From: STV, Incorporated
Date: **August 30, 2023**
Project: Bronx Metro-North Station Study EIS
Reference: Transportation Planning Factors and Travel Demand Forecast

---

This memorandum summarizes the transportation planning factors to be used for the analyses of traffic, parking, transit, and pedestrian conditions for the *Bronx Metro-North Station Study EIS*. Estimates of the peak travel demand for the Proposed Actions' reasonable worst-case development scenario (RWCDS) are provided, along with a discussion of trip assignment and study area definitions.

PROPOSED ACTIONS

The Department of City Planning (DCP) is proposing a series of land use actions (the "Proposed Actions") that would facilitate the implementation of a multi-year planning process conducted in the Parkchester, Van Nest, and Morris Park neighborhoods in the Bronx in partnership with local stakeholders. The Proposed Actions would affect an approximately 46-block area primarily along major corridors — East Tremont Avenue, White Plains Road, Bronxdale Avenue, Eastchester Road, and Stillwell Avenue — near the future Parkchester/Van Nest and Morris Park Metro-North stations in Bronx Community Districts 9, 10 and 11 (the "Project Area"). The approximately 28-block area closest to the future Parkchester/Van Nest station is generally bound by Baker Avenue and Van Nest Avenue to the north, Silver Street to the east, East Tremont Avenue to the south, and St. Lawrence Avenue to the west. The approximately 18-block area closest to the future Morris Park station is generally bound by Pelham Parkway to the north, Marconi Street to the east, Williamsbridge Road to the south, and Tenbroeck Avenue to the west.

The Proposed Actions are intended to leverage new planned Metro-North service to promote economic growth, facilitate the development of housing, including affordable housing, as well as guide investment in the public realm around stations, encouraging safety and comfort.

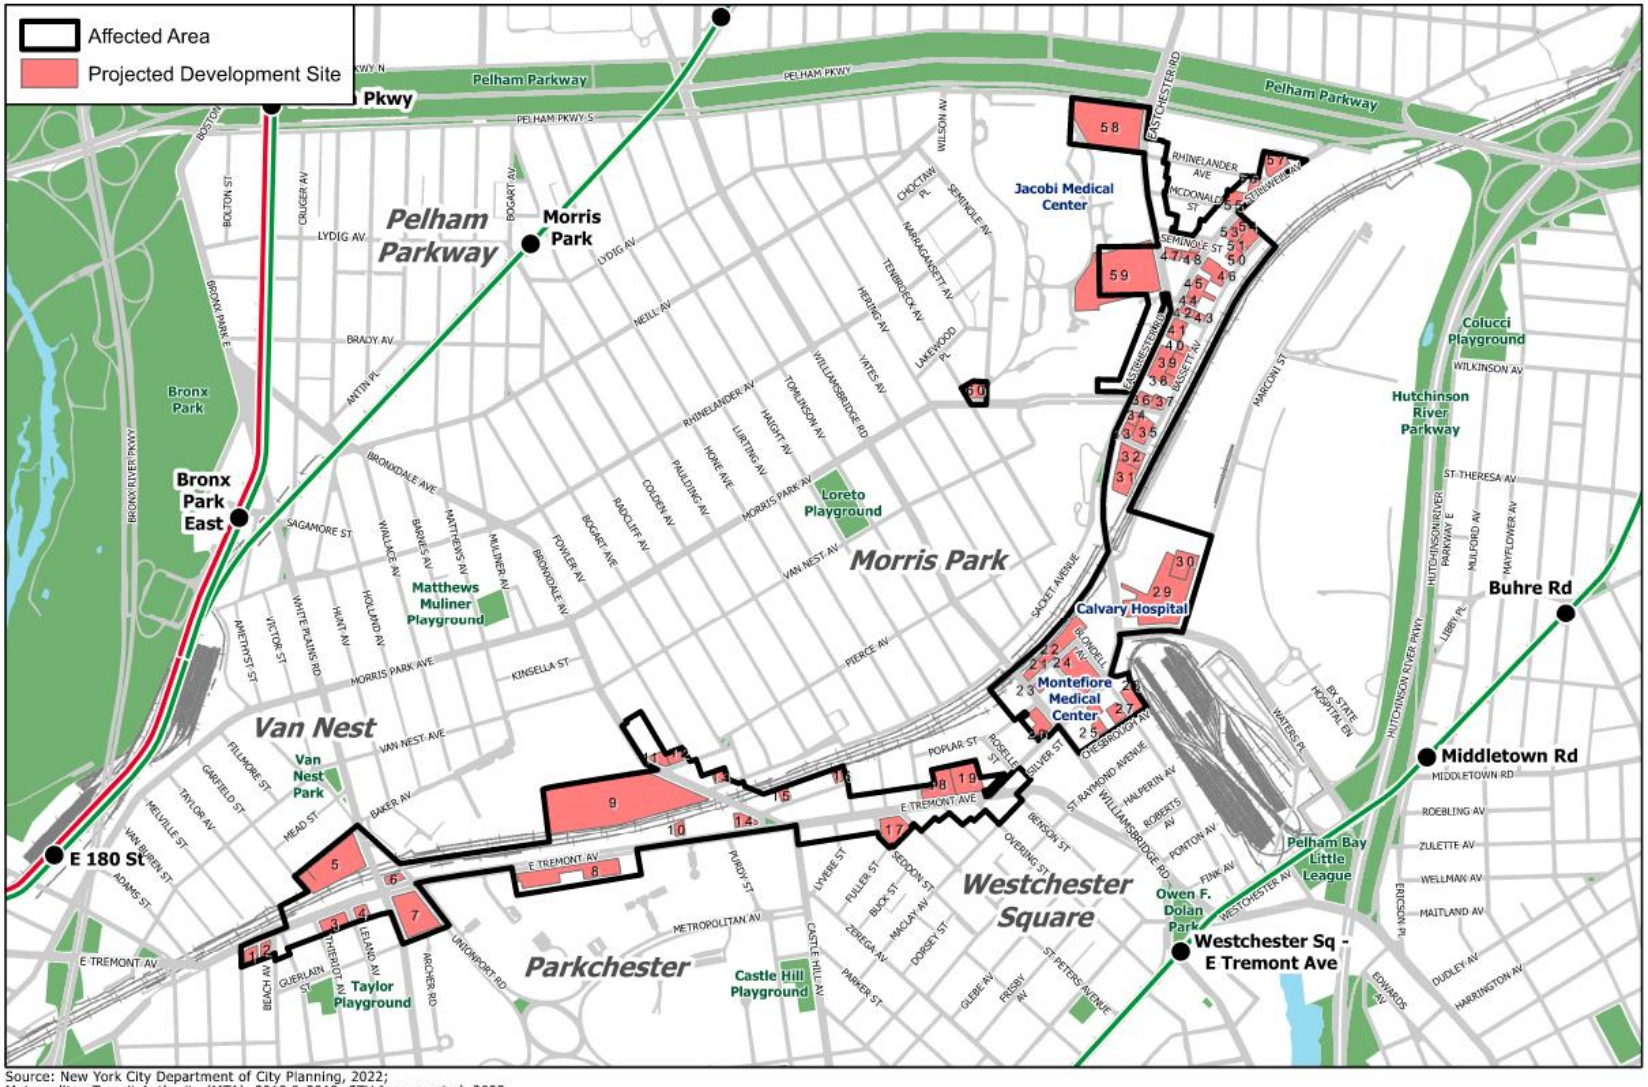

THE REASONABLE WORST CASE DEVELOPMENT SCENARIO

A RWCDS for both "future without the proposed actions" (Without-Action) and "future with the proposed actions" (With-Action) conditions is analyzed for an analysis year of 2033 in order to assess the potential effects of the Proposed Actions. Likely development sites were identified and divided into two categories: projected development sites and potential development sites to develop a reasonable estimate of future growth. The projected development sites are those considered more likely to be developed within the ten-year analysis period for the Proposed Actions (i.e., by the 2033 analysis year), while potential sites are considered less likely to be developed over the same period. Only projected development sites are

considered for the purposes of the transportation analyses. A total of 60 projected development sites were identified and are considered for the purposes of the transportation analyses (see **Figure 1**). **Table 1** lists the total anticipated Without-Action and With-Action land uses on projected development sites that were assumed for the purposes of the transportation analyses.

Table 1: 2033 RWCDS Without-Action and With-Action Land Uses

Land Use	Without-Action Condition	With-Action Condition	Net Increment
Residential			
Residential	239 DU	7,713 DU	7,474 DU

RWCDS PROJECTED DEVELOPMENT SITES

Bronx Metro-North Station Study

TRANSPORTATION PLANNING FACTORS

The transportation planning factors used to forecast the travel demand that would be generated by the Without-Action and With-Action land uses for each projected development site are listed in **Table 2** and discussed below. These values were primarily based on those cited in the 2021 *City Environmental Quality Review (CEQR) Technical Manual*, factors developed for recent environmental reviews, American Community Survey (ACS) journey-to-work 5-year (2013-2017) data, AASHTO CTPP reverse journey-to-work 5-year (2012-2016) data, and data from other standard professional references. Factors are shown for the weekday AM and PM peak hours (typical peak periods for commuter travel demand) and the weekday midday and Saturday peak hours (typical peak periods for retail demand).

Residential

The residential person trip and truck trip generation rates, temporal distributions, and directional in/out splits are based on recent trip generation survey data from NYCDOT and the latest *ITE Trip Generation Manual*. Modal split data was received from NYCDOT based on previously approved EIS's in the Bronx. Vehicle occupancies were based on data from the 2013-2017 5-year ACS journey-to-work data for census tracts encompassing the Bronx Metro-North Station Study Area (Bronx Census Tracts 200, 204, 210.01, 216.01, 216.02, 238, 240, 244, 256, 284, 286, and 296).

It is noted that ACS vehicle occupancy data reflect the average vehicle occupancy for personal auto trips to and from work, and therefore do not present the complete picture of average vehicle occupancy for other purposes (e.g., shopping, errands, social and recreational activities, school trips, etc.). In general, vehicle occupancy rates for non-work-related trips have been found to be higher than vehicle occupancy rates for work-related trips. As documented in the *East New York Rezoning* EIS, both national data from USDOT-FHWA's *Summary of Travel Trends: 2009 National Household Travel Survey* and regional data from the *Regional Travel-Household Interview Survey* prepared for the New York Metropolitan Transportation Council and the North Jersey Transportation Planning Authority indicate that average vehicle occupancy rates for all auto trips are more than 1.4 times the average vehicle occupancy rates for auto trips to and from work. As such, the weekday AM/PM peak hour vehicle occupancy rates derived from the ACS data are adjusted by a multiplicative factor of 1.4 for the weekday midday and Saturday peak hours to reflect the predominance of non-work-related trips during these periods. While not all AM and PM peak hour trips are work-related, the lower vehicle occupancy rates for trips to and from work are conservatively applied to all auto trips in these peak travel hours.

Residential-based trips in the weekday midday and Saturday peak hours more likely would be local, compared to non-local trips made during the commuter peak hours (and local trips would be expected to have a higher walk share, for example). However, modal splits based on the ACS journey-to-work data are conservatively assumed for all periods.

Retail

The trip generation rates and directional in/out splits for local retail uses were based on data from the *CEQR Technical Manual*. The temporal distribution, modal split, and vehicle occupancy rates for local retail is based on recent trip generation survey data from NYCDOT and the latest *ITE Trip Generation Manual.* Truck trip generation rates and temporal distributions were based on data from the *CEQR Technical Manual*. To reflect the scale of the affected area, it was assumed for the purposes of the travel demand forecast that 50 percent of all local retail trips would be linked trips.

Non-Retail Commercial Uses

Non-retail commercial land use in the rezoning area include office and life sciences. As listed in **Table 2**, the trip generation, directional in/out splits, and truck trip generation factors used for the office land use reflect those cited in the *CEQR Technical Manual.* The temporal distribution for office land use were based on recent trip generation survey data from NYCDOT and the latest *ITE Trip Generation Manual.* The modal split is based on previously approved EIS's in the Bronx. The travel demand factors for the life science land use were based on an NYCDOT survey of a NYC research laboratory facility.

Community Facility

The community facility land uses in the rezoning area include medical office, house of worship, and schools. The factors used to forecast the trip generation for the medical office reflect those cited in the *CEQR Technical Manual* and based on data provided by NYCDCP. The house of worship and community center trip generation factors were based on the 2016 *East New York Rezoning FEIS* and the 2017 *Jerome Avenue Rezoning FEIS*, respectively. It is conservatively assumed that an educational facility would develop on two projected development sites. Site 9 is projected to be a primary school. The trip generation rates and temporal distribution for school students, parents, and staff were based on the *CEQR Technical Manual*. The relation of school square footage to number of students and staff was based on New York City School Construction Authority Studies. The modal split for students was based on data provided by NYCDOT. The parent mode split was based on a proposed primary school at 160 Van Cortlandt Park South in the Bronx. The modal splits for school staff were based on AASHTO CTPP reverse journey-to-work data for workers in the census tracts encompassing the Rezoning Area. Site 59 is projected to be a STEAM (Science, Technology, Engineering, Arts & Math) Center. The factors used to determine the trip generation of the STEAM Center at site 9 are based on the *2018 Brooklyn Navy Yard EAS,* including the relation of center square footage to number of students and staff.

Industrial

Industrial land uses in the rezoning area include light industrial, warehouse, and auto repair. The trip generation rates for the light industrial land use was based on data from the *2016 East New York Rezoning Proposal FEIS.* Trip generation, in/out splits, and temporal distribution for the warehouse land use were

based on recent trip generation survey data from NYCDOT and the latest *ITE Trip Generation Manual,* except for the modal split which was based on the 2012-2016 AASHTO CTPP reverse journey-to-work data for workers in the census tracts encompassing the Rezoning Area. The auto repair trip generation factors were based on the 2017 *Jerome Avenue Rezoning FEIS*.

Table 2 (continued): Transportation Planning Factors

Notes:

(1) Based on data from *City Environmental Quality Review (CEQR) Technical Manual,* 2021.
(2) Based on NYCDOT recent trip generation survey data and the latest *ITE Trip Generation Manual.*
(3) Based on NYCDOT recommended modal split from previously approved EIS in the Bronx.
(4) Based on American Community Survey journey-to-work 5-Year (2015-2019) data for Bronx Census Tracts 200, 204, 210.01, 216.01, 216.02, 218, 238, 240, 244, 256, 284, and 296.
(5) Based on data from the *East New York Rezoning Proposal FEIS,* 2016.
(6) Based on NYCDOT citywide survey data for local retail mode choice.
(7) Based on AASHTO CTPP reverse journey-to-work 5-Year (2012-2016) data for Bronx Census Tracts 200, 204, 210.01, 216.01, 216.02, 218, 238, 240, 244, 256, 284, and 296.
(8) For medical offices larger than 15,000 sf, the weekday trip generation should be determined using the equation: 66.626x+141.77(x=size of gsf in 1,000 sf).
(9) Based on NYCDOT's Survey for Medical Office.
(10) Based on data from the *Jerome Avenue Rezoning FEIS,* 2017.
(11) The number of students is established from the square footage of the school size to student ratio based on NYC School Construction Authority studies.
(12) The modal split of the school for parents is based on a proposed primary school at 160 Van Cortlandt Park South in the Bronx.
(13) Based on NYCDOT provided rates from survey of an NYC research laboratory facility.
(14) Based on data from the *Brooklyn Navy Yard EAS,* 2018.
(15) Based on data provided by NYCDOT. Student auto and school bus trips are expected to make a complete in and out trip cycle in the peak hour.

TRIP GENERATION

The person and vehicle trips expected to result from the Proposed Actions are expressed as an "incremental change" or "net change" in trips. This incremental change is calculated by comparing the estimated numbers of trips resulting from the Proposed Actions (in the 2033 analysis year) to the numbers of trips estimated to be occurring in the vicinity of the rezoning area without the Proposed Actions. Trips are calculated based on the transportation planning factors shown previously in **Table 2**.

Table 3, "RWCDS Travel Demand Forecast," lists the estimate of the net incremental change in peak-hour person trips and vehicle trips, respectively (as compared to conditions in the area without the Proposed Actions) that would occur in 2033 with implementation of the Proposed Actions.

The Proposed Actions would be expected to generate a net increase of approximately 18,945 person trips in the weekday AM peak hour, 19,888 person trips in the weekday midday, 17,724 person trips in the weekday PM peak hour, and 18,759 person trips in the Saturday midday peak hour. These person trips can be translated into modal trip "types" for the entire study area as follows:

- Peak hour vehicle trips (including auto, school bus, truck, and taxi trips balanced to reflect that some taxis arrive or depart empty) would be expected to result in additional trips – approximately 4,327, 4,217, 3,177, and 2,811 vehicle trips ("in" and "out" trips, combined) in the weekday AM, midday, PM, and Saturday midday peak hours, respectively.
- Peak hour subway or railroad trips would increase by a net total of approximately 4,565, 3,633, 4,127, and 4,232 in the weekday AM, midday, PM, and Saturday midday peak hours, respectively.
- Peak hour bus trips would increase by a net total of approximately 3,148, 3,070, 2,626, and 2,659 in the weekday AM, midday, PM, and Saturday midday peak hours, respectively.
- Walk trips would increase by approximately 6,301, 7,270, 6,992, and 7,968 trips during the respective weekday AM, midday, PM, and Saturday midday peak hours.

The Rezoning Area is not currently served by a commuter railroad. However, the planned Metro-North service to the Rezoning Area will introduce two new stations within a convenient walking distance of the projected development sites.

Table 4 shows the net incremental change in peak hour vehicle trips (auto, taxi, and truck) that would be generated by each individual projected development site during the weekday AM, midday, PM, and Saturday midday peak hours.[1] Overall, Site 24 would generate the greatest number of new vehicle trips, with up to 1,087 incremental vehicle trips per hour. Sites 9 and 22 would generate the next highest number of incremental trips, with up to 751 and 670 vehicle trips per hour, respectively. There would be net decrease in vehicle trips during one or more peak hours at approximately 17 sites, primarily due to the reduction in office, auto repair, warehouse, and light industrial uses on these sites in the RWCDS compared to the Without-Action condition.

[1] Detailed demand forecast for each projected development site are provided in the Appendix.

Analysis Periods

According to *CEQR Technical Manual* guidelines, a quantified traffic analysis is typically required if a proposed action would result in more than 50 peak-hour vehicle trip ends. As listed in **Table 4**, the Proposed Actions are expected to result in more than 50 total vehicle trips during each weekday analysis hour; therefore, each of these periods will be included in the quantified analysis of traffic conditions. The specific hours to be analyzed in each peak period will be determined based on traffic count data collected along the street network in the study area.

Transit (both subway and bus) analyses generally examine conditions during the weekday AM and PM commuter peak periods, as it is during these times that overall transit demand (and the potential for

significant adverse impacts) is typically greatest. Therefore, the quantitative analyses of transit conditions with the Proposed Actions will focus on these two periods.

According to *CEQR Technical Manual* guidelines, a quantified analysis of pedestrian conditions is typically required if a proposed action would result in 200 or more peak hour pedestrian trips. The net increase in pedestrian trips resulting from the Proposed Actions would exceed the 200-trip *CEQR Technical Manual* analysis threshold during the weekday AM and PM commuter peak hours and the weekday midday and Saturday peak hours for retail demand. The specific analysis peak hours will be determined based on pedestrian counts that will be conducted as part of the pedestrian analyses for the *Bronx Metro-North Station Study EIS*. As project increment pedestrian trips during the Saturday peak hour would be lower than the weekday midday peak hour, significant adverse pedestrian impacts on Saturday over and above those identified for the weekday peak hours are considered unlikely. The analysis of pedestrian conditions will therefore focus on the weekday AM, midday and PM peak hours, and the Saturday peak hour will not be included for analysis.

TRAFFIC STUDY AREA

Area Street Network

As previously shown on **Figure 1,** the rezoning area consists of an approximately 40 block area near the future Parkchester/Van Nest and Morris Park Metro-North stations in the Bronx. The Parkchester/Van Nest station area projected development sites are generally situated around East Tremont and Bronxdale avenues. The Morris Park station area projected development sites are generally situated around Eastchester Road and Stillwell Avenue.

Primary East-West Corridors

East Tremont Avenue is a principal arterial that runs east-west through the Bronx, traversing from Morris Heights to the west to Throgs Neck to the east. East Tremont Avenue provides connections to local minor streets as well as access to Bruckner Boulevard, Hutchinson River Parkway, and the Cross-Bronx Expressway. East Tremont Avenue generally provides two travel lanes and curbside parking in both directions through the Rezoning Area. A painted or raised median exists for the majority of the street. East Tremont Avenue is an NYCDOT-designated local truck route.

Bounding the study area to the north is the Bronx-Pelham Parkway, a principal arterial operating east-west between the Bronx River Parkway and Interstate 95, the New England Thruway. Bronx-Pelham Parkway typically provides three through lanes in each direction with an express bus lane and two through lanes and on-street parking provided along the north and south service roads. The north and south Pelham Parkway service roads are NYCDOT-designated local truck route. Commercial traffic and trucks are not permitted on the main roadway.

Morris Park Avenue is a minor arterial that connects most of the local north-south streets. It generally runs parallel to East Tremont Avenue from Eastchester Road to the east and reroutes southbound to connect to East Tremont Avenue west of the Bronx River Parkway. Morris Park Avenue has two travel

lanes per direction and curbside parking on both sides of the road and is an NYCDOT-designated local truck route.

Primary North-South Corridors

Eastchester Road is a north-south principal arterial that runs through the Rezoning Area from Williamsbridge Road to the south to East Gun Hill Road to the north. Eastchester Road is generally 60 feet wide with two travel lanes in each direction and curbside parking on both sides. Eastchester Road is an NYCDOT-designated local truck route.

Stillwell Avenue is a minor arterial that runs from Eastchester Avenue in the Rezoning Area to the Hutchinson River Parkway. The roadway width in the study area is approximately 55 feet wide, with one travel lane in each direction and curbside parking (frequent double parking) on both sides.

East of the study area is the Hutchinson River Parkway, a major two-way northbound and southbound roadway classified as a Principal Arterial Expressway. The north and southbound roadways are separated by a landscaped median. It generally operates with three lanes in each direction. Commercial traffic and trucks are not permitted on the Hutchinson River Parkway.

Traffic Assignment and Analysis Locations

The assignment of vehicle trips was based on the location of the projected development sites and the anticipated origins and destinations of vehicle trips associated with the different uses projected for the rezoning area (e.g., commercial, residential, etc.). The origins/destinations of residential and non-retail commercial trips used for the assignments are based on flows from the 2012-2016 US Census journey-to-work and reverse journey-to-work data, respectively. Retail trip origins/destinations are based on population density in proximity to the rezoning area. **Table 5** presents the directional distributions of auto and taxi trips by land use based on the origin/destination data. Using these distributions, auto and taxi trips were first assigned to various portals on the perimeter of the rezoning area and then assigned via the most direct route to trip nodes located within each zone of a development site. Truck trips en route to and from each site were assigned to designated through and local truck routes and then to the most direct paths to and from the projected sites.

The assignment of vehicle trips to and from the origins and destinations varies among those development sites situated around the Parkchester/Van Nest station area versus those near the Morris Park station area. Morris Park station area trips to and from Manhattan, Brooklyn, Queens, Staten Island, and areas of the Bronx south and east of the Rezoning Area would use the Hutchinson River Parkway south to local roads or to the Whitestone and Throgs Neck Bridges. Trips to and from Westchester and Rockland counties and Connecticut would use the Hutchinson River Parkway northbound. Morris Park trips to and from New Jersey and Pennsylvania would take the Pelham Parkway east for access to I-95. Trips to areas of the Bronx north and west of the Rezoning Area would take Eastchester Road or Pelham Parkway, respectively.

Parkchester station area trips to and from Brooklyn, Queens, and Staten Island would use the Hutchinson River Parkway south the Whitestone and Throgs Neck Bridges from those development sites located in the east side of the Rezoning Area. Sites to those destinations located in the west side of the Rezoning Area would likely use East Tremont Avenue to Sheridan Boulevard and the Bruckner Expressway. Parkchester trips to and from Manhattan and areas of the Bronx south of the Rezoning Area would also use East Tremont Avenue to Sheridan Boulevard. Trips to and from Connecticut would use the Hutchinson River Parkway northbound. Parkchester trips to and from New Jersey and Pennsylvania would travel south to the Cross-Bronx Expressway for access to I-95.

Table 5: Directional Distributions of Auto/Taxi Trips by Land Use

Land Use	Bronx				Manhattan	Brooklyn/ Queens/ Staten Island	Long Island	Westchester and Rockland	Connecticut	NJ/PA
	North	East	South	West						
Non-Retail Commercial[1]	17%	8%	9%	8%	6%	9%	5%	29%	2%	6%
Residential[2]	16%	4%	8%	27%	17%	8%	3%	10%	3%	5%
Retail/Community Uses[3]	22%	13%	44%	22%	-	-	-	-	-	-

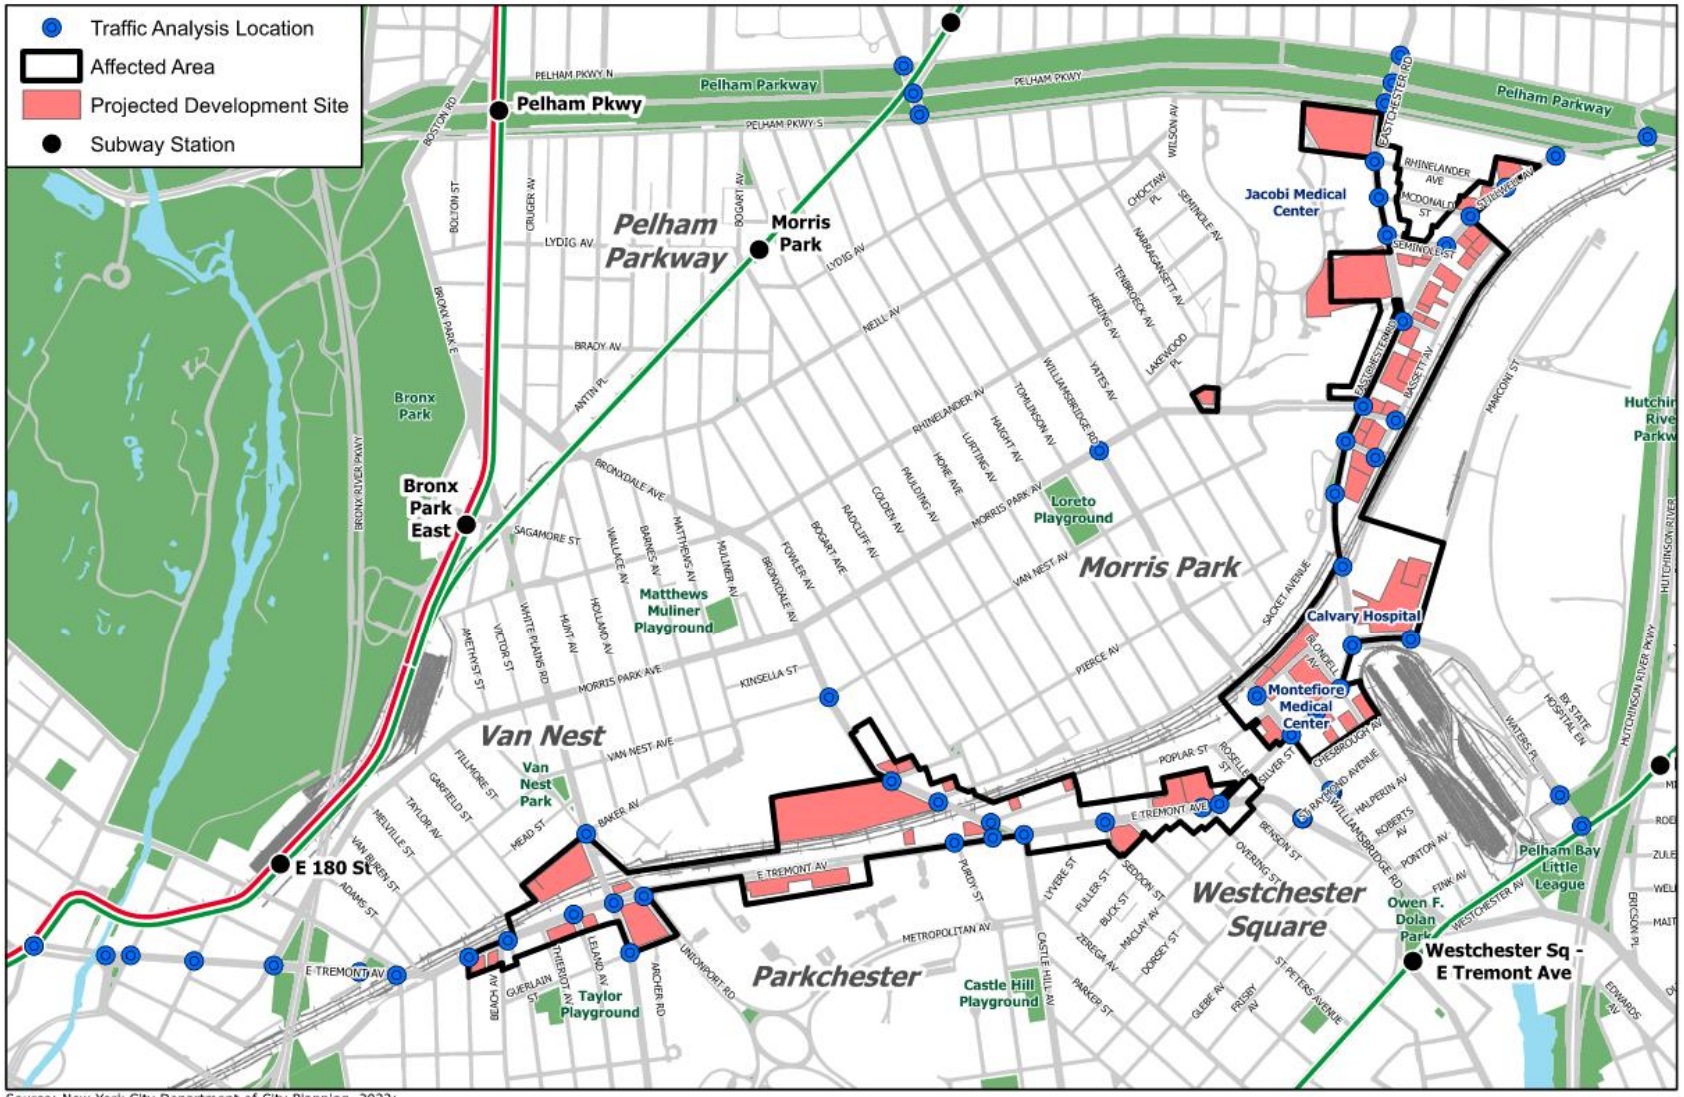

Notes:

1. Vehicle (auto/taxi) trip distribution for office, warehouse, self-storage, light industrial, life science, and auto repair trips for the proposed rezoning area.
   This distribution was based on reverse journey-to-work trips using 2012-2016 US Census data for tracts 200, 204, 210.01, 216.01, 216.02, 218, 238, 240, 244, 256, 284, and 296.
2. Vehicle (auto/taxi) trip distribution for residential.
   This distribution was based on journey-to-work trips using 2012-2016 US Census data for tracts 200, 204, 210.01, 216.01, 216.02, 218, 238, 240, 244, 256, 284, and 296.
3. Trip distribution for all other uses in the proposed rezoning area (retails, medical office, house of worship, and community center).
   This distribution was based population density for census tracts within an approximate 1/2-mile distance of the proposed rezoning area.

As noted previously, the Proposed Actions would be expected to generate a net increase of 4,327 vehicle trips during the weekday AM peak hour, 4,217 vehicle trips during the weekday midday peak hour, 3,177 vehicle trips during the weekday PM peak hour, and 2,811 vehicle trips during the Saturday midday peak hour. As these traffic volumes would exceed 50 trips in each peak hour (the CEQR Technical Manual Level 1 screening threshold for a detailed analysis), a preliminary assignment of net increment traffic volumes has been prepared to identify critical intersections that would potentially exceed 50 trips per hour (a Level 2 screening assessment). The preliminary assignment identified a number of intersections that would exceed the 50-trip threshold and 56 representative intersections were selected for a detailed traffic analysis as shown in Figure 2 and listed in Table 6. In addition, a detailed traffic analysis for the freeway and ramp junctions on the Hutchinson River Parkway will be performed for the weekday AM, midday, PM, and Saturday midday peak hours. The highway study area would likely consist of the mainline, weaving, and ramp juncture locations to/from Hutchinson River Parkway Interchanges 1B, 1C, and 1D. These locations were selected based on discussions with NYCDCP and NYCDOT.

Vehicular and Pedestrian Safety

Under *CEQR Technical Manual* guidance, the traffic study area should also consider intersections within the traffic and pedestrian study areas that have been identified as high crash locations. A high crash location is defined as a location identified along a Vision Zero corridor/intersection or where five or more pedestrian/bicyclist injury crashes have occurred in any consecutive 12 months of the most recent three-year period for which data are available. Within the traffic and pedestrian study areas, three intersections would be considered high-crash locations due to more than five pedestrian/bicycle injury crashes in a consecutive 12 month period. These intersections are Eastchester Road at Waters Place, Eastchester Road at Williamsbridge Road, and Waters Place at Fink Avenue and are included as traffic analysis locations. The analysis of vehicular and pedestrian safety in the EIS will focus on these high-crash locations and other intersections with a substantial number of crashes. Crash trends will be evaluated to determine if vehicle and/or pedestrian trips and any street network changes resulting from the Proposed Actions would adversely affect vehicular and pedestrian safety in the study area. Feasible improvement measures will be explored to alleviate potential safety issues.

TRANSIT

According to the general thresholds used by the MTA and specified in the *CEQR Technical Manual,* detailed transit analyses are required if a proposed action is projected to result in greater than 200 peak hour rail or bus transit riders. If a proposed action would result in 50 or more bus passengers being assigned to a single bus line (in one direction), or if it would result in an increase of 200 or more passengers at a single subway station or on a single subway line, a detailed bus or subway analysis would be warranted.

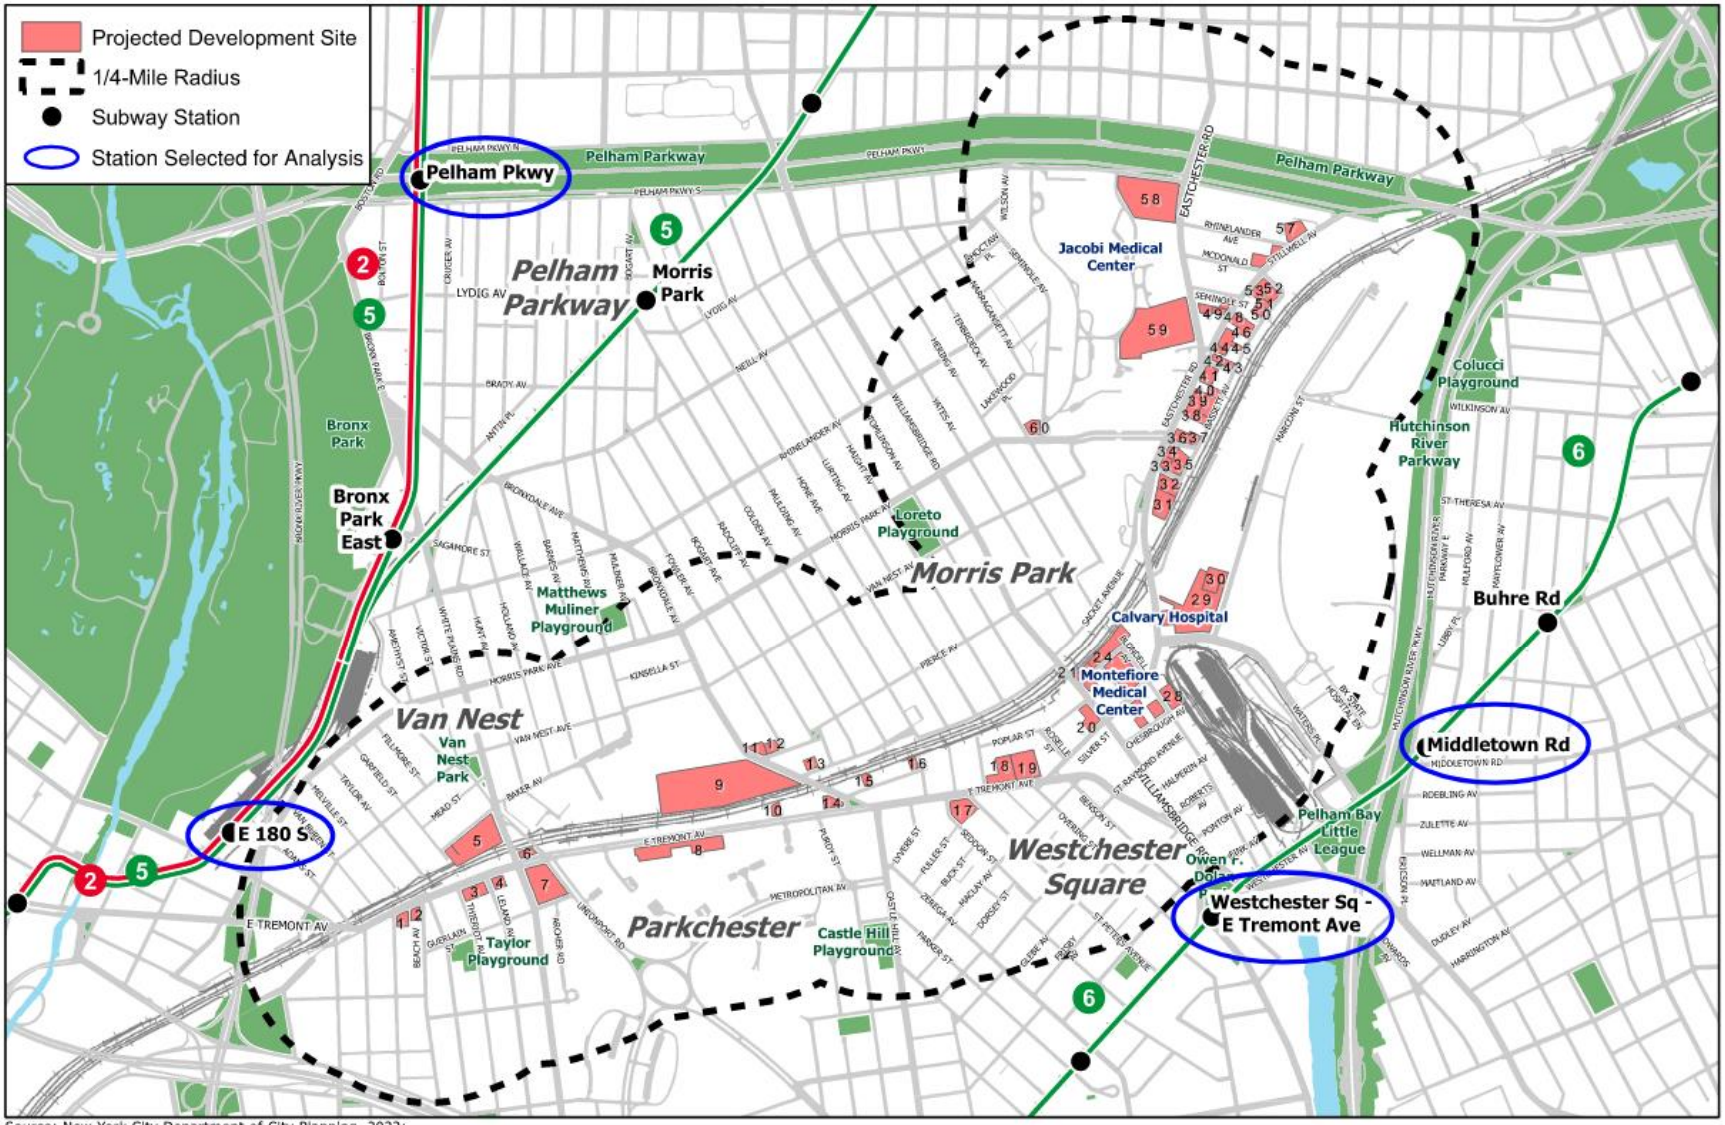

Subway Analysis

Subway Stations

There are a total of seven NYCT subway stations in proximity to the rezoning area that are expected to be used by new demand from projected development sites. These stations are presented in **Figure 3** and **Table 7**, along with the subway routes serving each facility. These are the stations most likely to be used based on the origins and destinations and walk distance from the projected development sites. As shown in **Figure 3**, 2 and 5 subway trains operating on the IRT White Plains Line and the IRT Dyre Avenue Line, respectively, are located west of the Rezoning Area and the 6 subway train operating on the IRT Pelham Line is located east of the Rezoning Area. Projected development sites in the Parkchester station area would most likely use the East 180th Street station for access to the 2 and 5 train lines. The Parkchester, Westchester Square, and Middletown Road stations are most likely to be used for access to the 6 train line.

0 0.25 0.5 Mile

Figure 3

REZONING AREA SUBWAY STATIONS

Subway Assignment and Analyzed Stations

As shown in **Table 3**, the Proposed Actions would generate a net increment of approximately 4,565 and 4,127 subway or rail trips during the weekday AM and PM commuter peak hours, respectively. The planned Metro-North service to the Rezoning Area will introduce two new Metro-North stations within a convenient walking distance of the projected development sites and will attract approximately 35 percent[2] of the transit rail trips. The remaining 65 percent would be assigned as subway trips for a net increment of 2,964 and 2,679 subway trips in the weekday AM and PM peak hours, respectively.

The incremental subway trips from each projected development site were assigned to the 2, 5, or 6 subway lines based on the existing subway schedule and assigned to the closest subway station in its proximity. **Table 7** shows the estimated net incremental subway trips generated by the Proposed Actions during the weekday AM and PM peak hours at each of the subway stations serving the rezoning area. The highest number of peak hour subway trips is expected to occur at the East 180th Street station serving the 2 and 5 lines which would experience approximately 1,320 incremental trips (in + out combined) in the AM peak hour and 1,187 in the PM peak hour. The Westchester Square station on the 6 Line would experience an estimated 992 trips in the AM and 862 in the PM. The Pelham Parkway station on the 2 and 5 Line would experience an estimated 291 trips in the AM peak hour and 285 trips in the PM peak hour. The Middletown Road station on the 6 line would experience an estimated 217 trips in the AM peak hour and 201 trips in the PM peak hour. All other stations would experience fewer than 200 incremental trips in both the AM and PM peak hours.

As incremental demand generated by the Proposed Actions would exceed the 200-trip *CEQR Technical Manual* analysis threshold at the East 180th Street, Westchester Square, Pelham Parkway, and Middletown Road stations, the analysis of subway station conditions in the EIS will focus on these four stations. For each of these facilities, key circulation elements (e.g., street stairs and fare arrays) expected to be used by concentrations of new demand from the Proposed Actions will be analyzed.

Subway Line Haul

As discussed above, the rezoning area is served by two NYCT subway routes—the 2 trains operating on the White Plains Line, the 5 trains operating on the Dyre Avenue Line, and the 6 trains operating on the Pelham Line. As the Proposed Actions are expected to generate 200 or more new subway trips in one direction on one or more of these routes, an analysis of subway line haul conditions will be included in the EIS. The analysis will use existing maximum load point subway service and ridership data provided by NYCT to assess existing, future No-Action, and future With-Action conditions at the peak load points of the respective subway lines during the weekday AM and PM peak hours.

[2] Based on AASHTO CTPP 5-year (2012-2016) flow data for Woodlawn Metro-North Station adjacent census tracts (Bronx Census Tracts 449.01, 449.02 and 451.01)

Metro-North Assignment and Analyzed Stations

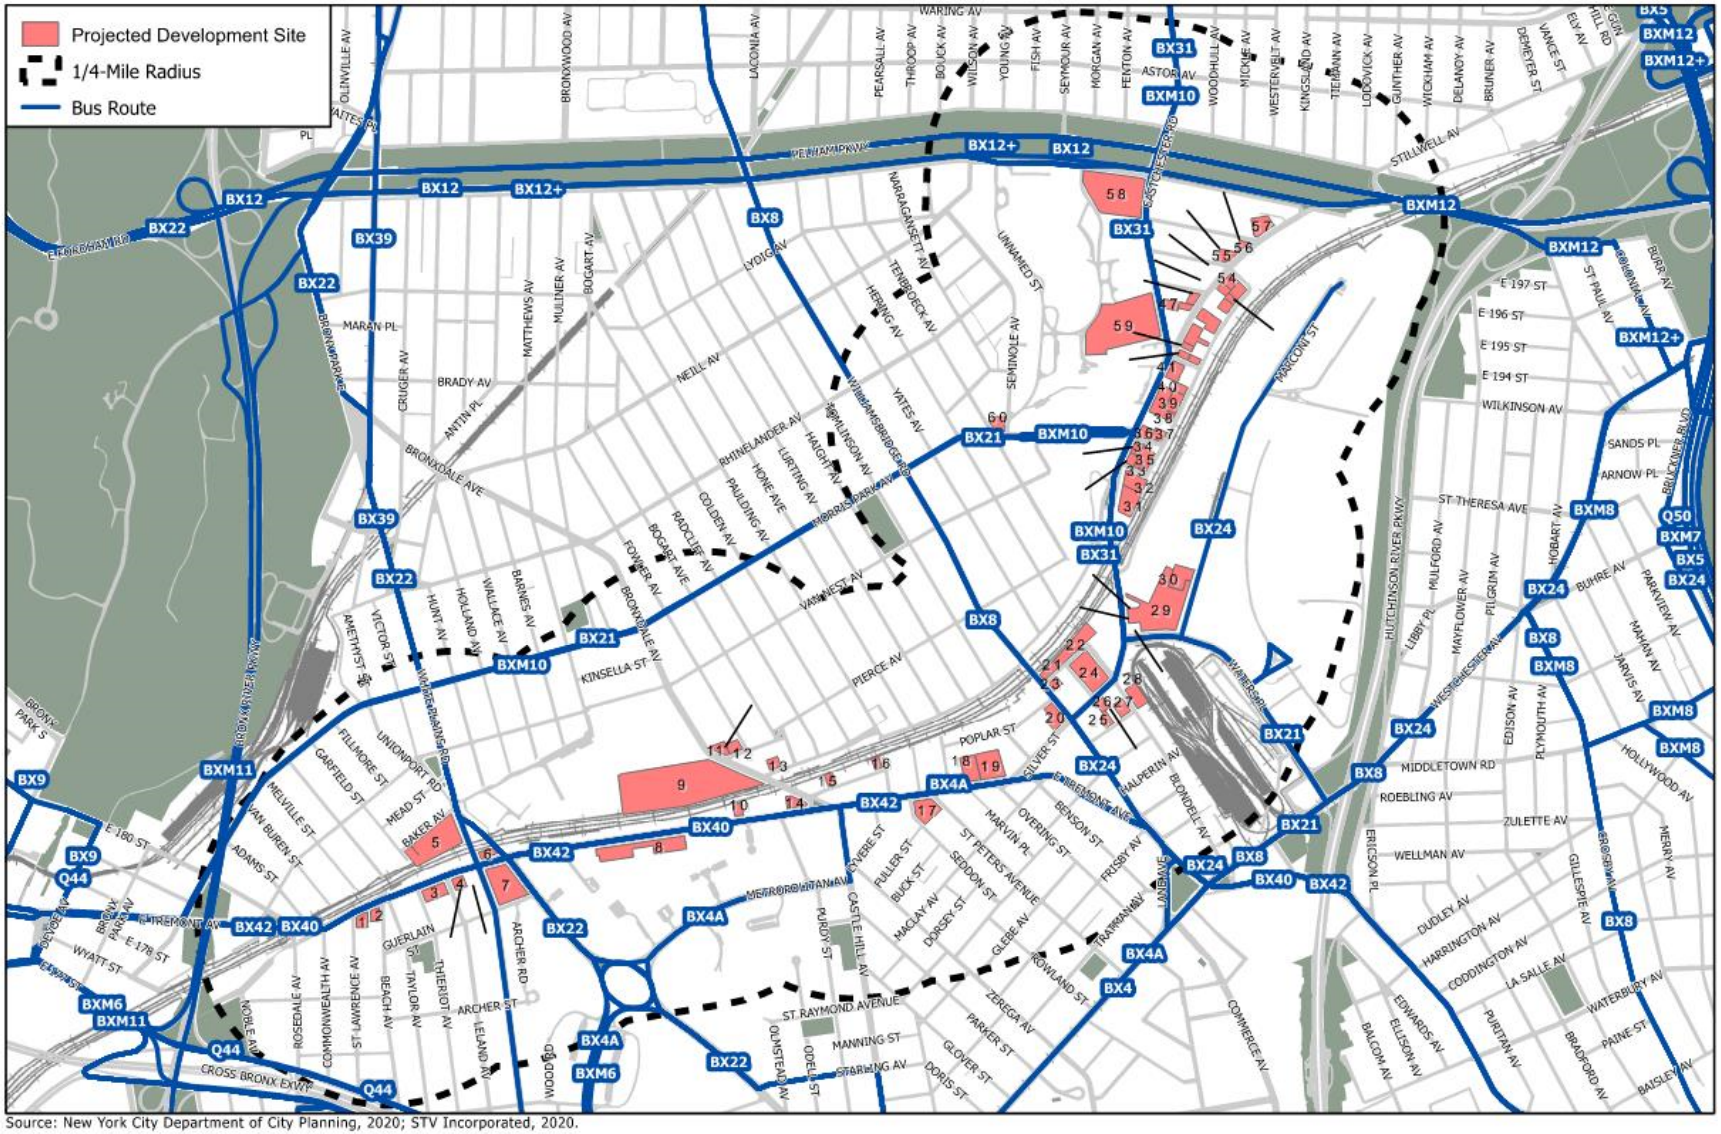

The Rezoning Area will be served by two new Metro-North stations in the Parkchester/Van Nest and Morris Park areas. Census data from the representative neighborhood of Woodlawn indicates that 35 percent of transit rail riders will use these new stations. As shown in **Table 7**, the Proposed Actions would generate a net increment of approximately 1,601 and 1,448 Metro-North rail trips during the weekday AM and PM commuter peak hours, respectively. The incremental rail trips from each projected development site were assigned to the designated station area, which results in 622 and 584 trips at the Parkchester station and 980 and 864 trips at the Morris Park station during the weekday AM and PM peak hours, respectively.

As incremental demand generated by the Proposed Actions would exceed the 200-trip *CEQR Technical Manual* analysis threshold in both peak hours at the Parkchester and Morris Park stations, the analysis of station conditions in the EIS will focus on these two stations. For each of these facilities, key circulation elements expected to be used by concentrations of new demand from the Proposed Actions will be analyzed based on available station plans.

Bus Analysis

Bus Routes

As shown in **Figure 4**, a total of 14 NYCT bus services operate within and approximate ¼-mile of projected development sites. These include both the local and Select Bus Service (SBS) services on the Bx12 route and the express BxM10. These routes and the principal corridors on which they operate in proximity to the rezoning area are listed in **Table 8**.

BxM10	NYCT	Williamsbridge/Morris Park - Midtown	Eastchester Road/ Morris Park Avenue

Bus Assignments and Analyzed Routes

As shown in **Table 3**, projected development sites are expected to generate a net total of approximately 3,148 and 2,626 incremental bus trips during the weekday AM and PM peak hours, respectively. Additionally, it is expected that a portion of subway trips would originate as bus trips. All of the subway stations in the area are located beyond a ¼-mile radius from the projected development sites, as shown in **Figure 3.** As a result, an additional 2,406 and 2,218 incremental bus would be added as connections to subway stations for a total of 5,544 and 4,826 new bus trips during the weekday AM and PM peak hours, respectively.

Bus trip assignments were developed based on existing 2012-2016 AASHTO CTPP data to determine the destination tracts of bus trips originating in the Rezoning Area census tracts. Bus trips were assigned to bus lines that serve these areas. Incremental bus trips from each projected development site were assigned to a variety of bus lines as a result of multiple destinations from each census tract. The CTPP data for reverse-journey-to-work indicate that all inbound trips originate from Bronx census tracts; as a result all inbound trips to non-residential uses were assigned to local Bronx buses.

Table 9 shows the anticipated numbers of new riders expected on each local bus route in the AM and PM peak hours. According to the general thresholds used by the MTA and specified in the *CEQR Technical Manual*, a detailed analysis of bus conditions is generally not required if a proposed action is projected to result in fewer than 50 peak hour trips being assigned to a single bus route (in one direction), as this level of new demand is considered unlikely to result in significant adverse impacts. As shown in **Table 9**, a total of one express and eight local bus routes operated by NYCT have the potential to experience 50 or more

new trips in one direction in at least one peak hour and will therefore be analyzed in the EIS. These routes are the Bx4A, Bx12, Bx12-SBS, Bx21, Bx31, Bx39, Bx40, Bx42 and BxM10.

Total		2,603	2,941	5,544	2,317	2,508	4,826

Notes:

Bold - denotes 50 or more incremental trips.

PEDESTRIANS

Under *CEQR Technical Manual* guidelines, detailed pedestrian analyses are generally warranted if a proposed action is projected to result in 200 or more new peak hour pedestrians at any sidewalk, corner reservoir area or crosswalk. As shown in **Table 3**, the Proposed Actions are expected to generate

approximately 6,301 walk-only trips (in + out combined) in the weekday AM peak hour, 7,270 in the midday peak hour, 6,992 in the PM peak hour, and 7,968 in the Saturday peak hour. Persons en route to and from subway/rail station entrances and bus stops would add approximately 7,713, 6,703, 6,753 and 6,891 additional pedestrian trips to rezoning area sidewalks and crosswalks during these same periods, respectively. In the weekday AM and PM peak hours, new pedestrian trips would be most concentrated on sidewalks and crosswalks adjacent to projected development sites as well as along corridors connecting these sites to area subway station entrances. In the midday and Saturday peak hours, pedestrian trips would tend to be more dispersed, as people travel throughout the area for lunch, shopping and/or errands.

The analysis of pedestrian conditions in the EIS will focus on representative pedestrian elements where new trips generated by projected developments are expected to be most concentrated. It is expected that these elements—sidewalks, corner areas and crosswalks—will be primarily located in the vicinity of major projected development sites and along corridors connecting these sites to area subway station entrances and bus routes.

PARKING

Parking demand from the predominantly commercial and retail uses that would be developed under the Proposed Actions' RWCDS typically peaks in the weekday midday period and declines during the afternoon and evening. By contrast, parking demand from the Proposed Actions' relatively small residential component would typically peak during the overnight period.

It is anticipated that the on-site required accessory parking may not be sufficient to accommodate the overall incremental demand that would be generated by the Proposed Actions. As such, detailed existing on-street and off-street parking inventories for the weekday midday period will be provided in the EIS to document the existing supply and demand during this peak period for commercial and retail uses. The parking analyses will document changes in the parking supply and utilization in the rezoning area and within a ¼-mile radius of projected development sites under both No-Action and With-Action conditions.

The forecast of parking demand generated by the commercial and retail uses under the Proposed Actions' RWCDS will be derived from the forecasts of daily auto trips from these uses. The parking demand from the Proposed Actions relatively residential component will be based on 2013-2017 ACS data on average vehicles per household for Bronx Census Tracts encompassing the rezoning area. Estimates of future parking utilization will account for net reductions in demand associated with No-Action land uses displaced from projected development sites under the RWCDS.

The forecast of new parking supply under the RWCDS will be based on the number of accessory parking spaces that would be provided on projected development sites in both the No-Action and With-Action conditions. The forecast of future supply will also account for accessory parking spaces associated with the With-Action commercial uses.

1 "Mvt." refers to the specific intersection approach lane(s) at how the lane(s) operate and/or specific pavement striping. TR is a combined through- right turn lane(s), R or L refers to exclusive right- or left-turn movement lane(s), at LTR is a mixed lane(s) that allows for all movement types.

2 V/C is the volume-to-capacity ratio for the Mvt. listed in the first column. Values above 1.0 indicate an excess of demand over capacity.

3 Level of service (LOS) for signalized intersections is based upon average control delay per vehicle (sec/veh) for each lane group listed in the Mvt. Column as noted in the 2000 HCM - TRB.

4 The delay calculations for signalized intersections represent the average control delay experienced by all vehicles that arrive in the analysis period, including delays incurred beyond the analysis period when the lane group is saturated.

5 LOS for unsignalized intersections is based upon total average delay per vehicle (sec/veh) for each lane group listed in the Mvt. column as noted in the 2000 HCM - TRB.

denotes lane group not present due to calibration differences between scenario

denotes lane group not present in given analysis period due to the lane group containing a defacto left or right turn in scenario in a different analysis period

No-Action Conditions

1 "Mvt." refers to the specific intersection approach lane(s) at how the lane(s) operate and/or specific pavement striping. TR is a combined through- right turn lane(s), R or L refers to exclusive right- or left-turn movement lane(s), at LTR is a mixed lane(s) that allows for all movement types.

2 V/C is the volume-to-capacity ratio for the Mvt. listed in the first column. Values above 1.0 indicate an excess of demand over capacity.

3 Level of service (LOS) for signalized intersections is based upon average control delay per vehicle (sec/veh) for each lane group listed in the Mvt. Column as noted in the 2000 HCM - TRB.

4 The delay calculations for signalized intersections represent the average control delay experienced by all vehicles that arrive in the analysis period, including delays incurred beyond the analysis period when the lane group is saturated.

5 LOS for unsignalized intersections is based upon total average delay per vehicle (sec/veh) for each lane group listed in the Mvt. column as noted in the 2000 HCM - TRB.

Shading denotes lanes not present due to calibration differences between scenario

Shading denotes lanes not present due to the lane group containing a defacto left or right turn in scenario

Shading denotes lanes configurations changed due to No Build projects or mitigations

With-Action Conditions

1 "Mvt." refers to the specific intersection approach lane(s) at how the lane(s) operate and/or specific pavement striping. TR is a combined through- right turn lane(s), R or L refers to exclusive right- or left-turn movement lane(s), at LTR is a mixed lane(s) that allows for all movement types.

2 V/C is the volume-to-capacity ratio for the Mvt. listed in the first column. Values above 1.0 indicate an excess of demand over capacity.

3 Level of service (LOS) for signalized intersections is based upon average control delay per vehicle (sec/veh) for each lane group listed in the Mvt. Column as noted in the 2000 HCM - TRB.

4 The delay calculations for signalized intersections represent the average control delay experienced by all vehicles that arrive in the analysis period, including delays incurred beyond the analysis period when the lane group is saturated.

5 LOS for unsignalized intersections is based upon total average delay per vehicle (sec/veh) for each lane group listed in the Mvt. column as noted in the 2000 HCM - TRB.

Shading denotes lanes not present due to calibration differences between scenario

Shading denotes lanes not present due to the lane group containing a defacto left or right turn in scenario

Shading denotes lanes configurations changed due to No Build projects or mitigations
