as well as footing walls of building. No sign of petroleum product in excavation in rear of building, excavation in file room or excavation in tank room via visual or olfactory evidence. Heavy rains in rear excavation which is close or two bedrock (evidenced by large schist cobbles)and staning rainwater in excavation had no sheen or product evident. Vought approved backfill of excavations and noted that SSDS was not required in file room excavation due to clean endpoint samples and no olfactory or visual evidence of petroleum. Tree removal may proceed but in light of no further excavation of soils required (stained soil under trees however in light of extreme amounts of soil already removed), Vought no longer required removal of soil under trees. Backfill will scheduled to begin on 5/10 and may take approximately one week followed by reconcreting which is expected to take another week and epoxy seal as well. 5/16/13-Vought-Received email from Liebhaber that Ron,Can you give us an update on the backfill work with respect to timing? Also, while the odor seemed to have dissipated with removal of the material in the back storage area, we still continue to have an issue. I know that a lot of contaminated soil was removed, but due to structural concerns the remainder could not safely be removed. We tried closing off the end of the soffit as a means to cut off the path from the source but this has not helped. In fact, the odor is quite strong today. Notwithstanding the fact that your readings are within limits, what else can we do to address this persistent issue? Thanks, Herrygers replied that Michael: The need for a concrete truck & pump truck both on-site occurred suddenly and we are still trying to get all of our ducks in a row to get both of these vehicles scheduled to begin backfilling the rear alley (and obtaining a road closure permit in order to park both large trucks in front of the building). When we get everything lined up, we will mobilize and the backfilling of the alley with cement (that will harden to concrete) should only take about 1 week to complete.We've already backfilled both the tank room and rear storage room excavations with stone up to the bottom of the

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

adjacent floor slabs. New floor slabs will be poured in those former excavations when the concrete pump truck is on-site. We also affixed caution tape over both rear building entrances into the back alley as a safety measure to discourage anyone from entering the rear alley. I know the blower is still operating on-site until we complete the concrete pouring work. The tree removal contractor is still schededuled to remove both rear alley trees during the week of May 20th. Liebhaber replied that Thanks for the update. What else can be done about the fuel odor? Herrygers replied that you are referring to an odor that you've been smelling close to the closet/hallway near the front of the building, you'll need to check with your landlord because our investigation identified that none of the heating oil that spilled from the March 21st delivery impacted any area near the front of the building. Regarding any residual odor discernible near the rear spill affected rooms or alley, these areas have been remediated and will all be capped once the concrete is poured inside & outside and after an epoxy paint sealant is placed atop the 2 rear rooms affected by the spill. However, the blower that Eastern has operating on-site should be mitigating any heating oil odor from the rear spill affected areas. Vought replied to all that Mike, From the Department's point of view, if the odor persists we can always call out NYCDOH again to do another inspection. Another possible route is indoor air sampling with SUMMA cannisters (to confirm that the vapors are indeed petroleum related via laboratory analysis) but this may indeed be the responsibility of Josef pending further discussion with NYSDOH/NYCDOH and the continued persistence of vapors. The optimum time for any indoor air sampling would be once all the backfills and epoxy are done (so no remaining sources of volatiles are present) so I am thinking it wise to wait to see if the vapors persist after the work is completed.If you feel the vapors are unbearable until that time let me know I and can have NYCDOH come out again for another site visit, Thanks for your continued patience.
5/24/13-Vought-Liebhaber sent email to all that Can you give us another update? The tree removal company never came this week. We continue to breathe in the vapors which come from the back storage area and permeate throughout our office. We also have plywood protection over our floor and the office is covered in a layer of dust. While we wait to determine a definitive date when work will resume, it would be very helpful to us if a few items could be completed in the interim. In particular, pouring and epoxy coating the floors in back storage area and tank room to seal in any remaining vapors. And also removing the floor protection and doing a light preliminary cleaning. Please let us know. Herrygers replied that Michael:The tree removal contractor showed up earlier this week to remove the trees, but no one was at your office that early in the morning, so he could not get to the alley to remove the trees.We are closer to getting to lining everything up (the NYC bureaucracy to get the road cleared for both a concrete truck and a pump truck is not easy). We have identified 2 different contractors who we can use, but we are trying to shore up when they can get this scheduled - it will take several days to backfill the alley.We may try to get a smaller crew on-site next week to pour the next concrete floor slab sections for the rear storage room & alley, then after these floor sections solidify, we can coat them with epoxy paint sealant. Ideally we were planning to pour the new floor slab sections when the concrete pump truck was on-site to fill the alley, but if this looks like it might take too long, we will get the floor work scheduled sooner.

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

FYI....the indoor excavations were already backfilled with gravel, so there are gravel filed holes under the floor boards. You should be contacted Tuesday by a contractor (Tech Clean) whom we will be using to perform a final HEPA vacuum & wipedown cleaning in your office. We need them to inspect the area to be cleaned, provide us with their quote, then get this scheduled. Thank you for your continued patience. 5/31/13-Vought-Received email from Herrygers that I just wanted to let everyone know that we seem to be close to getting all of our ducks in a row with NYC and the concrete pump contractor to perform the final concrete pump backfilling of the alley and rear floor slab sections. We hope to complete the notifications to NYC to clear the section of the street that we will need - this hopefully will be completed by mid to late week, next week. Once that has been confirmed, we plan to have our concrete contractor on-site immediately thereafter (probably starting late next week or first thing the following week). The concrete pumping will probably take 3-5 days to complete. After the concrete has solidified we plan to coat the floor of the 2 rear rooms with epoxy paint and then we will have Tech Clean on-site to perform a final HEPA vacuum & wipedown throughout the Liebhaber Construction office & storage spaces. Our tree contractor (who did visit the site a few weeks ago, but could not get in) plan to be on-site early next week to remove the 2 alley trees. Once we've firmed up a date to start the concrete pump work, I will email everyone again. Thank you. Liebhaber replied that Thanks for the update. Please, let the tree guys know that we open between 8:30 9:00. 6/5/13-Vought-Herrygers sent email that The tree contractor has been rescheduled to perform his work next week Wednesday (June 12th), pending the concrete pump work which would take precedent.At this time, it appears likely that everything can be setup to begin the concrete pump work on Monday (June 10th), but I am awaiting final confirmation of that - I'll let you know as soon as I know (the NYC bureaucracy has been a tricky thing to navigate during this cleanup). 6/7/13-Vought-CC'd on email from Herrygers to Liebhaber that Michael:The tree removal contractor is still scheduled to remove the 2 rear alley trees on Wednesday (June 12th). Ironically, everything had all be setup earlier today to clear some vehicle parking space and mobilize the concrete pump truck and concrete supply truck to your on Monday; however once the rain situation had been evaluated, it seems highly likely that the rear alley will contain a large volume of water come Monday morning (due to Tropical Storm Andrea, which is scheduled to pass through NYC later this weekend). Additionally, I am being advised that you've had quite a lot of rain there lately, so it is my guess that some rainwater is still pooled up in the bottom of the alley excavation. Concrete can't be poured into the excavation if there is water pooled up in its base. Our current plan is to have someone from Eastern inspect the alley for water either later Monday or on Tuesday. Once it is cleared of water, then we may proceed. This situation ironically may be giving our tree contractor the window he needs to get the trees removed before the concrete is poured. Please keep us advised about water pooled up in the alley, if you have visual access into the alley. Liebhaber replied that I would guess there is about 6 of water at a few spots and it is raining again today. But this is a very small percentage of water relative to the total volume of the excavation. Can they adjust the design mix or just have the pour displace any water? I don t think we re looking for this to have any significant structural value. Also, have you made provisions for

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

reinstalling the area drains? There were drains existing. Without the drains we will be creating new problems going forward. We re eager to get this going as well. Herrygers replied that Michael: It is my understanding that no pre-existing active drain pipes were located on the ground surface of the alley where the excavation occurred. I know that several old rusted pipes were encountered during excavation. However, if you are aware of the former location of drain pipes in the alley where the excavation occurred, please get with our geologist who will be on-site on the day that the concrete pumping occurs and convey to him any knowledge you have about any of the old rusted pipes that are visible in the sidewall of the alley excavation and we can work to tie in to them. Our plan has been to install a few vertical PVC casings with surface pipe grates that would be used to drain surface water from atop the new alley's concrete slab directly into the subsurface soils below the concrete slab. Given that there is 6 inches of water in the base of the excavation and it is still raining, we probably won't be able to begin the concrete pour until Wednesday at the latest - please email me tomorrow morning with an updated observation of the depth of water in the alley - your information has been helpful. FYI...we really don't want to just displace a large volume of existing water in the bottom of the excavation during the pour, to avoid running the risk of having some settling of the alley's new concrete slab (which will be 7 feet thick in some places). Thank you. 6/10/13-Vought-CC'd on email from Liebhaber that My understanding is that there is a clay layer at the bottom of the excavation, so my concern is the rainwater will just hit the clay and fill up the pipe. I would be more comfortable if there was a drainage layer at the bottom of the excavation so the water has somewhere to go. There is a tie in to the storm at the foundation wall. Even if everything was rusted before, the water was still able to drain through the cracked slab and upper soil layers. Now we are creating a 7 + thick solid concrete block underlain by clay. Vought sent email that Gentlemen, The DEC is not the expert in this particular concern however I must note as a geologist that the site is ultimately underlain by bedrock regardless of clay or not which may ultimately limit drainage if no tie in is performed. From the Department's point of view, the standard phrasing is that the site must be restored to pre-spill conditions which also includes drainage structures. The Department does not object to any improvements from the prior condition but cannot require them as well but does strongly encourage them in order to maintain relations with impacted parties. Thanks and continue to keep me posted. Herrygers sent email that Michael:The tree removal contractor is scheduled to be on-site tomorrow. If they are able, they should be removing both trees in the alley.One of Eastern's technician's inspected the alley today and confirmed that due to the rain over the past 24 hours, there is more water in the alley than was apparently observed yesterday. Hopefully, we will have no rain on-site for the rest of the week (although currently rain is forecast for Thursday/Friday, then again early next week) - if the rain will just stay away long enough for the water will drain in time for us to mobilize to the site next week to perform the concrete pour.Michael - if you could take a quick look at the alley's water condition/depth first thing Friday morning and email me what you observe, we will use that information to plan ahead for the following week.Thank you. 6/12/13-Vought-Herrygers sent email that Michael: As noted, the tree removal contractor was on-site today, but was unable to safely remove

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

the trees due to the presence of a large volume of rainwater in the excavation. It is noted that a lot more rain is forecast for the site tomorrow and possibly Friday and more rain on Monday. We are considering a possible option of pumping out the water in the alley, but only if the weather forecast for the following 5 days do not forecast any rain, in order to allow enough time completely finish pouring the new concrete slab. Based on the present forecast, it seems unlikely that the concrete pour work will occur any time during the next 10 days. It is possible that the tree removal work may be rescheduled for later next week, pending water in the alley and forecast. Liebhaber replied that This is completely unacceptable. It is now 3 months since the spill occurred. Our company has suffered significant disruptions to our business. We have been working in a filthy, disgusting, oil smelling environment. We have been extremely patient during this ordeal and as the impacted party we have not received the priority consideration that we should be getting. I asked you 3 weeks ago to have someone clean our office, since the next step of backfilling has been delayed with no foreseeable completion. You sent a guy as a token gesture. He stopped by, looked at the space and we haven't seen him since. He also told us he would install another type of machine that would break down the chemical odors in the air (which, by the way he agreed were from the oil spill). We're still waiting for that. I also asked you to seal up the floors in the back areas to help with the persistent vapor issue. You've never responded to that. It's been over 5 weeks since the crew left the site. You stated in a prior email from May 16th that the need for a concrete truck & pump both on-site occurred suddenly... Suddenly?!? What exactly were you planning to do once the excavation was complete? You spent over a month trying to get a permit for a guzzler truck and it didn't dawn on you throughout that entire time that you should be working on the permits for the next phase or your work? Basic planning, it's Project Management 101. Since the time that the crew was last at the site you could have: - Already filled the excavation by bucket with gravel and poured a new slab. You decided not to. That was a poor decision. - Sent a small crew back to concrete and epoxy the areas in the storage and tank rooms to try and alleviate the odor. (Yes, it is an fuel oil odor and not some mysterious foreign odor that some of your guys have tried to convince us of. And yes, it is related to the spill). But again, you decided not to. That was another poor decision. - Purchased a $50 pump from Home Depot to pump the water out of the excavation so you can pour. But you didn't. Yet again, a poor decision.- Sent a crew back to remove the protection and do a first pass cleaning while you waited for the permitting which you have mismanaged. You know the refrain by now. In short, you've made a lot of poor decisions and we've borne the impact. It's clear that you have not fully considered that this is an occupied remediation site and not factored that into your decision making process.In the morning, I will have some of my workers take up the protection. I will then contact a remediation company that we work with to come to our office and begin cleaning. Let me know if you would like to have your team perform this work otherwise advise me where to send the bill which I expect you to fully reimburse us for. Herrygers sent email that Michael: At first I thought you email was addressed at Mother Nature (obviously we can't stop it from raining on-site). If you want to hire contractors to finish the restoration task you are more than welcome to do so, but please note that neither G&D Petroleum nor their carrier is

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

responsible for paying for any costs that had not been pre-approved by the carrier. G&D Petroleum and their carrier have been very proactive in remediating the spilled heating oil and would have no problem if a building tenant or the building owner decided to finish up the planned restoration tasks on their own dime. Both the NYSDEC and the NYDOH have inspected the building and your office space and have confirmed that no heating oil vapor issue exists. Despite this, a large blower has been maintained and operational in your space. Additionally both the rear storage room and tank room excavations have been backfilled already. It is should also be noted that all of our confirmation soil samples in the rear storage room excavation were below NYSDEC Standards. Water in the alley excavation could be pumped out (at an additional expense), but because this water is in contact with some soils that exceed NYSDEC Standards, it would need to be disposed of at a licensed facility and can't simply be pumped out into a storm sewer (that would not be allowed and even if the alley soils were all below NYSDEC Standards, this action could not occur with a NYC permit). Pumping the alley excavation of its water would only assist with the subsequent concrete pumping if that phase of work could be completed before a heavy rain event (that is why it would only be considered, if we still had water in the alley, but the forecast indicated no rain events for the next 5-7 days...which currently is not the situation, given that rain is forecast for today, tomorrow, early next week and late next week). However, given the continued rain delays affecting the concrete pumping scope of work, we are planning to send a crew to the site Monday morning to mix concrete on-site and to pour the new concrete floor slab sections for the rear storage room and tank room. After those are poured and have fully solidified (in about 1 weeks time), then the crew will return to acid etch both floors and then coat with 2 layers of epoxy paint sealant. The tree removal work will occur whenever the tree contractor can safely remove the 2 trees. Several weeks ago, we completed all arrangements and can obtain the necessary permits to perform the concrete pumping work - we're just waiting on Mother Nature to cooperate at this point. Regarding the final cleaning, we sent Tech Clean to the site to evaluate their costs to perform a final HEPA vacuum & wipedown of your office space, the rear storage room and tank room. We are actually still waiting for their quote to perform that scope of work. We intend to have the final cleaning performed, but not until we've finished all work involving personnel & equipment passing through your office space to the rear alley. Please let me know if you are planning to incur the costs yourselves (or have worked out something with the building owner) for performance of any of our planned tasks and I will remove them from our plate. 6/14/13-Vought-Sent email to all parties that After reviewing the below email string and a phone discussion with both Mr. Liebhaber and Michael Hughes from the NYSDOH, the Department requires that the property (in particular the offices) be professionally cleaned by a contractor to reduce nuisance odors (as per Environmental Conservation Law) possibly associated with the spill. The Department also strongly concurs with the backfill of the excavations in the rear storage room and tank room scheduled for Monday which also may reduce any contributing nuisance odors to the site. With respect to reimbursement of bills, there are two responsible parties for this spill which include both G&D Transportation as well as the property owner (Mr. Bildirici). Please also keep in mind that G&D Petroleum and their carrier as well as Mr.

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

Bildirici are responsible for paying remedial costs. If the costs are referred for reimbursement directly to the New York State Spill Fund, no pre-approval is necessary, however the legitimacy of the costs will be considered along with possible fines and penalties to the Responsible Parties as well via cost recovery action by the New York State Attorney Generals Office. I am hoping that this lengthy process can be avoided by everyone effectuating backfill of the excavations as well as facilitate the addressing of concerns of the impacted party. The Department also disagrees with the statement that Both the NYSDEC and the NYDOH have inspected the building and your office space and have confirmed that no heating oil vapor issue exists . The report by NYCDOH dated 4/16/13 noted that OEI advises to continue to have active mechanical ventilation until excavation/remediation is completed . The Department required Mr. Bildirici to relocate the vent pipe or install a high level alarm as per a letter dated 3/27/13 and the deadline for the work was one month (due to DEC on 4/27/13). As this work has not been performed, the Department will be sending a letter to Mr. Bildirici that the case is being referred to the Office of General Counsel for enforcement including fines and penalties. This letter will be sent in subsequent email as well as US Mail. Thanks gentlemen and feel free to call me on my cell as well if any questions, 6/14/13-Vought-Sent out deadline letter to Bildirici for relocation of vent pipe or installation of high level alarm by 7/15/13 or case will be referred to DLE for enforcement. 6/15/13-Vought-Received email from Herrygers that Jeffrey:Thank you for your response. I wanted to concur that the pouring of the new concrete slabs atop the backfill in the two rear room excavations is scheduled for Monday. Although this is labor intensive and will have to mixed & poured just right to avoid setup, the crews will be working to get that completed early next week.It should be noted that stone backfill was placed in both of those rear room excavation approximately 1 month ago - in addition to the fact that all final confirmation soil samples collected from the rear storage room excavation were below Standards.There seems to be some confusion about our plans to clean the office spaces and rear rooms inside the site building. It was always our plan (and still is) to have these areas cleaned by Tech Clean. That final cleaning will include HEPA vacuuming and wipedown of all surfaces and objects throughout the office spaces and both affected rear rooms in the building. Tech Clean has already been on-site and is currently finalizing their cost estimate to perform this final cleaning, once all work on-site has been finished and no more contractors are either hauling tree debris or pumping concrete through the office spaces. In addition to this final thorough HEPA vacuuming cleaning and wipedown planned, we have also arranged for an interim professional cleaning of the office spaces for next week. This cleaning will occur, in addition to the aforementioned cleaning.Finally, I also wanted to provide some clarification on the comments pertaining to the NYDOH inspection and subsequent report submitted on April 16th. Previous comments were in direct response to the sentences in that report that state survey of the basement’s office space did not any oil type odor - tests for volatile organic compounds found no detectable levels . As recommended by the NYDOH in the April 16th report, mechanical ventilation system has been maintained until the excavation/remediation was completed. We plan to continue to maintain mechanical ventilation on-site until after the final HEPA vacuum cleaning & wipedown work has been completed. As noted, all excavation

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

work on-site was completed over a month ago and restoration tasks have already begun. The only remedial task left to be completed involves the epoxy paint application to the floors of the tank room and rear storage room. As soon as Mother Nature cooperates, we will be able to both get the trees removed from the alley and the alley backfilled with concrete.Thank you. Vought sent email that Ron, Thanks as well for your email and also facilitating the interim professional office cleaning this week and the backfill of the rear two storage rooms. I am certainly hoping that Mother Nature cooperates soon with regards to the backfill of the rear alley excavation as the excavation is immediately adjacent to a structural support wall. We may have to soon consider alternative concrete mixes and or pumping to facilitate backfill if nature does not cooperate. I have also received your email today noting the difficulties in access provided by the tenant and the property owner. The Department must note that it is one of the Responsible Parties (Mr. Bildirici) that is SOLELY responsible to provided this access at all times. If he does not provide access, it may be interpreted by our legal Department that he is unwilling to perform the remediation and as such we will require him to complete all further work including assuming all further costs for backfill and site restoration.Please continue to keep sending me documentation of the access issues so that the Department will have the support it needs to require Mr. Bildirici to assume SOLE responsibility for all further work including costs and possible penalties. I am hoping that Mr. Bildirici responds to this email and facilitates access to alleviate both yours and the Department's concerns. Thanks. 6/18/13-Vought-Received email from Herrygers that After about a 2.5 hour delay today (we were told by the tenant on Monday that they would have someone on-site by 7:30 am to let our professional cleaning crew in today), but someone did not show up until almost 10:00 am. I told the crew at 9:30 am that they could leave, but they drove back just before 10:00 am to check and found someone had arrived to let them in. Our professional cleaning crew cleaned the tenants space today. We have the application of the epoxy paint to the rear storage room and tank room for next week Monday - hopefully we won't have any access issues them. It is our plan to mobilize to the site to pump out the alley liquid (for off-site disposal), but only when I am sure that the no rain is forecast for the site for 5-7 days and when the concrete contractor confirms that he can be on-site for 3-4 days straight to perform the work - we need to give the NYC Police Department 24 hours notice to ticket and then tow the vehicles still in the space needed by the concrete contractor - I'll keep you posted on when that all comes together. 6/20/13-Vought-Received email from Liebhaber that Gentlemen,The back storage area slab has been poured and the office has had a preliminary cleaning but unfortunately the vapors persist. I know we had previously discussed waiting until all the remediation worked has been completed to reassess. However, I note that with all the work that has been done thus far there has been no discernible difference in the level of the odor which remains quite strong. Since we have seen no improvement, I have very little confidence that the remainder of the work which is outside will have any impact on the vapors inside. It is now 3 months that we have been breathing these fumes. I go home a night and my clothes smell. It produces a foul taste in my mouth. Jeff/Ron, what are the next steps to pursue? Josef, you have been mostly silent throughout this entire process. As a responsible party in this

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

matter, tell us what steps you plan to take to mitigate this condition. 6/21/13-Vought-Received email from Herrygers that Jeffrey: Mr. Liebhaber seems to have forgotten that we still have yet to coat the 2 rear rooms that experienced excavation with epoxy paint (which will occur next week, regardless of the alley condition) - I will email him about that. Of course, in addition to the professionally cleaning that occurred in his office on Tuesday, we still plan to have a complete HEPA vacuum wipedown occur in his office once all work has been completed. Additionally, the alley will be backfilled, just as soon as we can pull this all together (we're hoping to get that started next week because the weather looks like it may cooperate, but we still need to confirm with the NYC Police Department and concrete contractor will work out to get access scheduled and equipment on-site next week too....working on it though. According to our on-site geologist, the odor that Mr. Liebhaber is referring has a likely origin near the front of the building and is unrelated to the recent heating oil spill out back. I know that we and the NYDOH did not detect anything in the Liebhaber office any where near 5.0 ppm, so I'm at a bit of a loss as to what may be done for him further (with the exception of the 3 remaining tasks planned). Thank you. Herrygers sent another email to Liebhaber that Michael: Please note that we still plan to perform the following tasks: 1) epoxy paint coating of the rear storage room floor and tank room floor - next week. 2) backfilling of the alley - when this can all be pulled together.3) final HEPA vacuum & wipedown cleaning of your office space - once the remaining tasks are performed (including the alley tree removal). Vought sent email that Michael, If the vapor continue to persist after the epoxy coating of the tank room and floor next week, I will contact NYSDOH and NYCDOH to see if a more sensitive indoor air sampling is needed (via SUMMA cannisters versus the two previous NYCDOH PID surveys) and if warranted who is responsible to perform the task. If this air sampling was to be performed, as per past experience, it would be performed after all potential vapor intrusion pathways are sealed (eg the epoxy must be applied first). I have copied both NYSDOH and NYCDOH for their information as well as they may read your email below and have additional comments. Ron, Please advise as to when specifically epoxy coating is scheduled for (which is hopefully early next week). Thanks, 6/21/13-Vought-Email from Herrygers that Jeffrey:Application of the epoxy paint sealant is scheduled for Tuesday (June 25th).If the NYSDOH or NYCDOH suggests that an air sample be collected via Summa Canister, we can certainly collect those sample(s) - just confirm which analytical method is approved/preferred.It should be noted that due to the sensitivity of the air analysis for a Summa Canister sample, any such air sample should not be collected until well after the epoxy paint sealant ceases off-gassing.Additionally, air sampling should not occur until after the potential pathway of any possible heating oil particulates be removed as well via our final HEPA vacuuming & wipedown of the Liebhaber office spaces, rear storage room and tank room - of course, the cleaning solutions used by Tech Clean to perform this final cleaning need to finish off-gassing before a Summa Canister sample is collected too. We actually have everything in place to pump out the alley water, set up barricades for the police to tow any vehicles away within 24-48 hours, then mobilize our concrete pump truck to the site for next week; however, we are having difficulty lining up a concrete supplier contractor - we've contacted nearly 10 contractors and they've all

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

seem to be so busy, we are having difficulty with one committing for next week - we will continue to work to get this final piece of the alley concrete backfilling puzzle completed and let you know when everything is finally in place. Thank you. Vought sent email that Ron, Thanks for the info and glad to know epoxy is scheduled as well early next week as your willingness to collect Summa samples (if warranted after epoxying). As Mr. Liebhaber's concerns regarding vapor impacts are immediate, the Department is hoping that the below work is expedited but it may not able to be so as per your below email. Pending the persistence of vapor after the epoxy and pending Mr. Liebhabers input, I may discuss this as well with NYSDOH for confirmation and if sampling is warranted sooner of if they have any additional suggestions. Thanks, -Jeff 6/22/13-Vought-Received email from Herrygers that Jeffrey:Thank you for your input - please let us know what you and the NYSDOH decide about the site's air sampling. I just wanted to reiterate that it is still our opinion that the odor mentioned by Mr. Liebhaber appears to be unrelated to the heating oil that spilled in the rear alley and 2 rear rooms. We await the input from the NYSDOH. I also wanted to update everyone that we had a new development on Friday with a different concrete supplier and if we can confirm with them some time on Monday that they can mobilize to the site next week, we may begin the parking space clearance by late Monday or Tuesday, then get a vacuum truck on-site by Tuesday/Wednesday to pump out any residual alley water (for off-site disposal), then proceed immediately with commencement of the pumping of concrete into the alley. I'll let all interested parties know sometime on Monday or Tuesday morning, if we could get this new concrete supplier lined up for next week. 6/24/13-Vought-Received email from Herrygers that Michael, We are going to be onsite tomorrow morning at 0730 to etch and epoxy the back office and tank room. Please make arrangements to have the office open for us to begin work. There Is going to be a strong odor from the process for the next 2 to 3 days. We recommend that people who are sensitive to odors not be in the office during this time. Liebhaber replied to Willams John Villa that JV,Our office regularly opens at 8:30am. Unfortunately, we do not have anyone available to open at 7:30am. Josef, the landlord, is copied on this email. Ultimately, it is his responsibility to provide access when needed. Hopefully, he has someone available to give you access at the earlier time. 6/25/13-Vought-Received email from Herrygers that Jeffrey:I just wanted to convey that our epoxy paint crew just completed their prep work for both the rear storage room floor and tank room floor - they acid etched both floors. I also wanted to report that before they began their work today, they measured PID readings throughout the Liebhaber office space, the rear storage room (with the newly patched concrete slab floor) and the tank room (with its newly patched concrete slab floor). No readings above 0.0 ppm were noted anywhere inside the building. I also interviewed both workers and neither one smelled any residual oil odor anywhere on-site, including in the Liebhaber office space. I just wanted to pass this along. The crew will return tomorrow to apply the first coat of epoxy paint to the floor of both rooms and then will return on Thursday to apply the second/final coat of epoxy paint to the floors.We are still working on trying to get the concrete pump contractor and concrete supplier contractor to both confirm exactly when they can schedule to be on-site to get the alley filled with concrete. I'll keep you posted on that. 6/27/13-Vought-Sent email that Ron, Thanks for the update

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

and please note that I have copied Mr. Liebhaber as well. In an earlier email it was noted that There Is going to be a strong odor from the process for the next 2 to 3 days. We recommend that people who are sensitive to odors not be in the office during this time. I am hoping that Mr. Liebhaber also considers this information as well and takes necessary precautions. As I noted in my email on 6/21, if Mr. Leibhaber notes continued vapors after application and drying of the epoxy, I will contact NYSDOH for consultation on further action (such as possible collection of indoor and ambient SUMMA samples).Thanks, -Jeff Herrygers sent reply that Jeffrey: Thank you. The second coat of epoxy should be applied this morning. The odor from the epoxy paint itself should dissipate by next week. As I mentioned previously, if the NYSDOH or NYSDEC would like an air sample collected via Summa Canister for analysis, I recommend it be collected after we've also completed backfilling/sealing of the alley and after the final HEPA vacuum wipedown occurs inside the Liebhaber tenant space. This way any heating oil specific compounds identified via air sample won't be attributed to either vapors drifting in from alley soils or from dust inside the Liebhaber space that may still be emanating residual heating oil vapors. If an air sample is collected before completion of those 2 tasks, then any detected heating oil specific compounds would probably just be attributed to one of those two sources and then we'd just have to re-sample the air after they were completed anyway. We're still working to get a concrete contractor to commit to a 3-4 consecutive day period, but they all seem to be very busy and non-committal. At this point, once we have a concrete contractor commit to this, we have a plan in place to set up barricades for parking, get the NYC police to ticket and/or tow any vehicles in our needed parking area within 24-48 hours of our notification to them, then mobilize a vacuum truck to vacuum out any remaining water in the alley (for off-site disposal at a licensed facility)...then immediately switch out the vacuum truck with a concrete pump truck and concrete supply truck. We were really working to get this scheduled for this week, but none of the 4 concrete contractors we've been working would commit. Getting a 3-4 consecutive day period next week (with July 4th on Thursday) likely won't happen, so now we are targeting the following week. I'll continue to keep you posted. 6/28/13-Vought-Received email from Herrygers that Jeffrey: One of our concrete contractors has scheduled the concrete pumping work for the alley for July 9-12. Our plan is to set up barricades along the needed parking area in front of the building on Sunday night (July 7th), then hopefully within 24 hours the spaces will either be empty or the police will have towed away vehicles for us to park Eastern's vacuum truck. Once the vacuum truck gains parking access, they will pump out any remaining water in the alley, then the concrete pump truck and concrete supply truck will take its place and begin the 3-4 day concrete pumping to fill the alley excavation. We also plan to have Crawford Environmental on-site on Monday (July 8th) to construct drain piping that will be situated within the newly poured concrete block alley, to allow for drainage through the new concrete block. If this schedule holds up, we will plan to have Tech Clean on-site to perform the final HEPA vacuum and wipedown work early the week of July 15th.I'll continue to keep you posted. Thank you. Vought sent email that Ron, Thanks for the update as well as the upcoming schedule. All of the emails on this site have been quite useful as I am using them for our database remarks which will give a good site history if ever needed. Please note that I will

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

be away on vacation all next week and returning to the office on 7/10. If any emergency issue should arise, please contact the Spills Hotline at 1-800-457-7362 and someone from the Spills Unit will be able to assist until my return.A good holiday to you as well as those included above, -Jeff 7/15/13-Vought-File review to date by Vought: Email from Liebhaber to Herrygers-7/11/13. Email that Ron, When are you doing the work in the back? When are you cleaning my office? It still has a terrible smell and has not gotten any better. Email from Herrygers to Liebhaber-7/12/13. Email that Michael:The timing of your email is fortuitous. We seem to be having so much trouble getting both a concrete supplier and concrete pump contractor to both commit to scheduling the 4-5 consecutive days to perform the backfilling of the alley with concrete (without changing their mind about scheduled work at the last minute) that we decided to proceed with alley backfilling using a more dependable method. We are all ready to begin implementing this alternate alley backfilling method on Monday morning at 7:30 am (July 15th). The alley will be backfilled using standard fill (sand & gravel) transported via bucket brigade. This method will be somewhat labor intensive, but not as labor intensive as excavating the soil from the alley, then transporting it by bucket off-site. Eastern Environmental estimates that it will take about 10 working days; however it might take less time (depending on the efficiency of the crew and if you or Josef can make sure they are provided access every day by 7:30 am. Once the alley is backfilled up to the level of the adjacent property's alley, then either a new concrete slab will be installed (mixed and poured by hand in the alley) or concrete pavers will be installed on a new level surface. Once the alley's new paved surface is ready, Crawford Environmental will return and cut the 2 new drain pipes (that they installed on Monday) level with the new alley's pavement and install drain grates. The tree removal work should occur concurrent over the next week or two with the backfilling activities. Liebhaber replied that Ron, I ll start by reiterating my dissatisfaction with the way you ve managed the completion of this work. Another month has elapsed with no progress in filling the rear yard nor mitigating the odor in our office. And now after more than 2 months since the crew left the site you ve finally decided to complete the work using a method that is more reliable and was suggested from the very outset by others. If you had done this 9 weeks ago, you would have been done 7 weeks ago. Again, your decision making has not considered the impact on the occupants of this site. Today you ve sent an email informing us that you plan to start the work on Monday, giving us only 1 business days notice. And this was only in response to my email to you last night. Further, you re again attempting to shift the onus on us to provide access which is not our responsibility. As per previous emails, our office opens at 8:30am. Therefore, earlier access will need to be provided by the landlord, Josef. With respect to Tech Clean, please ensure the cleaning will include shampooing the carpets and other fabric surfaces, wipe down of all other surfaces, cleaning (or potential replacement of porous surfaces like ceiling tiles) and full cleaning of all of the utility/ancillary rooms adjacent to our office workspace. In addition, you will need to restore the finish floor in the rear storage room to its original condition. Herrygers replied that Michael:Our goal in performing all tasks has been to minimize the time it takes to get these tasks completed (same thing applies to the alley). I realize your frustration with the duration to get all tasks completed, but there are numerous factors beyond our control

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

that have resulted in this delay - if the alley were accessible by vehicle directly and the NYC permitting process were not anti user friendly, the spill remediation and site restoration would have been completed long ago. Not having any experience managing spill remediations, I can understand your frustration and lack of understanding on the numerous factors that may cause delays in pulling everything together to get everything completed sooner rather than later. Please note that last Friday everyone (including you) were informed that we would begin the work to restore the alley on Monday this week. Crawford Environmental was on-site first thing Monday morning and installed 2 new drains in the alley. So you actually received notice last week that we were starting the alley restoration work. Circumstances beyond our control occurred early this week that resulted in changing to the more time consuming alley restoration option because the less time consuming option (concrete pumping) was taking too long to get started. It was not until early this morning that I had final confirmation that Eastern could mobilize to complete all tasks needed under this other option...that's why you (and everyone else) were emailed this morning. Numerous actions were taken over the past several weeks to further mitigate any potential residual odor inside your space, including pouring new concrete slab sections inside the building, coating both spill affected floors with epoxy paint sealant, professional cleaning of your space, etc. Additionally, the onus to provide access solely rests with the building owner because of his ownership of the building and his responsibility regarding the spill incident. Given the Manhattan traffic situation, it would be more time efficient for our crew to begin work at 7:30 am, so if Josef could assist with arranging this, please communicate that to either myself or Scott with Eastern Environmental. Thank you. 7/15/13-Vought-Completed case initiation form for Mr. Bildirici and failure to relocate vent pipe or install high level alarm as per DEC deadline letter dated 6/14/13. 7/26/13-Vought-To date file review by Vought: Email from Bildirici to Vought-7/15/13. Email that hi mr vought, we had contracted a company do do the job, let me send you the propsal, and when it will be done by, please advise us of anything you want us to do, we will do it, we do not want to deal with fines and penalties thank you very much in advance josef bildirici Email from Management Co to All-7/16/13. Email that Attached please find the signed revised proposal that was faxed over to Riteway Tank Maintenance 700 Hicks Street Brooklyn, NY 11231 718 855 7272 on June 26th as well as the Invoice from Castle Oil as proof that the Petrometer was replaced. Sincerely , Sibel Alev Vought added proposal to E-docs. Email from Herrygers to Vought-7/16/13. Email that Jeffrey: Our contractors on-site did verify that Castle Oil did install a new petrometer a few months ago. FYI...I don't see anything in the attached quote or email thread that confirms either a quote was provided or the work performed to install a new vent pipe near the front of the building. Email from Bildirici to Vought-7/17/13. Email that Dear Mr. Vought, Installation of High Level alarm was completed by Riteway Tank maintenance yesterday. Sincerely, Sibel Alev Email from Herrygers to Vought-7/23/13. Email that Jeffrey: I just wanted to update you on a few things. The backfilling of the alley is going well. We expect the alley will be fully backfilled before the end of this week. We have 2 new floor drains installed in the backfill, connected to apparent pre-existing drain pipes. The tree removal contractor is scheduled to remove 2 alley trees next

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

week, with Eastern then placing new concrete paver stones in the alley shortly thereafter. Once the alley restoration work has been completed, then we plan to get Tech Clean on-site to perform the final indoor HEPA vacuum cleaning and wipedown work. Our geologist was on-site today performing a detailed PID assessment throughout the tenant space and we are pleased to report that he did not detect any measurable organic vapor concentrations anywhere. All readings were 0.0 ppm (and the device was properly calibrated). PID readings were taken in the ambient are of the tenant space, rear storage room and sidewall. PID readings were also taken of the ceiling tiles, carpeted floors, etc. I also wanted to convey that Crawford Environmental is working on a report to provide once the site work has been completed. Thank you. Email from Herrygers to Vought with cc to all-7/26/13. Email that Jeff: I received word that the backfilling of the alley was completed on Wednesday and Eastern graded the alley backfill yesterday. Next a tree removal contractor is scheduled to be on-site next Tuesday (July 30th) to remove the one tree whose roots were undermined slightly by the excavation - it should be noted that both trees appear to have been dead long before the spill occurred, but we are not planning to remove the second tree whose roots were not undermined by the excavation work. Eastern plans to return to the site Wednesday/Thursday next week (July 31 - August 1) to place concrete paver stones over the alley backfill and to cut and cover the 2 new drain pipes with grates. Michael:Is it okay to schedule Tech Clean to perform their final HEPA vacuum cleaning & wipedown beginning Monday, August 5th? Their work should only take a few days to complete. Vought sent reply email that Ron, Thanks for the update and we look forward to hearing from Mike about the presence/absence of vapors after the cleaning. If vapors are noted, I think I will come to the site again as well before pursuing possible indoor air sampling via an inquiry to NYSDOH. Herrygers replied that Let me know if that happens and I will have our geologist on-site too for that inspection. FYI...we’re working on the Spill Cleanup Report for you too and hope to have that completed and to you within the next 30 days or so. 7/29/13-Vought-Cc’d on email from Liebhaber to Herrygers that Ron,1.Your prior email(s) mentioned removing both trees. Are you now removing just one? Note that both trees are dead and over time would be at risk of falling down. 2.Please confirm the schedule for restoring the finish floor in the rear storage area. 3.Please confirm that the A/C ducts will also be cleaned. 4.Unfortunately, there has been no improvement in the odor. I can also smell oil odor in my clothes when I go home in the evenings. 5.August 5th is fine for the cleaners. Vought also called and spoke to Riteway (Rob Hill 718-855-7272) and confirmed that they indeed installed a high level alarm. Herrygers replied via email to all that Michael: Both trees are scheduled to be removed - we received some miscommunication prior to our last email. The floor board work is scheduled to be completed at the end of this week (depending on how soon Eastern completes the alley restoration work this week). Cleaning of the AC ductwork in your office space is part of Tech Clean’s final cleaning work. Tech Clean should be on-site on August 5th to begin their final cleaning.I’m not sure how to explain the odors you are smelling, several independent persons have been on-site over the past several weeks (some measuring with a PID) and none of them have noted a heating oil odor or detected anything with their PID. Let me know if you think this odor may be confined to some items of clothing that you have and we may be able to arrange for those items to be cleaned.

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

8/6/13-Vought-File review to date by Vought: Email from Herrygers to Vought-8/5/13. Email that Jeffrey: I just wanted to update you and advise that before the end of last week, the alley was completely backfilled, compacted and covered with new concrete pavers. Two new floor drains also are present in the new alley backfill. Also, the 2 trees in the alley were removed last week too. Eastern also completed the final wooden floor restoration work before the end of last week as well. Our final task planned is for Tech Clean to perform their comprehensive HEPA vacuum & wipedown throughout the Liebhaber space and other affected areas inside the building. They will begin that work tomorrow (Tuesday, August 6th). Tech Clean will also be cleaning the ductwork in the Liebhaber space. As soon as Crawford Environmental has completed the Site Remediation Report, this will be submitted to you for review. Leibhaber replied that Ron,They did not complete the wood floor. They did about half of it. We showed them that it was not complete. Ron, The entire room had plywood floor some of which was removed by the original remediation company who responded to the spill. Also, the guys replacing the plywood are not providing adequate sleeper support in the middle of the sheets. They are only providing perimeter support at 4 o.c. which is causing the floor to be bouncy. This is not the way it was originally installed. Vought sent email to both parties that Mike/Ron, Good news reading the below in that we are closing up on restoration activities. Continue to keep me posted on these activities (including installation of sleepers under the wood floor) as well as the presence of absence of vapors once the professional cleaning activities are completed. Thanks, -Jeff 9/17/13-Vought-Received call from and spoke to Liebhaber who confirmed that basement and alley restoration was done however persistent odors from the area around the front closet (and note that tank room and spill was in rear of basement) were making him sick . Vought noted that he would call and confer with NYSDOH for possible indoor air sampling and discussion of parties required to perform such work. 9/23/13-Vought-Called and left messsage for NYSDOH Hughes to return call to Vought to discuss Liebhaber vapor issues as reported on 9/17. Vought spoke with NYSDOH Hughes and he requestd that Vought send him email with cc to NYCDOH Andrea noting persistence of vapor complaints and requesting another site visit possibly followed by indoor SUMMA cannister sampling (pending results of NYCDOH site visit). 9/24/13-Vought-Sent email to NYSDOH Hughes and NYCDOH D'Andrea that Mike, I am sending this email as a follow-up to our phone conversation yesterday afternoon with respect to continued and recent vapor complaints by the owner of the contracting business located in the basement of the Spill Site (Liebhaber Construction Services). I have enclosed the last email string below to provide you a refresher but here is a review as well: The Department was notified of a #2 fuel overfill on 3/21/13 at the above site that is a four-five story residential Unit. The Spill came out of the vent pipe in the rear yard of the building and seeped into the soil and also ran into a back file room stairway and into the file room itself of the basement of the building which is currently and fully occupied by Liebhaber Construction Services (who have been impacted by vapors). Cleanup included the removal of impacted soils and concrete from the rear of the basement and tank room and extensive excavation of soils outside in the rear yard of the building. Excavation has been completed and the site restored in full (including backfill of the excavations, installation of concrete, washing of concrete surfaces and epoxying of floors). The Department

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

is awaiting a Closure Report with soil endpoint analysis from the excavations. Due to vapor issues, a ventilation unit was operational during the cleanup and NYCDOH performed two site visits with PID monitoring and noted no concerns and provided written reports to DEC as well. I spoke with the business owner (Michael Liebhaber) recently on 9/17/13 and he noted that the vapors are still making him sick and that they seem to be coming from a front closet (through which the fill line runs but not directly impacted by the oil Spill as it was in the rear of the basement). I have been to the site a few times and noted no olfactory detections of vapors in the office (but note my time on site was limited). As always Mike and Chris, I would much appreciate any guidance/requirements you can provide such as further sampling, site visits etc. Thanks again for your help, NYSDOH Hughes later sent email to NYCDOH D'Andrea that Chris,Jeff mentioned that your staff made two previous visits, were odors of any kind noted? Would it be possible for staff to make another visit to confirm or at least characterize any odors if they exist? Not sure what else to recommend short of air testing. However, if odors are intermittent sampling not yield anything conclusive. Any thoughts??
9/26/13-Vought-NYCDOH D'Andrea replied that Yes, we will revisit the location and let you know if we find anything.
9/27/13-Vought-Forwarded NYCDOH email to Liebhaber and sent email that Mike, As per below email string, note that NYCDOH will be performing another site visit. Please keep me posted on the progress so I can send an inquiry for the written results as well as follow up on them later. I have also copied Allan Friedman from NYCDOH above (who I believe will be performing the site visit) as it is imperative that you both be on-site at the same time so you can describe the issues to him. Thanks again for your patience, . Site visit set with Liebhaber, NYCDOH Friedman, Herrygers and Vought for Tues 10/1 at 3pm. 10/2/13-Vought-Site visit on 10/1 with DEC Mahat, Liebhaber, Crawford, DOH Wickham. Site has been fully restored including backfill and epoxy seal of excavation in tank room, backfill and restoration of file room, backfill and restoration of back yard and installation of whistle and a high-level alarm at fill port.
Liebhaber noted to all that he was smelling odors today, smelled them everyday, they smelled like tail pipe exhaust and had some tightness in his chest as a result. DOH performed air monitoring with PID and CO meters and did find readings of around 5ppm from the front closet around an area of stained concrete and drywall. DOH and DEC noted that the vapors were possibly fuel type in nature but were not able to determine further without chemical analysis. Vought explained to all parties that as vapor were possibly fuel oil that both the property owner and oil company were required to address them (as with all other requirements to date). Crawford noted that he would discuss with Herrygers. Vought sent email to all parties (including DOH, Herrygers, Liebhaber and Bildirici) noting continued joint responsibility for addressing issue and requested to be kept posted on further action. Vought requested to be kept updated.
10/4/13-Vought-Bildirici sent email to all parties that hi ron, since you are more familiar with the issues ,what is the step thatneeds to be taken ,pls advise ??josef 10/7/13-Vought-Received email from Ron to Josef that Josef:The stain identified on the floor & drywall in the closet at Liebhaber's office is unrelated to either the heating oil spill that occurred earlier this year or the heating oil system altogether. The spill occurred 30 feet away at the back of the building and even though the heating oil fill pipe runs along the

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

ceiling above the floor & wall stain, there was no evidence that your fill port pipe was leaking. None of the spilled oil could have flowed all the way back to this closet, because the pitch of the pipe (and floor) is toward the back of the building.Therefore, G&D Petroleum's insurance carrier is unable to assist with addressing this unrelated matter because it is not covered under their insured's policy. Addressing the staining and odor identified in the closet would seem to be a matter between yourself and Liebhaber. 10/11/13-Vought-Email from Liebhaber to Ron/Josef that I am following up regarding this matter. The vapors continue to be an issue. Please advise when the remaining work will be completed.Regards, 10/15/13-Vought-Sent email to Bildirici that Josef: The steps to be taken are rather simple considering this may be the final effort in a long remediation. The impacted drywall (approximately 3' x 3' section) in the front closet (evident by staining) needs to be replaced as well as washing and sealing (via epoxy or other basement sealer) of the impacted concrete. Herrygers Environmental has indicated to the Department that they are not willing to perform this remaining work as they feel that the impact to the front closet is not related to the Spill on record. The Department continues to hold both parties (G&D and Mr. Bildirici) joint and severally liable for the fuel oil spills and will consider enforcement via referral to the Office of General Counsel (copied above) against both parties if the remaining work is not performed. Josef, please indicate whether you are willing to perform this work by COB Thursday 10/17, or a Case Initiation Form will be submitted to General Counsel which may include additional fines and penalties against one or both responsible parties. As always, feel free to call me on my cell at 917-577-1728 if you wish to discuss. Vought received reply from Bildirici as well as call and as per email hi jeffry , it was nice talking to you ,as discussed we will send someone to take care of the issue ,buti am having some hard time to understand where the cement work is ,few month ago we had hired crawford environmental to the the job ,i called ron herrygers and explained him thatwe already did the job ,he suggested that may be it is another location so i put a call to pat crawford and waiting his response ,in anycase planning to send some people today or tomorrow to deal with it. Vought sent reply that Josef, Michael was present during our site visit with NYSDOH and I am thinking he also knows the location. The location specifically was the stained drywall under the electrical box on the left side of the front closet as one faces 75th Street. The entire length of impacted drywall was under 4 feet long originating from the near left corner as one faces 75th Street. Please coordinate your work with Michael. Patrick from Crawford I am hoping will also be present to assist as he was on-site during the most recent multi-agency site visit and he may also want to be present to document the remaining work as a route to spill closure.Keep me posted . 3/7/14-Vought-Received call from and spoke to Liebhaber and requested that he send email noting same. Liebhaber sent email dated 3/4/14 to Vought with cc to NYCDOH Friedman, Herrygers and Bildirici that Jeff, The work described below was completed. The section of drywall was replaced and also the floor was painted with the epoxy paint. However, we are still having the issues with the fumes and it is very strong at times. When the guy was here doing the floor, he said to me that he saw, as he described black wet dirt under a section of loose concrete in the front closet. What are the next steps at this point? . Vought also received email from Herrygers that Jeff:I spoke with Pat Crawford and he confirmed that

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

no loose concrete or soil was exposed on the floor of this small front closet. Given that everything has been done to address this non heating oil odor in Liebhaber's front closet (including removal of the drywall and coating the floor with epoxy paint), I'm not sure what else can be done on-site. Please keep me posted on any actions regarding this, especially any future site inspections. FYI....Pat Crawford advised me that I should be receiving his draft for our Spill Cleanup Report soon - once we've finalized it, we will submit it to you for your review - the report will include all indoor & outdoor confirmation soil samples, photodocumentation of all of the excavation & backfilling work, etc. Thank you. Vought called and spoke to Liebhaber to get more information on black wet dirt and to confirm epoxy application after drywall removal. Liebahber confirmed that epoxy to concrete floor adjacent to formerly impacted drywall was applied but also noted that front of same room epoxy was peeling (not in an area impacted by petroleum) and that there was a burn mark on wall where new fill line exited though wall to outdoor. Liebhaber also noted that guy doing floor noted he removed the black wet dirt and sealed wall with concrete. As this room was not located near historical petroleum impact, the wet drywall removed and concrete epoxy sealed, as well prior site visit by DOH and staff and continuation of vapor complaint by Liebhaber, Vought sent a request for NYCDOH Friedman for another site visit with cc to NYSDOH Hughes. Vought sent email to NYCDOH with cc to Liebhaber, Bildirici, DOH Hughes, Herrygers that Allan, I received the below email from Michael Liebhaber (basement occupant) of the above site and despite the corrective action that was completed during the last site visit with DEC and DOH (removal of stained drywall and application of epoxy sealer), he is still noting very strong...fumes as per the below email string. I called and spoke to Mike to get more information on the black wet dirt as per his below email and to confirm the epoxy application after drywall removal. He confirmed that epoxy was applied to the concrete floor adjacent to the formerly impacted drywall (which was removed). He also noted that in the front of same room the epoxy was peeling from the floor (not in an area impacted by petroleum) and that there was a burn mark on wall where the new fill line exited though the wall to the outdoors. Mike also noted that guy doing floor noted that he removed the black wet dirt and sealed the hole with concrete. With respect to the black wet dirt , the Department is not requiring any further action due to: 1) the fact we have no confirmation that it was contaminated (stained soil does not necessarily mean petroleum impacted soil) 2) the relatively large distance of this room from the historical petroleum spill and 3) the stained soil was removed and hole sealed with concrete. As Mike was noting the presence of very strong ...fumes , I was hoping that you could advise as to the next step. Thanks for your help as always and feel free to call me on my cell at 917-577-1728 if you wish. 3/10/14-Vought-Received call from and spoke to NYSDOH Allan Friedman who noted that he did not perform prior site visit and that it was NYCDOH Claudio Wickham. Friedman noted he would send email reply with time of site visit. Vought then received email from Liebhaber with cc to NYSDOH Hughes, NYCDOH D'Andrea that Jeff/Allan, to follow up from last week, I am letting you know that the fumes are very strong and unbearable today. Please let us know what the next steps are. Thanks. NYCDOH Friedman replied to Liehaber (with cc to NYSDOH Hughes, NYCDOH D'Andrea) that Appointment was set for 3/19/14 8:30AM-12:00PM. Jeff, Please let me know whether it works for you. Thanks. Allan. Vought

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

sent email to all that Allan, I will certainly be available during that time period. It is imperative that we all meet at the same time (DEC and DOH) and as such if you could provide a more specific time I would greatly appreciate it. If it helps, I will aim to be there at 11am so that we can all meet to perform the survey. If there is a better time, specifically, please let me know. The Department also strongly encourages the presence of both the property owner and the environmental consultant (copied above) as both parties may be considered responsible depending on the results of the survey. Thanks again for your help and looking forward to the meeting. 3/12/14-Vought-Vought informed of imperative meeting with Regional Director regarding separate issue during scheduled time of site visit and sent email to NYCDOH Friedman with cc to all parties that Allan, I must unfortunately request a change of time for the air survey (if possible) that we scheduled for Wednesday at 3/19 at 11am. An imperative meeting with my Regional Director has come up that I cannot miss. As the air survey is equally as important I was hoping we could change our meeting time to 1pm or possibly an earlier day. If NYCDOH is not available at an earlier date or at 1pm on 3/19, then I can follow up with everyone after the survey is performed. If the only available times are after 3/19 please let me know and I will call Mr. Liebhaber to discuss if he considers my attendance imperative and is willing to consider a date after 3/19.I apologize for the complications this change may have brought to you and everyone posted. Vought sent another email to NYCDOH Friedman with cc to all that Allan, I received your text accepting the change of meeting time from 11am to 1pm at the above Site on 3/19. Thanks for the change and I look forward to meeting DOH. I spoke with Mr. Liebhaber and he is also available at 1pm. As before the Department again strongly encourages the participation of Herrygers Environmental and the property owner and thanks them for their patience with the schedule change as well. Thanks again, -Jeff Vought received email from Bildirici that Hi all, I will be there God willing ,Managment . 3/19/14-Vought-Site visit with Vought, NYCDOH Compton Tucker, Pat Crawford (Crawford Environmental), Joe Bildirici(property owner) and Michael Liebhaber(potentially impacted party). NYCDOH surveyed all areas of basement and all areas were under 1ppm. Liebhaber noted that odor was stronger during some days and this was a lighter day . Vought and DOH Tucker and Crawford noted no olfactory detections of vapors however Liebhaber noted that he did smell odors when closer to one of the front rooms (not directly impacted by the spill). Vought inspected front room that had prior odors during site visit on 10/1/13 (not defined as petroleum in nature however) and drywall was replaced and fresh epoxy applied. As per report from NYCDOH Tucker provided by Mr. Bildirici, Survey of the premises revealed the following observations: -no odor was evident inside office (front + rear) -minirae detected less than 1ppm of volatile organic compounds throughout office + oil tank room. Given the above observations there is no cause for action. Note: Front utility closet - no oil odor noted + less than 1ppm of VOC detected. Despite results of survey, Liebhaber was not assured of his health and safety and Vought noted that he would forward email with results to NYSDOH Hughes with cc to him and NYCDOH and request for further advisement. 3/20/14-Vought-Sent email to NYSDOH Hughes with cc to all that Mike, The following notes are my entry for the results of the DEC/NYCDOH site visit and indoor air survey on 3/19: 3/19/14-Vought-Site visit with Vought, NYCDOH Compton Tucker, Pat

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

Crawford (Crawford Environmental), Joe Bildirici(property owner) and Michael Liebhaber(potentially impacted party). NYCDOH surveyed all areas of basement and all areas were under 1ppm. Liebhaber noted that odor was stronger during some days and this was a lighter day . Vought and DOH Tucker and Crawford noted no olfactory detections of vapors however Liebhaber noted that he did smell odors when closer to one of the front rooms (not directly impacted by the spill). Vought inspected front room that had prior odors during site visit on 10/1/13 (not defined as petroleum in nature however) and drywall was replaced and fresh epoxy applied. As per report from NYCDOH Tucker provided by Mr. Bildirici, Survey of the premises revealed the following observations: -no odor was evident inside office (front + rear) -minirae detected less than 1ppm of volatile organic compounds throughout office + oil tank room. Given the above observations there is no cause for action. Note: Front utility closet - no oil odor noted + less than 1ppm of VOC detected. Despite results of survey, Liebhaber was not assured of his health and safety and Vought noted that he would forward email with results to NYSDOH Hughes with cc to him and NYCDOH and request for further advisement. Mike, also attached is a copy of the most recent NYCDOH survey (which was provided to me by the property owner) as well as the prior NYCDOH survey. The Department still awaits the Closure Report from Crawford Environmental but anticipates no further action on the site with respect to the soil and groundwater once received and reviewed. Please note that all parties are copied above and feel free as always to call me on my cell at 917-577-1728 to discuss if you wish. I will also be taking vacation Friday 3/21 and returning to the office this Monday 3/24. Thanks as always for your help and guidance. 4/14/14-Vought-File review to Vought: Email from Liebhaber to Vought-4/11/14. Email that Gentlemen, After speaking with Mike Hughes a few weeks back, he asked me to track when I smell vapors in the front area of our office. I am reporting back that the vapors continue to come from the front closet area. Some days are better than others but there is a very real and consistent vapor permeating throughout the front office area around my desk every day. It does smell like fuel oil to me. This is an odor that was never present prior to the spill last year but has been around ever since. Given that the fill line runs directly through the areas we are discussing it very plausible that this odor is related to the spill. We ve been extremely patient and accommodating in working with everyone during this entire process and I greatly appreciate all the efforts on the part of Jeff from DEC. However, I am concerned now that the involved parties are starting to turn the page on this issue and move on. I have real health concerns regarding the vapors in the office. There needs to be further action on this. Mike, please tell me what the next steps are. Thank you Email from Herrygers to Vought-4/12/14. Email that Jeffrey: I finally received the draft Report from Pat Crawford and expect to have the report finalized and submitted to you within the next 10 days. 4/14/14-Vought-Email from NYSDOH Hughes to NYCDOH D'Andrea, NYCDOH Friedman and NYCDOH Vought. Email requesting thoughts on 4/11 email from Liebhaber and possible offer for conference call. Vought called and spoke to NYSDOH Hughes and discussed site history and lack of olfactory confirmation of odors by Vought and NYCDOH. NYSDOH Hughes will call and followup with NYCDOH to discuss another possible site visit or possible sampling of indoor air via SUMMAs supplied by NYSDOH. 4/16/14-Vought-Sent email update to Rich Clifford (richc@castle.com) as per his prior telephone

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

request. 6/16/14-Vought-Called and spoke to NYSDOH Hughes and in order to confirm whether odor issues persisted, Vought called and spoke to Liebhaber. Liebhaber noted that with respect to odors that lately its been okay and vapors only appeared once in a while and agreed to spill closure and that if vapors arose again, he would notify Vought and spill would be reopened upon confirmation by DEC. Liebhaber and Vought discussed fact that cleanup of minor spill by fill port may have addresses possible petroleum odors. Liebhaber had no objections to closure of the spill and Vought explained FOIL process in case Liebhaber wanted copy of reports and files. 6/17/14-Vought-Reviewed Remedial Action Report(RAR) from Crawford Environmental dated May 2014. Added report to D2. RAR included sections on site description and background, geography, geology, site history, site remediation activities, soil characterization methods, groundwater characterization methods, soil quality, groundwater quality and conclusions/recommendations. Spill amount was estimated at 70-110 gallons and RAR noted overlfow occurred due to a malfunctioning petrometer . Riteway excavated approximately 15 55-gallon drums of soil and epoxied part of the floor in tank room and impacted file storage room. Crawford mobilized to site and installed three test pits in file room, tank room and rear alley way and also used services of structural engineer to provide guidance. A total of 203 tons of soil was removed. Groundwater sampling was not performed onsite through the duration of remedial activities as groundwater was not encountered. Crawford acid-etched the floor in the tank room and file storage room and then applied two coats of epoxy. Report also contains summary of PID results from PID surveys. Disposal manifests also included in RAR. Four borings performed in file storage room and two borings were performed in tank room. Soil analyses from borings in tank room showed up to: 10,400ppb xylene(SB5). Soil analyses from borings in file storage room showed up to: 23,000ppb xylene(SB3), 3600ppb ethylbenzene(SB3). Soil analyses from endpoint samples from rear alley excavation show up to: 1900ppb ethybenzene(A-11), 20,000ppb xylene(A-11). Professional cleaning of offices occurred on 6/18/13. Report concludes that the mass of contaminated soil that could have been removed without causing a structural concern onsite was removed. and requested spill closure. 6/18/14-Vought-Spill closed due: 1)no further vapor complaints 2)removal of 203 tons of soil from site 3)unfeasibility to reach Unrestricted SCO's as per CP51 Guidance as it is currently neither cost effective or implementable to remove soil contamination under a structural building support or structural walls 4)relocation of vent pipe to front of building adjacent to fill port making an future overfill of similar magnitude highly unlikely by same cause 5)encapsulation of replaced indoor concrete with epoxy reducing possibility of future odor concerns 6)two NYCDOH site visits noting all indoor air readings to be acceptable as per NYCDOH 7)Concurrence on closure with NYSDOH Hughes as noted above. Spill closed by Vought and Vought drafted Spill Closure letter and will send to all parties upon confirmation that they will be sending digital version of RAP for addition to DEC D2 files. Spill closure letter added to D2 and Vought sent email to Herrygers that Vought reviewed RAR and spill was closed and as soon as Vought received notification that CD with RAR was in mail, that Vought will send Spill Closure letter. 6/18/14-Vought-Received digital copy of RAR and added to D2 and sent Spill closure via email to all parties and via US mail to addressees. Vought sent email to all parties that Gentlemen, I spoke with Michael

OVERFILL AND SPILL IN REAR YARD (Continued) **S113405881**

Liebhaber (copied above) on 6/16 and he noted that with respect to odors, that lately it's been okay and vapors only appeared once in a while . Mike also greed to closure of the spill. We discussed that if the odors arose again, he would notify DEC and the spill may be reopened upon confirmation by DEC. We also discussed that the cleanup of the minor spill by the fill port may have addressed possible petroleum odors in the front of the office around the utility closet. I also informed him of the FOIL (Freedom of Information Law) process in case he wishes to obtain a copy of the Remedial Action Report and file from DEC.I have also reviewed the RAR report as well and have no objections and as such the Department's standardized closure letter is attached below. Originals of the letter are in the mail to G&D Petroleum and Mr. Bildirici as well.Thanks everyone for their work as well as patience on this spill and as always feel free to get back to me if you have any questions or concerns. "

DEC Memo:	"11/29/16-Vought-See also closed spill 1507219 at 152 East 87th Street for more information. The following notes copied from closed spill 1507219: 10/9/15-Vought-Duty desk officer during day spill was received. Vought called Flemming Lee Shue Daniel Dirocco (Ph:212-675-3225 email: daniel@flemingLeeShue) to get more information on spill and left number with receptionist for him to return call. Vought looked and no Spills or PBS records for site. Vought received callback from and spoke to Daniel Dirocco and he received a call from his client with regards to degraded #2 fuel oil seeping into an excavation in the basement being performed as part of the redevelopment of the site from a parking garage to residential towers. They were installing new foundation supports (called rakers) in the northwest side of the building and degraded #2 fuel oil (black in color and not viscous) came in via the water table at 2'bg (and bedrock is at 5'bg). No PID readings were noted and absorbent pads and socks were put along the excavation perimeter. The foundation supports are almost installed and part of it will include brace installation where they can install additional test pits in the area of concern. Site had one AST that was under the sidewalk and had no signs of spills. Dirocco noted that they were going to eventually install a new concrete slab with moisture barrier in the basement and he also noted that they would be able to install a temporary well in the excavation. As per Dirocco excavation is approximately 5'x4'x3'. Dirocco also noted that they would be installing the test pits Tues or Wed of next week and that DEC Zhune would likely be performing a site visit. Dirocco noted that their was another building to the west of the seepage location. Vought sent email to DiRocco that Daniel, It was good to talk to you and here are the requirements and tracking items so far that the Department has with respect to the spill: 1)Owner information from DiRocco for requirement letter. 2)Possible site visit on 10/14 to inspect for possible off-site sources such a building to the west and inspect excavation in site. 10/16/15-Zhune inspected the oil tank in the building at 150 East 87th Street. During the inspection no visual and olfactory oil contamination was

150 EAST 87TH STREET (Continued) **S119028358**

observed. The owner will test the tank. Management company 429 E 52nd Street New York, NY Ann Gregory 212-688-0700 212-688-0706 Jorge (super)(150 East 87th Street) 917-416-1562 Debra (150 East 87th Street) 212-879-5342 11/23/15-Debra called to say they are in the process to test the tank at 150 East 87th Street. 11/25/16-Vought-Downloaded Closure Report from shared website, uploaded it to D2, and reviewed: Spill Closure Report (FLS DiRocco)-8/31/16. FLS oversaw the removal of #2 fuel oil impacted soils on Site and the collection of confirmatory endpoint soil samples which indicated impacted soils had been remediated to concentrations below the NYSDEC Unrestricted Use Soil Cleanup Objectives. Following confirmation of the removal of impacted soils onsite the Site was capped with a new concrete foundation slab and water/vapor proof liner. During the remediation FLS did not identify a source of the release within the Site boundaries and noted petroleum impacted soils remain along the western property boundary. Based on our observations, the source of the petroleum release emanating from the west/northwest of this Site. Allen Garage LLC has completed the remediation of the impacted soils on their Site and therefore FLS is requesting closure of Spill No. 15-07219. The Site is currently being redeveloped into a 6-story residential building with a full cellar. The property was formerly utilized as a commercial parking garage. Currently the Site is undergoing redevelopment into a residential apartment building. The proposed future use will include mechanical rooms and a parking garage in the cellar level, a residential lobby and additional parking on the ground floor, and residential apartments on the remaining floors. Historically, the Site was used as a parking garage since 1938 through 2015, prior to which it was used as residential dormitories. Sanborn maps indicate that six 550- gallon buried gasoline tanks were located at the parking garage. gasoline USTs were closed in place with concrete during May 1987. The affidavit indicates that petroleum contamination was observed around the UST and an oil-water separator was temporarily installed at the recommendation of the New York State Department of Environmental Conservation (NYSDEC). According to the affidavit, the separator was removed once recovery was complete and a 4-inch well was left in place. An 8-inch manhole cover was observed in the cellar of the building and is likely related to the well described in the affidavit. Since no analytical results are available from the well.... Bedrock was encountered at approximately 2 feet below grade. One groundwater sample was collected from an existing monitoring well, GW-1, which was determined to be described in the 1987 FDNY Affidavit as the 4-inch well left in place following the removal of an oil-water separator installed after closure of six 550-gallon gasoline USTs. Results of the ESA indicated no concentrations of VOCs or SVOCs in soil that exceed the NY Unrestricted Use Soil Cleanup Objectives (UUSCOs). Analytical results from the groundwater sample indicated no exceedances of NYSDEC TOGS 1.1.1, Class GA, Ambient Water Quality Standards (TOGS) with the exception of benzene. Site investigations have identified an immeasurable layer of light non-aqueous phase liquid (LNAPL) present within the small excavation pits along the western Site boundary. The largest amount of LNAPL was encountered along the western wall approximately 40 feet south of the northern property boundary and the former site AST. A sample of the LNAPL was collected by FLS on October 9, 2015 and transported to Accutest Laboratories in Massachusetts for forensic fingerprint analysis to determine, to the

150 EAST 87TH STREET (Continued) **S119028358**

extent possible, the type of petroleum product, level of degradation, and estimated age of release. The sample was also analyzed for specific gravity. The results of the forensic analysis indicate that the LNAPL is likely highly degraded distillate fuel oil that was released into the environment more than 20 years ago. According to the laboratory report the LNAPL may represent No. 2 fuel oil with asphalt or bitumen or a No. 4 or No. 6 fuel oil blended with distillate fuels. Based on the field investigation, the source of LNAPL is not from this Site and likely originates offsite to the west of the property approximately 50 feet south of the AST as noted by the heavy volume of LNAPL that accumulated in this area. Interim remedial measures, described in the NYSDEC approved November 2015 RAWP, have been implemented at the Site to manage the LNAPL including product recovery via placement of absorbent pads and booms. The absorbent pads and booms are replaced regularly for continuous recovery. Local dewatering of the existing excavation pits was required to proceed with installation of support of foundation elements as part of redevelopment and to remove impacted soil. A dewatering treatment system was specified and setup at the Site in order to properly collect any LNAPL from the groundwater prior to discharging to the municipal sewer. Post-excavation endpoint soil samples were collected from the sidewall and base of the excavation in the northwest corner. Bedrock was encountered at 2.5-3 feet below grade and groundwater was not present about the bedrock interface. The inactive gasoline USTs encountered in the eastern portion of the Site were removed from the Site by a contractor in accordance with 6 NYCRR 613.9(b). The removal documentation is provided in Appendix E. Soils beneath the tank and in the vicinity of the concrete vault were observed for visual and olfactory evidence of contamination and were screened with a PID. Any impacted soil was excavated for disposal offsite to the extent feasible. Sidewall samples were collected from the tank pit following removal. No samples were collected from below the tank due to the presence of bedrock. Soil analyses show 2550ppb naphthalene in sidewall sample EP-SW(0.5) from foundation adjacent to 150 West 87th Street and where product seepage was observed. Soil analyses from gasoline UST excavation show up to: 2420ppb benzene(SW-S(2.5-3'bg)), 1060ppb toluene(SW-S(2.5-3'bg)), 44,900ppb ethylbenzene(SW-S(2.5-3'bg)), 276,000ppb xylene(SW-S(2.5-3'bg)), and 6940ppb naphthalene. Report also contains specifications for MiraPLY-H Waterproofing Membrane. Notes that it has Tremendous impermeability and excellent resistance to chemicals.. Disposal manifests also included in report. Following confirmation of the completion of the removal of petroleum impacted soils the contractor proceeded with the installation of the building foundation slab and underlying waterproof/vapor membrane. A total of approximately 551 tons of impacted soil were removed from the Site. Soil was likely impacted from product entering the site from an offsite source to the west. Soil was also impacted from the six 550-gallon USTs encountered on the eastern side of the Site. Bedrock was encountered at approximately two feet below grade. Groundwater was not encountered above bedrock post remediation and therefore no groundwater sample was collected. FLS recommends closure of Spill No. 1507219... . 11/29/16-Vought-Called and spoke to property owners representative Deborah Leonard (The MP 1291 Trust Ph:212-879-5342 email:dleonard@perlbinderrealty.com)and she noted that tank tightness test was not performed to date and also noted she did not understand how they could be possible source as her tank was covered. Vought

150 EAST 87TH STREET (Continued) **S119028358**

explained possibility of subsurface transport. Deborah also noted that site was scheduled to convert to natural gas, with tank removal, next Spring and which was delayed until this time due to complications associated with sidewalk and development of next door property. Vought also noted that this spill would be closed and new spill would be opened on 150 East 87th Street and that spill closure would be considered for that spill if tank system at 150 East 87th Street passed system tightness test. Deborah provided the following contact info for the DEC letter: Ms. Muffy Flouret The MP 1291 Trust 429 East 52nd Street New York, NY 10022 11/29/16-Vought-Sent letter to Flouret with cc to Conlon and Leonard requiring performance of full system tank tightness test within one month. Vought emailed letter to Leonard with email that Dear Ms. Leonard, Attached is the Department s letter that we discussed today. An original of the letter is in the US Mail to Ms. Flouret. The Department looks forward to receiving the results of the tightness test results of the entire tank system within one month as per the letter. Thanks. 12/27/16-Vought-Received email from Leonard that Mr. Vought I have mailed the tank test report to the DEC LIC address but I am sending a copy of it to you in this email (2nd attachment) inasmuch as you were my contact on the matter. Thank you for your discussion with me regarding this issue; I hope the enclosed is sufficient to satisfy any concerns regarding 150 East 87th St. (a/k/a 1291 Lexington Avenue, NY, NY.) 12/30/16-Vought-Added tank test report to D2. Test performed by Phil Fazin on 12/15/16 and report shows tight tank & system . Vought provided results to DEC Falvey who reviewed and concurred that tank system was shown to be tight. Spill closed by Vought and closure letter added to D2 and sent to: Ms. Muffy Flouret The MP 1291 Trust 429 East 52nd Street New York, NY 10022 "

Remarks: "Spill opened due to investigation results of Closed Spill 1507219 which showed fuel oil emanating from eastern foundation of this site onto their property as per the Spill Closure Report for Spill 1507219."

Contact Name:	ANTHONY MILANESE
DEC Memo:	"01/02/18-Hiralkumar Patel. 6:08 AM:- spoke with Anthony. he mentioned that approx. 20 gal of #2 oil spilled onto sidewalk during delivery due to bad connection at fill port. spilled material has impacted sidewalk and street along curb. cleanup is in progress. DEC Zhune responded. 1/2/18-Zhune responded to this spill- The building is a 25 floor building with 245 apartments. The building uses dual fuel. The tank is a 5000 gallons tank. The city changed the sidewalk and the street and damaged the fill port at this site. The super ordered 2500 gallons of oil #2 fuel oil. Today at 5;40am East Coast Petroleum Inc (oil Company) tried to do the delivery oil and oil pop up by the damage fill port. East Coast stopped the delivery. Approximately 10 -20 gallons spilled onto the sidewalk, curb and impacted a catch basin located on the corner of 2nd ave. and 86th Street. East Coast is cleaning the spill. They are fixing the fill port. Once they fix the fill port they will be able to have the delivery. Victor Nazareo (super) 212-706-8600 1/4/18-Victor Nazario email-As per your request, here is an update on the oil clean-up process at 240 East 86 street. So far, the company Milro has applied absorbant material to the entire area of the oil spill, including the

APARTMENT BUILDING (Continued) **S121463434**

street curb portion, and have swept it all up. They also came and cleaned the catch basin. They will be returning in a couple of days when it warms up somewhat to do a power wash of the entire area. I also asked Andrew of Milro to send you a copy of the report. He says that he has worked with you in the past, and will be submitting a report directly to you. 1/2/18-Mike email- Milro was contracted to open and two storm drains for the above referenced spill. Milro removed 550 gallons of oil impacted water. Milro was not contracted to clean the sidewalk. Will the NYSDEC require any additional work? Are you performing an additional site inspection? What do we need to close the spill? 1/3/18-Mike email-I spoke with Tom Ryan from Energi yesterday afternoon. Milro has been contracted to clean the sidewalk at the above referenced spill. Once the weather warms from the frigid temperatures Milro will return and degrease and wash the sidewalk. Current temperatures will cause the water being used to freeze and could cause potential slip hazards 1/3/18Mike email-New information has been brought to my attention. The storm drains had concrete bottoms. Milro removed all debris from the storm drains. This work is complete 1/22/18- Victor Nazario email-Milro came today to power wash the sidewalk and the catch basin. 1/24/18- Victor Nazario email-I spoke to Anthony of East Coast. He is in communication with Milro, who completed the cleaning. Milro will be sending you a copy of the report directly. 4/24/18-Andrew Dolan from Milro emailed the spill closure report dated April 24, 2018. The report stated that Milro Associated, Inc. was contacted on January 2, 2018 to respond to a #2 fuel oil spill. The oil spill was caused by a remote fill cap broke during a fuel oil delivery. An approximately 10 gallons of diesel fuel to be released onto the street, two storms drains and concrete sidewalk. Milro installed absorbents to clean the oil impacted street. The storm drains were cleaned and removed of oil impacted materials. the storm drains had concrete bottoms and did not impacted surrounding drains. on January 22, 2018, Milro returned and power washed the concrete sidewalk. the storm drains were observed no additional oil. oil contaminated abosorbents and debris were properly disposed of in accordance with all federal, state and local regulations. A non-hazardous waste manifest is attached. Based on this information this spill is closed. Spill Closed. "

DEC Memo:	"3/1/12 Received call on 2/27/13 from Sal Vona, prospective buyer of the property. Today, I returned his call. He told me that the tank is AST and failed because of the manway gasket. No product escaped. Vault was inspected and no product was found. I told him to submit: 1. Passing ttt report. 2. Failing ttt report. 3. Letter from contractor that repaired tank which explains the reason for failure and stating that no contamination (if that is the case) was found. I told him that Tim Demeo is the case manager, but let him know that he can follow-up with me as needed. Mr. Vona stated that he hopes to have the documentation sent by overnight mail on Monday. bf 3/27/13 AFrischeisen intern TTF letter sent. 4/2/13 TJD File review. 2K FO AST (concrete encased) failed a tank tightness on 2/12/13 - reported as a dry leak, likely associated with a failed manway gasket. Property has a pending property transaction - following failed test the current owner retained Rockaway Fuel Oil Corp. to respond, investigate and repair reported condition. On 2/12/13, the contractor replaced the failed manway gasket and inspected tank system including the performance a new tightness test which reportedly passed (no documentation provided). The prospective purchaser then retained the original tank tester (ATS) to return for a subsequent tightness test on 2/25/13 - tank system passed tightness test. All required closure documentation has been received. No further action is required. "

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was ROMMEL C 04/12/04 TRANSFERRED FROM TIBBE TO ROMMEL. 3/28/05 - also see spill 0000253. - KST September 2005. Persons at facility refused to talk to DEC. Sent a letter on 9/30/05 requesting information. No response received as of January 2006. Albany review - sxdewes 1/29/07 - Austin - Transferred from Albany assignment to Patel in R-2 office for further work - end 06/04/07-Hiralkumar Patel. another spill reported at same site. spill #: 0000253. callers remarks were: RETIRED TANKS REMOVED AND SAMPLES TAKEN SHOWED EVIDENCE OF SOIL CONTAMINATION UNDER TANKS - CALLER IS ATTORNEY REPRESENTING OWNER visited site. site occupied by Uptown Motors, Ltd, a garage. Andrew Buczek is a business owner. met operator Mahasana DeSilva. as per Mr. DeSilva, site has no underground tanks. Mr. DeSilva works at this site for 18 years and doesn't remember any tanks removed from ground. found four 275 gal ASTs in basement. two ASTs used for used oil and two for fresh motor oil. found oil spilled around ASTs. asked Mr. DeSilva to clean area around these ASTs. business owner is out of country and will be back next week. asked Mr. DeSilva to ask Andrew to call with property owner's contact information as both property

UPTOWN MOTORS LIMITED (Continued) **S104194995**

owner and business owner are responsible for any contamination. Andrew Buczek General Manager Uptown Motors, Ltd. 327 East 84th Street New York, NY 10028 Ph. (212) 535-0520 Fax (212) 861-3975 06/12/07-Hiralkumar Patel. visited site again. met Mr. Buczek. he is leasee and ownes only four aboveground tanks. Mr. Buczek mentioned that previous gasoline tanks were owned by property owner and they were removed in 2000. Mr. Buczek is doing business for about 25 years at the site. previous gasoline tanks were located in basement next to basement lift area. 06/13/07-Hiralkumar Patel. left message for Ms. Heinz, a property owner/manager. Cynthia Heinz 327 E 84th Street Inc. 878 High Pointe Circle Minneola, FL 34715 Ph. (352) 241-8873 Fax (352) 241-8874 received call from Ms. Heinz. she has report and will mail me. 06/20/07-Hiralkumar Patel. received report from Ms. Heinz. abstract: - depth of groundwater at the site is approx. 18 ft bg - removed two 550 gal gasoline USTs - no evidence of leakage was found after first tank (north tank - #1) removal, but exterior of the second tank (south tank - #2) was found to be rusted and pitted - six endpoint samples were collected from excavation area (one from each sidewall, one bottom sample under tank #1 and one bottom sample under tank #2) - as a result of the bedrock being encountered the bottom sample could only be obtained approx. one ft below the former tank base (almost at bedrock which is about one ft below tank bottom) - dimensions of the final excavation was approx. 15 ft*12 ft and depth was 4 ft - found contamination in bottom endpoint sample under South Tank (tank #2) ----------South Tank Bottom Toluene----------50,900 Xylene----------2,585 06/21/07-Hiralkumar Patel. sent letter to Ms. Heinz requiring groundwater sample at previous southern tank location. letter faxed to Ms. Heinz and Mr. Buczek. 06/29/07-Hiralkumar Patel. received call from Mike Fontana from Aquatek, who has hired by Ms. Heinz for required work. he is contacting different companies for drill rig which can fit at site. he requested deadline extension. told Mike to provide updates on regular basis and the department can extends a deadline. Mike Fontana Aquatek Ph. (973) 716-9110 07/23/07-Hiralkumar Patel. received message from Mike from Aquatek. he is going to meet driller at site on 07/24/07 at 11 am. 08/21/07-Hiralkumar Patel. received message from Mike. they will do boring, today at tank location. 08/23/07-Hiralkumar Patel. received email from Mike. they drilled one boring and took soil ang groundwater samples. will send report once get anlaytical data from lab. 10/23/07-Hiralkumar Patel. received report from Aquatek. abstract: - installed one boring to depth of 6 ft below basement floor where found refusal - found groundwater at 4.5 ft below basement floor - took soil sample at 5.5 to 6 ft below basment floor (means below groundwater table) - took groundwater sample - no contamination found in soil or groundwater sample report is missing PID values during boring. from previous tank closure report, contamination was found in bottom endpoint sample under tank #2 (southern tank) and excavation was to depth of 4 ft bg. spoke with Mike. during boring, they did not found any contamination in soil or any high PID. Mike mentioned that he found fill material to depth of 5.5 ft and there was only six inches left above bedrock with native material. no odor was found during boring/sampling. based on available report, case closed. NFA sent to Ms. Heinz. letter faxed to Ms. Heinz and Andrew."

Spiller Address:	152 EAST 87TH STREET
Spiller Company:	999
Contact Name:	DANIEL DIROCCO
DEC Memo:	"10/9/15-Vought-Duty desk officer during day spill was received. Vought called Flemming Lee Shue Daniel Dirocco (Ph:212-675-3225

FORMER COMMERCIAL/FUTURE RESIDENTIAL BUILDING (Continued) **S118262346**

email: daniel@flemingLeeShue) to get more information on spill and left number with receptionist for him to return call. Vought looked and no Spills or PBS records for site. Vought received callback from and spoke to Daniel Dirocco and he received a call from his client with regards to degraded #2 fuel oil seeping into an excavation in the basement being performed as part of the redevelopment of the site from a parking garage to residential towers. They were installing new foundation supports (called rakers) in the northwest side of the building and degraded #2 fuel oil (black in color and not viscous) came in via the water table at 2'bg (and bedrock is at 5'bg). No PID readings were noted and absorbent pads and socks were put along the excavation perimeter. The foundation supports are almost installed and part of it will include brace installation where they can install additional test pits in the area of concern. Site had one AST that was under the sidewalk and had no signs of spills. Dirocco noted that they were going to eventually install a new concrete slab with moisture barrier in the basement and he also noted that they would be able to install a temporary well in the excavation. As per Dirocco excavation is approximately 5'x4'x3'. Dirocco also noted that they would be installing the test pits Tues or Wed of next week and that DEC Zhune would likely be performing a site visit. Dirocco noted that their was another building to the west of the seepage location. Vought sent email to DiRocco that Daniel, It was good to talk to you and here are the requirements and tracking items so far that the Department has with respect to the spill: 1)Owner information from DiRocco for requirement letter. 2)Possible site visit on 10/14 to inspect for possible off-site sources such a building to the west and inspect excavation in site. 3)Collection of soil sidewall endpoints from test pits and bottom groundwater samples as water in excavation. 4)Installation of temporary well in excavation. 5)Submission of moisture mitigation efforts as site is being redeveloped (submission of development plans) 6)Delineation of contamination 7)IRM product recovery from excavation. Once you send the owners information, I will formalize the above in a letter and upon sending that letter, will transfer the case to Veronica. Thanks . 10/13/15-Vought-Received email from DiRocco dated 10/12 that Jeff/Veronica, We instructed the contractor to hold off working in the corner of the Site where the floating product was appearing until we have a had a chance to discuss our options. In the meantime we have placed absorbent pads and socks in the open holes with floating product. Please let us now the status of the Spills letter and when you would like to inspect the Site. Thank you. Vought sent reply to DiRocco with cc to Zhune that Daniel, Apologies for the delayed response. Is it is possible for Veronica to come out to the site instead on Thurs 10/15 at 11am? Also please provide us the owner s information so that we can send out the Spills letter. Thanks. Vought received reply from DiRocco that owners address was in previous email. Vought noted another email sent with note that owners address is: Allan Garage LLC 441 Lexington Ave, Ste 805 New York, NY 10017 Attention: Christopher LaPunzina 10/14/15-Vought-Sent letter via email and US Mail to LaPunzina with cc to Zhune and DiRocoo with one month deadline requiring 1)Collection of soil sidewall and bottom groundwater endpoint samples from excavation of proposed building 2)Submission of development plans for site 3)Implementation of Interim Remedial Measures to recover free product from excavation. Vought also added letter to DecDocs. Vought noted in email that Daniel, Attached you will find the Department s requirement letter, an original of which is in the

FORMER COMMERCIAL/FUTURE RESIDENTIAL BUILDING (Continued) **S118262346**

mail to Mr. LaPunzina. Looking forward so speaking with you after Veronica performs the site visit tomorrow at 11am with yourself and/or Sasha. Thanks. Vought added letter to DecDocs. 10/14/15-Vought-Looked at NYC City Map and property to northwest is 150 East 87th Street (aka 1291 Lexington Avenue, as per NYCDOB online records). Vought searched PBS and Spills database for both addresses and no Registrations or spills noted at this address. Vought provided information and spill report to DEC Zhune for her site visit scheduled for 10/15 at 11am. 10/15/15-Zhune visited the site met Sasha Rothenberg and from Fleming Lee Shue and Mr.Jeremy Sinclair the project manager for CMA Construction (the general contractor for the development). During my inpection I observed half of an AST sitting on soil in the basement. As per Mr. Sinclair the tank had been out of service for about 20 years. In 1985 the building converted to gas. I also observed three pits adjacent to the tank, two of this pits have oil. There are absorvents pads in the pits that contained oil. As per Sasha they are using absorbent pads to remove the oil. They will do dewatering to remove the oil. They will use an oil/water separator to separate oil from water, they will discharge the water to the sewer but they will get all the DEP's permits. I searched for the fill port but I could not find it. I went to the next door building located at 150 East 87th Street. Mr. Cahal (Owner)-212-879-5341 said they have a 1500-gallon UST (Tank encased in concrete with weepholes). The tank uses fuel oil #2. I could not inspect this site because the tank room was looked and the owner had not the keys. The owner asked me to come back to tomorrow 10/15/15 for the inspection. 10/15/15- DEC-Jeff Vought, DEC-Veronica Zhune and Daniel Dirocco and Sasha Rothenberg from Fleming and Lee Shue had a teleconference to discuss options after Veronica inspection of the site and the adjacent site to the west. Mr. Dirocco said a letter of how to proceed will be sent to the Department within two weeks. 10/16/15-Zhune inspected the oil tank in the building at 150 East 87th Street. During the inspection no visual and olfactory oil contamination was observed. The owner will test the tank. Management company 429 E 52nd Street New York, NY Ann Gregory 212-688-0700 212-688-0706 Jorge (super)(150 East 87th Street) 917-416-1562 Debra (150 East 87th Street) 212-879-5342 11/23/15-Debra called to say they are in the process to test the tank at 150 East 87th Street. 12/3/15-Vought-Email from FLS DiRocco to DEC Cynthia Freedman with attached PBS Registration. Email noted Cynthia,Attached is a scan of the PBS registration form including a cover letter and copy of the check for $300 to cover fees. A hard copy with the check has been sent by mail. Note these tanks were inactive and were discovered during redevelopment of the Site and are being removed and documented under the existing Spill Case number, 15-07219.Let me know if you have any questions. 11/25/16-Vought-Received phone message from FLS Maricate Conlon (Ph:212-675-3225 email:maricate2flemingleeshue.com) regarding closure report status. File review to date by Vought: Email from FLS DiRocco to DEC Zhune-5/17/16. Email that Veronica, On Friday May 13, 2016 we removed and loaded out of the soils impacted by the petroleum coming from offsite. We removed a total of 11 trucks and we collected the end point samples. The excavation extended down to bedrock which is very shallow at 1.5 to 2 feet in this area. Once they have constructed the building slab with waterproofing we will provide NYSDEC with the Spill Closure Report to document the remediation. Any questions give myself or Mari Cate a call. Email from FLS Maricate Conlon to DEC Zhune-6/20/16. Email that Good afternoon Veronica,As an update, on

FORMER COMMERCIAL/FUTURE RESIDENTIAL BUILDING (Continued) **S118262346**

Wednesday June 8th, 2016 FLS collected an additional endpoint sample from the northwest portion of the Site to delineate the area of impact from the offsite petroleum. All soils impacted from the petroleum coming from offsite were removed and the excavation was taken to bedrock. Results of the soil endpoint samples are pending. As work on Site continues, FLS will collect additional sidewall samples from the former tank location to delineate any remaining impacts in that area. FLS will provide NYSDEC with a Spill Closure Report upon receipt of endpoint sample results and completion of building slab construction and waterproofing installation. Please let us know if you have any questions. Email from FLS Conlon to DEC Zhune-8/31/16. Email that Hello Veronica,The Spill Closure Report documenting the remedial activities conducted at 152 East 87th Street, New York, New York can be accessed at the following link. Fleming Lee-Shue, Inc. provided oversight during the remediation and requests the closure of Spill No. 15-07219. https://www.dropbox.com/sh/q9k5awbuqvi237c/AAA4eR5EJM9WhdY3nwBCmySga?dl=0. Please let us know if you have any questions or comments while reviewing this report.Thank you. Email from FLS Conlon to DEC Zhune-9/13/16. Email that Good afternoon Veronica,I just wanted to confirm you received the closure report for Spill No. 15-07219 sent over at the end of last month. Please let us know if you need anything additional for your review. 11/25/16-Vought-Downloaded Closure Report from shared website, uploaded it to D2, and reviewed: Spill Closure Report (FLS DiRocco)-8/31/16. FLS oversaw the removal of #2 fuel oil impacted soils on Site and the collection of confirmatory endpoint soil samples which indicated impacted soils had been remediated to concentrations below the NYSDEC Unrestricted Use Soil Cleanup Objectives. Following confirmation of the removal of impacted soils onsite the Site was capped with a new concrete foundation slab and water/vapor proof liner. During the remediation FLS did not identify a source of the release within the Site boundaries and noted petroleum impacted soils remain along the western property boundary. Based on our observations, the source of the petroleum release emanating from the west/northwest of this Site. Allen Garage LLC has completed the remediation of the impacted soils on their Site and therefore FLS is requesting closure of Spill No. 15-07219. The Site is currently being redeveloped into a 6-story residential building with a full cellar. The property was formerly utilized as a commercial parking garage. Currently the Site is undergoing redevelopment into a residential apartment building. The proposed future use will include mechanical rooms and a parking garage in the cellar level, a residential lobby and additional parking on the ground floor, and residential apartments on the remaining floors. Historically, the Site was used as a parking garage since 1938 through 2015, prior to which it was used as residential dormitories. Sanborn maps indicate that six 550- gallon buried gasoline tanks were located at the parking garage. gasoline USTs were closed in place with concrete during May 1987. The affidavit indicates that petroleum contamination was observed around the UST and an oil-water separator was temporarily installed at the recommendation of the New York State Department of Environmental Conservation (NYSDEC). According to the affidavit, the separator was removed once recovery was complete and a 4-inch well was left in place. An 8-inch manhole cover was observed in the cellar of the building and is likely related to the well described in the affidavit. Since no analytical results are available

FORMER COMMERCIAL/FUTURE RESIDENTIAL BUILDING (Continued) **S118262346**

from the well.... Bedrock was encountered at approximately 2 feet below grade. One groundwater sample was collected from an existing monitoring well, GW-1, which was determined to be described in the 1987 FDNY Affidavit as the 4-inch well left in place following the removal of an oil-water separator installed after closure of six 550-gallon gasoline USTs. Results of the ESA indicated no concentrations of VOCs or SVOCs in soil that exceed the NY Unrestricted Use Soil Cleanup Objectives (UUSCOs). Analytical results from the groundwater sample indicated no exceedances of NYSDEC TOGS 1.1.1, Class GA, Ambient Water Quality Standards (TOGS) with the exception of benzene. Site investigations have identified an immeasurable layer of light non-aqueous phase liquid (LNAPL) present within the small excavation pits along the western Site boundary. The largest amount of LNAPL was encountered along the western wall approximately 40 feet south of the northern property boundary and the former site AST. A sample of the LNAPL was collected by FLS on October 9, 2015 and transported to Accutest Laboratories in Massachusetts for forensic fingerprint analysis to determine, to the extent possible, the type of petroleum product, level of degradation, and estimated age of release. The sample was also analyzed for specific gravity. The results of the forensic analysis indicate that the LNAPL is likely highly degraded distillate fuel oil that was released into the environment more than 20 years ago. According to the laboratory report the LNAPL may represent No. 2 fuel oil with asphalt or bitumen or a No. 4 or No. 6 fuel oil blended with distillate fuels. Based on the field investigation, the source of LNAPL is not from this Site and likely originates offsite to the west of the property approximately 50 feet south of the AST as noted by the heavy volume of LNAPL that accumulated in this area. Interim remedial measures, described in the NYSDEC approved November 2015 RAWP, have been implemented at the Site to manage the LNAPL including product recovery via placement of absorbent pads and booms. The absorbent pads and booms are replaced regularly for continuous recovery. Local dewatering of the existing excavation pits was required to proceed with installation of support of foundation elements as part of redevelopment and to remove impacted soil. A dewatering treatment system was specified and setup at the Site in order to properly collect any LNAPL from the groundwater prior to discharging to the municipal sewer. Post-excavation endpoint soil samples were collected from the sidewall and base of the excavation in the northwest corner. Bedrock was encountered at 2.5-3 feet below grade and groundwater was not present about the bedrock interface. The inactive gasoline USTs encountered in the eastern portion of the Site were removed from the Site by a contractor in accordance with 6 NYCRR 613.9(b). The removal documentation is provided in Appendix E. Soils beneath the tank and in the vicinity of the concrete vault were observed for visual and olfactory evidence of contamination and were screened with a PID. Any impacted soil was excavated for disposal offsite to the extent feasible. Sidewall samples were collected from the tank pit following removal. No samples were collected from below the tank due to the presence of bedrock. Soil analyses show 2550ppb naphthalene in sidewall sample EP-SW(0.5) from foundation adjacent to 150 West 87th Street and where product seepage was observed. Soil analyses from gasoline UST excavation show up to: 2420ppb benzene(SW-S(2.5-3'bg)), 1060ppb toluene(SW-S(2.5-3'bg)), 44,900ppb ethylbenzene(SW-S(2.5-3'bg)), 276,000ppb xylene(SW-S(2.5-3'bg)), and 6940ppb naphthalene. Report also contains specifications for

FORMER COMMERCIAL/FUTURE RESIDENTIAL BUILDING (Continued) **S118262346**

MiraPLY-H Waterproofing Membrane. Notes that it has Tremendous impermeability and excellent resistance to chemicals.. Disposal manifests also included in report. Following confirmation of the completion of the removal of petroleum impacted soils the contractor proceeded with the installation of the building foundation slab and underlying waterproof/vapor membrane. A total of approximately 551 tons of impacted soil were removed from the Site. Soil was likely impacted from product entering the site from an offsite source to the west. Soil was also impacted from the six 550-gallon USTs encountered on the eastern side of the Site. Bedrock was encountered at approximately two feet below grade. Groundwater was not encountered above bedrock post remediation and therefore no groundwater sample was collected. FLS recommends closure of Spill No. 1507219... . 11/29/16-Vought-Called and spoke to property owners representative Deborah Leonard (The MP 1291 Trust Ph:212-879-5342 email:dleonard@perlbinderrealty.com)and she noted that tank tightness test was not performed to date and also noted she did not understand how they could be possible source as her tank was covered. Vought explained possibility of subsurface transport. Deborah also noted that site was scheduled to convert to natural gas, with tank removal, next Spring and which was delayed until this time due to complications associated with sidewalk and development of next door property. Vought also noted that this spill would be closed and new spill would be opened on 150 East 87th Street and that spill closure would be considered for that spill if tank system at 150 East 87th Street passed system tightness test. Debra provided the following contact info for the DEC letter: Ms. Muffy Flouret The MP 1291 Trust 429 East 52nd Street New York, NY 10022 11/29/16-Vought-This spill administratively closed by Vought due to removal of contaminated soil to bedrock, future development of site with basement parking garage and mechanical spaces (which mitigates need for SSDS and ventilation as per prior guidance from NYSDOH), no groundwater at bedrock interface, and removal of 551 tons of contaminated soil to the extent feasible, and opening of new spill for possible source of western sidewall seepage adjacent to 150 East 87th Street. Vought drafted, added to D2, and sent closure letter to Allan Parking with cc to FLS Conlon. See open Spill Number at 150 East 87th Street for more information. Vought sent closure letter to FLS Conlon/DiRocco/Fleming with email that Mari Cate,Thanks again for your patience and the Department s Spill Closure letter is attached above and the original is in the US Mail to Allan Garage LLC. I spoke with a representative of 150 East 87th Street today and they have not yet performed a tightness test of their tank system as per the Department s requirements. I informed them that I will be opening up a spill on their property and sending them a formal requirement letter to have their tank system tested. I will copy you on that letter as well. "

Remarks: "soil appears to be contaminated with old home heating fuel, clean up is pending."

Updated By: BXANDERS
Site Description: "Location: The site is located at 1299 First Avenue in the Borough of New York, New York. It is located on the western quadrant of the intersection of East 70th Street and 1st Avenue. The site is surrounded by residential apartment buildings to the north and west with mixed commercial/ residential buildings to the south and east. The Site is designated as Block 1444, Lot 30. Site Features: This 1957-square feet site is developed with a 4-story mixed use commercial/ residential building. The first floor is used as a convenience store with the basement used as storage. The site is surrounded by residential and commercial buildings. Current Zoning/ Uses: The site has a zoning code of C2-8, which allows mixed residential and commercial usage. The current use of the site conforms to the zoning code. Historical Uses: Former Nu Brite Cleaners, a dry cleaning facility (EPA Generator ID NYD981075039), occupied the commercial space. The former dry cleaning operations may have contributed to the known contamination found in groundwater. Site Geology and Hydrogeology: The site?s elevation is approximately 50 feet above mean sea level. The vicinity of the Site is characterized by metamorphosed sequences of bedrock overlain by Pleistocene-aged glacial till deposits. The regional groundwater flow direction in the vicinity of the Site is toward the east-northeast, in the direction of the East River. The depth to water at the Site ranges between 15 and 16 feet below grade."
Env Problem: "Nature and Extent of Contamination: Based on the investigations conducted to date, chlorinated solvents are known to present in the subsurface. These contaminants are impacting soil and groundwater. Previous investigations include two rounds of soil sampling events in November 2007 and August 20008 in addition to two Groundwater Investigation Reports dated May 2010 and July 2010. Soi l- Chlorinated volatile organic compounds (cVOCs) such as tetrachloroethene (PCE) and trichloroethene (TCE) were detected in groundwater. PCE at 12,000 ppm was detected on site at SP-2. TCE at 3.1 ppm, PCE at 1,000 ppm were detected on site at SP-5. These concentrations exceeded applicable standards. The presence of chlorinated VOCs in soil is most likely due to former operation of the dry cleaner. Groundwater - cVOCs such as PCE, TCE, cis1,2-dichloroethene (cis 1,2-DCE), and vinyl chloride (VC) were detected in groundwater. TCE at 120 ppb, PCE at 3,300 ppb, and cis 1,2-DCE at 140 ppb were detected in on-site MW-1 exceeding applicable standards. In addition, vinyl chloride was detected in

FORMER NU-BRITE CLEANERS (Continued) **S113916767**

cross/downgradient, off-site well MW-4 exceeding applicable standards. MW-3 was dry during the sampling event. The presence of chlorinated VOCs in groundwater is most likely due to former operation of the dry cleaner. Significant Threat: NYSDEC has determined that this site poses a significant threat to the environment."

Record Updated Date: 07/09/2018
Update By: JHOCONNE
Site Description: "Location: The site is located in a commercial and residential area of the Upper East Side section of the Borough of Manhattan. The site is an approximate 1,957 square foot (.0449 acre) rectangular parcel making up the entirety of a tax lot identified on New York City tax maps as Block 1444, Lot 30. Block 1444 is bound to the north by E 70th Street, to the east by 1st Avenue, to the south by 69th Street, and to the west by 2nd Avenue. South and west adjacent properties include mixed use commercial and residential buildings. To the east is 1st Avenue beyond which are also commercial and residential buildings. To the north is E 70th Street beyond which is a senior center. Site Features: The site is currently developed with a 4-story commercial/residential building (measuring approximately 25 x 65). The basement depth is approximately six feet (ft) below sidewalk grade (bsg) and is divided into two sections. Two 275-gallon above ground storage tanks (ASTs) containing number two fuel oil are located in the western section of the basement. Within the footprint of the site is a separate one-story building (measuring approximately 12 x 25) located west of the main site building. There is a small (10 x 20) space located beneath the one-story building that contains a boiler thought to service both on-site buildings. Current Zoning and Land Use: The Site is currently zoned C2-8 (commercial districts that are predominantly residential). The first floor of the main building is utilized as a convenience store and pharmacy while the basement is used for storage. Residential units occupy floors two through four. The separate 1-story building is occupied by a surgical and brace supplier. Surrounding properties include mixed use commercial and residential buildings to the south, west, and east; and a senior center to the north. Past Use of the Site: Historic Sanborn Maps indicate that a drycleaner was present on-site between 1976 and 1996. City Directory search records list a drycleaner (NU Brite Cleaners) in operation at the site between 1950 and 1988. Nu Brite was identified as a Resource Conservation Recovery Act (RCRA) Non-Generator of hazardous wastes between 1999 and 2007. Between 2000 and 2005, the rear portion of the commercial space was leased to Global Entrepreneurship Inc., which provided dry cleaning services with off-site dry cleaning operations. It is unclear if the rear portion of the commercial space refers to the small one-story building located west of the main building or to another section of the main commercial space. The site was utilized as an auto body repair shop from 1927 to 1942. Site Geology and Hydrogeology: The site is fairly level and located approximately 50 feet above sea level (NGVD 1988). The shallow subsurface of the site consists of a mixture of fine to medium sands and silts with medium, sub angular gravel. Minimal debris (concrete and brick) was encountered during performance of a Remedial Investigation (RI). Native soils include occasional sandy clay lenses that are present around 15 to 20 feet below sidewalk grade (ft bsg) along with weathered gravel, quartz and schist. Bedrock geology in the vicinity of the Site is characterized as the Hartland Formation (Middle Ordovician to Lower Cambrian). The Hartland formation consists of interbedded units of fine grained quartz feldspar, fine to coarse grained quartzofeldspathic, muscovite biotite garnet schist, and quartz biotite hornblend amphibolite. Depth to bedrock was encountered at approximately 29 ft bsg. Groundwater is typically encountered approximately 15 to 20 feet below ground surface. Regional groundwater flow is east northeast

FORMER NU-BRITE CLEANERS (Continued) **S113916767**

	towards the East River which located approximately 1,500 feet to the east."
Env Problem:	"Nature and Extent of Contamination: Based on the investigations conducted to date, the primary contaminants of concern at the site are chlorinated solvents (PCE, TCE) and its breakdown products. on site oil, groundwater and soil vapor are impacted by these contaminants. Soil - PCE and its breakdown products were detected in soil at concentration exceeding the unrestricted SCO with maximum PCE concentration of 12,000 parts per million (ppm). TCE was detected at a maximum concentration of 3.1 ppm Groundwater - PCE and its breakdown products were detected in groundwater at concentration exceeding the groundwater standard with a maximum concentration of PCE at 5,500 parts per billion (ppb), TCE at a maximum concentration of 590 ppb, and cis 1,2-DCE at a maximum concentration of 3,000 ppb, VC at maximum concentration of 1,200 ppb. Soil Vapor - PCE and TCE were detected in sub-slab soil vapor samples both on and off-site with concentrations up to 773,000 ug/m3 and 19,300 ug/m3, respectively; PCE and TCE were detected in on-site and off-site soil vapor samples with maximum concentrations of 4,630 ug/m3, and 2,710 ug/m3, respectively; PCE was detected in indoor air at maximum concentrations of 66 ug/m3 and TCE was at 1.7 ug/m3. "
Health Problem:	"Direct contact with contaminants in the soil is unlikely because the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in soil vapor (air spaces within the soil) may move into overlying buildings and affect the indoor air quality. This process which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Actions have been taken on-site to address potential exposures associated with soil vapor intrusion. Additional investigation is needed to evaluate the potential for soil vapor intrusion off-site."

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was M TIBBE 07/21/2005 1020 hrs: Called Ralph Ortiz, superintendent of building at 400 East 71st, referred to Lisa Bluttal at Transworld Equity (212-355-4900). Lisa will check files regarding cleanup of spill. A.L Eastmond (Carlos/Neal) apparently did the work to close the original 20k buried tank. NYC building permit indicates buried oil tank was replaced with an above-ground storage tank, also changed from #6 to #2 fuel oil, date 05/14/1991. PBS database (2-403458) indicates 05/01/1991 installation of a 5,800-gallon above ground tank for #4 oil. The 20k tank was closed in place. 08/18/2006: No additional written information is available, however conversations with owners indicate that spill was minor and cleaned up and the new tank has been in service with no difficulties. Given the age of the spill and its location in a parking garage, potential environmental impact is considered to be low. Spill should be closed. M.Brand NYSDEC DER Albany. 10/2/09 - Austin - Spill transferred from Albany staff to Ahmed, for further investigation to see if there is concurrance on closure for this spill - end 10/27/11 - Austin - Spill Transferred from Ahmed to Vought - end 1/6/12-Vought-Received call from Jocelyn Finney (Ph:631-753-0333) who noted that she was looking to get spill closed as quickly as possible and was inquiring about further DEC requirements. As per notes above site has a 20,000-gallon #6 fuel oil UST that was closed in place and replaced with a 5800-gallon #2 fuel oil UST in 1991. PERSONAL NOTE: Vought disagrees with notes of DEC Brand above that spill should be closed given the age of the spill and its location in a parking garage . Degradation of heavy #6 fuel oil cannot be confirmed as well as location of UST in a parking garage may impact other residences given close proximity

LEAKING UST ABANDONED IN PLACE (Continued) **S104275599**

in Manhattan of other residences and basements. As such DEC requires investigation of the original 20,000-gallon #6 fuel oil UST. PBS registation notes former 20,000-gallon UST was diesel. Caller Remarks note that OIL LEAKING FROM TANK TO AREA BELOW . Vought called Finney and noted below reqiurements. 1/12/12-Vought-Conference call with owner Lisa Bluttal and owners tank rep (Chris Burge-Total tank Ph:917-841-3373). Vought explained requirements and Bluttal will submit investigation work plan via email to Vought for approval. 1/25/12-Vought-Received Subsurface Investigation Work Plan from Miller (Nick Marrone Ph:631-369-4900 Fax:631-369-4909) dated 1/23/12. Miller proposes to install four soil borings in the vicinity of the former 20K underground storage tank... . Borings will be installed via Geoprobe until groundwater or refusal is encountered. The sample with the highest PID reading will be sent to lab and an ISR will be submitted to the DEC. It is our understanding that additional borings/monitoring wells and remedial action may be required upon review of the field and laboratory data by your office. Proposal was sent from: Ms. Lisa Bluttal Manocherian Brothers 150 East 58th Street 28th Floor New York, NY 10155-2899 Ph: (212)355-4900 Fax: (212)355-3066 Vought sent review letter requiring submission of a site plan, performance of soil borings to at least five feet below tank invert and not to refusal or bedrock as proposed and correction of PBS 2-403458 20,000-gallon UST from diesel to #6 with above requirements to Bluttal with cc to Finney and Marrone. 1/31/12-Vought-Received email revision entitled Subsurface Investigation Work Plan (Revised January 27, 2012) from Miller Marrone. Work Plan proposes installation of six soil borings to at least tank bottom . If groundwater is encountered within 20-feet of the surface and there has been a suspected leak the installation of three monitoring wells to NYSDEC specifications cannot be completed at this location because of location of the 20K UST. If applicable, monitoring wells may be done outside of the building at a later date. AN Investigation Summary Report will be generated and submitted to NYSDEC. Proposal also includes submission of a surrounding area site map including piping and remote fill locations. Proposal also included site plan with UST and proposed boring locations. No investigation proposed are former remote fill as staining in boiler room (which is approximately 8’ below grade) is adjacent to former UST location and not remote fill. Marrone also noted that PBS Registration will be ammended by Controlled Combustion. Vought drafted and sent approval letter of Plan to all parties. 2/8/12-Vought-Received Subsurface Investigation Report dated 2/7/12 via email. 3/6/12-Vought-Reviewed Subsurface Investigation Report dated 2/17/12. Six Geoprobe borings installed on 1/31/12. Site is a 23 story residential building. PBS registration noted UST was closed in place on 5/1/91 and a 5800-gallon AST was installed in an adjacent tank room. Two schools located .25 miles from site. No. 6 staining was observed coming from the south boiler room wall. Upon inspection, a pump, separator drum and recovery drum was discovered at the parking garage lower level. Oil staining was present in the two sumps that were connected to the system. Refusal at 13-15’bg on schist bedrock and groundwater at depth of 10’bg. All soil samples exhibited No. 6 oil staining except boring B-5 . Since the building is set onto the rock, perched groundwater on top of bedrock is likely traveling to the deepest point beneath the building sump areas . There was not enough groundwater for collection of a groundwater sample. Soil analyticals show: 1900ppb ethylbenzene(B1 9-12’bg), 1660ppb xylene(B1

LEAKING UST ABANDONED IN PLACE (Continued) **S104275599**

9-12'bg), 17,000ppb napthalene(B1 9-12'bg), 1500ppb ethylbenzene(B2 9-12'bg),1300ppb xylene(B2 9-12'bg), 460ppb xylene(B3 9-12'bg), 1500ppb ethylbenzene(B4 9-12'bg), 1700ppb xylene(B4 9-12'bg), 13000ppb napthalene(B4 9-12'bg), 2800ppb ethylbenzene(B6 9-12'bg), 2600ppb xylene(B6 9-12'bg), 26000ppb napthalene(B6 9-12'bg). MEG believes that the No. 6 oil spill extent has not been completely defined . Report recommends submission of a possible workplan. Vought called Marrone (Ph:845-569-1200) and agreed to installation of one monitoring well adjacent to former UST location with biweekly monitoring and quarterly sampling. Vought sent and e-doc'd letter requiring installatoin of one well next to former UST. Letter sent via email and mail and called and spoke to Bluttal and explained same. 4/19/12-Vought-Vought received call from and spoke to Marrone and one inch well was installed and on 4/9 well was guaged and inch of product in well. Well installed at former boring location B-3. Groundwater not at 10' bg as previously submitted but at 6 below grade. Marrone will submit site plan with well location and summary letter to DEC within two weeeks. 6/5/12-Vought-Received call from and spoke to Jerry Williams (Controlled Combustion Ph:718-367-9800x204 email:j.williams@heatingny.com). Williams requested review. 6/19/12-Vought-Reviewed Groundwater Monitoring report dated 4/25 submitted by Miller (Marrone). One inch diameter well installed adjacent to UST with a total well depth of 13'. Viscous dark oily product was present measuring .10-feet in thickness. No groundwater sample collected due to presence of free product. Miller recomends installation of recovery wells or sumps to recover oil and active recovery techniques will be discussed in a later work plan. Vought called Miller (Marrone) and Miller is working for Controlled Combustion. Vought and Marrone discussed installation of recovery wells and/or sumps and interim remedial methods (eg manual bailing). VEFR may not be effective due to one inch well and viscous product. Vought called Williams and explained DEC requirements and Vought drafted letter with requirements as well and added to E-docs and sent to Bluttal with cc to Maronne and Williams. 9/4/12-Vought-Received call from Miller (Ferguson) requesting review of Work Plan. 1/6/12-Vought-Received numerous inquires from Miller (Fergusion) with respect to review of 6/22/12 Work Plan. Vought unable to review Work Plan to date due to extreme workload associated with Hurricane Sandy and Boston 30 Spills. 1/7/12-Vought-Called and spoke to Miller (Ferguson) and he noted that an additional Work Plan with either sumps or recovery well installation proposal will be submitted to DEC upon installation of additional delineation wells. Vought sent approval letter for Work Plan dated 6/22/12 to owner with cc to Ferguson and added letter to e-docs. 10/1/12-Vought performed complete file review to date: Work Plan (Miller)-6/22/12. Proposal to install three delineation monitoring wells (one inch diameter) west and south of MW1 and survey of surrounding buildings with DEC assistance. Deepest dry and highest PID soil samples will be collected for analysis. Proposal also includes recommendation for installation of two 4 recovery wells (or sumps). Proposal also for weekly recovery of product via bailer on MW1 and submission of interm remedial recovery records. Quarterly Status Report (Miller)-May 2012 to July 2012-9/6/12. In Borings B1 thru B6, All soil samples exhibited No.6 oil staining except boring B-5 . Bedrock in all borings from 13.5-14.5' bg. Weekly bailing has been ongoing with latest product thickness on 8/31/12 at .01'. Report recommends continuation of bailing events. Report recommends continuation of

LEAKING UST ABANDONED IN PLACE (Continued) **S104275599**

hand bailing until DEC approves RAP. 5/3/13-Vought-Received call from and spoke to Ferguson and he will be installing one 4 recovery well next week and will perform additional delineation wells pending thickness of product in recovery well considering overhead limitations in underground parking garage and effects of feasibility of well installation. Current file review to date: Email from Ferguson to Vought-4/17/13. Email that Looking to move forward at the 71st street site We are planning on setting a 4 recovery well at least a foot below the watertable, adjacent to the tank and setting up a belt skimmer system for the recovery of the product. Would you like me to prepare a quick work plan showing the location of the well and the system proposed? Thanks, Email from Ferguson to Vought-4/24/13. Email that Hey Jeff,Looking to start the work at 71st street we are going to install a 4 recovery well in the location of the well currently on site. And install a belt skimmer system to recover the oil.You had wanted an update when we decided upon which way we were going to go. Give me a call when you get a chance so we can discuss. Thanks,Rob 5/8/13-Vought-Received email from Ferguson that Going to be installing the recovery well at 400 71st street On Monday May 13th we will be on site between 1am and 9am, we will also be out there on Tuesday (same time) to install bollards. Once the well is installed and I get a good depth reading I will order the belt skimmer. Rob 4/3/14-Vought-To date file review by Vought: 8/16/13-Vought-Email from Ferguson that Hey Jeff, Just a heads up I had written the system installation report for the above site and thought I sent it off to you then got pulled out into the field for a few weeks and was wondering why I hadn t heard back from you.Ends up I never sent you the report sorry. I am going to give it one final read and then send it to you on Monday we may need a second well I think the product may have moved. I will call you about mid-week to discuss. Thanks, Rob Vought received another email from Ferguson with attached Quarterly Status Report that described system installation. Quarterly Status Report (Miller) December 2012 to May 2013. Miller still awaiting DEC Approval of RAP dated 6/22/12. Sensitive receptor survey also performed and noted surrounding properties were mixed residential commercial uses with two schools .25 miles from the site. Weekly bailing being performed as IRM shows depth to water from 5-8'bg and product thicknesses of trace to .1' thick. Report notes that in May 2013, a 4 recovery well was installed adjcent to MW1 and a belt skimmer will be installed in June 2013. Vought added report to e-docs. Quarterly Status Report (Miller) October 2012 to December 2013. Miller still awaiting DEC Approval of RAP dated 6/22/12. Product thicknesses from trace to .02 to .03' thick in MW1 and no product in RW1 due to operational belt skimmer. Vought added report to e-docs. A belt skimmer was installed in June 2013 at RW1 as well as a 55-gallon drum for recovered product. Depth to water is 5-7'bg. During Quarter, site was visit three times (10/14, 11/1, 12/2) and the drum had the following thicknesses: (5.5 , 6 and 6). Report recommends monthy OM&M visit and quarterly reporting. Vought no longer required appointment with consultant for surrounding building sump survey in lieu of off-site well installation as cone of depression of water table associated with sump would likely result in no off-site migration of contamination also characterized by high viscosity. 4/4/14-Vought-Sent approval letter for Work Plan dated 6/22/12 to Bluttal with cc to Miller Ferguson and added letter to e-docs. 2/10/15-Vought-Received email from Miller (Ferguson) that Jeff, Just cleaning up last years folders did I send these over to

LEAKING UST ABANDONED IN PLACE (Continued) **S104275599**

you? If so please disregard if not sorry here you go Thanks. Attached to email was Quarterly Status Report dated 10/10/14 and Quarterly Status Report dated 1/30/15. Vought added both reports to D2. Quarterly Status Report July to Sept 2014 (Miller)-10/10/14. In the interim, MEG has been going to the site weekly since June 26, 2012. Since the weekly bailing of the free product began, the thickness has been diminishing. The surrounding properties include residential apartments/co-ops and local commercial retail. Report includes sensitive receptor survey. On June 25, 2013, MEG installed a belt skimmer system at the recovery well (RW-1)location. Remediation system operation, maintenance, and product monitoring visits should be conducted on a monthly basis. Reporting to the NYSDEC will be done quarterly, which will include field observations, product recovery amounts, and disposal documentation. Monitoring results show .01' free product (MW1) and DTW of 5-9'bg. Quarterly Status Report Oct to Dec 2014 (Miller)-1/30/15. In the interim, MEG has been going to the site weekly since June 26, 2012. Since the weekly bailing of the free product began, the thickness has been diminishing. The surrounding properties include residential apartments/co-ops and local commercial retail. Report includes sensitive receptor survey. On June 25, 2013, MEG installed a belt skimmer system at the recovery well (RW-1)location. Remediation system operation, maintenance, and product monitoring visits should be conducted on a monthly basis. Reporting to the NYSDEC will be done quarterly, which will include field observations, product recovery amounts, and disposal documentation. Monitoring results show thick free product (MW1) and DTW of 5-9'bg. 5/15/17-Vought-To date file review by Vought: Quarterly Status Report Jan to March 2015 (Miller)-1/30/15. In the interim, MEG has been going to the site weekly since June 26, 2012. Since the weekly bailing of the free product began, the thickness has been diminishing. The surrounding properties include residential apartments/co-ops and local commercial retail. Report includes sensitive receptor survey. On June 25, 2013, MEG installed a belt skimmer system at the recovery well (RW-1)location. Remediation system operation, maintenance, and product monitoring visits should be conducted on a monthly basis. Reporting to the NYSDEC will be done quarterly, which will include field observations, product recovery amounts, and disposal documentation. Monitoring results show thick free product (MW1) and DTW of 6-9'bg. Vought added report to D2. Quarterly Status Report April to June 2015 (Miller)-1/30/15. In the interim, MEG has been going to the site weekly since June 26, 2012. Since the weekly bailing of the free product began, the thickness has been diminishing. The surrounding properties include residential apartments/co-ops and local commercial retail. Report includes sensitive receptor survey. On June 25, 2013, MEG installed a belt skimmer system at the recovery well (RW-1)location. Remediation system operation, maintenance, and product monitoring visits should be conducted on a monthly basis. Reporting to the NYSDEC will be done quarterly, which will include field observations, product recovery amounts, and disposal documentation. Monitoring results show: .11' free product (MW1-5/2/15), .05' free product (MW1-6/3/15) and DTW of 6-9'bg. Vought added report to D2. 5/16/17-Vought-Received email from Ferguson on 5/9/17 that Morning Jeff, Just checking to see if you had a chance to review this site the client is wanting to know if you would be will to close it. Also here is the most recent QMR I ve been out in the field a bunch lately and I do not think I sent it over to you yet. Thanks . Vought added attached QMR to D2 and reviewed:

LEAKING UST ABANDONED IN PLACE (Continued) **S104275599**

Quarterly Status Report Jan to March 2017 (Miller)-4/28/17. Bedrock/refusal (Schist) was observed in all borings advanced ranging from 13-feet to 14.5-feet below grade. Due to the depths of the bedrock discovered, the building s footing is likely sitting on bedrock.Before the building was constructed, overburden and bedrock must have blasted/removed. Since the building is set onto the rock, perched groundwater on top of the bedrock is likely traveling to the deepest point beneath the building or to sump areas. Monitoring results show: Thick free product(MW1-1/23/17), .03' free product(MW1-2/22/17), .05' free product(MW1-3/27/17) and DTW of 6-9'bg. Remediation system operation, maintenance, and product monitoring visits should continue to be conducted on a monthly basis. Due to an increase in product within the recovery well, MEG recommends that the belt skimmer not be relocated at this time. A new small belt should be placed on the belt skimmer in its current location in an attempt to reach a greater depth within the recovery well. Reporting to the NYSDEC will be done quarterly, which will include field observations, product recovery amounts, and disposal documentation. 5/16/17-Vought-Sent email to Miller(Ferguson) that Rob, I reviewed the QMR below as well as those from the prior emails and have the following questions/comments: 1) Any Quarterly Monitoring Reports between April-June 2015 and Jan-March 2017? 2) Correction of QMR statement that On June 22, 2012, MEG provided a work plan to the NYSDEC. MEG is awaiting approval of the work plan from NYSDEC. My spill notes are as follows: 4/4/14-Vought-Sent approval letter for Work Plan dated 6/22/12 to Bluttal with cc to Miller Ferguson and added letter to e-docs. 3) Please define thick oil. 4) Correction of Recommendation for continued monitoring as client is seeking closure, which DEC is willing to consider at this time pending possible submission of additional reports, if available, and definition of thick oil. QMR should include a request for closure. If you need me to formalize the above in a letter let me know. Feel free to forward this email onto the client as well. Thanks, Vought received reply from Ferguson that Jeff, Attached are the missing reports let me know if you are missing any others. I will revise the next quarter s QMR to include your comments below and will request the closure in there as well. No need to formalize it yet the Patel closed out the York site (same client) so now he wants this one closed told him I d ask but that each site is different so not to get his hopes up. Thanks Again, . Vought added attached QMR's dated 4/25/17 and 7/24/15. Upon review Vought realized this QMRs already added to D2 and reviewed by Vought above. Vought sent email to Miller(Ferguson) that Thanks Rob, I look forward to the updated QMR with the closure request, edits and clarifications. DEC Requires resubmission of QMR including: 1)Any Quarterly Monitoring Reports between 2015 and 2017?. 2)Correction of QMR to reflect that another workplan was submitted and was approved by DEC after 6/22/12 workplan via using DEC Remarks above. 3)What is thick oil as noted in QMRs 4)Correction of recommendation for continued monitoring as Ferguson requested closure in email. 4)cc to Ferguson 12/18/17 - Austin - Project reassigned from Vought to Patel - end 01/03/18-Hiralkumar Patel. with DEC Austin's approval, reviewed emails in DEC Vought's account related to the subject spill case. DEC Vought received email from Robert Ferguson on 11/06/17 including quarterly reports for 2nd and 3rd quarters of 2017. maximum of 0.10 ft product (on 06/26/17) noted in well MW-1 during gauging from Apr. to Sep. 2017. 01/05/18-Hiralkumar Patel. 8:45 AM:- spoke with Robert Ferguson at

LEAKING UST ABANDONED IN PLACE (Continued) **S104275599**

Miller Env and asked him to correct information about work plan approval status in reports as DEC Vought asked earlier. also inquired him about 'thick' oil noted in wells. he stated that product must have coated probe sensor preventing product thickness measurements. Robert will submit 2017 4th Quarter report next week including corrections/clarifications. asked Robert to include a summary table with well gauging data since 2012. Robert Ferguson Miller Environmental Group, Inc. Ph. (516) 876-7940 Ext. 311 (631) 603-6683 email: rferguson@millerenv.com 01/08/18-Hiralkumar Patel. 9:38 AM:- received email from Rob including 2017 4th Quarter report. during monthly gauging, 0.09 ft product noted in well MW-1 and 'thick' oil noted during gauging in Nov. and Dec. 2017. report also included a summary table including gauging data since 2012. reviewed site map submitted with the quarterly report. the map does not show location of well MW-1. as per site history, a 1-inch well (MW-1) was installed, on 04/02/12, adjacent to the UST at former boring location B-3. on 05/29/13, a 4-in recovery well (RW-1) was installed adjacent to well MW-1. the recovery well was installed to a depth of 8 ft below ground surface. 01/10/18-Hiralkumar Patel. 8:45 AM:- visited site and met building super. inspected boiler room. no signs of oil seepage noted from boiler room's southern wall. current/former tank was located in parking garage on south side of the boiler room. noted drum skimmer near southeast corner of the existing tank room. 11:32 AM:- sent email to (and left message for) Rob inquiring about location of well MW-1 which is not included in site map in the quarterly reports. 3:18 PM:- received email from Rob including report with revised site map. revised map includes location of well MW-1. 01/29/18-Hiralkumar Patel. 2:49 PM:- left message for Rob. 03/06/18-Hiralkumar Patel. 8:16 AM:- left message for Rob. 8:54 AM:- sent email to Rob and inquired him about next gauging event. 9:27 AM:- received email from Rob. he mentioned that crew from Miller was on-site last week for monthly gauging event (for Feb. 2018) and likes to schedule next event after two weeks (for Mar. 2018). 10:12 AM:- received email from Rob confirming next gauging at 8 AM on 03/21/18. 03/20/18-Hiralkumar Patel. 12:40 PM:- received email from Rob. monthly gauging event rescheduled for 03/27/18 due to snow storm forecast for tomorrow. 03/26/18-Hirakumar Patel. 2:35 PM:- spoke with Rob and cancelled tomorrow's scheduled site inspection due to ongoing emergency response at another spill site. 05/09/18-Hiralkumar Patel. 12:29 PM:- received email from Rob including quarterly status report for Jan.-Mar. 2018. no product noted in recovery well RW-1, but between 0.02 and 0.06 ft of product noted in well MW-1. well gauging data shows that groundwater was mostly noted below 8.5 ft depth in recovery well RW-1, but measured mostly between 5.5 and 6 ft depth in monitoring well MW-1. as per text in the report, the recovery well was installed to a depth of 8 ft bg, but well gauging data shows water level below 8.5 ft depth. 06/14/18-Hiralkumar Patel. 3:03 PM:- sent email to Rob and asked him to submit construction log for RW-1 and MW-1. 10/23/18-Hiralkumar Patel. 8:45 AM:- visited site and met Thomas Cameron from Miller. inspected boiler room. no signs of petroleum seepage were noted. Tom gauged monitoring well MW-1 and recovery well RW-1 earlier in morning and found no product. two wells are located approx. 2 inch apart. Tom mentioned that the monitoring well MW-1 is actually a 3/4 in. dia. piezometer and top of piezometer is approx. 1 inch below parking garage floor. the recovery well is made of slotted PVC pipe from top to bottom and top of PVC is approx. 32.5 in. above the garage floor. bottom of recovery well RW-1 is 84.5

LEAKING UST ABANDONED IN PLACE (Continued) **S104275599**

in. below garage floor (and 117 in. from top of PVC). groundwater was found at approx. 5.85 ft below top of piezometer well MW-1. during inspection Tom showed an out-of-service oil recovery system located more than 80-100 ft away from existing RW-1 skimmer location. no oil was found in a sump adjacent to this out-of-service system. Tom mentioned that the system is off for long time and he has been checking the adjacent sump during each site visit and never observed any oil in it. 01/08/19-Hiralkumar Patel. after discussing with DEC Austin, case closed based on review of all available information (minimal impact to possibly perched groundwater on bedrock, no more oil seepage into boiler room, minimal product recovery (if any) from one recovery well). Transworld Equities Co. **property owner** c/o Manocherian Brothers 150 East 58th Street, 28th Floor New York, NY 10155 Attn.: Lisa Bluttal email: lbluttal@manocherianbrothers.com 10:59 AM:- sent spill closure letter to Ms. Bluttal. letter emailed to Ms. Bluttal and Rob."

Remarks: "20K TANK LOCATED IN GARAGE AREA, OIL LEAKING FROM TANK TO AREA BELOW, 4K TANK TRUCK PARKED OUTSIDE BEING USED INSTEAD OF TANK TO FEED BOILERTRUCK APPEARS TO BELONG TO STUYVESANT."

DEC Memo:	"7/16/2013 - Feng - DEC Jeff Vought, Sharif Rahman and June Feng spoke to Bob Hill. During the delievery of #4 oil (Hess is the oil company, Madio K is the deliver), the fuel line has broken and released around 400-500 gallons of oil. The oil ran on the boiler room floor, which they didn't know how much. A vac truck is onsite and so far generated 7 drums of oil. Contamination underneath the sidewalk is assumed. The tank size is unknown. NO vapor complaint yet. RP is unknown. DEP is involved too. Dispatched DEC Rahman to be onsite to investigate. Spill is assigned to Rahman. 07/16/2013 Responded to the site on behalf of Veronica Zhune(Zhune is the day time runner).RiteWay crews and vac truck on site recovering loose oil from the back alley, under/around stairways floor. As per building management, estimated 400 gallons #4 oil spilled through the underground broken fill line, entered the building through wall and spreaded all over outside of boiler room. No oil in the tank room. Tank is 12,000 gallon vaulted. DEC requires: 1-Excavation of fill line under sidewalk, disposal of contaminated soil followed by end point sampling. 2- Clean up of loose oil from the open area at the back alley. 3- Submission of closure report to DEC 4- PBS update,

RESIDENCE (Continued) **S113819131**

2-043389 expired. Building Manager: Brian Mcglone, 212-535-6910.(sr) 07/22/13-Zhune-Diana sent an update of the cleanup. Right Way Tank arrived at 1:25 pm and began cleaning up the oil, pumping out the spilled oil. They clean up the back alley, what they could in the electric room (they could not clean inside the electric boxes), they cleaned out the floor drain and the sump pit. (a small amount of oil did find it way into the sump pit). They also disposed of all contaminated materials in the alleyway. including 36 paving stones. Right way needs return to clean up the oil under the side way, some spots in the electric room and remove their drums of contaminated waste. They are also giving a price on replacing the ruptured section on the fill line. The electrical service boxes were covered in oil and need to be replaced. Response worked through the night to run temporary bypass so the boxes can be moved. Leardon Boiler Works will be doing the work on the new fill line and cement work. Their proposal has been accepted by the Board. 12/05/13- Jennifer Lewis from P.W. Grosser Consulting sent the following email dated 11/22/13. They have had to do the remediation in the sidewalk in stages so as not to completely block access to the sidewalk. The first stage involved the excavation of the fill port and soils towards the building. The second stage involved the excavation of impacted soils near the vent pipe. The third stage (which has not happened yet) will be the excavation of more soils in line with the fill pipe entering the building. Endpoint samples from the first stage (collected in August and shown on the attached data table) were clean, so they backfilled that section and re-poured the concrete. Endpoint samples from the second stage are slightly elevated for a couple of SVOCs (samples collected in November and shown on attached data table). The soils did not exhibit petroleum staining or odor, so this may be more consistent with fill material. 12/10/14-Jennifer Lewis sent the report dated 12/10/14. The report stated that Riteway removed approximately 600 gallons of petroleum and liquids that puddled on the electrical room and in the injector pit. After the petroleum was removed, the floor and walls in the electrical room were cleaned and recoated. The soil removal beneath the sidewalk was conducted in four stages. The first stage involved the excavation of the sidewalk flags immediately over the fill line from the sidewalk to the building. Based upon the migration of the petroleum contaminants, the excavation then expanded into the three other stages along the building foundation wall. Groundwater was not encountered during the excavation. Eleven endpoint soil samples were collected: Three bottom samples and eight sidewalls samples were collected. The analytical results inidicated some VOCs detected below the limit acceptable and minor exceedances of SVOCs consistent with urban fill material. Spill Closed."

Remarks: "400 TO 500 GALLONS OF OIL FROM A BROKEN LINE. CLEAN UP IS IN PROGRESS."

DEC Memo:	"10/21/2014 - Feng - Duty Desk. DEC J. Vought, S. Mahat and J. Feng spoke with Mark Salamack of Petroleum Tank Cleaner (917-559-5519). It is a co-op building. They had a delivery and changed the fuel type to #4 oil a week ago. Today when PTC showed up at the site, there was about 5-inch of oil on the floor. There is no secondary containment and it appeared that the tank is leaking. The tank is a size of 7,500-gallon above ground tank with 6,100 gallon of oil inside the tank. Dispatched S. Mahat to respond to the spill. Assigned the spill to S. Mahat. 10/21/14: Mahat Site Visit : DEC Mahat responded to a reported 5 inches of oil standing in a secondary containment. Tank is AST with the capacity of 7500 gallon. Upon DEC arrival, the gague was reading 5800 gallon and delivery of 6800 gallon was done. Estimated 1000 gallon was lost to the secondary containment and it was seepingthroug the wall to the basment next door impacting a restaurent storage area. A NOV was given to the property managment with 6 voilations for them to address as soon as possible. PTC has retained by the management to pump out the tank and remaiing oil from the containment. Furthermore, PTC will perform a powerwash when it is necessary. Two temporary tanks were installed for heating and hot water. ********** PBS : 2-082503 ********** Contact Information : Jose : ***** Super 917.334.3315 Richard Hill ***** Management 516.902.5250 (Cell) 516.837.7000 (Office) 10/29/14: Mahat T/C : DEC Mahat contacted Mr. Hill inquiring about the staus of the tank and clean up of the spilled area. He mentioned that the management has decided to remove the tank from the basement and install a new one. Mean time PTC will continue their clean up activities of the site. A site visit is schedule on 10/31/14. 12/17/14: Mahat DEC Mahat received an email from Richard Hill reporting the progress on the project. Mr. Mahat, As per your conversation with Richard Hill on December 16, 2014, the tank at 445 East 77th Street has been completely removed and Petroleum Tank Cleaners cleaned the tank room and is now in the process of submitting the report to DEC. We have received the permit for the replacement tank. Photos of the area are included in this e-mail. Please feel free to call Richard Hill at 516-902-5250 with any questions or concerns. Joan Olfano Assistant Property Manager Violations Specialist (T) (516) 837-7000 ext. 207 (F) (516) 374-7508 e-mail: joan@abromgmt.com DEC is waiting for a complete cleanup report. 12/23/14: Mahat DEC Mahat partnered with Mark Salamack (PTC @ 917.559.5519) about the spill case. As per Mark, the current excavation is 3feet and further excavation is not feasible due to structural limits. Three samples were taken from the open excavation on the tank room. Analytical report has been uploaded

77TH OWNERS CORP (Continued) **S117363732**

on D2 for reference. Backfill will be performed on the site with following requirement by the managment team: Attention Santosh: I am the owner and registered managing agent for the subject property 445 E 77tti. Street, New York, NY 10075. I have been given instructions on how to prepare the floor in the tank room for the new oil tank. I have agreed to do the following and give direct instructions to the concrete company on the following: 1)An impermeable vapor barrier will be installed in place prior to pouring a cement floor for the planned tank installation. 2)Said concrete floor shall be a minimum of 8 inches thick. 3)Once dry, the concrete floor and the walls will be coated with epoxy to a height .to serve as secondary containment. Epoxy to be applied prior to laying in the saddles for the new tank and touched up after the construction to repair any arears that may be scraped, or marred in any way. Can you please verify that you have received so that I can start to commence the work. DEC is waiting for a spill closure letter from PTC. 3/26/15: Mahat DEC Mahat review the case file : Based on the email confirmation provided my the Management team. No further investigation is rewuired by the Department. Hence, the spill case will closed in DEC Spill Database. "

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was KOLLEENY TRANSFERRED FROM KOLLEENY TO I. ISLAM 4/25/05- The site is under remediation by O'Brien-Kreitzberg (OBK). Quarterly monitoring report (Oct.-Dec./04) is reviewed.Even though the groundwater sampling results from all wells show constantly decreasing trend of contamination, still two of the 5 monitoring wells exhibit minor exceedances of VOCs. Minor Free Product was detected in one well only and absorbent sock was installed in that well. Quarterly groundwater monitoring to continue.- II 7/29/05- Reviewed the monitoring report for 2nd quarter 2005. GW sampling result from the lone monitoring well MW-13 shows minor exceedance of MTBE only (12ppb). Absorbent sock has been installed in well EW-01 following after the detection of 0.03 feet of Free product in the well. Installed the report in the eDoc folder. Monitoring for Free product in well EW-01, and GW in well MW-13 will continue. - II 3/09/06: This spill transferred from I. Islam to Q. Abidi. 4/27/06: Talked to URS Ms. Jane Staten (716)856-5636, She informed that groundwatert sampling was due Dec. 13, 2005. But it has not been done yet.They will start groundwater

79 STREET TRANSVERSE DPR -DDC (Continued) **S110772122**

sampling of 2nd quarter 2006 next week or following week. -QA 8/18/06 DEC lead transferred from Q. Abidi to J.A. Maisonave. - JAM 8/31/07 According to letter submitted by URS titled Proposed Soil Sampling Plan and dated December 14, 2006. A product recovery system operated at the site between April 2002 and February 2003 and consisted of one extraction well, EW-01. Groundwater is sampled semi-annually. On July 19, 2006 only well MW-13 was sampled and results returned non-detect for VOCs and SVOCs. Extraction well EW-01 contained product of thickness 0.24 feet and was removed by vac truck. On August 15, 2006 EW-01 contained product of thickness 0.6 feet. URS proposed advancing 5 soil borings around the tank and extraction well EW-01. URS will also resume groundwater monitoring at the other 8 monitoring wells on-site. URS submitted this letter for informational purposes only. Letter is in edocs. Reviewed letter submitted by URS titled Investigation Summary Report and Proposed Remedial Strategy and dated June 18, 2007. On April 3, 2007, 5 soil borings were advanced and 2 samples from each boring were sent for lab analysis. Analytical results showed that VOCs were not detected above TAGM and one SVOC, benzo(a)pyrene, exceeded its TAGM concentration in soil boring SB-07 from 7 to 9 feet bgs. Groundwater was analyzed from 8 monitoring wells and results showed an exceedence of only one VOC in MW-07 (Total VOC in MW-07 was 11ppb). According to URS Soil analytical data did not indicate the presence of gross soil contamination. However, PID readings, odors and observed free product noted on the boring logs suggest the presence of free product in soil, which is likely the source of the persistent product in well EW-01. URS recommends removing and replacing the tank and dispenser and excavating all contaminated soil. To minimize disruption to park operations, the work will be performed in the colder months. Letter is in edocs. - JAM 4/29/08 Reviewed letter titled Free Product Recovery Data through January 2008 submitted by URS and dated February 18, 2008. URS recorded 0.01 feet on Jan 28, 2008. URS suspended semi-annual groundwater monitoring after April 2007 because the analytical data continued to show only minor dissolved phase contamination. Letter uploaded to edocs. I sent an email today approving the Proposed Remedial Strategy from the report submitted by URS, and dated June 18, 2007. The UST will be removed and upgraded and contaminated soil will be excavated. I requested end-point soil samples be collected as well as resuming the groundwater monitoring after the tank is upgraded. I expect a report summarizing all results. The email is uploaded to edocs. - JAM 10/08/08 Reviewed the report titled Free Product Recovery through August 2008 submitted by URS and dated Semptember 12, 2008. URS continues to gauge monitoring wells monthly and removes any free product present. On May 15, 2008 URS resumed groundwater sampling. Water samples were collected from MW-06, MW-07, MW-10 and MW-11. No samples were collected from EW-01, MW-03A and MW-04A due to the presence of free product. Samples results showed minor exceedences in wells MW-06 and MW-11 at 57ppb and 89ppb, respectively. No SVOCs exceeded NYSDEC criteria. URS states that the tank will be removed and upgraded and contaminated soil will be removed during the 4th quarter 2008. URS will continue to recover free product monthly and collect groundwater samples on a semi-annual basis. Report uploaded to eDocs. - JAM 1/23/09 Reviewed the report titled Groundwater Sampling Results/Free Product Recovery through 4th Qtr 2008 submitted by URS dated December 21, 2008. URS monitors groundwater on a semi-annual basis. On Oct 21, 2008, seven wells were sampled, well EW-1 was not sampled due to the presence of a product

79 STREET TRANSVERSE DPR -DDC (Continued) **S110772122**

sheen. Analytical results show that well MW-6 exhibited on VOC above criteria and a total VOC concentration of 180ppb. No SVOCs were detected. URS installed an absorbent sock in EW-1 to collect the free product. The approved remedy to remove the UST and contaminated soil near EW-1. This work was out to bid and should be performed in the Spring of 09. URS will continue semi-annual monitoring and will replace the absorbent sock in EW-1 when warrented. The report is uploaded to eDocs. - JAM 1/29/10 Received a phone call from Jane Staten at URS. The tank removal and soil excavation, as proposed in the June 18, 2007 Investigation Summary Report and Proposed Remedial Strategy, has commenced. The tank has been removed and they will be installing sheeting today to continue the soil excavation. She said that the likely source of the contamination was discovered when removing the dispensors. A filter on the dispensor was not installed correctly and was leaking. The excavation will continue into next week. End-point samples will be collected and a Tank Closure Report will be submitted. - JAM 2/23/10 Spoke to Jane Staten at URS. The excavation is completed and a new tank is being installed. Summary Report to follow. - JAM 10/25/10 In the quarterly status update meeting with the DDC and URS, parties discussed residual soil contamination in the vacinity of the tank. Quarterly GW monitoring will continue. Results from the tank removal were submitted on June 30, 2010 and the Post-Excavation Strategy was submitted on August 30, 2010. Both files uploaded to eDocs. - JAM 11-10-2010 The spill was transferred from J. Maisonave to Alex Zhitomirsky, as per V. Brevdo/J. Kolleeny. AZ 1-21-2011 Reviewed Post Excavation Strategy Report and discussed it with K. Shenahan over the phone. Soil excavation was performed in two areas. A total of 399.24 tons of contaminated soil was removed. Also, the existing tank and associated piping were removed. Only minor soil contamination remains in the saturated zone. RegenOx was placed at the bottom of the excavation. URS proposed quarterly groundwater sampling. This proposal is approved. E-mail to K. Shenahan/V. Brevdo/Mehrzad Asbagh: Dear Kevin, As per our telephone conversation, I've reviewed Post Excavation Strategy Report and approve proposed quarterly groundwater monitoring program. AZ. 7-8-2011 Reviewed GW QMR through 4th Quarter 2010. In November 2010 sampling was performed. MW-12 wasn't sampled because the area was flooded with rain. MW-07 was the only well to contain any VOCs at a concentration above the NYSDEC Groundwater Quality Criteria. It contained benzene at 1.2 ppb. If results from the next monitoring event are similar, the spill will be recommended for closure. AZ 7-11-2011 Reviewed GW QMR through 1st Quarter 2011. Contacted K. Shenahan. The report stated that end point samples taken in 2010 during removal of 2,000 gal diesel tank showed only minor soil contamination. However, the report stated that CPU-NW exhibited 21,770 ppb of total VOC. This sample was taken at the depth of 12' which is apparently below GWT. I asked Kevin to confirm the depth of gw and indicate where the end point sampling points are located. AZ 7-12-2011 Received an email from K. Shenahan: Alex,I have researched the questions you needed answers for and am providing the information in this e-mail. The groundwater table beneath this site is between 5 and 10 feet (see attached table). Bedrock was encountered at about 15 feet. The attached tank closure report indicates that closure samples were taken from the two remedial excavations from the north, south, east and west walls. The report indicated that these samples were collected from 12 to 14 feet below grade. When URS reviewed the data it became apparent that two samples were also collected from the

79 STREET TRANSVERSE DPR -DDC (Continued) **S110772122**

bottom of the larger excavation at a depth of 15 feet and one sample was also collected from bottom of the UST excavation. Based on the depths of sample collection and the water level measurements, all of the closure samples were collected from the saturated zone. The closure report indicated that there were no elevated PID readings associated with the closure soil samples, however, the analytical does indicate some exceedances from the north wall of the larger excavation. Our thought is....given the significant remedial work completed to date, and the fact the groundwater is clean, the RegenOx placed into the excavations will address the residuals. I'll call you in the morning to discuss further. I have discussed the site with K. Shenahan. About 398 tons of soil and the tank was removed in 2010. 600 pounds of RegenOX was mixed into soil and left in place. No sampling location map was compiled by Franklin. It was decided that due to high concentrations of contamination in saturated soil(up to 21,770 ppb of total VOC) groundwater monitoring will be continued for a year. It could be done semi-annually. MW-08 will be re-installed to confirm soil conditions. Soil samples will be taken. AZ 7-14-2011 The site was discussed in a meeting with URS/DDC. URS stated that petro odor was noticeable at the location of a north wall end point sample(21,770 ppb of total VOC) but further excavation in this direction was impossible due to the existing brick wall. Re-installation of MW-8 is impossible to the the existence of underground lines and a brick wall. Monitoring will be continued. AZ 1-17-2011 Excavation was completed at the site in 2010. 2,000 gal diesel UST and 186 tons of soil were removed. Also, 213 tons of contaminated soil was removed from the adjacent area. RegenOx was mixed into the soil at the bottom of the excavation and left in place. Extend of the excavation to the north was limited by the presence of arched brick storm sewer. Soil samples collected from the sidewalls bottom of the excavation areas showed only minor soil contamination remaining in the saturated zone at the site. Only one sample contained concentrations above the NYSDEC TAGM 4046 criteria. In August 2010 URS recommended quarterly groundwater monitoring. In the quarterly report dated June 1, 2011, URS requested spill closure, since significant remediation has been completed and only slight impacts remain at the site. At the quarterly meeting with NYCDDC and URS, DEC rejected the request to close the spill due to the contamination in closure sample CPU-NW and requested to continue monitoring program for at least two quarters, at which time DEC would reconsider the spill closure request. Two additional rounds of sampling have been documented. The most recent data supports the request to close this spill number. The analytical results showed that no VOC or SVOC were detected in any wells at concentrations exceeding the State criteria. Based on this information, this spill number is closed. The following Letter was sent to DDC/URS/V. Brevdo: Dear Kevin, I have reviewed a Monitoring Report through Third Quarter 2011 and Request for Spill Closure for the above site. The report stated that excavation was completed at the site in 2010. 2,000 gal diesel UST and 186 tons of soil were removed. Also, 213 tons of contaminated soil was removed from the adjacent area. RegenOx was mixed into the soil at the bottom of the excavation and left in place. Extend of the excavation to the north was limited by the presence of arched brick storm sewer. Soil samples collected from the sidewalls bottom of the excavation areas showed only minor soil contamination remaining in the saturated zone at the site. Only one sample contained concentrations above the NYSDEC TAGM 4046 criteria.

79 STREET TRANSVERSE DPR -DDC (Continued) **S110772122**

In August 2010 URS recommended quarterly groundwater monitoring. In the quarterly report dated June 1, 2011, URS requested spill closure, since significant remediation has been completed and only slight impacts remain at the site. At the quarterly meeting with NYCDDC and URS, DEC rejected the request to close the spill due to the contamination in closure sample CPU-NW and requested to continue monitoring program for at least two quarters, at which time DEC would reconsider the spill closure request. Two additional rounds of sampling have been documented. The most recent data supports the request to close this spill number. The analytical results showed that no VOC or SVOC were detected in any wells at concentrations exceeding the State criteria. Based on this information, this spill number is closed. All wells associated with this spill should be properly abandoned. The Department hereby reserves all of its rights concerning, and such forbearance shall not extend to, any further investigation or remedial action the Department deems necessary due to: I. The off-site migration of petroleum contaminants that was not addressed by this evaluation. II. Environmental conditions related to the Site which were unknown to the Department at the time of this approval. III. Information received, in whole or in part, after the Department's spill case closure, which indicates that the corrective action was not sufficiently protective of human health for the reasonably anticipated use(s) of the site; or IV. Fraud in obtaining this approval for inactivation. Please be advised that you should maintain a permanent file of all documentation and correspondence regarding this case for future use. The Department's files regarding this release may not be maintained indefinitely. Sincerely, Alex Zhitomirsky "

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was O'CONNELL E2MIS 122069 If this is a Con Edison manhole it contains electrical cable and splices. Many manholes have a sealed sump in the floor which is used to allow runoff when pumping the structure. A hose is place in this sump and water on the floor will flow into the sump allowing the floor to be cleaned. If cleaned prior to analysis of the fluid, the structure will be cleaned as >50 PPM and all liquid and waste will be manifested accordingly. The structure will be double washed with a degreaser, i.e. Slix. All cleaning material and PPE will also be treated as >50. If any sludge is found within a manhole it is treated as lead contaminated and manifested accordingly. The spill identification tag will remain secured to the structure until the analysis is completed and if <500 PPM the signage will be removed. If the analysis is >499 PPM, a grid will be prepared for wipe testing the area. Until the analysis of the wipes are proven to be <10ugs/100cme2 all additional waste produced from the structure will be treated as the original analysis. If this spill occurred in a transformer vault containing a sump pump and there was a possible release, the drainpipe trap will be dismantled to determine if oil was released. Sludge found in a vault, through historical analysis, has been determined not to contain lead. 12/21/98...08:57 J.MCCABE #06470 REPORTS: EMP. J.PELZER# 06470 WORKING ON DEAD FDR-24M87. Site Description: "The site is an active dry cleaner located in an urban area on the west side of Manhattan. The cleaners is on the ground floor of a multi-story building. The investigation of nearby VCP site #V00425 indicted the presence of 200-300 ppb of PCE in a well immediately downgradient of Celebrity French Dry Cleaners. Celebrity French was designated a P site so a Site Characterization can be conducted to determine whether they are the source of this contamination. The site charactarization began in Fall 2008 and will include groundwater, sub-slab vapor, and soil sampling. Results indicate no contamination of significance. NFA letter sent to owner 3/3/10."
Env Problem: "Investigation indicated only low level PCE contamination downgradient of the building at a cancentration of 49 ppb in November 2008. A sub-slab PCE vapor sample taken at than time indicated PCE at 7,400 ug/m3. Indoor air samples taken in March 2009 found 170 ug/m3 of PCE in the basement and 150 ug/m3 of PCE in the 1st floor in the active dry cleaner. PCE concentration in 2nd floor air were 5.9 ug/m3. Indoor air sampling in adjacent buildings had a maximum concentration of 40 ug/m3."

Environmental Interest/Information System:
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.
ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Updated By: HEHUSSEI
Site Description: "Location: The East 60th Street Con Ed Steam Station Site is located in an urban area of New York County (Manhattan) in New York City. The site is partially located beneath the elevated section of the Ed Koch Queensboro Bridge (also known as the 59th Street Bridge) between East 59th and East 60th Streets. Site Features: The Site consists of the interior basement floor of the building which occupies the site. Current Zoning/Use(s): The on site building is in use as a steam generation plant by a utility company which distributes steam to utility customers. The Site parcel is in a manufacturing zone, with commercial zoning to the west and north, and residential zoning to the south of East 59th Street. The surrounding properties are currently used for a combination of uses, with a park/playground to the north across East 60th Street, residential to the south across East 59th Street, a Department of Transportation yard adjacent to the west, and the FDR Drive (hgihway) to the east. Further to the east is the East River, which is the receiving waterbody for the facility's SPDES discharge. Historical Uses: Prior uses that appear to have led

EAST 60TH STREET, CON ED STEAM STATION (Continued) **U003394420**

to site contamination potentially include the use of mercury-filled flow measurement equipment as part of the steam plant operations. Upon finding mercury in the facility's SPDES discharge sampling, a report was made to the Department's Division of Water and subsequently a report was made to the Department's Spill Hotline upon finding mercury beads in the facility's internal drainage system. Site investigations were undertaken under the spill program to delineate areas of mercury contamination. Remedial measures were implemented including excavation of impacted media and encapsulation of the basement floor and components of the drainage system with a two-layer epoxy coating."

Env Problem: "Nature and Extent of Contamination: The primary contaminant of concern at the site is mercury. Investigations initially identified mercury in the facility's SPDES discharge, which prompted the investigation of potential source areas. The presumed principal source area identified was the floor trench drainage system, which is a concrete-lined floor trench to which various equipment within the facility discharge wastewater from the steam plant operations and through which this wastewater is conveyed toward the facility discharge point. Some sections of the trench were found to be in disrepair with cracked and or spalling concrete. Liquid mercury was observed in two separate locations in the trench system. Additional investigation with sampling identified mercury concentrations above industrial use recommended soil cleanup objectives in soil beneath and in the vicinity of the floor trench. In that an additional goal of the remedial effort was to prevent mercury contamination from being discharged through the facility's SPDES dicharge, additional sampling was conducted to identify other possible sources of low concentration sources of mercury including the concrete floor itself and the paint on the floor. Remediation at the site is complete. An estimated 4.5 pounds of liquid mercury were removed from the two areas in the trench system where it was found. Approximately 4.3 cubic yards of mercury-impacted soils and concrete were also removed from the trench areas. An additional 15 cubic yards of concrete were removed during activities to repair spalling concrete and repair of concrete slab areas beneath the boilers. The facility owner decided to apply a two-coat epoxy system to the entire floor area and the trench system to minimize to the extent feasible the release of mercury through the facility discharge. To apply the epoxy, the floor area needed to be scarified; the paint chips and concrete generated in this process were removed in 22 55-gallon drums. Waste water generated from dust control or washing activities was containerized in fractionation tanks and removed for offsite disposal. In addition, the facility oil water separator and structures were cleaned and/or repaired until analysis demonstrated that mercury concentrations were less than 50 parts per trillion in water passing through the system, per the Department's Division of Water's requirements."

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State and tribal institutional control / engineering control registries

RES DECL: Restrictive Declarations Listing
A restrictive declaration is a covenant running with the land which binds the present and future owners of the property. As a condition of certain special permits, the City Planning Commission may require an applicant to sign and record a restrictive declaration that places specified conditions on the future use and development of the property. Certain restrictive declarations are indicated by a D on zoning maps.

VCP: Voluntary Cleanup Agreements
New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing
In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

HIST SPILLS: SPILLS Database

This database contains records of chemical and petroleum spill incidents. Under State law, petroleum and hazardous chemical spills that can impact the waters of the state must be reported by the spiller (and, in some cases, by anyone who has knowledge of the spills). In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY SPILLS database. Department of Environmental Conservation.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

E DESIGNATION: E DESIGNATION SITE LISTING
The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

HSWDS: Hazardous Substance Waste Disposal Site Inventory
The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

SPDES: State Pollutant Discharge Elimination System

New York State has a state program which has been approved by the United States Environmental Protection Agency for the control of wastewater and stormwater discharges in accordance with the Clean Water Act. Under New York State law the program is known as the State Pollutant Discharge Elimination System (SPDES) and is broader in scope than that required by the Clean Water Act in that it controls point source discharges to groundwaters as well as surface waters.

VAPOR REOPENED: Vapor Intrusion Legacy Site List

New York is currently re-evaluating previous assumptions and decisions regarding the potential for soil vapor intrusion exposures at sites. As a result, all past, current, and future contaminated sites will be evaluated to determine whether these sites have the potential for exposures related to soil vapor intrusion.

NYC LEAD 2: Recent Lead Paint Violations
Pursuant to New York City?s Housing Maintenance Code, the Department of Housing Preservation and Development (HPD) issues violations against conditions in rental dwelling units that have been verified to violate the New York City Housing Maintenance Code (HMC) or the New York State Multiple Dwelling Law (MDL). Violations are issued when an inspection verifies that a violation of the HMC or MDL exists. It is closed when the violation is corrected, as observed/verified by HPD or as certified by the landlord.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

LENOX HILL HOSPITAL
100 EAST 77TH STREET
NEW YORK, NY 10075

TARGET PROPERTY COORDINATES

Latitude (North):	40.773703 - 40ˆ 46’ 25.33’’
Longitude (West):	73.960845 - 73ˆ 57’ 39.04’’
Universal Tranverse Mercator:	Zone 18
UTM X (Meters):	587695.8
UTM Y (Meters):	4513944.5
Elevation:	64 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	14115942 CENTRAL PARK, NY
Version Date:	2019

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

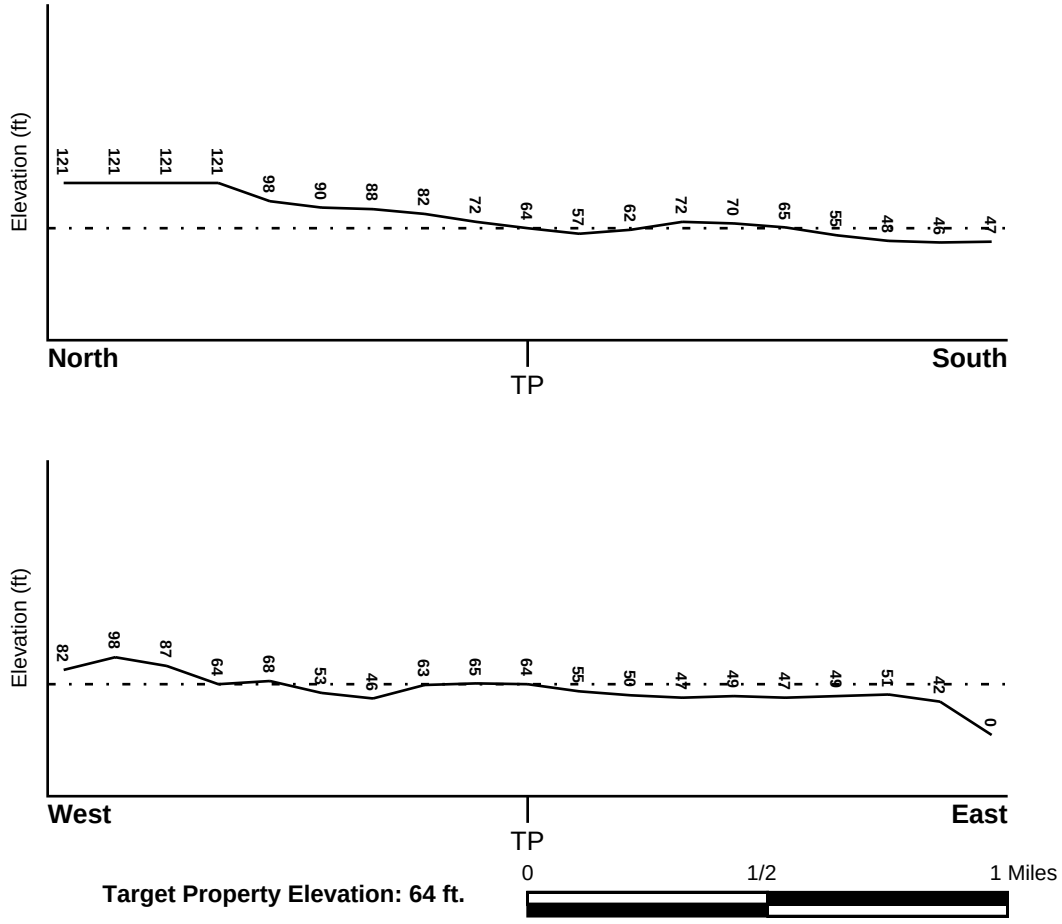
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SSE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Target Property Elevation: 64 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
1	1/4 - 1/2 Mile SSW	NNW
1G	1/4 - 1/2 Mile SSW	NNW

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT **GEOLOGIC AGE IDENTIFICATION**

Era:	Paleozoic	Category:	Stratified Sequence
System:	Ordovician		
Series:	Middle Ordovician (Mohawkian)		
Code:	O2 *(decoded above as Era, System & Series)*		

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: silt loam
loamy sand
sandy loam
fine sandy loam

Surficial Soil Types: silt loam
loamy sand
sandy loam
fine sandy loam

Shallow Soil Types: sandy loam

Deeper Soil Types: unweathered bedrock
very gravelly - loamy sand
stratified
sandy loam

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Appendix A – Health and Safety Plan

1.0 INTRODUCTION

This Sampling Protocol provides a scope of work for conducting a Subsurface (Phase II) Investigation at Lenox Hill Hospital's (LHH's) existing campus on the block bounded by Park and Lexington Avenues and East 76th and East 77th Streets (Block 1411, Lots 1 and 113) (aka Projected Development Site 1) and three buildings on the north side of East 77th Street across from the main hospital complex (Block 1412, Lots 9, 10, and 11) (aka Projected Development Site 1a) (collectively "Site"). A Site location map is provided as Figure 1. The site details and proposed sampling locations are provided on Figure 2. The proposed redevelopment of the Site would entail demolition of portions of the current hospital and renovations of existing structures for a new state-of-the-art hospital facility (to occur in multiple stages).

This scope of work is intended to assess the potential for encountering subsurface hazardous materials during excavation that would be associated with the proposed redevelopment of the Site. The scope is based on the findings of previous environmental investigations, including a June 2022 *Phase I Environmental Site Assessment (ESA)* by AKRF. The scope includes the collection of soil, groundwater, and soil vapor samples for laboratory analysis. A Health and Safety Plan (HASP), included as Appendix A, provides measures for protecting on-site personnel and the public during the implementation of the Sampling Protocol. The Sampling Protocol and HASP have been prepared for submission to the New York City Department of Environmental Protection (NYCDEP) for review and approval.

1.1 Site Characterization

Topography at the Site is relatively level, with a slight downward slope to the east. Based on the U.S. Geological Survey, Central Park, NY Quadrangle (2013) map, the Site is approximately 65 feet above the National Geodetic Vertical Datum of 1988 (an approximation of mean sea level).

A geotechnical investigation conducted by RA Consultants LLC in 2018 (discussed in Section 1.4) indicated the depth to groundwater was measured between approximately 17 to 18.5 feet below sidewalk grade (roughly 5 to 7 feet below basement level) and noted to be perched on bedrock. Groundwater flows in an easterly direction toward the East River, located approximately 3,400 feet away. However, actual flow can be affected by many factors including subway tunnels (including the adjacent No. 4, 5, and 6 subways beneath Lexington Avenue), underground utilities, and other factors beyond the scope of this study. Groundwater in Manhattan is not used as a source of drinking water.

1.2 Proposed Project

The proposed redevelopment of the Site would entail demolition of portions of the current hospital and renovations of existing structures for a new state-of-the-art hospital facility (to occur in multiple stages). It is anticipated that the proposed construction would require excavation up to approximately 10 feet below the current basement and cellar grade (i.e., well below the bedrock interface) and may require dewatering.

1.3 Site History

Historical Sanborn maps indicated that Block 1411 (Projected Development Site 1) comprised the "German Hospital" on the north side of the block and apparent tenement buildings on the south side since at least 1898. Between circa 1911 and 1939, the hospital complex expanded, with several additions and new hospital structures including the Einhorn Memorial Building. By 1939, the entire hospital block (Block 1411) was occupied by the LHH campus, with additional hospital structures including the Uris and Wolman Pavilions and a community health center noted by 1979; the hospital campus remained similar through the 2005 Sanborn map. Sanborn maps indicated that the current ancillary LHH buildings on the north-adjacent block (Block 1412/Projected Development

Site 1a) contained three dwellings since at least 1898, that were noted to include several commercial uses between circa 1911 and 2005 including auto houses, offices and a farrier (subsequently a garage) at 113 East 77th Street.

1.4 Previous Environmental Investigations

Phase I Environmental Site Assessment, Lenox Hill Hospital Redevelopment, AKRF Inc., June 2022

The Phase I ESA conducted at the Site in June 2022 identified "Recognized Environmental Conditions" (RECs), i.e., the presence or likely presence of hazardous substances or petroleum in the ground or groundwater. These were:

- The Site (Block 1411, Projected Development Site 1) was registered with the New York State Department of Environmental Conservation (NYSDEC) Petroleum Bulk Storage (PBS) Program (PBS# 2-606498) with one in-service diesel aboveground storage tank (AST) located within a basement-level concrete tank room, two (2) 317-gallon day tanks within a sub-basement-level emergency generator room, and an ancillary 330-gallon diesel AST (also supplied by the 20,000-gallon AST) located on the roof of the Uris building. The tanks were used to fuel the LHH emergency generator systems. No spills were listed in regulatory database information in connection with the ASTs; however, it was noted that undocumented releases from historic bulk petroleum storage operations may have affected environmental conditions at the Site.
- The LHH main hospital (Block 1411, Projected Development Site 1) is registered as a small quantity generator (SQG) and historic Large Quantity Generator (LQG) of hazardous wastes typically associated with medical facilities, including: formaldehyde, xylene, chromium, spent non-halogenated solvents, corrosive wastes, ignitable wastes, pharmaceutical wastes, silver, mercury, and chloroform between approximately 1992 and 2018. Several prior violations were cited for the facility (as documented in a February 2011 Notice of Violation issued by NYSDEC) under the descriptions of "Generators Pre-transport," "Universal Waste —small quantity generators," and "Treatment, Storage, and Disposal facilities (TSDs)—Interim Status (IS) preparedness and prevention" that were subsequently resolved/closed (these closed status violations were not indicative of environmental concerns).
- Historical land use maps and city directories indicated that the current ancillary hospital buildings on the north-adjacent block (Block 1412, Projected Development Site 1a) contained three dwellings since at least 1898 and were noted to include several commercial and automotive uses between circa 1911 and 2005, including auto storage houses, offices, and a farrier (subsequently a garage) at 113 East 77th Street. Historic garage uses were also noted at the 111 and 115 East 77th Street buildings. Such uses may have included petroleum and/or solvents and mercury (associated with the former farrier).
- Historical land use maps, city directories and the regulatory database review identified nearby uses between circa 1896 and 2005, including automotive garages on blocks south, northeast, and west of the Property, and several drycleaners on the surrounding blocks. The regulatory database information indicated two closed-status spills documenting petroleum contaminated soil and groundwater at 122 East 78th Street (immediately north of Projected Development Site 1a).

Based upon the findings in the Phase I ESA, AKRF recommended the performance of a subsurface (Phase II) investigation including the collection and laboratory analysis of subsurface samples.

Report of Geotechnical Investigation, Lenox Hill Hospital (100 East 77th Street) Manhattan, NY 10075, RA Consultants LLC, January 2018

The January 2018 Geotechnical Investigation included the advancement of 17 geotechnical borings in select basement and sub-basement areas within the hospital and within the East 76th Street sidewalk immediately

south of the hospital. Borings encountered fill materials consisting of a mixture of gravel, sand, bricks, crushed stone, and construction debris to approximately 5 to 15 feet below the basement level and to approximately 3 feet below the sub-basement level. The fill was underlain by decomposed rock and mica schist. Competent bedrock was encountered between approximately 10 and 25 feet below the basement level, and between approximately 5 and 20 feet below the sub-basement level. Two groundwater observation wells were installed within the East 76th Street sidewalk as part of the investigation; the depth to groundwater measured between approximately 17 to 18.5 feet below sidewalk grade and noted to be perched above bedrock and flowing toward the East River.

2.0 SCOPE OF WORK

Field work will be conducted under the site-specific Health and Safety Plan, provided as Appendix A. The scope consists of the collection and laboratory analysis of soil, groundwater, and soil vapor samples from the areas of proposed soil disturbance and includes:

- A geophysical survey to search for potential USTs (and to clear boring locations);
- The advancement of 15 borings with the collection of up to 30 soil samples;
- The retrofitting of 6 of the borings with temporary wells (if groundwater is encountered before the shallow bedrock interface) with the collection of a groundwater sample from each; and
- The installation of 10 soil vapor probes with the collection of one soil vapor sample from each.

Based on the results of the 2018 geotechnical investigation, it should be noted that the surface of bedrock is highly variable beneath the property and groundwater appears to be either perched or flow within bedrock. Therefore, the advancement of deep borings and the collection of two soil samples and/or groundwater samples may not be feasible. Furthermore, due to site access restrictions (i.e., conducting borings within basement and sub-basement areas), the use of larger, more powerful drilling equipment will not be possible, potentially precluding the ability to advance borings to significant depths.

2.1 Geophysical Survey

A geophysical survey will be conducted on accessible portions of the Site prior to drilling to clear the proposed sampling locations for subsurface utilities and to search for potential USTs; depending on site conditions GPR can assist with locating buried tanks and other underground anomalies. The geophysical survey will comprise a ground-penetrating radar (GPR) survey and a magnetometer survey. GPR uses electromagnetic wave propagation and scattering to image and identify changes in electrical and magnetic properties in the ground. The magnetometer survey works on the premise that the subsurface has a relatively static magnetic field, and certain forces interrupt that field. Both systems are widely used for locating utility lines, USTs, etc.

2.2 Borings

AKRF will advance the 15 soil borings (SB-01 through SB-15) using a remote-access Geoprobe® Direct Push Probe (DPP) tool or similar. To the extent feasible, borings will be advanced to approximately 12 feet below the basement (borings SB-01 and SB-13 through SB-15) and up to 7 feet below the sub-basement (borings SB-02 through SB-12) (e.g., the 2-foot interval below the anticipated new foundation excavation depth) or Geoprobe® refusal on bedrock if shallower (it is anticipated that shallow bedrock will be encountered in the borings).

At each location, AKRF field personnel will record and document subsurface conditions. Approximate boring locations are shown on Figure 2; however, locations will be finalized in the

field based on access, utilities, geophysical survey findings, etc. Utility markouts by Dig Safely New York will be requested in advance by the drilling contractor.

2.3 Soil Sampling

Soil cores will be obtained in a stainless steel, macro-core sampler with an internal acetate liner and field-screened using a photoionization detector (PID), which measures relative concentrations of volatile organic compounds (VOCs). Up to two soil samples will be collected from each for laboratory analysis. Samples selected for laboratory analysis will be biased towards any intervals containing urban fill material or evidence of contamination (e.g., staining, odors, elevated PID readings). Absent any such signs, a shallow sample will be collected from the 0 to 2-foot interval and a deeper sample will be collected immediately above the groundwater or bedrock interface or at the bottom of the boring (i.e., the two-foot interval below the anticipated excavation depth). A second sample will only be collected from borings that can be advanced beyond 5 feet. If groundwater or bedrock is encountered at a shallower depth than the proposed maximum excavation depth during borehole advancement, the deeper subsurface soil sample will be collected from the two-foot interval above the groundwater interface or bedrock.

The samples will be analyzed by a New York State Department of Health (NYSDOH)-certified laboratory using Category A deliverables for VOCs by EPA Method 8260, semi-volatile organic compounds (SVOCs) by EPA Method 8270, polychlorinated biphenyls (PCBs) by EPA Method 8082, pesticides by EPA Method 8081, and Target Analyte List (TAL) metals. The samples will be placed in laboratory-supplied containers and shipped in coolers in accordance with EPA protocols. In addition, one trip blank will be collected for quality assurance/quality control (QA/QC) purposes.

2.4 Groundwater Sampling

Samples will be collected from six temporary well points installed in select borings (TW-01, TW-05, TW-10, TW-12, TW-13 and TW-14); no permanent wells will be installed. The anticipated locations are shown on Figure 2. These may be modified, e.g., based on where groundwater is encountered and/or where signs of contamination are noted. It should be noted that shallow bedrock conditions were encountered in the January 2018 Geotechnical Investigation (discussed above in Section 1.4) and, as such, the potential for collecting groundwater samples may be limited. Shallow bedrock conditions (potentially above the water table in the selected or accessible sampling locations) may prevent the collection of groundwater samples altogether.

Samples will be placed in laboratory-supplied containers and shipped in accordance with appropriate EPA protocols to a New York State Department of Health-certified laboratory. The samples will be analyzed for the same parameters as the soil samples with the addition that analyses for metals will be conducted on both filtered and unfiltered samples; filtering will occur in the field using inline filters. After the sampling is completed, boreholes will be patched to surface grade by the drilling contractor.

2.5 Sub-Slab Soil Vapor Sampling

Ten soil vapor samples will be collected from approximately the locations shown on Figure 2. Probes will be installed using the Geoprobe® DPP unit to advance an expendable drive point to approximately 12 feet below the basement and up to 7 feet below the sub-basement (the anticipated foundation depth) or the 2-foot interval above the water table or bedrock interface (if shallower). A six-inch stainless steel screen implant with connected Teflon tubing to grade will be installed through the Geoprobe® rods and threaded into the drive point. Prior to sample collection, purging of three sampler volumes will be conducted using a GilAir pump. During purging, an inverted five-

gallon bucket will be placed over the sampling point and helium gas will be introduced through a small hole in the bucket to saturate the atmosphere around the sample port. Purged vapors will be collected into a Tedlar bag and field-screened for organic vapors using a PID. The purged air will also be monitored using a portable helium detector to check for short-circuiting of ambient air into the vapor sampling point. If the purged soil gas contains greater than 10% helium, additional bentonite will be used to enhance the surface seal, and the point will be retested.

Following purging, each sample will be collected in a six-liter stainless steel Summa canister equipped with a vacuum gauge and a flow controller calibrated for sampling over two hours. Vacuum readings will be collected at the start and end of sampling. At the completion of the sampling, the tubing will be removed and the surface will be restored. Sampling will be in accordance with the October 2006 NYSDOH *Guidance for Evaluating Soil Vapor Intrusion in the State of New York*.

The canisters will be labeled, sealed, shipped to a laboratory, and analyzed for VOCs by EPA Method TO-15.

3.0 QUALITY ASSURANCE/QUALITY CONTROL PLAN

3.1 Laboratory Methods

A New York State-certified (NYSDOH ELAP) laboratory will perform all analytical work. The laboratory will operate a Quality Assurance/Quality Control (QA/QC) program that will consist of proper laboratory practices (including the required chain-of-custody), an internal quality control program, and external quality control audits by New York State.

3.2 Field Quality Control Sampling

For QA/QC purposes, one trip blank will be sent with the collected samples for laboratory analysis. The trip blank would be analyzed for VOCs by EPA Method 8260 to check for contamination during transport or sampling.

3.3 Sample Custody

To ensure the integrity of samples taken, a strict chain of custody record must be maintained on each sample. This begins after sampling with the entry in the sampler's field log book of the sampling details:

a) Date and time of sampling;

b) Sample location (as specific as possible);

c) The unique sample number, size, and container(s) used;

d) Sample description;

e) Weather conditions (if applicable); and

f) Any additional comments.

In addition, a record must be kept of the sample's progress from the sample site to the laboratory where it will be analyzed. This is the chain-of-custody form. The form must include:

a) The sample number;

b) The sampler's name;

c) Date and time of sampling;

d) Location at which the sample was taken, including the address, if possible;

e) A description of the sample, as best known;

f) Signatures of people involved in the chain of possession; and

g) Inclusive dates of possession of each person in the chain.

The chain-of-custody form must accompany the sample throughout its trip to the laboratory. If the sample(s) must be shipped to a laboratory, most shipping agents will refuse to sign or separately carry the chain-of-custody form. In this one case, it is permissible to put the chain-of-custody form into the box with the sample and then seal the box. The recipient of the box, the laboratory's sample custodian, can then attest to the box's arrival still sealed and unopened.

Accompanying the chain-of-custody record, or included in it, must be a request to the laboratory for sample analyses. Information required includes:

a) Name of person receiving the sample;

b) Laboratory sample number;

c) Date of sample receipt;

d) Sample allocation; and

e) Analyses to be performed.

Finally, on arrival at the laboratory, the sample custodian must enter the sample in the laboratory's sample log book. The chain-of-custody should be kept on file at the laboratory.

3.4 Field Decontamination Procedures

To avoid contamination and cross-contamination of samples, all sampling equipment will be cleaned before collection of each sample. The following field procedures will be followed for all samples:

1. Scrub using tap water/Simple Green® mixture and bristle brush
2. Rinse with tap water.
3. Scrub again with tap water/ Simple Green® and bristle brush.
4. Rinse with tap water.
5. Rinse with distilled water.
6. Air dry the equipment.

4.0 REPORT

A subsurface investigation report will be prepared following the completion of the sampling and analysis program at the Site, and will be submitted to NYCDEP for approval. The report will include an executive summary, describe field procedures and observations, include soil boring logs and a Site plan showing sample locations, summarize laboratory analytical results, and discuss the significance of the results (i.e., in comparison to NYSDEC and/or NYSDOH regulatory guidelines). If soil and/or groundwater contamination is discovered, AKRF will provide recommendations for further action.

1.0 INTRODUCTION

The project site consists of Lenox Hill Hospital (LHH's) existing campus on the block bounded by Park and Lexington Avenues and East 76th and East 77th Streets (Block 1411, Lots 1 and 113) (aka Projected Development Site 1) and three buildings on the north side of East 77th Street across from the main hospital complex (Block 1412, Lots 9, 10, and 11) (aka Projected Development Site 1a). The proposed redevelopment of the Site would entail demolition of portions of the current hospital and renovations of existing structures for a new state-of-the-art hospital facility (to occur in multiple stages).

The subsurface investigation will include the collection of soil, groundwater, and soil vapor samples. This environmental Health and Safety Plan (HASP) has been developed for implementation during Site investigation activities conducted by all personnel on-site, both AKRF employees and others. This HASP does not discuss routine health and safety issues common to general construction/excavation, including but not limited to slips, trips, falls, shoring, and other physical hazards.

All AKRF employees are directed that all work must be performed in accordance with the Company's Generic HASP and all OSHA applicable regulations for the work activities required for the project. All project personnel are furthermore directed that they are not permitted to enter Permit Required Confined Spaces (as defined by OSHA). For issues unrelated to contaminated materials, all non-AKRF employees are to be bound by all applicable OSHA regulations as well as any more stringent requirements specified by their employer in their corporate HASP or otherwise. AKRF is not responsible for providing oversight for issues unrelated to contaminated materials for non-employees. This oversight shall be the responsibility of the employer of that worker or other official designated by that employer.

2.1.4 Chemicals of Concern

Chemicals	REL/PEL/STEL	Health Hazards
Arsenic	REL= 0.002 mg/m^3 PEL= 0.010 mg/ m3	Irritation skin, possible dermatitis; respiratory distress; diarrhea; kidney damage; muscle tremor, convulsions; possible gastrointestinal tract, reproductive effects; possible liver damage
Barium	REL = 0.5 mg/m^3 PEL = 0.5 mg/m^3	Gastrointestinal disturbances and muscular weakness, vomiting, abdominal cramps, diarrhea, difficulties in breathing, increased or decreased blood pressure, numbness around the face, and muscle weakness
Benzene	REL = 0.1 ppm PEL = 1 ppm STEL = 5 ppm	Irritation eyes, skin, nose, respiratory system; dizziness; headache, nausea, staggered gait; anorexia, lassitude, dermatitis; bone marrow depression, potential occupational carcinogen.
Toluene	REL = 100 ppm PEL = 200 ppm STEL = 300 ppm	Irritation eyes, nose; lassitude, confusion, euphoria, dizziness, headache; dilated pupils, lacrimation (discharge of tears); anxiety, muscle fatigue, insomnia; paresthesia (skin tingling or numbness); dermatitis; liver, kidney damage.
Ethylbenzene	REL = 100 ppm PEL = 100 ppm	Irritation eyes, skin, mucous membrane; headache; dermatitis; narcosis, coma.
Xylenes	REL = 100 ppm PEL = 100 ppm	Irritation eyes, skin, nose, throat; dizziness, excitement, drowsiness, poor coordination, staggering gait; corneal vacuolization; anorexia, nausea, vomiting, abdominal pain; dermatitis.
Naphthalene	REL = 10 ppm PEL = 10 ppm	Irritation eyes; headache, confusion, excitement, malaise; nausea, vomiting, abdominal pain; irritation bladder; profuse sweating; jaundice; hematuria (blood in the urine), renal shutdown; dermatitis, optical neuritis, corneal damage.
Fuel Oil	REL = 350 mg/m^3 PEL = 400 ppm	Nausea, irritation – eyes, hypertension, headache, light-headedness, loss of appetite, poor coordination; long-term exposure – kidney damage, blood clotting problems; potential carcinogen.
Methyl Tert Butyl Ether (MTBE)	REL = 40 ppm	Headaches, nausea, dizziness, mental confusion, gastrointestinal irritation, liver and kidney damage, and nervous system effects
Mercury	REL = 0.05 mg/m^3 PEL = 0.1 mg/m^3	Irritation eyes, skin; cough, chest pain, dyspnea (breathing difficulty), bronchitis, pneumonitis; tremor, insomnia, irritability, indecision, headache, lassitude (weakness, exhaustion); stomatitis, salivation; gastrointestinal disturbance, anorexia, weight loss; proteinuria
Lead	REL=0.1 mg/m^3 PEL=0.05 mg/m^3	Weakness, lassitude, insomnia; facial pallor, pale eye, anorexia, low-weight, malnutrition, constipation, abdominal pain, colic; anemia; gingival lead line; tremors, paralysis wrists and ankles; encephalopathy; kidney disease; irritation eyes; hypotension.
Polycyclic Aromatic Hydrocarbons (PAHs)	PEL = 5 mg/m^3	Harmful effects to skin, bodily fluids, and ability to fight disease, reproductive problems; [potential occupational carcinogen]
PCBs	PCB-1242: REL = 1 mg/m^3 PEL = 0.001 mg/m^3 PCB-1254: REL = 0.5 mg/m^3 PEL = 0.001 mg/m^3	Rash; anemia, liver, stomach, thyroid damage; reduced ability to fight disease; impaired reproduction
Tetrachlorethylene (PCE)	PEL = 100 ppm STEL = 200 ppm	Irritation eyes, skin, nose, throat, respiratory system; nausea; flush face, neck; dizziness, poor coordination; headache, drowsiness; skin erythema (skin redness); liver damage; potential occupational carcinogen
Trichloroethylene (TCE)	REL = 25 ppm	Headaches, lung irritation, dizziness, poor coordination,

Chemicals	REL/PEL/STEL	Health Hazards
	PEL = 100 ppm	impaired heart function, unconsciousness, and nerve, kidney and liver damage.
DDT	REL=0.5 mg/m^3 PEL=1 mg/m^3	Tremors, headaches, nausea, and seizures
Dieldrin	REL=0.25 mg/m^3 PEL=0.25 mg/m^3	Central nervous system excitation culminating in convulsions and death
Comments: REL = NIOSH Recommended Exposure Limit PEL = OSHA Permissible Exposure Limit STEL = OSHA Short Term Exposure Limit ppm = parts per million mg/m^3 = milligrams per cubic meter		

2.2 Designated Personnel

AKRF will appoint one of its on-site personnel as the Site Safety Officer (SSO). This individual will be responsible for the implementation of the HASP. The SSO will work under the direction of a Qualified Environmental Professional (QEP) and will be experienced. Health and safety training required for the SSO and all field personnel are outlined in Section 2.3 of this HASP.

2.3 Training

All personnel who enter the work area while intrusive activities are being performed will have completed a 40-hour training course that meets OSHA requirements of 29 CFR Part 1910, Occupational Safety and Health Standards. In addition, all personnel will have up-to-date 8-hour refresher training. The training will allow personnel to recognize and understand the potential hazards to health and safety. All field personnel must attend a training program, whose purpose is to:

- Make them aware of the potential hazards they may encounter;
- Provide the knowledge and skills necessary for them to perform the work with minimal risk to health and safety; Make them aware of the purpose and limitations of safety equipment; and
- Ensure that they can safely avoid or escape from emergencies.

Each member of the field crew will be instructed in these objectives before he/she goes onto the Site. A site safety meeting will be conducted at the start of the project. Additional meetings shall be conducted, as necessary, for new personnel working at the Site.

2.4 Medical Surveillance Program

All AKRF personnel performing field work involving subsurface disturbance at the Site are required to have passed a complete medical surveillance examination in accordance with 29 CFR 1910.120 (f). A physician's medical release for work will be confirmed by the SSO before an employee can begin site activities. The medical release shall consider the type of work to be performed and the required personal protective equipment (PPE). The medical examination will, at a minimum, be provided annually and upon termination of hazardous waste site work.

2.5 Site Work Zones

During any activities involving subsurface disturbance, the work area must be divided into various zones to prevent the spread of contamination, ensure that proper protective equipment is donned, and provide an area for decontamination.

The Exclusion Zone is defined as the area where exposure to impacted media could be encountered. The Contamination Reduction Zone (CRZ) is the area where decontamination procedures take place and is located next to the Exclusion Zone. The Support is the zone area where support facilities such as vehicles, fire extinguisher, and first aid supplies are located. The emergency staging area (part of the Support Zone) is the area where all workers on-site would assemble in the event of an emergency. A summary of these areas is provided below. These zones may changed by SSO, depending on that day's activities. All field personnel will be informed of the location of these zones before work begins.

Task	Exclusion Zone	CRZ	Support Zone
Soil Borings and Soil Vapor Point Installation	10 ft from drill rig	25 ft from drill rig	As Needed
Comments: Control measures such as "caution tape" and/or traffic cones will be placed around the perimeter of the work area when work is being done in a public area.			

2.6 Air Monitoring

The purpose of the air monitoring program is to identify any exposure of the field personnel to potential environmental hazards in the soil and groundwater. Results of the air monitoring will be used to determine the appropriate response action, if needed.

2.6.1 Volatile Organic Compounds

A photoionization detector (PID) will be used to perform air monitoring during soil disturbance activities to determine airborne levels of total VOCs. The PID will be calibrated at the start of the workday with a 100 ppm isobutylene standard.

2.6.2 Work Zone Air Monitoring

Real time air monitoring will be performed with the PID. Measurements will be taken prior to commencement of work and continuously during the work, as outlined in the following table. Measurements will be made as close to the workers as practicable and at the breathing height of the workers. The SSO shall set up the equipment and confirm that it is working properly. His/her designee may oversee the air measurements during the day. The initial measurement for the day will be performed before the start of work and will establish the background level for that day. The final measurement for the day will be performed after the end of work. The action levels and required responses are listed in the following table.

Instrument	Action Level	Response Action
PID	Less than 10 ppm in breathing zone	Level D or D-Modified
	Between 10 ppm and 20 ppm	Level C
	More than 20 ppm	Stop work. Resume work when readings are less then 20 ppm.

2.7 Personal Protection Equipment

The personal protection equipment required for various kinds of site investigation tasks are based on 29 CFR 1910.120, Hazardous Waste Operations and Emergency Response, Appendix B, "General Description and Discussion of the Levels of Protection and Protective Gear."

AKRF field personnel and other site personnel shall wear, at a minimum, Level D personal protective equipment. The protection will be based on the air monitoring described in Section 2.6.

Level of Protection and PPE		All Tasks
Level D (**X**) Steel Toe Shoes (**X**) Hard Hat (within 25 ft of drill rig) (**X**) Work Gloves	(**X**) Safety Glasses ( ) Face Shield (**X**) Ear Plugs (within 25 ft of drill rig) (**X**) Nitrile Gloves (**X**) Tyvek for drill operator if NAPL present	Yes
Level C ***(in addition to Level D)*** (**X**) Half-Face Respirator OR (**X**) Full Face Respirator ( ) Full-Face PAPR	( ) Particulate Cartridge ( ) Organic Cartridge (**X**) Dual Organic/ Particulate Cartridge	If PID > 10 ppm (breathing zone)
Comments: Cartridges to be changed out at least once per shift unless warranted beforehand (e.g., more difficult to breathe or any odors detected).		

2.8 General Work Practices

To protect the health and safety of the field personnel, field personnel will adhere to the guidelines listed below during activities involving subsurface disturbance:

- Eating, drinking, chewing gum or tobacco, and smoking are prohibited, except in designated areas on the Site. These areas will be designated by the SSO.
- Workers must wash their hands thoroughly on leaving the work area and before eating, drinking, or any other such activity.
- The workers should shower as soon as possible after leaving the Site. Contact with contaminated or suspected surfaces should be avoided.
- The buddy system should always be used; each buddy should watch for signs of fatigue, exposure, and heat/cold stress.

3.0 EMERGENCY PROCEDURES AND EMERGENCY RESPONSE PLAN

The field crew will be equipped with emergency equipment, such as a first aid kit and disposable eye washes. In the case of a medical emergency, the SSO will determine the nature of the emergency and he/she will have someone call for an ambulance, if needed. If the nature of the injury is not serious, i.e., the person can be moved without expert emergency medical personnel, he/she should be taken to a hospital by on-site personnel. Directions to the hospital are provided below, and a hospital route map is attached.

3.1 HOSPITAL DIRECTIONS

Hospital Name:	Lenox Hill Hospital Emergency Medicine Department
Phone Number:	(212) 434-3030
Address/Location:	100 East 77th Street (The Emergency Department is located on East 77th Street between Park Avenue and Lexington Avenue)
Directions:	1. Turn LEFT on East 77th Street toward Park Avenue 2. The Emergency Department entrance will be on the LEFT.

3.2 EMERGENCY CONTACTS

Company	Individual Name	Title	Contact Number
AKRF	Neoma Chefalo	Project Manager	646-388-9854 (office)
	Axel Schwendt	Project Manager Alternate	646-388-9529 (office)
	Stephen Grens	SSO	203-810-6513 (cell)
	Steve Schmid	Alternate SSO	646-388-9557 (cell)
Northwell Health Facilities Services	Jonathan Cogswell	Project Representative	(212) 434-2349 – office
Ambulance, Fire Department & Police Department	-	-	911
NYSDEC Spill Hotline	-	-	800-457-7362

4.0 APPROVAL & ACKNOWLEDGMENTS OF HASP

APPROVAL

Signed: _____ Date: _____

AKRF Project Manager

Signed: _____ Date: _____

AKRF Health and Safety Officer

Below is an affidavit that must be signed by all workers who enter the Site. A copy of the HASP must be on-site at all times and will be kept by the SSO.

AFFIDAVIT

I,_____(name), of_____(company name), have read the Health and Safety Plan (HASP) for the LHH Redevelopment Site. I agree to conduct all on-site work in accordance with the requirements set forth in this HASP and understand that failure to comply with this HASP could lead to my removal from the Site.

APPENDIX A

POTENTIAL HEALTH EFFECTS FROM ON-SITE CONTAMINANTS

Aldrin and Dieldrin - ToxFAQs™

What are aldrin and dieldrin?

Aldrin and dieldrin are insecticides (products that kill insects) that are very similar. They are also called pesticides because they kill insects that are pests, such as termites. Pure aldrin and dieldrin are white powders with a mild chemical odor. They are not found naturally in the environment. Aldrin quickly breaks down to dieldrin in the body and also in the environment.

Aldrin and dieldrin were widely used as pesticides for crops like corn, cotton, and citrus fruit from the 1950s until 1970. They were also used to control termites until 1989. These chemicals have not been manufactured or approved for used since 1990.

What happens to aldrin and dieldrin in the environment?

Low levels of aldrin and dieldrin have been measured in soil, sediment, surface water, and groundwater. Sunlight and bacteria change aldrin to dieldrin so that we mostly find dieldrin in the environment.

Aldrin and dieldrin bind tightly to soil and slowly evaporate to the air. Dieldrin in soil and water breaks down very slowly. Plants take in and store aldrin and dieldrin from the soil.

How can I be exposed to aldrin and dieldrin?

Most people are not likely to be exposed to aldrin and dieldrin. The most likely way you could be exposed to small amounts of these chemicals is from eating food (root crops, dairy products, and meat) grown in contaminated soil, drinking contaminated water, or possibly through lactation. Homes treated for termites before 1989 with aldrin or dieldrin may still have low levels of these chemicals in the soil. In these cases, there is a potential for movement from soil into indoor air through cracks and crevices in foundation structure. If you live near a hazardous waste site, you might be exposed to aldrin and dieldrin from contaminated air, dirt, or water.

Most people are not likely to be exposed to aldrin or dieldrin

How can aldrin and dieldrin affect my health?

People who on purpose or accidently ate large amounts of aldrin or dieldrin have suffered convulsions (spasms), and some died. Workers who were exposed to lower amounts of these chemicals, but for a longer period of time, had headaches, dizziness, irritability, vomiting, and uncontrolled muscle movement. Once they were away from exposure to these chemicals, the workers got better quickly. Because these chemicals can build up in the body, health effects can happen after a longer period of exposure, even to smaller amounts.

In animal studies, animals fed high and low amounts of aldrin or dieldrin had convulsions, tremors, learning problems, liver damage, and reproduction problems. When pregnant animals were fed aldrin or dieldrin, their pups (babies) were less likely to survive. It is not known if these same effects would happen in people. The amount of aldrin or dieldrin that causes these effects in animals is much higher than is expected to be found in the environment.

Aldrin and Dieldrin

Can aldrin and dieldrin cause cancer?

In animals, aldrin and dieldrin have been shown to cause liver cancer when fed to mice.

The U.S. Department of Health and Human Services (DHHS) has not evaluated the carcinogenicity of aldrin or dieldrin.

The U.S. Environmental Protection Agency (EPA) has classified aldrin and dieldrin as *probable human carcinogens* (Group B2).

The International Agency for Research on Cancer (IARC) has categorized dieldrin and aldrin metabolized to dieldrin as *probably carcinogenic to humans* (Group 2A).

Can I get a medical test to check for exposure to aldrin and dieldrin?

Aldrin is quickly changed into dieldrin in the body, so the amount of dieldrin is usually measured. Tests to measure the amount of dieldrin in the blood might help see if someone was exposed.

These tests cannot predict whether you will have health problems from the exposure to aldrin or dieldrin. Doctor's offices do not routinely offer these tests. If you think you have been exposed, call your doctor, nurse, or poison control.

How can I protect myself and my family from aldrin and dieldrin?

Most people don't need to take any special steps to avoid aldrin and dieldrin in their daily lives. People living near sites contaminated with aldrin or dieldrin can reduce their exposure by washing their hands, scrubbing vegetables grown close to the ground, and limiting intake of vegetables grown in contaminated soil. Keep children from playing in the dirt or water near hazardous waste sites to avoid coming in contact with these chemicals.

Arsenic - ToxFAQs™

CAS # 7440-38-2

This fact sheet answers the most frequently asked health questions (FAQs) about arsenic. For more information, call the CDC Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to higher than average levels of arsenic occur mostly in the workplace, near hazardous waste sites, or in areas with high natural levels. At high levels, inorganic arsenic can cause death. Exposure to lower levels for a long time can cause a discoloration of the skin and the appearance of small corns or warts. Arsenic has been found in at least 1,149 of the 1,684 National Priority List (NPL) sites identified by the Environmental Protection Agency (EPA).

What is arsenic?

Arsenic is a naturally occurring element widely distributed in the earth's crust. In the environment, arsenic is combined with oxygen, chlorine, and sulfur to form inorganic arsenic compounds. Arsenic in animals and plants combines with carbon and hydrogen to form organic arsenic compounds.

Inorganic arsenic compounds are mainly used to preserve wood. Copper chromated arsenate (CCA) is used to make "pressure-treated" lumber. CCA is no longer used in the U.S. for residential uses; it is still used in industrial applications. Organic arsenic compounds are used as pesticides, primarily on cotton fields and orchards.

What happens to arsenic when it enters the environment?

- Arsenic occurs naturally in soil and minerals and may enter the air, water, and land from wind-blown dust and may get into water from runoff and leaching.
- Arsenic cannot be destroyed in the environment. It can only change its form.
- Rain and snow remove arsenic dust particles from the air.
- Many common arsenic compounds can dissolve in water. Most of the arsenic in water will ultimately end up in soil or sediment.
- Fish and shellfish can accumulate arsenic; most of this arsenic is in an organic form called arsenobetaine that is much less harmful.

How might I be exposed to arsenic?

- Ingesting small amounts present in your food and water or breathing air containing arsenic.
- Breathing sawdust or burning smoke from wood treated with arsenic.
- Living in areas with unusually high natural levels of arsenic in rock.
- Working in a job that involves arsenic production or use, such as copper or lead smelting, wood treating, or pesticide application.

How can arsenic affect my health?

Breathing high levels of inorganic arsenic can give you a sore throat or irritated lungs.

Ingesting very high levels of arsenic can result in death. Exposure to lower levels can cause nausea and vomiting, decreased production of red and white blood cells, abnormal heart rhythm, damage to blood vessels, and a sensation of "pins and needles" in hands and feet.

Ingesting or breathing low levels of inorganic arsenic for a long time can cause a darkening of the skin and the appearance of small "corns" or "warts" on the palms, soles, and torso.

Skin contact with inorganic arsenic may cause redness and swelling.

Almost nothing is known regarding health effects of organic arsenic compounds in humans. Studies in animals show that some simple organic arsenic

Arsenic

CAS # 7440-38-2

compounds are less toxic than inorganic forms. Ingestion of methyl and dimethyl compounds can cause diarrhea and damage to the kidneys.

How likely is arsenic to cause cancer?

Several studies have shown that ingestion of inorganic arsenic can increase the risk of skin cancer and cancer in the liver, bladder, and lungs. Inhalation of inorganic arsenic can cause increased risk of lung cancer. The Department of Health and Human Services (DHHS) and the EPA have determined that inorganic arsenic is a known human carcinogen. The International Agency for Research on Cancer (IARC) has determined that inorganic arsenic is carcinogenic to humans.

How can arsenic affect children?

There is some evidence that long-term exposure to arsenic in children may result in lower IQ scores. There is also some evidence that exposure to arsenic in the womb and early childhood may increase mortality in young adults.

There is some evidence that inhaled or ingested arsenic can injure pregnant women or their unborn babies, although the studies are not definitive. Studies in animals show that large doses of arsenic that cause illness in pregnant females, can also cause low birth weight, fetal malformations, and even fetal death. Arsenic can cross the placenta and has been found in fetal tissues. Arsenic is found at low levels in breast milk.

How can families reduce the risks of exposure to arsenic?

- If you use arsenic-treated wood in home projects, you should wear dust masks, gloves, and protective clothing to decrease exposure to sawdust.
- If you live in an area with high levels of arsenic in water or soil, you should use cleaner sources of water and limit contact with soil.
- If you work in a job that may expose you to arsenic, be aware that you may carry arsenic home on your clothing, skin, hair, or tools. Be sure to shower and change clothes before going home.

Is there a medical test to determine whether I've been exposed to arsenic?

There are tests available to measure arsenic in your blood, urine, hair, and fingernails. The urine test is the most reliable test for arsenic exposure within the last few days. Tests on hair and fingernails can measure exposure to high levels of arsenic over the past 6-12 months. These tests can determine if you have been exposed to above-average levels of arsenic. They cannot predict whether the arsenic levels in your body will affect your health.

Has the federal government made recommendations to protect human health?

The EPA has set limits on the amount of arsenic that industrial sources can release to the environment and has restricted or cancelled many of the uses of arsenic in pesticides. EPA has set a limit of 0.01 parts per million (ppm) for arsenic in drinking water.

The Occupational Safety and Health Administration (OSHA) has set a permissible exposure limit (PEL) of 10 micrograms of arsenic per cubic meter of workplace air (10 $\mu g/m^3$) for 8 hour shifts and 40 hour work weeks.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

BARIUM

CAS # 7440-39-3

Division of Toxicology and Human Health Sciences ToxFAQs™ **June 2013**

This fact sheet answers the most frequently asked health questions (FAQs) about barium and barium compounds. For more information, call the ATSDR Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because these substances may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to barium occurs mostly in the workplace or from drinking contaminated water. Ingesting drinking water containing levels of barium above the EPA drinking water guidelines for relatively short periods of time can cause gastrointestinal disturbances and muscle weakness. Ingesting high levels for a long time can damage the kidneys. Barium and barium compounds have been found in at least 798 of the 1,684 National Priority List sites identified by the Environmental Protection Agency (EPA).

What is barium?

Barium is a silvery-white metal which exists in nature only in ores containing mixtures of elements. It combines with other chemicals such as sulfur or carbon and oxygen to form barium compounds.

Barium compounds are used by the oil and gas industries to make drilling muds. Drilling muds make it easier to drill through rock by keeping the drill bit lubricated. They are also used to make paint, bricks, ceramics, glass, and rubber.

Barium sulfate is sometimes used by doctors to perform medical tests and to take x-rays of the gastrointestinal tract.

What happens to barium when it enters the environment?

- Barium gets into the air during the mining, refining, and production of barium compounds, and from the burning of coal and oil.
- The length of time that barium will last in air, land, water, or sediments depends on the form of barium released.
- Barium compounds, such as barium sulfate and barium carbonate, which do not dissolve well in water, can last a long time in the environment.
- Barium compounds, such as barium chloride, barium nitrate, or barium hydroxide, that dissolve easily in water usually do not last in these forms for a long time in the environment. The barium in these compounds that is dissolved in water quickly combines with sulfate or carbonate that are naturally found in water and become the longer lasting forms (barium sulfate and barium carbonate).
- Fish and aquatic organisms can accumulate barium.

How might I be exposed to barium?

- Ingesting small amounts present in your food and water or breathing air containing very low levels of barium.
- Living in areas with unusually high natural levels of barium in the drinking water.
- Working in a job that involves barium production or use.
- Living or working near waste sites where barium has been disposed of.

How can barium affect my health?

The health effects of the different barium compounds depend on how well the compound dissolves in water or in the stomach contents. Barium compounds that do not dissolve well, such as barium sulfate, are not generally harmful.

Barium has been found to potentially cause gastrointestinal disturbances and muscular weakness when people are exposed to it at levels above the EPA drinking water standards for relatively short periods of time. Some people who eat or drink amounts of barium above background levels found in food and water for a short period may experience vomiting, abdominal cramps, diarrhea, difficulties in breathing, increased or decreased blood pressure, numbness around the face, and muscle weakness. Eating or drinking very large amounts of barium compounds that easily dissolve can cause changes in heart

rhythm or paralysis and possibly death. Animals that drank barium over long periods had damage to the kidneys, decreases in body weight, and some died.

How likely is barium to cause cancer?
The Department of Health and Human Services (DHHS) and the International Agency for Research on Cancer (IARC) have not classified barium as to its carcinogenicity. The EPA has determined that barium is not likely to be carcinogenic to humans following ingestion and that there is insufficient information to determine whether it will be carcinogenic to humans following inhalation exposure.

How can barium affect children?
We do not know whether children will be more or less sensitive than adults to barium toxicity. A study in rats that swallowed barium found a decrease in newborn body weight; we do not know if a similar effect would be seen in humans.

How can families reduce the risk of exposure to barium?
- The greatest potential source of barium exposure is through food and drinking water. However, the amount of barium in foods and drinking water are typically too low to be of concern.

Is there a medical test to determine whether I've been exposed to barium?
There is no routine medical test to determine whether you have been exposed to barium. Doctors can measure barium in body tissues and fluids, such as bones, blood, urine, and feces, using very complex instruments. These tests cannot be used to predict the extent of the exposure or potential health effects.

The geometric mean barium level measured in the U.S. general population aged 6 and older is reported by the Centers for Disease Control and Prevention (CDC) as 1.56 µg/g creatinine (measured in urine).

Has the federal government made recommendations to protect human health?
The EPA has set a limit of 2.0 milligrams of barium per liter of drinking water (2.0 mg/L), which is the same as 2 ppm.

The Occupational Safety and Health Administration (OSHA) has set Permissible Exposure Limits (PELs) of 0.5 milligrams of soluble barium compounds per cubic meter of workplace air (0.5 mg/m^3) for 8 hour shifts and 40 hour work weeks. The OSHA limits for barium sulfate dust are 15 mg/m^3 of total dust and 5 mg/m^3 for respirable fraction.

The National Institute for Occupational Safety and Health (NIOSH) has set Recommended Exposure Limits (RELs) of 0.5 mg/m^3 for soluble barium compounds. The NIOSH has set RELs of 10 mg/m^3 (total dust) for barium sulfate and 5 mg/m^3 (respirable fraction).

DDT, DDE, and DDD - ToxFAQs™

What are DDT, DDE, and DDD?

DDT (dichlorodiphenyltrichloroethane) is a man-made chemical that does not occur naturally in the environment. It is a white, crystalline solid with no odor or taste. DDE (dichlorodiphenyldichloroethylene) and DDD (dichlorodiphenyldichloroethane) are chemicals similar to DDT that can form when DDT breaks down.

DDT is a pesticide that was once widely used to control insects in agriculture and insects that carry diseases such as malaria. Its use was banned in 1972 because of damage to wildlife but is still used in a limited number of countries where diseases such as malaria are a major health problem. DDE has no commercial use. DDD was also used to kill pests, but its use has also been banned. One form of DDD has been used to treat cancer of the adrenal gland.

What happens to DDT, DDE, and DDD in the environment?

DDT can get into the environment when it is used as a pesticide. DDE and DDD form when DDT breaks down. These chemicals can evaporate into the air from water and moist soil and may then be carried to locations very far from the original source. They can be removed from the air by rain and snow or be broken down by sunlight. DDT, DDE, and DDD stick strongly to the soil and are not likely to move into the groundwater. Microorganisms in the soil slowly break down DDT (it can take anywhere from 2 to 15 years to break down half of the DDT). DDT does not dissolve easily in water and is mostly found in the sediment on the bottom of bodies of water. DDT, DDE, and DDD can build up in plants and animals.

How can I be exposed to DDT, DDE, and DDD?

Most people are not likely to be exposed to DDT, DDE, or DDD. The most common way to be exposed to small amounts of these chemicals is from eating contaminated food such as meat, fish, poultry, and dairy products. If you live near a hazardous waste site, you might be exposed to DDT, DDE, and DDD from contaminated air, dirt, or water.

Since DDT was banned in 1972, exposure to DDT, DDE, and DDD has decreased dramatically. Small amounts may still be found in some food.

How can DDT, DDE, and DDD affect my health?

People who accidentally swallowed large amounts of DDT had tremors, headaches, nausea, and seizures. These effects went away after the exposure stopped. No effects were seen in volunteers who took a small daily dose of DDT by capsule for 18 months. Studies have shown that women with high amounts of DDE in their blood were more likely to have a premature baby or a baby with a wheeze. Exposure to DDT may also increase chances of developing Type II diabetes mellitus in some groups of people.

Animal studies generally used higher amounts of DDT, DDE, and DDD than you would likely be exposed to in the United States. In studies where animals were fed DDT, DDE, or DDD, harmful effects were seen on their nervous system, liver, and reproductive system (including decreased fertility).

DDT, DDE, and DDD

Can DDT, DDE, and DDD cause cancer?

Studies have shown that people with higher levels of DDT in their blood have an increased risk of developing liver cancer. Liver cancer was also seen in animals that were fed DDT over a long period of time.

The U.S. Department of Health and Human Services (DHHS) has determined that DDT may reasonably be anticipated to be a human carcinogen (causing cancer in people).

The U.S. Environmental Protection Agency (EPA) has classified DDT, DDE, and DDD as probable human carcinogens.

The International Agency for Research on Cancer (IARC) determined DDT may possibly cause cancer in humans.

Can I get a medical test to check for DDT, DDE, and DDD?

Tests are available to measure levels of DDT, DDE, and DDD in the blood, hair, and breast milk.

These tests cannot predict whether you will have health problems from the exposure to DDT, DDE, and DDD. Doctor's offices do not routinely offer these tests.

How can I protect myself and my family from DDT, DDE, and DDD?

Most people don't need to take any special steps to avoid DDT, DDE, and DDD in their daily lives. Washing fruits and vegetable that come from foreign countries will remove most DDT if any is present. Children should avoid playing in dirt or water near hazardous waste sites to avoid coming in contact with these chemicals.

Follow health advisories that tell you about consumption of fish and wildlife caught in contaminated areas.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

BENZENE
CAS # 71-43-2

This fact sheet answers the most frequently asked health questions (FAQs) about benzene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Benzene is a widely used chemical formed from both natural processes and human activities. Breathing benzene can cause drowsiness, dizziness, and unconsciousness; long-term benzene exposure causes effects on the bone marrow and can cause anemia and leukemia. Benzene has been found in at least 813 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is benzene?

(Pronounced bĕn′zēn′)

Benzene is a colorless liquid with a sweet odor. It evaporates into the air very quickly and dissolves slightly in water. It is highly flammable and is formed from both natural processes and human activities.

Benzene is widely used in the United States; it ranks in the top 20 chemicals for production volume. Some industries use benzene to make other chemicals which are used to make plastics, resins, and nylon and synthetic fibers. Benzene is also used to make some types of rubbers, lubricants, dyes, detergents, drugs, and pesticides. Natural sources of benzene include volcanoes and forest fires. Benzene is also a natural part of crude oil, gasoline, and cigarette smoke.

What happens to benzene when it enters the environment?

- Industrial processes are the main source of benzene in the environment.
- Benzene can pass into the air from water and soil.
- It reacts with other chemicals in the air and breaks down within a few days.
- Benzene in the air can attach to rain or snow and be carried back down to the ground.
- It breaks down more slowly in water and soil, and can pass through the soil into underground water.
- Benzene does not build up in plants or animals.

How might I be exposed to benzene?

- Outdoor air contains low levels of benzene from tobacco smoke, automobile service stations, exhaust from motor vehicles, and industrial emissions.
- Indoor air generally contains higher levels of benzene from products that contain it such as glues, paints, furniture wax, and detergents.
- Air around hazardous waste sites or gas stations will contain higher levels of benzene.
- Leakage from underground storage tanks or from hazardous waste sites containing benzene can result in benzene contamination of well water.
- People working in industries that make or use benzene may be exposed to the highest levels of it.
- A major source of benzene exposures is tobacco smoke.

How can benzene affect my health?

Breathing very high levels of benzene can result in death, while high levels can cause drowsiness, dizziness, rapid heart rate, headaches, tremors, confusion, and unconsciousness. Eating or drinking foods containing high levels of benzene can cause vomiting, irritation of the stomach, dizziness, sleepiness, convulsions, rapid heart rate, and death.

ToxFAQs Internet address via WWW is http://www.atsdr.cdc.gov/toxfaq.html

The major effect of benzene from long-term (365 days or longer) exposure is on the blood. Benzene causes harmful effects on the bone marrow and can cause a decrease in red blood cells leading to anemia. It can also cause excessive bleeding and can affect the immune system, increasing the chance for infection.

Some women who breathed high levels of benzene for many months had irregular menstrual periods and a decrease in the size of their ovaries. It is not known whether benzene exposure affects the developing fetus in pregnant women or fertility in men.

Animal studies have shown low birth weights, delayed bone formation, and bone marrow damage when pregnant animals breathed benzene.

How likely is benzene to cause cancer?

The Department of Health and Human Services (DHHS) has determined that benzene is a known human carcinogen. Long-term exposure to high levels of benzene in the air can cause leukemia, cancer of the blood-forming organs.

Is there a medical test to show whether I've been exposed to benzene?

Several tests can show if you have been exposed to benzene. There is test for measuring benzene in the breath; this test must be done shortly after exposure. Benzene can also be measured in the blood, however, since benzene disappears rapidly from the blood, measurements are accurate only for recent exposures.

In the body, benzene is converted to products called metabolites. Certain metabolites can be measured in the urine. However, this test must be done shortly after exposure and is not a reliable indicator of how much benzene you have been exposed to, since the metabolites may be present in urine from other sources.

Has the federal government made recommendations to protect human health?

The EPA has set the maximum permissible level of benzene in drinking water at 0.005 milligrams per liter (0.005 mgL). The EPA requires that spills or accidental releases into the environment of 10 pounds or more of benzene be reported to the EPA.

The Occupational Safety and Health Administration (OSHA) has set a permissible exposure limit of 1 part of benzene per million parts of air (1 ppm) in the workplace during an 8-hour workday, 40-hour workweek.

Glossary

Anemia: A decreased ability of the blood to transport oxygen.

Carcinogen: A substance with the ability to cause cancer.

CAS: Chemical Abstracts Service.

Chromosomes: Parts of the cells responsible for the development of hereditary characteristics.

Metabolites: Breakdown products of chemicals.

Milligram (mg): One thousandth of a gram.

Pesticide: A substance that kills pests.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

ETHYLBENZENE
CAS # 100-41-4

Agency for Toxic Substances and Disease Registry ToxFAQs **June 1999**

This fact sheet answers the most frequently asked health questions (FAQs) about ethylbenzene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Ethylbenzene is a colorless liquid found in a number of products including gasoline and paints. Breathing very high levels can cause dizziness and throat and eye irritation. Ethylbenzene has been found in at least 731 of the 1,467 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is ethylbenzene?

(Pronounced ĕthʹ əl bĕnʹ zēnʹ)

Ethylbenzene is a colorless, flammable liquid that smells like gasoline. It is found in natural products such as coal tar and petroleum and is also found in manufactured products such as inks, insecticides, and paints.

Ethylbenzene is used primarily to make another chemical, styrene. Other uses include as a solvent, in fuels, and to make other chemicals.

What happens to ethylbenzene when it enters the environment?

- Ethylbenzene moves easily into the air from water and soil.
- It takes about 3 days for ethylbenzene to be broken down in air into other chemicals.
- Ethylbenzene may be released to water from industrial discharges or leaking underground storage tanks.
- In surface water, ethylbenzene breaks down by reacting with other chemicals found naturally in water.
- In soil, it is broken down by soil bacteria.

How might I be exposed to ethylbenzene?

- Breathing air containing ethylbenzene, particularly in areas near factories or highways.
- Drinking contaminated tap water.
- Working in an industry where ethylbenzene is used or made.
- Using products containing it, such as gasoline, carpet glues, varnishes, and paints.

How can ethylbenzene affect my health?

Limited information is available on the effects of ethylbenzene on people's health. The available information shows dizziness, throat and eye irritation, tightening of the chest, and a burning sensation in the eyes of people exposed to high levels of ethylbenzene in air.

Animals studies have shown effects on the nervous system, liver, kidneys, and eyes from breathing ethylbenzene in air.

How likely is ethylbenzene to cause cancer?

The EPA has determined that ethylbenzene is not classifiable as to human carcinogenicity.

ToxFAQs Internet address via WWW is http://www.atsdr.cdc.gov/toxfaq.html

No studies in people have shown that ethylbenzene exposure can result in cancer. Two available animal studies suggest that ethylbenzene may cause tumors.

How can ethylbenzene affect children?

Children may be exposed to ethylbenzene through inhalation of consumer products, including gasoline, paints, inks, pesticides, and carpet glue. We do not know whether children are more sensitive to the effects of ethylbenzene than adults.

It is not known whether ethylbenzene can affect the development of the human fetus. Animal studies have shown that when pregnant animals were exposed to ethylbenzene in air, their babies had an increased number of birth defects.

How can families reduce the risk of exposure to ethylbenzene?

Exposure to ethylbenzene vapors from household products and newly installed carpeting can be minimized by using adequate ventilation.

Household chemicals should be stored out of reach of children to prevent accidental poisoning. Always store household chemicals in their original containers; never store them in containers children would find attractive to eat or drink from, such as old soda bottles. Gasoline should be stored in a gasoline can with a locked cap.

Sometimes older children sniff household chemicals, including ethylbenzene, in an attempt to get high. Talk with your children about the dangers of sniffing chemicals.

Is there a medical test to show whether I've been exposed to ethylbenzene?

Ethylbenzene is found in the blood, urine, breath, and some body tissues of exposed people. The most common way to test for ethylbenzene is in the urine. This test measures substances formed by the breakdown of ethylbenzene. This test needs to be done within a few hours after exposure occurs, because the substances leave the body very quickly.

These tests can show you were exposed to ethylbenzene, but cannot predict the kind of health effects that might occur.

Has the federal government made recommendations to protect human health?

The EPA has set a maximum contaminant level of 0.7 milligrams of ethylbenzene per liter of drinking water (0.7 mg/L).

The EPA requires that spills or accidental releases into the environment of 1,000 pounds or more of ethylbenzene be reported to the EPA.

The Occupational Safety and Health Administration (OSHA) has set an occupational exposure limit of 100 parts of ethylbenzene per million parts of air (100 ppm) for an 8-hour workday, 40-hour workweek.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

FUEL OILS

CAS # 8008-20-6, 70892-10-3, 68476-30-2, 68476-34-6, 68476-31-3

This fact sheet answers the most frequently asked health questions (FAQs) about fuel oils. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Fuel oils are liquid mixtures produced from petroleum, and their use mostly involves burning them as fuels. Drinking or breathing fuel oils may cause nausea or nervous system effects. However, exposure under normal use conditions is not likely to be harmful. Fuel oils have been found in at least 26 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are fuel oils?

(Pronounced fyo͞o′əl oilz)

Fuel oils are a variety of yellowish to light brown liquid mixtures that come from crude petroleum. Some chemicals found in fuel oils may evaporate easily, while others may more easily dissolve in water.

Fuel oils are produced by different petroleum refining processes, depending on their intended uses. Fuel oils may be used as fuel for engines, lamps, heaters, furnaces, and stoves, or as solvents.

Some commonly found fuel oils include kerosene, diesel fuel, jet fuel, range oil, and home heating oil. These fuel oils differ from one another by their hydrocarbon compositions, boiling point ranges, chemical additives, and uses.

What happens to fuel oils when they enter the environment?

- Some chemicals found in fuel oils may evaporate into the air from open containers or contaminated soil or water.
- Some chemicals found in fuel oils may dissolve in water after spills to surface waters or leaks from underground storage tanks.
- Some chemicals found in fuel oils may stick to particles in water, which will eventually cause them to settle to the bottom sediment.
- Some of the chemicals found in fuel oils may be broken down slowly in air, water, and soil by sunlight or small organisms.
- Some of the chemicals found in fuel oils may build up significantly in plants and animals.

How might I be exposed to fuel oils?

- Using a home kerosene heater or stove, or using fuel oils at work.
- Breathing air in home or building basements that has been contaminated with fuel oil vapors entering from the soil.
- Drinking or swimming in water that has been contaminated with fuel oils from a spill or a leaking underground storage tank.
- Touching soil contaminated with fuel oils.
- Using fuel oils to wash paint or grease from skin or equipment.

How can fuel oils affect my health?

Little information is available about the health effects that may be caused by fuel oils. People who use kerosene

stoves for cooking do not seem to have any health problems related to their exposure.

Breathing some fuel oils for short periods may cause nausea, eye irritation, increased blood pressure, headache, lightheadedness, loss of appetite, poor coordination, and difficulty concentrating. Breathing diesel fuel vapors for long periods may cause kidney damage and lower your blood's ability to clot.

Drinking small amounts of kerosene may cause vomiting, diarrhea, coughing, stomach swelling and cramps, drowsiness, restlessness, painful breathing, irritability, and unconsciousness. Drinking large amounts of kerosene may cause convulsions, coma, or death. Skin contact with kerosene for short periods may cause itchy, red, sore, or peeling skin.

How likely are fuel oils to cause cancer?

The International Agency for Research on Cancer (IARC) has determined that some fuel oils (heavy) may possibly cause cancer in humans, but for other fuel oils (light) there is not enough information to make a determination. IARC has also determined that occupational exposures to fuel oils during petroleum refining are probably carcinogenic in humans.

Some studies with mice have suggested that repeated contact with fuel oils may cause liver or skin cancer. However, other mouse studies have found this not to be the case. No studies are available in other animals or in people on the carcinogenic effects of fuel oils.

Is there a medical test to show whether I've been exposed to fuel oils?

There is no medical test that shows if you have been exposed to fuel oils. Tests are available to determine if some of the chemicals commonly found in fuel oils are in your blood. However, the presence of these chemicals in blood may not necessarily mean that you have been exposed to fuel oils.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) and the Air Force Office of Safety and Health (AFOSH) have set a permissible exposure level (PEL) of 400 parts of petroleum distillates per million parts of air (400 ppm) for an 8-hour workday, 40-hour workweek.

The National Institute for Occupational Safety and Health (NIOSH) recommends that average workplace air levels not exceed 350 milligrams of petroleum distillates per cubic meter of air (350 mg/m^3) for a 40-hour workweek.

The Department of Transportation (DOT) lists fuel oils as hazardous materials and, therefore, regulates their transportation.

Glossary

Carcinogenic: Able to cause cancer.

CAS: Chemical Abstracts Service.

Evaporate: To change into a vapor or a gas.

Hydrocarbon: Any compound made up of hydrogen and carbon.

Milligram (mg): One thousandth of a gram.

ppm: Parts per million.

Sediment: Mud and debris that have settled to the bottom of a body of water.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

LEAD

CAS # 7439-92-1

Division of Toxicology and Environmental Medicine ToxFAQs™ **August 2007**

This fact sheet answers the most frequently asked health questions (FAQs) about lead. For more information, call the ATSDR Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to lead can happen from breathing workplace air or dust, eating contaminated foods, or drinking contaminated water. Children can be exposed from eating lead-based paint chips or playing in contaminated soil. Lead can damage the nervous system, kidneys, and reproductive system. Lead has been found in at least 1,272 of the 1,684 National Priority List sites identified by the Environmental Protection Agency (EPA).

What is lead?

Lead is a naturally occurring bluish-gray metal found in small amounts in the earth's crust. Lead can be found in all parts of our environment. Much of it comes from human activities including burning fossil fuels, mining, and manufacturing.

Lead has many different uses. It is used in the production of batteries, ammunition, metal products (solder and pipes), and devices to shield X-rays. Because of health concerns, lead from paints and ceramic products, caulking, and pipe solder has been dramatically reduced in recent years. The use of lead as an additive to gasoline was banned in 1996 in the United States.

What happens to lead when it enters the environment?

- ❏ Lead itself does not break down, but lead compounds are changed by sunlight, air, and water.
- ❏ When lead is released to the air, it may travel long distances before settling to the ground.
- ❏ Once lead falls onto soil, it usually sticks to soil particles.
- ❏ Movement of lead from soil into groundwater will depend on the type of lead compound and the characteristics of the soil.

How might I be exposed to lead?

- ❏ Eating food or drinking water that contains lead. Water pipes in some older homes may contain lead solder. Lead can leach out into the water.
- ❏ Spending time in areas where lead-based paints have been used and are deteriorating. Deteriorating lead paint can contribute to lead dust.
- ❏ Working in a job where lead is used or engaging in certain hobbies in which lead is used, such as making stained glass.
- ❏ Using health-care products or folk remedies that contain lead.

How can lead affect my health?

The effects of lead are the same whether it enters the body through breathing or swallowing. Lead can affect almost every organ and system in your body. The main target for lead toxicity is the nervous system, both in adults and children. Long-term exposure of adults can result in decreased performance in some tests that measure functions of the nervous system. It may also cause weakness in fingers, wrists, or ankles. Lead exposure also causes small increases in blood pressure, particularly in middle-aged and older people and can cause anemia. Exposure to high lead levels can severely damage the brain and kidneys in adults or children and ultimately cause death. In pregnant women, high levels of exposure to lead may cause miscarriage. High-level exposure in men can damage the organs responsible for sperm production.

How likely is lead to cause cancer?

We have no conclusive proof that lead causes cancer in humans. Kidney tumors have developed in rats and mice that had been given large doses of some kind of lead compounds. The Department of Health and Human Services

(DHHS) has determined that lead and lead compounds are reasonably anticipated to be human carcinogens and the EPA has determined that lead is a probable human carcinogen. The International Agency for Research on Cancer (IARC) has determined that inorganic lead is probably carcinogenic to humans and that there is insufficient information to determine whether organic lead compounds will cause cancer in humans.

How can lead affect children?

Small children can be exposed by eating lead-based paint chips, chewing on objects painted with lead-based paint, or swallowing house dust or soil that contains lead.

Children are more vulnerable to lead poisoning than adults. A child who swallows large amounts of lead may develop blood anemia, severe stomachache, muscle weakness, and brain damage. If a child swallows smaller amounts of lead, much less severe effects on blood and brain function may occur. Even at much lower levels of exposure, lead can affect a child's mental and physical growth.

Exposure to lead is more dangerous for young and unborn children. Unborn children can be exposed to lead through their mothers. Harmful effects include premature births, smaller babies, decreased mental ability in the infant, learning difficulties, and reduced growth in young children. These effects are more common if the mother or baby was exposed to high levels of lead. Some of these effects may persist beyond childhood.

How can families reduce the risks of exposure to lead?

❑ Avoid exposure to sources of lead.

❑ Do not allow children to chew or mouth surfaces that may have been painted with lead-based paint.

❑ If you have a water lead problem, run or flush water that has been standing overnight before drinking or cooking with it.

❑ Some types of paints and pigments that are used as make-up or hair coloring contain lead. Keep these kinds of products away from children

❑ If your home contains lead-based paint or you live in an area contaminated with lead, wash children's hands and faces often to remove lead dusts and soil, and regularly clean the house of dust and tracked in soil.

Is there a medical test to determine whether I've been exposed to lead?

A blood test is available to measure the amount of lead in your blood and to estimate the amount of your recent exposure to lead. Blood tests are commonly used to screen children for lead poisoning. Lead in teeth or bones can be measured by X-ray techniques, but these methods are not widely available. Exposure to lead also can be evaluated by measuring erythrocyte protoporphyrin (EP) in blood samples. EP is a part of red blood cells known to increase when the amount of lead in the blood is high. However, the EP level is not sensitive enough to identify children with elevated blood lead levels below about 25 micrograms per deciliter (μg/dL). These tests usually require special analytical equipment that is not available in a doctor's office. However, your doctor can draw blood samples and send them to appropriate laboratories for analysis.

Has the federal government made recommendations to protect human health?

The Centers for Disease Control and Prevention (CDC) recommends that states test children at ages 1 and 2 years. Children should be tested at ages 3–6 years if they have never been tested for lead, if they receive services from public assistance programs for the poor such as Medicaid or the Supplemental Food Program for Women, Infants, and Children, if they live in a building or frequently visit a house built before 1950; if they visit a home (house or apartment) built before 1978 that has been recently remodeled; and/or if they have a brother, sister, or playmate who has had lead poisoning. CDC considers a blood lead level of 10 μg/dL to be a level of concern for children.

EPA limits lead in drinking water to 15 μg per liter.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

METHYL *TERT*-BUTYL ETHER (MTBE) CAS # 1634-04-4

Agency for Toxic Substances and Disease Registry ToxFAQs **September 1997**

This fact sheet answers the most frequently asked health questions (FAQs) about methyl *tert*-butyl ether (MTBE). For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Methyl *tert*-butyl ether (MTBE) is a flammable liquid which is used as an additive in unleaded gasoline. Drinking or breathing MTBE may cause nausea, nose and throat irritation, and nervous system effects. MTBE has been found in at least 11 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is methyl *tert*-butyl ether?

(Pronounced měthʹəl tŭrʹshē-ĕrʹē byo͞otʹl ēʹthər)

Methyl *tert*-butyl ether (MTBE) is a flammable liquid with a distinctive, disagreeable odor. It is made from blending chemicals such as isobutylene and methanol, and has been used since the 1980s as an additive for unleaded gasolines to achieve more efficient burning.

MTBE is also used to dissolve gallstones. Patients treated in this way have MTBE delivered directly to their gall bladders through special tubes that are surgically inserted.

What happens to MTBE when it enters the environment?

- MTBE quickly evaporates from open containers and surface water, so it is commonly found as a vapor in the air.
- Small amounts of MTBE may dissolve in water and get into underground water.
- It remains in underground water for a long time.
- MTBE may stick to particles in water, which will cause it to eventually settle to the bottom sediment.
- MTBE may be broken down quickly in the air by sunlight.
- MTBE does not build up significantly in plants and animals.

How might I be exposed to MTBE?

- Touching the skin or breathing contaminated air while pumping gasoline.
- Breathing exhaust fumes while driving a car.
- Breathing air near highways or in cities.
- Drinking, swimming, or showering in water that has been contaminated with MTBE.
- Receiving MTBE treatment for gallstones.

How can MTBE affect my health?

Breathing small amounts of MTBE for short periods may cause nose and throat irritation. Some people exposed to MTBE while pumping gasoline, driving their cars, or working

in gas stations have reported having headaches, nausea, dizziness, and mental confusion. However, the actual levels of exposure in these cases are unknown. In addition, these symptoms may have been caused by exposure to other chemicals.

There are no data on the effects in people of drinking MTBE. Studies with rats and mice suggest that drinking MTBE may cause gastrointestinal irritation, liver and kidney damage, and nervous system effects.

How likely is MTBE to cause cancer?

There is no evidence that MTBE causes cancer in humans. One study with rats found that breathing high levels of MTBE for long periods may cause kidney cancer. Another study with mice found that breathing high levels of MTBE for long periods may cause liver cancer.

The Department of Health and Human Services (DHHS), the International Agency for Research on Cancer (IARC), and the EPA have not classified MTBE as to its carcinogenicity.

Is there a medical test to show whether I've been exposed to MTBE?

MTBE and its breakdown product, butyl alcohol, can be detected in your breath, blood, or urine for up to 1 or 2 days after exposure. These tests aren't available at most doctors' offices, but can be done at special laboratories that have the right equipment. There is no other test specific to determining MTBE exposure.

Has the federal government made recommendations to protect human health?

The EPA has issued guidelines recommending that, to protect children, drinking water levels of MTBE not exceed 4 milligrams per liter of water (4 mg/L) for an exposure of 1-10 days, and 3 mg/L for longer-term exposures.

The American Conference of Governmental Industrial Hygienists (ACGIH) has recommended an exposure limit of 40 parts of MTBE per million parts of air (40 ppm) for an 8-hour workday, 40-hour workweek.

Glossary

Carcinogenicity: Ability to cause cancer.

CAS: Chemical Abstracts Service.

Evaporate: To change into a vapor or gas.

Milligram (mg): One thousandth of a gram.

ppm: Parts per million.

Sediment: Mud and debris that have settled to the bottom of a body of water.

AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

NAPHTHALENE
CAS # 91-20-3

1-METHYLNAPHTHALENE
CAS # 90-12-0

2-METHYLNAPHTHALENE
CAS # 91-57-6

Division of Toxicology ToxFAQs™ **August 2005**

This fact sheet answers the most frequently asked health questions (FAQs) about naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because these substances may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to naphthalene, 1-methylnaphthalene, or 2-methylnaphthalene happens mostly from breathing air contaminated from the burning of wood, tobacco, or fossil fuels, industrial discharges, or moth repellents. Exposure to large amounts of naphthalene may damage or destroy some of your red blood cells. Naphthalene has caused cancer in animals. Naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene have been found in at least 687, 36, and 412, respectively, of the 1,662 National Priority List sites identified by the Environmental Protection Agency (EPA).

What are naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene?

Naphthalene is a white solid that evaporates easily. Fuels such as petroleum and coal contain naphthalene. It is also called white tar, and tar camphor, and has been used in mothballs and moth flakes. Burning tobacco or wood produces naphthalene. It has a strong, but not unpleasant smell. The major commercial use of naphthalene is in the manufacture of polyvinyl chloride (PVC) plastics. Its major consumer use is in moth repellents and toilet deodorant blocks.

1-Methylnaphthalene and 2-methylnaphthalene are naphthalene-related compounds. 1-Methylnaphthalene is a clear liquid and 2-methylnaphthalene is a solid; both can be smelled in air and in water at very low concentrations.

1-Methylnaphthalene and 2-methylnaphthalene are used to make other chemicals such as dyes and resins. 2-Methylnaphthalene is also used to make vitamin K.

What happens to naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene when they enter the environment?

- ❏ Naphthalene enters the environment from industrial and domestic sources, and from accidental spills.
- ❏ Naphthalene can dissolve in water to a limited degree and may be present in drinking water from wells close to hazardous waste sites and landfills.
- ❏ Naphthalene can become weakly attached to soil or pass through soil into underground water.
- ❏ In air, moisture and sunlight break it down within 1 day. In water, bacteria break it down or it evaporates into the air.
- ❏ Naphthalene does not accumulate in the flesh of animals or fish that you might eat.
- ❏ 1-Methylnaphthalene and 2-methylnaphthalene are expected to act like naphthalene in air, water, or soil because they have similar chemical and physical properties.

How might I be exposed to naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene?

- ❏ Breathing low levels in outdoor air.
- ❏ Breathing air contaminated from industrial discharges or smoke from burning wood, tobacco, or fossil fuels.
- ❏ Using or making moth repellents, coal tar products, dyes or inks could expose you to these chemicals in the air.
- ❏ Drinking water from contaminated wells.
- ❏ Touching fabrics that are treated with moth repellents containing naphthalene.
- ❏ Exposure to naphthalene, 1-methylnaphthalene and 2-methylnaphthalene from eating foods or drinking beverages is unlikely.

How can naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene affect my health?

Exposure to large amounts of naphthalene may damage or destroy some of your red blood cells. This could cause you to have too few red blood cells until your body replaces the destroyed cells. This condition is called hemolytic anemia. Some symptoms of hemolytic anemia are fatigue, lack of appetite, restlessness, and pale skin. Exposure to large amounts of naphthalene may also cause nausea, vomiting, diarrhea, blood in the urine, and a yellow color to the skin. Animals sometimes develop cloudiness in their eyes after swallowing high amounts of naphthalene. It is not clear whether this also develops in people. Rats and mice that breathed naphthalene vapors daily for a lifetime developed irritation and inflammation of their nose and lungs. It is unclear if naphthalene

causes reproductive effects in animals; most evidence says it does not.

There are no studies of humans exposed to 1-methylnaphthalene or 2-methylnaphthalene.

Mice fed food containing 1-methylnaphthalene and 2-methylnaphthalene for most of their lives had part of their lungs filled with an abnormal material.

How likely are naphthalene, 1-methylnaphthalene, or 2-methylnaphthalene to cause cancer?

There is no direct evidence in humans that naphthalene, 1-methylnaphthalene, or 2-methylnaphthalene cause cancer. However, cancer from naphthalene exposure has been seen in animal studies. Some female mice that breathed naphthalene vapors daily for a lifetime developed lung tumors. Some male and female rats exposed to naphthalene in a similar manner also developed nose tumors.

Based on the results from animal studies, the Department of Health and Humans Services (DHHS) concluded that naphthalene is reasonably anticipated to be a human carcinogen. The International Agency for Research on Cancer (IARC) concluded that naphthalene is possibly carcinogenic to humans. The EPA determined that naphthalene is a possible human carcinogen (Group C) and that the data are inadequate to assess the human carcinogenic potential of 2-methylnaphthalene.

How can naphthalene, 1-methylnaphthalene, or 2-methylnaphthalene affect children?

Hospitals have reported many cases of hemolytic anemia in children, including newborns and infants, who either ate naphthalene mothballs or deodorants cakes or who were in close contact with clothing or blankets stored in naphthalene mothballs. Naphthalene can move from a pregnant woman's blood to the unborn baby's blood. Naphthalene has been detected in some samples of breast milk from the general U.S. population, but not at levels that are expected to be of concern.

There is no information on whether naphthalene has affected development in humans. No developmental abnormalities were observed in the offspring from rats, mice, and rabbits fed naphthalene during pregnancy.

We do not have any information on possible health effects of 1-methylnaphthalene or 2-methylnaphthalene on children.

How can families reduce the risks of exposure to naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene?

❑ Families can reduce the risks of exposure to naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene by avoiding smoking tobacco, generating smoke during cooking, or using fireplaces or heating appliances in the their homes.

❑ If families use naphthalene-containing moth repellents, the material should be enclosed in containers that prevent vapors from escaping, and kept out of the reach from children.

❑ Blankets and clothing stored with naphthalene moth repellents should be aired outdoors to remove naphthalene odors and washed before they are used.

❑ Families should inform themselves of the contents of air deodorizers that are used in their homes and refrain from using deodorizers with naphthalene.

Is there a medical test to determine whether I've been exposed to naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene?

Tests are available that measure levels of these chemicals and their breakdown products in samples of urine, feces, blood, maternal milk, or body fat. These tests are not routinely available in a doctor's office because they require special equipment, but samples can be sent to special testing laboratories. These tests cannot determine exactly how much naphthalene, 1-methylnaphthalene, or 2-methylnaphthalene you were exposed to or predict whether harmful effects will occur. If the samples are collected within a day or two of exposure, then the tests can show if you were exposed to a large or small amount of naphthalene, 1-methylnaphthalene, or 2-methylnaphthalene.

Has the federal government made recommendations to protect human health?

The EPA recommends that children not drink water with over 0.5 parts per million (0.5 ppm) naphthalene for more than 10 days or over 0.4 ppm for any longer than 7 years. Adults should not drink water with more than 1 ppm for more than 7 years. For water consumed over a lifetime (70 years), the EPA suggests that it contain no more than 0.1 ppm naphthalene.

The Occupational Safety and Health Administration (OSHA) set a limit of 10 ppm for the level of naphthalene in workplace air during an 8-hour workday, 40-hour workweek. The National Institute for Occupational Safety and Health (NIOSH) considers more than 500 ppm of naphthalene in air to be immediately dangerous to life or health. This is the exposure level of a chemical that is likely to impair a worker's ability to leave a contaminate area and therefore, results in permanent health problems or death.

Polychlorinated Biphenyls - ToxFAQs™

This fact sheet answers the most frequently asked health questions (FAQs) about polychlorinated biphenyls. For more information, call the CDC Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Polychlorinated biphenyls (PCBs) are a mixture of individual chemicals which are no longer produced in the United States, but are still found in the environment. Health effects that have been associated with exposure to PCBs include acne-like skin conditions in adults and neurobehavioral and immunological changes in children. PCBs are known to cause cancer in animals. PCBs have been found in at least 500 of the 1,598 National Priorities List (NPL) sites identified by the Environmental Protection Agency (EPA).

What are polychlorinated biphenyls?

Polychlorinated biphenyls are mixtures of up to 209 individual chlorinated compounds (known as congeners). There are no known natural sources of PCBs. PCBs are either oily liquids or solids that are colorless to light yellow. Some PCBs can exist as a vapor in air. PCBs have no known smell or taste. Many commercial PCB mixtures are known in the U.S. by the trade name Aroclor.

PCBs have been used as coolants and lubricants in transformers, capacitors, and other electrical equipment because they don't burn easily and are good insulators. The manufacture of PCBs was stopped in the U.S. in 1977 because of evidence they build up in the environment and can cause harmful health effects. Products made before 1977 that may contain PCBs include old fluorescent lighting fixtures and electrical devices containing PCB capacitors, and old microscope and hydraulic oils.

What happens to PCBs when they enter the environment?

- PCBs entered the air, water, and soil during their manufacture, use, and disposal; from accidental spills and leaks during their transport; and from leaks or fires in products containing PCBs.
- PCBs can still be released to the environment from hazardous waste sites; illegal or improper disposal of industrial wastes and consumer products; leaks from old electrical transformers containing PCBs; and burning of some wastes in incinerators.
- PCBs do not readily break down in the environment and thus may remain there for very long periods of time. PCBs can travel long distances in the air and be deposited in areas far away from where they were released. In water, a small amount of PCBs may remain dissolved, but most stick to organic particles and bottom sediments. PCBs also bind strongly to soil.
- PCBs are taken up by small organisms and fish in water. They are also taken up by other animals that eat these aquatic animals as food. PCBs accumulate in fish and marine mammals, reaching levels that may be many thousands of times higher than in water.

How might I be exposed to PCBs?

- Using old fluorescent lighting fixtures and electrical devices and appliances, such as television sets and refrigerators, that were made 30 or more years ago. These items may leak small amounts of PCBs into the air when they get hot during operation, and could be a source of skin exposure.
- Eating contaminated food. The main dietary sources of PCBs are fish (especially sportfish caught in contaminated lakes or rivers), meat, and dairy products.
- Breathing air near hazardous waste sites and drinking contaminated well water.
- In the workplace during repair and maintenance of PCB transformers; accidents, fires or spills involving transformers, fluorescent lights, and other old electrical devices; and disposal of PCB materials.

How can PCBs affect my health?

The most commonly observed health effects in people exposed to large amounts of PCBs are skin conditions such as acne and rashes. Studies in exposed workers have shown changes in blood and urine that may indicate liver damage. PCB exposures in the general population are not likely to result in skin and liver effects. Most of the studies of health effects of PCBs in the general population examined children of mothers who were exposed to PCBs.

Animals that ate food containing large amounts of PCBs for short periods of time had mild liver damage and some died. Animals that ate smaller amounts of PCBs in food over

several weeks or months developed various kinds of health effects, including anemia; acne-like skin conditions; and liver, stomach, and thyroid gland injuries. Other effects of PCBs in animals include changes in the immune system, behavioral alterations, and impaired reproduction. PCBs are not known to cause birth defects.

How likely are PCBs to cause cancer?

Few studies of workers indicate that PCBs were associated with certain kinds of cancer in humans, such as cancer of the liver and biliary tract. Rats that ate food containing high levels of PCBs for two years developed liver cancer. The Department of Health and Human Services (DHHS) has concluded that PCBs may reasonably be anticipated to be carcinogens. PCBs have been classified as probably carcinogenic, and carcinogenic to humans (group 1) by the Environmental Protection Agency (EPA) and International Agency for Research on Cancer (IARC), respectively.

How can PCBs affect children?

Women who were exposed to relatively high levels of PCBs in the workplace or ate large amounts of fish contaminated with PCBs had babies that weighed slightly less than babies from women who did not have these exposures. Babies born to women who ate PCB-contaminated fish also showed abnormal responses in tests of infant behavior. Some of these behaviors, such as problems with motor skills and a decrease in short-term memory, lasted for several years. Other studies suggest that the immune system was affected in children born to and nursed by mothers exposed to increased levels of PCBs. There are no reports of structural birth defects caused by exposure to PCBs or of health effects of PCBs in older children. The most likely way infants will be exposed to PCBs is from breast milk. Transplacental transfers of PCBs were also reported In most cases, the benefits of breast-feeding outweigh any risks from exposure to PCBs in mother's milk.

How can families reduce the risks of exposure to PCBs?

- You and your children may be exposed to PCBs by eating fish or wildlife caught from contaminated locations. Certain states, Native American tribes, and U.S. territories have issued advisories to warn people about PCB-contaminated fish and fish-eating wildlife. You can reduce your family's exposure to PCBs by obeying these advisories.
- Children should be told not play with old appliances, electrical equipment, or transformers, since they may contain PCBs.
- Children should be discouraged from playing in the dirt near hazardous waste sites and in areas where there was a transformer fire. Children should also be discouraged from eating dirt and putting dirty hands, toys or other objects in their mouths, and should wash hands frequently.
- If you are exposed to PCBs in the workplace it is possible to carry them home on your clothes, body, or tools. If this is the case, you should shower and change clothing before leaving work, and your work clothes should be kept separate from other clothes and laundered separately.

Is there a medical test to show whether I've been exposed to PCBs?

Tests exist to measure levels of PCBs in your blood, body fat, and breast milk, but these are not routinely conducted. Most people normally have low levels of PCBs in their body because nearly everyone has been environmentally exposed to PCBs. The tests can show if your PCB levels are elevated, which would indicate past exposure to above-normal levels of PCBs, but cannot determine when or how long you were exposed or whether you will develop health effects.

Has the federal government made recommendations to protect human health?

The EPA has set a limit of 0.0005 milligrams of PCBs per liter of drinking water (0.0005 mg/L). Discharges, spills or accidental releases of 1 pound or more of PCBs into the environment must be reported to the EPA. The Food and Drug Administration (FDA) requires that infant foods, eggs, milk and other dairy products, fish and shellfish, poultry and red meat contain no more than 0.2-3 parts of PCBs per million parts (0.2-3 ppm) of food. Many states have established fish and wildlife consumption advisories for PCBs.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

POLYCYCLIC AROMATIC HYDROCARBONS (PAHs)

Agency for Toxic Substances and Disease Registry ToxFAQs **September 1996**

This fact sheet answers the most frequently asked health questions (FAQs) about polycyclic aromatic hydrocarbons (PAHs). For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Exposure to polycyclic aromatic hydrocarbons usually occurs by breathing air contaminated by wild fires or coal tar, or by eating foods that have been grilled. PAHs have been found in at least 600 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are polycyclic aromatic hydrocarbons?

(Pronounced pŏl′ĭ-sī′klĭk ăr′ə-măt′ĭk hī′drə-kar′bənz)

Polycyclic aromatic hydrocarbons (PAHs) are a group of over 100 different chemicals that are formed during the incomplete burning of coal, oil and gas, garbage, or other organic substances like tobacco or charbroiled meat. PAHs are usually found as a mixture containing two or more of these compounds, such as soot.

Some PAHs are manufactured. These pure PAHs usually exist as colorless, white, or pale yellow-green solids. PAHs are found in coal tar, crude oil, creosote, and roofing tar, but a few are used in medicines or to make dyes, plastics, and pesticides.

What happens to PAHs when they enter the environment?

- PAHs enter the air mostly as releases from volcanoes, forest fires, burning coal, and automobile exhaust.
- PAHs can occur in air attached to dust particles.
- Some PAH particles can readily evaporate into the air from soil or surface waters.
- PAHs can break down by reacting with sunlight and other chemicals in the air, over a period of days to weeks.
- PAHs enter water through discharges from industrial and wastewater treatment plants.
- Most PAHs do not dissolve easily in water. They stick to solid particles and settle to the bottoms of lakes or rivers.
- Microorganisms can break down PAHs in soil or water after a period of weeks to months.
- In soils, PAHs are most likely to stick tightly to particles; certain PAHs move through soil to contaminate underground water.
- PAH contents of plants and animals may be much higher than PAH contents of soil or water in which they live.

How might I be exposed to PAHs?

- Breathing air containing PAHs in the workplace of coking, coal-tar, and asphalt production plants; smokehouses; and municipal trash incineration facilities.
- Breathing air containing PAHs from cigarette smoke, wood smoke, vehicle exhausts, asphalt roads, or agricultural burn smoke.
- Coming in contact with air, water, or soil near hazardous waste sites.
- Eating grilled or charred meats; contaminated cereals, flour, bread, vegetables, fruits, meats; and processed or pickled foods.
- Drinking contaminated water or cow's milk.

- Nursing infants of mothers living near hazardous waste sites may be exposed to PAHs through their mother's milk.

How can PAHs affect my health?

Mice that were fed high levels of one PAH during pregnancy had difficulty reproducing and so did their offspring. These offspring also had higher rates of birth defects and lower body weights. It is not known whether these effects occur in people.

Animal studies have also shown that PAHs can cause harmful effects on the skin, body fluids, and ability to fight disease after both short- and long-term exposure. But these effects have not been seen in people.

How likely are PAHs to cause cancer?

The Department of Health and Human Services (DHHS) has determined that some PAHs may reasonably be expected to be carcinogens.

Some people who have breathed or touched mixtures of PAHs and other chemicals for long periods of time have developed cancer. Some PAHs have caused cancer in laboratory animals when they breathed air containing them (lung cancer), ingested them in food (stomach cancer), or had them applied to their skin (skin cancer).

Is there a medical test to show whether I've been exposed to PAHs?

In the body, PAHs are changed into chemicals that can attach to substances within the body. There are special tests that can detect PAHs attached to these substances in body tissues or blood. However, these tests cannot tell whether any health effects will occur or find out the extent or source of your exposure to the PAHs. The tests aren't usually available in your doctor's office because special equipment is needed to conduct them.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) has set a limit of 0.2 milligrams of PAHs per cubic meter of air (0.2 mg/m^3). The OSHA Permissible Exposure Limit (PEL) for mineral oil mist that contains PAHs is 5 mg/m^3 averaged over an 8-hour exposure period.

The National Institute for Occupational Safety and Health (NIOSH) recommends that the average workplace air levels for coal tar products not exceed 0.1 mg/m^3 for a 10-hour workday, within a 40-hour workweek. There are other limits for workplace exposure for things that contain PAHs, such as coal, coal tar, and mineral oil.

Glossary

Carcinogen: A substance that can cause cancer.

Ingest: Take food or drink into your body.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

TOLUENE
CAS # 108-88-3

Division of Toxicology ToxFAQs™ **February 2001**

This fact sheet answers the most frequently asked health questions (FAQs) about toluene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to toluene occurs from breathing contaminated workplace air, in automobile exhaust, some consumer products paints, paint thinners, fingernail polish, lacquers, and adhesives. Toluene affects the nervous system. Toluene has been found at 959 of the 1,591 National Priority List sites identified by the Environmental Protection Agency

What is toluene?

Toluene is a clear, colorless liquid with a distinctive smell. Toluene occurs naturally in crude oil and in the tolu tree. It is also produced in the process of making gasoline and other fuels from crude oil and making coke from coal.

Toluene is used in making paints, paint thinners, fingernail polish, lacquers, adhesives, and rubber and in some printing and leather tanning processes.

What happens to toluene when it enters the environment?

❑ Toluene enters the environment when you use materials that contain it. It can also enter surface water and groundwater from spills of solvents and petrolieum products as well as from leasking underground storage tanks at gasoline stations and other facilities.

❑ When toluene-containing products are placed in landfills or waste disposal sites, the toluene can enter the soil or water near the waste site.

❑ Toluene does not usually stay in the environment long.

❑ Toluene does not concentrate or buildup to high levels in animals.

How might I be exposed to toluene?

❑ Breathing contaminated workplace air or automobile exhaust.

❑ Working with gasoline, kerosene, heating oil, paints, and lacquers.

❑ Drinking contaminated well-water.

❑ Living near uncontrolled hazardous waste sites containing toluene products.

How can toluene affect my health?

Toluene may affect the nervous system. Low to moderate levles can cause tiredness, confusion, weakness, drunken-type actions, memory loss, nausea, loss of appetite, and

hearing and color vision loss. These symptoms usually disappear when exposure is stopped.

Inhaling High levels of toluene in a short time can make you feel light-headed, dizzy, or sleepy. It can also cause unconsciousness, and even death.

High levels of toluene may affect your kidneys.

How likely is toluene to cause cancer?

Studies in humans and animals generally indicate that toluene does not cause cancer.

The EPA has determined that the carcinogenicity of toluene can not be classified.

How can toluene affect children?

It is likely that health effects seen in children exposed to toluene will be similar to the effects seen in adults. Some studies in animals suggest that babies may be more sensitive than adults.

Breathing very high levels of toluene during pregnancy can result in children with birth defects and retard mental abilities, and growth. We do not know if toluene harms the unborn child if the mother is exposed to low levels of toluene during pregnancy.

How can families reduce the risk of exposure to toluene?

❑ Use toluene-containing products in well-ventilated areas.

❑ When not in use, toluene-containing products should be tightly covered to prevent evaporation into the air.

Is there a medical test to show whether I've been exposed to toluene?

There are tests to measure the level of toluene or its breakdown products in exhaled air, urine, and blood. To determine if you have been exposed to toluene, your urine or blood must be checked within 12 hours of exposure. Several other chemicals are also changed into the same breakdown products as toluene, so some of these tests are not specific for toluene.

Has the federal government made recommendations to protect human health?

EPA has set a limit of 1 milligram per liter of drinking water (1 mg/L).

Discharges, releases, or spills of more than 1,000 pounds of toluene must be reported to the National Response Center.

The Occupational Safety and Health Administration has set a limit of 200 parts toluene per million of workplace air (200 ppm).

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

XYLENE
CAS # 1330-20-7

This fact sheet answers the most frequently asked health questions (FAQs) about xylene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Exposure to xylene occurs in the workplace and when you use paint, gasoline, paint thinners and other products that contain it. People who breathe high levels may have dizziness, confusion, and a change in their sense of balance. This substance has been found in at least 658 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is xylene?

(Pronounced zī′lēn)

Xylene is a colorless, sweet-smelling liquid that catches on fire easily. It occurs naturally in petroleum and coal tar and is formed during forest fires. You can smell xylene in air at 0.08–3.7 parts of xylene per million parts of air (ppm) and begin to taste it in water at 0.53–1.8 ppm.

Chemical industries produce xylene from petroleum. It's one of the top 30 chemicals produced in the United States in terms of volume.

Xylene is used as a solvent and in the printing, rubber, and leather industries. It is also used as a cleaning agent, a thinner for paint, and in paints and varnishes. It is found in small amounts in airplane fuel and gasoline.

What happens to xylene when it enters the environment?

- Xylene has been found in waste sites and landfills when discarded as used solvent, or in varnish, paint, or paint thinners.
- It evaporates quickly from the soil and surface water into the air.
- In the air, it is broken down by sunlight into other less harmful chemicals.
- It is broken down by microorganisms in soil and water.
- Only a small amount of it builds up in fish, shellfish, plants, and animals living in xylene-contaminated water.

How might I be exposed to xylene?

- Breathing xylene in workplace air or in automobile exhaust.
- Breathing contaminated air.
- Touching gasoline, paint, paint removers, varnish, shellac, and rust preventatives that contain it.
- Breathing cigarette smoke that has small amounts of xylene in it.
- Drinking contaminated water or breathing air near waste sites and landfills that contain xylene.
- The amount of xylene in food is likely to be low.

How can xylene affect my health?

Xylene affects the brain. High levels from exposure for short periods (14 days or less) or long periods (more than 1 year) can cause headaches, lack of muscle coordination, dizziness, confusion, and changes in one's sense of balance. Exposure of

people to high levels of xylene for short periods can also cause irritation of the skin, eyes, nose, and throat; difficulty in breathing; problems with the lungs; delayed reaction time; memory difficulties; stomach discomfort; and possibly changes in the liver and kidneys. It can cause unconsciousness and even death at very high levels.

Studies of unborn animals indicate that high concentrations of xylene may cause increased numbers of deaths, and delayed growth and development. In many instances, these same concentrations also cause damage to the mothers. We do not know if xylene harms the unborn child if the mother is exposed to low levels of xylene during pregnancy.

How likely is xylene to cause cancer?

The International Agency for Research on Cancer (IARC) has determined that xylene is not classifiable as to its carcinogenicity in humans.

Human and animal studies have not shown xylene to be carcinogenic, but these studies are not conclusive and do not provide enough information to conclude that xylene does not cause cancer.

Is there a medical test to show whether I've been exposed to xylene?

Laboratory tests can detect xylene or its breakdown products in exhaled air, blood, or urine. There is a high degree of agreement between the levels of exposure to xylene and the levels of xylene breakdown products in the urine. However, a urine sample must be provided very soon after exposure ends because xylene quickly leaves the body. These tests are not routinely available at your doctor's office.

Has the federal government made recommendations to protect human health?

The EPA has set a limit of 10 ppm of xylene in drinking water.

The EPA requires that spills or accidental releases of xylenes into the environment of 1,000 pounds or more must be reported.

The Occupational Safety and Health Administration (OSHA) has set a maximum level of 100 ppm xylene in workplace air for an 8-hour workday, 40-hour workweek.

The National Institute for Occupational Safety and Health (NIOSH) and the American Conference of Governmental Industrial Hygienists (ACGIH) also recommend exposure limits of 100 ppm in workplace air.

NIOSH has recommended that 900 ppm of xylene be considered immediately dangerous to life or health. This is the exposure level of a chemical that is likely to cause permanent health problems or death.

Glossary

Evaporate: To change from a liquid into a vapor or a gas.

Carcinogenic: Having the ability to cause cancer.

CAS: Chemical Abstracts Service.

ppm: Parts per million.

Solvent: A liquid that can dissolve other substances.

Mercury - ToxFAQs™

What is mercury?

Mercury is a naturally occurring element with a chemical symbol of Hg. Elemental mercury is a silver liquid at room temperature that can also evaporate into the air as a gas or become a solid at very low temperatures. It can combine with other substances to form solid compounds that are categorized into two groups: inorganic mercury salts and organic mercury compounds. Mercury and mercury compounds are odorless.

Mercury is used in a number of industries and products. It is primarily used in the manufacture of electronics, fluorescent-lighting, and production of chlorine-caustic soda. It is also used in dental products (fillings), although uses in dentistry are being phased-out. Other historical uses of mercury (batteries; thermometers and other scientific and medical devices; electronic switches and lighting applications; paints and pigments; fungicides and pesticides) have been eliminated or drastically reduced.

What happens to mercury in the environment?

Because mercury is a naturally occurring element, it can be found in the air, water, or soil. It can also be found in the environment due to industrial releases to air and water. Industrial releases to air have steadily decreased over the past few decades.

Mercury does not break down in the environment. In air, mercury may spread far from where it was released. Mercury seldom appears as a silver liquid in the environment. In water, mercury can evaporate into the air. In soil, it can adhere (stick) to soil and sediments (dirt deposits at the bottom of bodies of water). One type of organic mercury compound called methylmercury can build up in plants and fish.

How can I be exposed to mercury?

Most people are exposed to organic mercury compounds (typically methylmercury) in food (such as fish, seafood, rice) or to elemental mercury from dental fillings. Food is the most common form of exposure. Most people are not exposed to inorganic mercury salts. Industrial and dental workers who use mercury are primarily exposed to elemental mercury. Some cultures use mercury in traditional medicines or religious practices, although this is not recommended or approved for use in the United States.

How can mercury affect my health?

Mercury can affect the nervous system and kidneys. The health effects from exposure to mercury depend on a number of factors including the amount and form of mercury, route and length of exposure, and age.

All forms of mercury can affect the nervous system and the kidneys. Workers exposed to elemental mercury vapor and people who eat foods with high levels of methylmercury experienced tremors, incoordination, impaired vision, impaired learning and memory, and mood changes. Some children born in communities that ate food with high levels of organic mercury had learning, sensory, and movement problems. In people exposed to high levels of methylmercury in their diets, birth defects have occurred. Some humans and animals that ate mercury compounds had high blood pressure and alterations in their immune systems. Animals that breathed elemental mercury vapor or ate organic or inorganic mercury compounds in their diets showed nervous system effects and/or kidney damage. Animals that ate high levels of mercury compounds showed decreased fertility and/or birth defects.

Mercury

Can mercury cause cancer?

Rats that ate an inorganic mercury compound for a long period of time developed stomach or thyroid cancer. Rats and mice that aate organic mercury compounds for a long period of time developed kidney cancer.

The U.S. Department of Health and Human Services (DHHS) has not evaluated the potential of mercury or mercury compounds to cause cancer in people.

The U.S. Environmental Protection Agency (EPA) has determined that mercuric chloride (inorganic mercury salt) and methylmercury (organic mercury compound) are possible human carcinogens (cause cancer). The EPA did not classify the potential of elemental mercury to cause cancer in humans.

The International Agency for Research on Cancer (IARC) classified methylmercury compounds as possibly carcinogenic to humans. IARC designated inorganic mercury and elemental mercury as not classifiable for causing cancer in humans.

Can I get a medical test to check for mercury?

Mercury can be measured in your blood, urine, hair, or toenails. However, tests cannot determine which form of mercury you were exposed to. Tests also cannot predict whether you will have health problems. If you think you have been exposed to mercury, call your doctor, nurse, or poison control center.

How can I protect myself and my family from mercury?

People should avoid eating fish that contain high levels of methylmercury. This is particularly important for pregnant women and children. Follow your state's health advisories that tell you about whether it is okay to eat fish or wildlife caught in contaminated areas. Avoid all contact with spills of the liquid form of elemental mercury (the type of mercury found in old thermometers). If a spill occurs, refer to https://www.atsdr.cdc.gov/dontmesswithmercury for safe clean-up practices. Most people don't need to take any special steps to avoid exposure to inorganic mercury salts in their daily lives. Keep children from playing in areas near hazardous waste sites to avoid coming in contact with mercury.

Trichloroethylene - ToxFAQs™

CAS # 79-01-6

This fact sheet answers the most frequently asked health questions (FAQs) about trichloroethylene. For more information, call the ATSDR Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Trichloroethylene is used as a solvent for cleaning metal parts. Exposure to very high concentrations of trichloroethylene can cause dizziness headaches, sleepiness, incoordination, confusion, nausea, unconsciousness, and even death. Trichloroethylene has been found in at least 1,051 of the 1,854 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is trichloroethylene?

Trichloroethylene is a colorless, volatile liquid. Liquid trichloroethylene evaporates quickly into the air. It is nonflammable and has a sweet odor.

The two major uses of trichloroethylene are as a solvent to remove grease from metal parts and as a chemical that is used to make other chemicals, especially the refrigerant, HFC-134a.

What happens to trichloroethylene when it enters the environment?

- Trichloroethylene can be released to air, water, and soil at places where it is produced or used.
- Trichloroethylene is broken down quickly in air.
- Trichloroethylene breaks down very slowly in soil and water and is removed mostly through evaporation to air.
- It is expected to remain in groundwater for long time since it is not able to evaporate.
- Trichloroethylene does not build up significantly in plants or animals.

How might I be exposed to trichloroethylene?

- Breathing trichloroethylene in contaminated air.
- Drinking contaminated water.
- Workers at facilities using this substance for metal degreasing are exposed to higher levels of trichloroethylene.
- If you live near such a facility or near a hazardous waste site containing trichloroethylene, you may also have higher exposure to this substance.

How can trichloroethylene affect my health?

Trichloroethylene was once used as an anesthetic for surgery. Exposure to moderate amounts of trichloroethylene may cause headaches, dizziness, and sleepiness; large amounts may cause coma and even death. Eating or breathing high levels of trichloroethylene may damage some of the nerves in the face. Exposure to high levels can also result in changes in the rhythm of the heartbeat, liver damage, and evidence of kidney damage. Skin contact with concentrated solutions of trichloroethylene can cause skin rashes. There is some evidence exposure to trichloroethylene in the work place may cause scleroderma (a systemic autoimmune disease) in some people. Some men occupationally-exposed to trichloroethylene and other chemicals showed decreases in sex drive, sperm quality, and reproductive hormone levels.

How likely is trichloroethylene to cause cancer?

There is strong evidence that trichloroethylene can cause kidney cancer in people and some evidence for trichloroethylene-induced liver cancer and malignant lymphoma. Lifetime exposure to trichloroethylene resulted in increased liver cancer in mice and increased kidney cancer and testicular cancer in rats.

The Department of Health and Human Services (DHHS) considers trichloroethylene to be a known human carcinogen. The International Agency for Research on Cancer (IARC) classified trichloroethylene as carcinogenic to humans. The EPA has characterized trichloroethylene as carcinogenic to humans by all routes of exposure.

Trichloroethylene

CAS # 79-01-6

How can trichloroethylene affect children?

It is not known whether children are more susceptible than adults to the effects of trichloroethylene.

Some human studies indicate that trichloroethylene may cause developmental effects such as spontaneous abortion, congenital heart defects, central nervous system defects, and small birth weight. However, these people were exposed to other chemicals as well.

In some animal studies, exposure to trichloroethylene during development caused decreases in body weight, increases in heart defects, changes to the developing nervous system, and effects on the immune system.

How can families reduce the risk of exposure to trichloroethylene?

- Avoid drinking water from sources that are known to be contaminated with trichloroethylene. Use bottled water if you have concerns about the presence of chemicals in your tap water. You may also contact local drinking water authorities and follow their advice.
- Prevent children from playing in dirt or eating dirt if you live near a waste site that has trichloroethylene.
- Trichloroethylene is used in many industrial products. Follow instructions on product labels to minimize exposure to trichloroethylene.

Is there a medical test to determine whether I've been exposed to trichloroethylene?

Trichloroethylene and its breakdown products (metabolites) can be measured in blood and urine. However, the detection of trichloroethylene or its metabolites cannot predict the kind of health effects that might develop from that exposure. Because trichloroethylene and its metabolites leave the body fairly rapidly, the tests need to be conducted within days after exposure.

Has the federal government made recommendations to protect human health?

The EPA set a maximum contaminant goal (MCL) of 0.005 milligrams per liter (mg/L; 5 ppb) as a national primary drinking standard for trichloroethylene.

The Occupational Safety and Health Administration (OSHA) set a permissible exposure limit (PEL) of 100 ppm for trichloroethylene in air averaged over an 8-hour work day, an acceptable ceiling concentration of 200 ppm provided the 8 hour PEL is not exceeded, and an acceptable maximum peak of 300 ppm for a maximum duration of 5 minutes in any 2 hours.

The National Institute for Occupational Safety and Health (NIOSH) considers trichloroethylene to be a potential occupational carcinogen and established a recommended exposure limit (REL) of 2 ppm (as a 60-minute ceiling) during its use as an anesthetic agent and 25 ppm (as a 10-hour TWA) during all other exposures.

Tetrachloroethylene - ToxFAQs™

CAS # 127-18-4

This fact sheet answers the most frequently asked health questions (FAQs) about tetrachloroethylene. For more information, call the ATSDR Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Tetrachloroethylene is a manufactured chemical used for dry cleaning and metal degreasing and in the aerospace industry. Exposure to very high concentrations of tetrachloroethylene can cause dizziness headaches, sleepiness, incoordination confusion, nausea, unconsciousness, and even death. Tetrachloroethylene has been found in at least 949 of the 1,854 National Priorities List sites identified by U.S. Environmental Protection Agency (EPA).

What is tetrachloroethylene?

Tetrachloroethylene is a nonflammable colorless liquid. Other names for tetrachloroethylene include perchloroethylene, PCE, perc, tetrachloroethene, and perchlor. Most people can smell tetrachloroethylene when it is present in the air at a level of 1 part in 1 million parts of air (1 ppm) or more.

Tetrachloroethylene is used as a dry cleaning agent and metal degreasing solvent. It is also used as a starting material (building block) for making other chemicals and is used in some consumer products.

What happens to tetrachloroethylene when it enters the environment?

- Tetrachloroethylene can be released into air, water, and soil at places where it is produced or used.
- Tetrachloroethylene breaks down very slowly in the air and so it can be transported long distances in the air. Half of the amount in the air will degrade in approximately 100 days.
- Tetrachloroethylene evaporates quickly from water into air. It is generally slow to break down in water.
- Tetrachloroethylene may evaporate quickly from shallow soils or may filter through the soil and into the groundwater below. It is generally slow to break down in soil.

How might I be exposed to tetrachloroethylene?

- When you bring clothes from the dry cleaners, they will release small amounts of tetrachloroethylene into the air.
- When you drink water containing tetrachloroethylene, you are exposed to it. You might also be exposed to tetrachloroethylene that is released into the air during showering and bathing.
- People residing near contaminated sites or dry cleaning locations may be exposed to higher levels than the general population.
- People working in the dry cleaning industries or using metal degreasing products may be exposed to elevated levels of tetrachloroethylene.

How can tetrachloroethylene affect my health?

Breathing high levels of tetrachloroethylene for a brief period may cause dizziness or drowsiness, headache, and incoordination; higher levels may cause unconsciousness and even death.

Exposure for longer periods to low levels of tetrachloroethylene may cause changes in mood, memory, attention, reaction time, and vision.

Studies in animals exposed to tetrachloroethylene have shown liver and kidney effects, and changes in brain chemistry, but we do not know what these findings mean for humans.

Tetrachloroethylene

CAS # 127-18-4

How likely is tetrachloroethylene to cause cancer?

Studies in humans suggest that exposure to tetrachloroethylene might lead to a higher risk of getting bladder cancer, multiple myeloma, or non-Hodgkin's lymphoma.

In animals, tetrachloroethylene has been shown to cause cancers of the liver, kidney, and blood system.

The Department of Health and Human Services (DHHS) considers tetrachloroethylene to be reasonably anticipated to be a human carcinogen. EPA considers tetrachloroethylene likely to be carcinogenic to humans by all routes of exposure. The International Agency for Research on Cancer (IARC) considers tetrachloroethylene probably carcinogenic to humans.

How can tetrachloroethylene affect children?

It is not known whether children are more susceptible than adults to the effects of tetrachloroethylene.

A few studies in humans have suggested that exposure to tetrachloroethylene increased the numbers of babies with birth defects, but these studies were not large enough to clearly answer the question. Studies in animals exposed by inhalation or stomach tube have not shown clear evidence of specific birth defects.

How can families reduce the risk of exposure to tetrachloroethylene?

- Tetrachloroethylene has been found in low levels in some food. You can minimize the risk of your family's exposure by peeling and thoroughly washing fruits and vegetables before cooking.
- Use bottled water if you have concerns about the presence of tetrachloroethylene in your tap water. You may also contact local drinking water authorities and follow their advice.
- Prevent children from playing in dirt or eating dirt if you live near a waste site that has tetrachloroethylene.
- Tetrachloroethylene is widely used as a scouring solvent that removes oils from fabrics, as a carrier solvent, as a fabric finish or water repellant, and as a metal degreaser/cleaner. Follow instructions on product labels to minimize exposure to tetrachloroethylene.

Is there a medical test to determine whether I've been exposed to tetrachloroethylene?

Tetrachloroethylene and its breakdown products (metabolites) can be measured in blood and urine. However, the detection of tetrachloroethylene or its metabolites cannot predict the kind of health effects that might develop from that exposure. Because tetrachloroethylene and its metabolites leave the body fairly rapidly, the tests need to be conducted within days after exposure.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) has set an 8-hour time weighted average permissible exposure limit of 100 ppm, an acceptable ceiling exposure limit of 200 ppm, and a maximum peak of 300 ppm (not to be exceeded for more than 5 minutes of any 3-hour period).

The National Institute for Occupational Safety and Health (NIOSH) recommends that workplace exposure to tetrachloroethylene be minimized due to concerns about its carcinogenicity.

1.0 INTRODUCTION

AKRF, Inc. (AKRF) conducted a Subsurface (Phase II) Investigation at Lenox Hill Hospital's (LHH's) existing campus on the block bounded by Park and Lexington Avenues and East 76th and East 77th Streets (Block 1411, Lots 1 and 113) (aka Projected Development Site 1) and three buildings on the north side of East 77th Street across from the main hospital complex (Block 1412, Lots 9, 10, and 11) (aka Projected Development Site 1a) (collectively "Site"). The proposed redevelopment of the Site would entail demolition of portions of the current hospital and renovations of existing structures for a new state-of-the-art hospital facility (to occur in multiple stages). A Site Location map is provided as Figure 1 and a Sample Location Plan is provided as Figure 2.

The purpose of the investigation was to determine whether past uses on or near the Site have adversely affected the Site's subsurface. The scope was based on the findings of a *Phase I Environmental Site Assessment (ESA)* prepared by AKRF in June 2022. The scope was established in the *Subsurface (Phase II) Investigation Sampling Protocol and Health and Safety Plan*, prepared by AKRF in June 2023 (and approved by NYCDEP in July 2023). The Phase II field activities were conducted on September 27 and 28, 2023 (with an additional soil vapor sample collected on October 18, 2023).

The scope of work included a geophysical investigation, the advancement of nine borings using manual methods (hand tools consisting of a core drill and a hand auger) with the collection and laboratory analysis of two soil samples, one groundwater sample (from an existing geotechnical monitoring well previously installed in the East 76th Street sidewalk immediately south of the hospital building), and nine soil vapor samples for laboratory analysis.

Due to physical limitations encountered during the field investigation, including intervening subsurface utilities, active electrical systems for critical hospital care systems, and ongoing hospital operations, the advancement of soil borings with a Geoprobe® direct-push drill rig was not possible as hospital operations prohibited the use of fuel-powered drilling equipment with exhaust inside the building, and limited the use of electrical power to standard outlets. As such, borings were advanced manually with hand tools consisting of a core drill and a hand auger which precluded the installation of soil borings to significant depths below the sub-basement and basement floor slabs and limited subsurface sample collection.

This report describes methods and results of the investigation.

2.0 SITE BACKGROUND

2.1 Site Characterization

Topography at the Site is relatively level, with a slight downward slope to the east. Based on the U.S. Geological Survey, Central Park, NY Quadrangle (2013) map, the Site is approximately 65 feet above the National Geodetic Vertical Datum of 1988 (an approximation of mean sea level).

A geotechnical investigation conducted by RA Consultants LLC in 2018 (discussed in Section 2.2) measured the depth to groundwater between approximately 17 and 18.5 feet below sidewalk grade (roughly 5 to 7 feet below basement level) and noted to be perched on bedrock. During the Phase II Investigation, groundwater was encountered at approximately 17 feet below (sidewalk) grade in an existing geotechnical monitoring well located within the East 76th Street sidewalk, immediately south of the hospital building. Groundwater is anticipated to flow in an easterly direction toward the East River, located approximately 3,400 feet away. However, actual flow can be affected by many factors including subway tunnels (including the adjacent No. 4, 5, and 6 subways beneath Lexington Avenue), underground utilities, and other factors beyond the scope of this study. Groundwater in Manhattan is not used as a source of drinking water.

The proposed redevelopment of the Site would entail demolition of portions of the current hospital and renovations of existing structures for a new state-of-the-art hospital facility (to occur in multiple stages). It is anticipated that the proposed construction would require excavation up to approximately 10 feet below the current basement and cellar grade (i.e., well below the bedrock interface) and may require dewatering.

2.2 Previous Environmental Investigations

Phase I Environmental Site Assessment, Lenox Hill Hospital Redevelopment, AKRF Inc., June 2022

The Phase I ESA conducted at the Site in June 2022 identified "Recognized Environmental Conditions" (RECs), i.e., the presence or likely presence of hazardous substances or petroleum in the ground or groundwater. These were:

- The Site (Block 1411, Projected Development Site 1) was registered with the New York State Department of Environmental Conservation (NYSDEC) Petroleum Bulk Storage (PBS) Program (PBS# 2-606498) with one in-service diesel aboveground storage tank (AST) located within a basement-level concrete tank room, two (2) 317-gallon day tanks within a sub-basement-level emergency generator room, and an ancillary 330-gallon diesel AST (also supplied by the 20,000-gallon AST) located on the roof of the Uris building. The tanks were used to fuel the LHH emergency generator systems. No spills were listed in regulatory database information in connection with the ASTs; however, it was noted that undocumented releases from historic bulk petroleum storage operations may have affected environmental conditions at the Site.
- The LHH main hospital (Block 1411, Projected Development Site 1) was registered as a small quantity generator (SQG) and historic Large Quantity Generator (LQG) of hazardous wastes typically associated with medical facilities.
- Historical land use maps and city directories indicated that the current ancillary hospital buildings on the north-adjacent block (Block 1412, Projected Development Site 1a) contained three dwellings since at least 1898 and were noted to include several commercial and automotive uses between circa 1911 and 2005, including auto storage houses, offices, and a farrier (subsequently a garage) at 113 East 77th Street. Historic garage uses were also noted at the 111 and 115 East 77th Street buildings. Such uses may have included petroleum and/or solvents and mercury (associated with the former farrier).
- Historical land use maps, city directories and the regulatory database review identified nearby uses between circa 1896 and 2005, including automotive garages on blocks south, northeast, and west of the Property, and several drycleaners on the surrounding blocks. The regulatory database information indicated two closed-status spills documenting petroleum contaminated soil and groundwater at 122 East 78th Street (immediately north of Projected Development Site 1a).

Based upon the findings in the Phase I ESA, AKRF recommended conducting a subsurface (Phase II) investigation, including the collection and laboratory analysis of subsurface samples.

Report of Geotechnical Investigation, Lenox Hill Hospital (100 East 77th Street) Manhattan, NY 10075, RA Consultants LLC, January 2018

The January 2018 Geotechnical Investigation included the advancement of 17 geotechnical borings in select basement and sub-basement areas within the hospital and within the East 76th Street sidewalk immediately south of the hospital. Borings encountered fill materials consisting of a mixture of gravel, sand, bricks, crushed stone, and construction debris to approximately 5 to

15 feet below the basement level and to approximately 3 feet below the sub-basement level. The fill was underlain by decomposed rock and mica schist. Competent bedrock was encountered between approximately 10 and 25 feet below the basement level, and between approximately 5 and 20 feet below the sub-basement level. Two groundwater observation wells were installed within the East 76th Street sidewalk as part of the investigation; the depth to groundwater measured between approximately 17 to 18.5 feet below sidewalk grade and noted to be perched above bedrock and flowing toward the East River.

3.0 FIELD ACTIVITIES

The Phase II field activities were conducted on September 27 and 28, 2023 (with an additional soil vapor sample collected on October 18, 2023) and included the advancement of nine borings using manual methods (hand tools consisting of a core drill and hand auger) with the collection and laboratory analysis of 2 soil samples, 1 groundwater sample (from an existing geotechnical monitoring well previously installed in the East 76th Street sidewalk immediately south of the hospital building), and 9 soil vapor samples at the locations shown on Figure 2.

Due to physical limitations encountered during the field investigation, including intervening subsurface utilities, active electrical systems for critical hospital care systems and ongoing hospital operations, the advancement of soil borings with a Geoprobe® direct-push drill rig was not possible as operations prohibited the use of fuel-powered drilling equipment with exhaust inside the building and limited the use of electrical power to standard outlets. Due to these limitations, the borings were advanced manually with hand tools consisting of a core drill and a hand auger which precluded the installation of soil borings to significant depths below the sub-basement and basement floor slabs. Shallow subsurface soil samples (from 0-2 feet below basement grade) were obtained from two borings (B-12 and B-15), at the locations shown on Figure 2. Subsurface soil was not encountered in the remainder of the borings installed during the investigation.

3.1 Geophysical Investigation

NOVA Geophysical Services (NOVA) of Douglaston, NY conducted a geophysical investigation to clear the soil borings of subsurface utilities/structures and to investigate the potential presence of subsurface anomalies consistent with underground storage tanks (USTs). The geophysical investigation comprised a ground-penetrating radar (GPR) survey and a metallic locator survey. The survey was limited to areas immediately surrounding the proposed sampling locations and other accessible areas. No anomalies consistent with the presence of a UST were detected.

3.2 Soil and Groundwater Sampling

Soil Sampling

A total of 9 borings were advanced using a core drill and a hand auger (due to access limitations within the basement and sub-basement interior of the buildings) by Eastern Environmental Solutions, Inc. (Eastern) at the locations shown on Figure 2. A hand auger (hand-held drilling equipment) was used to retrieve soil samples. Shallow subsurface soil (from 0-2 feet below basement grade) was sampled from two borings (B-12 and B-15), at the locations shown on Figure 2. Subsurface soil was not encountered in the remainder of the borings installed during the investigation prior to refusal on apparent bedrock and/or concrete foundations. Soil was field-screened using a photoionization detector (PID), which measures relative concentrations of volatile organic compounds (VOCs) and was calibrated at the start of the work day with 100 parts per million (ppm) isobutylene. At each boring location, AKRF field personnel recorded and documented subsurface conditions. Soil boring logs are provided in Appendix A.

Soil samples were collected using dedicated sampling equipment, placed into laboratory-supplied containers within a chilled cooler, and submitted via courier to Alpha Analytical Laboratories, Inc. (Alpha) of Mansfield, MA, a New York State ELAP-certified laboratory. Soil samples were analyzed for the following:

- Volatile organic compounds (VOCs) by EPA Method 8260;
- Semi-volatile organic compounds (SVOCs) by EPA Method 8270;
- Target Analyte List (TAL) metals (total and dissolved for groundwater samples);
- Polychlorinated biphenyls (PCBs) by EPA Method 8082; and
- Pesticides by EPA Method 8081.

Groundwater Sampling

No groundwater was encountered in any of the borings advanced during this investigation. One groundwater sample (MW-1) was collected from an existing geotechnical monitoring well previously installed by others in the East 76th Street sidewalk immediately south of the hospital, at the location show on Figure 2. Prior to sampling, the well was gauged with an oil/water interface probe to determine whether non-aqueous phase liquid (NAPL) was present. A peristaltic pump with dedicated tubing was used to purge three well volumes prior to sampling. The groundwater sample was collected directly into laboratory-supplied containers according to EPA analytical protocols. The sample was labeled, sealed, and placed in a chilled cooler for shipment to the laboratory.

The groundwater sample was analyzed for the same parameters as soil samples (noted above). Analysis for metals on groundwater samples was conducted on both filtered (dissolved) and unfiltered (total) samples. The sample was shipped to the laboratory with appropriate chain of custody documentation. All non-dedicated sampling equipment was decontaminated prior to and following sample collection in accordance with the procedures outlined in the Sampling Protocol.

3.3 Soil Vapor and Ambient Air Sample Collection and Analysis

Nine soil vapor sampling points (SV-1, SV-3, SV-5, SV-7, SV-8, SV-9, SV-10, SV-12, and SV-15) were installed at the locations shown on Figure 2. Sample SV-15 was collected from the basement level of 115 East 77th Street (Projected Development Site 1a). The remainder of the samples were collected from the main hospital campus (Projected Development Site 1), with samples SV-3, SV-5, SV-7 and SV-8 collected from below the partial sub-basement level and samples SV-1, SV-9, SV-10, and SV-12 collected from below the basement level. The sampling points were installed using a core drill and slide hammer (hand-held drilling equipment) due to access limitations.

The 0.75-inch diameter probe consisted of an expendable 6-inch long stainless steel screened drive point installed to a depth of approximately 18 inches below basement and sub-basement grade. Dedicated Teflon tubing with threaded fittings was connected to the probe. The hollow rod used to install the probe was then removed and the boring was backfilled with clean silica sand and a layer of hydrated bentonite to fill around the tubing to ground surface to provide a seal ensuring the collection of a representative sample and prevent short-circuiting of ambient air into the vapor sampling point. Prior to sampling, each soil vapor point was purged of three sampler volumes using a peristaltic pump. During purging, an inverted one-gallon bucket was placed over the sampling point and helium gas was introduced through a small hole in the bucket to saturate the atmosphere around the sample port with helium gas. The purged vapors were collected into a Tedlar bag and monitored using a portable helium detector to check for short-circuiting of

ambient air into the vapor sampling point and verify the adequacy of the bentonite seal. Helium concentrations of less than 10 percent were considered sufficient to verify a tight seal. All soil vapor points passed the seal integrity tests with helium readings below 10 percent. Purged vapors were also field-screened for organic vapors using a PID. After purging, the tubing was connected to a laboratory-supplied 6-liter SUMMA canister equipped with a flow regulator for collection over two hours. The samples were analyzed for VOCs by EPA Method TO-15.

Due to access limitations and interfering utilities/electrical system for the active hospital uses, six originally proposed boring/soil vapor sampling point locations (SV-2, SV-4, SV-6, SV-11, SV-13 and SV-14) were unable to be advanced.

3.4 Field Observations

Soil Sampling

Shallow soil encountered during this investigation (collected from the 0- to 2-foot interval below basement grade) generally consisted of sandy fill materials including gravel and silts. No elevated PID readings or petroleum-like odors were encountered in the borings.

Soil descriptions, observations, and PID readings were recorded on the soil boring logs provided in Appendix A.

Groundwater Sampling

Groundwater was not encountered in any of the borings advanced during this investigation. Groundwater was encountered at approximately 17 fbg in an existing geotechnical monitoring well located within the East 76th Street sidewalk immediately south of the hospital building. No odors, floating petroleum product or sheen were observed in the sample.

Soil Vapor/Ambient Air Sampling

Helium was not detected during the purging of the temporary sub-slab soil vapor sampling points, verifying an adequate bentonite seal at each location. PID readings of the purged soil vapor ranged from non-detect (ND) to a maximum concentration of 5.5 parts per million (ppm) in sample SV-15. Field logs of the soil vapor purging and sampling are included in Appendix B.

4.0 LABORATORY ANALYTICAL RESULTS

4.1 Soil Analytical Results

Two soil samples were collected for laboratory analysis with results compared to the New York State Department of Environmental Conservation (NYSDEC) 6 NYCRR Part 375 Remedial Program Soil Cleanup Objectives (SCOs) for Unrestricted Use (UUSCOs) for soil management purposes and for Restricted Residential Use (RRSCOs). Soil descriptions, observations, and PID readings were recorded on the soil boring logs provided in Appendix A. Laboratory analytical data sheets are included in Appendix C.

VOCs

Only two VOCs were detected in the soil samples above laboratory detection limits (acetone and naphthalene, which is also analyzed an SVOC) at trace and estimated concentrations below UUSCOs. Acetone is a common laboratory agent, and its detection is likely a laboratory artifact and not reflective of actual Site conditions. No other VOCs were detected above laboratory detection limits in the soil samples.

The complete analytical results for VOCs are presented in Table 1.

SVOCs

Low-level detections of certain polycyclic aromatic hydrocarbons (PAHs) including acenaphthene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(ghi)perylene, benzo(k)fluoranthene, carbazole, chrysene, dibenzo(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene), phenanthrene, and pyrene were detected in the two soil samples, but only at concentrations below UUSCOs. Based on their levels and on their distribution, these PAH detections are likely attributable to the fill material observed in the soil borings rather than a material release.

Bis(2-ethylhexyl)phthalate (a common plasticizer) was detected in B-15 (0-2) at 0.49 milligrams per kilogram (mg/kg) (there are no SCOs for this compound); the detection may be associated with a sampling artifact and is not likely indicative of a release.

The complete analytical results for SVOCs in soil are provided in Table 2.

Metals

Metals were detected in all samples, with some concentrations (including cadmium, copper, lead, mercury, nickel, and zinc) above UUSCOs. Of these, cadmium (maximum concentration 6.16 mg/kg), copper (maximum concentration 322 mg/kg) and lead (maximum concentration 3,370 mg/kg) also exceeded their RRSCOs of 4.3 mg/kg, 270 mg/kg, and 400 mg/kg, respectively, as noted in the table below.

In-Text Table T1
TAL Metals Concentrations in Soil Samples Above UUSCOs and/or RRSCOs

Analyte	Sample Identification	UUSCO (mg/kg)	RRSCO (mg/kg)	Concentration (mg/kg)
Cadmium	B15_0-2_20230928	2.5	4.3	**6.16**
Copper	B12_0-2_20230927	50	270	**54**
	B15_0-2_20230928			**322**
Lead	B12_0-2_20230927	63	400	**296**
	B15_0-2_20230928			**3,370**
Mercury	B15_0-2_20230928	0.18	0.81	**0.518**
Nickel	B15_0-2_20230928	30	310	**108**
Zinc	B15_0-2_20230928	109	10,000	**1,180**

Notes:
mg/kg = milligrams per kilogram
Exceedances of UUSCOs are highlighted in bold font.
Exceedances of RRSCOs are highlighted in gray shading.

Of note, the concentration of lead exceeded the 400 mg/kg RRSCO in sample B-15 (0-2), suggesting a potential for the levels of leachable lead to exceed hazardous waste thresholds in some soils that might be excavated during future construction; however, testing via the toxicity characteristic leaching procedure (TCLP) prior to soil disposal activities would be required to confirm this.

The complete analytical results for metals are provided in Table 3.

PCBs

No PCBs were detected in the soil samples above UUSCOs. The complete analytical results for PCBs are provided in Table 4.

Pesticides

One pesticide (4,4'-DDT) was detected in sample B-15 (0-2) at a concentration of 0.007 mg/kg (above its 0.0033 mg/kg UUSCO but well below its 7.9 mg/kg RRSCO). Additionally, 4,4'-DDE was detected in this sample at a trace/estimated concentration of 0.00116 mg/kg (below its 0.0033 mg/kg UUSCO).

These detections are likely attributable to the fill materials and are not indicative of a material release. The complete analytical results for pesticides are provided in Table 5.

4.2 Groundwater Analytical Results

Analytical results from the groundwater sample (MW-1) were compared to the Ambient Water Quality Standards and Guidance Values (AWQSGVs), as listed in NYSDEC Division of Water Technical Operational and Guidance Series (TOGS) 1.1.1. It should be noted that this is a very conservative comparison as the AWQSGVs are drinking water standards and guidelines, whereas site groundwater is not used as a source of drinking water. A complete laboratory analytical report is included in Appendix C.

VOCs

No VOCs were detected above laboratory detection limits in the groundwater sample.

The complete analytical results for VOCs are presented in Table 6.

SVOCs

No SVOCs were detected above laboratory detection limits in the groundwater sample.

The complete analytical results for SVOCs are presented in Table 7.

Metals

Metals were detected in both unfiltered and filtered analysis, with concentrations of 3 metals (iron, manganese, and sodium) exceeding AWQSGVs in the unfiltered sample, as noted in the table below.

In-Text Table T2
Total TAL Metals Concentrations in Groundwater Samples Above AWQSGVs

Analyte	Sample Identification	AWQSGV (µg/L)	Concentration (µg/L)
Iron, Total	MW-01_20230928	300	714
Manganese, Total	MW-01_20230928	300	1,260
Sodium, Total	MW-01_20230928	20,000	191,000
Notes: µg/L = micrograms per liter			

Concentrations in the filtered sample were significantly lower (with the exception of sodium, which also exceeded its AWQSGV in the filtered analysis, as noted in the table below). These metals are most likely attributable to entrained fill materials or regional conditions and do not indicate the likelihood of a site release.

In-Text Table T3
Dissolved TAL Metals Concentrations in Groundwater Samples Above AWQSGVs

Analyte	Sample Identification	AWQSGV (µg/L)	Concentration (µg/L)
Sodium, Dissolved	MW-01 20230928	20,000	217,000
Notes: µg/L = micrograms per liter			

The complete analytical results for total and dissolved metals are presented in Tables 8 and 9.

PCBs

PCBs were not identified in the groundwater sample above laboratory detection limits.

Pesticides

Two pesticides (4,4'-DDT and endrin) were detected in the groundwater sample at trace and estimated concentrations. Of these, endrin was detected above its AWQSGV (non-detect) at an estimated concentration of 0.008 µg/L. Absent any field evidence of contamination, the groundwater detections are likely associated with suspended particles of fill entrained in the samples and not indicative of a material release.

The complete analytical results for PCBs and pesticides are provided in Tables 10 and 11.

4.3 Soil Vapor and Ambient Air Sampling Results

The results of the five soil vapor samples were compared to the values in NYSDOH 2006 *Guidance for Evaluation Soil Vapor Intrusion*, as updated through May 2017. Analytical results are summarized in Table 12, and the complete laboratory analytical report is provided as Appendix C. The analytical data is discussed below.

VOCs

In the absence of soil vapor criteria, results were compared to the indoor air criteria published in the 2006 *NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York* Air Guideline Values (AGVs) and matrices, the September 2013 NYSDOH Fact Sheet update for tetrachloroethene (PCE), the August 2015 NYSDOH Fact Sheet for trichloroethene (TCE), and the 2017 decision matrix updates. These values provide a means of comparison, but since the AGVs are designed to be protective of indoor air, the comparison assumes complete penetration of any detected soil vapor into a hypothetical new building, a condition that would not actually occur. The complete laboratory analytical data sheets are located in Appendix C.

Eight of the analyzed VOCs [1,1,1-trichloroethane, 1,1-dichloroethene, carbon tetrachloride, cis-1,2-dichloroethene, methylene chloride, tetrachloroethene (PCE), trichloroethylene (TCE), and vinyl chloride] have AGVs or Matrix values. Of these eight VOCs, methylene chloride (maximum 21.2 µg/m^3 in SV-15), PCE (maximum 5.57 µg/m^3 in SV-10) and TCE (maximum 1.45 µg/m^3 in SV-15) were detected in one or more soil vapor samples, but below their respective AGVs and Matrix values.

Analytical results also indicated certain VOCs typically associated with petroleum (including 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, 2,2,4-trimethylpentane, 2-hexanone, cyclohexane, 4-ethyltoluene, benzene, ethanol, ethylbenzene, toluene, and xylenes [collectively referred to as BTEX], hexane, heptane, and tertiary butyl alcohol) at concentrations up to 460 µg/m^3 (ethanol), and other typically solvent-related VOCs [including acetone, 2-butanone (methyl ethyl ketone), chloroform, carbon disulfide, and isopropanol] were detected up to 943 µg/m^3

(chloroform). However, there are no established AGVs for these compounds. Nonetheless, these results are likely reflective of regional conditions associated with a history of petroleum use in the area.

5.0 CONCLUSIONS AND RECOMMENDATIONS

AKRF, Inc. (AKRF) conducted a Subsurface (Phase II) Investigation at Lenox Hill Hospital's (LHH's) existing campus on the block bounded by Park and Lexington Avenues and East 76th and East 77th Streets (Block 1411, Lots 1 and 113) (aka Projected Development Site 1) and three buildings on the north side of East 77th Street across from the main hospital complex (Block 1412, Lots 9, 10, and 11) (aka Projected Development Site 1a) (collectively "Site"). The proposed redevelopment of the Site would entail demolition of portions of the current hospital and renovations of existing structures for a new state-of-the-art hospital facility (to occur in multiple stages).

The purpose of the investigation was to determine whether past uses on or near the Site have adversely affected the Site's subsurface. The scope was based on the findings of a *Phase I Environmental Site Assessment (ESA)* prepared by AKRF in June 2022. The scope was established in *the Subsurface (Phase II) Investigation Sampling Protocol and Health and Safety Plan*, prepared by AKRF in June 2023 (and approved by NYCDEP in July 2023). The Phase II field activities were conducted on September 27 and 28, 2023 (with an additional soil vapor sample collected on October 18, 2023).

The scope of work included a geophysical investigation, the advancement of nine borings using manual methods (hand tools consisting of a core drill and hand auger) with the collection and laboratory analysis of two soil samples, one groundwater sample (from an existing geotechnical monitoring well previously installed in the East 76th Street sidewalk immediately south of the hospital building), and nine soil vapor samples for laboratory analysis.

Due to physical limitations encountered during the field investigation, including intervening subsurface utilities, active electrical systems for critical hospital care systems, and ongoing hospital operations, the advancement of soil borings with a Geoprobe® direct-push drill rig within the Site buildings was not possible as hospital operations prohibited the interior use of fuel-powered drilling equipment with exhaust and limited the use of electrical power to standard outlets. As such, borings were advanced manually with hand tools consisting of a core drill and a hand auger which precluded the installation of soil borings to significant depths below the sub-basement and basement floor slabs and limited sample collection.

Shallow soil encountered during this investigation (collected from the 0- to 2-foot interval below basement grade) generally consisted of sandy fill materials including gravel and silts. No elevated PID readings or petroleum-like odors were encountered in the borings. Groundwater was encountered at approximately 17 fbg in the existing geotechnical monitoring well and is expected to flow in an easterly direction towards the East River, located approximately 4,000 feet away.

Soil sample analytical results were compared to 6 NYCRR Part 375 Soil Cleanup Objectives for Unrestricted Use Soil Cleanup Objectives (UUSCOs) and Soil Cleanup Objectives for Restricted – Residential Use (RRSCOs). Groundwater sample results were compared to the NYSDEC Class GA Ambient Water Quality Standards and Guidance Values (AWQSGVs) as presented in the NYSDEC *Division of Water Technical Operational and Guidance Series (TOGS) 1.1.1*. Soil vapor sample analytical results were compared to the NYSDOH Indoor Air Guideline Values (AGVs) and Matrix Values contained in the *Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York*, dated October 2006, (as subsequently updated).

The following conclusions and recommendations are based upon the findings described above but are subject to the Limitations (Section 6.0). A summary of the investigation results is as follows:

Soil Analytical Results

- No VOCs were detected were above laboratory detection limits.
- No SVOCs exceeded UUSCOs or RRSCOs.

- Metals were detected in the samples, with some concentrations (including cadmium, copper, lead mercury, nickel and zinc) above UUSCOs and/or RRSCOs that were attributable to fill materials, although the level of total lead in sample B-15 indicated for the potential the levels of leachable lead to exceed hazardous waste thresholds in some soils that might be excavated. during future construction. Additional soil waste characterization data will be needed prior to soil disposal.
- PCBs were detected in the samples below UUSCOs and RRSCOs.
- One pesticide (4,4'-DDT) was detected in sample B-15 (0-2) above its UUSCO but was below its RRSCO.

The detections are typical of urban fill material and not indicative of a material release.

Groundwater Analytical Results

- No VOCs or SVOCs were detected above laboratory detection limits in the groundwater sample.
- Three metals (iron, manganese, and sodium) exceeded AWQSGVs in the unfiltered groundwater sample. In the dissolved (filtered) analysis, only one metal (sodium) was detected above its AWQSGV. The detected metals exceeding AWQSGVs in both the filtered and unfiltered analyses are most likely attributable to entrained fill materials or regional conditions and do not indicate any evidence of a release.
- PCBs were not detected in the groundwater sample.
- One pesticide (endrin) was detected above its AWQSGV at an estimated concentration.

The detections are typical of urban fill material and not indicative of a material release.

Soil Vapor Analytical Results

- Low-level detections of methylene chloride, PCE and TCE were detected in one or more soil vapor samples, below their respective AGVs or Matrix values.
- Several typically petroleum-related compounds, for which there are no AGVs, were detected in the samples.

The levels appeared typical those encountered in industrial/commercial areas of NYC and given that the same compounds were not detected at appreciable levels in the Site soil, they do not appear to indicate an on-site release.

RECOMMENDATIONS

- To address the potential for encountering identified or unexpected contamination during redevelopment, a Remedial Action Plan (RAP) and associated Construction Health and Safety Plan (CHASP) should be prepared for implementation during proposed construction and submitted to the New York City Department of Environmental Protection (NYCDEP) for review and approval. The RAP should address requirements for items such as: vapor mitigation [e.g., a vapor barrier]; soil stockpiling, off-site soil disposal and transportation; dust control; contingency measures if petroleum storage tanks or other contamination should be unexpectedly encountered; and, a minimum two-foot clean soil cap in any new landscaped or uncapped areas. The CHASP should include measures for worker and community protection, including personal protective equipment, dust control, air monitoring, and emergency response procedures.
- Excavated soil and fill material should be handled and managed in accordance with applicable regulatory requirements. Transportation of material leaving the Site for disposal must be in

accordance with federal, state and local regulatory requirements covering licensing of haulers and trucks, placarding, truck routes, manifesting, etc.

- Any unforeseen tanks, if encountered during the proposed excavation, should be properly closed and removed, along with any ancillary piping/equipment and contaminated soil. The closure should be performed in accordance with the applicable NYSDEC tank registration and spill reporting/closure regulations, if warranted.
- Dewatering for the proposed project, if required, should be conducted in accordance with a NYCDEP sewer discharge permit. Additional groundwater testing and pre-treatment would likely be necessary to comply with NYCDEP requirements for obtaining a sewer discharge permit.

6.0 LIMITATIONS

The findings set forth in this report are strictly limited in scope and time to the date of the evaluation described herein. The conclusions and recommendations presented in the report are based solely on the services and any limitations described in this report.

This report may contain conclusions that are based on the analysis of data collected at the time and locations noted in the report through intrusive or non-intrusive sampling. However, further investigation might reveal additional data or variations of the current data, which may differ from our understanding of the conditions presented in this report and require the enclosed recommendations to be reevaluated or modified.

Chemical analyses may have been performed for specific parameters during the course of this investigation, as summarized in the text and tables. It should be noted that additional chemical constituents, not searched for during this investigation, may be present at the site. Due to the nature of the investigation and the limited data available, no warranty, expressed or implied, shall be construed with respect to undiscovered liabilities. The presence of biological hazards, radioactive materials, lead-based paint and asbestos-containing materials was not investigated, unless specified in the report.

Interpretations of the data, including comparison to regulatory standards, guidelines or background values, are not opinions that these comparisons are legally applicable. Furthermore, any conclusions or recommendations should not be construed as legal advice. For such advice, the client is recommended to seek appropriate legal counsel. Disturbance, handling, transportation, storage and disposal of known or potentially contaminated materials is subject to all applicable laws, which may or may not be fully described as part of this report.

The analytical data, conclusions, and/or recommendations provided in this report should not be construed in any way as a comprehensive classification of waste that may be generated during future disturbance of the project site. Waste(s) generated at the site including excess fill may be considered regulated solid waste and potentially hazardous waste. Requirements for intended disposal facilities should be determined beforehand as the data provided in this report may be insufficient and could vary following additional sampling.

This report may be based solely or partially on data collected, conducted, and provided by, AKRF and/or others. No warranty is expressed or implied by usage of such data. Such data may be included in other investigation reports or documentation. In addition, these reports may have been based upon available previous reports, historical records, and documentation from federal, state and local government agencies, personal interviews, and geological mapping. This report is subject, at a minimum, to the limitations of the previous reports, historical documents, availability and accuracy of collected documentation, and personal recollection of those persons interviewed. In certain instances, AKRF has been required to assume that the information provided is accurate with limited or no corroboratory evidence.

This report is intended for the use solely by the Client. Reliance by third parties on the information and opinions contained herein is strictly prohibited and requires the written consent of AKRF. AKRF accepts no responsibility for damages incurred by third parties for any decisions or actions taken based on this report. This report must be used, interpreted, and presented in its entirety.

Subsurface (Phase II) Investigation
Notes

DEFINITIONS

J : The concentration given is an estimated value.

ND : The analyte was not detected above the laboratory reporting limit.

ND* : The standard is a non-detectable concentration by the approved analytical method.

NS : No standard.

† : Dilution factor varies.

mg/kg : milligrams per kilogram

µg/L : micrograms per liter

µg/m^3 : micrograms per cubic meter of air

STANDARDS

Part 375 Soil Cleanup Objectives : Soil Cleanup Objectives listed in New York State Department of Environmental Conservation (NYSDEC) "Part 375" Regulations [6 New York Codes, Rules and Regulations (NYCRR) Part 375].

Exceedances of Part 375 Unrestricted Use Soil Cleanup Objectives (UUSCOs) are highlighted in bold font.
Exceedances of Part 375 Restricted Residential Soil Cleanup Objectives (RRSCOs) are highlighted in gray shading.

NYSDEC Class GA AWQSGVs : New York State Department of Environmental Conservation (NYSDEC) Technical and Operational Guidance Series (1.1.1): Class GA Ambient Water Quality Standards and Guidance Values (AWQSGVs).

Exceedances of NYSDEC Class GA AWQSGVs are highlighted in bold font.

NYSDOH Soil Vapor Intrusion Air Guidance Value : New York State Department of Health (NYSDOH) Air Guideline Values (AGVs) presented in the Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York, dated October 2006 (“NYSDOH Vapor Intrusion Guidance Document”), updated September 2013 for change of AGV for PCE, August 2015 for TCE, and May 2017 for NYSDOH Matrices A, B, and C for PCE, TCE, c1,2-DCE, 1,1-DCE, carbon tetrachloride, 1,1,1-TCA, methylene chloride, and vinyl chloride. The matrix values listed are the sub-slab soil vapor concentrations where mitigation is recommended regardless of the indoor air concentration.

Exceedances of NYSDOH AGVs are highlighted in bold font.
Exceedances of NYSDOH Matrix Values are highlighted in gray shading.

APPENDIX B

SOIL VAPOR SAMPLING LOGS

Soil Vapor Sample Log

AKRF Project No:	12317		**Point Installed By:**	Eastern	
Project Location:	Lenox Hill Hospital		**Installation Method:**	Hammer Drill	
Client:	Northwell Health		**Sampled By:**	A. Cardenas, AKRF	
Date:	9/28/2023		**Weather:**	55 °F, Cloudy	
Sample Setup					
Vapor Point Depth:	12	Inches	**Total Time of Purge:**	10 Min	
Purging Pump:	Gilair Plus (or equal)		**Purge Volume:**	2 L	
Pump Flow Rate*:	0.2	L/min	**Purged Vapor PID:**	ND	ppm
			Helium Concentration:	ND	%
Sample Identification					
Soil Vapor Point ID:	**SV-01**		**SUMMA® Canister ID:**	**3359**	
Flow Controller ID:	**01773**		**Soil Vapor Sample ID:**	**SV-01_20230928**	

Sample Collection

Time		Vacuum (in/Hg)	Background PID	Notes
Time Started:	819	-29	ND	
Time Stopped:	1019	-5.4	ND	

Notes:

*Purge flow rate not to exceed 0.2 L/min.

ND = non-detect ppm = parts per million L/min = Liters per minute

Soil vapor sample SV-01 20230928 collected in a 6-L SUMMA® canister using a 2-hour flow controller.

Soil Vapor Sample Log

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY
For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Case Narrative (continued)

Volatile Organics in Air

Canisters were released from the laboratory on October 12, 2023. The canister certification results are provided as an addendum.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Authorized Signature: Christopher J Anderson Report Date: 10/27/23

Title: Technical Director/Representative

GLOSSARY

Acronyms

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

EPA - Environmental Protection Agency.

LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LCSD - Laboratory Control Sample Duplicate: Refer to LCS.

LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LOD - Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

LOQ - Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.

MSD - Matrix Spike Sample Duplicate: Refer to MS.

NA - Not Applicable.

NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.

NDPA/DPA - N-Nitrosodiphenylamine/Diphenylamine.

NI - Not Ignitable.

NP - Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.

NR - No Results: Term is utilized when 'No Target Compounds Requested' is reported for the analysis of Volatile or Semivolatile Organic TIC only requests.

RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

STLP - Semi-dynamic Tank Leaching Procedure per EPA Method 1315.

TEF - Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.

TEQ - Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.

TIC - Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Report Format: Data Usability Report

Footnotes

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Chlordane: The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Gasoline Range Organics (GRO): Gasoline Range Organics (GRO) results include all chromatographic peaks eluting from Methyl tert butyl ether through Naphthalene, with the exception of GRO analysis in support of State of Ohio programs, which includes all chromatographic peaks eluting from Hexane through Dodecane.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. In addition, the 'PFAS, Total (6)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA, PFDA and PFOS. For MassDEP DW compliance analysis only, the 'PFAS, Total (6)' result is defined as the summation of results at or above the RL. Note: If a 'Total' result is requested, the results of its individual components will also be reported.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where

Report Format: Data Usability Report

Data Qualifiers

the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

V - The surrogate associated with this target analyte has a recovery outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)

Z - The batch matrix spike and/or duplicate associated with this target analyte has a recovery/RPD outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)

ND - Not detected at the reporting limit (RL) for the sample.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY
For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Case Narrative (continued)

Volatile Organics in Air

Canisters were released from the laboratory on September 8, 2023. The canister certification results are provided as an addendum.

L2357439-04D,-06D: The sample has elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

The WG1836641-3 LCS recovery for pentane (142%), 1,2,4-trichlorobenzene (140%), 1,2,3-trichlorobenzene (133%) and hexachlorobutadiene (132%), associated with L2357439-01 through -08, is above the upper 130% acceptance limit. All samples associated with this LCS do not have reportable amounts of this analyte, or were re-analyzed on an instrument with QC within acceptance limtis.

The WG1836928-3 LCS recovery for methanol (69%), 1,1-dichloroethene (149%), methylene chloride (134%), 3-chloropropene (144%) and ethyl acetate (131%), associated with L2357439-04D and -06D, is above the upper 130% acceptance limit. All samples associated with this LCS do not have reportable amounts of this analyte.

Sample Receipt

The canister ID number for the sample designated SV-01_20230928 (L2357439-04) is listed on the CoC as 3354 but should be 3359.

The canister ID number for the sample designated SV-05_20230928 (L2357439-07) is listed on the CoC as 1972 but should be 1978.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Authorized Signature: Report Date: 10/09/23

Title: Technical Director/Representative

GLOSSARY

Acronyms

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

EPA - Environmental Protection Agency.

LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LCSD - Laboratory Control Sample Duplicate: Refer to LCS.

LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LOD - Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

LOQ - Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.

MSD - Matrix Spike Sample Duplicate: Refer to MS.

NA - Not Applicable.

NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.

NDPA/DPA - N-Nitrosodiphenylamine/Diphenylamine.

NI - Not Ignitable.

NP - Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.

NR - No Results: Term is utilized when 'No Target Compounds Requested' is reported for the analysis of Volatile or Semivolatile Organic TIC only requests.

RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

STLP - Semi-dynamic Tank Leaching Procedure per EPA Method 1315.

TEF - Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.

TEQ - Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.

TIC - Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Report Format: Data Usability Report

Footnotes

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Chlordane: The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Gasoline Range Organics (GRO): Gasoline Range Organics (GRO) results include all chromatographic peaks eluting from Methyl tert butyl ether through Naphthalene, with the exception of GRO analysis in support of State of Ohio programs, which includes all chromatographic peaks eluting from Hexane through Dodecane.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. In addition, the 'PFAS, Total (6)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA, PFDA and PFOS. For MassDEP DW compliance analysis only, the 'PFAS, Total (6)' result is defined as the summation of results at or above the RL. Note: If a 'Total' result is requested, the results of its individual components will also be reported.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where

Report Format: Data Usability Report

Data Qualifiers

the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

V - The surrogate associated with this target analyte has a recovery outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)

Z - The batch matrix spike and/or duplicate associated with this target analyte has a recovery/RPD outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)

ND - Not detected at the reporting limit (RL) for the sample.

Volatile Organics Instruments

Volatile Organics:

Instrument: Agilent 7890 GC/5975C MSD	Columns (length x ID x df):
Trap: Supelco K Trap (VOACARB 3000)	RTX-VMS 20m x 0.18mm x 1um
Concentrator: EST Encon (or equivalent)	RTX-VMS 30m x 0.25mm x 1.4um
Autosampler: EST Centurion (or equivalent)	RTX-502.2 40m x 0.18mm x 1um
Purge time: 11 min	

Volatile Organics: VPH

Instrument: Agilent 6890 (or equivalent)	Column Type: Restek RTX 502.2
Trap: Supelco K Trap (VOACARB 3000)	Column Length: 105 Meters
Concentrator: EST Encon (or equivalent)	df: 3.00 um
Autosampler: EST Centurion (or equivalent)	ID: 0.53mm

Volatile Organics: PIANO

Instrument: Agilent 7890 GC/5975C MSD	Column Type: DB-VRX
Trap: Supelco K Trap (VOACARB 3000)	Column Length: 60 Meters
Concentrator: Tekmar Velocity / EST Encon	df: 1.40 um
Autosampler: Varian Archon / EST Centurion	ID: 0.25 mm
Purge time: 11 min	Desorb: 1 min

Volatile Organics: Dissolved Gas

Instrument: Agilent 7890 (or equivalent) with FID/TCD	
	Column Type: Haysep S Column
	Column Length: 2 Meters packed (100/200 mesh)
Autosampler: LEAP Headspace	Purge time: 0.6 min

Volatile Organics in Air Instruments

Volatile Organics in Air:

Instruments: Agilent 6890 GC / 5975 MSD Shimadzu QP2010-SE / QP2020

Concentrator: Entech 7100A or 7200	Column Type: Restek RTX-1
Autosampler: Entech 7016CA or 7016D	Column Length: 60 Meters
	df: 1.00 um
	ID: 0.25 mm or 0.32 mm

Trap 1: Glass Bead: manufacturer-Entech: 20 cm packing material
Trap 2: Tenax: manufacturer-Entech: 20 cm packing material

Semivolatile Organics Instruments - Westborough

Semivolatile Organics (Acid/Base/Neutral Extractables):

Instrument: Agilent 5973N MSD	Injection volume: 1 ul;2 uL LVI
Column Type: Restek RXI-5SILMS	df: 0.32 um
Column Length: 30 Meters	ID: 0.25 mm

Polynuclear Aromatic Hydrocarbons by 8270 SIM:

Instrument: Agilent 5973 MSD	Injection volume: 1 ul;2 uL LVI
Column Type: Restek RXI-5SILMS	df: 0.25 um
Column Length: 30 Meters	ID: 0.25 mm

Pesticides/PCB/Herbicides:

Instrument: Agilent 6890 w/Dual Micro ECDs	Injection Volume: 1uL
Column A: Restek RTX-CL/STX-CL	df: 0.32
Column B: Restek RTX/STX-CLPPesticide II	df: 0.25
Column Length: 30 Meters	ID: 0.32 mm

Petroleum/EPH:

Instrument: Agilent 6890 w/FID / HP 5890 w/ FID	Injection Volume: 1uL
Column: Restek RTX 5	df: 0.25
Column Length: 30 Meters	
ID: 0.32 mm	

Semivolatile Organic Instruments - Mansfield

Semivolatile Organics (ALK-PAH Extractables):

Instrument: Agilent 5973N / 5975 MSD	Injection volume: 1 ul
Column Type: ZB-5	df: 0.25 um
Column Length: 60 Meters	ID: 0.25 mm

Semivolatile Organics (8270):

Instrument: Agilent 5973N / 5975 MSD	Injection volume: 2 ul
Column Type: ZB-Semivolatiles	df: 0.25 um
Column Length: 30 Meters	ID: 0.25 mm

Semivolatile Organics (8270 SIM):

Instrument: Agilent 5973N / 5975 MSD	Injection volume: 3 ul
Column Type: ZB-5	df: 0.25 um
Column Length: 30 Meters	ID: 0.25 mm

Semivolatile Organics (1,4-Dioxane):

Instrument: Agilent 5973N / 5975 / 5977 MSD	Injection volume: 3 ul
Column Type: RTX-5	df: 0.25um, 0.18 um
Column Length: 30 Meters	ID: 0.25um, 0.18 mm

Semivolatile Organics (209 Congener):

Instrument: Agilent 5973N / 5975 MSD	Injection volume: 3 ul
Column Type: RTX-5, RTX-PCB	df: 0.25um, 0.18 um
Column Length: 60 Meters	ID: 0.25um, 0.18 mm

Semivolatile Organics (8081):

Instrument: Agilent 6890 / 7890	Injection volume: 1 ul
Column Type: RTX-5 / RTX-CLP II	df: 0.25 um
Column Length: 60 Meters	ID: 0.25 mm

Semivolatile Organics (8082):

Instrument: Agilent 6890 w/Dual Micro ECDs	Injection Volume: 1uL
Column A: Restek RTX-CL/STX-CL	df: 0.32
Column B: Restek RTX/STX-CLPPesticide II	df: 0.25
Column Length: 30 Meters	ID: 0.32 mm

Semivolatile Organics (SHC Extractables):

Instrument: Agilent 6890	Injection volume: 1 ul
Column Type: RTX-5	df: 0.25 um
Column Length: 60 Meters	ID: 0.25 mm

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Project Number:	12317	**Report Date:**	10/06/23

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

PCBs

L2356839-01 and -04: The sample has elevated detection limits due to the limited sample volume utilized during extraction, as required by the sample matrix.

Total Metals

L2356839-01 and -03: The sample has elevated detection limits for all elements, with the exception of mercury, due to the dilution required by the sample matrix.

Dissolved Metals

The WG1834988-3 MS recovery for sodium (0%), performed on L2356839-04, does not apply because the sample concentration is greater than four times the spike amount added.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Project Number:	12317	**Report Date:**	10/06/23

GLOSSARY

Acronyms

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

EPA - Environmental Protection Agency.

LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LCSD - Laboratory Control Sample Duplicate: Refer to LCS.

LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LOD - Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

LOQ - Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.

MSD - Matrix Spike Sample Duplicate: Refer to MS.

NA - Not Applicable.

NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.

NDPA/DPA - N-Nitrosodiphenylamine/Diphenylamine.

NI - Not Ignitable.

NP - Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.

NR - No Results: Term is utilized when 'No Target Compounds Requested' is reported for the analysis of Volatile or Semivolatile Organic TIC only requests.

RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

STLP - Semi-dynamic Tank Leaching Procedure per EPA Method 1315.

TEF - Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.

TEQ - Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.

TIC - Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Report Format: DU Report with 'J' Qualifiers

Project Name:	LENOX HILL HOSPITAL	**Lab Number:**	L2356839
Project Number:	12317	**Report Date:**	10/06/23

Footnotes

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Chlordane: The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Gasoline Range Organics (GRO): Gasoline Range Organics (GRO) results include all chromatographic peaks eluting from Methyl tert butyl ether through Naphthalene, with the exception of GRO analysis in support of State of Ohio programs, which includes all chromatographic peaks eluting from Hexane through Dodecane.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. In addition, the 'PFAS, Total (6)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA, PFDA and PFOS. For MassDEP DW compliance analysis only, the 'PFAS, Total (6)' result is defined as the summation of results at or above the RL. Note: If a 'Total' result is requested, the results of its individual components will also be reported.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively

Report Format: DU Report with 'J' Qualifiers

Project Name:	LENOX HILL HOSPITAL	**Lab Number:**	L2356839
Project Number:	12317	**Report Date:**	10/06/23

Data Qualifiers

Identified Compounds (TICs). For calculated parameters, this represents that one or more values used in the calculation were estimated.

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

V - The surrogate associated with this target analyte has a recovery outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)

Z - The batch matrix spike and/or duplicate associated with this target analyte has a recovery/RPD outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624.1: m/p-xylene, o-xylene, Naphthalene
EPA 625.1: alpha-Terpineol
EPA 8260D: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270E: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine, alpha-Terpineol; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water
EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B, SM4500NO2-B**
EPA 524.2: THMs and VOCs; **EPA 504.1:** EDB, DBCP.

Re: Geophysical Engineering Survey (GES) Report
Lenox Hill Hospital
100 East 77th Street,
New York, New York 10075
AKRF Project #

Dear Ms. Chefalo

Nova Geophysical Services (NOVA) is pleased to provide the findings of the geophysical engineering survey (GES) at the above referenced project site: Lenox Hill Hospital: 100 East 77th Street, New York, New York (the "Site")

INTRODUCTION TO GEOPHYSICAL ENGINEERING SURVEY (GES)

NOVA performed a geophysical engineering survey (GES) consisting of a Ground Penetrating Radar (GPR) and Electromagnetic (EM) survey at the site. The purpose of this survey is to locate and identify utilities, underground storage tanks (USTs) and other substructures in the vicinity of proposed boring locations on September 13th, 2023.

The equipment selected for this investigation was a Sensors and Software Noggin 250 MHz ground penetrating radar (GPR) with a shielded antenna and a RadioDetection RD7100 Electromagnetic utility locator. A GPR system consists of a radar control unit, control cable, and transducer (antenna). The control unit transmits a trigger pulse at a normal repetition rate of 250 MHz. The trigger pulse is sent to the

transmitter electronics in the transducer via the control cable. The transmitter electronics amplify the trigger pulse into bipolar pulses that are radiated to the surface. The transformed pulses vary in shape and frequency according to the transducer used. In the subsurface, variations of the signal occur at boundaries where there is a dielectric contrast (void, steel, soil type, etc.). Signal reflections travel back to the control unit and are represented as color graphic images for interpolation.

A typical electromagnetic (EM) utility locating system consists of a transmitter unit and a receiver unit. The receiver unit can be used independently of the transmitter unit in order to detect utility lines with an inherent EM signature (electric utility lines, water lines, etc.). If needed a current at a specific frequency can also be placed on a utility that is being located. This can be done via the transmitter unit by either direct connection or induction via an EM field varying at specific frequency. The receiver unit is then set to the selected frequency and the electromagnetic field created by the current running through the utility can be located allowing the utility to be marked.

GEOPHYSICAL METHODS

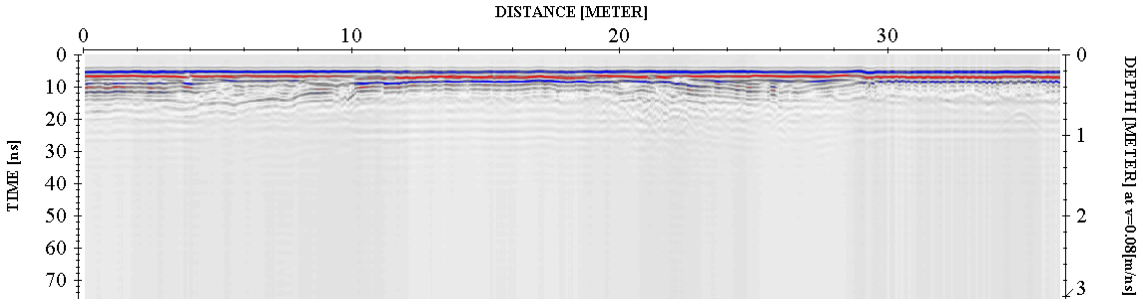
The project site was screened using GPR to search the specified area and inspected for reflections, which could be indicative of substructures and utilities within the subsurface. An EM utility locator was used to help determine the locations of utilities within the survey area.

EM data was collected and interpreted on site and suspected utilities marked as needed. GPR data profiles were collected for the areas of the Site specified by the client and processed as specified below.

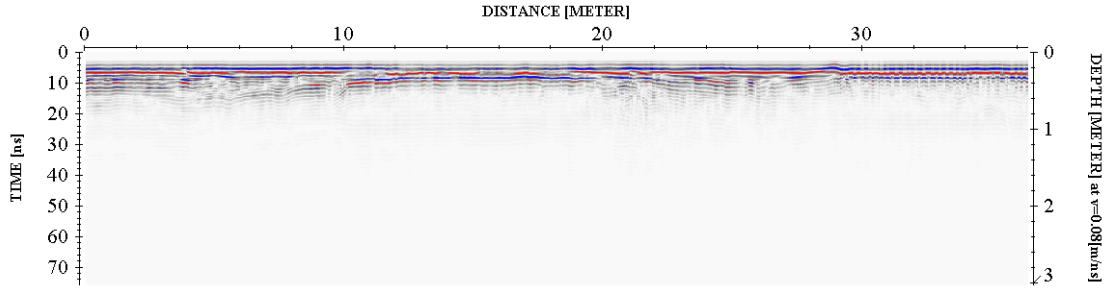
DATA PROCESSING

To improve the quality of the results and to better identify anomalies NOVA processed the collected data. The processing workflow is briefly described in this section.

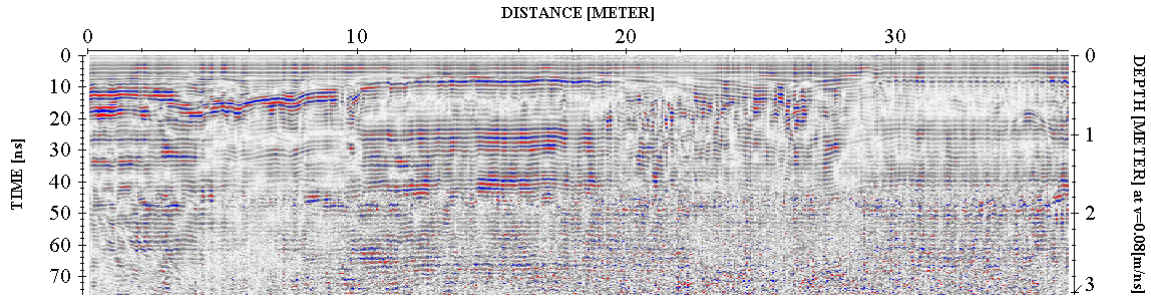
Step 1. Import Raw RAMAC data to standard processing format



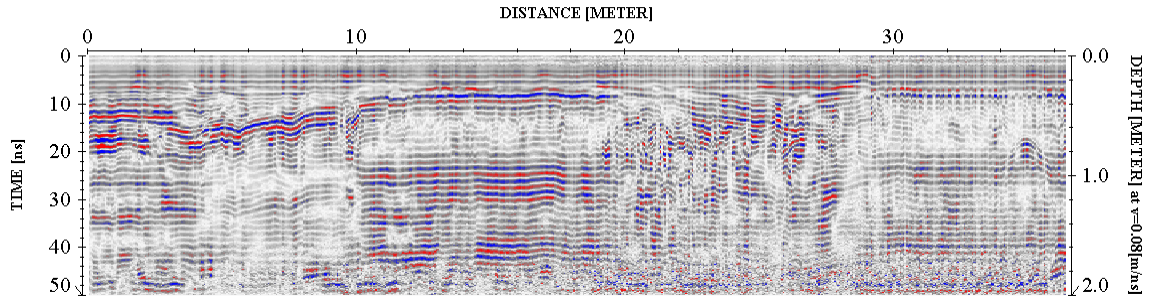
Step 2. Remove instrument noise *(dewow)*



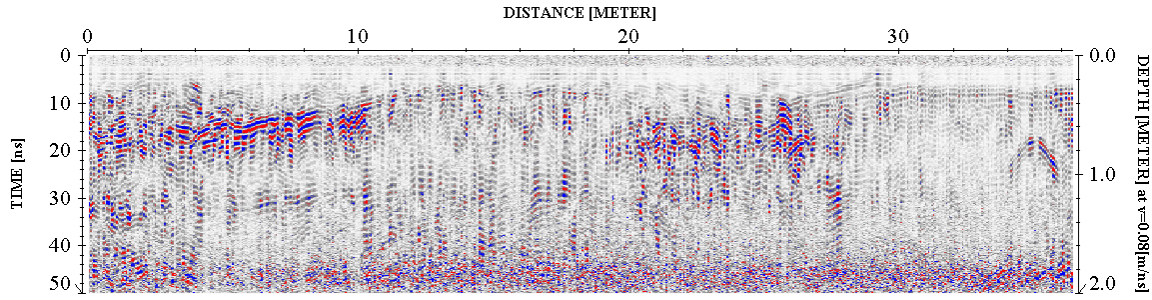
Step 3. Correct for attenuation losses *(energy decay function)*



Step 4. Remove static from bottom of profile *(time cut)*



Step 5. Mute horizontal ringing/noise *(subtracting average)*



The above example shows the significance of data processing. The last image (step 5) has higher resolution than the starting image (raw data – step 1) and represents the subsurface anomalies much more accurately.

PHYSICAL SETTINGS

NOVA observed the following physical conditions at the time of the survey.

Weather: Clear

Temperature: 75° F

Surface: Concrete, Tile

Survey Parameters: A GPR grid scan was conducted within the survey areas as shown on the survey plan. The approximate line spacing of the grid survey was approximately 2'. Additional GPR data was collected over features of interest. An EM utility locator was used in conjunction with GPR throughout the survey area.

Limitations: The geophysical noise level (GNL) at the site was high due to being in an urban environment, and other unknown anthropogenic noise sources. Utilities at depths greater than approximately 5 feet below ground surface or with insufficient dielectric contrast may not have been located with the applied geophysical techniques.

RESULTS

The results of the geophysical engineering survey (GES) identified the following at the project site:

- Anomalies resembling potential subsurface utilities (such as drainage, and electric) were identified within the surveyed areas. Additional anomalies resembling potential subsurface piping were identified but could not be connected to known utilities. The approximate locations are shown in the survey plan.
- The GES did not identify any anomalies consistent with an UST within the survey areas.
- All cleared boring locations were marked during the onsite mark out. Approximate locations of proposed borings are shown in the survey plan.

If you have any questions, please do not hesitate to contact the undersigned.

Sincerely,

NOVA Geophysical Services

Levent Eskicakit, P.G., E.P.

Project Manager

APPENDICES

Appendix A - Vapor Barrier Specifications
Appendix B - Construction Health and Safety Plan

1.0 INTRODUCTION

The project site is located on Lenox Hill Hospital's (LHH's) existing campus on the block bounded by Park and Lexington Avenues and East 76th and East 77th Streets (Block 1411, Lots 1 and 113) (aka Projected Development Site 1) and three buildings on the north side of East 77th Street across from the main hospital complex (Block 1412, Lots 9, 10, and 11) (aka Projected Development Site 1a) (collectively "Site"). The Site is located in a mixed-use residential, commercial, and institutional area. The site location is provided as Figure 1.

The proposed redevelopment of the Site would entail demolition of portions of the current hospital and renovations of existing structures for the new state-of-the-art hospital facility (to occur in multiple stages, construction plans have not been finalized). It is anticipated that the proposed construction would require excavation up to approximately 10 feet below the current basement and cellar grades (i.e., well below the bedrock interface) and may require dewatering.

The purpose of this Remedial Action Plan (RAP) is to present procedures for managing soil and groundwater during subsurface disturbance associated with the proposed project in accordance with applicable federal, state, and local requirements, including guidelines for temporary on-site stockpiling and off-site transportation and disposal of soil. The RAP is based on the results of the previous assessments/investigations described in Section 2.2. All work outlined within the RAP is subject to the Construction Phase Environmental Health and Safety Plan (CHASP) developed for the Site. The RAP and CHASP will be submitted to the New York City Department of Environmental Protection (NYCDEP) for review and approval.

2.0 SITE BACKGROUND

2.1 Site Characterization

Topography at the Site is relatively level, with a slight downward slope to the east. Based on the U.S. Geological Survey, Central Park, NY Quadrangle (2013) map, the Site is approximately 65 feet above the National Geodetic Vertical Datum of 1988 (an approximation of mean sea level).

During AKRF's Subsurface (Phase II) field activities conducted in September-October 2023, Groundwater was encountered at approximately 17 fbg in an existing geotechnical monitoring well located within the East 76th Street sidewalk immediately south of the hospital building. Groundwater beneath the site is expected to flow in an easterly direction towards the East River, located approximately 4,000 feet away. Shallow soil encountered during the Phase II Investigation (collected from the 0- to 2-foot interval below basement grade) generally consisted of sandy fill materials including gravel and silts. A geotechnical investigation [RA Consultants LLC, January 2018, discussed further in Section 2.2] indicated that soil beneath the Site consisted of a mixture of gravel, sand, bricks, crushed stone, and construction debris to approximately 5 to 15 feet below the basement level and to approximately 3 feet below the sub-basement level underlain by decomposed rock and mica schist.

2.2 Previous Environmental Investigations

Phase I Environmental Site Assessment, Lenox Hill Hospital Redevelopment, AKRF Inc., June 2022

The Phase I ESA conducted at the Site in June 2022 identified "Recognized Environmental Conditions" (RECs), i.e., the presence or likely presence of hazardous substances or petroleum in the ground or groundwater. These were:

- The Site (Block 1411, Projected Development Site 1) was registered with the New York State Department of Environmental Conservation (NYSDEC) Petroleum Bulk Storage (PBS) Program (PBS# 2-606498) with one in-service diesel aboveground storage tank (AST) located within a basement-level concrete tank room, two (2) 317-gallon day tanks within a sub-basement-level emergency generator room, and an ancillary 330-gallon diesel AST (also supplied by the 20,000-gallon AST) located on the roof of the Uris building. The tanks were used to fuel the LHH emergency generator systems. No spills were listed in regulatory database information in connection with the ASTs; however, it was noted that undocumented releases from historic bulk petroleum storage operations may have affected environmental conditions at the Site.
- The LHH main hospital (Block 1411, Projected Development Site 1) was registered as a small quantity generator (SQG) and historic Large Quantity Generator (LQG) of hazardous wastes typically associated with medical facilities.
- Historical land use maps and city directories indicated that the current ancillary hospital buildings on the north-adjacent block (Block 1412, Projected Development Site 1a) contained three dwellings since at least 1898 and were noted to include several commercial and automotive uses between circa 1911 and 2005, including auto storage houses, offices, and a farrier (subsequently a garage) at 113 East 77th Street. Historic garage uses were also noted at the 111 and 115 East 77th Street buildings. Such uses may have included petroleum and/or solvents and mercury (associated with the former farrier).
- Historical land use maps, city directories and the regulatory database review identified nearby uses between circa 1896 and 2005, including automotive garages on blocks south, northeast, and west of the Property, and several drycleaners on the surrounding blocks. The regulatory database information indicated two closed-status spills documenting petroleum contaminated soil and groundwater at 122 East 78th Street (immediately north of Projected Development Site 1a).

Based upon the findings in the Phase I ESA, AKRF recommended the performance of a subsurface (Phase II) investigation including the collection and laboratory analysis of subsurface samples.

Report of Geotechnical Investigation, Lenox Hill Hospital (100 East 77th Street) Manhattan, NY 10075, RA Consultants LLC, January 2018

The January 2018 Geotechnical Investigation included the advancement of 17 geotechnical borings in select basement and sub-basement areas within the hospital and within the East 76th Street sidewalk immediately south of the hospital. Borings encountered fill materials consisting of a mixture of gravel, sand, bricks, crushed stone, and construction debris to approximately 5 to 15 feet below the basement level and to approximately 3 feet below the sub-basement level. The fill was underlain by decomposed rock and mica schist. Competent bedrock was encountered between approximately 10 and 25 feet below the basement level, and between approximately 5 and 20 feet below the sub-basement level. Two groundwater observation wells were installed within the East 76th Street sidewalk as part of the investigation; the depth to groundwater measured between approximately 17 to 18.5 feet below sidewalk grade and noted to be perched above bedrock and flowing toward the East River.

Phase II Environmental Site Investigation, Lenox Hill Hospital Redevelopment, AKRF Inc., November 2023

Based on the 2022 Phase I ESA findings, a Subsurface (Phase II) Investigation was conducted consisting of a geophysical investigation, the advancement of nine borings using manual methods (hand tools consisting of a core drill and a hand auger) with the collection and laboratory analysis

of 2 soil samples, 1 groundwater sample (from an existing geotechnical monitoring well previously installed in the East 76th Street sidewalk immediately south of the hospital building), and collection of 9 soil vapor samples. The scope was established in the *Subsurface (Phase II) Investigation Sampling Protocol and Health and Safety Plan*, prepared by AKRF in June 2023 (and approved by NYCDEP in July 2023). Due to physical limitations encountered during the field investigation, borings were advanced manually with hand tools consisting of a core drill and a hand auger which precluded the installation of soil borings to significant depths below the sub-basement and basement floor slabs and limited subsurface sample collection.

The Subsurface Investigation identified the following:

Soil Analytical Results

- No VOCs were detected were above laboratory detection limits.
- No SVOCs exceeded UUSCOs or RRSCOs.
- Metals were detected in the samples, with some concentrations (including cadmium, copper, lead mercury, nickel and zinc) above UUSCOs and/or RRSCOs that were attributable to fill materials, although the level of total lead in sample B-15 (from Projected Development Site 1a) indicated for the potential the levels of leachable lead to exceed hazardous waste thresholds in some soils that might be excavated. during future construction. Additional soil waste characterization data will be needed prior to soil disposal.
- PCBs were detected in the samples below UUSCOs and RRSCOs.
- One pesticide (4,4'-DDT) was detected in sample B-15 (0-2) above its UUSCO but was below its RRSCO.

  The detections are typical of urban fill material and not indicative of a material release.

Groundwater Analytical Results

- No VOCs or SVOCs were detected above laboratory detection limits in the groundwater sample.
- Three metals (iron, manganese, and sodium) exceeded AWQSGVs in the unfiltered groundwater sample. In the dissolved (filtered) analysis, only one metal (sodium) was detected above its AWQSGV. The detected metals exceeding AWQSGVs in both the filtered and unfiltered analyses are most likely attributable to entrained fill materials or regional conditions and do not indicate any evidence of a release.
- PCBs were not detected in the groundwater sample.
- One pesticide (endrin) was detected above its AWQSGV at an estimated concentration.

The detections are typical of urban fill material and not indicative of a material release.

Soil Vapor Analytical Results

- Low-level detections of methylene chloride, PCE and TCE were detected in one or more soil vapor samples, below their respective AGVs or Matrix values.
- Several typically petroleum-related compounds, for which there are no AGVs, were detected in the samples.

The levels appeared typical those encountered in industrial/commercial areas of NYC and given that the same compounds were not detected at appreciable levels in the Site soil, they do not appear to indicate an on-site release.

3.0 CONSTRUCTION MEASURES

The proposed redevelopment of the Site would entail demolition of portions of the current hospital and renovations of existing structures for the new state-of-the-art hospital facility (to occur in multiple stages, construction plans have not been finalized). It is anticipated that the proposed construction would require excavation up to approximately 10 feet below the current basement and cellar grade (i.e., well below the bedrock interface) and may require dewatering. Soil encountered throughout the Site will likely include low levels of SVOCs, pesticides and metals, primarily in the shallow fill materials.

In the event that contaminated soil (e.g., petroleum-contaminated soil) is encountered, a contingency plan is provided in Section 3.2 for appropriate handling, testing, and disposal of these materials during general excavation. A contingency plan for the removal of any unexpectedly on-site encountered petroleum storage tanks is provided in Section 3.4. A groundwater management plan is provided in Section 3.8.

The project design will incorporate measures to minimize potential impacts after construction, as described in Section 4.0. Following completion of subsurface work and implementation of the NYCDEP-approved RAP, a New York State licensed Professional Engineer (P.E.)-certified closure report will be submitted to the NYCDEP for review and approval, as detailed in Section 6.0. The report will include a description of completed construction activities and any deviations from this RAP, copies of manifests/bills of lading associated with off-site disposal of material, photographs of the work, and any laboratory results received for additional sampling during construction including waste characterization, off-site disposal purposes, and imported soil, if applicable.

3.1 Pre-Demolition Surveys

Prior to the onset of any demolition (or renovation, as applicable) activities, surveys shall be conducted in all proposed demolition areas to identify all potential ACM, LBP, and PCBs, or other hazardous materials. All suspect materials identified in the surveys shall be managed, removed, and disposed of off-site in accordance with all federal, state, and local requirements.

3.2 Soil Disposal

If sludges, soil, or sediment known to be contaminated or showing evidence of potential contamination, such as discoloration, staining, or odors are encountered during excavation activities, the following procedures will be implemented:

1. Spill reporting to the NYSDEC Spill Hotline (800-457-7362) will be conducted, as necessary.
2. The suspect soil will be sampled for laboratory analyses. Soil samples will be analyzed, at a minimum, for parameters required by the intended disposal facility. Additional analytical requirements may be required based on the nature of the contamination.
3. If the suspect soil is determined to be significantly contaminated according to analytical results, it will be excavated and removed in accordance with the stockpiling and/or direct-loading procedures presented in Section 3.2.2 and 3.2.3, respectively.
4. The excavation will continue vertically until no evidence of contamination is noted in the base of the excavation or until groundwater or bedrock is encountered. The excavation will continue horizontally until no evidence of contamination is noted in the sidewalls of the excavation. Post-excavation endpoint samples will be collected from the sides and bottom of the excavated area and analyzed in accordance with the NYSDEC CP-51 or NYSDEC Division of Environmental Remediation DER-10, based on the nature of the identified contamination. If post-excavation samples exceed action levels, then additional excavation will be performed, as warranted.

5. Soils intended for off-site disposal will be tested in accordance with the requirements of the receiving facility (as discussed further in Section 3.2.1), and disposed of in accordance with applicable federal, state and local requirements. If additional sample analyses are required by alternative disposal facilities, additional analysis may be run on existing sample material at the laboratory as long as all holding time and preservation requirements have not been exceeded.
6. All analytical results, including endpoint sample and excavated soil characterization sampling results, must be received, reviewed, and discussed by the project team before the soil excavation can be backfilled, and before the excavated material can be disposed of off-site, as additional samples may need to be collected.
7. The excavated soil will then be disposed of in accordance with all applicable federal, state and local regulations.
8. Copies of correspondence with disposal facilities concerning classification of materials, testing results, and permits/approvals will be maintained by the project manager and will be submitted to NYSDEC in a Spill Closure Report, as necessary.

When applicable, hazardous waste manifest forms and/or non-hazardous waste records will be completed as required by the appropriate regulatory agencies for verifying the material and quantity of each load in units of volume and weight.

3.2.1 Off-site Disposal

Existing soil intended to be excavated (if any) during the construction activities will be characterized at a rate of one representative sample for every 800 cubic yards of soil or other frequency if required by the intended disposal facility. Waste characterization sampling will likely be conducted in-situ (i.e., in advance of excavation) using a grid-based system.

Each sample will be analyzed for NYSDEC Part 375 VOCs, SVOCs, pesticides, PCBs and target analyte list (TAL) metals, and other parameters required by the intended disposal facilities.

Off-site disposal analytical thresholds will be determined by the individual disposal facilities. Reuse of on-site soil as part of the Site cap is not planned as part of the redevelopment.

3.2.2 Stockpiling Procedures

No petroleum-contaminated soil excavated from the Site (if encountered) will be re-used on-site for any purposes. Contaminated material intended for off-site disposal may be stockpiled temporarily or loaded directly onto trucks for off-site disposal, if pre-approved by the receiving facility.

Soil with contamination established by laboratory analytical data or exhibiting field-screening evidence of contamination will be stockpiled on polyethylene sheeting following excavation. If the soil is expected to remain on-site overnight or longer, the stockpile will be covered with similar polyethylene sheeting, which will be secured with large rocks or other appropriate weights, such as sand bags, to protect against leaching or runoff of contaminants into groundwater or stormwater. Stockpiles will be managed to minimize particulate generation, and run-off and erosion using water, plastic covers, silt fences, and/or hay bales, as necessary.

Silt fencing and/or hay bales will also be used as needed near catch basins, and other discharge points to serve as a stormwater pollution prevention measure.

Soil will be segregated and stockpiled based on its known or anticipated type and/or level of contamination (based on analytical data, PID readings, odor, staining, etc.). Stockpiles will be separated by a sufficient distance or by physical barriers to ensure that mixing of dissimilar or potentially dissimilar materials does not occur. The location and classification of stockpiles will be tracked on Site drawings and updated, if necessary, at the end of each workday according to the following categories:

- Soil intended and approved by NYCDEP for reuse on-site (reuse criteria specified in Section 3.2.1);
- Non-petroleum-contaminated, non-hazardous soil for off-site disposal;
- Non-petroleum-contaminated, hazardous soil for off-site disposal;
- Petroleum-contaminated soil for off-site disposal; and
- Soil pending analysis, if in-situ testing is infeasible.

Copies of Site drawings will be kept in the field log book. Stockpiles intended for off-site disposal may be mixed with other compatible stockpiles on-site (compatibility will be determined by the requirements of the receiving disposal facility), but hazardous or petroleum-contaminated wastes will not be mixed with other non-hazardous wastes.

3.2.3 Alternatives to Stockpiling

Alternative procedures to stockpiling could include, but are not limited to, agreement(s) from the intended disposal or treatment facilities to accept boring data and/or analytical data previously obtained so that materials may be directly loaded into trucks for shipment to the disposal facility.

3.3 Waste Management and Transportation

Transportation of all material leaving the Site for off-site disposal will be in accordance with federal, state and local requirements (including, as applicable, 6 NYCRR Part 364 and U.S. DOT regulations) covering licensing of haulers and trucks, placarding, truck routes, manifesting, etc.

The schedule for truck arrival will be coordinated to meet the approved project schedule. The schedule will be compatible with the availability of equipment and personnel for material handling operations at the job site. Trucks will be protected against contamination by properly covering and lining truck beds with compatible material (such as polyethylene) or by decontaminating them prior to any use other than hauling contaminated materials.

All vehicles leaving the Site will be inspected to ensure that soil adhering to the wheels or under carriage is removed prior to the vehicle leaving the Site. Any situations involving material spilled in transit or mud and dust tracked off-site will be remedied. The truck access routes will be evaluated for road conditions, overhead clearance, and weight restrictions.

Contaminated materials from other projects will not be combined with material from the construction area. The transporter will not deliver waste to any facility other than the facility(s) listed on the shipping manifest.

3.4 Petroleum Tank Closure and Removal

In the event that unknown petroleum storage tanks are identified or encountered at the Site, the tanks and any appurtenances will be cleaned, removed and disposed of in accordance with accepted industry standards and applicable federal, state, and local regulatory agency requirements. Tank closure and any soil removal from the vicinity of any discovered USTs will be conducted in

accordance with the NYSDEC Divisions of Spills and Response Memorandum on Permanent Closure of Petroleum Storage Tanks, dated July 1998, and updated in December 2003, and NYSDEC Division of Environmental Remediation (DER) Commissioner Policy (CP) 51, "Soil Cleanup Guidance," dated October 21, 2012. Laboratory testing of both characterization samples and of samples obtained from the excavation areas will include NYSDEC CP-51 VOCs and SVOCs.

Any unregistered tanks encountered at the Site will be registered with NYSDEC's PBS database. Tank closure activities and any associated petroleum-contaminated soil removal will be documented in a separate Tank/Spill Closure Report, which will be submitted to NYSDEC to document all activity related to the formerly unregistered tanks.

Typical tank removal procedures are summarized below:

1. Open fill cap or vent pipe and measure for product. If measurable product exists, collect a sample of the product. Tank contents will be sampled in accordance with applicable federal, state and local requirements and tested in accordance with the requirements of the receiving facility. Proper disposal of tank contents at an approved facility will be dictated by sample results.
2. Vacuum liquid tank contents and pumpable tank bottom residue.
3. Excavate around the tank with care to avoid release of any residual tank and piping contents. Hand excavation around the tank may be necessary. The sidewalls of all excavated areas will be properly stabilized in accordance with Occupational Safety and Health Administration (OSHA) regulations. Continuously monitor the excavated areas in the worker breathing zone for the presence of flammable, toxic, or oxygen-deficient atmosphere with a PID, a combustible gas indicator (CGI), and an oxygen meter.
4. Inert the tank of flammable vapors using dry ice and verify inertness using an oxygen meter (less than 7 percent). An access hole will be cut in the tank and the tank will be thoroughly cleaned of residual liquids and sludges.
5. Entry of the tank, if necessary, will be conducted in conformance with OSHA confined space requirements.
6. Remaining fuels, loose slurry, sludge materials and wastewater will be collected in DOT-approved drums, sampled and analyzed for disposal characterization. After disposal characterization, waste material will be removed and disposed of in accordance with applicable regulations.
7. Remove the tank and all associated piping from the ground and clean the outside of the tank. The tank and piping will be rendered "not reusable," removed from the Site and disposed of according to applicable regulations with proper documentation. If present, remove and dispose of all concrete tank support structures or vaults, as encountered.
8. After tank removal, examine for evidence of petroleum releases in accordance with the NYSDEC Memorandum on Permanent Closure of Petroleum Storage Tanks. If there is evidence of a petroleum release, follow procedures for Soil Disposal provided in Section 3.2, in addition to the procedures below.
9. If the tank cannot be physically removed due to structural concerns, it will be cleaned following the procedures described in Items 1, 2, 4, 5, and 6 above. Following cleaning, the tank will be permanently closed by filling the tank with a solid, inert material such as cement slurry or foam in accordance with NYSDEC guidance and regulations.

10. Spill reporting to the NYSDEC Spill Hotline (800-457-7362) will be conducted, if deemed necessary in consultation with the project team.
11. All excavated materials will be field-screened with a PID. If soil contamination is present, excavate and remove contaminated soil from the tank areas in accordance with the stockpiling and/or direct-loading procedures presented in Sections 3.2.2 and 3.2.3, respectively. Material will be excavated, to the extent practicable, until field screening with a PID yields concentrations of less than 20 parts per million (ppm) and until there are no remaining visible signs of contamination or odors. After contaminated soil removal, collect endpoint samples at each sidewall and at the bottom of the excavation for analytical testing as specified in NYSDEC CP-51.
12. Photo-document all procedures and record all procedures in a bound field notebook.
13. Copies of all testing results, correspondence with disposal facilities concerning classification of materials, and permits/approvals will be maintained by the project manager and will be submitted to the NYSDEC in a Tank Closure Report, as warranted.
14. A signed affidavit will be prepared by the licensed tank installation (removal) contractor and submitted to the New York City Fire Department (NYCFD) certifying proper removal of the tank(s).

3.5 Dust Control

To prevent the potential migration of dust that may contain above-background levels of contaminants, the following measures will be implemented during all earth-disturbing operations:

- Water will be available (and used) for sprinkling/wetting to suppress dust in dry weather or as necessary.
- All haul trucks will have tarp covers.
- Stabilized construction entrances (e.g., gravel pads) and wash stations will be placed at access points to prevent tracking out of or dispersion of dust.

All work that involves soil disturbance or otherwise generates dust will be performed utilizing methods to minimize dust generation to the extent practicable. Particulate air monitoring requirements will be conducted as discussed in Section 3.6 of this RAP.

3.6 Work Zone Air Monitoring

A PID and particulate monitor will be used to monitor the work zone during all on site soil disturbance activities required for redevelopment. Measurements will be taken prior to commencement of work and continuously during the work as outlined in the following table. Measurements will be made as close to the workers as practicable. Particulate and PID measurements will be collected at the breathing height of the workers. The Site Safety Officer (SSO) shall set up the equipment and confirm that it is working properly. His/her designee may oversee the air measurements during the day. The initial measurement for the day will be performed before the start of work and will establish the background level for that day. The final measurement for the day will be performed after the end of work. The action levels and required responses are listed in the following table:

Instrument	Action Level	Response Action
PID	Less than 5 ppm in breathing zone	Level D or D-Modified
	Between 5 ppm and 50 ppm	Level C

Instrument	Action Level	Response Action
	More than 50 ppm	Stop work. Resume work when readings are less than 50 ppm.
Dust Trak	Less than 0.125 mg/m^3 above background in breathing zone	Level D or D-Modified
	Between 0.125 mg/m^3 and 0.15 mg/m^3 above background in breathing zone	Apply dust suppression measures in work zone (i.e., minimum of spraying down work areas with water, other measures to be determined based on particulate-generating activity).
	Greater than 0.15 mg/m^3 above background in breathing zone	Stop work. Apply additional dust suppression measures. Resume work when readings are less than 0.15 mg/m^3 above background.
mg/m^3 = milligrams per cubic meter ppm = parts per million		

Field personnel will be trained in the proper operation of all field instruments at the start of the field program. The equipment will be calibrated according to manufacturer specifications at the start of each day of fieldwork. If an instrument fails calibration, the project manager will be contacted immediately to obtain a replacement instrument and arrange for repairs. The PID will be calibrated each day using 100 ppm isobutylene standard gas.

3.7 Community Air Monitoring Plan (CAMP)

During all on site soil disturbance activities associated with the redevelopment, an air monitoring program will be implemented to avoid or minimize exposure of the field personnel and the public to potential environmental hazards. Results of this air monitoring will be used to determine appropriate response actions. The air monitoring, as necessary, will be conducted in accordance with the requirements of the New York State Department of Health Generic Community Air Monitoring Plan and Section 7.0 of the CHASP, included as Appendix B, as detailed below.

VOC Monitoring, Response Levels, and Actions

VOCs will initially be monitored at the downwind perimeter of the immediate work area (i.e., the exclusion zone) on a continuous basis during invasive work. Upwind concentrations will be measured at the start of each workday and periodically thereafter to establish background conditions. The monitoring will be performed using equipment appropriate to measure the types of contaminants known or suspected to be present. The equipment will be calibrated at least daily for the contaminant(s) of concern or for an appropriate surrogate. The equipment will be capable of calculating 15-minute running average concentrations, which will be compared to the levels specified below.

If the ambient air concentration of total organic vapors at the downwind perimeter of the work area or exclusion zone exceeds 5 parts per million (ppm) above background for the 15-minute average, work activities will be temporarily halted and monitoring continued. If the total organic vapor level readily decreases (per instantaneous readings) below 5 ppm over background, work activities will resume with continued monitoring.

If total organic vapor levels at the downwind perimeter of the work area or exclusion zone persist at levels in excess of 5 ppm over background but less than 25 ppm, work activities will be halted, the source of vapors identified, corrective actions taken to abate emissions, and monitoring continued. After these steps, work activities will resume provided that the total organic vapor level 200 feet downwind of the exclusion zone or half the distance to the nearest potential receptor or

residential/commercial structure, whichever is less - but in no case less than 20 feet, is below 5 ppm over background for the 15-minute average.

If the organic vapor level is above 25 ppm at the perimeter of the work area, activities will be shutdown.

All 15-minute readings will be recorded, as required, and be available for DEP personnel to review. Instantaneous readings, if any, used for decision purposes will also be recorded.

Particulate Monitoring, Response Levels, and Actions

Particulate concentrations will initially be monitored continuously at the upwind and downwind perimeters of the exclusion zone at temporary particulate monitoring stations. The particulate monitoring will be performed using real-time monitoring equipment capable of measuring particulate matter less than 10 micrometers in size (PM-10) and capable of averaging over a period of 15 minutes (or less) for comparison to the airborne particulate action level. The equipment will be equipped with an audible alarm to indicate exceedance of the action level. In addition, fugitive dust migration should be visually assessed during all work activities.

If the downwind PM-10 particulate level is 100 micrograms per cubic meter ($\mu g/m^3$) greater than background (upwind perimeter) for the 15-minute period or if airborne dust is observed leaving the work area, then dust suppression techniques will be employed. Work will continue with dust suppression techniques provided that downwind PM-10 particulate levels do not exceed 150 $\mu g/m^3$ above the upwind level and provided that no visible dust is migrating from the work area.

If, after implementation of dust suppression techniques, downwind PM-10 particulate levels are greater than 150 $\mu g/m^3$ above the upwind level, work will be stopped and a re-evaluation of activities initiated. Work will resume provided that dust suppression measures and other controls are successful in reducing the downwind PM-10 particulate concentration to within $\mu g/m^3$ of the upwind level and in preventing visible dust migration.

All readings will be recorded and be available for DEP personnel to review.

3.8 Groundwater Management Plan

Any dewatering activities would be conducted in accordance with a NYCDEP Bureau of Wastewater Treatment (BWT) Wastewater Quality Control Permit. Prior to initiating any dewatering, a groundwater sample must be collected and analyzed to ensure it meets the NYCDEP criteria for effluent to municipal sewers. Pre-treatment (dependent upon the testing results) may be necessary to comply with NYCDEP regulations.

4.0 PROJECT DESIGN MEASURES

4.1 Site Cap and Importation of Fill

It is anticipated that the new buildings and paved areas would occupy the entire project site and the new development would be primarily below the bedrock interface. However, if future construction plans are modified to include any landscaped or grass-covered areas (excluding sidewalk or rooftop planters), these areas of the Site would have a "soil cap" consisting of two feet of imported clean fill, i.e., tested at the source facility for Target Compound List (TCL) VOCs, SVOCs, pesticides, PCBs, and Target Analyte List (TAL) metals (initially at a frequency of one composite sample per 250 cubic yards, but with lower frequency for certain sources if approved by NYCDEP). If a "soil cap" is required, the soil must meet 6 NYCRR Part 375 Soil Cleanup Objectives for Restricted Residential Use (RRSCOs). The clean soil layer will be underlain by a demarcation layer such as orange snow fence to indicate the top of the original soil/fill. Pertinent clean soil/fill investigation activities will be documented and submitted to NYCDEP (e.g., in the Remedial Closure Report and in a "clean soil report") to ensure proper fill/soil importation and on-site placement. Per DEP requirements, the detailed clean soil report for DEP review and approval prior to importation and placement on-site would include, at a minimum, an executive summary, narrative of the field activities, laboratory data, and comparison of soil analytical results (i.e., to the cleanup objectives in NYSDEC 6 NYCRR Part 375 Environmental Remediation Programs).

4.2 Vapor Barrier

To reduce the potential for vapor intrusion into the future buildings, a vapor barrier will be installed as part of the new building foundations beneath the building slab, below and around any elevator pits, and outside of the sub-grade foundation sidewalls for each building. The proposed vapor barriers will consist of a minimum 20-mil barrier such as: GCP Applied Technologies (GCP) PREPRUFE® 300R 46-mil membrane or equivalent, on the underside of the foundation slab; and GCP PREPRUFE® 160R 32-mil membrane, Precon® 73-mil membrane, or equivalent along the outside of sub-grade walls. This vapor barrier system will be used unless an alternative is approved by NYCDEP. Any penetrations through the foundation of either building will be sealed in accordance with the manufacturer's specifications. The extent of the barrier (i.e., new building foundations) is shown on Figure 2.

Vapor barrier/waterproofing specifications, including typical cross sections, are provided in Appendix A.

5.0 QUALITY ASSURANCE/QUALITY CONTROL

All necessary analyses will be performed by a laboratory that has received approval from the New York State Department of Health's Environmental Laboratory Approval Program (ELAP) for the methods that require analysis.

5.1 Sample Collection

Samples will be collected in accordance with the following procedures:

- Record sample observations (evidence of contamination, PID readings, soil classification) in field log book.
- Collect an aliquot of soil or groundwater using a dedicated and disposable plastic sample spoon or sample bailer and place in laboratory-supplied sample jars. One grab sample will be

collected for volatile organic compound analysis, if applicable. One composite sample will be collected for all other analyses.

- Seal and label the sample jars as described in Section 5.4 below and place in a chilled cooler.

5.2 Decontamination Procedures

To avoid contamination and cross-contamination of samples, only dedicated or disposable sampling equipment may be used to collect these samples. All non-disposable equipment involved in field sampling must be decontaminated before being brought to the sampling location, and must be properly decontaminated after use.

5.3 Sample Identification

All samples will be consistently identified in all field documentation, chain-of-custody documents and laboratory reports using an alpha-numeric or alpha-alpha code. For stockpiled soil, the alpha prefix will be "SP" and the numbers following the alpha prefix will correspond to excavated stockpiles, beginning with "1, 2, 3…etc." For example, the first sample collected from the first stockpile will be labeled "SP-1-1" and the first sample collected from the second stockpile will be labeled "SP-2-1."

For groundwater samples, the alpha prefix will be "GW" and the number following the prefix will correspond to the sample number. For example, the first groundwater sample collected for sample analysis will be labeled "GW-1" and the second sample will be "GW-2."

5.4 Sample Labeling and Shipping

All sample containers will be labeled with the following information:

- Site identification
- Sample identification
- Date and time of collection
- Analysis(es) to be performed
- Sampler's initials

Once the samples are collected and labeled, they will be placed in chilled coolers and stored in a cool area away from direct sunlight to await shipment to the laboratory. Soil samples will be shipped to the laboratory at a frequency that will not result in an exceedance of applicable holding times for sample methods. At the start and end of each workday, field personnel will add ice to the coolers as needed.

The samples will be prepared for shipment by placing each sample jar in a sealable plastic bag, then wrapping each bag in bubble wrap to prevent breakage, adding freezer packs and/or fresh ice in sealable plastic bags and the chain-of-custody form. Samples will be shipped overnight (e.g., Federal Express) or transported by a laboratory courier. All coolers shipped to the laboratory will be sealed with mailing tape and a chain-of-custody (COC) seal to ensure that the coolers remain sealed during delivery.

5.5 Sample Custody

Field personnel will be responsible for maintaining the sample coolers in a secured location until they are picked up and/or sent to the laboratory. The record of possession of samples from the time they are obtained in the field to the time they are delivered to the laboratory or shipped off-site will be documented on COC forms. The COC forms will contain the following information: project

name; names of sampling personnel; sample number; date and time of collection and matrix; and signatures of individuals involved in sample transfer, and the dates and times of transfers. Laboratory personnel will note the condition of the custody seal and sample containers at sample check-in.

5.6 Documentation

A sample log book will be maintained. The following information, as a minimum will be recorded to the log.

- Sample identification number
- Sample location
- Field Observations
- Sample Type
- Analyses
- Date/Time of collection
- Collector's name
- Sample procedures and equipment utilized
- Date sent to laboratory/name of laboratory
- Copies of site drawings indicating stockpile numbers and locations

6.0 CLOSURE REPORT AND DOCUMENTATION

Upon completion of the subsurface disturbance anticipated as part of the proposed project, and upon completion of all NYCDEP-approved remedial requirements outlined in this RAP, a P.E.-certified Remedial Closure Report will be submitted to NYCDEP. This report will demonstrate that all remedial activities have been properly implemented. At a minimum, the report will include all transportation manifests, soil disposal/recycling certificates, proof of importing and grading certified clean fill/top soil for all landscaped areas and all pre-approved soil analytical testing results for the imported fill/top soil (if applicable). Any pertinent NYSDEC documentation/reports, etc., will also be included. Photographs of the vapor barrier installation will also be included. If applicable, copies of all pertinent NYSDEC correspondences, investigative/remedial work plans, reports, tank closure reports, No Further Action letters, etc. will be submitted to NYCDEP.

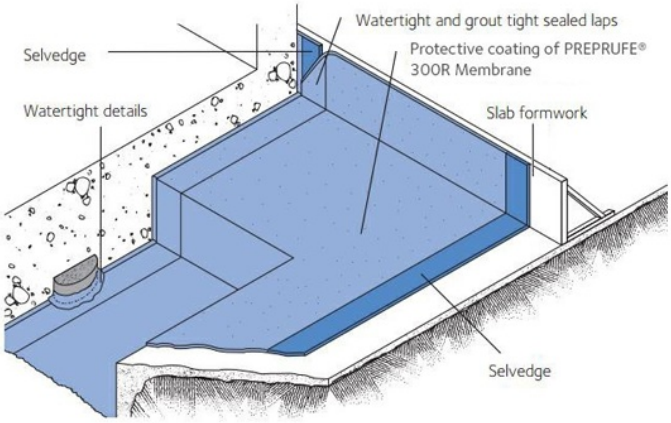
APPENDIX A
VAPOR BARRIER SITE PLAN AND SPECIFICATIONS

PREPRUFE® 300R & 160R Membranes Data Sheet (US Version)

Pre-applied waterproofing membranes that bond integrally to poured concrete for use below slabs or behind basement walls on confined sites

Product Description

GCP Applied Technologies ("GCP") PREPRUFE® 300R & 160R membranes are proprietary composite sheets comprised of a thick HDPE film, pressure sensitive adhesive and weather resistant protective coating. Designed with Advanced Bond Technology™, PREPRUFE® 300R & 160R membranes form a proprietary, integral bond to poured concrete, designed to prevent lateral migration of water while providing a robust barrier to water, moisture and gas penetration.



Drawings are for illustration purposes only.
Please refer to gcpat.com for specific application details.

Product Advantages

- Forms a continuous adhesive bond to concrete poured against it specifically designed to prevent water migration
- Continuous bond to poured concrete means PREPRUFE® 300R & 160R membranes are unaffected by ground settlement
- Can be placed directly over properly prepared compacted soil
- Does not activate prematurely during construction
- Fully adhered watertight laps and detailing
- Provides a barrier to water, moisture and gas - physically isolates the structure from the surrounding ground
- BBA Certified for all basement grades (BS 8102:2009)
- Impermeable- Perm rating less than 0.1 Perms
- Solar reflective - reduced temperature gain during construction

- Simple and quick to install – requires no priming on surfaces properly prepared following GCP surface preparation requirements
- Can be applied to permanent formwork - maximizes use of confined sites
- Allows for foot traffic immediately after application
- Ready for immediate placing of reinforcing steel
- Inherently waterproof--does not require water activation
- Waterproofing is not reliant on confining pressures or hydration
- Installed membrane is not affected by exposure to water during construction
- Waterproofing performance unaffected by wet/dry cycling
- Chemical resistance – protects structure from salt and sulfate attack, effective in most types of soils and waters

System Components:

Membrane

- PREPRUFE® 300R membrane- heavy-duty 46 mil grade can be used in horizontal applications below slabs and on rafts (i.e. mud slabs) and can be applied to vertical (blind side) substrates.
- PREPRUFE® 300R membrane is designed to accept the placing of heavy reinforcement using conventional concrete spacers
- PREPRUFE® 160R membrane 32 mil grade for blindside, zero property line applications against soil retention systems.
- PREPRUFE® 160R membrane is for vertical use only.

Ancillary Components (the most current Data Sheets for all system components are available on gcpat.com)

- PREPRUFE® Tape LT – Low temperature tape for covering cut edges, roll ends, penetrations and detailing in cold weather
- PREPRUFE® Tape HC - High temperature tape for covering cut edges, roll ends, penetrations at elevated temperatures
- PREPRUFE® CJ Tape LT – Low temperature joint tape for construction joints and detailing in cold weather conditions
- PREPRUFE® CJ Tape HC – High temperature joint tape for construction joints and detailing at elevated temperatures
- BITUTHENE® Liquid Membrane - for sealing around penetrations, etc.
- ADCOR® - waterstop for joints in concrete walls and floors
- PREPRUFE® Tieback Covers - preformed cover for soil retention wall tieback heads
- PREPRUFE® 300LT and 160LT membranes are an equal alternate for application at low temperatures. See GCPAT.com

Limitations of Use

- Approved uses only include those uses specifically detailed in this Product Data Sheet and other current Product Data Sheets that can be found at gcpat.com
- PREPRUFE® 300R & 160R membranes are not intended for any other use. Contact GCP Technical Services where any other use is anticipated or intended.
- PREPRUFE® 300R membranes are designed for in-service temperatures below 120°F (49°C)
- PREPRUFE® 160R membrane is not for use in horizontal applications
- PREPRUFE® 300R & 160R membranes should not be used with conventional twin-sided formwork. (See PREPRUFE® Technical Letter #13 Forming Systems For Use with PREPRUFE® Membranes)
- Special Note: When this information is printed from the gcpat.com global website, a footer appearing on this document will restrict its applicability to the United States. Note that the information and references in this document are hereby expanded and apply to North, Central and South America.

Safety and Handling

Users must read and understand the product label and Safety Data Sheets (SDS's) for each system component before use. All users must acquaint themselves with this information prior to working with the material. Carefully read detailed precaution statements on the product labels and SDS's before use. The most current SDS's can be obtained from the GCP web site at gcpat.com or by contacting GCP toll free at 1-866-333-3SBM (3726).

Storage

- Observe 1 year shelf life and use on a first in first out basis
- Store in dry conditions at 40°F (4.5°C)-90°F (32°C)
- Store off ground under tarps or otherwise protected from rain and ground moisture
- See PREPRUFE® Technical Letter #30 Shelf Life/Storage and Handling of GCP Waterproofing

Installation

Technical Support, Details and Technical Letters

The most up to date detail drawings and technical letters are available at gcpat.com. For complete application instructions, please refer to the current GCP Applied Technologies Contractor Handbook and Literature on (www.gcpat.com). Documents in hardcopy as well as information found on websites other than www.gcpat.com may be out of date or in error. Before using this product it is important that information be confirmed by accessing www.gcpat.com and reviewing the most recent product information, including without limitation Product Data Sheets and Contractor Manuals, Technical Bulletins, Detail Drawings and detailing recommendations. Please review all materials prior to installation of PREPRUFE® 300R & 160R membranes.

Support is also available by full-time technically trained GCP Applied Technologies field sales representatives and technical service personnel, backed by a central research and development technical services staff. For technical assistance with detailing and problem solving please call toll-free at (866) 333-3SBM (3726).

Temperature Requirements

- PREPRUFE® membranes can be applied at temperatures of 25°F (-4°C) or above. When installing PREPRUFE® products in cold or marginal weather conditions <55°F (<13°C) the use of PREPRUFE® Tape LT is required at all laps and detailing. All surfaces to receive PREPRUFE® Tape LT must be clean and dry.
- As an alternate, where temperatures are between between 25°F (-4°C) and 60°F(15.5°C) PREPRUFE® Low Temperature (LT) Membrane is can be used without taping of laps. Refer to PREPRUFE® LT Membrane data sheet and Technical Letter #16 PREPRUFE® Waterproofing membranes: Cold Weather installation for more information.

Substrate Preparation

All surfaces - It is essential to create a sound and solid substrate to eliminate movement during the concrete pour. Substrates must be regular and smooth with no gaps or voids greater than 0.5 in. (12 mm). Grout around all penetrations such as utility conduits, etc. for stability.

Horizontal - The substrate must be free of loose aggregate and sharp protrusions. Avoid curved or rounded substrates. When installing over earth or crushed stone, ensure substrate is well compacted to avoid displacement of substrate due to traffic or concrete pour. The surface does not need to be dry, but standing water must be removed.

Vertical - Use concrete, plywood, insulation or other approved facing to sheet piling to provide support to the membrane. Board systems such as timber lagging must be close butted to provide support and not more than 0.5" (12mm) out of alignment.

Membrane Application

PREPRUFE® 300R & 160R membranes are supplied in rolls 4 ft. (1.2m) wide, with a selvedge on one side to provide self-adhered laps for continuity between rolls. The rolls of PREPRUFE®Membrane and PREPRUFE® Tape are manufactured with a disposable plastic release liner which must be removed before placing reinforcement and concrete. NOTE that the release liner must also be removed before application of any required tapes and at all surfaces where a bond between layers is to be formed.

Horizontal substrates –

PREPRUFE® 300R membrane can be applied horizontally to smooth prepared concrete or well rolled and compacted earth or crushed stone substrate. Place the PREPRUFE® 300R membrane HDPE film side to the substrate with the clear plastic release liner facing towards the concrete pour. End laps should be staggered to avoid a buildup of layers. Leave plastic release liner in position until overlap procedure is completed. When completed remove release liner. When installing over carton forms, contact your local GCP representative.

Accurately position succeeding sheets to overlap the previous sheet 3 in. (75 mm) along the marked selvedge. Ensure the underside of the succeeding sheet is clean, dry and free from contamination before attempting to overlap. Peel back the plastic release liner from between the overlaps allowing the two overlapped layers to bond together. Ensure a continuous bond is achieved without creases and roll firmly with a heavy roller. Completely remove the plastic liner to expose the white protective coating. Any initial tack will quickly disappear. Notes:

- PREPRUFE® 300R membrane can be returned up the inside face of slab formwork. To attain a fully bonded system and to allow a tie in with BITUTHENE® self-adhered membrane or PROCOR® fluid-applied membrane to all vertical structural surfaces after removal of formwork.
- Rebar Chairs: See PREPRUFE® Technical Letter #15 Rebar Chairs on PREPRUFE® Membranes.

Vertical substrates –

PREPRUFE® 300R & 160R membranes can be applied vertically to permanent formwork or adjoining structures. Concrete should then be cast directly against the adhesive side of the membrane. The membrane may be installed in any convenient length. The clear plastic release liner must be facing towards the concrete pour. Membrane must be shingle overlapped a minimum of 3" (75mm) All laps over cut edges must be taped using PREPRUFE® Tape.

Vertically placed sheets can be held in place using fasteners appropriate to the substrate. Fastening can also be made through the selvedge overlap area using a small and low profile head fastener so that the membrane lays flat and allows firmly rolled overlaps. Fasteners should be placed in the selvedge approximately 0.5"(12.5mm) from the edge of the membrane. The adhesive selvedge of successive membrane sheets must completely cover any fasteners by a minimum if 1 in. (25mm). After rolling immediately remove the plastic release liner. When placing successive sheets insure the underside of each succeeding sheet is clean, dry and free from contamination before attempting to overlap. After placement roll the membrane firmly to ensure a watertight seal.

Note that PREPRUFE® 300R & 160R membranes are not recommended for use with conventional twin-sided formwork. (See PREPRUFE® Technical Letter #13 Forming Systems For Use with PREPRUFE® Membranes)

Roll ends and cut edges –

Overlap all roll ends and cut edges by a minimum 3 in. (75 mm) and ensure the area is clean and free from contamination, wiping with a damp cloth if necessary. Allow the membrane to dry and apply PREPRUFE® Tape LT (or HC in hot climates) centered over the lap edges and roll firmly. Immediately remove plastic release liner from the tape.

Membrane Repair

Inspect the membrane before installation of reinforcement steel, formwork and final placement of concrete. The membrane can be easily cleaned by power washing if required. Repair damage by wiping the area with a damp cloth to ensure the area is clean and free from dust, and other contaminants and allow the membrane to dry. Repair small punctures and slices (0.5 in. (12 mm) or less by applying PREPRUFE® Tape centered over the damaged area. Repair punctures and holes larger than 0.5 in. (12mm) by applying a patch of PREPRUFE® membrane. Extend the patch 6 in. (150 mm) beyond the damaged area. Seal all edges of the patch with PREPRUFE® Tape. Where exposed selvedge has lost adhesion or laps have not been sealed, ensure the area is clean and dry and cover with fresh PREPRUFE® Tape. Any areas of damaged adhesive should be covered with PREPRUFE® Tape. All PREPRUFE® Tape must be rolled firmly and the tinted release liner removed.

Slices or relief cuts can be butted or overlapped and repaired by applying PREPRUFE® Tape centered over the edge of the overlap or center of the butt joint. Where it is not possible to create a butt joint or overlap, repair with fresh membrane and PREPRUFE® Tape as detailed above.

Pouring of Concrete

Ensure the plastic release liner is removed from all areas of PREPRUFE® 300R & 160R Membrane and Tape.

Under most climatic conditions concrete should be poured within 56 days of membrane installation. Where ambient temperatures will exceed 38°C (100ºF) for more than a total of 7 days, concrete should be placed within 42 days of installation of the membrane. Concrete must be placed and compacted carefully to avoid damage to the Membrane. Never use a sharp object to consolidate the concrete.

Removal of Formwork

A minimum concrete compressive strength of 3000 psi (20 N/mm^2) is recommended prior to stripping formwork supporting PREPRUFE® membranes. Premature stripping may result in displacement of the membrane and/or spalling of the concrete. (see PREPRUFE® Technical Letter #17 Removal of Formwork Placed against PREPRUFE® membranes)

After removal of the formwork and prior to backfilling, all exposed PREPRUFE® Membrane must be protected from damage with an approved protective course.

Supply

DIMENSIONS (NOMINAL)	PREPRUFE® 300R MEMBRANE	PREPRUFE® 160R MEMBRANE
Roll size	4 ft x 98 ft (1.2 m x 30 m)	4 ft x 115 ft (1.2 m x 35 m)
Roll weight	108 lbs (50 kg)	92 lbs (42 kg)
Minimum side and end laps	3 in. (75 mm)	3 in. (75 mm)

Physical Properties

PROPERTY	TYPICAL VALUE 300R	TYPICAL VALUE 160R	TEST METHOD
Color	white	white	
Thickness	0.046 in. (1.2 mm)	0.032 in. (0.8 mm)	ASTM D3767
Lateral Water Migration Resistance	Pass at 231 ft (71 m) of hydrostatic head pressure	Pass at 231 ft (71 m) of hydrostatic head pressure	ASTM D5385[1]
Low Temperature Flexibility	Unaffected at -20°F (-29°C)	Unaffected at -20°F (-29°C)	ASTM D1970
Resistance to Hydrostatic Head	231 ft (71 m)	231 ft (71 m)	ASTM D5385[2]
Elongation	400%	400%	ASTM D412[3]
Tensile Strength, Film	4000 psi (27.6 MPa)	4000 psi (27.6 MPa)	ASTM D412
Crack Cycling at -9.4°F (-23°C), 100 cycles	Unaffected, Pass	Unaffected, Pass	ASTM C836[6]
Puncture Resistance	200 lbs (890 N)	100 lbs (445 N)	ASTM E154
Peel Adhesion to Concrete	5 lbs/in. (880 N/m)	5 lbs/in. (880 N/m)	ASTM D903[4]
Lap Peel Adhesion	5 lbs/in. (880 N/m)	5 lbs/in. (880 N/m)	ASTM D1876[5]
Permeance to Water Vapor Transmission (HDPE side exposed)	<0.1 perms (5.74 ng/(Pa x s x m^2))	<0.1 perms (5.74 ng/(Pa x s x m^2))	ASTM E96, method B
Water Absorption	0.5%	0.5%	ASTM D570

Footnotes:

1. Lateral water migration resistance is tested by casting concrete against membrane with a hole and subjecting the membrane to hydrostatic head pressure with water. The test measures the resistance of lateral water migration between the concrete and the membrane.
2. Hydrostatic head tests of PREPRUFE Membranes are performed by casting concrete against the membrane with a lap. Before the concrete cures, a 0.125 in. (3 mm) spacer is inserted perpendicular to the membrane to create a gap. The cured block (cured min. 7 days) is placed in a chamber where water is introduced to the membrane surface up to the head indicated.
3. Elongation of membrane is run at a rate of 2 in. (50 mm) per minute.
4. Concrete is cast against the protective coating surface of the membrane and allowed to properly cure (7 days minimum). Peel adhesion of membrane to concrete is measured at a rate of 2 in. (50 mm) per minute at room temperature
5. The test is conducted 15 minutes after the lap is formed and run at a rate of 2 in. (50 mm) per minute.
6. Test conducted at – 9.4°F (-23°C)

We hope the information here will be helpful. INSTALLATION INSTRUCTIONS

Tie into Preprufe Wall Waterproofing (Option-A)

Prior to Membrane Installation, Review the Preprufe® Data Sheet

Surface Prep

All surfaces must be sound and solid to eliminate movement during concrete placement. Substrate must be regular and smooth with no gaps or voids greater than 0.5 in (15 mm). Surface should also be free from loose aggregate and sharp protrusions as outlined the Preprufe® Data Sheet section on Surface Preparation.

Detailing

1. Install Preprufe membrane over the mud slab or compacted earth as detailed horizontal and vertical applications on the Preprufe data sheet.
2. Continue onto the vertical surface of the prepared soil retention system a minimum of 18 in (450 mm) above the finished elevation of the structural floor slab. It is practice to extend the Preprufe membrane above the height of the rebar from the slab.
3. Apply Preprufe® CJ Tape to the Preprufe membrane centered over the finished elevation of the concrete proposed concrete slab.
4. Secure the top of the membrane to temporarily hold it in place on the vertical substrate. Care should be taken to prevent damage to this exposed membrane concrete back-splash as well as slag from rebar welding in wall forms, by keeping the release liner on and protected with protection board, plywood or other material (See PRE-060)
5. If the exposed membrane above the slab is contaminated with concrete oversplash is the lap area, it must be cleaned down to good material before adhering Preprufe Tape.
6. Install Preprufe membrane over the prepared vertical soil retention system according to standard application instructions on the Preprufe data sheet.
7. Unfasten the vertical length of the Preprufe Membrane that extends above the and tuck the Preprufe 160R Membrane behind the 18 in (450 mm) length of Preprufe 300R Membrane, ensuring a minimum 3 in (75 mm) lap.
8. Install Preprufe CJ Tape centered over the lap.
9. Remove release liner and roll tape to ensure good adhesion using steel or vinyl cylindrical and Vee roller.

Special Notes

Ensure Adcor® waterstop is encapsulated with a min. of 3 in (75 mm.) concrete cover. Avoid installing Adcor® waterstop in areas where it may be subjected to prolonged exposure or immersion water prior to concrete placement. A GCP injectable waterstop should be considered if waterstop may be exposed and or immersed in water prior to concrete placement or when access to Adcor® waterstop is limited after installation by rebar. Apply Adcor® waterstop according to the installation instructions found on the data sheet.

GCP may require an alternative GCP waterstop based on design conditions, at GCP's discretion.

INSTALLATION INSTRUCTIONS

Column (Option 1)

Prior to Membrane Installation, Review the Preprufe® Data Sheet

Surface Prep

All surfaces must be sound and solid to eliminate movement during the concrete pour. Substrate must be regular and smooth with no gaps or voids greater than 0.5 in (15 mm). The surface should also be free from loose aggregate and sharp protrusions as outlined in the Preprufe® Data Sheet section on Surface Preparation.

Detailing

1. Place Preprufe membrane over the column footing and directly under the column.
2. Tie-in penetrations such as rebar and threaded rod that penetrate the membrane should be sealed with Bituthene Liquid Membrane.
3. Cut the membrane tight to the penetration and ensure the penetration is free from rust, dirt, dust, etc.
4. If membrane is not within 0.5 in (15 mm) of penetration, apply Preprufe Tape to cover the gap.
5. Mix and apply Bituthene Liquid Membrane around the penetration.
6. Bituthene Liquid Membrane should be placed to form a minimum 1 in (25 mm) continuous fillet around the penetration at the point of penetration.
7. Bituthene Liquid Membrane should be applied as a 90-mil (2.2 mm) continuous coating overlapping a minimum of 3 in (75 mm) onto the surface of the Preprufe membrane.
8. Apply Hydroduct® according to Hydroduct Data Sheet.

Special Notes

Preprufe membranes should not be used in areas where they will be permanently exposed to sunlight, weather or traffic. Protect membrane from sunlight as quickly as possible after installation.

INSTALLATION INSTRUCTIONS

Construction Joints (Option-A)

Prior to Membrane Installation, Review the Preprufe® Data Sheet

Surface Prep

All surfaces must be sound and solid to eliminate movement during the concrete pour. Substrate must be regular and smooth with no gaps or voids greater than 0.5 in (15 mm). The surface should also be free from loose aggregate and sharp protrusions as outlined in the Preprufe® Data Sheet section on Surface Preparation.

Detailing

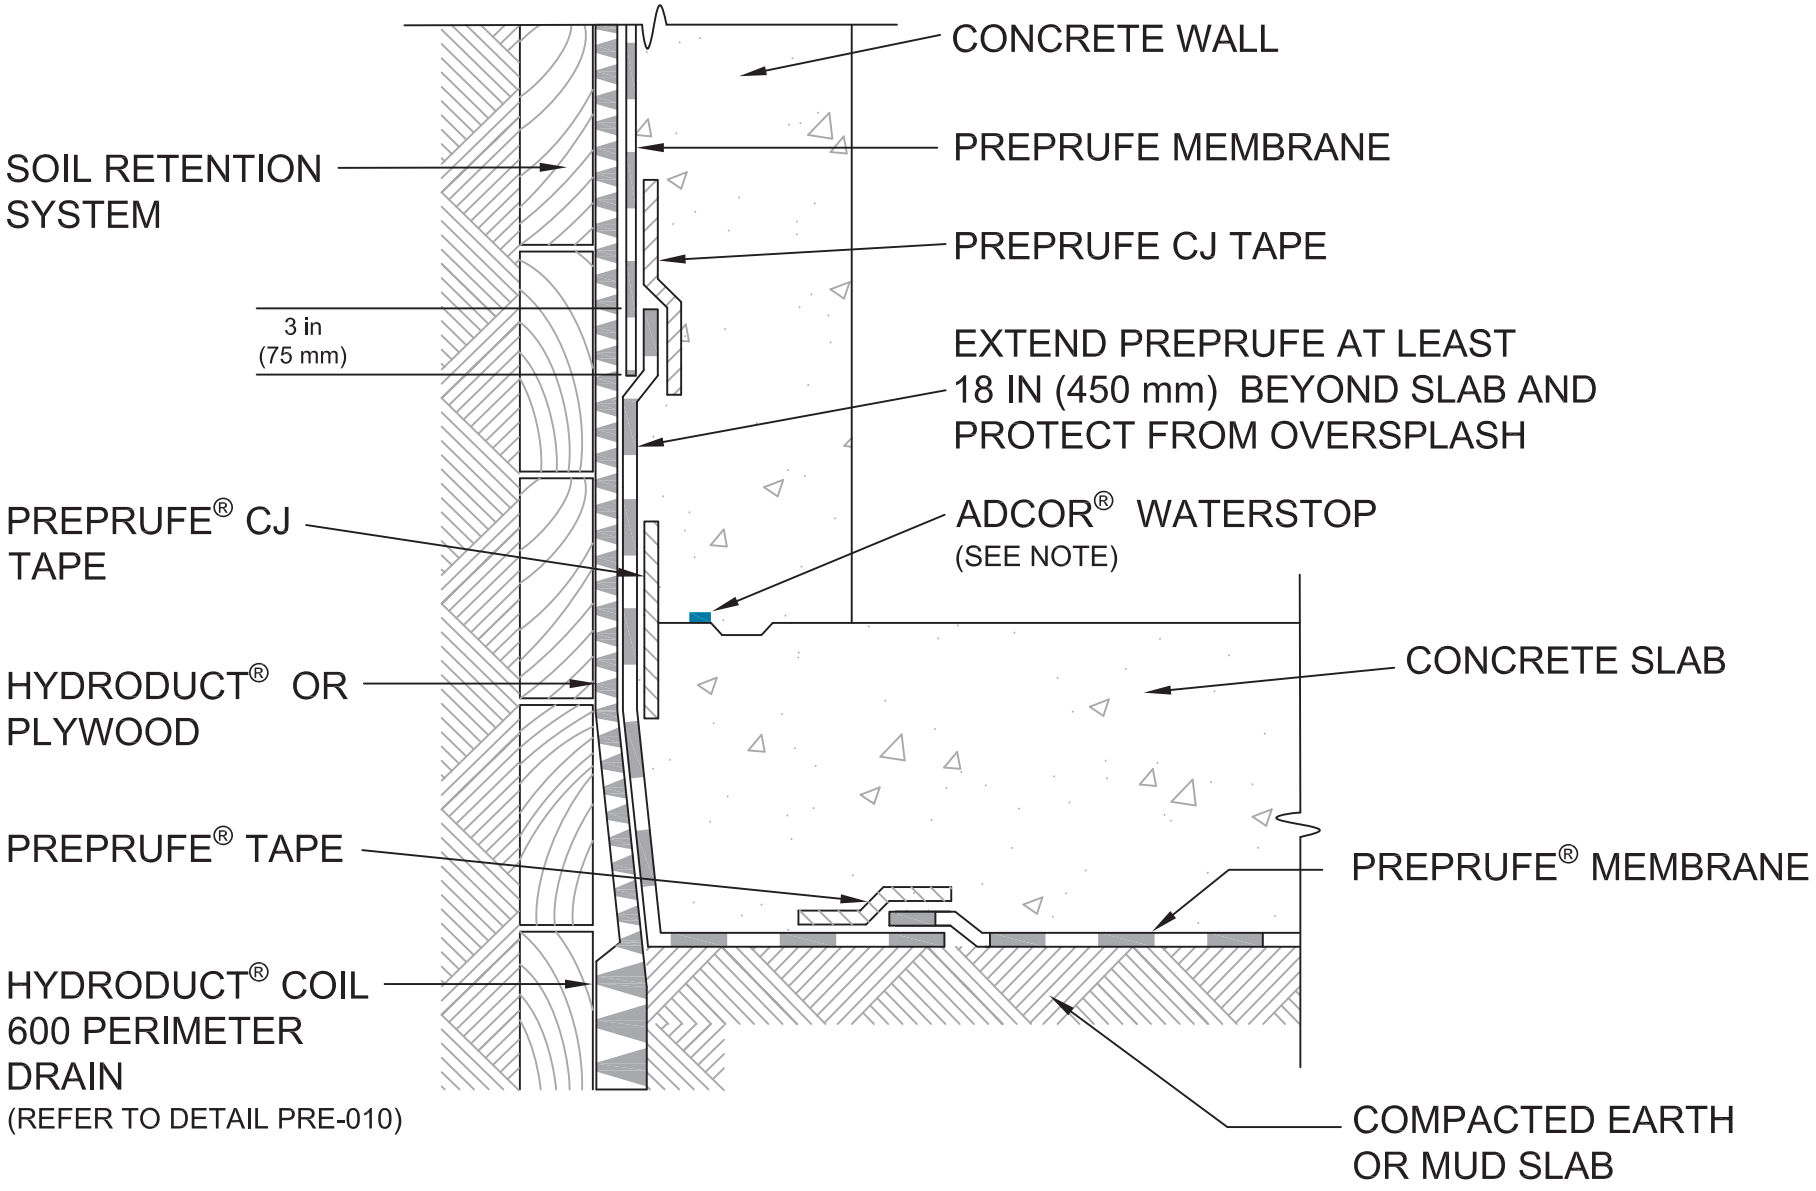
1. Install Preprufe membrane according to standard horizontal and vertical application instructions on the Preprufe data sheet found at www.gcpat.com.
2. Preprufe CJ Tape should be applied to the surface of the Preprufe membrane and centered along the line of all contraction (control) and construction joints.
3. Remove release liner and roll tape to ensure good adhesion using steel or vinyl cylindrical and Vee roller.
4. Ensure and damaged tape or membrane is repaired after removal of formwork or bulkhead.

Special Notes

Preprufe membranes should not be used in areas where they will be permanently exposed to sunlight, weather or traffic. Protect membrane from sunlight as quickly as possible after installation.

A GCP injectable waterstop should be considered if waterstop may be exposed and or immersed in water prior to concrete placement or when access to Adcor® waterstop is limited after installation by rebar. Apply Adcor® waterstop according to the installation instructions found on the data sheet.

GCP may require an alternative GCP waterstop based on design conditions, at GCP's discretion.



NOTE: GCP MAY REQUIRE AN ALTERNATE GCP WATERSTOP BASED ON DESIGN CONDITIONS

PREPRUFE® WATERPROOFING SYSTEM

DRAWING: PRE-042-A
SCALE: Not to scale
EFFECTIVE DATE: 07/01/2016
SUPERCEDES: 04012015

INSTALLATION INSTRUCTIONS

Wall Termination for Elevated Slabs

Prior to Membrane Installation, Review the Preprufe® Data Sheet

Surface Prep

All surfaces must be sound and solid to eliminate movement during the concrete pour. Substrate must be regular and smooth with no gaps or voids greater than 0.5 in (15 mm). The surface should also be free from loose aggregate and sharp protrusions as outlined in the Preprufe® Data Sheet section on Surface Preparation.

Detailing

1. Install Preprufe 300R Membrane over mud slab.
2. For compacted earth, proper compaction is required. If the wall area is too small to allow proper compaction, the base of the wall should be grouted solid. Areas to receive Bituthene Liquid Membrane MUST be grouted solid.
3. Apply Bituthene Liquid Membrane on the mud slab from the base of the wall to a minimum of 0.5 in (15 mm) under where the leading edge of the Preprufe Membrane will terminate.
4. Install Preprufe 300R Membrane tight to all vertical and horizontal intersections.
5. Apply Liquid Membrane to form a minimum 1 in (25 mm) continuous fillet between the Preprufe Membrane and the wall. Extend a 90-mil (2.2 mm) continuous coating of Liquid Membrane overlapping a minimum of 3 in (75 mm) onto the surface of the Preprufe Membrane and 3 in (75 mm) onto the wall.
6. Install a minimum 12 in (300 mm) strip of Bituthene Membrane centered over the Liquid Membrane fillet so that the Bituthene Membrane extends 6 in (150 mm) onto the wall and 6 in (150 mm) onto the Preprufe Membrane. Apply Bituthene Primer as per standard GCP instructions prior to installation of Bituthene membrane.
7. Apply a strip of Preprufe CJ Tape onto the Bituthene Membrane and overlap onto the Preprufe Field Membrane by a minimum of 2 in (50 mm). Apply a second strip of Preprufe CJ Tape starting at the top leading edge of the Bituthene Membrane and overlap onto the first strip of Preprufe CJ Tape by a minimum of 2 in (50 mm).
8. Terminate the top leading edge of Preprufe CJ Tape and Bituthene Membrane with a bead of Bituthene Liquid Membrane.

Special Notes

Preprufe membranes should not be used in areas where they will be permanently exposed to sunlight, weather or traffic. Protect membrane from sunlight as quickly as possible after installation.

Ensure Adcor® waterstop is encapsulated with 3 in (75 mm) of concrete cover minimum. Apply Adcor® waterstop according to the installation instructions found on the data sheet.

GCP may require an alternative GCP waterstop based on design conditions, at GCP's discretion.

MasterFormat: 07 13 00

JANUARY 2022
(Supersedes March 2021)

PRECON®

Pre-Applied/Underslab Waterproofing Membrane

DESCRIPTION

PRECON is a composite sheet membrane comprised of a non-woven fabric, elastomeric membrane, and W. R. MEADOWS' exclusive, patented PLASMATIC CORE (U.S. Patent No. 7,179,761). The PLASMATIC CORE is a seven-layer matrix designed for toughness and provides the lowest water vapor transmission (WVT) rating on the market. Once concrete is poured against PRECON and the concrete cures, a mechanical bond forms that secures the concrete to the membrane.

USES

PRECON is used as a blindside membrane in vertical applications where access to the positive side is limited. The membrane can also be used for horizontal applications for underslab waterproofing and vaporproofing.

FEATURES/BENEFITS

- Provides a waterproof seal between the membrane and poured concrete wall.
- Helps prevent moisture migration into the structure.
- Reduces methane and radon gas intrusion.

PACKAGING

4' (1.2 m) wide x 50' (15.2 m) long rolls, one roll per carton.

STORAGE AND HANDLING

Store membrane cartons on pallets and cover if left outside. Keep materials away from sparks and flames.

SPECIFICATIONS

- LARR Report 26023

APPLICATION

Surface Preparation ... Inspect all surfaces for any conditions detrimental to the proper completion of the work. Surfaces should be structurally sound. Remove debris or any other foreign material that could damage the membrane.

PRECON can be used with a caisson wall shoring system without the use of a drainage board, such as MEL-DRAIN™ from W. R. MEADOWS. W. R. MEADOWS recommends proper site drainage, but due to certain site conditions this sometimes cannot be done effectively. The decision to remove the drainage board should be at the discretion of the engineer. In situations where a drainage board is not applied, surface preparation is important. The substrate needs to be sound, solid, and smooth. Any gaps or voids >1" (25 mm) need to be grouted. When PRECON is used with MEL-DRAIN from W. R. MEADOWS, the system can bridge gaps <2" (50.8 mm). However, gaps >2" (50.8 mm) will need to be grouted.

Application Method ... PRECON may be applied at temperatures down to 40° F (5° C); however, in less-than-ideal environments or marginal conditions, consider the use of PRECON LOW TEMP below 60° F (16° C). PRECON LOW TEMP can be used in temperatures down to 25° F (-4° C). MEL-PRIME™ from W. R. MEADOWS should be used to enhance the bond at the selvedge edge when conditions warrant with both PRECON and PRECON LOW TEMP. Prior to application of the blindside membrane, attach MEL-DRAIN™ rolled matrix drainage system from W. R. MEADOWS to lagging or soil retention system.

In vertical applications of PRECON, mechanically attach with fasteners every 12" (304.8 mm) across the top, within ½" (13 mm) of the top edge of the membrane. Install the membrane with the fabric side facing toward the concrete pour.

Remove release paper on 6" (152.4 mm) overlap. Apply membrane and roll press into place with a tile type roller.

End Laps ... Overlap membrane 6" (152.4 mm). Prior to overlap, apply BEM, HYDRALASTIC 836, or MEL-ROL® LIQUID MEMBRANE (two-component) from W. R. MEADOWS in area to be lapped. Roll press membrane into BEM, HYDRALASTIC 836, or MEL-ROL LIQUID MEMBRANE. At terminations of membrane, apply BEM, HYDRALASTIC 836, or MEL-ROL LIQUID MEMBRANE 12" (304.8 mm) wide centered over the termination and while still wet, embed 12" (31 cm) wide DETAIL FABRIC into the HYDRALASTIC 836 or MEL-ROL LIQUID MEMBRANE and roll press into place. Ensure that DETAIL FABRIC is centered over the termination with 6" (152.4 mm) on each side of lap edge. Apply additional HYDRALASTIC 836 on all terminations of DETAIL FABRIC.

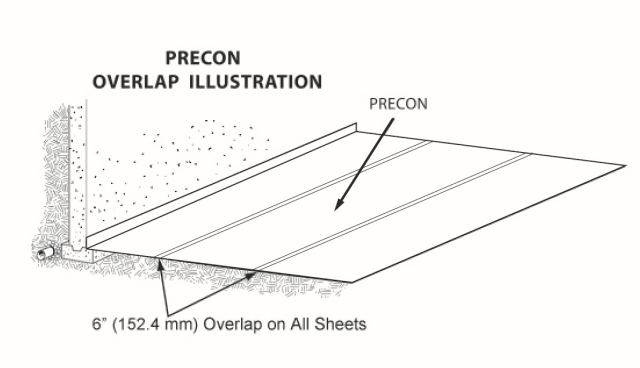
CONTINUED ON REVERSE SIDE ...

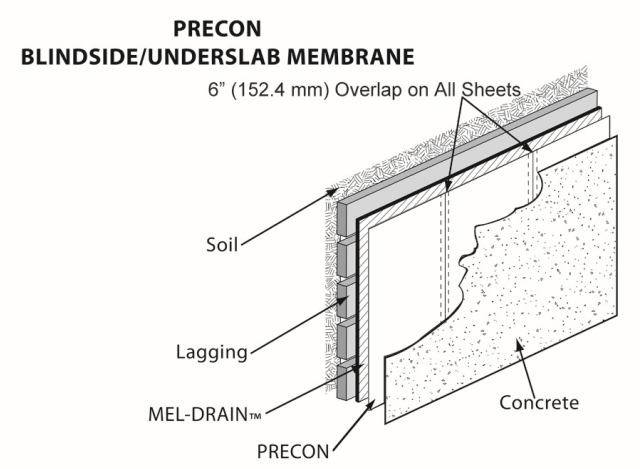
W. R. MEADOWS, INC.
P.O. Box 338 • HAMPSHIRE, IL 60140-0338
Phone: 847/214-2100 • Fax: 847/683-4544
1-800-342-5976
www.wrmeadows.com • info@wrmeadows.com

Additionally, the use of DETAIL TAPE H and DETAIL TAPE V from W. R. MEADOWS can be used in both horizontal and vertical end laps. View PRECON END LAP TAPING METHOD TECHNICAL BULLETIN available at www.wrmeadows.com for full information.

Penetrations and Protrusions ... Detail around all horizontal and vertical penetrations using BEM, HYDRALASTIC 836, or MEL-ROL LIQUID MEMBRANE (two-component) from W. R. MEADOWS. Apply BEM, HYDRALASTIC 836, or MEL-ROL LIQUID MEMBRANE by forming a fillet around the pipe or protrusion, overlapping the fabric side of PRECON and the protrusion a minimum of 2.5" (64 mm). If the gap between the protrusion and the membrane is greater than ½" (13 mm), apply DETAIL FABRIC over uncured BEM, HYDRALASTIC 836, or MEL-ROL LIQUID MEMBRANE. All penetration and protrusion surfaces must be clean, rust-free, and sound prior to application of BEM, HYDRALASTIC 836, or MEL-ROL LIQUID MEMBRANE.

*MEL-ROL LIQUID MEMBRANE is a two-component material, not to be confused with MEL-ROL LM.





For horizontal applications involving a cluster of penetrations, consider the use of HYDRALASTIC 836. Prior to application of HYDRALASTIC 836, prepare the surfaces of the penetrations as above and provide a block out using 2' x 4' (.6 x 1.2 m) lumber or other in order to create a "pitch pan" area to receive HYDRALASTIC 836.

Patching ... Prior to pouring, inspect membrane for punctures or damage and repair as necessary with HYDRALASTIC 836 and/or DETAIL FABRIC. (BEM or MEL-ROL LIQUID MEMBRANE may be used in place of HYDRALASTIC 836.) In addition, ensure the membrane is free of standing water and has been cleaned of any deleterious materials that will affect the bond of the concrete to the membrane.

Underslab Application ... Refer to ACI 302.1R-04: Chapter 4 – Site Preparation and Placing Environment for sub-grade preparation prior to PRECON placement.

PRECAUTIONS

Concrete should be poured within 60 days of membrane installation. For installations below 40° F (4° C), contact W. R. MEADOWS technical services. When using bar supports, use those with a flat bottom.

For CAD details, most recent data sheet, LEED information, and SDS, visit www.wrmeadows.com.

TECHNICAL DATA

CHASP Appendix C - Emergency Hand Signals

1.0 PURPOSE

This Construction Health and Safety Plan (CHASP) was prepared in conjunction with the Remedial Action Plan (RAP) for the project site located on Lenox Hill Hospital's (LHH's) existing campus on the block bounded by Park and Lexington Avenues and East 76th and East 77th Streets (Block 1411, Lots 1 and 113) (aka Projected Development Site 1) and three buildings on the north side of East 77th Street across from the main hospital complex (Block 1412, Lots 9, 10, and 11) (aka Projected Development Site 1a) (collectively "Site").

The proposed redevelopment of the Site would entail demolition of portions of the current hospital and renovations of existing structures for the new state-of-the-art hospital facility (to occur in multiple stages, construction plans have not been finalized). It is anticipated that the proposed construction would require excavation up to approximately 10 feet below the current basement and cellar grade (i.e., well below the bedrock interface) and may require dewatering.

The purpose of this CHASP is to assign responsibilities, establish personnel protection standards and mandatory safety practices and procedures, and provide for contingencies that may arise during rehabilitation activities at the Site. The CHASP is intended to minimize health and safety risks resulting from the known or potential presence of subsurface hazardous materials.

This plan is not designed to address geotechnical, mechanical or general construction safety concerns, nor to supersede or replace any Occupational Safety and Health Administration (OSHA) regulation and/or local and state construction codes or regulations.

2.0 APPLICABILITY

The proposed redevelopment of the Site would entail demolition of portions of the current hospital and renovations of existing structures for the new state-of-the-art hospital facility (to occur in multiple stages). It is anticipated that the proposed construction would require excavation up to approximately 10 feet below the current basement and cellar grade (i.e., well below the bedrock interface) and may require dewatering.

Work subject to this CHASP includes all activities that disturb the existing soil on-site. The contractors and their subcontractors involved in the proposed project will provide a copy of this CHASP to their employees whose work involves any potential exposure to on-site soil and will complete all work in accordance with this CHASP.

3.0 SITE DESCRIPTION

3.1 General Information

Topography at the Site is relatively level, with a slight downward slope to the east. Based on the U.S. Geological Survey, Central Park, NY Quadrangle (2013) map, the Site is approximately 65 feet above the National Geodetic Vertical Datum of 1988 (an approximation of mean sea level).

During AKRF's Subsurface (Phase II) field activities conducted in September-October 2023, Groundwater was encountered at approximately 17 fbg in an existing geotechnical monitoring well located within the East 76th Street sidewalk immediately south of the hospital building. Shallow soil encountered during the investigation (collected from the 0- to 2-foot interval below basement grade) generally consisted of sandy fill materials including gravel and silts. Groundwater beneath the site is expected to flow in an easterly direction towards the East River, located approximately 4,000 feet away.

The proposed redevelopment of the Site would entail demolition of portions of the current hospital and renovations of existing structures for a new state-of-the-art hospital facility (to occur in multiple stages). It is anticipated that the proposed construction would require excavation up to approximately 10 feet below the current basement and cellar grade (i.e., well below the bedrock interface) and may require dewatering.

3.2 Hazard Potential

The most likely routes of exposure are breathing of semivolatile organic compounds (SVOCs), volatile organic compounds (VOCs), metals, pesticides, PCBs, petroleum-related compounds, or particulate-laden air released during soil disturbing activities, dermal contact, and accidental ingestion; although only pesticides and metals were detected above the Unrestricted Use Soil Cleanup Objectives (UUSCOs) and/or Restricted Residential Soil Cleanup Objectives (RRSCOs). Appendix A includes specific health effects from chemicals present or potentially present on-site. Although some of the chemicals of concern listed in the following sections were not detected during the subsurface investigation, they are included here as a precaution. The remaining sections of this CHASP address procedures (including training, air monitoring, work practices and emergency response) to reduce the potential for unnecessary and unacceptable exposure to these contaminants.

3.3 Hazard Evaluation

The most likely routes of exposure are breathing of SVOCs or particulate-laden air released during soil disturbing activities, dermal contact, and accidental ingestion. Appendix A includes specific health effects from the known on-site chemicals. The remaining sections of this CHASP address procedures (including training, air monitoring, work practices and emergency response) to reduce the potential for unnecessary and unacceptable exposure to these contaminants.

The potential adverse health effects from these detected contaminants are diverse. Many of these compounds are known or suspected to result in chronic illness from long-term exposures. However, due to the limited nature of the proposed construction, only acute effects are a potential concern.

This CHASP addresses potential environmental hazards from the presence of hazardous materials. It is not intended to address the normal hazards of construction work, which are separately covered by OSHA regulations and/or local and state construction codes and regulations. Although some of the chemicals of concern listed in the sections below were not detected during the Phase II study conducted, they are included here as a precaution.

3.3.1 Hazards of Concern

Check all that apply		
(x) Organic Chemicals	(x) Inorganic Chemicals	( ) Radiological
( ) Biological	( ) Explosive/Flammable	( ) Oxygen Deficient Atm.
(x) Heat Stress	(x) Cold Stress	( ) Other
Comments: No personnel are permitted to enter permit confined spaces		

3.3.2 Physical Characteristics

Check all that apply		
(x) Liquid	(x) Solid	(x) Sludge
(x) Vapors	(x) Unknown	( ) Other
Comments:		

3.3.3 Hazardous Materials

Check all that apply

( ) PCBs					( ) Mold
(x) Metals					( ) Cyanide
(x) Other: VOCs & SVOCs					

3.3.4 Chemicals of Concern

Chemical	REL/PEL/STEL	Health Hazards
Arsenic	REL= 0.002 mg/m^3 PEL= 0.010 mg/ m3	Irritation skin, possible dermatitis; respiratory distress; diarrhea; kidney damage; muscle tremor, convulsions; possible gastrointestinal tract, reproductive effects; possible liver damage
Barium	REL = 0.5 mg/m^3 PEL = 0.5 mg/m^3	Gastrointestinal disturbances and muscular weakness, vomiting, abdominal cramps, diarrhea, difficulties in breathing, increased or decreased blood pressure, numbness around the face, and muscle weakness
Benzene	REL = 0.1 ppm PEL = 1 ppm STEL = 5 ppm	Irritation eyes, skin, nose, respiratory system; dizziness; headache, nausea, staggered gait; anorexia, lassitude, dermatitis; bone marrow depression, potential occupational carcinogen.
Cadmium	REL: N/A PEL: 0.005 mg/m^3	Pulmonary edema, dyspnea (breathing difficulty), cough, chest tightness, substernal (occurring beneath the sternum) pain; headache; chills, muscle aches; nausea, vomiting, diarrhea; anosmia (loss of the sense of smell), emphysema, proteinuria, mild anemia; [potential occupational carcinogen].
Copper	REL: 1 mg/m^3 PEL: 1 mg/m^3	Irritation eyes, nose, pharynx; nasal septum perforation; metallic taste; dermatitis; In Animals: lung, liver, kidney damage; anemia.
DDD, DDE, & DDT (pesticides)	REL: 0.5 mg/m^3 PEL: 1 mg/m^3	Irritation eyes, skin; paresthesia tongue, lips, face; tremor; anxiety, dizziness, confusion, malaise (vague feeling of discomfort), headache, lassitude (weakness, exhaustion); convulsions; paresis hands; vomiting; [potential occupational carcinogen].
Fuel Oil	REL = 350 mg/m^3 PEL = 400 ppm	Nausea, irritation – eyes, hypertension, headache, light-headedness, loss of appetite, poor coordination; long-term exposure – kidney damage, blood clotting problems; potential carcinogen.

Chemical	REL/PEL/STEL	Health Hazards
Lead	REL: 0.050 mg/m^3 PEL:0.050 mg/m^3	Lassitude (weakness, exhaustion), insomnia; facial pallor; anorexia, weight loss, malnutrition; constipation, abdominal pain, colic; anemia; gingival lead line; tremor; paralysis wrist, ankles; encephalopathy; kidney disease; irritation eyes; hypertension.
Mercury	REL: 0.05 mg/m^3 REL C: 0.1 mg/m^3 PEL: 0.1 mg/m^3	Irritation eyes, skin; cough, chest pain, dyspnea (breathing difficulty), bronchitis, pneumonitis; tremor, insomnia, irritability, indecision, headache, lassitude (weakness, exhaustion); stomatitis, salivation; gastrointestinal disturbance, anorexia, weight loss; proteinuria.
Nickel	REL: 0.015 mg/m^3 PEL: 1 mg/m^3	Sensitization dermatitis, allergic asthma, pneumonitis; [potential occupational carcinogen].
PAHs	REL: 0.1 mg/m^3 PEL: 0.2 mg/m^3	Effects reported from occupational exposure to PAHs include chronic bronchitis, chronic cough irritation, bronchogenic cancer, dermatitis, cutaneous photosensitization, and pilosebaceous reactions. Reported health effects associated with chronic exposure to coal tar and its by-products (e.g., PAHs): Skin: erythema, burns, and warts on sun-exposed areas with progression to cancer. The toxic effects of coal tar are enhanced by exposure to ultraviolet light. Eyes: irritation and photosensitivity. Respiratory system: cough, bronchitis, and bronchogenic cancer. Gastrointestinal system: leukoplakia, buccal-pharyngeal cancer, and cancer of the lip. Hematopoietic system: leukemia (inconclusive) and lymphoma. Genitourinary system: hematuria and kidney and bladder cancers.
Particulate	REL = 15 mg/m^3 (total) PEL = 5 mg/m^3 (respirable)	Irritation eyes, skin, throat, upper respiratory system
PCBs	REL = 0.001 mg/m^3 PEL = 0.5 mg/m^3 (skin)	Irritation eyes, chloracne; liver damage; reproductive effects; [potential occupational carcinogen].
Tetrachloroethylene (PCE)	PEL: 100 ppm PEL C: 200 ppm; max peak: 300 ppm	Irritation eyes, skin, nose, throat, respiratory system; nausea; flush face, neck; dizziness, incoordination; headache, drowsiness; skin erythema (skin redness); liver damage; [potential occupational carcinogen].
Trichloroethene (TCE)	PEL = 100 ppm	Irritation lung; headaches, dizziness, poor coordination and difficulty concentrating; kidney and liver damage, impaired heart function; impaired immune system function and fetal development in pregnant women [potential occupational carcinogen].
Zinc	REL: 5 mg/m^3 REL C: 15 mg/m^3 N STEL: 10 mg/m^3 PEL: 5 mg/m^3 (ZnO fume); 15 mg/m^3 (ZnO dust)	Chills, elevated body temperature, myalgia, cough, fatigue, chest pain, stomach cramps, nausea, anemia, changes in cholesterol levels, and vomiting.

Chemical	REL/PEL/STEL	Health Hazards
Notes: REL: Recommended exposure limit (NIOSH) PEL: Permissible exposure limits (OSHA) STEL: Short-term exposure limit N: NIOSH O: OSHA C: Ceiling		

4.0 HEALTH AND SAFETY OFFICER

The contractor or engineer will designate one of its personnel as the Site Safety Officer (SSO). The SSO will be a competent person responsible for the implementation of this plan. The SSO will have completed a 40-hour training course (updated by an annual refresher) that meets OSHA requirements of 29 CFR Part 1910, Occupational Safety and Health Standards. The SSO has stop-work authorization, which he/she will execute on his/her determination of an imminent safety hazard, emergency situation, or other potentially dangerous situation. If the SSO must be absent from the Site, he/she will designate a suitably qualified replacement that is familiar with the CHASP.

5.0 TRAINING

All those who enter the work area while intrusive activities are being performed must recognize and understand the potential hazards to health and safety. All construction personnel upon entering the Site must attend a brief training meeting, its purpose being to:

- Make workers aware of the potential hazards they may encounter;
- Instruct workers on how to identify potential hazards,
- Provide the knowledge and skills necessary for them to perform the work with minimal risk to health and safety;
- Make workers aware of the purpose and limitations of safety equipment; and
- Ensure that they can safely avoid or escape from emergencies.

Each member of the construction crew will be instructed in these objectives before he/she goes onto the Site. Construction personnel will be responsible for identifying potential hazards in the work zone. The SSO or other suitably trained individual will be responsible for conducting the training program. Others who enter the Site must be accompanied by a suitably-trained construction worker.

6.0 GENERAL WORK PRACTICES

To protect the health and safety of the field personnel, all field personnel will adhere to the guidelines listed below during activities involving subsurface disturbance in contaminated areas.

- Eating, drinking, chewing gum or tobacco, and smoking are prohibited, except in designated areas on the Site. These areas will be designated by the SSO.
- Workers must wash their hands and face thoroughly on leaving the work area and before eating, drinking, or any other such activity. The workers should shower as soon as possible after leaving the Site.

- Contact with contaminated or suspected surfaces should be avoided.
- The buddy system should always be used; each buddy should watch for signs of fatigue, exposure, and heat stress.

7.0 PERSONAL PROTECTIVE EQUIPMENT & AIR MONITORING

7.1 Personal Protective Equipment

The personal protection equipment required for various kinds of site investigation tasks are based on 29 CFR 1910.120, Hazardous Waste Operations and Emergency Response, Appendix B, "General Description and Discussion of the Levels of Protection and Protective Gear."

AKRF field personnel and other Site personnel will wear, at a minimum, Level D personal protective equipment. The protection will be based on the air monitoring described in Section 7.2.

Table 1
Level of Protection Summary

LEVEL OF PROTECTION & PPE		1 – Excavation	2 – Other Earth Moving Activities
Level D (x) Steel Toe Shoes (x) Hard Hat **(within 25 ft of excavator)** (x) Work Gloves	(x) Safety Glasses ( ) Face Shield (x) Ear Plugs (within 25 ft of drill rig/excavator) (x) Latex Gloves	Yes	Yes
Level D – Modified ***(in addition to Level D)*** (x) Tyvek Coveralls	(x) Nitrile Gloves ( ) Overboots ( ) Saranex Coveralls	As necessary	As Necessary
Level C *(in addition to Level D – Modified)* ( ) Half-Face Respirator (x) Full Face Respirator ( ) Full-Face PAPR	( ) Particulate Cartridge ( ) Organic Cartridge (x) Dual Organic/ Particulate Cartridge	If PID > 10 ppm (breathing zone)	If PID > 10 ppm (breathing zone)
Comments: Cartridges to be changed out at least once per shift unless warranted beforehand (e.g., more difficult to breath or any odors detected).			

7.2 Work Zone Air Monitoring

Real time air monitoring will be performed when required by the RAP using a photoionization detector (PID) and with a particulate air monitor during tank removal and other work with known or likely contaminated soil. Measurements would be taken prior to commencement of work and continuously during the work as outlined in the following table. Measurements will be made as close to the workers as practicable and at the breathing height of the workers. The SSO will set up the equipment and confirm that it is working properly. His/her designee may oversee the air measurements during the day. The initial measurement for the day will be performed before the start of work and will establish the background level for that day. The final measurement for the day will be performed after the end of work. The action levels and required responses are listed in the following table.

Table 2
Action Levels and Required Safety Response Actions

Instrument	Action Level	Response Action
PID (MiniRAE 3000 or equivalent)	Less than 5 ppm in breathing zone	Level D or D-Modified
	Between 5ppm and 50 ppm	Level C
	More than 50 ppm	Stop work. Resume work when readings are less than 50 ppm.
Particulate monitor (TSI SidePak AM510 or equivalent)	Less than 0.125 mg/m^3 above background in breathing zone	Level D or D-Modified
	Between 0.125 mg/m^3 and 0.15 mg/m^3 above background in breathing zone	Apply dust suppression measures in work zone (i.e., minimum of spraying down work areas with water, other measures to be determined based on particulate-generating activity).
	Greater than 0.15 mg/m^3 above background in breathing zone	Stop work. Apply additional dust suppression measures. Resume work when readings are less than 0.15 mg/m^3 above background.
mg/m^3 = milligrams per cubic meter ppm = parts per million		

Field personnel will be trained in the proper operation of all field instruments at the start of the field program. Instruction manuals for the equipment will be on file at the site for referencing proper operation, maintenance and calibration procedures.

The equipment will be calibrated according to manufacturer specifications at the start of each day of fieldwork. If an instrument fails calibration, the project manager will be contacted immediately to obtain a replacement instrument and arrange for repairs. A calibration log will be maintained to record the date of each calibration, any failure to calibrate and corrective actions taken. The PID will be calibrated each day using 100 parts per million (ppm) isobutylene standard gas.

7.3 Community Air Monitoring Plan

During all on-site soil disturbance activities for the redevelopment, an air monitoring program will be implemented to avoid or minimize exposure of the field personnel and the public to potential environmental hazards. Results of this air monitoring will be used to determine appropriate response actions. The air monitoring, if necessary, will be conducted in accordance with the requirements of the New York State Department of Health Generic Community Air Monitoring Plan and Section 7.0 of the CHASP, as detailed below.

VOC Monitoring, Response Levels, and Actions

VOCs will initially be monitored at the downwind perimeter of the immediate work area (i.e., the exclusion zone) on a continuous basis during invasive work. Upwind concentrations will be measured at the start of each workday and periodically thereafter to establish background conditions. The monitoring will be performed using equipment appropriate to measure the types of contaminants known or suspected to be present. The equipment will be calibrated at least daily for the contaminant(s) of concern or for an appropriate surrogate. The equipment will be capable of calculating 15-minute running average concentrations, which will be compared to the levels specified below.

If the ambient air concentration of total organic vapors at the downwind perimeter of the work area or exclusion zone exceeds 5 parts per million (ppm) above background for the 15-minute average, work activities will be temporarily halted and monitoring continued. If the total organic vapor level readily decreases (per instantaneous readings) below 5 ppm over background, work activities will resume with continued monitoring.

If total organic vapor levels at the downwind perimeter of the work area or exclusion zone persist at levels in excess of 5 ppm over background but less than 25 ppm, work activities will be halted, the source of vapors identified, corrective actions taken to abate emissions, and monitoring continued. After these steps, work activities will resume provided that the total organic vapor level 200 feet downwind of the exclusion zone or half the distance to the nearest potential receptor or residential/commercial structure, whichever is less - but in no case less than 20 feet, is below 5 ppm over background for the 15-minute average.

If the organic vapor level is above 25 ppm at the perimeter of the work area, activities will be shutdown.

All 15-minute readings will be recorded, as required, and be available for DEP personnel to review. Instantaneous readings, if any, used for decision purposes will also be recorded.

Particulate Monitoring, Response Levels, and Actions

Particulate concentrations will initially be monitored continuously at the upwind and downwind perimeters of the exclusion zone at temporary particulate monitoring stations. The particulate monitoring will be performed using real-time monitoring equipment capable of measuring particulate matter less than 10 micrometers in size (PM-10) and capable of averaging over a period of 15 minutes (or less) for comparison to the airborne particulate action level. The equipment will be equipped with an audible alarm to indicate exceedance of the action level. In addition, fugitive dust migration should be visually assessed during all work activities.

If the downwind PM-10 particulate level is 100 micrograms per cubic meter ($\mu g/m^3$) greater than background (upwind perimeter) for the 15-minute period or if airborne dust is observed leaving the work area, then dust suppression techniques will be employed. Work will continue with dust suppression techniques provided that downwind PM-10 particulate levels do not exceed 150 $\mu g/m^3$ above the upwind level and provided that no visible dust is migrating from the work area.

If, after implementation of dust suppression techniques, downwind PM-10 particulate levels are greater than 150 $\mu g/m^3$ above the upwind level, work will be stopped and a re-evaluation of activities initiated. Work will resume provided that dust suppression measures and other controls are successful in reducing the downwind PM-10 particulate concentration to within $\mu g/m^3$ of the upwind level and in preventing visible dust migration.

All readings will be recorded and be available for DEP personnel to review.

8.0 DECONTAMINATION PROCEDURES

8.1 Personnel Decontamination

Personnel decontamination (decon), if deemed necessary by the SSO, will take place in a designated decontamination area. This area will be delineated during each stage of work. Personnel decontamination will consist of the following steps:

- Soap and potable water wash and potable water rinse of gloves;
- Coverall removal (if applicable);

- Glove removal;
- Disposable clothing removal; and
- Field wash of hands and face.

8.2 Sampling Equipment Decontamination

Any non-disposable sampling equipment for confirmatory sampling or other equipment that is in contact with contaminated materials will be decontaminated in accordance with the following procedure:

- Double wash with solution of Simple Green® and clean tap water;
- Double rinse with clean tap water;
- Rinse with clean distilled water; and
- Allow equipment to air dry.

8.3 Heavy Equipment Decontamination

If heavy equipment comes in contact with contaminated materials, it will be decontaminated prior to being relocated to a clean area or leaving the site. A designated decontamination pad will be constructed, where soil, dust, or oil will be washed off the exterior, undercarriage, and wheels or tracks of the equipment.

9.0 EMERGENCY RESPONSE

9.1 Emergency Procedures

In the event that an emergency develops on site, the procedures delineated herein are to be immediately followed. Emergency conditions are considered to exist if:

- Any member of the field crew is involved in an accident or experiences any adverse effects or symptoms of exposure while on-site;
- A condition is discovered that suggests the existence of a situation more hazardous than anticipated; and
- A spill of oil or other hazardous materials.
- General emergency procedures and specific procedures for personal injury and chemical exposure are described below. In the event of an accident or emergency, an Incident Report form should be filled out and placed in the project file. An example Incident Report form is provided in Appendix B. Information on emergency hand signals is provided in Appendix C.

9.1.1 Chemical Exposure

If a member of the field crew demonstrates symptoms of chemical exposure the procedures outlined below should be followed:

- Another team member (buddy) should remove the individual from the immediate area of contamination. The buddy should communicate to the SSO (via voice and hand signals) of the chemical exposure. The SSO should contact the appropriate emergency response agency.
- Precautions should be taken to avoid exposure of other individuals to the chemical.

- If the chemical is on the individual's clothing, the chemical should be neutralized or removed if it is safe to do so.
- If the chemical has contacted the skin, the skin should be washed with copious amounts of water.
- In case of eye contact, an emergency eye wash should be used. Eyes should be washed for at least 15 minutes.
- All chemical exposure incidents must be reported in writing to the Project Manager. The SSO is responsible for completing the Incident Report Form.

9.1.2 Personal Injury

In case of personal injury at the site, the following procedures should be followed:

- Another team member (buddy) should signal the SSO that an injury has occurred.
- A field team member trained in first aid can administer treatment to an injured worker.
- If deemed necessary, the victim should then be transported to the nearest hospital or medical center. If necessary, an ambulance should be called to transport the victim.
- The SSO is responsible for making certain that an Incident Report Form is completed. This form is to be submitted to the AKRF Health and Safety Officer. Follow-up action should be taken to correct the situation that caused the accident.
- Any incident (near miss, property damage, first aid, medical treatment, etc.) must be reported.

A first-aid kit, eye-wash, and blood-born pathogens kit will be kept on-site during the field activities.

9.1.3 Evacuation Procedures

- The SSO will initiate evacuation procedures by signaling to leave the Site or containment structure;
- All personnel in the work area should evacuate the area and meet in the common designated area;
- All personnel suspected to be in or near the contract work area should be accounted for and the whereabouts or missing persons determined immediately; and
- The SSO will then give further instruction.

9.1.4 Procedures Implemented in the Event of a Major Fire, Explosion, or Emergency

- Notify the paramedics and/or fire department, as necessary;
- Signal the evacuation procedure previously outlined and implement the entire procedure;
- Isolate the area;
- Stay upwind of any fire;
- Keep the area surrounding the problem source clear after the incident occurs; and
- Complete accident report for and distribute to appropriate personnel.

9.1.5 Spill Response

All personnel must take every precaution to minimize the potential for spills during site operations. Any spill will be reported immediately to the SSO. The SSO will then report any required spills to the NYCDEP and/or NYSDEC Hotline. Spill control apparatus (sorbent materials) will be located on-site. All materials used for the clean up of spills will be containerized and labeled separately from other wastes. The SSO, in consultation with AKRF's Project Manager, will determine whether additional spill response measures are required.

9.2 Hospital Directions

The location of the nearest hospital, shown on Figure 1, is **Lenox Hill Hospital Emergency Medicine Department**.

Hospital Information and Directions

Hospital Name:	Lenox Hill Hospital Emergency Medicine Department
Phone Number:	(212) 434-3030
Address/Location:	100 East 77th Street (The Emergency Department is located on East 77th Street between Park Avenue and Lexington Avenue)
Directions:	1. Turn LEFT on East 77th Street toward Park Avenue 2. The Emergency Department Entrance will be on the LEFT.

9.3 CHASP Contact Information

CHASP APPENDIX A

POTENTIAL HEALTH EFFECTS FROM ON-SITE CONTAMINANTS

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

ARSENIC
CAS # 7440-38-2

Division of Toxicology ToxFAQs™ December 2003

This fact sheet answers the most frequently asked health questions (FAQs) about arsenic. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to higher than average levels of arsenic occurs mostly in the workplace, near hazardous waste sites, or in areas with high natural levels. At high levels, inorganic arsenic can cause death. Exposure to lower levels for a long time can cause a discoloration of the skin and the appearance of small corns or warts. Arsenic has been found at 1,014 of the 1,598 National Priority List sites identified by the Environmental Protection Agency (EPA).

What is arsenic?

Arsenic is a naturally occurring element widely distributed in the earth's crust. In the environment, arsenic is combined with oxygen, chlorine, and sulfur to form inorganic arsenic compounds. Arsenic in animals and plants combines with carbon and hydrogen to form organic arsenic compounds.

Inorganic arsenic compounds are mainly used to preserve wood. Organic arsenic compounds are used as pesticides, primarily on cotton plants.

What happens to arsenic when it enters the environment?

❑ Arsenic cannot be destroyed in the environment. It can only change its form.
❑ Arsenic in air will settle to the ground or is washed out of the air by rain.
❑ Many arsenic compounds can dissolve in water.
❑ Fish and shellfish can accumulate arsenic, but the arsenic in fish is mostly in a form that is not harmful.

How might I be exposed to arsenic?

❑ Eating food, drinking water, or breathing air containing arsenic.
❑ Breathing contaminated workplace air.
❑ Breathing sawdust or burning smoke from wood treated with arsenic.
❑ Living near uncontrolled hazardous waste sites containing arsenic.
❑ Living in areas with unusually high natural levels of arsenic in rock.

How can arsenic affect my health?

Breathing high levels of inorganic arsenic can give you a sore throat or irritated lungs. Ingesting high levels of inorganic arsenic can result in death. Lower levels of arsenic can cause nausea and vomiting, decreased production of red and white blood cells, abnormal heart rhythm, damage to blood vessels, and a sensation of "pins and needles" in hands and feet.

Ingesting or breathing low levels of inorganic arsenic for a long time can cause a darkening of the skin and the

appearance of small "corns" or "warts" on the palms, soles, and torso.

Skin contact with inorganic arsenic may cause redness and swelling.

Organic arsenic compounds are less toxic than inorganic arsenic compounds. Exposure to high levels of some organic arsenic compounds may cause similar effects as inorganic arsenic.

How likely is arsenic to cause cancer?

Several studies have shown that inorganic arsenic can increase the risk of lung cancer, skin cancer, bladder cancer, liver cancer, kidney cancer, and prostate cancer. The World Health Organization (WHO), the Department of Health and Human Services (DHHS), and the EPA have determined that inorganic arsenic is a human carcinogen.

How can arsenic affect children?

We do not know if exposure to arsenic will result in birth defects or other developmental effects in people. Birth defects have been observed in animals exposed to inorganic arsenic.

It is likely that health effects seen in children exposed to high amounts of arsenic will be similar to the effects seen in adults.

How can families reduce the risk of exposure to arsenic?

❑ If you use arsenic-treated wood in home projects, you should wear dust masks, gloves, and protective clothing to decrease exposure to sawdust.
❑ If you live in an area with high levels of arsenic in water or soil, you should use cleaner sources of water and limit contact with soil.

Is there a medical test to show whether I've been exposed to arsenic?

There are tests to measure the level of arsenic in blood, urine, hair, or fingernails. The urine test is the most reliable test for arsenic exposure within the last few days. Tests on hair and fingernails can measure exposure to high levels or arsenic over the past 6-12 months. These tests can determine if you have been exposed to above-average levels of arsenic. They cannot predict how the arsenic levels in your body will affect your health.

Has the federal government made recommendations to protect human health?

EPA has set limits on the amount of arsenic that industrial sources can release to the environment and has restricted or canceled many uses of arsenic in pesticides. EPA has set a limit of 0.01 parts per million (ppm) for arsenic in drinking water.

The Occupational Safety and Health Administration has set limits of 10 μg arsenic per cubic meter of workplace air (10 $\mu g/m^3$) for 8 hour shifts and 40 hour work weeks.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

BARIUM AND COMPOUNDS

CAS # 7440-39-3

Division of Toxicology and Environmental Medicine ToxFAQs™ **August 2007**

This fact sheet answers the most frequently asked health questions (FAQs) about barium and barium compounds. For more information, call the ATSDR Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because these substances may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to barium occurs mostly in the workplace or from drinking contaminated water. Ingesting drinking water containing levels of barium above the EPA drinking water guidelines for relatively short periods of time can cause gastrointestinal disturbances and muscle weakness. Ingesting high levels for a long time can damage the kidneys. Barium and barium compounds have been found in at least 798 of the 1,684 National Priority List sites identified by the Environmental Protection Agency (EPA).

What is barium?

Barium is a silvery-white metal which exists in nature only in ores containing mixtures of elements. It combines with other chemicals such as sulfur or carbon and oxygen to form barium compounds.

Barium compounds are used by the oil and gas industries to make drilling muds. Drilling muds make it easier to drill through rock by keeping the drill bit lubricated. They are also used to make paint, bricks, ceramics, glass, and rubber.

Barium sulfate is sometimes used by doctors to perform medical tests and to take x-rays of the gastrointestinal tract.

What happens to barium when it enters the environment?

❏ Barium gets into the air during the mining, refining, and production of barium compounds, and from the burning of coal and oil.
❏ The length of time that barium will last in air, land, water, or sediments depends on the form of barium released.
❏ Barium compounds, such as barium sulfate and barium carbonate, which do not dissolve well in water, can last a long time in the environment.
❏ Barium compounds, such as barium chloride, barium nitrate, or barium hydroxide, that dissolve easily in water usually do not last in these forms for a long time in the environment. The barium in these compounds that is dissolved in water quickly combines with sulfate or carbonate that are naturally found in water and become the longer lasting forms (barium sulfate and barium carbonate).
❏ Fish and aquatic organisms can accumulate barium.

How might I be exposed to barium?

❏ Ingesting small amounts present in your food and water or breathing air containing very low levels of barium.
❏ Living in areas with unusually high natural levels of barium in the drinking water.
❏ Working in a job that involves barium production or use.
❏ Living or working near waste sites where barium has been disposed of.

How can barium affect my health?

The health effects of the different barium compounds depend on how well the compound dissolves in water or in the stomach contents. Barium compounds that do not dissolve well, such as barium sulfate, are not generally harmful.

BARIUM AND COMPOUNDS
CAS # 7440-39-3

Barium has been found to potentially cause gastrointestinal disturbances and muscular weakness when people are exposed to it at levels above the EPA drinking water standards for relatively short periods of time. Some people who eat or drink amounts of barium above background levels found in food and water for a short period may experience vomiting, abdominal cramps, diarrhea, difficulties in breathing, increased or decreased blood pressure, numbness around the face, and muscle weakness. Eating or drinking very large amounts of barium compounds that easily dissolve can cause changes in heart rhythm or paralysis and possibly death. Animals that drank barium over long periods had damage to the kidneys, decreases in body weight, and some died.

How likely is barium to cause cancer?

The Department of Health and Human Services (DHHS) and the International Agency for Research on Cancer (IARC) have not classified barium as to its carcinogenicity. The EPA has determined that barium is not likely to be carcinogenic to humans following ingestion and that there is insufficient information to determine whether it will be carcinogenic to humans following inhalation exposure.

How can barium affect children?

We do not know whether children will be more or less sensitive than adults to barium toxicity. A study in rats that swallowed barium found a decrease in newborn body weight; we do not know if a similar effect would be seen in humans.

How can families reduce the risks of exposure to barium?

The greatest potential source of barium exposure is through food and drinking water. However, the amount of barium in foods and drinking water are typically too low to be of concern.

Is there a medical test to determine whether I've been exposed to barium?

There is no routine medical test to determine whether you have been exposed to barium. Doctors can measure barium in body tissues and fluids, such as bones, blood, urine, and feces, using very complex instruments. These tests cannot be used to predict the extent of the exposure or potential health effects.

The geometric mean barium level measured in the U.S. general population aged 6 and older is reported by the Centers for Disease Control and Prevention (CDC) as 1.44 μg/g creatinine (measured in urine).

Has the federal government made recommendations to protect human health?

The EPA has set a limit of 2.0 milligrams of barium per liter of drinking water (2.0 mg/L), which is the same as 2 ppm.

The Occupational Safety and Health Administration (OSHA) has set Permissible Exposure Limits (PELs) of 0.5 milligrams of soluble barium compounds per cubic meter of workplace air (0.5 mg/m^3) for 8 hour shifts and 40 hour work weeks. The OSHA limits for barium sulfate dust are 15 mg/m^3 of total dust and 5 mg/m^3 for respirable fraction.

The National Institute for Occupational Safety and Health (NIOSH) has set Recommended Exposure Limits (RELs) of 0.5 mg/m^3 for soluble barium compounds. The NIOSH has set RELs of 10 mg/m^3 (total dust) for barium sulfate and 5 mg/m^3 (respirable fraction).

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

BENZENE
CAS # 71-43-2

This fact sheet answers the most frequently asked health questions (FAQs) about benzene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Benzene is a widely used chemical formed from both natural processes and human activities. Breathing benzene can cause drowsiness, dizziness, and unconsciousness; long-term benzene exposure causes effects on the bone marrow and can cause anemia and leukemia. Benzene has been found in at least 813 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is benzene?

(Pronounced bĕn′zēn′)

Benzene is a colorless liquid with a sweet odor. It evaporates into the air very quickly and dissolves slightly in water. It is highly flammable and is formed from both natural processes and human activities.

Benzene is widely used in the United States; it ranks in the top 20 chemicals for production volume. Some industries use benzene to make other chemicals which are used to make plastics, resins, and nylon and synthetic fibers. Benzene is also used to make some types of rubbers, lubricants, dyes, detergents, drugs, and pesticides. Natural sources of benzene include volcanoes and forest fires. Benzene is also a natural part of crude oil, gasoline, and cigarette smoke.

What happens to benzene when it enters the environment?

- Industrial processes are the main source of benzene in the environment.
- Benzene can pass into the air from water and soil.
- It reacts with other chemicals in the air and breaks down within a few days.
- Benzene in the air can attach to rain or snow and be carried back down to the ground.
- It breaks down more slowly in water and soil, and can pass through the soil into underground water.
- Benzene does not build up in plants or animals.

How might I be exposed to benzene?

- Outdoor air contains low levels of benzene from tobacco smoke, automobile service stations, exhaust from motor vehicles, and industrial emissions.
- Indoor air generally contains higher levels of benzene from products that contain it such as glues, paints, furniture wax, and detergents.
- Air around hazardous waste sites or gas stations will contain higher levels of benzene.
- Leakage from underground storage tanks or from hazardous waste sites containing benzene can result in benzene contamination of well water.
- People working in industries that make or use benzene may be exposed to the highest levels of it.
- A major source of benzene exposures is tobacco smoke.

How can benzene affect my health?

Breathing very high levels of benzene can result in death, while high levels can cause drowsiness, dizziness, rapid heart rate, headaches, tremors, confusion, and unconsciousness. Eating or drinking foods containing high levels of benzene can cause vomiting, irritation of the stomach, dizziness, sleepiness, convulsions, rapid heart rate, and death.

ToxFAQs Internet address via WWW is http://www.atsdr.cdc.gov/toxfaq.html

The major effect of benzene from long-term (365 days or longer) exposure is on the blood. Benzene causes harmful effects on the bone marrow and can cause a decrease in red blood cells leading to anemia. It can also cause excessive bleeding and can affect the immune system, increasing the chance for infection.

Some women who breathed high levels of benzene for many months had irregular menstrual periods and a decrease in the size of their ovaries. It is not known whether benzene exposure affects the developing fetus in pregnant women or fertility in men.

Animal studies have shown low birth weights, delayed bone formation, and bone marrow damage when pregnant animals breathed benzene.

How likely is benzene to cause cancer?

The Department of Health and Human Services (DHHS) has determined that benzene is a known human carcinogen. Long-term exposure to high levels of benzene in the air can cause leukemia, cancer of the blood-forming organs.

Is there a medical test to show whether I've been exposed to benzene?

Several tests can show if you have been exposed to benzene. There is test for measuring benzene in the breath; this test must be done shortly after exposure. Benzene can also be measured in the blood, however, since benzene disappears rapidly from the blood, measurements are accurate only for recent exposures.

In the body, benzene is converted to products called metabolites. Certain metabolites can be measured in the urine. However, this test must be done shortly after exposure and is not a reliable indicator of how much benzene you have been exposed to, since the metabolites may be present in urine from other sources.

Has the federal government made recommendations to protect human health?

The EPA has set the maximum permissible level of benzene in drinking water at 0.005 milligrams per liter (0.005 mgL). The EPA requires that spills or accidental releases into the environment of 10 pounds or more of benzene be reported to the EPA.

The Occupational Safety and Health Administration (OSHA) has set a permissible exposure limit of 1 part of benzene per million parts of air (1 ppm) in the workplace during an 8-hour workday, 40-hour workweek.

Glossary

Anemia: A decreased ability of the blood to transport oxygen.

Carcinogen: A substance with the ability to cause cancer.

CAS: Chemical Abstracts Service.

Chromosomes: Parts of the cells responsible for the development of hereditary characteristics.

Metabolites: Breakdown products of chemicals.

Milligram (mg): One thousandth of a gram.

Pesticide: A substance that kills pests.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

CADMIUM
CAS # 7440-43-9

This fact sheet answers the most frequently asked health questions (FAQs) about cadmium. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to cadmium happens mostly in the workplace where cadmium products are made. The general population is exposed from breathing cigarette smoke or eating cadmium contaminated foods. Cadmium damages the lungs, can cause kidney disease, and may irritate the digestive tract. This substance has been found in at least 776 of the 1,467 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is cadmium?

(Pronounced kăd′mē-əm)

Cadmium is a natural element in the earth's crust. It is usually found as a mineral combined with other elements such as oxygen (cadmium oxide), chlorine (cadmium chloride), or sulfur (cadmium sulfate, cadmium sulfide).

All soils and rocks, including coal and mineral fertilizers, contain some cadmium. Most cadmium used in the United States is extracted during the production of other metals like zinc, lead, and copper. Cadmium does not corrode easily and has many uses, including batteries, pigments, metal coatings, and plastics.

What happens to cadmium when it enters the environment?

- Cadmium enters air from mining, industry, and burning coal and household wastes.
- Cadmium particles in air can travel long distances before falling to the ground or water.
- It enters water and soil from waste disposal and spills or leaks at hazardous waste sites.
- It binds strongly to soil particles.
- Some cadmium dissolves in water.
- It doesn't break down in the environment, but can change forms.
- Fish, plants, and animals take up cadmium from the environment.
- Cadmium stays in the body a very long time and can build up from many years of exposure to low levels.

How might I be exposed to cadmium?

- Breathing contaminated workplace air (battery manufacturing, metal soldering or welding).
- Eating foods containing it; low levels in all foods (highest in shellfish, liver, and kidney meats).
- Breathing cadmium in cigarette smoke (doubles the average daily intake).
- Drinking contaminated water.
- Breathing contaminated air near the burning of fossil fuels or municipal waste.

How can cadmium affect my health?

Breathing high levels of cadmium severely damages the lungs and can cause death. Eating food or drinking water with very high levels severely irritates the stomach, leading to vomiting and diarrhea. Long-term exposure to lower levels of cadmium in air, food, or water leads to a buildup of cadmium in the kidneys and possible kidney disease.

ToxFAQs Internet address via WWW is http://www.atsdr.cdc.gov/toxfaq.html

Other long-term effects are lung damage and fragile bones. Animals given cadmium in food or water had high blood pressure, iron-poor blood, liver disease, and nerve or brain damage.

We don't know if humans get any of these diseases from eating or drinking cadmium. Skin contact with cadmium is not known to cause health effects in humans or animals.

How likely is cadmium to cause cancer?

The Department of Health and Human Services (DHHS) has determined that cadmium and cadmium compounds may reasonably be anticipated to be carcinogens.

How can cadmium affect children?

The health effects in children are expected to be similar to those in adults (kidney, lung and intestinal damage).

We don't know if cadmium causes birth defects in people. Cadmium does not readily go from a pregnant woman's body into the developing child, but some portion can cross the placenta. It can also be found in breast milk. The babies of animals exposed to high levels of cadmium during pregnancy had changes in behavior and learning ability. Cadmium may also affect birth weight and the skeleton in developing animals.

Animal studies also indicate that more cadmium is absorbed into the body if the diet is low in calcium, protein, or iron, or is high in fat. A few studies show that younger animals absorb more cadmium and are more likely to lose bone and bone strength than adults.

How can families reduce the risk of exposure to cadmium?

In the home, store substances that contain cadmium safely, and keep nickel-cadmium batteries out of reach of young children. If you work with cadmium, use all safety precautions to avoid carrying cadmium-containing dust home from work on your clothing, skin, hair, or tools.

A balanced diet can reduce the amount of cadmium taken into the body from food and drink.

Is there a medical test to show whether I've been exposed to cadmium?

Tests are available in some medical laboratories that measure cadmium in blood, urine, hair, or nails. Blood levels show recent exposure to cadmium, and urine levels show both recent and earlier exposure. The reliability of tests for cadmium levels in hair or nails is unknown.

Has the federal government made recommendations to protect human health?

The EPA has set a limit of 5 parts of cadmium per billion parts of drinking water (5 ppb). EPA doesn't allow cadmium in pesticides.

The Food and Drug Administration (FDA) limits the amount of cadmium in food colors to 15 parts per million (15 ppm).

The Occupational Safety and Health Administration (OSHA) limits workplace air to 100 micrograms cadmium per cubic meter (100 µg/m^3) as cadmium fumes and 200 µg cadmium/m^3 as cadmium dust.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

COPPER

CAS # 7440-50-8

Division of Toxicology ToxFAQs™ September 2002

This fact sheet answers the most frequently asked health questions (FAQs) about copper. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Copper is a reddish metal that occurs naturally in the environment. It also occurs naturally in plants and animals. Low levels of copper are essential for maintaining good health. High levels can cause harmful effects such as irritation of the nose, mouth and eyes, vomiting, diarrhea, stomach crumps, and nausea. Copper has been found in at least 884 of the 1,613 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is copper?

Copper is a reddish metal that occurs naturally in rocks, soil, water, and air. Copper also occurs naturally in plants and animals.

Metallic copper can be easily molded or shaped. Metallic copper can be found in the U.S. penny, electrical wiring, and some water pipes. Metallic copper is also found in mixtures (called alloys) with other metals such as brass and bronze. Copper is also found as part of other compounds forming salts. Copper salts occur naturally, but are also manufactured. The most common copper salt is copper sulfate. Most copper compounds are blue-green in color. Copper compounds are commonly used in agriculture to treat plant diseases like mildew, for water treatment and, as preservatives for wood, leather, and fabrics.

What happens to copper when it enters the environment?

❑ Copper can enter the environment from the mining of copper and other metals and from factories that make or use metallic copper or copper compounds.

❑ It can also enter the environment through domestic waste water, combustion of fossil fuels and wastes, wood production, phosphate fertilizer production, and natural sources (e.g., windblown dust from soils, volcanoes, decaying vegetation, forest fires, and sea spray).

❑ Copper in soil strongly attaches to organic material and minerals.

❑ Copper that dissolves in water becomes rapidly bound to particles suspended in the water.

❑ Copper does not typically enter groundwater.

❑ Copper carried by particles emitted from smelters and ore processing plants is carried back to the ground by gravity or in rain or snow.

❑ Copper does not break down in the environment.

How might I be exposed to copper?

❑ Breathing air, drinking water, eating food, and by skin contact with soil, water, or other copper-containing substances.

❑ Some copper in the environment can be taken up by plants and animals.

❑ Higher exposure may occur if your water is corrosive and you have copper plumbing and brass water fixtures. ❑ You may be exposed to higher amounts of copper if you drink water or swim in lakes or reservoirs recently treated with copper to control algae or receive cooling water from a power plant that may have high amounts of dissolved copper.

❑ Using some garden products (e.g., fungicides) to control plant diseases.

❑ Living near bronze and brass production facilities may expose you to higher copper levels in soil.

❑ You may breathe copper-containing dust or have skin contact if you work in the industry of mining copper or

processing the ore. You may breathe high levels if you grind or weld copper metal.

How can copper affect my health?

Copper is essential for good health, but high amounts can be harmful. Long-term exposure to copper dust can irritate your nose, mouth, and eyes, and cause headaches, dizziness, nausea, and diarrhea.

Drinking water with higher than normal levels of copper may cause vomiting, diarrhea, stomach cramps, and nausea. Intentionally high intakes of copper can cause liver and kidney damage and even death.

How likely is copper to cause cancer?

We do not know whether copper can cause cancer in humans. The EPA has determined that copper is not classifiable as to carcinogenicity.

How can copper affect children?

Exposure to high levels of copper will result in the same type of effects in children and adults. Studies in animals suggest that the young children may have more severe effects than adults; we do not know if this would also be true in humans. There is a very small percentage of infants and children who are unusually sensitive to copper.

We do not know if copper can cause birth defects or other developmental effects in humans. Studies in animals suggest that ingestion of high levels of copper may cause a decrease in fetal growth.

How can families reduce the risk of exposure to copper?

❑ The greatest potential source of copper exposure is through drinking water, especially in water that is first drawn in the morning after sitting in copper pipes and brass faucets overnight.

❑ To reduce exposure, run the water for at least 15-30 seconds before using it.

❑ If you are exposed to copper at work, you may carry copper home on your skin, clothes, or tools. You can avoid this by showering, and changing clothing before leaving work, and your work clothes should be kept separate from other clothes and laundered separately.

Is there a medical test to show whether I've been exposed to copper?

Copper is normally found in all tissues of the body, blood, urine, feces, hair, and nails. High levels of copper in these samples can show that you have been exposed to higher than normal levels of copper. Tests to measure copper levels in the body are not routinely available at the doctor's office because they require special equipment. These tests cannot tell the extent of exposure or whether you will experience harmful effects.

Has the federal government made recommendations to protect human health?

The EPA has determined that drinking water should not contain more than 1.3 milligrams of copper per liter of water (1.3 mg/L).

The Occupational Safety and Health Administration (OSHA) has set a limit of 0.1 mg per cubic meter (0.1 mg/m^3) of copper fumes (vapor generated from heating copper) and 1 mg/m^3 of copper dusts (fine metallic copper particles) and mists (aerosol of soluble copper) in workroom air during an 8-hour work shift, 40-hour workweek.

The Food and Nutrition Board of the Institute of Medicine recommends dietary allowances (RDAs) of 340 micrograms (340 µg) of copper per day for children aged 1-3 years, 440 µg/day for children aged 4-8 years, 700 µg/day for children aged 9-13 years, 890 µg/day for children aged 14-18 years, and 900 µg/day for adults.

CAS # 50-29-3, 72-55-9, 72-54-8

Division of Toxicology ToxFAQs™ **September 2002**

This fact sheet answers the most frequently asked health questions (FAQs) about DDT, DDE, and DDD. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to DDT, DDE, and DDD occurs mostly from eating foods containing small amounts of these compounds, particularly meat, fish and poultry. High levels of DDT can affect the nervous system causing excitability, tremors and seizures. In women, DDE can cause a reduction in the duration of lactation and an increased chance of having a premature baby. DDT, DDE, and DDD have been found in at least 441 of the 1,613 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are DDT, DDE, and DDD?

DDT (dichlorodiphenyltrichloroethane) is a pesticide once widely used to control insects in agriculture and insects that carry diseases such as malaria. DDT is a white, crystalline solid with no odor or taste. Its use in the U.S. was banned in 1972 because of damage to wildlife, but is still used in some countries.

DDE (dichlorodiphenyldichloroethylene) and DDD (dichlorodiphenyldichloroethane) are chemicals similar to DDT that contaminate commercial DDT preparations. DDE has no commercial use. DDD was also used to kill pests, but its use has also been banned. One form of DDD has been used medically to treat cancer of the adrenal gland.

What happens to DDT, DDE, and DDD when they enter the environment?

❑ DDT entered the environment when it was used as a pesticide; it still enters the environment due to current use in other countries.

❑ DDE enters the environment as contaminant or breakdown product of DDT; DDD also enters the environment as a breakdown product of DDT.

❑ DDT, DDE, and DDD in air are rapidly broken down by sunlight. Half of what's in air breaks down within 2 days.

❑ They stick strongly to soil; most DDT in soil is broken down slowly to DDE and DDD by microorganisms; half the DDT in soil will break down in 2-15 years, depending on the type of soil.

❑ Only a small amount will go through the soil into groundwater; they do not dissolve easily in water.

❑ DDT, and especially DDE, build up in plants and in fatty tissues of fish, birds, and other animals.

How might I be exposed to DDT, DDE, and DDD?

❑ Eating contaminated foods, such as root and leafy vegetables, fatty meat, fish, and poultry, but levels are very low.

❑ Eating contaminated imported foods from countries that still allow the use of DDT to control pests.

❑ Breathing contaminated air or drinking contaminated water near waste sites and landfills that may contain higher levels of these chemicals.

❑ Infants fed on breast milk from mothers who have been exposed.

❑ Breathing or swallowing soil particles near waste sites or landfills that contain these chemicals.

How can DDT, DDE, and DDD affect my health?

DDT affects the nervous system. People who accidentally swallowed large amounts of DDT became excitable and had tremors and seizures. These effects went away after the exposure stopped. No effects were seen in people who took small daily doses of DDT by capsule for 18 months.

A study in humans showed that women who had high amounts of a form of DDE in their breast milk were unable to

breast feed their babies for as long as women who had little DDE in the breast milk. Another study in humans showed that women who had high amounts of DDE in breast milk had an increased chance of having premature babies.
In animals, short-term exposure to large amounts of DDT in food affected the nervous system, while long-term exposure to smaller amounts affected the liver. Also in animals, short-term oral exposure to small amounts of DDT or its breakdown products may also have harmful effects on reproduction.

How likely are DDT, DDE, and DDD to cause cancer?

Studies in DDT-exposed workers did not show increases in cancer. Studies in animals given DDT with the food have shown that DDT can cause liver cancer.
The Department of Health and Human Services (DHHS) determined that DDT may reasonable be anticipated to be a human carcinogen. The International Agency for Research on Cancer (IARC) determined that DDT may possibly cause cancer in humans. The EPA determined that DDT, DDE, and DDD are probable human carcinogens.

How can DDT, DDE, and DDD affect children?

There are no studies on the health effects of children exposed to DDT, DDE, or DDD. We can assume that children exposed to large amounts of DDT will have health effects similar to the effects seen in adults. However, we do not know whether children differ from adults in their susceptibility to these substances.
There is no evidence that DDT, DDE, or DDD cause birth defects in people. A study showed that teenage boys whose mothers had higher DDE amounts in the blood when they were pregnant were taller than those whose mothers had lower DDE levels. However, a different study found the opposite in preteen girls. The reason for the discrepancy between these studies is unknown.
Studies in rats have shown that DDT and DDE can mimic the action of natural hormones and in this way affect the development of the reproductive and nervous systems. Puberty was delayed in male rats given high amounts of DDE as juveniles. This could possibly happen in humans. A study in mice showed that exposure to DDT during the first weeks of life may cause neurobehavioral problems later in life.

How can families reduce the risk of exposure to DDT,DDE, and DDE?

❑ Most families will be exposed to DDT by eating food or drinking liquids contaminated with small amounts of DDT.
❑ Cooking will reduce the amount of DDT in fish.
❑ Washing fruit and vegetables will remove most DDT from their surface.
❑ Follow health advisories that tell you about consumption of fish and wildlife caught in contaminated areas.

Is there a medical test to show whether I've been exposed to DDT, DDE, and DDD?

Laboratory tests can detect DDT, DDE, and DDD in fat, blood, urine, semen, and breast milk. These tests may show low, moderate, or excessive exposure to these compounds, but cannot tell the exact amount you were exposed to, or whether you will experience adverse effects. These tests are not routinely available at the doctor's office because they require special equipment.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) sets a limit of 1 milligram of DDT per cubic meter of air (1 mg/m^3) in the workplace for an 8-hour shift, 40-hour workweek.
The Food and Drug Administration (FDA) has set limits for DDT, DDE, and DDD in foodstuff at or above which the agency will take legal action to remove the products from the market.

FUEL OILS

CAS # 8008-20-6, 70892-10-3, 68476-30-2, 68476-34-6, 68476-31-3

This fact sheet answers the most frequently asked health questions (FAQs) about fuel oils. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Fuel oils are liquid mixtures produced from petroleum, and their use mostly involves burning them as fuels. Drinking or breathing fuel oils may cause nausea or nervous system effects. However, exposure under normal use conditions is not likely to be harmful. Fuel oils have been found in at least 26 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are fuel oils?

(Pronounced fyo͞o′əl oilz)

Fuel oils are a variety of yellowish to light brown liquid mixtures that come from crude petroleum. Some chemicals found in fuel oils may evaporate easily, while others may more easily dissolve in water.

Fuel oils are produced by different petroleum refining processes, depending on their intended uses. Fuel oils may be used as fuel for engines, lamps, heaters, furnaces, and stoves, or as solvents.

Some commonly found fuel oils include kerosene, diesel fuel, jet fuel, range oil, and home heating oil. These fuel oils differ from one another by their hydrocarbon compositions, boiling point ranges, chemical additives, and uses.

What happens to fuel oils when they enter the environment?

- Some chemicals found in fuel oils may evaporate into the air from open containers or contaminated soil or water.
- Some chemicals found in fuel oils may dissolve in water after spills to surface waters or leaks from underground storage tanks.
- Some chemicals found in fuel oils may stick to particles in water, which will eventually cause them to settle to the bottom sediment.
- Some of the chemicals found in fuel oils may be broken down slowly in air, water, and soil by sunlight or small organisms.
- Some of the chemicals found in fuel oils may build up significantly in plants and animals.

How might I be exposed to fuel oils?

- Using a home kerosene heater or stove, or using fuel oils at work.
- Breathing air in home or building basements that has been contaminated with fuel oil vapors entering from the soil.
- Drinking or swimming in water that has been contaminated with fuel oils from a spill or a leaking underground storage tank.
- Touching soil contaminated with fuel oils.
- Using fuel oils to wash paint or grease from skin or equipment.

How can fuel oils affect my health?

Little information is available about the health effects that may be caused by fuel oils. People who use kerosene

stoves for cooking do not seem to have any health problems related to their exposure.

Breathing some fuel oils for short periods may cause nausea, eye irritation, increased blood pressure, headache, lightheadedness, loss of appetite, poor coordination, and difficulty concentrating. Breathing diesel fuel vapors for long periods may cause kidney damage and lower your blood's ability to clot.

Drinking small amounts of kerosene may cause vomiting, diarrhea, coughing, stomach swelling and cramps, drowsiness, restlessness, painful breathing, irritability, and unconsciousness. Drinking large amounts of kerosene may cause convulsions, coma, or death. Skin contact with kerosene for short periods may cause itchy, red, sore, or peeling skin.

How likely are fuel oils to cause cancer?

The International Agency for Research on Cancer (IARC) has determined that some fuel oils (heavy) may possibly cause cancer in humans, but for other fuel oils (light) there is not enough information to make a determination. IARC has also determined that occupational exposures to fuel oils during petroleum refining are probably carcinogenic in humans.

Some studies with mice have suggested that repeated contact with fuel oils may cause liver or skin cancer. However, other mouse studies have found this not to be the case. No studies are available in other animals or in people on the carcinogenic effects of fuel oils.

Is there a medical test to show whether I've been exposed to fuel oils?

There is no medical test that shows if you have been exposed to fuel oils. Tests are available to determine if some of the chemicals commonly found in fuel oils are in your blood. However, the presence of these chemicals in blood may not necessarily mean that you have been exposed to fuel oils.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) and the Air Force Office of Safety and Health (AFOSH) have set a permissible exposure level (PEL) of 400 parts of petroleum distillates per million parts of air (400 ppm) for an 8-hour workday, 40-hour workweek.

The National Institute for Occupational Safety and Health (NIOSH) recommends that average workplace air levels not exceed 350 milligrams of petroleum distillates per cubic meter of air (350 mg/m^3) for a 40-hour workweek.

The Department of Transportation (DOT) lists fuel oils as hazardous materials and, therefore, regulates their transportation.

Glossary

Carcinogenic: Able to cause cancer.

CAS: Chemical Abstracts Service.

Evaporate: To change into a vapor or a gas.

Hydrocarbon: Any compound made up of hydrogen and carbon.

Milligram (mg): One thousandth of a gram.

ppm: Parts per million.

Sediment: Mud and debris that have settled to the bottom of a body of water.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

LEAD

CAS # 7439-92-1

Division of Toxicology and Environmental Medicine ToxFAQs™ **August 2007**

This fact sheet answers the most frequently asked health questions (FAQs) about lead. For more information, call the ATSDR Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to lead can happen from breathing workplace air or dust, eating contaminated foods, or drinking contaminated water. Children can be exposed from eating lead-based paint chips or playing in contaminated soil. Lead can damage the nervous system, kidneys, and reproductive system. Lead has been found in at least 1,272 of the 1,684 National Priority List sites identified by the Environmental Protection Agency (EPA).

What is lead?

Lead is a naturally occurring bluish-gray metal found in small amounts in the earth's crust. Lead can be found in all parts of our environment. Much of it comes from human activities including burning fossil fuels, mining, and manufacturing.

Lead has many different uses. It is used in the production of batteries, ammunition, metal products (solder and pipes), and devices to shield X-rays. Because of health concerns, lead from paints and ceramic products, caulking, and pipe solder has been dramatically reduced in recent years. The use of lead as an additive to gasoline was banned in 1996 in the United States.

What happens to lead when it enters the environment?

- ❏ Lead itself does not break down, but lead compounds are changed by sunlight, air, and water.
- ❏ When lead is released to the air, it may travel long distances before settling to the ground.
- ❏ Once lead falls onto soil, it usually sticks to soil particles.
- ❏ Movement of lead from soil into groundwater will depend on the type of lead compound and the characteristics of the soil.

How might I be exposed to lead?

- ❏ Eating food or drinking water that contains lead. Water pipes in some older homes may contain lead solder. Lead can leach out into the water.
- ❏ Spending time in areas where lead-based paints have been used and are deteriorating. Deteriorating lead paint can contribute to lead dust.
- ❏ Working in a job where lead is used or engaging in certain hobbies in which lead is used, such as making stained glass.
- ❏ Using health-care products or folk remedies that contain lead.

How can lead affect my health?

The effects of lead are the same whether it enters the body through breathing or swallowing. Lead can affect almost every organ and system in your body. The main target for lead toxicity is the nervous system, both in adults and children. Long-term exposure of adults can result in decreased performance in some tests that measure functions of the nervous system. It may also cause weakness in fingers, wrists, or ankles. Lead exposure also causes small increases in blood pressure, particularly in middle-aged and older people and can cause anemia. Exposure to high lead levels can severely damage the brain and kidneys in adults or children and ultimately cause death. In pregnant women, high levels of exposure to lead may cause miscarriage. High-level exposure in men can damage the organs responsible for sperm production.

How likely is lead to cause cancer?

We have no conclusive proof that lead causes cancer in humans. Kidney tumors have developed in rats and mice that had been given large doses of some kind of lead compounds. The Department of Health and Human Services

(DHHS) has determined that lead and lead compounds are reasonably anticipated to be human carcinogens and the EPA has determined that lead is a probable human carcinogen. The International Agency for Research on Cancer (IARC) has determined that inorganic lead is probably carcinogenic to humans and that there is insufficient information to determine whether organic lead compounds will cause cancer in humans.

How can lead affect children?

Small children can be exposed by eating lead-based paint chips, chewing on objects painted with lead-based paint, or swallowing house dust or soil that contains lead.

Children are more vulnerable to lead poisoning than adults. A child who swallows large amounts of lead may develop blood anemia, severe stomachache, muscle weakness, and brain damage. If a child swallows smaller amounts of lead, much less severe effects on blood and brain function may occur. Even at much lower levels of exposure, lead can affect a child's mental and physical growth.

Exposure to lead is more dangerous for young and unborn children. Unborn children can be exposed to lead through their mothers. Harmful effects include premature births, smaller babies, decreased mental ability in the infant, learning difficulties, and reduced growth in young children. These effects are more common if the mother or baby was exposed to high levels of lead. Some of these effects may persist beyond childhood.

How can families reduce the risks of exposure to lead?

❑ Avoid exposure to sources of lead.

❑ Do not allow children to chew or mouth surfaces that may have been painted with lead-based paint.

❑ If you have a water lead problem, run or flush water that has been standing overnight before drinking or cooking with it.

❑ Some types of paints and pigments that are used as make-up or hair coloring contain lead. Keep these kinds of products away from children

❑ If your home contains lead-based paint or you live in an area contaminated with lead, wash children's hands and faces often to remove lead dusts and soil, and regularly clean the house of dust and tracked in soil.

Is there a medical test to determine whether I've been exposed to lead?

A blood test is available to measure the amount of lead in your blood and to estimate the amount of your recent exposure to lead. Blood tests are commonly used to screen children for lead poisoning. Lead in teeth or bones can be measured by X-ray techniques, but these methods are not widely available. Exposure to lead also can be evaluated by measuring erythrocyte protoporphyrin (EP) in blood samples. EP is a part of red blood cells known to increase when the amount of lead in the blood is high. However, the EP level is not sensitive enough to identify children with elevated blood lead levels below about 25 micrograms per deciliter (μg/dL). These tests usually require special analytical equipment that is not available in a doctor's office. However, your doctor can draw blood samples and send them to appropriate laboratories for analysis.

Has the federal government made recommendations to protect human health?

The Centers for Disease Control and Prevention (CDC) recommends that states test children at ages 1 and 2 years. Children should be tested at ages 3–6 years if they have never been tested for lead, if they receive services from public assistance programs for the poor such as Medicaid or the Supplemental Food Program for Women, Infants, and Children, if they live in a building or frequently visit a house built before 1950; if they visit a home (house or apartment) built before 1978 that has been recently remodeled; and/or if they have a brother, sister, or playmate who has had lead poisoning. CDC considers a blood lead level of 10 μg/dL to be a level of concern for children.

EPA limits lead in drinking water to 15 μg per liter.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

MERCURY
CAS # 7439-97-6

This fact sheet answers the most frequently asked health questions (FAQs) about mercury. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to mercury occurs from breathing contaminated air, ingesting contaminated water and food, and having dental and medical treatments. Mercury, at high levels, may damage the brain, kidneys, and developing fetus. This chemical has been found in at least 714 of 1,467 National Priorities List sites identified by the Environmental Protection Agency.

What is mercury?

(Pronounced mŭr′kyə-rē)

Mercury is a naturally occurring metal which has several forms. The metallic mercury is a shiny, silver-white, odorless liquid. If heated, it is a colorless, odorless gas.

Mercury combines with other elements, such as chlorine, sulfur, or oxygen, to form inorganic mercury compounds or "salts," which are usually white powders or crystals. Mercury also combines with carbon to make organic mercury compounds. The most common one, methylmercury, is produced mainly by microscopic organisms in the water and soil. More mercury in the environment can increase the amounts of methylmercury that these small organisms make.

Metallic mercury is used to produce chlorine gas and caustic soda, and is also used in thermometers, dental fillings, and batteries. Mercury salts are sometimes used in skin lightening creams and as antiseptic creams and ointments.

What happens to mercury when it enters the environment?

- Inorganic mercury (metallic mercury and inorganic mercury compounds) enters the air from mining ore deposits, burning coal and waste, and from manufacturing plants.
- It enters the water or soil from natural deposits, disposal of wastes, and volcanic activity.
- Methylmercury may be formed in water and soil by small organisms called bacteria.
- Methylmercury builds up in the tissues of fish. Larger and older fish tend to have the highest levels of mercury.

How might I be exposed to mercury?

- Eating fish or shellfish contaminated with methylmercury.
- Breathing vapors in air from spills, incinerators, and industries that burn mercury-containing fuels.
- Release of mercury from dental work and medical treatments.
- Breathing contaminated workplace air or skin contact during use in the workplace (dental, health services, chemical, and other industries that use mercury).
- Practicing rituals that include mercury.

How can mercury affect my health?

The nervous system is very sensitive to all forms of mercury. Methylmercury and metallic mercury vapors are more harmful than other forms, because more mercury in these forms reaches the brain. Exposure to high levels of metallic, inorganic, or organic mercury can permanently damage the brain, kidneys, and developing fetus. Effects on brain functioning may result in irritability, shyness, tremors, changes in vision or hearing, and memory problems.

Short-term exposure to high levels of metallic mercury vapors may cause effects including lung damage, nausea,

vomiting, diarrhea, increases in blood pressure or heart rate, skin rashes, and eye irritation.

How likely is mercury to cause cancer?

There are inadequate human cancer data available for all forms of mercury. Mercuric chloride has caused increases in several types of tumors in rats and mice, and methylmercury has caused kidney tumors in male mice. The EPA has determined that mercuric chloride and methylmercury are possible human carcinogens.

How can mercury affect children?

Very young children are more sensitive to mercury than adults. Mercury in the mother's body passes to the fetus and may accumulate there. It can also can pass to a nursing infant through breast milk. However, the benefits of breast feeding may be greater than the possible adverse effects of mercury in breast milk.

Mercury's harmful effects that may be passed from the mother to the fetus include brain damage, mental retardation, incoordination, blindness, seizures, and inability to speak. Children poisoned by mercury may develop problems of their nervous and digestive systems, and kidney damage.

How can families reduce the risk of exposure to mercury?

Carefully handle and dispose of products that contain mercury, such as thermometers or fluorescent light bulbs. Do not vacuum up spilled mercury, because it will vaporize and increase exposure. If a large amount of mercury has been spilled, contact your health department. Teach children not to play with shiny, silver liquids.

Properly dispose of older medicines that contain mercury. Keep all mercury-containing medicines away from children.

Pregnant women and children should keep away from rooms where liquid mercury has been used.

Learn about wildlife and fish advisories in your area from your public health or natural resources department.

Is there a medical test to show whether I've been exposed to mercury?

Tests are available to measure mercury levels in the body. Blood or urine samples are used to test for exposure to metallic mercury and to inorganic forms of mercury. Mercury in whole blood or in scalp hair is measured to determine exposure to methylmercury. Your doctor can take samples and send them to a testing laboratory.

Has the federal government made recommendations to protect human health?

The EPA has set a limit of 2 parts of mercury per billion parts of drinking water (2 ppb).

The Food and Drug Administration (FDA) has set a maximum permissible level of 1 part of methylmercury in a million parts of seafood (1 ppm).

The Occupational Safety and Health Administration (OSHA) has set limits of 0.1 milligram of organic mercury per cubic meter of workplace air (0.1 mg/m^3) and 0.05 mg/m^3 of metallic mercury vapor for 8-hour shifts and 40-hour work weeks.

Nickel - ToxFAQs™

What is Nickel?

Nickel (Ni) is an element and a metal found naturallly in the environment. Nickel is obtained through mining and recycling, and can be found in water, soils, and air. Nickel is mainly used to make stainless steel and used by many other industries in the United States and worldwide. Combining nickel with other metals, such as iron and copper, forms alloys with numerous uses including in medical devices, jewelry, and coins. Nickel compounds are formed when combining nickel with elements like sulfur and oxygen, and are used in nickel plating and batteries. Nickel is also present in foods, drinking water, tobacco products, and e-cigarette liquid.

What happens to nickel in the environment?

- Nickel is released from windblown dusts and from human activities like trash incineration, coal-burning, and oil-burning.
- In air, nickel usually attaches to particles (particulate matter) that may fall to the ground, or be brought down by rain or snow.
- Nickel most often enters water as runoff, and then generally it strongly attaches to soils.
- Certain plants can take up nickel from soils through their roots and accumulate it.
- Nickel is not expected to accumulate in large amounts in fish or other organisms found in water.

Nickel allergy, usually a skin reaction to touching nickel, is estimated to affect 11-16% of the global population.

How can I be exposed to nickel?

- You are mainly exposed to nickel by eating foods or drinking water that contain it, but usually in small amounts.
- You may be exposed when you touch items that contain nickel, such as medical devices or jewelry.
- You may breathe in air that contains small amounts of nickel. You can also breathe in nickel by smoking tobacco or tobacco containing products, or by using electronic cigarettes.
- If you work in an industry that processes or uses nickel, you may have a high exposure to nickel.
- Soils near mines, processing facilities, or waste dumps may be contaminated with nickel.

How can nickel affect my health?

The most common health effect is an allergic reaction in the form of itchy rash (contact dermatitis). This can happen where your skin comes in direct contact with nickel or on another place on your body not directly exposed. Globally, an estimated 11-16% of the population may have allergic skin reactions to nickel. You can develop a sensitivity if you have direct contact with nickel, such as by frequently wearing jewelry containing nickel. You may also experience allergic reactions from eating food, water, or breathing air containing nickel.

Exposure to high amounts of nickel at your job can cause respiratory problems, including asthma if you are allergic. Drinking water that contains high amounts of nickel can cause nausea, diarrhea, vomiting, or cramping, and could potentially negatively affect your kidneys and liver.

In studies on laboratory animals, eating or drinking large amounts of nickel caused lung disease and negatively affected the stomach, blood, liver, kidneys, immune system, reproduction, and development.

Nickel

The U.S. Department of Health and Human Services (HHS) has classified metallic nickel as reasonably anticipated to be a human carcinogen (cancer causing) based on evidence from animal studies. HHS has also classified nickel compounds as known to be a human carcinogen based on evidence in human studies.

The U.S. Environmental Protection Agency (EPA) has classified nickel subsulfide and nickel refinery dust as human carcinogens, based on evidence in human studies. The EPA has not evaluated whether nickel soluble salts are cancer causing.

The International Agency for Research on Cancer (IARC) has determined that nickel compounds and nickel metals are carcinogenic to humans, based on evidence in human and animal studies.

Can I get a medical test to check for nickel?

You can take a blood, urine, or feces test that will measure the amount of nickel in your body. However, these tests will not predict if you will have health problems. These tests are not part of tests routinely done at a doctor's office, but at a special lab. If you think you may have been exposed to high levels of nickel, talk to your doctor, nurse, or health clinic, or call poison control.

How can I protect my family from nickel exposure?

You may eliminate or reduce the risk of an allergic skin reaction by avoiding nickel-containing products and not wearing jewelry containing nickel.

Most people may eat food or drink water that contain low amounts of nickel, which are not usually a cause of concern for health.

If you work with nickel, be sure to wear the necessary protective clothing and equipment and always follow safety procedures, including showering and changing your clothes before you go home each day.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

POLYCYCLIC AROMATIC HYDROCARBONS (PAHs)

Agency for Toxic Substances and Disease Registry ToxFAQs **September 1996**

This fact sheet answers the most frequently asked health questions (FAQs) about polycyclic aromatic hydrocarbons (PAHs). For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Exposure to polycyclic aromatic hydrocarbons usually occurs by breathing air contaminated by wild fires or coal tar, or by eating foods that have been grilled. PAHs have been found in at least 600 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are polycyclic aromatic hydrocarbons?

(Pronounced pŏl′ĭ-sī′klĭk ăr′ə-măt′ĭk hī′drə-kar′bənz)

Polycyclic aromatic hydrocarbons (PAHs) are a group of over 100 different chemicals that are formed during the incomplete burning of coal, oil and gas, garbage, or other organic substances like tobacco or charbroiled meat. PAHs are usually found as a mixture containing two or more of these compounds, such as soot.

Some PAHs are manufactured. These pure PAHs usually exist as colorless, white, or pale yellow-green solids. PAHs are found in coal tar, crude oil, creosote, and roofing tar, but a few are used in medicines or to make dyes, plastics, and pesticides.

What happens to PAHs when they enter the environment?

- PAHs enter the air mostly as releases from volcanoes, forest fires, burning coal, and automobile exhaust.
- PAHs can occur in air attached to dust particles.
- Some PAH particles can readily evaporate into the air from soil or surface waters.
- PAHs can break down by reacting with sunlight and other chemicals in the air, over a period of days to weeks.
- PAHs enter water through discharges from industrial and wastewater treatment plants.
- Most PAHs do not dissolve easily in water. They stick to solid particles and settle to the bottoms of lakes or rivers.
- Microorganisms can break down PAHs in soil or water after a period of weeks to months.
- In soils, PAHs are most likely to stick tightly to particles; certain PAHs move through soil to contaminate underground water.
- PAH contents of plants and animals may be much higher than PAH contents of soil or water in which they live.

How might I be exposed to PAHs?

- Breathing air containing PAHs in the workplace of coking, coal-tar, and asphalt production plants; smokehouses; and municipal trash incineration facilities.
- Breathing air containing PAHs from cigarette smoke, wood smoke, vehicle exhausts, asphalt roads, or agricultural burn smoke.
- Coming in contact with air, water, or soil near hazardous waste sites.
- Eating grilled or charred meats; contaminated cereals, flour, bread, vegetables, fruits, meats; and processed or pickled foods.
- Drinking contaminated water or cow's milk.

- Nursing infants of mothers living near hazardous waste sites may be exposed to PAHs through their mother's milk.

How can PAHs affect my health?

Mice that were fed high levels of one PAH during pregnancy had difficulty reproducing and so did their offspring. These offspring also had higher rates of birth defects and lower body weights. It is not known whether these effects occur in people.

Animal studies have also shown that PAHs can cause harmful effects on the skin, body fluids, and ability to fight disease after both short- and long-term exposure. But these effects have not been seen in people.

How likely are PAHs to cause cancer?

The Department of Health and Human Services (DHHS) has determined that some PAHs may reasonably be expected to be carcinogens.

Some people who have breathed or touched mixtures of PAHs and other chemicals for long periods of time have developed cancer. Some PAHs have caused cancer in laboratory animals when they breathed air containing them (lung cancer), ingested them in food (stomach cancer), or had them applied to their skin (skin cancer).

Is there a medical test to show whether I've been exposed to PAHs?

In the body, PAHs are changed into chemicals that can attach to substances within the body. There are special tests that can detect PAHs attached to these substances in body tissues or blood. However, these tests cannot tell whether any health effects will occur or find out the extent or source of your exposure to the PAHs. The tests aren't usually available in your doctor's office because special equipment is needed to conduct them.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) has set a limit of 0.2 milligrams of PAHs per cubic meter of air (0.2 mg/m^3). The OSHA Permissible Exposure Limit (PEL) for mineral oil mist that contains PAHs is 5 mg/m^3 averaged over an 8-hour exposure period.

The National Institute for Occupational Safety and Health (NIOSH) recommends that the average workplace air levels for coal tar products not exceed 0.1 mg/m^3 for a 10-hour workday, within a 40-hour workweek. There are other limits for workplace exposure for things that contain PAHs, such as coal, coal tar, and mineral oil.

Glossary

Carcinogen: A substance that can cause cancer.

Ingest: Take food or drink into your body.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

POLYCHLORINATED BIPHENYLS

Division of Toxicology ToxFAQs™ **February 2001**

This fact sheet answers the most frequently asked health questions (FAQs) about polychlorinated biphenyls. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Polychlorinated biphenyls (PCBs) are a mixture of individual chemicals which are no longer produced in the United States, but are still found in the environment. Health effects that have been associated with exposure to PCBs include acne-like skin conditions in adults and neurobehavioral and immunological changes in children. PCBs are known to cause cancer in animals. PCBs have been found in at least 500 of the 1,598 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are polychlorinated biphenyls?

Polychlorinated biphenyls are mixtures of up to 209 individual chlorinated compounds (known as congeners). There are no known natural sources of PCBs. PCBs are either oily liquids or solids that are colorless to light yellow. Some PCBs can exist as a vapor in air. PCBs have no known smell or taste. Many commercial PCB mixtures are known in the U.S. by the trade name Aroclor.

PCBs have been used as coolants and lubricants in transformers, capacitors, and other electrical equipment because they don't burn easily and are good insulators. The manufacture of PCBs was stopped in the U.S. in 1977 because of evidence they build up in the environment and can cause harmful health effects. Products made before 1977 that may contain PCBs include old fluorescent lighting fixtures and electrical devices containing PCB capacitors, and old microscope and hydraulic oils.

What happens to PCBs when they enter the environment?

❑ PCBs entered the air, water, and soil during their manufacture, use, and disposal; from accidental spills and leaks during their transport; and from leaks or fires in products containing PCBs.

❑ PCBs can still be released to the environment from hazardous waste sites; illegal or improper disposal of industrial wastes and consumer products; leaks from old electrical transformers containing PCBs; and burning of some wastes in incinerators.

❑ PCBs do not readily break down in the environment and thus may remain there for very long periods of time. PCBs can travel long distances in the air and be deposited in areas far away from where they were released. In water, a small amount of PCBs may remain dissolved, but most stick to organic particles and bottom sediments. PCBs also bind strongly to soil.

❑ PCBs are taken up by small organisms and fish in water. They are also taken up by other animals that eat these aquatic animals as food. PCBs accumulate in fish and marine mammals, reaching levels that may be many thousands of times higher than in water.

How might I be exposed to PCBs?

❑ Using old fluorescent lighting fixtures and electrical devices and appliances, such as television sets and refrigerators, that were made 30 or more years ago. These items may leak small amounts of PCBs into the air when they get hot during operation, and could be a source of skin exposure.

❑ Eating contaminated food. The main dietary sources of PCBs are fish (especially sportfish caught in contaminated lakes or rivers), meat, and dairy products.

❑ Breathing air near hazardous waste sites and drinking contaminated well water.

❑ In the workplace during repair and maintenance of PCB transformers; accidents, fires or spills involving transformers, fluorescent lights, and other old electrical devices; and disposal of PCB materials.

How can PCBs affect my health?

The most commonly observed health effects in people exposed to large amounts of PCBs are skin conditions such as acne and rashes. Studies in exposed workers have shown changes in blood and urine that may indicate liver damage. PCB exposures in the general population are not likely to result in skin and liver effects. Most of the studies of health effects of PCBs in the general population examined children of mothers who were exposed to PCBs.

Animals that ate food containing large amounts of PCBs for short periods of time had mild liver damage and some died. Animals that ate smaller amounts of PCBs in food over several weeks or months developed various kinds of health effects, including anemia; acne-like skin conditions; and liver, stomach, and thyroid gland injuries. Other effects

of PCBs in animals include changes in the immune system, behavioral alterations, and impaired reproduction. PCBs are not known to cause birth defects.

How likely are PCBs to cause cancer?

Few studies of workers indicate that PCBs were associated with certain kinds of cancer in humans, such as cancer of the liver and biliary tract. Rats that ate food containing high levels of PCBs for two years developed liver cancer. The Department of Health and Human Services (DHHS) has concluded that PCBs may reasonably be anticipated to be carcinogens. The EPA and the International Agency for Research on Cancer (IARC) have determined that PCBs are probably carcinogenic to humans.

How can PCBs affect children?

Women who were exposed to relatively high levels of PCBs in the workplace or ate large amounts of fish contaminated with PCBs had babies that weighed slightly less than babies from women who did not have these exposures. Babies born to women who ate PCB-contaminated fish also showed abnormal responses in tests of infant behavior. Some of these behaviors, such as problems with motor skills and a decrease in short-term memory, lasted for several years. Other studies suggest that the immune system was affected in children born to and nursed by mothers exposed to increased levels of PCBs. There are no reports of structural birth defects caused by exposure to PCBs or of health effects of PCBs in older children. The most likely way infants will be exposed to PCBs is from breast milk. Transplacental transfers of PCBs were also reported In most cases, the benefits of breast-feeding outweigh any risks from exposure to PCBs in mother's milk.

How can families reduce the risk of exposure to PCBs?

❑ You and your children may be exposed to PCBs by eating fish or wildlife caught from contaminated locations. Certain states, Native American tribes, and U.S. territories have issued advisories to warn people about PCB-contaminated fish and fish-eating wildlife. You can reduce your family's exposure to PCBs by obeying these advisories.

❑ Children should be told not play with old appliances, electrical equipment, or transformers, since they may contain PCBs.

❑ Children should be discouraged from playing in the dirt near hazardous waste sites and in areas where there was a transformer fire. Children should also be discouraged from eating dirt and putting dirty hands, toys or other objects in their mouths, and should wash hands frequently.

❑ If you are exposed to PCBs in the workplace it is possible to carry them home on your clothes, body, or tools. If this is the case, you should shower and change clothing before leaving work, and your work clothes should be kept separate from other clothes and laundered separately.

Is there a medical test to show whether I've been exposed to PCBs?

Tests exist to measure levels of PCBs in your blood, body fat, and breast milk, but these are not routinely conducted. Most people normally have low levels of PCBs in their body because nearly everyone has been environmentally exposed to PCBs. The tests can show if your PCB levels are elevated, which would indicate past exposure to above-normal levels of PCBs, but cannot determine when or how long you were exposed or whether you will develop health effects.

Has the federal government made recommendations to protect human health?

The EPA has set a limit of 0.0005 milligrams of PCBs per liter of drinking water (0.0005 mg/L). Discharges, spills or accidental releases of 1 pound or more of PCBs into the environment must be reported to the EPA. The Food and Drug Administration (FDA) requires that infant foods, eggs, milk and other dairy products, fish and shellfish, poultry and red meat contain no more than 0.2-3 parts of PCBs per million parts (0.2-3 ppm) of food. Many states have established fish and wildlife consumption advisories for PCBs.

Tetrachloroethylene - ToxFAQs™

CAS # 127-18-4

This fact sheet answers the most frequently asked health questions (FAQs) about tetrachloroethylene. For more information, call the ATSDR Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Tetrachloroethylene is a manufactured chemical used for dry cleaning and metal degreasing and in the aerospace industry. Exposure to very high concentrations of tetrachloroethylene can cause dizziness headaches, sleepiness, incoordination confusion, nausea, unconsciousness, and even death. Tetrachloroethylene has been found in at least 949 of the 1,854 National Priorities List sites identified by U.S. Environmental Protection Agency (EPA).

What is tetrachloroethylene?

Tetrachloroethylene is a nonflammable colorless liquid. Other names for tetrachloroethylene include perchloroethylene, PCE, perc, tetrachloroethene, and perchlor. Most people can smell tetrachloroethylene when it is present in the air at a level of 1 part in 1 million parts of air (1 ppm) or more.

Tetrachloroethylene is used as a dry cleaning agent and metal degreasing solvent. It is also used as a starting material (building block) for making other chemicals and is used in some consumer products.

What happens to tetrachloroethylene when it enters the environment?

- Tetrachloroethylene can be released into air, water, and soil at places where it is produced or used.
- Tetrachloroethylene breaks down very slowly in the air and so it can be transported long distances in the air. Half of the amount in the air will degrade in approximately 100 days.
- Tetrachloroethylene evaporates quickly from water into air. It is generally slow to break down in water.
- Tetrachloroethylene may evaporate quickly from shallow soils or may filter through the soil and into the groundwater below. It is generally slow to break down in soil.

How might I be exposed to tetrachloroethylene?

- When you bring clothes from the dry cleaners, they will release small amounts of tetrachloroethylene into the air.
- When you drink water containing tetrachloroethylene, you are exposed to it. You might also be exposed to tetrachloroethylene that is released into the air during showering and bathing.
- People residing near contaminated sites or dry cleaning locations may be exposed to higher levels than the general population.
- People working in the dry cleaning industries or using metal degreasing products may be exposed to elevated levels of tetrachloroethylene.

How can tetrachloroethylene affect my health?

Breathing high levels of tetrachloroethylene for a brief period may cause dizziness or drowsiness, headache, and incoordination; higher levels may cause unconsciousness and even death.

Exposure for longer periods to low levels of tetrachloroethylene may cause changes in mood, memory, attention, reaction time, and vision.

Studies in animals exposed to tetrachloroethylene have shown liver and kidney effects, and changes in brain chemistry, but we do not know what these findings mean for humans.

Tetrachloroethylene

CAS # 127-18-4

How likely is tetrachloroethylene to cause cancer?

Studies in humans suggest that exposure to tetrachloroethylene might lead to a higher risk of getting bladder cancer, multiple myeloma, or non-Hodgkin's lymphoma.

In animals, tetrachloroethylene has been shown to cause cancers of the liver, kidney, and blood system.

The Department of Health and Human Services (DHHS) considers tetrachloroethylene to be reasonably anticipated to be a human carcinogen. EPA considers tetrachloroethylene likely to be carcinogenic to humans by all routes of exposure. The International Agency for Research on Cancer (IARC) considers tetrachloroethylene probably carcinogenic to humans.

How can tetrachloroethylene affect children?

It is not known whether children are more susceptible than adults to the effects of tetrachloroethylene.

A few studies in humans have suggested that exposure to tetrachloroethylene increased the numbers of babies with birth defects, but these studies were not large enough to clearly answer the question. Studies in animals exposed by inhalation or stomach tube have not shown clear evidence of specific birth defects.

How can families reduce the risk of exposure to tetrachloroethylene?

- Tetrachloroethylene has been found in low levels in some food. You can minimize the risk of your family's exposure by peeling and thoroughly washing fruits and vegetables before cooking.
- Use bottled water if you have concerns about the presence of tetrachloroethylene in your tap water. You may also contact local drinking water authorities and follow their advice.
- Prevent children from playing in dirt or eating dirt if you live near a waste site that has tetrachloroethylene.
- Tetrachloroethylene is widely used as a scouring solvent that removes oils from fabrics, as a carrier solvent, as a fabric finish or water repellant, and as a metal degreaser/cleaner. Follow instructions on product labels to minimize exposure to tetrachloroethylene.

Is there a medical test to determine whether I've been exposed to tetrachloroethylene?

Tetrachloroethylene and its breakdown products (metabolites) can be measured in blood and urine. However, the detection of tetrachloroethylene or its metabolites cannot predict the kind of health effects that might develop from that exposure. Because tetrachloroethylene and its metabolites leave the body fairly rapidly, the tests need to be conducted within days after exposure.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) has set an 8-hour time weighted average permissible exposure limit of 100 ppm, an acceptable ceiling exposure limit of 200 ppm, and a maximum peak of 300 ppm (not to be exceeded for more than 5 minutes of any 3-hour period).

The National Institute for Occupational Safety and Health (NIOSH) recommends that workplace exposure to tetrachloroethylene be minimized due to concerns about its carcinogenicity.

Trichloroethylene - ToxFAQs™

CAS # 79-01-6

This fact sheet answers the most frequently asked health questions (FAQs) about trichloroethylene. For more information, call the ATSDR Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Trichloroethylene is used as a solvent for cleaning metal parts. Exposure to very high concentrations of trichloroethylene can cause dizziness headaches, sleepiness, incoordination, confusion, nausea, unconsciousness, and even death. Trichloroethylene has been found in at least 1,051 of the 1,854 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is trichloroethylene?

Trichloroethylene is a colorless, volatile liquid. Liquid trichloroethylene evaporates quickly into the air. It is nonflammable and has a sweet odor.

The two major uses of trichloroethylene are as a solvent to remove grease from metal parts and as a chemical that is used to make other chemicals, especially the refrigerant, HFC-134a.

What happens to trichloroethylene when it enters the environment?

- Trichloroethylene can be released to air, water, and soil at places where it is produced or used.
- Trichloroethylene is broken down quickly in air.
- Trichloroethylene breaks down very slowly in soil and water and is removed mostly through evaporation to air.
- It is expected to remain in groundwater for long time since it is not able to evaporate.
- Trichloroethylene does not build up significantly in plants or animals.

How might I be exposed to trichloroethylene?

- Breathing trichloroethylene in contaminated air.
- Drinking contaminated water.
- Workers at facilities using this substance for metal degreasing are exposed to higher levels of trichloroethylene.
- If you live near such a facility or near a hazardous waste site containing trichloroethylene, you may also have higher exposure to this substance.

How can trichloroethylene affect my health?

Trichloroethylene was once used as an anesthetic for surgery. Exposure to moderate amounts of trichloroethylene may cause headaches, dizziness, and sleepiness; large amounts may cause coma and even death. Eating or breathing high levels of trichloroethylene may damage some of the nerves in the face. Exposure to high levels can also result in changes in the rhythm of the heartbeat, liver damage, and evidence of kidney damage. Skin contact with concentrated solutions of trichloroethylene can cause skin rashes. There is some evidence exposure to trichloroethylene in the work place may cause scleroderma (a systemic autoimmune disease) in some people. Some men occupationally-exposed to trichloroethylene and other chemicals showed decreases in sex drive, sperm quality, and reproductive hormone levels.

How likely is trichloroethylene to cause cancer?

There is strong evidence that trichloroethylene can cause kidney cancer in people and some evidence for trichloroethylene-induced liver cancer and malignant lymphoma. Lifetime exposure to trichloroethylene resulted in increased liver cancer in mice and increased kidney cancer and testicular cancer in rats.

The Department of Health and Human Services (DHHS) considers trichloroethylene to be a known human carcinogen. The International Agency for Research on Cancer (IARC) classified trichloroethylene as carcinogenic to humans. The EPA has characterized trichloroethylene as carcinogenic to humans by all routes of exposure.

Trichloroethylene

CAS # 79-01-6

How can trichloroethylene affect children?

It is not known whether children are more susceptible than adults to the effects of trichloroethylene.

Some human studies indicate that trichloroethylene may cause developmental effects such as spontaneous abortion, congenital heart defects, central nervous system defects, and small birth weight. However, these people were exposed to other chemicals as well.

In some animal studies, exposure to trichloroethylene during development caused decreases in body weight, increases in heart defects, changes to the developing nervous system, and effects on the immune system.

How can families reduce the risk of exposure to trichloroethylene?

- Avoid drinking water from sources that are known to be contaminated with trichloroethylene. Use bottled water if you have concerns about the presence of chemicals in your tap water. You may also contact local drinking water authorities and follow their advice.
- Prevent children from playing in dirt or eating dirt if you live near a waste site that has trichloroethylene.
- Trichloroethylene is used in many industrial products. Follow instructions on product labels to minimize exposure to trichloroethylene.

Is there a medical test to determine whether I've been exposed to trichloroethylene?

Trichloroethylene and its breakdown products (metabolites) can be measured in blood and urine. However, the detection of trichloroethylene or its metabolites cannot predict the kind of health effects that might develop from that exposure. Because trichloroethylene and its metabolites leave the body fairly rapidly, the tests need to be conducted within days after exposure.

Has the federal government made recommendations to protect human health?

The EPA set a maximum contaminant goal (MCL) of 0.005 milligrams per liter (mg/L; 5 ppb) as a national primary drinking standard for trichloroethylene.

The Occupational Safety and Health Administration (OSHA) set a permissible exposure limit (PEL) of 100 ppm for trichloroethylene in air averaged over an 8-hour work day, an acceptable ceiling concentration of 200 ppm provided the 8 hour PEL is not exceeded, and an acceptable maximum peak of 300 ppm for a maximum duration of 5 minutes in any 2 hours.

The National Institute for Occupational Safety and Health (NIOSH) considers trichloroethylene to be a potential occupational carcinogen and established a recommended exposure limit (REL) of 2 ppm (as a 60-minute ceiling) during its use as an anesthetic agent and 25 ppm (as a 10-hour TWA) during all other exposures.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

ZINC
CAS # 7440-66-6

Division of Toxicology ToxFAQs™ **August 2005**

This fact sheet answers the most frequently asked health questions (FAQs) about zinc. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Zinc is a naturally occurring element. Exposure to high levels of zinc occurs mostly from eating food, drinking water, or breathing workplace air that is contaminated. Low levels of zinc are essential for maintaining good health. Exposure to large amounts of zinc can be harmful. It can cause stomach cramps, anemia, and changes in cholesterol levels. Zinc has been found in at least 985 of the 1,662 National Priority List sites identified by the Environmental Protection Agency (EPA).

What is zinc?

Zinc is one of the most common elements in the earth's crust. It is found in air, soil, and water, and is present in all foods. Pure zinc is a bluish-white shiny metal.

Zinc has many commercial uses as coatings to prevent rust, in dry cell batteries, and mixed with other metals to make alloys like brass, and bronze. A zinc and copper alloy is used to make pennies in the United States.

Zinc combines with other elements to form zinc compounds. Common zinc compounds found at hazardous waste sites include zinc chloride, zinc oxide, zinc sulfate, and zinc sulfide. Zinc compounds are widely used in industry to make paint, rubber, dyes, wood preservatives, and ointments.

What happens to zinc when it enters the environment?

❏ Some is released into the environment by natural processes, but most comes from human activities like mining, steel production, coal burning, and burning of waste.
❏ It attaches to soil, sediments, and dust particles in the air.
❏ Rain and snow remove zinc dust particles from the air.
❏ Depending on the type of soil, some zinc compounds can move into the groundwater and into lakes, streams, and rivers.
❏ Most of the zinc in soil stays bound to soil particles and does not dissolve in water.
❏ It builds up in fish and other organisms, but it does not build up in plants.

How might I be exposed to zinc?

❏ Ingesting small amounts present in your food and water.
❏ Drinking contaminated water or a beverage that has been stored in metal containers or flows through pipes that have been coated with zinc to resist rust.
❏ Eating too many dietary supplements that contain zinc.
❏ Working on any of the following jobs: construction, painting, automobile mechanics, mining, smelting, and welding; manufacture of brass, bronze, or other zinc-containing alloys; manufacture of galvanized metals; and manufacture of machine parts, rubber, paint, linoleum, oilcloths, batteries, some kind of glass, ceramics, and dyes.

How can zinc affect my health?

Zinc is an essential element in our diet. Too little zinc can cause problems, but too much zinc is also harmful.

Harmful effects generally begin at levels 10-15 times higher than the amount needed for good health. Large doses taken by mouth even for a short time can cause stomach cramps, nausea, and vomiting. Taken longer, it can cause anemia and decrease the levels of your good cholesterol. We do not know if high levels of zinc affect reproduction in humans. Rats that were fed large amounts of zinc became infertile.

Inhaling large amounts of zinc (as dusts or fumes) can cause a specific short-term disease called metal fume fever. We do not know the long-term effects of breathing high levels of zinc.

Putting low levels of zinc acetate and zinc chloride on the skin of rabbits, guinea pigs, and mice caused skin irritation. Skin irritation will probably occur in people.

How likely is zinc to cause cancer?

The Department of Health and Human Services (DHHS) and the International Agency for Research on Cancer (IARC) have not classified zinc for carcinogenicity. Based on incomplete information from human and animal studies, the EPA has determined that zinc is not classifiable as to its human carcinogenicity.

How can zinc affect children?

Zinc is essential for proper growth and development of young children. It is likely that children exposed to very high levels of zinc will have similar effects as adults. We do not know whether children are more susceptible to the effects of excessive intake of zinc than the adults.

We do not know if excess zinc can cause developmental effects in humans. Animal studies have found decreased weight in the offspring of animals that ingested very high amounts of zinc.

How can families reduce the risks of exposure to zinc?

❑ Children living near waste sites that contain zinc may be exposed to higher levels of zinc through breathing contaminated air, drinking contaminated drinking water, touching or eating contaminated soil.

❑ Discourage your children from eating soil or putting their hands in their mouths and teach them to wash their hands frequently and before eating.

❑ If you use medicines or vitamin supplements containing zinc, make sure you use them appropriately and keep them out of the reach of children.

Is there a medical test to determine whether I've been exposed to zinc?

There are tests available to measure zinc in your blood, urine, hair, saliva, and feces. These tests are not usually done in the doctor's office because they require special equipment. High levels of zinc in the feces can mean high recent zinc exposure. High levels of zinc in the blood can mean high zinc consumption and/or high exposure. Tests to measure zinc in hair may provide information on long-term zinc exposure; however, the relationship between levels in your hair and the amount of zinc you were exposed to is not clear.

Has the federal government made recommendations to protect human health?

The EPA recommends that drinking water should contain no more than 5 milligrams per liter of water (5 mg/L) because of taste. The EPA requires that any release of 1,000 pounds (or in some cases 5,000 pounds) into the environment be reported to the agency.

To protect workers, the Occupational Safety and Health Administration (OSHA) has set an average limit of 1 mg/m^3 for zinc chloride fumes and 5 mg/m^3 for zinc oxide (dusts and fumes) in workplace air during an 8-hour workday, 40-hour workweek.

Similarly, the National Institute for Occupational Safety and Health (NIOSH) has set the same standards for up to a 10-hour workday over a 40-hour workweek.

REPORT FORMS

WEEKLY SAFETY REPORT FORM

Week Ending: _____ Project Name/Number: _____

Report Date: _____ Project Manager Name: _____

Summary of any violations of procedures occurring that week:

_____

_____

_____

Summary of any job related injuries, illnesses, or near misses that week:

_____

_____

_____

_____

Summary of air monitoring data that week (include and sample analyses, action levels exceeded, and actions taken):

_____

_____

_____

Comments:

_____

_____

_____

Name: _____ Company: _____

Signature: _____ Title: _____

INCIDENT REPORT FORM

Date of Report: _____

Injured: _____

Employer: _____

Site: _____ Site Location: _____

Report Prepared By: _____ _____
Signature Title

ACCIDENT/INCIDENT CATEGORY (check all that applies)

___Injury	___ Illness	___ Near Miss
__ Property Damage	___ Fire	___ Chemical Exposure
__ On-site Equipment	___ Motor Vehicle	___ Electrical
__ Mechanical	___ Spill	___ Other

DATE AND TIME OF ACCIDENT/INCIDENT: Narrative report of Accident/Incident: Identify: 1) actions leading to or contributing to the accident/incident; 2) the accident/incident occurrence; and 3) actions following the accident/incident.

CHASP APPENDIX C

EMERGENCY HAND SIGNALS

EMERGENCY SIGNALS

In most cases, field personnel will carry portable radios for communication. If this is the case, a transmission that indicates an emergency will take priority over all other transmissions. All other site radios will yield the frequency to the emergency transmissions.

Where radio communications is not available, the following air-horn and/or hand signals will be used:

EMERGENCY HAND SIGNALS

OUT OF AIR, CAN'T BREATH!

Hand gripping throat

LEAVE AREA IMMEDIATELY, NO DEBATE!

(No Picture) Grip partner's wrist or place both hands around waist

NEED ASSISTANCE!

Hands on top of head

OKAY! – I'M ALL RIGHT!

- I UNDERSTAND!

Thumbs up

NO! - NEGATIVE!

Thumbs down
